

+3V/+5V, 250MHz, SOT23 ADC Buffer Amplifiers with High-Speed Disable

General Description

The MAX4285/MAX4286 single and MAX4287/MAX4288/MAX4387/MAX4388 dual ADC buffer amplifiers feature high-speed performance and single +3V supply operation. The MAX4285/MAX4286/MAX4288 and MAX4388 offer a disable feature that reduces power-supply current and places the outputs in a high-impedance state. All six devices operate from a +2.85V to +6.5V single supply or from $\pm 1.425V$ to $\pm 3.25V$ dual supplies. The common-mode input voltage range extends to the negative power-supply rail (ground in single-supply applications).

These devices require 20mA of quiescent supply current per amplifier while achieving a 250MHz -3dB bandwidth and a 350V/ μ s slew rate. The combination of an 8ns (to 0.1%) settling time, 88dBc (f = 5MHz) of SFDR, and up to 100mA output drive makes these amplifiers ideal for high-speed ADC drivers for communications and instrumentation applications. In addition, when disabled, their high output impedance makes them ideal for multiplexing applications.

The MAX4285/MAX4286 are available in space-saving 6-pin SOT23 and 8-pin SO packages. The MAX4287/MAX4387 come in 8-pin μ MAX and 8-pin SO packages, while the MAX4288/MAX4388 come in 10-pin μ MAX and 14-pin SO packages.

Applications

High-Speed ADC Drivers
Communications Equipment
Instrumentation
CCD Imaging Systems
Ultrasound

Typical Operating Circuit appears at end of data sheet.

Pin Configurations appear at end of data sheet.

Features

- ◆ High Speed at 3V
 - 250MHz -3dB Bandwidth (MAX4285/87/88)
 - 150MHz -3dB Bandwidth (MAX4286, MAX4387/88)
 - 350V/ μ s Slew Rate
- ◆ +2.85V to +6.5V Single-Supply Operation
- ◆ Input Common-Mode Range Extends to V_{EE}
- ◆ Low Distortion at 5MHz
 - 88dBc SFDR
- ◆ High Output Current Drive: -106mA to +77mA
- ◆ 6ns Settling Time to 0.1%
- ◆ High-Speed Enable/Disable
 - 40ns Enable Time
 - 50ns Disable Time
 - High Output Impedance
- ◆ Space-Saving SOT23 and μ MAX Packages

ABSOLUTE MAXIMUM RATINGS

Supply Voltage ($V_{CC} - V_{EE}$)	-0.3V to +7.5V	8-Pin μ MAX (derate 4.1mW/°C above +70°C)	330mW
Input Voltage Range (IN+, IN-)	($V_{EE} - 0.3V$) to ($V_{CC} + 0.3V$)	10-Pin μ MAX (derate 5.6mW/°C above +70°C)	444mW
Differential Input Voltage	-0.3V to +7.5V	8-Pin SO (derate 5.88mW/°C above +70°C)	471mW
Voltage at $\overline{DISABLE}$	($V_{EE} - 0.3V$) to ($V_{CC} + 0.3V$)	14-Pin SO (derate 8.3mW/°C above +70°C)	667mW
Current into IN+, IN-, $\overline{DISABLE}$	$\pm 20mA$	Operating Temperature Range	-40°C to +85°C
Output Short-Circuit Duration	Indefinite	Junction Temperature	+150°C
Continuous Power Dissipation ($T_A = +70^\circ C$)		Storage Temperature Range	-65°C to +150°C
6-Pin SOT23 (derate 7.1mW/°C above +70°C)	571mW	Lead Temperature (soldering, 10s)	+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Detailed Description

The MAX4285–MAX4288 and MAX4387/MAX4388 are voltage-feedback op amps, intended for use as ADC input buffers. They operate from a single +2.85V to +6.5V supply or dual $\pm 1.425\text{V}$ to $\pm 3.25\text{V}$ supplies. Their high output drive, wide bandwidth, fast settling, low noise, and low distortion make them ideal for the brutal task of meeting the dynamic input drive requirements of high-speed ADCs or other demanding applications.

The MAX4285/MAX4286/MAX4288 and MAX4388 have a high-speed disable mode that places the outputs in a high-impedance state and lowers operating supply current to 1mA. The enable time is typically 40ns, and the disable time is typically 50ns. The MAX4285/MAX4286 have a single enable pin ($\overline{\text{DISABLE}}$), and the MAX4288/

MAX4388 have dual disable pins ($\overline{\text{DISABLEA}}$, $\overline{\text{DISABLEB}}$).

The MAX4285/MAX4287/MAX4288 are internally compensated for unity-gain stability. The MAX4286/MAX4387/MAX4388 are compensated for gains of +5V/V or greater.

