

Advanced PMU for Hisilicon Processors

FEATURES

- Three Step-Down DC/DC Converters
- Four Low-Dropout Linear Regulators
- Integrated *ActivePath* Charger
- I²C™ Serial Interface
- Advanced Enable/Disable Sequencing Controller
- Minimal External Components
- Tiny 5×5mm TQFN55-40 Package
 - 0.75mm Package Height
 - Pb-Free and RoHS Compliant

GENERAL DESCRIPTION

The ACT8946A is a complete, cost effective, highly-efficient power management solution, optimized for the unique power, voltage-sequencing, and control requirements. It is ideal for a wide range of high performance portable handheld applications such as human-machine interfaces, control panels, smart grid infrastructures, network gateways, M2M systems, 2D barcode scanners, barcode printers, machine vision equipment, as well as home and commercial building

automations, POS terminals, medical devices and white goods. This device integrates the complete battery charging and management system with seven power supply channels.

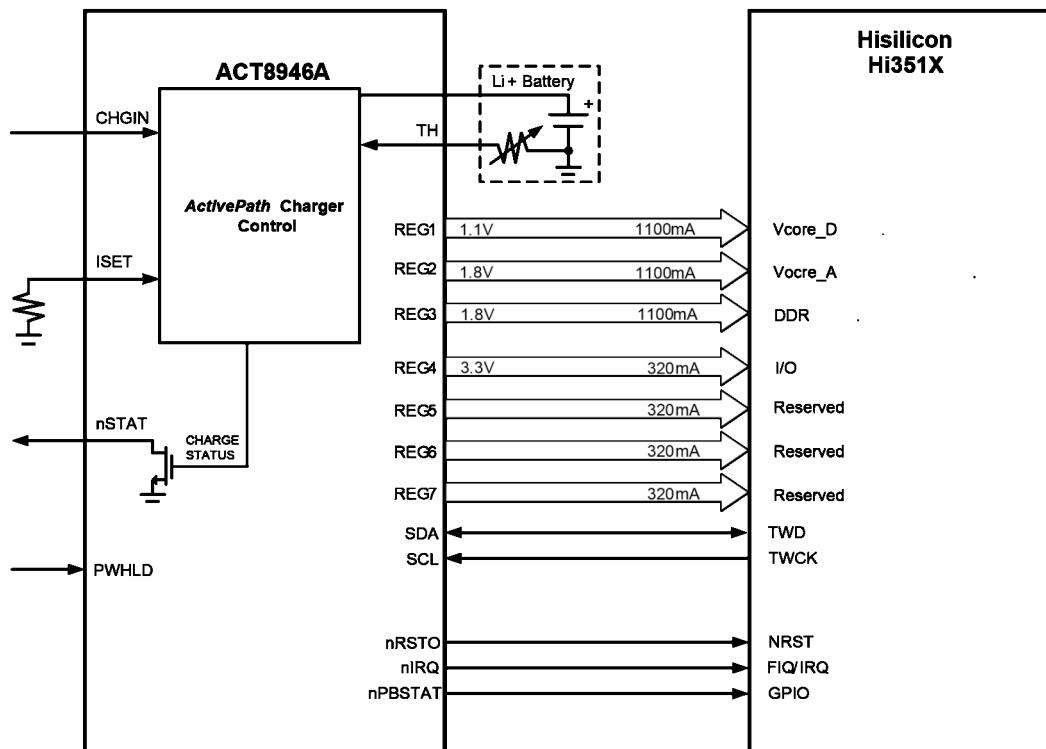

This device features three step-down DC/DC converters and four low-noise, low-dropout linear regulators, along with a complete battery charging solution featuring the advanced *ActivePath* system-power selection function.

The three DC/DC converters utilize a high-efficiency, fixed-frequency (2MHz), current-mode PWM control architecture that requires a minimum number of external components. Two DC/DCs are capable of supplying up to 1100mA of output current, while the third supports up to 1200mA. All four low-dropout linear regulators are high-performance, low-noise regulators that supply up to 320mA of output current.

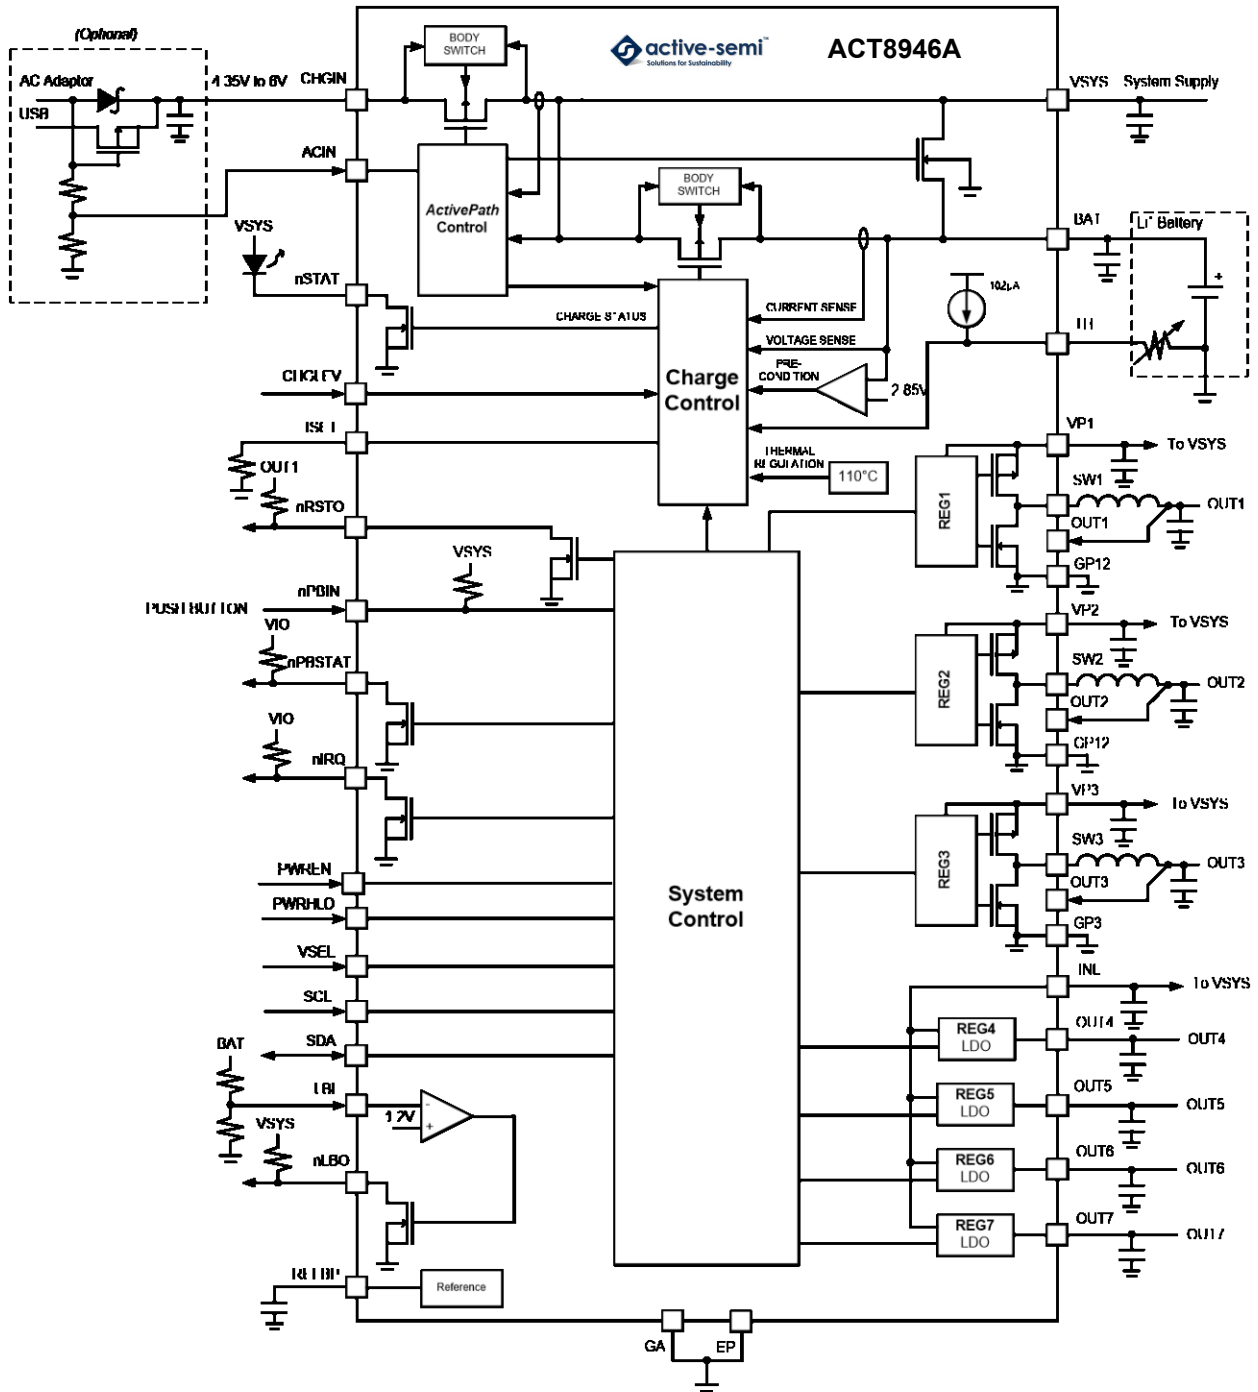

The ACT8946A is available in a compact, Pb-Free and RoHS-compliant TQFN55-40 package.

