

# SAMA5D2 Series

---

## Ultra-Low-Power Arm® Cortex®-A5 Core-Based MPU, 500 MHz, Graphics Interface, Ethernet 10/100, CAN, USB, PCI 5.0 Pre-Certified

---

### Introduction

---

The SAMA5D2 series is a high-performance, ultra-low-power Arm Cortex-A5 CPU-based embedded microprocessor (MPU) running up to 500 MHz, with support for multiple memories such as DDR2, DDR3L, LPDDR2, LPDDR3, and QSPI and e.MMC Flash. The devices integrate powerful peripherals for connectivity and user interface applications, and offer advanced security functions (Arm TrustZone®, tamper detection, secure data storage, etc.), as well as high-performance crypto accelerators AES, SHA and TRNG.

Selected members of the SAMA5D2 series are qualified for extended industrial temperature range operation (-40°C to 105°C external temperature).

The SAMA5D2 series is delivered with a free Linux® distribution and bare metal C examples.

### Features

---

- Arm Cortex-A5 Core
  - Armv7-A architecture
  - Arm TrustZone
  - NEON™ Media Processing Engine
  - Up to 500 MHz
  - ETM/ETB 8 Kbytes
- Memory Architecture
  - Memory Management Unit (MMU)
  - 32-Kbyte L1 data cache, 32-Kbyte L1 instruction cache
  - 128-Kbyte L2 cache configurable to be used as an internal SRAM
  - One 128-Kbyte scrambled internal SRAM
  - One 160-Kbyte internal ROM
    - 64-Kbyte scrambled and maskable ROM embedding bootloader/Secure bootloader
    - 96-Kbyte unscrambled, unmaskable ROM for NAND Flash BCH ECC table
  - High-bandwidth scramblable 16-bit or 32-bit Double Data Rate (DDR) multiport dynamic RAM controller supporting up to 512 Mbytes 8-bank DDR2/DDR3 (DLL off only) / DDR3L (DLL off only) / LPDDR1/LPDDR2/LPDDR3, including “on-the-fly” encryption/decryption path
  - 8-bit SLC/MLC NAND controller, with up to 32-bit Error Correcting Code (PMECC)
- System Running up to 166 MHz in Typical Conditions

- Reset Controller (RSTC), Shutdown Controller (SHDWC), Periodic Interval Timer (PIT), independent Watchdog Timer (WDT) and secure Real-Time Clock (RTC) with clock calibration
- One 600 to 1200 MHz PLL for the system and one 480 MHz PLL optimized for high-speed USB
- Digital fractional PLL for audio (11.2896 MHz and 12.288 MHz)
- Internal low-power 12 MHz RC and 32 kHz typical RC
- Selectable 32.768 Hz low-power oscillator and 8 to 24 MHz oscillator
- 51 DMA channels including two 16-channel 64-bit Central DMA Controllers
- 64-bit Advanced Interrupt Controller (AIC)
- 64-bit Secure Advanced Interrupt Controller (SAIC)
- Three programmable external clock signals
- Low-Power Modes
  - Ultra-low-power mode with fast wake-up capability
  - Low-power Backup mode with 5-Kbyte SRAM and SleepWalking™ features
    - Wake up from up to nine wake-up pins, UART reception, analog comparison
    - Fast wake-up capability
    - Extended Backup mode with DDR in Self-Refresh mode
- Peripherals
  - LCD TFT controller (LCDC) up to 1024x768 or 1280x768 (still image). Four overlays, rotation, post-processing and alpha blending, 24-bit parallel RGB interface
  - ITU-R BT. 601/656/1120 Image Sensor Controller (ISC) supporting up to 5 Mpixel sensors with a parallel 12-bit interface for Raw Bayer, YCbCr, Monochrome and JPEG-compressed sensor interface
  - Two Synchronous Serial Controllers (SSC), two Inter-IC Sound Controllers (I2SC), and one Stereo Class D amplifier (CLASSD)
  - One Peripheral Touch Controller (PTC) with up to 8 X-lines and 8 Y-lines (64-channel capacitive touch)
  - One Pulse Density Modulation Interface Controller (PDMIC)
  - One USB device high-speed port (UDPHS) and one USB host high-speed port or two USB host high-speed ports (UHPHS)
  - One USB host high-speed port with a High-Speed Inter-Chip (HSIC) interface
  - One 10/100 Ethernet MAC (GMAC)
    - Energy efficiency support (IEEE® 802.3az standard)
    - Ethernet AVB support with IEEE802.1AS timestamping
    - IEEE802.1Qav credit-based traffic-shaping hardware support
    - IEEE1588 Precision Time Protocol (PTP)
  - Two high-speed memory card hosts:
    - SDMMC0: SD 3.0, eMMC 4.51, 8 bits
    - SDMMC1: SD 2.0, eMMC 4.41, 4 bits only
  - Two master/slave Serial Peripheral Interfaces (SPI)
  - Two Quad Serial Peripheral Interfaces (QSPI)
  - Five FLEXCOMs (USART, SPI and TWI)
  - Five UARTs
  - Two master CAN-FD (MCAN) controllers with SRAM-based mailboxes, and time- and event-triggered transmission

MCAN implements the non-ISO CAN FD frame format and therefore does not pass the CAN FD Conformance Test according to ISO 16845-1:2016.

- One Rx only UART in backup area (RXLP)
- One Analog Comparator Controller (ACC) in backup area
- Two 2-wire interfaces (TWIHS) up to 400 Kbits/s supporting the I<sup>2</sup>C protocol and SMBUS
- One full-featured 4-channel 16-bit Pulse Width Modulation (PWM) controller
- Two 3-channel 32-bit Timer/Counters (TC), supporting basic PWM modes
- One 12-channel, 12-bit, Analog-to-Digital Converter (ADC) with resistive touchscreen capability
- Safety
  - Zero-power Power-on Reset (POR) cells
  - Main crystal clock failure detector
  - Write-protected registers
  - Integrity Check Monitor (ICM) based on SHA256
  - Memory Management Unit (MMU)
  - Independent watchdog
- Security
  - 5 Kbytes of internal scrambled SRAM:
    - 1 Kbyte nonerasable on tamper detection
    - 4 Kbytes erasable on tamper detection
  - 256 bits of scrambled and erasable registers
  - Up to eight tamper pins for static or dynamic intrusion detections<sup>(1)</sup>
  - Environmental monitors on specific versions: temperature, voltage, frequency and active die shield<sup>(2)</sup>
  - Secure Bootloader<sup>(3)</sup>
  - On-the-fly AES encryption/decryption on DDR and QSPI memories (AESB)
  - RTC including timestamping on security intrusions
  - Programmable fuse box with 544 fuse bits (including JTAG protection and BMS)

**Note:**

1. For information specific to dynamic tamper protection (PIOBU), refer to the document *SAMA5D2 External Tamper Protections* (document no. 44095).
  2. For environmental monitors, refer to the document *SAMA5D23 and SAMA5D28 Environmental Monitors* (document no. 44036), available under Non-Disclosure Agreement (NDA). Contact a Microchip Sales Representative for details.
  3. For secure boot strategies, refer to the document *SAMA5D2 Series Secure Boot Strategy* (document no. 44040), available under Non-Disclosure Agreement (NDA). Contact a Microchip Sales Representative for details.
- Hardware Cryptography
    - SHA (SHA1, SHA224, SHA256, SHA384, SHA512): compliant with FIPS PUB 180-2
    - AES: 256-, 192-, 128-bit key algorithms, compliant with FIPS PUB 197
    - TDES: two-key or three-key algorithms, compliant with FIPS PUB 46-3
    - True Random Number Generator (TRNG) compliant with NIST Special Publication 800-22 Test Suite and FIPS PUBs 140-2 and 140-3
  - Up to 128 I/Os

- Fully programmable through set/clear registers
- Multiplexing of up to eight peripheral functions per I/O line
- Each I/O line can be assigned to a peripheral or used as a general-purpose I/O
- The PIO controller features a synchronous output providing up to 32 bits of data output in one write operation
- Packages
  - 289-ball LFBGA, 14 x 14 mm body, 0.8 mm pitch
  - 256-ball TFBGA, 8 x 8 mm body, 0.4 mm pitch
  - 196-ball TFBGA, 11 x 11 mm body, 0.75 mm pitch

### 1. Description

The SAMA5D2 Series is a high-performance, power-efficient embedded MPU based on the Arm Cortex-A5 processor. It integrates the Arm NEON SIMD engine for accelerated multimedia and signal processing, a configurable 128-Kbyte L2 cache and a floating point unit (FPU) for high-precision computing. The device features an advanced user interface and connectivity peripherals. Advanced security is provided by powerful cryptographic accelerators, by the Arm TrustZone technology securing access to memories and sensitive peripherals, and by several hardware features that safeguard memory content, authenticate software, detect physical attacks and prevent information leakage during code execution.

The SAMA5D2 features an internal multilayer bus architecture associated with 2 x 16 DMA channels and dedicated DMAs for the communication and interface peripherals required to ensure uninterrupted data transfers with minimal processor overhead. The device supports DDR2, DDR3, DDR3L, LPDDR1, LPDDR2, LPDDR3, QSPI and e.MMC Flash, and SLC/MLC parallel NAND Flash memory up to 32-bit ECC.

The comprehensive peripheral set includes an LCD TFT controller with overlays for hardware-accelerated image composition, an image sensor controller, audio support through I<sup>2</sup>S, SSC, a stereo Class D amplifier and a digital microphone. Connectivity peripherals include a 10/100 EMAC, USBs, CANs, FLEXCOMs, UARTs, SPIs and two QSPIs, SDIO/SD/e.MMCs, and TWIs/I<sup>2</sup>C.

Protection of code and data is provided by automatic scrambling of memories and an Integrity Check Monitor (ICM) to detect any modification of the memory contents. The SAMA5D2 also supports execution of encrypted code (QSPI or one portion of the DDR) with an “on-the-fly” encryption-decryption process.

With its secure design architecture, cryptographic acceleration engines, and secure bootloader, the SAMA5D2 is the ideal solution for point-of-sale (POS), IoT and industrial applications requiring device authentication, anti-cloning, data protection and secure communication.

SAMA5D2 devices feature three software-selectable low-power modes: Idle, Ultra-Low-Power and Backup.

In Idle mode, the processor is stopped while all other functions can be kept running.

In Ultra-Low-Power mode 0, the processor is stopped while all other functions are clocked at 512 Hz and interrupts or peripherals can be configured to wake up the system based on events, including partial asynchronous wake-up (SleepWalking).

In Ultra-Low-Power mode 1, all clocks and functions are stopped but some peripherals can be configured to wake up the system based on events, including partial asynchronous wake-up (SleepWalking).

In Backup mode, RTC and wake-up logic are active. The Backup mode can be extended to feature DDR in Self-refresh mode.

SAMA5D2 devices also include an Event System that allows peripherals to receive, react to and send events in Active and Idle modes without processor intervention.

