

# **General Description**

The 8N3PG10MBKI-062 is a very versatile programmable LVPECL synthesizer that can be used for OTN/SONET to Ethernet or 10 GB Ethernet to OTN/SONET rate conversions. The conversion rate is pin-selectable and one of the four rates is supported at a time. In the default configuration, an input clock of 100MHz is converted to 311.04MHz output.

The device uses IDT's fourth generation FemtoClock NG technology to deliver low phase noise clocks combined with low power consumption.

## Features

- Fourth Generation FemtoClock<sup>®</sup> Next Generation (NG) technology
- Footprint compatible with 5mm x 7mm differential oscillators
- One differential LVPECL output pair
- CLK, nCLK input pair can accept the following levels: HCSL, LVDS, LVPECL and LVHSTL
- Output frequencies: 150MHz, 125MHz, 155.52MHz and 311.04MHz
- RMS phase jitter, 12kHz 20MHz: 0.295ps (typical) @ 3.3V
- Full 3.3V or 2.5V operating supply
- -40°C to 85°C ambient operating temperature
- Lead-free (RoHS 6) packaging

## Wiring the Differential Input to Accept Single-Ended Levels

*Figure 1* shows how a differential input can be wired to accept single ended levels. The reference voltage  $V_1 = V_{CC}/2$  is generated by the bias resistors R1 and R2. The bypass capacitor (C1) is used to help filter noise on the DC bias. This bias circuit should be located as close to the input pin as possible. The ratio of R1 and R2 might need to be adjusted to position the  $V_1$  in the center of the input voltage swing. For example, if the input clock swing is 2.5V and  $V_{CC}$  = 3.3V, R1 and R2 value should be adjusted to set  $V_1$  at 1.25V. The values below are for when both the single ended swing and  $V_{CC}$  are at the same voltage. This configuration requires that the sum of the output impedance of the driver (Ro) and the series resistance (Rs) equals the transmission line impedance. In addition, matched termination at the input will attenuate the signal in half. This can be done in one of two ways. First, R3 and R4 in parallel should equal the transmission

line impedance. For most 50 $\Omega$  applications, R3 and R4 can be 100 $\Omega$ . The values of the resistors can be increased to reduce the loading for slower and weaker LVCMOS driver. When using single-ended signaling, the noise rejection benefits of differential signaling are reduced. Even though the differential input can handle full rail LVCMOS signaling, it is recommended that the amplitude be reduced. The datasheet specifies a lower differential amplitude, however this only applies to differential signals. For single-ended applications, the swing can be larger, however V<sub>IL</sub> cannot be less than -0.3V and V<sub>IH</sub> cannot be more than V<sub>CC</sub> + 0.3V. Though some of the recommended components might not be used, the pads should be placed in the layout. They can be utilized for debugging purposes. The datasheet specifications are characterized and guaranteed by using a differential signal.

Figure 1. Recommended Schematic for Wiring a Differential Input to Accept Single-ended Levels

### **Recommendations for Unused Input Pins**

#### Inputs:

#### **LVCMOS Control Pins**

For the control pins that have internal pullup resistors; additional resistance is not required but can be added for additional protection. A  $1k\Omega$  resistor can be used.

## 3.3V Differential Clock Input Interface

The CLK /nCLK accepts LVDS, LVPECL, LVHSTL, HCSL and other differential signals. Both  $V_{SWING}$  and  $V_{OH}$  must meet the  $V_{PP}$  and  $V_{CMR}$  input requirements. *Figure 2A to Figure 2E* show interface examples for the CLK/nCLK input driven by the most common driver types. The input interfaces suggested here are examples only.

Figure 2A. CLK/nCLK Input Driven by an IDT Open Emitter LVHSTL Driver

Figure 2B. CLK/nCLK Input Driven by a 3.3V LVPECL Driver

Figure 2C. CLK/nCLK Input Driven by a 3.3V LVDS Driver

Please consult with the vendor of the driver component to confirm the driver termination requirements. For example, in Figure 2A, the input termination applies for IDT open emitter LVHSTL drivers. If you are using an LVHSTL driver from another vendor, use their termination recommendation.

Figure 2E. CLK/nCLK Input Driven by a 3.3V HCSL Driver

## 2.5V Differential Clock Input Interface

The CLK /nCLK accepts LVDS, LVPECL, LVHSTL, HCSL and other differential signals. Both  $V_{SWING}$  and  $V_{OH}$  must meet the  $V_{PP}$  and  $V_{CMR}$  input requirements. *Figure 3A to Figure 3E* show interface examples for the CLK/nCLK input driven by the most common driver types. The input interfaces suggested here are examples only.

## **VFQFN EPAD Thermal Release Path**

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in *Figure 4.* The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as "heat pipes". The number of vias (i.e. "heat pipes") are application specific and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, please refer to the Application Note on the Surface Mount Assembly of Amkor's Thermally/ Electrically Enhance Leadframe Base Package, Amkor Technology.