* I²C™ is a trademark of NXP.

ORDERING INFORMATION^{①②}

| PART NUMBER | V _{OUT1} | V _{OUT2} | V _{OUT3} | V _{OUT4} | V _{OUT5} | V _{OUT6} | V _{OUT7} | PACKAGE | PINS | TEMPERATURE RANGE |
|-----------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-----------|------|-------------------|
| ACT8946AQJ203-T | 1.1V | 1.8V | 1.8V | 3.3V | - | - | - | TQFN55-40 | 40 | -40°C to +85°C |
| ACT8946AQJ204-T | 1.1V | 1.8V | 1.8V | 3.3V | 3.3V | 3.3V | 1.2V | TQFN55-40 | 40 | -40°C to +85°C |
| ACT8946AQJ303-T | 1.1V | 1.8V | 1.5V | 3.3V | 3.3V | 3.3V | - | TQFN55-40 | 40 | -40°C to +85°C |

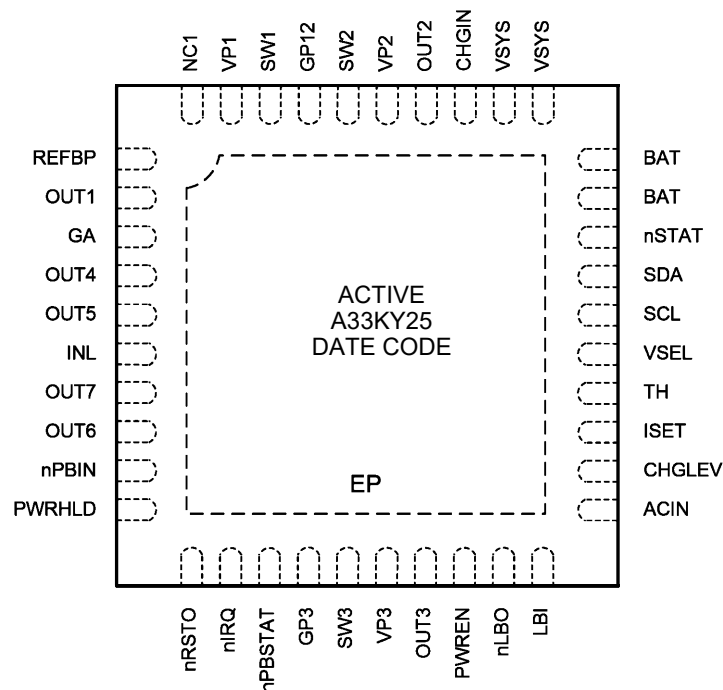

①: All Active-Semi components are RoHS Compliant and with Pb-free plating otherwise specified.

②: Standard product options are listed in this table. Contact factory for custom options.

③: To select V_{STBYx} as the output regulation voltage for REGx, drive VSEL to logic high. V_{STBYx} can be set by software via I²C interface. Refer to appropriate sections of this datasheet for V_{STBYx} setting.

PIN CONFIGURATION

TOP VIEW

Thin - QFN (TQFN55-40)

PIN DESCRIPTIONS

| PIN | NAME | DESCRIPTION |
|-----|---------|---|
| 1 | REFBP | Reference Bypass. Connect a 0.047 μ F ceramic capacitor from REFBP to GA. This pin is discharged to GA in shutdown. |
| 2 | OUT1 | Output Feedback Sense for REG1. |
| 3 | GA | Analog Ground. Connect GA directly to a quiet ground node. Connect GA, GP12 and GP3 together at a single point as close to the IC as possible. |
| 4 | OUT4 | REG4 output. Capable of delivering up to 320mA of output current. Connect a 3.3 μ F ceramic capacitor from OUT4 to GA. The output is discharged to GA with 1.5k Ω resistor when disabled. |
| 5 | OUT5 | REG5 output. Capable of delivering up to 320mA of output current. Connect a 3.3 μ F ceramic capacitor from OUT5 to GA. The output is discharged to GA with 1.5k Ω resistor when disabled. |
| 6 | INL | Power Input for REG4, REG5, REG6, and REG7. Bypass to GA with a high quality ceramic capacitor placed as close to the IC as possible. |
| 7 | OUT7 | REG7 output. Capable of delivering up to 320mA of output current. Connect a 3.3 μ F ceramic capacitor from OUT7 to GA. The output is discharged to GA with 1.5k Ω resistor when disabled. |
| 8 | OUT6 | REG6 output. Capable of delivering up to 320mA of output current. Connect a 3.3 μ F ceramic capacitor from OUT6 to GA. The output is discharged to GA with 1.5k Ω resistor when disabled. |
| 9 | nPBIN | Master Enable Input. Drive nPBIN to GA through a 50k Ω resistor to enable the IC, drive nPBIN directly to GA to assert a manual reset condition. Refer to the <i>nPBIN Multi-Function Input</i> section for more information. nPBIN is internally pulled up to VSYS through a 35k Ω resistor. |
| 10 | PWRHLD | Power Hold Input. Enable input for all regulators. PWRHLD is internally pulled down to GA through a 500k Ω resistor. Refer to the <i>Control Sequences</i> section for more information. |
| 11 | nRSTO | Active Low Reset Output. See the <i>nRSTO Output</i> section for more information. |
| 12 | nIRQ | Open-Drain Interrupt Output. nIRQ is asserted any time an unmasked fault condition exists or a charger interrupt occurs. See the <i>nIRQ Output</i> section for more information. |
| 13 | nPBSTAT | Active-Low Open-Drain Push-Button Status Output. nPBSTAT is asserted low whenever the nPBIN is pushed, and is high-Z otherwise. See the <i>nPBSTAT Output</i> section for more information. |
| 14 | GP3 | Power Ground for REG3. Connect GA, GP12, and GP3 together at a single point as close to the IC as possible. |
| 15 | SW3 | Switching Node Output for REG3. |
| 16 | VP3 | Power Input for REG3. Bypass to GP3 with a high quality ceramic capacitor placed as close to the IC as possible. |
| 17 | OUT3 | Output Feedback Sense for REG3. |
| 18 | PWREN | Power Enable Input. Refer to the <i>Control Sequences</i> section for more information. |
| 19 | nLBO | Low Battery Indicator Output. nLBO is asserted low whenever the voltage at LBI is lower than 1.2V, and is high-Z otherwise. See the <i>Precision Voltage Detector</i> section for more information. |
| 20 | LBI | Low Battery Input. The input voltage is compared to 1.2V and the output of this comparison drives nLBO. See the <i>Precision Voltage Detector</i> section for more information. |
| 21 | ACIN | AC Input Supply Detection. See the <i>Charge Current Programming</i> section for more information. |
| 22 | CHGLEV | Charge Current Selection Input. See the <i>Charge Current Programming</i> section for more information. |
| 23 | ISET | Charge Current Set. Program the charge current by connecting a resistor (R _{ISET}) between ISET and GA. See the <i>Charge Current Programming</i> section for more information. |
| 24 | TH | Temperature Sensing Input. Connect to battery thermistor. TH is pulled up with a 102 μ A (typ) current internally. See the <i>Battery Temperature Monitoring</i> section for more information. |
| 25 | VSEL | Step-Down DC/DCs Output Voltage Selection. Drive to logic low to select default output voltage. Drive to logic high to select secondary output voltage. See the <i>Output Voltage Programming</i> section for more information. |