# SAMA5D2 Series Configuration Summary

## 2. Configuration Summary

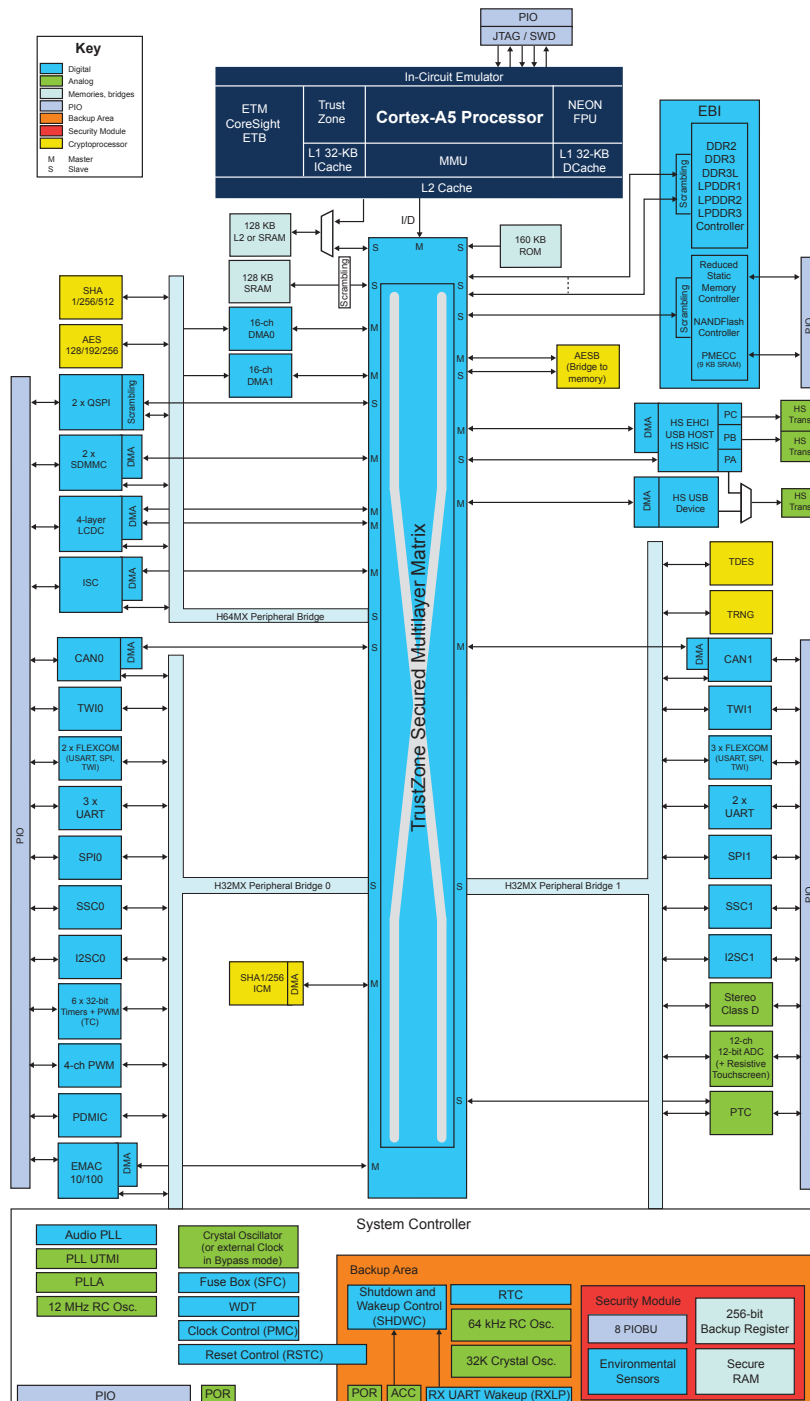

Table 2-1. SAMA5D2 Configuration Summary

Feature	SAMA5D21	SAMA5D22	SAMA5D23	SAMA5D24	SAMA5D26	SAMA5D27	SAMA5D28
Package	TFBGA196			TFBGA256	LFBGA289		
PIOs	72			105	128		
DDR Bus	16-bit			16/32-bit			
SMC	Up to 16-bit						
SRAM	128 Kbytes						
QSPI	2						
LCD	24-bit RGB						
Camera Interface (ISC)	1						
EMAC	1						
PTC	–	4 X-lines x 8 Y-lines		8 X-lines x 8 Y-lines	–	8 X-lines x 8 Y-lines	
CAN	–	1		–		2	
USB	2 (2 Hosts or 1 Host/1 Device)			3 (2 Hosts/ 1 HSIC, or 1 Host/ 1 Device/ 1 HSIC)	2 (2 Hosts or 1 Host/ 1 Device)	3 (2 Hosts/1 HSIC or 1 Host/1 Device/1 HSIC)	
UART/SPI/I <sup>2</sup> C	9 / 6 / 6			10 / 7 / 7			
SDIO/SD/MMC	1			2			
I <sup>2</sup> S/SSC/ Class D/PDM	2 / 2 / 1 / 1						
ADC Inputs	5			12			
Timers	5			6			
PWM	4 (PWM) + 5 (TC)			4 (PWM) + 6 (TC)			
Tamper Pins	6			2	8		
AESB	–	Yes			–	Yes	
Environmental Monitors, Die Shield	–		Yes		–		Yes

For information on device pin compatibility, see the section "[Pinouts](#)".

## 5. Safety and Security Features

### 5.1 Design for Safety and IEC60730 Class B Certification

#### 5.1.1 Background Information

The IEC 60730 standard encompasses all aspects of appliance design. Annex H of the standard covers the aspects most relevant to microcontrollers. It details the tests and diagnostics which are intended to ensure safe operation of embedded control hardware and software. IEC 60730 defines three classifications for electronic control functions:

- Class A - Control functions which are not intended to be relied upon for safety of the equipment
- Class B - Control functions intended to prevent unsafe operation of the controlled equipment
- Class C - Control functions intended to prevent special hazards such as explosions

Specific design techniques have been used in the SAMA5D2 to ease compliance with the IEC 60730 Class B Certification and to resolve general-purpose safety concerns. This allows reduced software development and code size as well as savings on external hardware circuitry, since built-in self-tests are already embedded in the MPU. The table “Safety and IEC 60730 Features List” below gives the list of peripherals which incorporate these techniques, and details whether these features are applicable for the IEC 60730 Class B Certification or for general-purpose safety considerations.

### 5.2 Design for Security

The SAMA5D2 embeds peripherals with security features to prevent counterfeiting, to secure external communication, and to authenticate the system.

The table “Security Features” provides the list of peripherals and an overview of their security function. For more information, see the sections on each peripheral.

### 5.3 Safety and IEC 60730 Features

**Table 5-1. Safety and IEC 60730 Features List**

Peripheral	Component	Fault/Error/Feature	Requirements for Class B IEC 60730 <sup>(1)</sup>	General Safety
PMC	Clock	CPU clock monitoring - Overclocking detection	–	X
		32.768 kHz crystal oscillator frequency monitoring - Abnormal frequency deviation	X	X
		Main crystal oscillator - Crystal failure detection	X	X

# SAMA5D2 Series

## Safety and Security Features

.....continued

Peripheral	Component	Fault/Error/Feature	Requirements for Class B IEC 60730 <sup>(1)</sup>	General Safety
PIOC	I/O Periphery	Programmable configuration lock (active until next V <sub>DDCORE</sub> reset) to protect against further software modifications (intentional or unintentional)	–	X
		Digital I/O - Plausibility check	X	–
		Analog I/O and ADC converter - Plausibility check	X	–
ADCC				
ICM (SHA)	Memory and Internal Data Path	All internal and external memories such as QSPI, DDR, and all memories on SMC	X	–
NAND Flash Controller ECC		Non-volatile memory - Multiple error detection (2 to 32)	–	X
System Controller	Supply Monitor	Power supplies - VDDCORE, VDDIO, VDDANA, VDDBU abnormal levels	–	X
WDT, RSTC	Watchdog	Watchdog can be fed by an internal always ON clock - Program counter stuck at faults.	X	X
		Watchdog configuration can be locked (write-protected) - Errant writes (Programming errors, errors introduced by system or hardware failures)	–	X
		Watchdog overflow generates a system reset	X	X
Cortex MMU	Memory Management Unit	Cortex-A5 Memory Management Unit	–	X
MATRIX, AIC, RTC, SYSC, RXLP, ACC, PMC, PIO, MPDDRC, SMC, CLASSD, SSC, TWI, UART, SPI, FLEXCOM, QSPI, TC, PDMIC, ADC	Peripherals	Configuration, Interrupt Enable/Disable, Control registers can be independently write-protected - Errant writes (Programming errors, errors introduced by system or hardware failures)	–	X

# SAMA5D2 Series

## Safety and Security Features

.....continued

Peripheral	Component	Fault/Error/Feature	Requirements for Class B IEC 60730 <sup>(1)</sup>	General Safety
PWM, PIO	PWM	Fault inputs can be configured to put the PWM outputs in Safe mode - Programming errors, errors introduced by system or hardware failures	–	X
		PIO controller can lock the PWM I/O - Programming errors, errors introduced by system or hardware failures	–	X
		Fault inputs can be external (IO) or internal (ADC, TIMER, ACC, etc.) - Programming errors, errors introduced by system or hardware failures	–	X

**Note:**

Class B IEC 60730 Requirements. Annex H - Table H.1 (H.11.12.7 of edition 3).

### 5.4 Security Features

**Table 5-2. Security Features**

Peripheral	Function	Description	Comments
TrustZone	Security Enclave	Partition secure/non-secure world	Arm technology
Cortex MMU	Memory Management Unit	Cortex-A5 Memory Management Unit	–
PIO	I/O Control/Peripheral Access	When a peripheral is not selected (PIO-controlled), I/O lines have no access to the peripheral.	–
	Freeze	Capability to freeze either the functional part or the physical part of the configuration.	Once the freeze command is issued, no modifications to the current configuration are possible. Only a hardware reset allows a change to the configuration.

# SAMA5D2 Series

## Safety and Security Features

.....continued

Peripheral	Function	Description	Comments
Classical Advanced Software Crypto Library (CASCL)	Cryptography	Software ECC (Asymmetric key algorithm, elliptic curves)	Software library <sup>(1)</sup>
		Software RSA (Asymmetric key algorithm)	
TDES, TRNG	Cryptography	Hardware-accelerated Triple DES	FIPS-compliant <sup>(3)</sup>
		True Random Number Generator	
AES, SHA	Cryptography	Hardware-accelerated AES up to 256 bits	
		SHA up to 512 and HMAC-SHA	
	Secure Boot	Code encrypted/decrypted, Trusted Code Authentication	Hardware SHA (HMAC) + Software RSA or AES Hardware (CMAC)
AESB	AES on-the-fly	On-the-fly encryption/decryption for DDR and QSPI memories	AES128
Memories	Scrambling	On-the-fly scrambling/unscrambling for memories	All internal and external memories such as QSPI, DDR, and all memories on SMC
ICM	Memory Integrity Check Monitoring	Uses a hardware Secure Hash Algorithm (up to SHA256)	More robust than CRC. All internal and external memories such as QSPI, DDR, and all memories on SMC can be monitored
SECUMOD	JTAG	JTAG entry monitor	These tamper pins (JTAG, test, PIOBUs, monitors, etc.) can be configured to immediately erase Backup memories (BUSRAM4KB and BUREG256b), or generate an interrupt or a wakeup signal.
	Test	Test entry monitor	
	Active Shield <sup>(2)</sup>	Die Active Shield	
	Voltage Monitoring <sup>(2)</sup>	VDDDBU monitoring	
		VDDCORE monitoring	
	Temperature Monitoring <sup>(2)</sup>	Temperature monitoring	
	Frequency Monitoring <sup>(2)</sup>	32.768 kHz crystal oscillator monitoring	
		CPU clock monitoring	
	IO Tamper Pin	8 tamper detection pins. Active and Dynamic modes supported.	
	Secure Backup SRAM	5 Kbytes scrambled and non-imprinting avoiding data persistence	
Secure Backup Registers	256-bit register bank, scrambled	Erasable on tamper detection	

# SAMA5D2 Series

## Safety and Security Features

.....continued

Peripheral	Function	Description	Comments
RTC	RTC	Timestamping of tamper events. Protection against bad configuration (invalid entry for date and time are impossible)	All events are logged in the RTC. Timestamping gives the source of the reset/erase memory/interruption
		RTC robustness against glitch attack on 32 kHz crystal oscillator	–
Secure Fuse	JTAG Access Control	Disable JTAG access by fuse bit	–
	Secure Debug Disable	JTAG debug allowed in Normal mode only, not in Secure mode	TrustZone

**Note:**

1. A PCI-certified Advanced Software Crypto Library (ASCL) is available under NDA.
2. Available on SAMA5D23 and SAMA5D28 only. For environmental monitors, refer to *SAMA5D23 and SAMA5D28 Environmental Monitors* (document no. 44036), available under Non-Disclosure Agreement (NDA). Contact a Microchip sales representative for details.
3. Refer to the sections on each peripheral for details on FIPS compliancy.

## 6. Package and Pinout

### 6.1 Packages

The SAMA5D2 is available in the packages listed below.

**Table 6-1. SAMA5D2 Packages**

Package Name	Pin Count	Ball Pitch
LFBGA289	289	0.8 mm
TFBGA256	256	0.4 mm
TFBGA196	196	0.75 mm

The package mechanical characteristics are described in the section [Mechanical Characteristics](#).

### 6.2 Pinouts

Pinouts are provided in the tables below:

- [Pin Description \(all packages\)](#)
- [Pin Description \(SAMA5D23 pins different from those in table "Pin Description \(all packages\)" \)](#)
- [Pin Description \(SAMA5D28B/C pins different from those in the table "Pin Description \(all packages\)" \)](#)

I/Os for each peripheral are grouped into IO sets, listed in the column 'IO Set' in the pinout tables below. For all peripherals, it is mandatory to use I/Os that belong to the same IO set. The timings are not guaranteed when IOs from different IO sets are mixed.

**Table 6-2. Pin Description (all packages)**

**Note:**

1. Signal = 'PIO' if GPIO; Dir = Direction; PU = Pull-up; PD = Pull-down; HiZ = High impedance; ST = Schmitt Trigger
2. The GPIO reset state is not guaranteed during the power-up phase. During this phase, the GPIOs are in Input Pull-Up mode and they take their reset value only after VDDCORE POR reset has been released. If a GPIO must be at level zero at power-up, it is recommended to connect an external pull-down to ensure this state.
3. For NRST usage, refer to the section [Reset and Test](#).
4. JTAG boundary scan is available only on JTAG IO Set 1.

The SAMA5D23 is not pin-to-pin compatible with SAMA5D21/SAMA5D22. The table below provides the differences in pinout.

