## 1. General description

The 74LVC2T45-Q100; 74LVCH2T45-Q100 are dual bit, dual supply translating transceivers with 3-state outputs that enable bidirectional level translation. They feature two 2-bits input-output ports (nA and nB), a direction control input (DIR) and dual supply pins ( $V_{CC(A)}$  and  $V_{CC(B)}$ ). Both  $V_{CC(A)}$  and  $V_{CC(B)}$  can be supplied at any voltage between 1.2 V and 5.5 V making the device suitable for translating between any of the low voltage nodes (1.2 V, 1.5 V, 1.8 V, 2.5 V, 3.3 V and 5.0 V). Pins nA and DIR are referenced to  $V_{CC(A)}$  and pins nB are referenced to  $V_{CC(B)}$ . A HIGH on DIR allows transmission from nA to nB and a LOW on DIR allows transmission from nB to nA.

The devices are fully specified for partial power-down applications using  $I_{OFF}$ . The  $I_{OFF}$  circuitry disables the output, preventing any damaging backflow current through the device when it is powered down. In suspend mode when either  $V_{CC(A)}$  or  $V_{CC(B)}$  are at GND level, both A port and B port are in the high-impedance OFF-state.

Active bus hold circuitry in the 74LVCH2T45-Q100 holds unused or floating data inputs at a valid logic level.

This product has been qualified to the Automotive Electronics Council (AEC) standard Q100 (Grade 1) and is suitable for use in automotive applications.

[1] C<sub>PD</sub> is used to determine the dynamic power dissipation (P<sub>D</sub> in μW).

$$P_D = C_{PD} \times V_{CC}^2 \times f_i \times N + \Sigma(C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

N = number of inputs switching;

$\Sigma(C_L \times V_{CC}^2 \times f_o)$  = sum of the outputs.

### 13. Application information

#### 13.1. Unidirectional logic level-shifting application

The circuit given in Fig. 14 is an example of the 74LVC2T45-Q100; 74LVCH2T45-Q100 being used in a unidirectional logic level-shifting application.

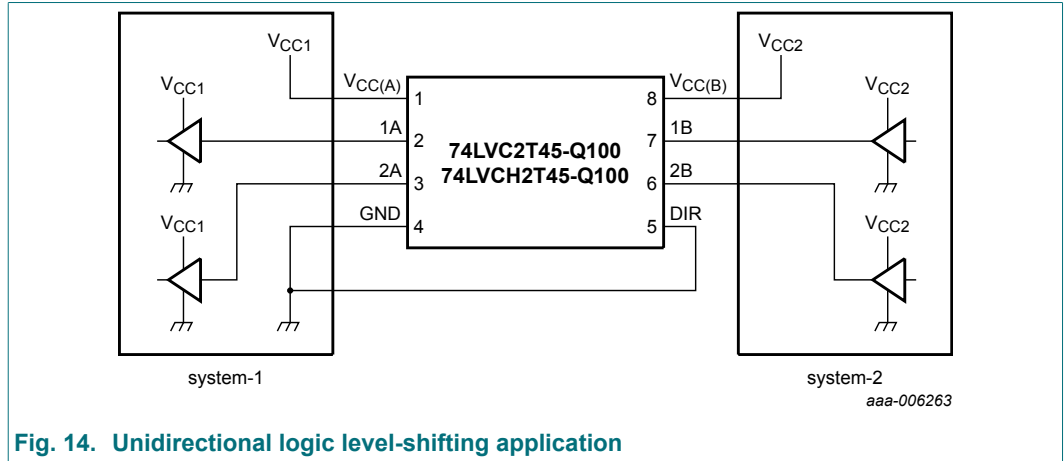

Fig. 14. Unidirectional logic level-shifting application

Table 16. Description of unidirectional logic level-shifting application

Pin	Name	Function	Description
1	V <sub>CC(A)</sub>	V <sub>CC1</sub>	supply voltage of system-1 (1.2 V to 5.5 V)
2	1A	OUT	output level depends on V <sub>CC1</sub> voltage
3	2A	OUT	output level depends on V <sub>CC1</sub> voltage
4	GND	GND	device GND
5	DIR	DIR	the GND (LOW level) determines B port to A port direction
6	2B	IN	input threshold value depends on V <sub>CC2</sub> voltage
7	1B	IN	input threshold value depends on V <sub>CC2</sub> voltage
8	V <sub>CC(B)</sub>	V <sub>CC2</sub>	supply voltage of system-2 (1.2 V to 5.5 V)

### 13.2. Bidirectional logic level-shifting application

Fig. 15 shows the 74LVC2T45-Q100; 74LVCH2T45-Q100 being used in a bidirectional logic level-shifting application. Since the device does not have an output enable pin, the system designer should take precautions to avoid bus contention between system-1 and system-2 when changing directions.

Fig. 15. Bidirectional logic level-shifting application

Table 17 gives a sequence that will illustrate data transmission from system-1 to system-2 and then from system-2 to system-1.

Table 17. Description of bidirectional logic level-shifting application

H = HIGH voltage level;  
 L = LOW voltage level;  
 Z = high-impedance OFF-state.

State	DIR CTRL	I/O-1	I/O-2	Description
1	H	output	input	system-1 data to system-2
2	H	Z	Z	system-2 is getting ready to send data to system-1. I/O-1 and I/O-2 are disabled. The bus-line state depends on bus hold
3	L	Z	Z	DIR bit is set LOW. I/O-1 and I/O-2 still are disabled. The bus-line state depends on bus hold
4	L	input	output	system-2 data to system-1

### 13.3. Power-up considerations

The device is designed such that no special power-up sequence is required other than GND being applied first.

Table 18. Typical total supply current (I<sub>CC(A)</sub> + I<sub>CC(B)</sub>)

V <sub>CC(A)</sub>	V <sub>CC(B)</sub>					Unit
	0 V	1.8 V	2.5 V	3.3 V	5.0 V	
0 V	0	< 1	< 1	< 1	< 1	µA
1.8 V	< 1	< 2	< 2	< 2	2	µA
2.5 V	< 1	< 2	< 2	< 2	< 2	µA
3.3 V	< 1	< 2	< 2	< 2	< 2	µA
5.0 V	< 1	2	< 2	< 2	< 2	µA

### 13.4. Enable times

Calculate the enable times for the 74LVC2T45-Q100; 74LVCH2T45-Q100 using the following formulas:

- $t_{PZH} \text{ (DIR to A)} = t_{PLZ} \text{ (DIR to B)} + t_{PLH} \text{ (B to A)}$
- $t_{PZL} \text{ (DIR to A)} = t_{PHZ} \text{ (DIR to B)} + t_{PHL} \text{ (B to A)}$
- $t_{PZH} \text{ (DIR to B)} = t_{PLZ} \text{ (DIR to A)} + t_{PLH} \text{ (A to B)}$
- $t_{PZL} \text{ (DIR to B)} = t_{PHZ} \text{ (DIR to A)} + t_{PHL} \text{ (A to B)}$

In a bidirectional application, these enable times provide the maximum delay from the time the DIR bit is switched until an output is expected. For example, if the 74LVC2T45-Q100; 74LVCH2T45-Q100 initially is transmitting from A to B, then the DIR bit is switched, the B port of the device must be disabled before presenting it with an input. After the B port has been disabled, an input signal applied to it appears on the corresponding A port after the specified propagation delay.