PIN DESCRIPTIONS CONT'D

| PIN | NAME | DESCRIPTION |
|--------|-------|---|
| 26 | SCL | Clock Input for I ² C Serial Interface. |
| 27 | SDA | Data Input for I ² C Serial Interface. Data is read on the rising edge of SCL. |
| 28 | nSTAT | Active-Low Open-Drain Charger Status Output. nSTAT has a 8mA (typ) current limit, allowing it to directly drive an indicator LED without additional external components. See the <i>Charge Status Indicator</i> section for more information. |
| 29, 30 | BAT | Battery Charger Output. Connect this pin directly to the battery anode (+ terminal) |
| 31, 32 | VSYS | System Output Pin. Bypass to GA with a 10μF or larger ceramic capacitor. |
| 33 | CHGIN | Power Input for the Battery Charger. Bypass CHGIN to GA with a capacitor placed as close to the IC as possible. |
| 34 | OUT2 | Output Feedback Sense for REG2. |
| 35 | VP2 | Power Input for REG2. Bypass to GP12 with a high quality ceramic capacitor placed as close to the IC as possible. |
| 36 | SW2 | Switching Node Output for REG2. |
| 37 | GP12 | Power Ground for REG1 and REG2. Connect GA, GP12 and GP3 together at a single point as close to the IC as possible. |
| 38 | SW1 | Switching Node Output for REG1. |
| 39 | VP1 | Power Input for REG1. Bypass to GP12 with a high quality ceramic capacitor placed as close to the IC as possible. |
| 40 | NC1 | No Connect. Not internally connected. |
| EP | EP | Exposed Pad. Must be soldered to ground on PCB. |

ABSOLUTE MAXIMUM RATINGS^①

| PARAMETER | VALUE | UNIT |
|---|-----------------------------|------|
| VP1, VP2 to GP12 VP3 to GP3 | -0.3 to + 6 | V |
| BAT, VSYS, INL to GA | -0.3 to + 6 | V |
| CHGIN to GA | -0.3 to + 14 | V |
| SW1, OUT1 to GP12 | -0.3 to ($V_{VP1} + 0.3$) | V |
| SW2, OUT2 to GP12 | -0.3 to ($V_{VP2} + 0.3$) | V |
| SW3, OUT3 to GP3 | -0.3 to ($V_{VP3} + 0.3$) | V |
| nIRQ, nLBO, nPBSTAT, nRSTO, nSTAT to GA | -0.3 to + 6 | V |
| nPBIN, ACIN, CHGLEV, ISET, LBI, PWRHLD, PWREN, REFBP, SCL, SDA, TH, VSEL to GA | -0.3 to ($V_{SYS} + 0.3$) | V |
| OUT4, OUT5, OUT6, OUT7 to GA | -0.3 to ($V_{INL} + 0.3$) | V |
| GP12, GP3 to GA | -0.3 to + 0.3 | V |
| Operating Ambient Temperature | -40 to 85 | °C |
| Maximum Junction Temperature | 125 | °C |
| Maximum Power Dissipation TQFN55-40 (Thermal Resistance $\theta_{JA} = 30^{\circ}\text{C/W}$) | 2.7 | W |
| Storage Temperature | -65 to 150 | °C |
| Lead Temperature (Soldering, 10 sec) | 300 | °C |

①: Do not exceed these limits to prevent damage to the device. Exposure to absolute maximum rating conditions for long periods may affect device reliability.

I²C INTERFACE ELECTRICAL CHARACTERISTICS

(V_{VSYS} = 3.6V, T_A = 25°C, unless otherwise specified.)

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|--------------------------------------|--|------|-----|------|------|
| SCL, SDA Input Low | V _{VSYS} = 3.1V to 5.5V, T _A = -40°C to 85°C | | | 0.35 | V |
| SCL, SDA Input High | V _{VSYS} = 3.1V to 5.5V, T _A = -40°C to 85°C | 1.55 | | | V |
| SDA Leakage Current | | | | 1 | μA |
| SCL Leakage Current | | | | 2 | μA |
| SDA Output Low | I _{OL} = 5mA | | | 0.35 | V |
| SCL Clock Period, t _{SCL} | | 1.5 | | | μs |
| SDA Data Setup Time, t _{SU} | | 100 | | | ns |
| SDA Data Hold Time, t _{HD} | | 300 | | | ns |
| Start Setup Time, t _{ST} | For Start Condition | 100 | | | ns |
| Stop Setup Time, t _{SP} | For Stop Condition | 100 | | | ns |

REGISTER AND BIT DESCRIPTIONS

Table 1: Global Register Map

| OUTPUT | ADDRESS | BIT | NAME | ACCESS | DESCRIPTION |
|--------|---------|-------|------------|--------|---|
| SYS | 0x00 | [7] | TRST | R/W | Reset Timer Setting. Defines the reset time-out threshold. Reset time-out is 64ms when value is 1, reset time-out is 260ms when value is 0. See <i>nRSTO Output</i> section for more information. |
| SYS | 0x00 | [6] | nSYSMODE | R/W | SYSLEV Mode Select. Defines the response to the SYSLEV voltage detector, 1: Generate an interrupt when $V_{V_{SYS}}$ falls below the programmed SYSLEV threshold, 0: automatic shutdown when $V_{V_{SYS}}$ falls below the programmed SYSLEV threshold. |
| SYS | 0x00 | [5] | nSYSLEVMSK | R/W | System Voltage Level Interrupt Mask. SYSLEV interrupt is masked by default, set to 1 to unmask this interrupt. See the <i>Programmable System Voltage Monitor</i> section for more information |
| SYS | 0x00 | [4] | nSYSSTAT | R | System Voltage Status. Value is 1 when $V_{V_{SYS}}$ is lower than the SYSLEV voltage threshold, value is 0 when $V_{V_{SYS}}$ is higher than the system voltage detection threshold. |
| SYS | 0x00 | [3:0] | SYSLEV | R/W | System Voltage Detect Threshold. Defines the SYSLEV voltage threshold. See the <i>Programmable System Voltage Monitor</i> section for more information. |
| SYS | 0x01 | [7:6] | - | R/W | Reserved. |
| SYS | 0x01 | [5] | - | R/W | Reserved. |
| SYS | 0x01 | [4] | - | R/W | Reserved. |
| SYS | 0x01 | [3:0] | SCRATCH | R/W | Scratchpad Bits. Non-functional bits, maybe be used by user to store system status information. Volatile bits, which are cleared when system voltage falls below UVLO threshold. |
| REG1 | 0x20 | [7:6] | - | R | Reserved. |
| REG1 | 0x20 | [5:0] | VSET1 | R/W | Primary Output Voltage Selection. Valid when VSEL is driven low. See the <i>Output Voltage Programming</i> section for more information. |
| REG1 | 0x21 | [7:6] | - | R | Reserved. |
| REG1 | 0x21 | [5:0] | VSET2 | R/W | Secondary Output Voltage Selection. Valid when VSEL is driven high. See the <i>Output Voltage Programming</i> section for more information. |
| REG1 | 0x22 | [7] | ON | R/W | Regulator Enable Bit. Set bit to 1 to enable the regulator, clear bit to 0 to disable the regulator. |
| REG1 | 0x22 | [6] | PHASE | R/W | Regulator Phase Control. Set bit to 1 for the regulator to operate 180° out of phase with the oscillator, clear bit to 0 for the regulator to operate in phase with the oscillator. |
| REG1 | 0x22 | [5] | MODE | R/W | Regulator Mode Select. Set bit to 1 for fixed-frequency PWM under all load conditions, clear bit to 0 to transit to power-savings mode under light-load conditions. |
| REG1 | 0x22 | [4:2] | DELAY | R/W | Regulator Turn-On Delay Control. See the <i>REG1, REG2, REG3 Turn-on Delay</i> section for more information. |
| REG1 | 0x22 | [1] | nFLTMSK | R/W | Regulator Fault Mask Control. Set bit to 1 enable fault-interrupts, clear bit to 0 to disable fault-interrupts. |
| REG1 | 0x22 | [0] | OK | R | Regulator Power-OK Status. Value is 1 when output voltage exceeds the power-OK threshold, value is 0 otherwise. |

①: V_{NOM} refers to the nominal output voltage level for V_{OUT} as defined by the *Ordering Information* section.

②: $IMAX$ Maximum Output Current.