## 7. Power Considerations

### 7.1 Power Supplies

**Table 7-1. SAMA5D2 Power Supplies**

Name	Voltage Range, Nominal	Associated Ground	Powers
VDDCORE	1.10V – 1.32V, 1.20V	GNDCORE	Core, including the processor, the embedded memories and the peripherals
VDDPLLA	1.10V – 1.32V, 1.20V	GNDPLLA	PLLA Cell
VDDUTMIC	1.10V – 1.32V, 1.20V	GNDUTMII	USB device and host UTMI+ core
VDDHSIC	1.10V – 1.30V, 1.20V	GNDUTMII	USB High-Speed Inter-Chip
VDDIODDR	1.70V – 1.90V, 1.80V 1.14V – 1.30V, 1.20V 1.29V – 1.45V, 1.35V 1.43V – 1.57V, 1.50V	GNDIODDR	LPDDR1 / DDR2 Interface I/O lines LPDDR2 / LPDDR3 Interface I/O lines DDR3L Interface I/O lines DDR3 Interface I/O lines
VDDIOP0	1.65V – 3.60V	GNDIOP0	Peripheral I/O lines
VDDIOP1	1.65V – 3.60V	GNDIOP1	Peripheral I/O lines
VDDIOP2	1.65V – 3.60V	GNDIOP2	Peripheral I/O lines
VDDISC	1.65V – 3.60V	GNDISC	Image Sensor I/O lines
VDDSDMMC	1.65V – 3.60V	GNDSDMMC	SDMMC I/O lines
VDDUTMII	3.00V – 3.60V, 3.30V	GNDUTMII	USB device and host UTMI+ interface
VDDOSC	1.65V – 3.60V	GNDOSC	Main Oscillator cell and PLL UTMI. If PLL UTMI or USB is used, the range is restricted to 3.00V–3.60V
VDDAUDIOPLL	3.00V – 3.60V, 3.30V	GNAUDIOPLL GNDDPLL	Audio PLL
VDDANA	1.65V – 3.60V, 3.30V	GNDANA	VDD Analog
VDDFUSE	2.25V – 2.75V, 2.50V	GNDFUSE	Fuse box for programming. It can be tied to ground with a 100 Ω resistor for fuse reading only. It must be powered for fuse programming and to switch to Secure mode.
VDDBU	1.65V – 3.60V	GNDBU	Slow Clock Oscillator, the internal 64-kHz RC Oscillator and a part of the System Controller

### 7.2 Power-up Considerations

At power-up, from a supply sequencing perspective, the SAMA5D2 power supply inputs are categorized into two groups:

- Group 1 (core group) contains VDDCORE, VDDUTMIC, VDDHSIC and VDDPLLA.
- Group 2 (periphery group) contains all other power supply inputs except VDDFUSE.

The figure below shows the recommended power-up sequence. Note that:

- VDDBU, when supplied from a battery, is an always-on supply input and is therefore not part of the power supply sequencing. When no backup battery is present in the application, VDDBU is part of Group 2.
- VDDFUSE is the only power supply that may be left unpowered during operation. This is possible if and only if the application does not access the Customer Fuse Matrix in Write mode. It is good practice to turn on VDDFUSE only when the Customer Fuse Matrix is accessed in Write mode, and to turn off VDDFUSE otherwise.
- VDDIODDR may be nominally supplied at 1.2V when the SAMA5D2 device is equipped with an LPDDR2 or LPDDR3 memory. In this case, VDDIODDR can be considered as part of Group 1.

**Figure 7-1. Recommended Power-up Sequence**

**Table 7-2. Power-up Timing Specification**

Symbol	Parameter	Conditions	Min	Max	Unit
$t_1$	Group 2 to Group 1 delay	Delay from the last Group 2 established <sup>(1)</sup> supply to the first Group1 supply turn-on	0	–	ms
$t_2$	Group 1 delay <sup>(2)</sup>	Delay from the first group 1 established supply to the last Group 1 established supply	–	1	
$t_3$	VDDFUSE to VDDDBU delay	Delay from VDDDBU established to VDDFUSE turn-on	1	–	
$t_{RSTPU}$	Reset delay at power-up	From the last established supply to NRST high	1	–	

**Note:**

1. An “established” supply refers to a power supply established at 90% of its final value.
2. Also applies to VDDIODDR when considered as part of Group 1.

### 7.3 Power-down Considerations

The figure below shows the SAMA5D2 power-down sequence that starts by asserting the NRST line to 0. Once NRST is asserted, the supply inputs can be immediately shut down without any specific timing or order. VDDDBU may not be shut down if the application uses a backup battery on this supply input. In applications where VDDFUSE is powered, it is mandatory to shut down VDDFUSE prior to removing any other supply. VDDFUSE can be removed before or after asserting the NRST signal.

**Figure 7-2. Recommended Power-down Sequence**

**Table 7-3. Power-down Timing Specification**

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{RSTPD}$	Reset delay at power-down	From NRST low to the first supply turn-off	0	–	ms
$t_1$	VDDFUSE delay at shut-down	From VDDFUSE < 1V to the first supply turn-off	0	–	

## 7.4 Power Supply Sequencing at Backup Mode Entry and Exit

### 7.4.1 VDDBU Power Architecture

The backup power switch aims at optimizing the power consumption on VDDBU source by switching the supply of the backup digital part (BUREG memories + 64-kHz RC oscillator) to VDDANA.

When enabled, the backup power source can be automatically switched to VDDANA, which reduces power consumption on VDDBU. Then, VDDBU powers the pads, VDDBU POR, 32-kHz crystal and, on secure products SAMA5D23 and SAMA5D28, the temperature sensor and the backup supply monitor.

The power source (VDDANA or VDDBU) can be selected manually or can be set to work automatically by programming an SFRBU register (refer to SFRBU\_PSWBUCTRL in the section [Special Function Registers Backup \(SFRBU\)](#)).

### 7.4.2 Backup Mode Entry

The figure below shows the recommended power down sequence to place the SAMA5D2 either in Backup mode or in Backup mode with its DDR in self-refresh. The SHDN signal, output of Shutdown Controller (SHDWC), signals the shutdown request to the power supply. This output is supplied by VDDBU that is present in Backup mode. Placing the external DDR memory in self-refresh while in Backup mode, requires to maintain also VDDIODDR. One possible way to signal this additional need to the power supply is to position one of the general purpose I/Os supplied by VDDBU (PIOBUx) in a predefined state.

**Figure 7-3. Recommended Backup Mode Entry**

**Table 7-4. Powerdown Timing Specification**

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{RSTPD}$	Reset delay at powerdown	From NRST low to the first supply turn-off	0	–	ms

### 7.4.3 Backup Mode Exit (Wake-up)

The figure below shows the recommended power-up sequence to wake up SAMA5D2 from Backup mode. Upon a wake-up event, the Shutdown Controller toggles its SHDN output back to VDDBU to request the power supply to restart. Except for VDDIODDR which may already be present if the external DDR memory was placed in Self-refresh mode, this power-up sequence is the same one as presented in the figure “Recommended Power-up Sequence”. In particular, the definitions of Group 1 and Group 2 are the same.

**Figure 7-4. Recommended Power Supply Sequencing at Wake-up**

**Table 7-5. Power-up Timing Specification**

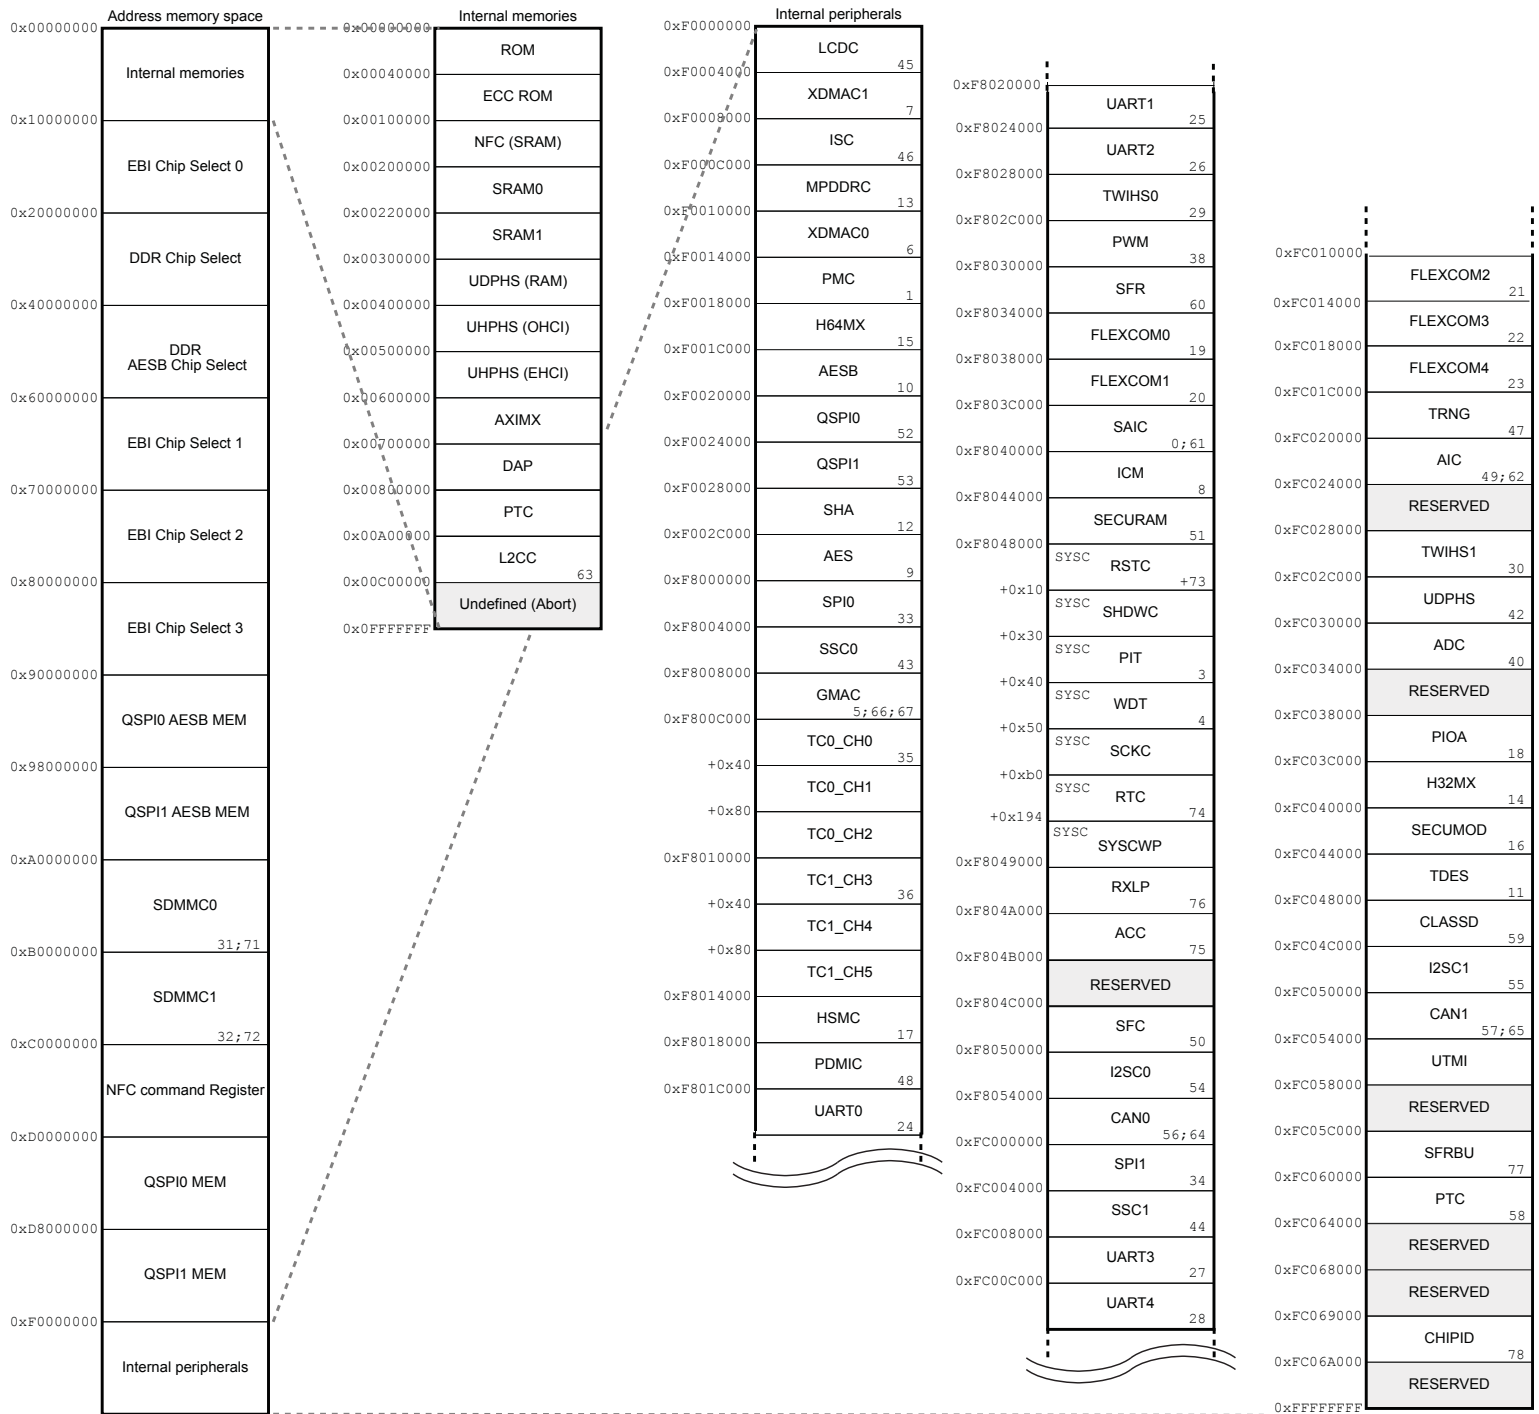

Symbol	Parameter	Conditions	Min	Max	Unit
$t_1$	Group 2 to Group 1 delay	Delay from the last Group 2 established <sup>(1)</sup> supply to the first Group1 supply turn-on	1	–	ms
$t_2$	Group 1 delay <sup>(2)</sup>	Delay from the first group 1 established supply to the last Group 1 established supply	–	1	
$t_{RSTPU}$	Reset delay at power-up	From the last established supply to NRST high.	1	–	

**Note:**

1. An “established” supply refers to a power supply established at 90% of its final value.
2. Also applies to VDDIODDR when considered as part of Group 1.

