Notes:

- 1) To prevent input signal oscillations minimize wiring length to controller (~2cm). Additional RC filtering (C5 etc.) may be required. If filtering is added be careful to maintain proper dead time and voltage levels. See application notes for details.
- 2) Internal HVIC provides high voltage level shifting allowing direct connection of all six driving signals to the controller.
- 3) FO output is an open collector type. Pull-up resistor (R3) should be adjusted to current sink capability of the module.
- 4) Boot strap supply component values must be adjusted depending on the PWM frequency and technique.
- 5) Wiring length associated with RSHUNT, RSF, CSF must be minimized to avoid improper operation of the SC function.
- 6) RSF, CSF set short circuit protection trip time. Recommend time constant is 1.5us-2.0us. See application notes.
- 7) Local decoupling/high frequency filter capacitors must be connected as close as possible to the modules pins.
- 8) The length of the DC link wiring between C6, C7, the DIP's P terminal and the shunt must be minimized to prevent excessive transient voltages. In particular C7 should be mounted as close to the DIP as possible.
- 9) Use high quality, tight tolerance current sensing resistor. Connect resistor as close as possible to the DIP's N terminal. Be careful to check for proper power rating. See application notes for calculation of resistance value.