③: Dropout Voltage is defined as the differential voltage between input and output when the output voltage drops 100mV below the regulation voltage (for 3.1V output voltage or higher)

④: LDO current limit is defined as the output current at which the output voltage drops to 95% of the respective regulation voltage. Under heavy overload conditions the output current limit folds back by 30% (typ)

ActivePath™ CHARGER ELECTRICAL CHARACTERISTICS

Control Signals

Enable Inputs

The ACT8946A features a variety of control inputs, which are used to enable and disable outputs depending upon the desired mode of operation. PWRHLD is a logic input,

nIRQ Output

nIRQ is an open-drain output that asserts low any time an interrupt is generated. Connect a 10kΩ or greater pull-up resistor from nIRQ to an appropriate voltage supply. nIRQ is typically used to drive the interrupt input of the system processor.

Many of the ACT8946A's functions support interrupt-generation as a result of various conditions. These are typically masked by default, but may be unmasked via the I²C interface. For more information about the available fault conditions, refer to the appropriate sections of this datasheet.

Note that under some conditions a false interrupt may be generated upon initial startup. For this reason, it is recommended that the interrupt service routine check and validate nSYSLEVMSK[] and nFLTMSK[] bits before processing an interrupt generated by these bits. These interrupts may be validated by nSYSSTAT[], OK[] bits.

Figure 2: ACT8946AQJ203-T Enable/Disable Sequence

FUNCTIONAL DESCRIPTION

I²C Interface

The ACT8946A features an I²C interface that allows advanced programming capability to enhance overall system performance. To ensure compatibility with a wide range of system processors, the I²C interface supports clock speeds of up to 400kHz ("Fast-Mode" operation) and uses standard I²C commands. I²C write-byte commands are used to program the ACT8946A, and I²C read-byte commands are used to read the ACT8946A's internal registers. The ACT8946A always operates as a slave device, and is addressed using a 7-bit slave address followed by an eighth bit, which indicates whether the transaction is a read-operation or a write-operation, [1011011x].

SDA is a bi-directional data line and SCL is a clock input. The master device initiates a transaction by issuing a START condition, defined by SDA transitioning from high to low while SCL is high. Data is transferred in 8-bit packets, beginning with the MSB, and is clocked-in on the rising edge of SCL. Each packet of data is followed by an "Acknowledge" (ACK) bit, used to confirm that the data was transmitted successfully.

For more information regarding the I²C 2-wire serial interface, go to the NXP website: <http://www.nxp.com>.

Voltage Monitor and Interrupt

Programmable System Voltage Monitor

The ACT8946A features a programmable system-voltage monitor, which monitors the voltage at VSYS and compares it to a programmable threshold voltage. The programmable voltage threshold is programmed by SYSLEV[3:0], as shown in Table 3.

SYSLEV[] is set to 3.0V by default. There is a 200mV rising hysteresis on SYSLEV[] threshold such that V_{VSYS} needs to be 3.2V(typ) or higher in order to power up the IC.

The nSYSSTAT[] bit reflects the output of an internal voltage comparator that monitors V_{VSYS} relative to the SYSLEV[] voltage threshold, the value of nSYSTAT[] = 1 when V_{VSYS} is lower than the SYSLEV[] voltage threshold, and nSYSTAT[] = 0 when V_{VSYS} is higher than the SYSLEV[] voltage threshold. Note that the SYSLEV[] voltage threshold is defined for falling voltages, and that the comparator produces about 200mV of hysteresis at VSYS. As a result, once V_{VSYS} falls below the SYSLEV threshold, its voltage must increase by more than about 200mV to clear that condition.

After the IC is powered up, the ACT8946A responds in one of two ways when the voltage at VSYS falls below the SYSLEV[] voltage threshold:

1) If nSYSMODE[] = 1 (default case), when system voltage level interrupt is unmasked (nSYSLEVMSK[]=1) and V_{VSYS} falls below the

programmable threshold, the ACT8946A asserts nIRQ, providing a software "under-voltage alarm". The response to this interrupt is controlled by the CPU, but will typically initiate a controlled shutdown sequence either or alert the user that the battery is low. In this case the interrupt is cleared when V_{VSYS} rises up again above the SYSLEV rising threshold and nSYSSTAT[] is read via I²C.

2) If nSYSMODE[] = 0, when V_{VSYS} falls below the programmable threshold the ACT8946A shuts down, immediately disabling all regulators. This option is useful for implementing a programmable "under-voltage lockout" function that forces the system off when the battery voltage falls below the SYSLEV threshold voltage. Since this option does not support a controlled shutdown sequence, it is generally used as a "fail-safe" to shut the system down when the battery voltage is too low.

Table 3: SYSLEV Falling Threshold

| SYSLEV[3:0] | SYSLEV Falling Threshold (Hysteresis = 200mV) |
|-------------|---|
| 0000 | 2.3 |
| 0001 | 2.4 |
| 0010 | 2.5 |
| 0011 | 2.6 |
| 0100 | 2.7 |
| 0101 | 2.8 |
| 0110 | 2.9 |
| 0111 | 3.0 |
| 1000 | 3.1 |
| 1001 | 3.2 |
| 1010 | 3.3 |
| 1011 | 3.4 |
| 1100 | 3.5 |
| 1101 | 3.6 |
| 1110 | 3.7 |
| 1111 | 3.8 |

Precision Voltage Detector

The LBI input connects to one input of a precision voltage comparator, which can be used to monitor a system voltage such as the battery voltage. An external resistive-divider network can be used to set voltage monitoring thresholds, as shown in *Functional Block Diagram*. The output of the comparator is present at the nLBO open-drain output.

Thermal Shutdown

The ACT8946A integrates thermal shutdown protection circuitry to prevent damage resulting from excessive thermal stress, as may be encountered under fault conditions. This circuitry disables all regulators if the ACT8946A die temperature exceeds 160°C, and prevents the regulators from being enabled until the IC temperature drops by 20°C (typ).

STEP-DOWN DC/DC REGULATORS

General Description

The ACT8946A features three synchronous, fixed-frequency, current-mode PWM step down converters that achieve peak efficiencies of up to 97%. REG1 and REG2 are capable of supplying up to 1100mA of output current, while REG3 supports up to 1200mA. These regulators operate with a fixed frequency of 2MHz, minimizing noise in sensitive applications and allowing the use of small external components.

100% Duty Cycle Operation

Each regulator is capable of operating at up to 100% duty cycle. During 100% duty-cycle operation, the high-side power MOSFET is held on continuously, providing a direct connection from the input to the output (through the inductor), ensuring the lowest possible dropout voltage in battery powered applications.

Synchronous Rectification

REG1, REG2, and REG3 each feature integrated n-channel synchronous rectifiers, maximizing efficiency and minimizing the total solution size and cost by eliminating the need for external rectifiers.

Soft-Start

When enabled, each output voltage tracks an internal 400 μ s soft-start ramp, minimizing input current during startup and allowing each regulator to power up in a smooth, monotonic manner that is independent of output load conditions.

Compensation

Each buck regulator utilizes current-mode control and a proprietary internal compensation scheme to simultaneously simplify external component selection and optimize transient performance over its full operating range. No compensation design is required; simply follow a few simple guidelines described below when choosing external components.

Input Capacitor Selection

The input capacitor reduces peak currents and noise induced upon the voltage source. A 4.7 μ F ceramic capacitor is recommended for each regulator in most applications.

Output Capacitor Selection

For most applications, 22 μ F ceramic output capacitors are recommended for REG1, REG2 and REG3.

Despite the advantages of ceramic capacitors, care must be taken during the design process to ensure stable operation over the full operating voltage and temperature range. Ceramic capacitors are available in a variety of dielectrics, each of which

exhibits different characteristics that can greatly affect performance over their temperature and voltage ranges.

Two of the most common dielectrics are Y5V and X5R. Whereas Y5V dielectrics are inexpensive and can provide high capacitance in small packages, their capacitance varies greatly over their voltage and temperature ranges and are not recommended for DC/DC applications. X5R and X7R dielectrics are more suitable for output capacitor applications, as their characteristics are more stable over their operating ranges, and are highly recommended.

Inductor Selection

REG1, REG2, and REG3 utilize current-mode control and a proprietary internal compensation scheme to simultaneously simplify external component selection and optimize transient performance over their full operating range. These devices were optimized for operation with 2.2 μ H inductors, although inductors in the 1.5 μ H to 3.3 μ H range can be used. Choose an inductor with a low DC-resistance, and avoid inductor saturation by choosing inductors with DC ratings that exceed the maximum output current by at least 30%.