## 8. Memories

**Figure 8-1. Memory Mapping**

offset 

block

ID

  
(+ : wired-or)

## 8.1 Embedded Memories

### 8.1.1 Internal SRAM

The SAMA5D2 embeds a total of 128 Kbytes of high-speed SRAM. After reset, and until the Remap command is performed, the SRAM is accessible at address 0x0020 0000. When the AXI Bus Matrix is remapped, the SRAM is also available at address 0x0.

The device features a second 128-Kbyte SRAM that can be allocated either to the L2 cache controller or used as an internal SRAM. After reset, this block is connected to the system SRAM, making the two 128-Kbyte RAMs contiguous. The SRAM\_SEL bit, located in the [SFR\\_L2CC\\_HRAMC](#) register, is used to reassign this memory as a L2 cache memory.

### 8.1.2 Internal ROM

The product embeds one 160-Kbyte secured internal ROM mapped at address 0 after reset. The ROM contains a standard and secure bootloader as well as the BCH (Bose, Chaudhuri and Hocquenghem) code tables for NAND Flash ECC correction. The memory area containing the secure boot is automatically hidden after the execution of the secure boot while the one containing the code tables for ECC remains visible.

### 8.1.3 Boot Strategies

For standard boot strategies, refer to the section [Standard Boot Strategies](#).

For secure boot strategies, refer to the document “SAMA5D2x Secure Boot Strategy”, document no. 44040 (Non-Disclosure Agreement required).

## 8.2 External Memory

The SAMA5D2 offers connections to a wide range of external memories or to parallel peripherals.

### 8.2.1 External Bus Interface

The External Bus Interface (EBI) is a 16-bit-wide interface working at MCK/2.

The EBI supports:

- Static memories
- 8-bit NAND Flash with 32-bit BCH ECC
- 16-bit NAND Flash

EBI I/Os accept three drive levels (Low, Medium, High) to avoid overshoots and provide the best performances according to the bus load and external memories voltage.

The drive levels are configured with the DRVSTR field in the [PIO Configuration Register](#) (PIO\_CFGRx) if the corresponding line is nonsecure or the [Secure PIO Configuration Register](#) (S\_PIO\_CFGRx) if the I/O line is secure.

At reset, the selected drive is low. The user must make sure to program the correct drive according to the device load. The I/O embeds serial resistors for impedance matching.

### 8.2.2 Supported Memories on DDR Interface

- 16-bit or 32-bit external interface
- 512 Mbytes of address space on DDR CS and DDR/AES CS in 32-bit mode

- 256 Mbytes of address space on DDR CS and DDR/AES CS in 16-bit mode
- Supports 16-bit or 32-bit 8-bank DDR2, DDR3, LPDDR1, LPDDR2 and LPDDR3 memories
- Automatic drive level control
- Multiport
- Scramblable data path
- Port 0 of this interface has an embedded automatic AES encryption and decryption mechanism (refer to the section [Advanced Encryption Standard Bridge \(AESB\)](#)). Writing to or reading from the address 0x40000000 may trigger the encryption and decryption mechanism depending on the AESB on External Memories configuration.
- TrustZone: The multiport feature of this interface implies TrustZone configuration constraints. Refer to the section [TrustZone Technology](#) for more details.

### 8.2.3 Supported Memories on Static Memories and NAND Flash Interfaces

The Static Memory Controller is dedicated to interfacing external memory devices:

- Asynchronous SRAM-like memories and parallel peripherals
- NAND Flash (MLC and SLC) 8-bit datapath

The Static Memory Controller is able to drive up to four chip select. NCS3 is dedicated to the NAND Flash control.

The HSMC embeds a NAND Flash Controller (NFC). The NFC can handle automatic transfers, sending the commands and address cycles to the NAND Flash and transferring the contents of the page (for read and write) to the NFC SRAM. It minimizes the processor overhead.

In order to improve overall system performance, the DATA phase of the transfer can be DMA-assisted.

The static memory embeds the NAND Flash Error Correcting Code controller with the following features:

- Algorithm based on BCH codes
- Supports also SLC 1-bit (BCH 2-bit), SLC 4-bit (BCH 4-bit)
- Programmable Error Correcting Capability
  - 2-bit, 4-bit, 8-bit and 16-bit errors for 512 bytes/sector (4-Kbyte page)
  - 24-bit error for 1024 bytes/sector (8-Kbyte page)
- Programmable sector size: 512 bytes or 1024 bytes
- Programmable number of sectors per page: 1, 2, 4 or 8 blocks of data per page
- Programmable spare area size
- Supports spare area ECC protection
- Supports 8-Kbyte page size using 1024 bytes/sector and 4-Kbyte page size using 512 bytes/sector
- Error detection is interrupt-driven
- Provides hardware acceleration for error location
- Finds roots of error-locator polynomial
- Programmable number of roots

### 8.2.4 DDR and SDMMC I/Os Calibration

#### 8.2.4.1 DDR I/O Calibration

The DDR2/DDR3/LPDDR1/LPDDR2/LPDDR3/DDR3L I/Os embed an automatic impedance matching control to avoid overshoots and reach the best performance levels depending on the bus load and external memories. A serial termination connection scheme, where the driver has an output impedance matched to the characteristic impedance of the line, is used to improve signal quality and reduce EMI.

One specific analog input, DDR\_CAL, is used to calibrate all DDR / IOs.

The MPDDRC supports the ZQ calibration procedure used to calibrate the SAMA5D2 DDR I/O drive strength and the commands to setup the external DDR device drive strength (refer to the section [Multiport DDR-SDRAM Controller \(MPDDRC\)](#)). The calibration cell supports all the memory types listed above.

**Figure 8-2. DDR Calibration Cell**

The calibration cell provides an input pin, DDR\_CAL, loaded with one of the following resistor RZQ values:

- 24 K $\Omega$  for LPDDR2/LPDDR3
- 23 K $\Omega$  for DDR3L
- 22 K $\Omega$  for DDR3
- 21 K $\Omega$  for DDR2/LPDDR1

The typical value for CZQ is 22 pF.

#### 8.2.4.1.1 LPDDR2 Power Fail Management

The DDR controller (MPDDRC) is used to manage the LPDDR memory when an uncontrolled power off occurs.

The DDR power rail must be monitored externally and generate an interrupt when a power fail condition is triggered. The interrupt handler must apply the sequence defined in the MPDDRC Low-power register (MPDDRC\_LPR) by setting bit LPDDR2\_PWOFF (LPDDR2 Power Off bit).

#### 8.2.4.2 SDMMC I/O Calibration

The SAMA5D2 also embeds an SDMMC I/O calibration cell. The purpose of this block is to provide to e.MMC/SD I/Os an output impedance reference to limit the impact of process, voltage and temperature on the drivers output impedance. The impedance control is required at high frequency in order to improve signal quality.

The control and procedure to setup the SDMMC calibration cell is described in the section [Secure Digital MultiMedia Card Controller \(SDMMC\)](#).

**Figure 8-3. SDMMC I/O Calibration Cell**

The calibration cell provides an input pin SDCAL loaded with a 20 K $\Omega$  resistor for 1.8V memories and a 16.9 K $\Omega$  resistor for 3.3V memories.

According to the e.MMC specification, the output impedance calibration is mandatory for HS200 mode (1.8V) when it is not for other modes (3.3V).

In addition, according to the SD specification, the output impedance calibration is mandatory for 1.8V signaling when it is not for 3.3V signaling.

Thus, the calibration cell design is oriented to get the highest accuracy under 1.8V.

In case of interfacing which would need to operate under both 1.8V and 3.3V, external devices RZQ and CZQ must get values related to the 1.8V mode. The typical value for CZQ is 22 pF.

## 9. Event System

The events generated by peripherals are designed to be directly routed to peripherals managing/using these events without processor intervention. Peripherals receiving events contain logic by which to select the one required.

### 9.1 Real-time Event List

- Timers, PWM, and IO peripherals generate event triggers which are directly routed to event managers such as ADC, for example, to start measurement/conversion without processor intervention.
- ADC is connected to nine trigger inputs defined as two groups:
  - One group of eight elements for Timer Counter (TC0 to TC4), ADTRIG and PMW0 event0, PMW0 event1
  - One group of one element for low-rate trigger, RTC
- UART, USART, SPI, TWI, PWM, CLASSD, AES, SHA, ADC, PIO, TIMER (Capture mode) generate event triggers directly connected to DMA controllers (XDMAC) for data transfer without processor intervention.
- PWM safety events (faults) are in combinational form and directly routed from event generators (ADC, ACC, PMC, TIMER) to the PWM module.
- PWM receives external triggers to provide PFC, DC/DC functions.
- PWM output comparators generate events directly connected to TIMER.
- PMC safety event (clock failure detection) can be programmed to switch the MCK on a reliable main RC internal clock without processor intervention.

### 9.2 Real-time Event Mapping

**Table 9-1. Real-time Event Mapping List**

Function	Application	Description	Event Source	Event Destination
Safety	General-purpose	Automatic switch to reliable main RC oscillator in case of main crystal clock failure <sup>(1)</sup>	Power Management Controller (PMC)	PMC

## **10. System Controller**

The system controller is a set of peripherals handling key elements of the system, such as power, resets, clocks, time, interrupts, watchdog, etc.

The system controller's peripherals are all mapped between addresses 0xF8049000 and 0xF8048000.

The figure below shows the system controller block diagram.

**Figure 10-1. System Controller Block Diagram**

### 10.1 Power-On Reset

The SAMA5D2 embeds several Power-On Resets (PORs) to ensure the power supply is established when the reset is released. These PORs are dedicated to monitoring VDDBU, VDDIOP and VDDCORE respectively.

## 11. Peripherals

### 11.1 Peripheral Mapping

As shown in the figure [Memory Mapping](#), the peripherals are mapped in the upper 256 Mbytes of the address space, between addresses 0xF000 0000 and 0xFFFC 0000.

### 11.2 Peripheral Identifiers

For details, refer to [Table 18-9](#).

### 11.3 Peripheral Signal Multiplexing on I/O Lines

The SAMA5D2 features several PIO Controllers that multiplex the I/O lines of the peripheral set.

The table [Pin Description \(all packages\)](#) defines how the I/O lines are multiplexed on the different PIO Controllers. Several I/O sets are available for each peripheral. However, selecting I/Os from different I/O sets for one peripheral is prohibited.

The column “Reset State” shows whether the PIO line resets in I/O mode or in Peripheral mode. If I/O is shown, the PIO line resets in input with the pull-up enabled, so that the device is maintained in a static state as soon as the reset is released. As a result, the bit corresponding to the PIO line in register PIO\_CFGR (PIO Configuration Register) resets low.

If a signal name is shown in the “Reset State” column, the PIO line is assigned to this function and the corresponding bit in PIO\_CFGR resets high. That is the case for pins controlling memories, in particular address lines, which require the pin to be driven as soon as the reset is released.

The PIO state can be retained when the system enters in Backup mode.

### 11.4 Peripheral Clock Types

The table below lists the clock types available on embedded peripherals in SAMA5D2. Clock type suffixes HS and LS refer to Matrix (H64MX) and Matrix (H32MX), respectively.

For details on embedded peripherals, refer to the section [Matrix \(H64MX/H32MX\)](#).

