

### LA Varistor Series

#### Description

The LA Varistor Series of transient voltage surge suppressors are radial leaded varistors (MOVs) that are designed to be operated continuously across AC power lines. These UL recognized varistors require very little mounting space, and are offered in various standard lead form options.

The LA Varistor Series are available in four model sizes: 7mm, 10mm, 14mm and 20mm; and have a  $V_{M(AC)RMS}$  voltage range from 130V to 1000V, and an energy absorption capability up to 360J. Some LA Series model numbers are available with clamping voltage selections, designated by a model number suffix of either A or B. The 'A' selection is the standard model; the 'B' selection provides a lower clamping voltage. See LA Series Device Ratings and Specifications

### Phenolic Coating Option -- LA Series Varistors for Hi-Temperature Operating Conditions:

- Phenolic-coated LA Series devices are available with improved maximum operating maximum temperature 125°C.
- These devices also have improved temperature cycling performance capability.
- Ratings and Specifications are as per standard LA Series except Hi-Pot Encapsulation (Isolation Voltage Capability) = 500V.
- These devices are not UL, CSA, VDE or CECC certified.
- To order: add X1347 to end of part number (e.g. V230LA20APX1347).
- Product marking:

**Copper Electrode Option:**

- Add 'W' to the end of the part number (e.g. V230LA20AP**W**)
- Product marking:

**Current Energy and Power Dissipation Ratings**

Should transients occur in rapid succession, the average power dissipation is the energy (watt-seconds) per pulse times the number of pulses per second. The power so developed must be within the specifications shown on the Device Ratings and Specifications Table for the specific

device. The operating values of a MOV need to be derated at high temperatures as shown above. Because varistors only dissipate a relatively small amount of average power they are not suitable for repetitive applications that involve substantial amounts of average power dissipation.

**Figure 1A - Power Derating for Epoxy Coated**

**Figure 1B - Power Derating for Phenolic Coated**

**Peak Pulse Current Test Waveform**

- $O_1$  = Virtual Origin of Wave
- $T$  = Time from 10% to 90% of Peak
- $T_1$  = Rise Time =  $1.25 \times T$
- $T_2$  = Decay Time

**Example** - For an 8/20  $\mu$ s Current Waveform:

- $8\mu s = T_1 = \text{Rise Time}$
- $20\mu s = T_2 = \text{Decay Time}$

NOTE: If pulse ratings are exceeded, a shift of  $V_{NIDCI}$  (at specified current) of more than +/-10% could result. This type of shift, which normally results in a decrease of  $V_{NIDCI}$ , may result in the device not meeting the original published specifications, but does not prevent the device from continuing to function, and to provide ample protection.