Configuration Options

Output Voltage Programming

By default, each regulator powers up and regulates to its default output voltage. Output voltage is selectable by setting VSEL pin that when VSEL is low, output voltage is programmed by VSET1[] bits, and when VSEL is high, output voltage is programmed by VSET2[] bits. However, once the system is enabled, each regulator's output voltage may be independently programmed to a different value, typically in order to minimize the power consumption of the microprocessor during some operating modes. Program the output voltages via the I²C serial interface by writing to the regulator's VSET1[] register if VSEL is low or VSET2[] register if VSEL is high as shown in Table 4.

Enable / Disable Control

During normal operation, each buck may be enabled or disabled via the I²C interface by writing to that regulator's ON[] bit. The regulator accept rising or falling edge of ON[] bit as on/off signal. To enable the regulator, clear ON[] to 0 first then set to 1. To disable the regulator, set ON[] to 1 first then clear it to 0.

REG1, REG2, REG3 Turn-on Delay

Each of REG1, REG2 and REG3 features a programmable Turn-on Delay which help ensure a reliable qualification. This delay is programmed by DELAY[2:0], as shown in Table 5.

Table 4: REGx/VSET[] Output Voltage Setting

| REGx/VSET[2:0] | REGx/VSET[5:3] | | | | | | | |
|----------------|----------------|-------|-------|-------|-------|-------|-------|-------|
| | 000 | 001 | 010 | 011 | 100 | 101 | 110 | 111 |
| 000 | 0.600 | 0.800 | 1.000 | 1.200 | 1.600 | 2.000 | 2.400 | 3.200 |
| 001 | 0.625 | 0.825 | 1.025 | 1.250 | 1.650 | 2.050 | 2.500 | 3.300 |
| 010 | 0.650 | 0.850 | 1.050 | 1.300 | 1.700 | 2.100 | 2.600 | 3.400 |
| 011 | 0.675 | 0.875 | 1.075 | 1.350 | 1.750 | 2.150 | 2.700 | 3.500 |
| 100 | 0.700 | 0.900 | 1.100 | 1.400 | 1.800 | 2.200 | 2.800 | 3.600 |
| 101 | 0.725 | 0.925 | 1.125 | 1.450 | 1.850 | 2.250 | 2.900 | 3.700 |
| 110 | 0.750 | 0.950 | 1.150 | 1.500 | 1.900 | 2.300 | 3.000 | 3.800 |
| 111 | 0.775 | 0.975 | 1.175 | 1.550 | 1.950 | 2.350 | 3.100 | 3.900 |

Table 5: REGx/DELAY[] Turn-On Delay

| DELAY[2] | DELAY[1] | DELAY[0] | TURN-ON DELAY |
|----------|----------|----------|---------------|
| 0 | 0 | 0 | 0 ms |
| 0 | 0 | 1 | 2 ms |
| 0 | 1 | 0 | 4 ms |
| 0 | 1 | 1 | 8 ms |
| 1 | 0 | 0 | 16 ms |
| 1 | 0 | 1 | 32 ms |
| 1 | 1 | 0 | 64 ms |
| 1 | 1 | 1 | 128 ms |

Operating Mode

REG1, REG2, and REG3 each operate in fixed-frequency PWM mode at medium to heavy loads when MODE[] bit is set to 0, and transition to a proprietary power-saving mode at light loads in order to maximize standby battery life. In applications where low noise is critical, force fixed-frequency PWM operation across the entire load current range, at the expense of light-load efficiency, by setting the MODE[] bit to 1.

OK[] and Output Fault Interrupt

Each DC/DC features a power-OK status bit that can be read by the system microprocessor via the I²C interface. If an output voltage is lower than the power-OK threshold, typically 7% below the programmed regulation voltage, that regulator's OK[] bit will be 0.

If a DC/DC's nFLTMSK[] bit is set to 1, the ACT8946A will interrupt the processor if that DC/DC's output voltage falls below the power-OK threshold. In this case, nIRQ will assert low and remain asserted until either the regulator is turned off or back in regulation, and the OK[] bit has been read via I²C.

PCB Layout Considerations

High switching frequencies and large peak currents make PC board layout an important part of step-down DC/DC converter design. A good design minimizes excessive EMI on the feedback paths and voltage gradients in the ground plane, both of which can result in instability or regulation errors.

Step-down DC/DCs exhibit discontinuous input current, so the input capacitors should be placed as close as possible to the IC, and avoiding the use of via if possible. The inductor, input filter capacitor, and output filter capacitor should be connected as close together as possible, with short, direct, and wide traces. The ground nodes for each regulator's power loop should be connected at a single point in a star-ground configuration, and this point should be connected to the backside ground plane with multiple via. The output node for each regulator should be connected to its corresponding OUTx pin through the shortest possible route, while keeping sufficient distance from switching nodes to prevent noise injection. Finally, the exposed pad should be directly connected to the backside ground plane using multiple via to achieve low electrical and thermal resistance.

LOW-NOISE, LOW-DROPOUT LINEAR REGULATORS

General Description

REG4, REG5, REG6, and REG7 are low-noise, low-dropout linear regulators (LDOs) that supply up to 320mA. Each LDO has been optimized to achieve low noise and high-PSRR, achieving more than 65dB PSRR at frequencies up to 10kHz.

Output Current Limit

Each LDO contains current-limit circuitry featuring a current-limit fold-back function. During normal and moderate overload conditions, the regulators can support more than their rated output currents. During extreme overload conditions, however, the current limit is reduced by approximately 30%, reducing power dissipation within the IC.

Compensation

The LDOs are internally compensated and require very little design effort, simply select input and output capacitors according to the guidelines below.

Input Capacitor Selection

Each LDO requires a small ceramic input capacitor to supply current to support fast transients at the input of the LDO. Bypassing each INL pin to GA with 1 μ F. High quality ceramic capacitors such as X7R and X5R dielectric types are strongly recommended.

Output Capacitor Selection

Each LDO requires a 3.3 μ F ceramic output capacitor for stability. For best performance, each output capacitor should be connected directly between the output and GA pins, as close to the output as possible, and with a short, direct connection. High quality ceramic capacitors such as X7R and X5R dielectric types are strongly recommended.

Configuration Options

Output Voltage Programming

By default, each LDO powers up and regulates to its default output voltage. Once the system is enabled, each output voltage may be independently programmed to a different value by writing to the regulator's VSET[] register via the I²C serial interface as shown in Table 4.

Enable / Disable Control

During normal operation, each LDO may be enabled or disabled via the I²C interface by writing to that LDO's ON[] bit. The regulator accept rising or falling edge of ON[] bit as on/off signal. To enable the regulator, clear ON[] to 0 first then set to 1. To disable the regulator, set ON[] to 1 first then clear it to 0.

REG4, REG5, REG6, REG7 Turn-on Delay

Each of REG4, REG5, REG6 and REG7 features a programmable Turn-on Delay which help ensure a reliable qualification. This delay is programmed by

DELAY[2:0], as shown in Table 5.

Output Discharge

Each of the ACT8946A's LDOs features an optional output discharge function, which discharges the output to ground through a 1.5k Ω resistance when the LDO is disabled. This feature may be enabled or disabled by setting DIS[]; set DIS[] to 1 to enable this function, clear DIS[] to 0 to disable it.

Low-Power Mode

Each of ACT8946A's LDOs features a LOWIQ[] bit which, when set to 1, reduces the LDO's quiescent current by about 16%, saving power and extending battery lifetime.

OK[] and Output Fault Interrupt

Each LDO features a power-OK status bit that can be read by the system microprocessor via the interface. If an output voltage is lower than the power-OK threshold, typically 11% below the programmed regulation voltage, the value of that regulator's OK[] bit will be 0.

If a LDO's nFLTMSK[] bit is set to 1, the ACT8946A will interrupt the processor if that LDO's output voltage falls below the power-OK threshold. In this case, nIRQ will assert low and remain asserted until either the regulator is turned off or back in regulation, and the OK[] bit has been read via I²C.

PCB Layout Considerations

The ACT8946A's LDOs provide good DC, AC, and noise performance over a wide range of operating conditions, and are relatively insensitive to layout considerations. When designing a PCB, however, careful layout is necessary to prevent other circuitry from degrading LDO performance.

A good design places input and output capacitors as close to the LDO inputs and output as possible, and utilizes a star-ground configuration for all regulators to prevent noise-coupling through ground. Output traces should be routed to avoid close proximity to noisy nodes, particularly the SW nodes of the DC/DCs.

REFBP is a noise-filtered reference, and internally has a direct connection to the linear regulator controller. Any noise injected onto REFBP will directly affect the outputs of the linear regulators, and therefore special care should be taken to ensure that no noise is injected to the outputs via REFBP. As with the LDO output capacitors, the REFBP bypass capacitor should be placed as close to the IC as possible, with short, direct connections to the star-ground. Avoid the use of via whenever possible. Noisy nodes, such as from the DC/DCs, should be routed as far away from REFBP as possible.