**Table 11-1. Peripheral Clock Types**

Clock Type	Description
HCLOCK_HS HCLOCK_LS	AHB Clock. Managed with the PMC_PCER, PMC_PCDR, PMC_PCSR and PMC_PCR registers of Peripheral Clock. <sup>(1)</sup>
PCLOCK_HS PCLOCK_LS	APB Clock. Managed with the PMC_PCER, PMC_PCDR, PMC_PCSR and PMC_PCR registers of Peripheral Clock. <sup>(1)</sup>
SYS_CLK_LS	This clock cannot be disabled. <sup>(2)</sup>
SYS_CLOCK	This clock cannot be disabled. <sup>(2)</sup>

.....continued

Clock Type	Description
PROC_CLK	The clock related to Processor Clock (PCK) and managed with the PMC_SCDR and PMC_SCSR registers of PMC System Clock
SLOW_CLOCK	The clock related to the backup area and the RTC and managed with the SCKC_CR. This clock can be generated either by an external 32.768 kHz crystal oscillator or by the on-chip 64 kHz RC oscillator.

**Note:**

1. Refer to the figure [General Clock Block Diagram](#) in the section [Power Management Controller \(PMC\)](#).
2. Refer to the MCK clock in the figure [General Clock Block Diagram](#) in the section [Power Management Controller \(PMC\)](#).

## 12. Chip Identifier (CHIPID)

### 12.1 Description

Chip Identifier (CHIPID) registers are used to recognize the device and its revision. These registers provide the sizes and types of the on-chip memories, as well as the set of embedded peripherals.

Two CHIPID registers are embedded: Chip ID Register (CHIPID\_CIDR) and Chip ID Extension Register (CHIPID\_EXID). Both registers contain a hard-wired value that is read-only.

The CHIPID\_CIDR register contains the following fields:

- VERSION: Identifies the revision of the silicon
- EPROC: Indicates the embedded ARM processor
- NVPTYP and NVPSIZ: Identify the type of embedded non-volatile memory and the size
- SRAMSIZ: Indicates the size of the embedded SRAM
- ARCH: Identifies the set of embedded peripherals
- EXT: Shows the use of the extension identifier register

The CHIPID\_EXID register is device-dependent and reads 0 if CHIPID\_CIDR.EXT = 0.

### 12.2 Embedded Characteristics

- Chip ID Registers
  - Identification of the Device Revision, Sizes of the Embedded Memories, Set of Peripherals, Embedded Processor

**Table 12-1. SAMA5D2 Chip ID Registers**

#### Bit 31 – EXT Extension Flag

Value	Description
0	Chip ID has a single register definition without extension.
1	An extended Chip ID exists.

#### Bits 30:28 – NVPTYP[2:0] Nonvolatile Program Memory Type

Value	Name	Description
0	ROM	ROM
1	ROMLESS	ROMless or on-chip Flash
2	FLASH	Embedded Flash Memory
3	ROM_FLASH	ROM and Embedded Flash Memory – NVPSIZ is ROM size – NVPSIZ2 is Flash size
4	SRAM	SRAM emulating ROM

#### Bits 27:20 – ARCH[7:0] Architecture Identifier

Value	Name	Description
0xA5	SAMA5	SAMA5

### Bits 19:16 – SRAMSIZE[3:0] Internal SRAM Size

Value	Name	Description
0	48K	48 Kbytes
1	192K	192 Kbytes
2	384K	384 Kbytes
3	6K	6 Kbytes
4	24K	24 Kbytes
5	4K	4 Kbytes
6	80K	80 Kbytes
7	160K	160 Kbytes
8	8K	8 Kbytes
9	16K	16 Kbytes
10	32K	32 Kbytes
11	64K	64 Kbytes
12	128K	128 Kbytes
13	256K	256 Kbytes
14	96K	96 Kbytes
15	512K	512 Kbytes

### Bits 15:12 – NVPSIZE2[3:0] Second Nonvolatile Program Memory Size

Value	Name	Description
0	NONE	None
1	8K	8 Kbytes
2	16K	16 Kbytes
3	32K	32 Kbytes
4	–	Reserved
5	64K	64 Kbytes
6	–	Reserved
7	128K	128 Kbytes
8	–	Reserved
9	256K	256 Kbytes
10	512K	512 Kbytes
11	–	Reserved
12	1024K	1024 Kbytes
13	–	Reserved
14	2048K	2048 Kbytes
15	–	Reserved

### Bits 11:8 – NVPSIZE[3:0] Nonvolatile Program Memory Size

Value	Name	Description
0	NONE	None
1	8K	8 Kbytes
2	16K	16 Kbytes
3	32K	32 Kbytes
4	-	Reserved
5	64K	64 Kbytes

# SAMA5D2 Series

## Chip Identifier (CHIPID)

Value	Name	Description
6	-	Reserved
7	128K	128 Kbytes
8	160K	160 Kbytes
9	256K	256 Kbytes
10	512K	512 Kbytes
11	-	Reserved
12	1024K	1024 Kbytes
13	-	Reserved
14	2048K	2048 Kbytes

## 13. Cortex-A5 Processor (ARM)

### 13.1 Reference Documents

The following table gives the references of the documents and their denominations in this document.

**Table 13-1. Reference Documents**

Document Title	Document No.
Cortex-A5 Technical Reference Manual	ARM DDI 0433
Cortex-A5 Floating-Point Unit Technical Reference Manual	ARM DDI 0449
Cortex-A5 NEON Media Processing Engine Technical Reference Manual	ARM DDI 0450
ARM Architecture Reference Manual, ARMv7-A and ARMv7-R edition	ARM DDI 0406

### 13.2 Description

The ARM Cortex-A5 processor is a high-performance, low-power, ARM macrocell with an L1 cache subsystem that provides full virtual memory capabilities. The Cortex-A5 processor implements the ARMv7 architecture and runs 32-bit ARM instructions, 16-bit and 32-bit Thumb-2 instructions, and 8-bit Java™ byte codes in Jazelle® state.

The Cortex-A5 NEON Media Processing Engine (MPE) extends the Cortex-A5 functionality to provide support for the ARM v7 Advanced SIMD v2 and Vector Floating-Point v4 (VFPv4) instruction sets. The Cortex-A5 NEON MPE provides flexible and powerful acceleration for signal processing algorithms including multimedia such as image processing, video decode/encode, 2D/3D graphics, and audio. See the Cortex-A5 NEON Media Processing Engine Technical Reference Manual.

The Cortex-A5 processor includes TrustZone® technology to enhance security by partitioning the SoC's hardware and software resources in a Secure world for the security subsystem and a Normal world for the rest, enabling a strong security perimeter to be built between the two. See Security Extensions overview in the Cortex-A5 Technical Reference Manual. See the ARM Architecture Reference Manual for details on how TrustZone works in the architecture.

**Note:** All ARM publications referenced in this datasheet can be found at [www.arm.com](http://www.arm.com).

#### 13.2.1 Power Management

The Cortex-A5 design supports the following main levels of power management:

- Run Mode
- Standby Mode

##### 13.2.1.1 Run Mode

Run mode is the normal mode of operation where all of the processor functionality is available. Everything, including core logic and embedded RAM arrays, is clocked and powered up.

##### 13.2.1.2 Standby Mode

Standby mode disables most of the clocks of the processor, while keeping it powered up. This reduces the power drawn to the static leakage current, plus a small clock power overhead required to enable the processor to wake up from Standby mode. The transition from Standby mode to Run mode is caused by one of the following:

- the arrival of an interrupt, either masked or unmasked
- the arrival of an event, if standby mode was initiated by a Wait for Event (WFE) instruction
- a debug request, when either debug is enabled or disabled
- a reset.

### 13.3 Embedded Characteristics

- In-order Pipeline with Dynamic Branch Prediction
- ARM, Thumb-2, and Thumb-2EE Instruction Set Support
- TrustZone Security Extensions
- Harvard Level 1 Memory System with a Memory Management Unit (MMU)
- 32 Kbytes Data Cache
- 32 Kbytes Instruction Cache
- 64-bit AXI Master Interface
- ARM v7 Debug Architecture
- Trace Support through an Embedded Trace Macrocell (ETM) Interface
- Media Processing Engine (MPE) with NEON Technology
- Jazelle Hardware Acceleration

### 13.4 Block Diagram

**Figure 13-1. Cortex-A5 Processor Top-level Diagram**

## 13.5 Programmer Model

### 13.5.1 Processor Operating Modes

The following operation modes are present in all states:

- User mode (USR) is the usual ARM program execution state. It is used for executing most application programs.
- Fast Interrupt (FIQ) mode is used for handling fast interrupts. It is suitable for high-speed data transfer or channel process.
- Interrupt (IRQ) mode is used for general-purpose interrupt handling.
- Supervisor mode (SVC) is a protected mode for the operating system.
- Abort mode (ABT) is entered after a data or instruction prefetch abort.
- System mode (SYS) is a privileged user mode for the operating system.
- Undefined mode (UND) is entered when an undefined instruction exception occurs.
- Monitor mode (MON) is secure mode that enables change between Secure and Non-secure states, and can also be used to handle any of FIQs, IRQs and external aborts. Entered on execution of a Secure Monitor Call (SMC) instruction.

Mode changes may be made under software control, or may be brought about by external interrupts or exception processing. Most application programs execute in User Mode. The non-user modes, known as privileged modes, are entered in order to service interrupts or exceptions or to access protected resources.

### 13.5.2 Processor Operating States

The processor has the following instruction set states controlled by the T bit and J bit in the CPSR.

- ARM state:  
The processor executes 32-bit, word-aligned ARM instructions.
- Thumb-2 state:  
The processor executes 16-bit and 32-bit, halfword-aligned Thumb-2 instructions.
- Thumb-2EE state:  
The processor executes a variant of the Thumb-2 instruction set designed as a target for dynamically generated code. This is code compiled on the device either shortly before or during execution from a portable bytecode or other intermediate or native representation.
- Jazelle state:  
The processor executes variable length, byte-aligned Java bytecodes.

The J bit and the T bit determine the instruction set used by the processor. The table below shows the encoding of these bits.

**Table 13-2. CPSR J and T Bit Encoding**

J	T	Instruction Set State
0	0	ARM
0	1	Thumb-2
1	0	Jazelle
1	1	Thumb-2EE

Alternating between ARM and Thumb-2 states does not affect the processor mode or the register contents. See the ARM Architecture Reference Manual, ARMv7-A and ARMv7-R edition for information on entering and exiting Thumb-2EE state.

### 13.5.2.1 Switching State

It is possible to change the instruction set state of the processor between:

- ARM state and Thumb-2 state using the BX and BLX instructions.
- Thumb-2 state and Thumb-2EE state using the ENTERX and LEAVEX instructions.
- ARM and Jazelle state using the BXJ instruction.
- Thumb-2 and Jazelle state using the BXJ instruction.

See the ARM Architecture Reference Manual for more information about changing instruction set state.

### 13.5.3 Cortex-A5 Registers

This view provides 16 ARM core registers, R0 to R15, that include the Stack Pointer (SP), Link Register (LR), and Program Counter (PC). The current execution mode determines the selected set of registers, as shown in the table below. This shows that the arrangement of the registers provides duplicate copies of some registers, with the current register selected by the execution mode. This arrangement is described as banking of the registers, and the duplicated copies of registers are referred to as banked registers.

**Table 13-3. Cortex-A5 Modes and Registers Layout**

User and System	Monitor	Supervisor	Abort	Undefined	Interrupt	Fast Interrupt
R0	R0	R0	R0	R0	R0	R0
R1	R1	R1	R1	R1	R1	R1
R2	R2	R2	R2	R2	R2	R2
R3	R3	R3	R3	R3	R3	R3
R4	R4	R4	R4	R4	R4	R4

R13 <sup>(1)</sup>	R13_MON <sup>(1)</sup>	R13_SVC <sup>(1)</sup>	R13_ABT <sup>(1)</sup>	R13_UND <sup>(1)</sup>	R13_IRQ <sup>(1)</sup>	R13_FIQ <sup>(1)</sup>
R14 <sup>(1)</sup>	R14_MON <sup>(1)</sup>	R14_SVC <sup>(1)</sup>	R14_ABT <sup>(1)</sup>	R14_UND <sup>(1)</sup>	R14_IRQ <sup>(1)</sup>	R14_FIQ <sup>(1)</sup>
PC	PC	PC	PC	PC	PC	PC

.....continued

User and System	Monitor	Supervisor	Abort	Undefined	Interrupt	Fast Interrupt
CPSR	CPSR	CPSR	CPSR	CPSR	CPSR	CPSR
	SPSR_MON <sup>(1)</sup>	SPSR_SVC <sup>(1)</sup>	SPSR_ABT <sup>(1)</sup>	SPSR_UND <sup>(1)</sup>	SPSR_IRQ <sup>(1)</sup>	SPSR_FIQ <sup>(1)</sup>

**Note:**

1. Mode-specific banked registers.

The core contains one CPSR, and six SPSRs for exception handlers to use. The program status registers:

- hold information about the most recently performed ALU operation
- control the enabling and disabling of interrupts
- set the processor operating mode

**Figure 13-2. Status Register Format**

- N: Negative, Z: Zero, C: Carry, and V: Overflow are the four ALU flags
- Q: cumulative saturation flag
- IT: If-Then execution state bits for the Thumb-2 IT (If-Then) instruction
- J: Jazelle bit, see the description of the T bit
- GE: Greater than or Equal flags, for SIMD instructions
- E: Endianness execution state bit. Controls the load and store endianness for data accesses. This bit is ignored by instruction fetches.
  - E = 0: Little endian operation
  - E = 1: Big endian operation
- A: Asynchronous abort disable bit. Used to mask asynchronous aborts.
- I: Interrupt disable bit. Used to mask IRQ interrupts.
- F: Fast interrupt disable bit. Used to mask FIQ interrupts.
- T: Thumb-2 execution state bit. This bit and the J execution state bit, bit [24], determine the instruction set state of the processor, ARM, Thumb-2, Jazelle, or Thumb-2EE.
- Mode: five bits to encode the current processor mode. The effect of setting M[4:0] to a reserved value is UNPREDICTABLE.