Figure 4. P.C. Assembly for Exposed Pad Thermal Release Path – Side View (drawing not to scale

## **Termination for 3.3V LVPECL Outputs**

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

The differential outputs are low impedance follower outputs that generate ECL/LVPECL compatible signals. Therefore, terminating resistors (DC current path to ground) or current sources must be

Figure 5A. 3.3V LVPECL Output Termination

used for functionality. These outputs are designed to drive  $50\Omega$  transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figure 5A* and *Figure 5B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

Figure 5B. 3.3V LVPECL Output Termination

## **Termination for 2.5V LVPECL Outputs**

*Figure 6A* and *Figure 6C* show examples of termination for 2.5V LVPECL driver. These terminations are equivalent to terminating  $50\Omega$  to V<sub>CC</sub> – 2V. For V<sub>CC</sub> = 2.5V, the V<sub>CC</sub> – 2V is very close to ground

Figure 6A. 2.5V LVPECL Driver Termination Example

Figure 6B. 2.5V LVPECL Driver Termination Example

level. The R3 in Figure 6B can be eliminated and the termination is shown in *Figure 6C*.

Figure 6C. 2.5V LVPECL Driver Termination Example

# **Power Considerations**

This section provides information on power dissipation and junction temperature for the 8N3PG10MBKI-062. Equations and example calculations are also provided.

#### 1. Power Dissipation.

The total power dissipation for the 8N3PG10MBKI-062 is the sum of the core power plus the power dissipation due to loading. The following is the power dissipation for  $V_{CC} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipation due to loading.

- Power (core)<sub>MAX</sub> = V<sub>CC\_MAX</sub> \* I<sub>EE\_MAX</sub> = 3.465V \* 189mA = 654.885mW
- Power (outputs)<sub>MAX</sub> = 30mW/Loaded Output pair

Total Power\_MAX (3.3V, with all outputs switching) = 654.885mW + 30mW = 684.885mW

#### 2. Junction Temperature.

Junction temperature, Tj, is the temperature at the junction of the bond wire and bond pad, and directly affects the reliability of the device. The maximum recommended junction temperature is 125°C. Limiting the internal transistor junction temperature, Tj, to 125°C ensures that the bond wire and bond pad temperature remains below 125°C.

The equation for Tj is as follows: Tj =  $\theta_{JA}$  \* Pd\_total + T<sub>A</sub>

Tj = Junction Temperature

 $\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

Pd\_total = Total Device Power Dissipation (example calculation is in section 1 above)

T<sub>A</sub> = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming no air flow and a multi-layer board, the appropriate value is 39.2°C/W per *Table 7* below.

Therefore, Tj for an ambient temperature of 85°C with all outputs switching is:

 $85^{\circ}C + 0.685W * 39.2^{\circ}C/W = 111.9^{\circ}C$ . This is well below the limit of  $125^{\circ}C$ .

This calculation is only an example. Tj will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

#### Table 7. Thermal Resistance $\theta_{JA}$ for 10 Lead VFQFN, Forced Convection

θ <sub>JA</sub> by Velocity	
Meters per Second	0
Multi-Layer PCB, JEDEC Standard Test Boards	39.2°C/W

#### 3. Calculations and Equations.

The purpose of this section is to calculate the power dissipation for the LVPECL output pair.

The LVPECL output driver circuit and termination are shown in Figure 7.

Figure 7. LVPECL Driver Circuit and Termination

To calculate power dissipation due to loading, use the following equations which assume a 50 $\Omega$  load, and a termination voltage of V<sub>CC</sub> – 2V.

- For logic high,  $V_{OUT} = V_{OH\_MAX} = V_{CC\_MAX} 0.9V$ ( $V_{CC\_MAX} - V_{OH\_MAX}$ ) = 0.9V
- For logic low,  $V_{OUT} = V_{OL\_MAX} = V_{CC\_MAX} 1.7V$ ( $V_{CC\_MAX} - V_{OL\_MAX}$ ) = 1.7V

Pd\_H is power dissipation when the output drives high.

Pd\_L is the power dissipation when the output drives low.

 $\mathsf{Pd}_{\mathsf{H}} = [(\mathsf{V}_{\mathsf{OH}\_\mathsf{MAX}} - (\mathsf{V}_{\mathsf{CC}\_\mathsf{MAX}} - 2\mathsf{V}))/\mathsf{R}_{\mathsf{L}}] * (\mathsf{V}_{\mathsf{CC}\_\mathsf{MAX}} - \mathsf{V}_{\mathsf{OH}\_\mathsf{MAX}}) = [(2\mathsf{V} - (\mathsf{V}_{\mathsf{CC}\_\mathsf{MAX}} - \mathsf{V}_{\mathsf{OH}\_\mathsf{MAX}}))/\mathsf{R}_{\mathsf{L}}] * (\mathsf{V}_{\mathsf{CC}\_\mathsf{MAX}} - \mathsf{V}_{\mathsf{OH}\_\mathsf{MAX}}) = [(2\mathsf{V} - 0.9\mathsf{V})/50\Omega] * 0.9\mathsf{V} = \mathbf{19.8}\mathsf{mW}$ 

 $Pd_{L} = [(V_{OL\_MAX} - (V_{CC\_MAX} - 2V))/R_{L}] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OL\_MAX}))/R_{L}] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - 1.7V)/50\Omega] * 1.7V = 10.2mW$ 

Total Power Dissipation per output pair = Pd\_H + Pd\_L = 30mW

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