ActivePath CHARGER

General Description

The ACT8946A features an advanced battery charger that incorporates the patent-pending *ActivePath architecture for system power selection*. This combination of circuits provides a complete, advanced battery-management system that automatically selects the best available input supply, manages charge current to ensure system power availability, and provides a complete, high-accuracy ($\pm 0.5\%$), thermally regulated, full-featured single-cell linear Li+ charger that can withstand input voltages of up to 12V.

ActivePath Architecture

The *ActivePath* architecture performs three important functions:

- 1) System Configuration Optimization
- 2) Input Protection
- 3) Battery-Management

System Configuration Optimization

The *ActivePath* circuitry monitors the state of the input supply, the battery, and the system, and automatically reconfigures itself to optimize the power system. If a valid input supply is present, *ActivePath* powers the system from the input while charging the battery in parallel. This allows the battery to charge as quickly as possible, while supplying the system. If a valid input supply is not present, *ActivePath* powers the system from the battery. Finally, if the input is present and the system current requirement exceeds the capability of the input supply, *ActivePath* allows system power to be drawn from both the battery and the input supply.

Input Protection

Input Over-Voltage Protection

The *ActivePath* circuitry features input over-voltage protection circuitry. This circuitry disables charging when the input voltage exceeds the voltage set by OVPSET[] as shown in Table 6, but stands off the input voltage in order to protect the system. Note that the adjustable OVP threshold is intended to provide the charge cycle with adjustable immunity against upward voltage transients on the input, and is not intended to allow continuous charging with input voltages above the charger's normal operating voltage range. Independent of the OVPSET[] setting, the charge cycle is not allowed to resume until the input voltage falls back into the charger's normal operating voltage range (i.e. below 6.0V).

In an input over-voltage condition this circuit limits $V_{V_{SYS}}$ to 4.6V, protecting any circuitry connected to V_{SYS} from the over-voltage condition, which may exceed this circuitry's voltage capability. This circuit is capable of withstanding input voltages of up to 12V.

Table 6: Input Over-Voltage Protection Setting

| OVPSET[1] | OVPSET[0] | OVP THRESHOLD |
|-----------|-----------|---------------|
| 0 | 0 | 6.6V |
| 0 | 1 | 7.0V |
| 1 | 0 | 7.5V |
| 1 | 1 | 8.0V |

Input Supply Overload Protection

The *ActivePath* circuitry monitors and limits the total current drawn from the input supply to a value set by the ACIN and CHGLEV inputs, as well as the resistor connected to ISET. Drive ACIN to a logic-low for "USB Mode", which limits the input current to either 100mA, when CHGLEV is driven to a logic-low, or 450mA, when CHGLEV is driven to a logic-high. Drive ACIN to a logic-high for "AC-Mode", which limits the input current to 2A, typically.

Input Under Voltage Lockout

If the input voltage applied to CHGIN falls below 3.5V (typ), an input under-voltage condition is detected and the charger is disabled. Once an input under-voltage condition is detected, a new charge cycle will initiate when the input exceeds the under-voltage threshold by at least 500mV.

Battery Management

The ACT8946A features a full-featured, intelligent charger for Lithium-based cells, and was designed specifically to provide a complete charging solution with minimum system design effort.

The core of the charger is a CC/CV (Constant-Current/Constant-Voltage), linear-mode charge controller. This controller incorporates current and voltage sense circuitry, an internal 70m Ω power MOSFET, thermal-regulation circuitry, a full-featured state machine that implements charge control and safety features, and circuitry that eliminates the reverse blocking diode required by conventional charger designs.

The charge termination voltage is highly accurate ($\pm 0.5\%$), and features a selection of charge safety time-out periods that protect the system from operation with damaged cells. Other features include pin-programmable fast-charge current and one current-limited nSTAT output that can directly drive LED indicator or provide a logic-level status signal to the host microprocessor.

Dynamic Charge Current Control (DCCC)

The ACT8946A's *ActivePath* charger features dynamic charge current control (DCCC) circuitry, which acts to ensure that the system remains powered while operating within the maximum output capability of the power adapter. The DCCC circuitry continuously monitors $V_{V_{SYS}}$, and if the voltage at V_{SYS} drops by more than 200mV, the DCCC

circuitry automatically reduces charge current in order to prevent V_{VSYS} from continuing to drop.

Charge Current Programming

The ACT8946A's *ActivePath* charger features a flexible charge current-programming scheme that combines the convenience of internal charge current programming with the flexibility of resistor based charge current programming. Current limits and charge current programming are managed as a function of the ACIN and CHGLEV pins, in combination with R_{ISET} , the resistance connected to the ISET pin.

ACIN is a logic input that configures the current-limit of *ActivePath*'s linear regulator as well as that of the battery charger. ACIN features a precise 1.2V logic threshold, so that the input voltage detection threshold may be adjusted with a simple resistive voltage divider. This input also allows a simple, low-cost dual-input charger switch to be implemented with just a few, low-cost components.

When the voltage at ACIN is above the 1.2V threshold, the charger operates in "AC-Mode" with a charge current programmed by R_{ISET} , and the R_{ISET} is given by:

$$R_{ISET} \text{ (k}\Omega\text{)} = 2336 \times (1V/I_{CHG} \text{ (mA)}) - 0.205$$

With a given R_{ISET} then charge current will reduce 5 times when CHGLEV is driven low.

When ACIN is below the 1.2V threshold, the charger operates in "USB-Mode", with a maximum CHGIN input current and charge current defined by the CHGLEV input; 450mA, if CHGLEV is driven to a logic-high, or 100mA, if CHGLEV is driven to a logic-low.

The ACT8946A's charge current settings are summarized in Table 7.

Table 7: ACIN and CHGLEV Inputs

| ACIN | CHGLEV | CHARGE CURRENT (mA) | PRECONDITION CHARGE CURRENT (mA) |
|------|--------|---------------------|----------------------------------|
| 0 | 1 | 450 | 45 |
| 1 | 0 | $I_{CHG}/5$ | $10\% \times I_{CHG}$ |
| 1 | 1 | I_{CHG} | $10\% \times I_{CHG}$ |

Note that the actual charge current may be limited to a current lower than the programmed fast charge current due to the ACT8946A's internal thermal regulation loop. See the *Thermal Regulation* section for more information.

Charger Input Interrupts

In order to ease input supply detection and eliminate the size and cost of external detection circuitry, the charger has the ability to generate interrupts based upon the status of the input supply. This function is capable of generating an interrupt when the input is connected, disconnected, or both. An interrupt is generated any time the input supply

is connected when INSTAT[] bit is set to 1 and the INCON[] bit is set to 1, and an interrupt is generated any time the input supply is disconnected when INSTAT[] bit is set to 1 and the INDIS[] bit is set to 1.

INDAT[] indicates the status of the CHGIN input supply. A value of 1 indicates that a valid CHGIN input ($CHGIN \text{ UVLO Threshold} < V_{CHGIN} < CHGIN \text{ OVP Threshold}$) is present, a value of 0 indicates a valid input is not present.

When an interrupt is generated by the input supply, reading the INSTAT[] returns a value of 1. INSTAT[] is automatically cleared to 0 upon reading. When no interrupt is generated by the input supply, reading the INSTAT[] returns a value of 0.

When responding to an Input Status Interrupt, it is often useful to know the state of the ACIN input. For example, in a dual-input charger application knowing the state of the ACIN input can identify which type of input supply has been connected. The state of the ACIN input can be read at any time by reading the ACINSTAT[] bit, where a value of 1 indicates that the voltage at ACIN is above the 1.2V threshold (indicating that a wall-cube has been attached), and a value of 0 indicates that the voltage is below this threshold (indicating that ACIN input is not valid and USB supply input is selected).

Thermal Regulation

The charger features an internal thermal regulation loop that monitors die temperature and reduces charging current as needed to ensure that the die temperature does not exceed the thermal regulation threshold of 110°C. This feature protects against excessive junction temperature and makes the device more accommodating to aggressive thermal designs. Note, however, that attention to good thermal designs is required to achieve the fastest possible charge time by maximizing charge current.

Charge Safety Timers

The charger features programmable charge safety timers which help ensure a safe charge by detecting potentially damaged cells. These timers are programmable via the PRETIMO[1:0] and TOTTIMO[1:0] bits, as shown in Table 8 and Table 9. Note that in order to account for reduced charge current resulting from DCCC operation in thermal regulation mode, the charge time-out periods are extended proportionally to the reduction in charge current. As a result, the actual safety period may exceed the nominal timer period.