**Table 13-4. Processor Mode vs. Mode Field**

Mode	M[4:0]
USR	10000
FIQ	10001
IRQ	10010
SVC	10011
MON	10110

.....continued

Mode	M[4:0]
ABT	10111
UND	11011
SYS	11111
Reserved	Other

### 13.5.3.1 CP15 Coprocessor

Coprocessor 15, or System Control Coprocessor CP15, is used to configure and control all the items in the list below:

- Cortex-A5
- Caches (ICache, DCache and write buffer)
- MMU
- Security
- Other system options

To control these features, CP15 provides 16 additional registers. See the table below.

**Table 13-5. CP15 Registers**

Register	Name	Read/Write
0	ID Code <sup>(1)</sup>	Read/Unpredictable
0	Cache type <sup>(1)</sup>	Read/Unpredictable
1	Control <sup>(1)</sup>	Read/Write
1	Security <sup>(1)</sup>	Read/Write
2	Translation Table Base	Read/Write
3	Domain Access Control	Read/Write
4	Reserved	None
5	Data fault Status <sup>(1)</sup>	Read/Write
5	Instruction fault status	Read/Write
6	Fault Address	Read/Write
7	Cache and MMU Operations <sup>(1)</sup>	Read/Write
8	TLB operations	Unpredictable/Write
9	Cache lockdown <sup>(1)</sup>	Read/Write
10	TLB lockdown	Read/Write
11	Reserved	None
12	Interrupts management	Read/Write
12	Monitor vectors	Read-only

.....continued

Register	Name	Read/Write
13	FCSE PID <sup>(1)</sup>	Read/Write
13	Context ID <sup>(1)</sup>	Read/Write
14	Reserved	None
15	Test configuration	Read/Write

**Note:**

1. This register provides access to more than one register. The register accessed depends on the value of the CRm field or opcode\_2 field.

### 13.5.4 CP15 Register Access

CP15 registers can only be accessed in privileged mode by:

- MCR (Move to Coprocessor from ARM Register) instruction is used to write an ARM register to CP15.
- MRC (Move to ARM Register from Coprocessor) instruction is used to read the value of CP15 to an ARM register.

Other instructions such as CDP, LDC, STC can cause an undefined instruction exception.

The assembler code for these instructions is:

```
MCR/MRC{cond} p15, opcode_1, Rd, CRn, CRm, opcode_2
```

The MCR/MRC instructions bit pattern is shown below:

Bit	31	30	29	28	27	26	25	24
	cond				1	1	1	0
Bit	23	22	21	20	19	18	17	16
	opcode_1			L	CRn			
Bit	15	14	13	12	11	10	9	8
	Rd				1	1	1	1
Bit	7	6	5	4	3	2	1	0
	opcode_2			1	CRm			

• **CRm[3:0]: Specified Coprocessor Action**

Determines specific coprocessor action. Its value is dependent on the CP15 register used. For details, see CP15 specific register behavior.

• **opcode\_2[7:5]**

Determines specific coprocessor operation code. By default, set to 0.

• **Rd[15:12]: ARM Register**

Defines the ARM register whose value is transferred to the coprocessor. If R15 is chosen, the result is unpredictable.

• **CRn[19:16]: Coprocessor Register**

Determines the destination coprocessor register.

- **L: Instruction Bit**

0: MCR instruction

1: MRC instruction

- **opcode\_1[23:20]: Coprocessor Code**

Defines the coprocessor specific code. Value is c15 for CP15.

- **cond [31:28]: Condition**

### 13.5.5 Addresses in the Cortex-A5 Processor

The Cortex-A5 processor operates using virtual addresses (VAs). The Memory Management Unit (MMU) translates these VAs into the physical addresses (PAs) used to access the memory system. Translation tables hold the mappings between VAs and PAs.

See the *ARM Architecture Reference Manual, ARMv7-A and ARMv7-R* edition for more information.

When the Cortex-A5 processor is executing in Non-secure state, the processor performs translation table look-ups using the Non-secure versions of the Translation Table Base Registers. In this situation, any VA can only translate into a Non-secure PA. When it is in Secure state, the Cortex-A5 processor performs translation table look-ups using the Secure versions of the Translation Table Base Registers. In this situation, the security state of any VA is determined by the NS bit of the translation table descriptors for that address.

Following is an example of the address manipulation that occurs when the Cortex-A5 processor requests an instruction:

1. The Cortex-A5 processor issues the VA of the instruction as Secure or Non-secure VA accesses according to the state the processor is in.
2. The instruction cache is indexed by the bits of the VA. The MMU performs the translation table look-up in parallel with the cache access. If the processor is in the Secure state it uses the Secure translation tables, otherwise it uses the Non-secure translation tables.
3. If the protection check carried out by the MMU on the VA does not abort and the PA tag is in the instruction cache, the instruction data is returned to the processor.
4. If there is a cache miss, the MMU passes the PA to the AXI bus interface to perform an external access. The external access is always Non-secure when the core is in the Non-secure state. In the Secure state, the external access is Secure or Non-secure according to the NS attribute value in the selected translation table entry. In Secure state, both L1 and L2 translation table walk accesses are marked as Secure, even if the first level descriptor is marked as NS.

### 13.5.6 Security Extensions Overview

The purpose of the Security Extensions is to enable the construction of a secure software environment. See the *ARM Architecture Reference Manual, ARMv7-A and ARMv7-R* edition for details of the Security Extensions.

### 13.5.6.1 System Boot Sequence

The Security Extensions enable the construction of an isolated software environment for more secure execution, depending on a suitable system design around the processor. The technology does not protect the processor from hardware attacks, and care must be taken to be sure that the hardware containing the reset handling code is appropriately secure.

The processor always boots in the privileged Supervisor mode in the Secure state, with the NS bit set to 0. This means that code that does not attempt to use the Security Extensions always runs in the Secure state. If the software uses both Secure and Non-secure states, the less trusted software, such as a complex operating system and application code running under that operating system, executes in Non-secure state, and the most trusted software executes in the Secure state.

The following sequence is expected to be typical use of the Security Extensions:

1. Exit from reset in Secure state.
2. Configure the security state of memory and peripherals. Some memory and peripherals are accessible only to the software running in Secure state.
3. Initialize the secure operating system. The required operations depend on the operating system, and include initialization of caches, MMU, exception vectors, and stacks.
4. Initialize Secure Monitor software to handle exceptions that switch execution between the Secure and Non-secure operating systems.
5. Optionally lock aspects of the secure state environment against further configuration.
6. Pass control through the Secure Monitor software to the non-secure OS with an SMC instruction.
7. Enable the Non-secure operating system to initialize. The required operations depend on the operating system, and typically include initialization of caches, MMU, exception vectors, and stacks.

The overall security of the secure software depends on the system design, and on the secure software itself.

## 13.5.7 TrustZone

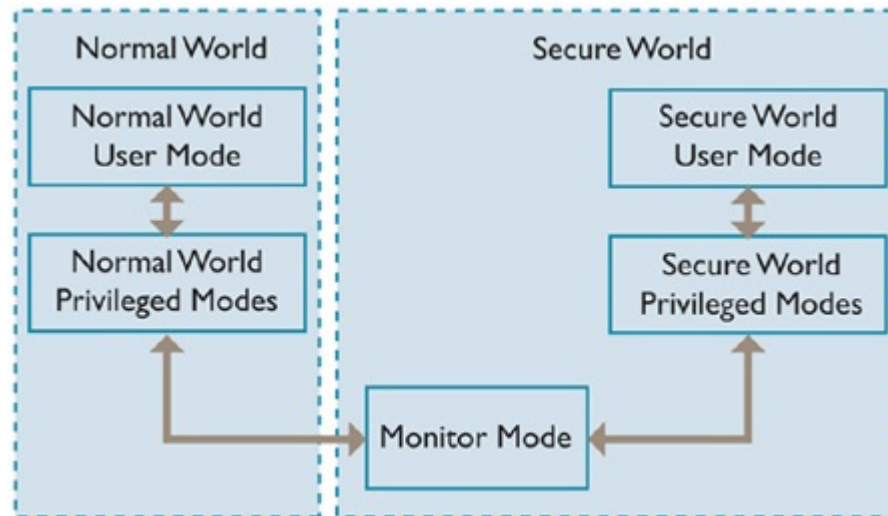

### 13.5.7.1 Hardware

TrustZone enables a single physical processor core to execute code safely and efficiently from both the Normal world and the Secure world. This removes the need for a dedicated security processor core, saving silicon area and power, and allowing high performance security software to run alongside the Normal world operating environment.

The two virtual processors context switch via a new processor mode called monitor mode when changing the currently running virtual processor.

**Figure 13-3. TrustZone Hardware Implementation**

### 13.5.7.2 Software

The mechanisms by which the physical processor can enter monitor mode from the Normal world are tightly controlled, and are all viewed as exceptions to the monitor mode software. Software executing a dedicated instruction can trigger entry to monitor, the Secure Monitor Call (SMC) instruction, or by a subset of the hardware exception mechanisms. Configuration of the IRQ, FIQ, external Data Abort, and external Prefetch Abort exceptions can cause the processor to switch into monitor mode.

The software that executes within monitor mode is implementation defined, but it generally saves the state of the current world and restores the state of the world at the location to which it switches. It then performs a return-from-exception to restart processing in the restored world.

**Figure 13-4. TrustZone Software Implementation in a Trusted Execution Environment (TEE)**

### 13.5.7.3 Debug

TrustZone hardware architecture is a security-aware debug infrastructure that can enable control over access to secure world debug, without impairing debug visibility of the Normal world. This is controlled with bits in the Secure Fuse Controller.

**Note:** Secure debug modes are described in the document SAMA5D2 External Tamper Protections, ref. 44095. Contact a Microchip sales representative for further details.

## 13.6 Memory Management Unit (MMU)

### 13.6.1 About the MMU

The MMU works with the L1 and L2 memory system to translate virtual addresses to physical addresses. It also controls accesses to and from external memory.

The ARM v7 Virtual Memory System Architecture (VMSA) features include the following:

- Page table entries that support:
  - 16 Mbyte supersections. The processor supports supersections that consist of 16 Mbyte blocks of memory.
  - 1 Mbyte sections
  - 64 Kbyte large pages
  - 4 Kbyte small pages
- 16 access domains

- Global and application-specific identifiers to remove the requirement for context switch TLB flushes.
- Extended permissions checking capability.

TLB maintenance and configuration operations are controlled through a dedicated coprocessor, CP15, integrated with the core. This coprocessor provides a standard mechanism for configuring the L1 memory system.

See the *ARM Architecture Reference Manual, ARMv7-A and ARMv7-R* edition for a full architectural description of the ARMv7 VMSA.

### 13.6.2 Memory Management System

The Cortex-A5 processor supports the ARM v7 VMSA including the TrustZone security extension. The translation of a Virtual Address (VA) used by the instruction set architecture to a Physical Address (PA) used in the memory system and the management of the associated attributes and permissions is carried out using a two-level MMU.

The first level MMU uses a Harvard design with separate micro TLB structures in the PFU for instruction fetches (IuTLB) and in the DPU for data read and write requests (DuTLB).

A miss in the micro TLB results in a request to the main unified TLB shared between the data and instruction sides of the memory system. The TLB consists of a 128-entry two-way set-associative RAM based structure. The TLB page-walk mechanism supports page descriptors held in the L1 data cache. The caching of page descriptors is configured globally for each translation table base register, TTBRx, in the system coprocessor, CP15.

The TLB contains a hitmap cache of the page types which have already been stored in the TLB.

#### 13.6.2.1 Memory Types

Although various different memory types can be specified in the page tables, the Cortex-A5 processor does not implement all possible combinations:

- Write-through caches are not supported. Any memory marked as write-through is treated as Non-cacheable.
- The outer shareable attribute is not supported. Anything marked as outer shareable is treated in the same way as inner shareable.
- Write-back no write-allocate is not supported. It is treated as write-back write-allocate.

The table below shows the treatment of each different memory type in the Cortex-A5 processor in addition to the architectural requirements.