Applications Information

Inverting and Noninverting Configurations

Select the gain-setting feedback (R_F) and input (R_G) resistor values considering the following criteria: large resistor values increase voltage noise and interact with the amplifier's input and PC board capacitance to effect system bandwidth. This generates undesirable poles and zeros that decrease bandwidth or cause oscillations.

MAX4285–MAX4288/MAX4387/MAX4388

+3V/+5V, 250MHz, SOT23 ADC Buffer Amplifiers with High-Speed Disable

For example, a noninverting gain-of-two configuration ($R_F = R_G$) using $1k\Omega$ resistors, combined with $2pF$ typical amplifier input capacitance, generates a pole at $159MHz$. Since this pole is within the amplifier bandwidth, it jeopardizes stability. Reducing these $1k\Omega$ resistors to 100Ω extends the pole frequency to $1.59GHz$, but affects output swing by adding 200Ω in parallel with the amplifier's load resistor. The typical value for R_F is 300Ω .

Layout and Power-Supply Bypassing

These amplifiers operate from a single $+2.85V$ to $+6.5V$ power supply or from $\pm 1.425V$ to $\pm 3.25V$ dual supplies. For single-supply operation, bypass V_{CC} to ground with a $0.1nF$ capacitor as close to the pin as possible, with a $0.1\mu F$ capacitor in parallel. If operating with dual supplies, bypass each supply with capacitors to ground.

Observe the following guidelines:

- A solid ground plane is essential for good high-frequency behavior.
- Where possible, use multiple ground vias.
- Use a PC board with at least two layers. Avoid areas of unreferenced copper-clad.
- Keep signal traces as short and as straight as possible. Do not make sharp turns; round all trace corners.
- Use a constant-impedance board design if possible.

High-Speed Disable

The MAX4285/MAX4286/MAX4288 and MAX4388 feature a disable ($\overline{DISABLE}$) input that places the amplifier in a low-power, high-output-impedance state. When $\overline{DISABLE}$ is asserted, the amplifier's output impedance is typically $35k\Omega$. This high output impedance, combined with the low $2pF$ output capacitance, make these devices ideal for ADC input multiplexing applications or switch applications. Typical enable/disable times are $40ns/50ns$.

Output Capacitive Loading and Stability

These op amps are optimized for AC performance. They are not designed to drive highly reactive loads, which decrease phase margin and may produce excessive ringing and oscillation. A small isolation resistor (usually 20Ω to 30Ω) placed before the reactive load reduces possible ringing and oscillation (Figure 1). At higher capacitive loads, AC performance is dependent on the interaction of the load capacitance, the isolation resistor, and on-board layout.

Output Drive Capability

The MAX4285-MAX4288 and MAX4387/MAX4388 have an output sink capability of $106mA$ and a source capability of $77mA$. This high current ability allows them to drive low-impedance and dynamic-impedance ADC inputs. The linear output range of these devices is ($V_{EE} + 0.4V$) to ($V_{CC} - 0.4V$). Operation beyond this range is not recommended due to reduced gain and phase margin.

* EXPOSED PAD (Note 5)

NOTES:

1. D&E DO NOT INCLUDE MOLD FLASH.
2. MOLD FLASH OR PROTRUSIONS NOT TO EXCEED .15 MM (.006").
3. CONTROLLING DIMENSION: MILLIMETERS.
4. MEETS JEDEC MO-187.
5. DIMENSIONS X & Y APPLY TO EXPOSED PAD (EP) VERSIONS ONLY. SEE INDIVIDUAL PRODUCT DATASHEET TO DETERMINE IF A PRODUCT USES EXPOSED PAD PACKAGE.
6. EXPOSED PAD FLUSH WITH BOTTOM OF PACKAGE WITHIN .002".

PROPRIETARY INFORMATION
TITLE:
PACKAGE OUTLINE, 8L UMAX WITH EP OPTION
APPROVAL: _____ DOCUMENT CONTROL NO. 21-0036 REV. H 1/1

8LUMAXD EFS

+3V/+5V, 250MHz, SOT23 ADC Buffer Amplifiers with High-Speed Disable

Package Information (continued)

MAX4285-MAX4288/MAX4387/MAX4388

10LUMAX.EPS

+3V/+5V, 250MHz, SOT23 ADC Buffer Amplifiers with High-Speed Disable

Package Information (continued)

Maxim cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim product. No circuit patent licenses are implied. Maxim reserves the right to change the circuitry and specifications without notice at any time.

16 Maxim Integrated Products, 120 San Gabriel Drive, Sunnyvale, CA 94086 408-737-7600

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