Charger Timer Interrupts

The charger features the ability to generate interrupts based upon the status of the charge timers. Set the TIMPRE[] bit to 1 and TIMRSTAT[] bit to 1 to generate an interrupt when the Precondition Timer expires. Set the TIMRTOT[] bit to 1 and TIMRSTAT[] bit to 1 to generate an

interrupt when the Total-Charge Timer expires.

TIMRDAT[] indicates the status of the charge timers. A value of 1 indicates a precondition time-out or a total charge time-out occurs, a value of 0 indicates other cases.

When an interrupt is generated by the charge timers, reading the TIMRSTAT[] returns a value of 1. TIMRSTAT[] is automatically cleared to 0 upon reading. When no interrupt is generated by the charge timers, reading the TIMRSTAT[] returns a value of 0.

Table 8: PRECONDITION Safety Timer Setting

Table 9: Total Safety Timer Setting

| PRETIMO[1] | PRETIMO[0] | PRECONDITION TIME-OUT PERIOD |
|------------|------------|------------------------------|
| 0 | 0 | 40 mins |
| 0 | 1 | 60 mins |
| 1 | 0 | 80 mins |
| 1 | 1 | Disabled |

Charge Status Indicator

| TOTTIMO[1] | TOTTIMO[0] | TOTAL TIME-OUT PERIOD |
|------------|------------|-----------------------|
| 0 | 0 | 3 hrs |
| 0 | 1 | 4 hrs |
| 1 | 0 | 5 hrs |
| 1 | 1 | Disabled |

The charger provides a charge-status indicator output, nSTAT. nSTAT is an open-drain output which sinks current when the charger is in an active-charging state, and is high-Z otherwise. nSTAT features an internal 8mA current limit, and is capable of directly driving a LED without the need of a current-limiting resistor or other external circuitry. To drive an LED, simply connect the LED between nSTAT pin and an appropriate supply, such as VSYS. For a logic-level charge status indication, simply connect a resistor from nSTAT to an appropriate voltage supply.

Table 10: Charging Status Indication Reverse-Current Protection

| STATE | nSTAT |
|-------------------|--------|
| PRECONDITION | Active |
| FAST-CHARGE | Active |
| TOP-OFF | Active |
| END-OF-CHARGE | High-Z |
| SUSPEND | High-Z |
| TEMPERATURE FAULT | High-Z |
| TIME-OUT-FAULT | High-Z |

The charger includes internal reverse-current protection circuitry that eliminates the need for blocking diodes, reducing solution size and cost as well as dropout voltage relative to conventional battery chargers. When the voltage at CHGIN falls below V_{BAT} , the charger automatically reconfigures its power switch to minimize current drawn from the battery.

Battery Temperature Monitoring

In a typical application, the TH pin is connected to the battery pack's thermistor input, as shown in Figure 3. The charger continuously monitors the temperature of the battery pack by injecting a $102\mu A$ (typ) current into the thermistor (via the TH pin) and sensing the voltage at TH. The voltage at TH is continuously monitored, and charging is suspended if the voltage at TH exceeds either of the internal V_{THH} and V_{THL} thresholds of 0.5V and 2.51V, respectively.

Figure 3: Simple Configuration

The net resistance (from TH to GA) required to cross the thresholds are given by:

$$102\mu A \times R_{NOM} \times k_{HOT} = 0.5V \rightarrow R_{NOM} \times k_{HOT} \approx 5k\Omega$$

$$102\mu A \times R_{NOM} \times k_{COLD} = 2.51V \rightarrow R_{NOM} \times k_{COLD} \approx 25k\Omega$$

where R_{NOM} is the nominal thermistor resistance at room temperature, and k_{HOT} and k_{COLD} represent the ratios of the thermistor's resistance at the desired hot and cold thresholds, respectively, to the resistance at $25^{\circ}C$.

Battery Temperature Interrupts

In order to ease detecting the status of the battery temperature, the charger features the ability to generate interrupts based upon the status of the battery temperature. Set the TEMPOUT[] bit to 1 and TEMPSTAT[] bit to 1 to generate an interrupt when battery temperature goes out of the valid temperature range. Set the TEMPIN[] bit to 1 and TEMPSTAT[] bit to 1 to generate an interrupt when battery temperature returns to the valid range.

TEMPDAT[] indicates the status of the battery temperature. A value of 1 indicates the battery temperature is inside of the valid range, a value of 0

indicates the battery is outside of the valid range.

When an interrupt is generated by the battery temperature event, reading the TEMPSTAT[] returns a value of 1. TEMPSTAT[] is automatically cleared to 0 upon reading. When no interrupt is generated by the battery temperature event, reading the TEMPSTAT[] returns a value of 0.

Charge-Control State Machine

PRECONDITION State

A new charging cycle begins with the PRECONDITION state, and operation continues in this state until V_{BAT} exceeds the Precondition Threshold Voltage. When operating in PRECONDITION state, the cell is charged at 10% of the programmed maximum fast-charge constant current, I_{CHG} .

Once V_{BAT} reaches the Precondition Threshold Voltage, the state machine jumps to the FAST-CHARGE state. If V_{BAT} does not reach the Precondition Threshold Voltage before the Precondition Time-out period expires, then the state machine jumps to the TIME-OUT-FAULT state in order to prevent charging a damaged cell. See the *Charge Safety Timers* section for more information.

FAST-CHARGE State

In the FAST-CHARGE state, the charger operates in constant-current (CC) mode and regulates the charge current to the current set by R_{ISET} . Charging continues in CC mode until V_{BAT} reaches the charge termination voltage (V_{TERM}), at which point the state-machine jumps to the TOP-OFF state. If V_{BAT} does not reach V_{TERM} before the total time out period expires then the state-machine will jump to the “EOC” state and will re-initiate a new charge cycle after 32ms “relax”. See the *Current Limits* and *Charge Current Programming* sections for more information about setting the maximum charge current.

TOP-OFF State

In the TOP-OFF state, the cell charges in constant-voltage (CV) mode. In CV mode operation, the charger regulates its output voltage to the 4.20V charge termination voltage, and the charge current is naturally reduced as the cell approaches full charge. Charging continues until the charge current drops to END-OF-CHARGE current threshold, at which point the state machine jumps to the END-OF-CHARGE (EOC) state.

If the state-machine does not jump out of the TOP-OFF state before the Total-Charge Time-out period expires, then the state machine jumps to the EOC state and will re-initiate a new charge cycle if V_{BAT} falls below termination voltage 205mV (typ). For more information about the charge safety timers, see the *Charging Safety Times* section.

END-OF-CHARGE (EOC) State

In the END-OF-CHARGE (EOC) state, the charger presents a high-impedance to the battery, minimizing battery current drain and allowing the cell to “relax”. The charger continues to monitor the cell voltage, and re-initiates a charging sequence if the cell voltage drops to 205mV (typ) below the charge termination voltage.

SUSPEND State

The state-machine jumps to the SUSPEND state any time the battery is removed, and any time the input voltage either falls below the CHGIN UVLO threshold or exceeds the OVP threshold. Once none of these conditions are present, a new charge cycle initiates.

A charging cycle may also be suspended manually by setting the SUSPEND[] bit. In this case, initiate a new charging sequence by clearing SUSPEND[] to 0.

State Machine Interrupts

The charger features the ability to generate interrupts when the charger state machine transitions, based upon the status of the CHG_ bits. Set CHGEOCIN[] bit to 1 and CHGSTAT[] bit to 1 to generate an interrupt when the charger state machine goes into the END-OF-CHARGE (EOC) state. Set CHGEOCOUT[] bit to 1 and CHGSTAT[] bit to 1 to generate an interrupt when the charger state machine exits the EOC state.

CHGDAT[] indicates the status of the charger state machine. A value of 1 indicates that the charger state machine is in END-OF-CHARGE state, a value of 0 indicates the charger state machine is in other states.

When an interrupt is generated by the charger state machine, reading the CHGSTAT[] returns a value of 1. CHGSTAT[] is automatically cleared to 0 upon reading. When no interrupt is generated by the charger state machine, reading the CHGSTAT[] returns a value of 0.

For additional information about the charge cycle, CSTATE[1:0] may be read at any time via I²C to determine the current charging state.