**Table 13-6. Treatment of Memory Attributes**

Memory Type Attribute	Shareability	Other Attributes	Notes
Strongly Ordered	–	–	–
Device	Non-shareable	–	–
	Shareable	–	–

.....continued

Memory Type Attribute	Shareability	Other Attributes	Notes
Normal	Non-shareable	Non-cacheable	Does not access L1 caches
		Write-through cacheable	Treated as non-cacheable
		Write-back cacheable, write allocate	Can dynamically switch to no write allocate, if more than three full cache lines are written in succession
		Write-back cacheable, no write allocate	Treated as non-shareable write-back cacheable, write allocate
	Inner shareable	Non-cacheable	–
		Write-through cacheable	Treated as inner shareable non-cacheable
		Write-back cacheable, write allocate	Treated as inner shareable non-cacheable unless the SMP bit in the Auxiliary Control Register is set (ACTLR[6] = b1). If this bit is set the area is treated as write-back cacheable write allocate.
		Write-back cacheable, no write allocate	
	Outer shareable	Non-cacheable	Treated as inner shareable non-cacheable
		Write-through cacheable	
		Write-back cacheable, write allocate	Treated as inner shareable non-cacheable unless the SMP bit in the Auxiliary Control Register is set (ACTLR[6] = b1). If this bit is set the area is treated as write-back cacheable write allocate.
		Write-back cacheable, no write allocate	

### 13.6.3 Translation Lookaside Buffer (TLB) Organization

The Translation Lookaside Buffer (TLB) has two parts:

- [Micro TLB](#)
- [Main TLB](#)

#### 13.6.3.1 Micro TLB

The first level of caching for the page table information is a micro TLB of 10 entries that is implemented on each of the instruction and data sides. These blocks provide a lookup of the virtual addresses in a single cycle.

The micro TLB returns the physical address to the cache for the address comparison, and also checks the access permissions to signal either a Prefetch Abort or a Data Abort.

All main TLB related maintenance operations affect both the instruction and data micro TLBs, causing them to be flushed. In the same way, any change of the following registers causes the micro TLBs to be flushed:

- Context ID Register (CONTEXTIDR)
- Domain Access Control Register (DACR)
- Primary Region Remap Register (PRRR)
- Normal Memory Remap Register (NMRR)
- Translation Table Base Registers (TTBR0 and TTBR1)

### 13.6.3.2 Main TLB

Misses from the instruction and data micro TLBs are handled by a unified main TLB. Accesses to the main TLB take a variable number of cycles, according to competing requests from each of the micro TLBs and other implementation-dependent factors.

The main TLB is 128-entry two-way set-associative.

#### TLB match process

Each TLB entry contains a virtual address, a page size, a physical address, and a set of memory properties. Each is marked as being associated with a particular application space (ASID), or as global for all application spaces. The CONTEXTIDR determines the currently selected application space.

A TLB entry matches when these conditions are true:

- Its virtual address matches that of the requested address.
- Its Non-secure TLB ID (NSTID) matches the Secure or Non-secure state of the MMU request.
- Its ASID matches the current ASID in the CONTEXTIDR or is global.

The operating system must ensure that, at most, one TLB entry matches at any time. The TLB can store entries based on the following block sizes:

<b>Supersections</b>	Describe 16 Mbyte blocks of memory
<b>Sections</b>	Describe 1 Mbyte blocks of memory
<b>Large pages</b>	Describe 64 Kbyte blocks of memory
<b>Small pages</b>	Describe 4 Kbyte blocks of memory

Supersections, sections and large pages are supported to permit mapping of a large region of memory while using only a single entry in the TLB. If no mapping for an address is found within the TLB, then the translation table is automatically read by hardware and a mapping is placed in the TLB.

### 13.6.4 Memory Access Sequence

When the processor generates a memory access, the MMU:

1. Performs a lookup for the requested virtual address and current ASID and security state in the relevant instruction or data micro TLB.
2. If there is a miss in the micro TLB, performs a lookup for the requested virtual address and current ASID and security state in the main TLB.
3. If there is a miss in main TLB, performs a hardware translation table walk.

The MMU can be configured to perform hardware translation table walks in cacheable regions by setting the IRGN bits in Translation Table Base Register 0 and Translation Table Base Register 1. If the encoding of the IRGN bits is write-back, an L1 data cache lookup is performed and data is read from the data

cache. If the encoding of the IRGN bits is write-through or non-cacheable, an access to external memory is performed. For more information, see *Cortex-A5 Technical Reference Manual*.

The MMU might not find a global mapping, or a mapping for the currently selected ASID, with a matching Non-secure TLB ID (NSTID) for the virtual address in the TLB. In this case, the hardware does a translation table walk if the translation table walk is enabled by the PD0 or PD1 bit in the Translation Table Base Control Register. If translation table walks are disabled, the processor returns a Section Translation fault. For more information, see *Cortex-A5 Technical Reference Manual*.

If the TLB finds a matching entry, it uses the information in the entry as follows:

1. The access permission bits and the domain determine if the access is enabled. If the matching entry does not pass the permission checks, the MMU signals a memory abort. See the *ARM Architecture Reference Manual, ARMv7-A and ARMv7-R* edition for a description of access permission bits, abort types and priorities, and for a description of the Instruction Fault Status Register (IFSR) and Data Fault Status Register (DFSR).
2. The memory region attributes specified in both the TLB entry and the CP15 c10 remap registers determine if the access is
  - Secure or Non-secure
  - Shared or not
  - Normal memory, Device, or Strongly-ordered

For more information, see *Cortex-A5 Technical Reference Manual, Memory region remap*.

3. The TLB translates the virtual address to a physical address for the memory access.

### 13.6.5 Interaction with Memory System

The MMU can be enabled or disabled as described in the *ARM Architecture Reference Manual, ARMv7-A and ARMv7-R* edition.

### 13.6.6 External Aborts

External memory errors are defined as those that occur in the memory system rather than those that are detected by the MMU. External memory errors are expected to be extremely rare. External aborts are caused by errors flagged by the AXI interfaces when the request goes external to the Cortex-A5 processor. External aborts can be configured to trap to Monitor mode by setting the EA bit in the Secure Configuration Register. For more information, see *Cortex-A5 Technical Reference Manual*.

#### 13.6.6.1 External Aborts on Data Write

Externally generated errors during a data write can be asynchronous. This means that the r14\_abt on entry into the abort handler on such an abort might not hold the address of the instruction that caused the exception.

The DFAR is Unpredictable when an asynchronous abort occurs.

Externally generated errors during data read are always synchronous. The address captured in the DFAR matches the address which generated the external abort.

#### 13.6.6.2 Synchronous and Asynchronous Aborts

The section System Control in the *Cortex-A5 Technical Reference Manual* describes synchronous and asynchronous aborts, their priorities, and the IFSR and DFSR. To determine a fault type, read the DFSR for a data abort or the IFSR for an instruction abort.

The processor supports an Auxiliary Fault Status Register for software compatibility reasons only. The processor does not modify this register because of any generated abort.

### 13.6.7 MMU Software Accessible Registers

The system control coprocessor registers, CP15, in conjunction with page table descriptors stored in memory, control the MMU.

Access all the registers with instructions of the form:

```
MRC p15, 0, <Rd>, <CRn>, <CRm>, <Opcode_2>
```

```
MCR p15, 0, <Rd>, <CRn>, <CRm>, <Opcode_2>
```

CRn is the system control coprocessor register. Unless specified otherwise, CRm and opcode\_2 should be zero.

## 14. L2 Cache Controller (L2CC)

### 14.1 Description

The L2 Cache Controller (L2CC) is based on the L2CC-PL310 ARM multi-way cache macrocell, version r3p2. The addition of an on-chip secondary cache, also referred to as a Level 2 or L2 cache, is a method of improving the system performance when significant memory traffic is generated by the processor.

### 14.2 Embedded Characteristics

- 8-Way Set Associative Cache Architecture
- Data Banking Not Supported
- No Parity Bit Embedded
- Lockdown by Master Not Supported
- Lockdown by Line Not Supported
- TrustZone Architecture for Enhanced OS Security

### 14.3 Product Dependencies

#### 14.3.1 Power Management

The L2 Cache Controller is continuously clocked by the Processor Clock. The Power Management Controller has no effect on the behavior of the L2 Cache Controller.

### 14.4 Functional Description

The addition of an on-chip secondary cache, also referred to as a Level 2 or L2 cache, is a recognized method of improving the performance of ARM-based systems when significant memory traffic is generated by the processor. By definition a secondary cache assumes the presence of a Level 1 or primary cache, closely coupled or internal to the processor. Memory access is fastest to L1 cache, followed closely by L2 cache. Memory access is typically significantly slower with L3 main memory.

The cache controller is a unified, physically addressed, physically tagged cache with up to 8 ways. The user can lock the replacement algorithm on a way basis, enabling the associativity to be reduced from 8-way down to 1-way (directly mapped).

The cache controller does not have snooping hardware to maintain coherency between caches, so the user has to maintain coherency by software.

#### 14.4.1 Double Linefill Issuing

The L2CC cache line length is 32-byte. Therefore, by default, on each L2 cache miss, the L2CC issues 32-byte linefills, 4 x 64-bit read bursts, to the L3 memory system. The L2CC can issue 64-byte linefills, 8 x 64-bit read bursts, on an L2 cache miss. When the L2CC is waiting for the data from L3, it performs a lookup on the second cache line targeted by the 64-byte linefill. If it misses, data corresponding to the second cache line are allocated to the L2 cache. If it hits, data corresponding to the second cache line are discarded.

The user can control this feature using the DLEN, DLFWRDIS and IDLEN bits of the [L2CC Prefetch Control Register](#). The IDLEN and DLFWRDIS bits are only used if the user sets the DLEN bit HIGH. The

# SAMA5D2 Series

## L2 Cache Controller (L2CC)

table below shows the behavior of the L2CC master ports, depending on the configuration chosen by the user.

**Table 14-1. L2CC Master Port Behavior**

Bit 30 DLEN	Bit 27 DLFWRDIS	Bit 23 IDLEN	Original Read Address from L1	Read Address to L3	AXI Burst Type	AXI Burst Length	Targeted Cache Lines
0	0 or 1	0 or 1	0x00	0x00	WRAP	0x3, 4x64-bit	0x00
0	0 or 1	0 or 1	0x20	0x20	WRAP	0x3, 4x64-bit	0x20
1	0 or 1	0	0x00	0x00	WRAP	0x7, 8x64-bit	0x00 and 0x20
1	1	0	0x08 or 0x10 or 0x18	0x08	WRAP	0x3, 4x64-bit	0x00
1	0	0	0x08 or 0x10 or 0x18	0x00	WRAP	0x7, 8x64-bit	0x00 and 0x20
1	0 or 1	0	0x20	0x20	WRAP	0x7, 8x64-bit	0x00 and 0x20
1	1	0	0x28 or 0x30 or 0x38	0x28	WRAP	0x3, 4x64-bit	0x20
1	0	0	0x28 or 0x30 or 0x38	0x20	WRAP	0x7, 8x64-bit	0x00 and 0x20
1	0 or 1	1	0x00	0x00	INCR or WRAP	0x7, 8x64-bit	0x00 and 0x20
1	1	1	0x08 or 0x10 or 0x18	0x08	WRAP	0x3, 4x64-bit	0x00
1	0	1	0x08 or 0x10 or 0x18	0x00	INCR or WRAP	0x7, 8x64-bit	0x00 and 0x20
1	0 or 1	1	0x20	0x20	INCR	0x7, 8x64-bit	0x20 and 0x40
1	1	1	0x28 or 0x30 or 0x38	0x28	WRAP	0x3, 4x64-bit	0x20
1	0	1	0x28 or 0x30 or 0x38	0x20	INCR	0x7, 8x64-bit	0x20 and 0x40

**Note:**

1. Double linefills are not issued for prefetch reads if exclusive cache configuration is enabled.
2. Double linefills are not launched when crossing a 4-Kbyte boundary.
3. Double linefills only occur if a WRAP4 or an INCR4 64-bit transaction is received on the slave ports. This transaction is most commonly seen as a result of a cache linefill in a master, but can be produced by a master when accessing memory marked as inner non-cacheable.

**Bits 22:20 – DL2WSIZE[2:0]** Data L2 Cache Way Size

The value is read from the field WAYSIZE in Auxiliary Control Register, should be 0x1.

**Bit 18 – DL2ASS** Data L2 Cache Associativity

The value is read from the field ASS in Auxiliary Control Register, should be 0.

**Bits 10:8 – IL2WSIZE[2:0]** Instruction L2 Cache Way Size

The value is read from the field WAYSIZE in Auxiliary Control Register, should be 0x1.

**Bit 6 – IL2ASS** Instruction L2 Cache Associativity

The value is read from the field ASS in Auxiliary Control Register, should be 0.

**14.5.3 L2CC Control Register**

**Name:** L2CC\_CR  
**Offset:** 0x100  
**Reset:** 0x00000000  
**Property:** Read/Write in Secure mode, Read-only in Non-secure mode

**Bit 0 – L2CEN L2 Cache Enable**

Value	Description
0	L2 Cache is disabled. This is the default value.
1	L2 Cache is enabled.

### 14.5.4 L2CC Auxiliary Control Register

**Name:** L2CC\_ACR  
**Offset:** 0x104  
**Reset:** 0x02020000  
**Property:** Read/Write in Secure mode, Read-only in Non-secure mode

The L2 Cache Controller (L2CC) must be disabled in the [L2CC Control Register](#) prior to any write access to this register.