Table 11: Charging Status Indication

| CSTATE[1] | CSTATE[0] | STATE MACHINE STATUS |
|-----------|-----------|----------------------------------|
| 1 | 1 | PRECONDITION State |
| 1 | 0 | FAST-CHARGE/ TOP-OFF State |
| 0 | 1 | END-OF-CHARGE State |
| 0 | 0 | SUSPEND/DISABLED/ FAULT State |

Figure 4: Typical Li+ charge profile and ACT8946A charge states

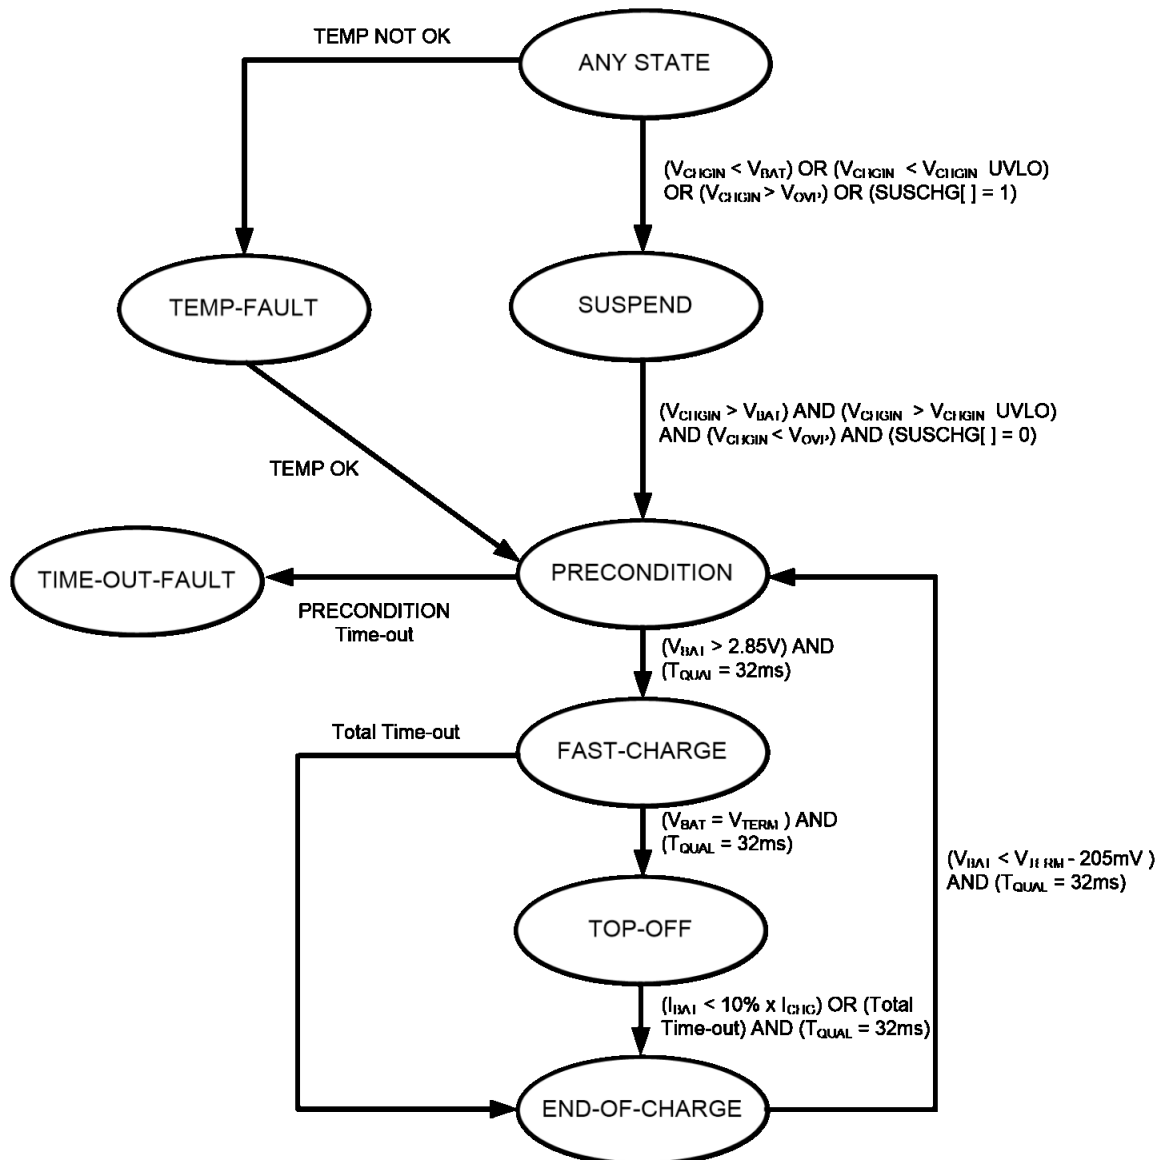

Figure 5: Charger State Diagram

CMI 204: ACT8946AQJ204-T

CMI 303 is optimized for the HiSilicon Hi3518E video microprocessors.

Voltage and Currents

| Rail | Active Mode Voltage (V) | Fsw (kHz) |
|------|-------------------------|-----------|
| REG1 | 1.1 | 2000 |
| REG2 | 1.8 | 2000 |
| REG3 | 1.8 | 2000 |
| REG4 | 3.3 | n/a |
| REG5 | 3.3 | n/a |
| REG6 | 3.3 | n/a |
| REG7 | 1.2 | n/a |

Startup and Sequencing

| Rail | Se-quence Order | Sequencing Input Trigger | StartUp Delay (us) |
|------|-----------------|--------------------------|--------------------|
| REG4 | 1 | VIN_UVLO | 0 |
| REG7 | 1 | VIN_UVLO | 0 |
| REG2 | 2 | REG4 | 4000 |
| REG3 | 3 | REG2 | 4000 |
| REG1 | 4 | REG2 | 8000 |
| REG5 | 5 | REG1 | 4000 |
| REG6 | 6 | REG1 | 8000 |

Hardware Configuration

CMI 204 should have PWRHLD directly connected to PWREN. These two pins are connected directly to VSYS to start the turn-on sequencing when input power is applied.

nRSTO

nRSTO deasserts 64ms after REG4 turns on.

Startup

CMI 204 Startup

Light Load PFM

All three switching converters, REG1/2/3, are configured to enter PFM mode at light loads to improve light load efficiency.

CMI 303: ACT8946AQJ303-T

CMI 303 is optimized for the HiSilicon Hi3516C and Hi3518E video microprocessors.

Voltage and Currents

| Rail | Active Mode Voltage (V) | Fsw (kHz) |
|------|-------------------------|-----------|
| REG1 | 1.1 | 2000 |
| REG2 | 1.8 | 2000 |
| REG3 | 1.5 | 2000 |
| REG4 | 3.3 | n/a |
| REG5 | 3.3 | n/a |
| REG6 | 3.3 | n/a |
| REG7 | OFF | n/a |

Startup and Sequencing

| Rail | Sequence Order | Sequencing Input Trigger | StartUp Delay (us) |
|------|----------------|--------------------------|--------------------|
| REG4 | 1 | VIN_UVLO | 0 |
| REG5 | 2 | REG4 | 4000 |
| REG6 | 3 | REG5 | 4000 |
| REG2 | 4 | REG5 | 8000 |
| REG3 | 5 | REG2 | 4000 |
| REG1 | 6 | REG2 | 8000 |
| REG7 | n/a | n/a | n/a |

Hardware Configuration

CMI 303 does not require any special hardware configuration.

Startup

Light Load PFM

All three switching converters, REG1/2/3, are configured to enter PFM mode at light loads to improve light load efficiency.

ERRATA INFO

Errata Name:

ACT8946A creates I²C BUS contention.

Description:

ACT8946A incorrectly detects its I²C slave address and pulls SDA low to acknowledge the address. This occurs under several conditions.

1. The IC is on a multi-slave I²C bus and the other slaves use multi-byte read or write commands, and the read/write data contains a string of bits that match the ACT8946A I²C address.
2. The host addresses a device with a 10 bit I²C address that contains a string of bits that match the ACT8946A I²C address.

Work Around:

This issue has several work arounds.

1. Do not put I²C devices that use multi-byte read or write commands on the ACT8946A I²C bus.
2. Disable the ACT8946A I²C communication after power up and before using any multi-byte read or write commands. This allows the user to do a one-time reconfiguration of the ACT8946A after power up. Disabling ACT8946A I²C communication reconfigures SDA and SCL high-impedance digital inputs. Because the specific commands to disable the I²C bus are CMI specific, please contact the factory for specific instructions.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