Bit	31	30	29	28	27	26	25	24

#### Bit 29 – IPEN Instruction Prefetch Enable

Value	Description
0	Instruction prefetching is disabled. This is the default value.
1	Instruction prefetching is enabled.

#### Bit 28 – DPEN Data Prefetch Enable

Value	Description
0	Data prefetching is disabled. This is the default value.
1	Data prefetching is enabled.

#### Bit 27 – NSIAC Non-Secure Interrupt Access Control

Value	Description
0	Interrupt Clear Register and Interrupt Mask Register can only be modified or read with secure accesses. This is the default value.
1	Interrupt Clear Register and Interrupt Mask Register can be modified or read with secure or non-secure accesses.

**Bit 26 – NSLEN** Non-Secure Lockdown Enable

Value	Description
0	Lockdown registers cannot be modified using non-secure accesses. This is the default value.
1	Non-secure accesses can write to the lockdown registers.

**Bit 25 – CRPOL** Cache Replacement Policy

Value	Description
0	Pseudo-random replacement using the LFSR algorithm.
1	Round-robin replacement. This is always the default value.

**Bits 24:23 – FWA[1:0]** Force Write Allocate

Value	Description
0	The L2 Cache controller uses AWCACHE attributes for WA. This is the default value.
1	User forces no allocate, WA bit must be set to 0.
2	User overrides AWCACHE attributes, WA bit must be set to 1. All cacheable write misses become write allocated.
3	The write allocation is internally mapped to 00.

**Bit 22 – SAOEN** Shared Attribute Override Enable

Value	Description
0	Treats shared accesses. This is the default value.
1	Shared attribute is internally ignored.

**Bit 21 – PEN** Parity Enable

Value	Description
0	Disabled. This is the default value.
1	Enabled.

**Bit 20 – EMBEN** Event Monitor Bus Enable

Value	Description
0	Disabled. This is the default value.
1	Enabled.

**Bits 19:17 – WAYSIZE[2:0]** Way Size

Value	Name	Description
0x0	RESERVED	Reserved
0x1	16KB_WAY	16-Kbyte way set associative
0x2	RESERVED	Reserved
0x3	RESERVED	Reserved
0x4	RESERVED	Reserved
0x5	RESERVED	Reserved
0x6	RESERVED	Reserved
0x7	RESERVED	Reserved

**Bit 16 – ASS** Associativity

# SAMA5D2 Series

## L2 Cache Controller (L2CC)

Value	Description
0	8-way. This is the default value.
1	Reserved.

**Bit 13 – SAIE** Shared Attribute Invalidate Enable

Value	Description
0	Shared invalidate behavior is disabled. This is the default value.
1	Shared invalidate behavior is enabled if the Shared Attribute Override Enable bit is not set. Shared invalidate behavior is enabled if both: <ul style="list-style-type: none"> <li>• Shareable Attribute Invalidate Enable bit is set in the Auxiliary Control Register, bit[13]</li> <li>• Shared Attribute Override Enable bit is not set in the Auxiliary Control Register, bit[22]</li> </ul>

**Bit 12 – EXCC** Exclusive Cache Configuration

Value	Description
0	Disabled. This is the default value.
1	Enabled.

**Bit 11 – SBDLE** Store Buffer Device Limitation Enable

Value	Description
0	Store buffer device limitation is disabled. Device writes can take all slots in the store buffer. This is the default value.
1	Store buffer device limitation is enabled.

**Bit 10 – HPSO** High Priority for SO and Dev Reads Enable

Value	Description
0	Strongly Ordered and Device reads have lower priority than cacheable accesses when arbitrated in the L2CC master ports. This is the default value.
1	Strongly Ordered and Device reads get the highest priority when arbitrated in the L2CC master ports.

### 14.5.5 L2CC Tag RAM Latency Control Register

**Name:** L2CC\_TRCR  
**Offset:** 0x108  
**Reset:** 0x00000111  
**Property:** Read/Write in Secure mode, Read-only in Non-secure mode

The L2 Cache Controller (L2CC) must be disabled in the [L2CC Control Register](#) prior to any write access to this register.

**Bits 10:8 – TWRLAT[2:0]** Write Access Latency  
 Latency to Tag RAM is the programmed value + 1.  
 Default value is 0.

**Bits 6:4 – TRDLAT[2:0]** Read Access Latency

**Bits 2:0 – TSETLAT[2:0]** Setup Latency

### 14.5.6 L2CC Data RAM Latency Control Register

**Name:** L2CC\_DRCR  
**Offset:** 0x10C  
**Reset:** 0x00000111  
**Property:** Read/Write in Secure mode, Read-only in Non-secure mode

The L2 Cache Controller (L2CC) must be disabled in the [L2CC Control Register](#) prior to any write access to this register.

**Bits 10:8 – DWRLAT[2:0]** Write Access Latency  
 Latency to Data RAM is the programmed value + 1.  
 Default value is 0.

**Bits 6:4 – DRDLAT[2:0]** Read Access Latency

**Bits 2:0 – DSETLAT[2:0]** Setup Latency

### 14.5.7 L2CC Event Counter Control Register

**Name:** L2CC\_ECR  
**Offset:** 0x200  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bit 2 – EVC1RST Event Counter 1 Reset

Value	Description
0	No effect, always read as zero.
1	Resets Counter 1.

#### Bit 1 – EVC0RST Event Counter 0 Reset

Value	Description
0	No effect, always read as zero.
1	Resets Counter 0.

#### Bit 0 – EVCEN Event Counter Enable

Value	Description
0	Disables Event Counter. This is the default value.
1	Enables Event Counter.

### 14.5.8 L2CC Event Counter 1 Configuration Register

**Name:** L2CC\_ECFGR1  
**Offset:** 0x204  
**Reset:** 0x02020000  
**Property:** Read/Write

#### Bits 5:2 – ESRC[3:0] Event Counter Source

Value	Name	Description
0x0	CNT_DIS	Counter Disabled
0x1	SRC_CO	Source is CO
0x2	SRC_DRHIT	Source is DRHIT
0x3	SRC_DRREQ	Source is DRREQ
0x4	SRC_DWHIT	Source is DWHIT
0x5	SRC_DWREQ	Source is DWREQ
0x6	SRC_DWTREQ	Source is DWTREQ
0x7	SRC_IRHIT	Source is IRHIT
0x8	SRC_IRREQ	Source is IRREQ
0x9	SRC_WA	Source is WA
0xa	SRC_IPFALLOC	Source is IPFALLOC
0xb	SRC_EPFHIT	Source is EPFHIT
0xc	SRC_EPFALLOC	Source is EPFALLOC
0xd	SRC_SRRCDV	Source is SRRCDV
0xe	SRC_SRCONF	Source is SRCONF
0xf	SRC_EPFRCVD	Source is EPFRCVD

#### Bits 1:0 – EIGEN[1:0] Event Counter Interrupt Generation

# SAMA5D2 Series

## L2 Cache Controller (L2CC)

Value	Name	Description
0x0	INT_DIS	Disables (default)
0x1	INT_EN_INCR	Enables with Increment condition
0x2	INT_EN_OVER	Enables with Overflow condition
0x3	INT_GEN_DIS	Disables Interrupt generation

### 14.5.9 L2CC Event Counter 0 Configuration Register

**Name:** L2CC\_ECFGR0  
**Offset:** 0x208  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 5:2 – ESRC[3:0] Event Counter Source

Value	Name	Description
0x0	CNT_DIS	Counter Disabled
0x1	SRC_CO	Source is CO
0x2	SRC_DRHIT	Source is DRHIT
0x3	SRC_DRREQ	Source is DRREQ
0x4	SRC_DWHIT	Source is DWHIT
0x5	SRC_DWREQ	Source is DWREQ
0x6	SRC_DWTREQ	Source is DWTREQ
0x7	SRC_IRHIT	Source is IRHIT
0x8	SRC_IRREQ	Source is IRREQ
0x9	SRC_WA	Source is WA
0xa	SRC_IPFALLOC	Source is IPFALLOC
0xb	SRC_EPFHIT	Source is EPFHIT
0xc	SRC_EPFALLOC	Source is EPFALLOC
0xd	SRC_SRRCVD	Source is SRRCVD
0xe	SRC_SRCONF	Source is SRCONF
0xf	SRC_EPFRCVD	Source is EPFRCVD

#### Bits 1:0 – EIGEN[1:0] Event Counter Interrupt Generation

# SAMA5D2 Series

## L2 Cache Controller (L2CC)

Value	Name	Description
0x0	INT_DIS	Disables (default)
0x1	INT_EN_INCR	Enables with Increment condition
0x2	INT_EN_OVER	Enables with Overflow condition
0x3	INT_GEN_DIS	Disables Interrupt generation

**14.5.10 L2CC Event Counter 1 Value Register**

**Name:** L2CC\_EVR1  
**Offset:** 0x20C  
**Reset:** 0x00000000  
**Property:** Read/Write

Counter 1 must be disabled in the [L2CC Event Counter 1 Configuration Register](#) prior to any write access to this register.

Bit	31	30	29	28	27	26	25	24
	VALUE[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	VALUE[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	VALUE[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	VALUE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – VALUE[31:0] Event Counter Value**

Value returns the number of instance of the selected event.

If a counter reaches its maximum value, it remains saturated at that value until it is reset.

### 14.5.11 L2CC Event Counter 0 Value Register

**Name:** L2CC\_EVR0  
**Offset:** 0x210  
**Reset:** 0x00000000  
**Property:** Read/Write

Counter 0 must be disabled in the [L2CC Event Counter 0 Configuration Register](#) prior to any write access to this register.

Bit	31	30	29	28	27	26	25	24
	VALUE[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	VALUE[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	VALUE[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	VALUE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – VALUE[31:0] Event Counter Value**

Value returns the number of instance of the selected event.

If a counter reaches its maximum value, it remains saturated at that value until it is reset.

### 14.5.12 L2CC Interrupt Mask Register

**Name:** L2CC\_IMR  
**Offset:** 0x214  
**Reset:** 0x00000000  
**Property:** Programmable in Auxiliary Control register.

The following configuration values are valid for all listed bit names of this register:

0: Masked. This is the default value.

1: Enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
								DECERR
Access								
Reset								0
Bit	7	6	5	4	3	2	1	0
	SLVERR	ERRRD	ERRRT	ERRWD	ERRWT	PARRD	PARRT	ECNTR
Access								
Reset	0	0	0	0	0	0	0	0

- Bit 8 – DECERR** DECERR from L3 Memory
- Bit 7 – SLVERR** SLVERR from L3 Memory
- Bit 6 – ERRRD** Error on L2 Data RAM, Read
- Bit 5 – ERRRT** Error on L2 Tag RAM, Read
- Bit 4 – ERRWD** Error on L2 Data RAM, Write
- Bit 3 – ERRWT** Error on L2 Tag RAM, Write
- Bit 2 – PARRD** Parity Error on L2 Data RAM, Read
- Bit 1 – PARRT** Parity Error on L2 Tag RAM, Read
- Bit 0 – ECNTR** Event Counter 1/0 Overflow Increment

### 14.5.13 L2CC Masked Interrupt Status Register

**Name:** L2CC\_MISR  
**Offset:** 0x218  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: No interrupt has been generated or the interrupt is masked.

1: The input lines have triggered an interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
								DECERR
Access								R
Reset								0
Bit	7	6	5	4	3	2	1	0
	SLVERR	ERRRD	ERRRT	ERRWD	ERRWT	PARRD	PARRT	ECNTR
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bit 8 – DECERR** DECERR from L3 memory

**Bit 7 – SLVERR** SLVERR from L3 memory

**Bit 6 – ERRRD** Error on L2 Data RAM, Read

**Bit 5 – ERRRT** Error on L2 Tag RAM, Read

**Bit 4 – ERRWD** Error on L2 Data RAM, Write

**Bit 3 – ERRWT** Error on L2 Tag RAM, Write

**Bit 2 – PARRD** Parity Error on L2 Data RAM, Read

**Bit 1 – PARRT** Parity Error on L2 Tag RAM, Read

**Bit 0 – ECNTR** Event Counter 1/0 Overflow Increment

### 14.5.14 L2CC Raw Interrupt Status Register

**Name:** L2CC\_RISR  
**Offset:** 0x21C  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: No interrupt has been generated.

1: The input lines have triggered an interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
								DECERR
Access								R
Reset								0
Bit	7	6	5	4	3	2	1	0
	SLVERR	ERRRD	ERRRT	ERRWD	ERRWT	PARRD	PARRT	ECNTR
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bit 8 – DECERR** DECERR from L3 memory

**Bit 7 – SLVERR** SLVERR from L3 memory

**Bit 6 – ERRRD** Error on L2 Data RAM, Read

**Bit 5 – ERRRT** Error on L2 Tag RAM, Read

**Bit 4 – ERRWD** Error on L2 Data RAM, Write

**Bit 3 – ERRWT** Error on L2 Tag RAM, Write

**Bit 2 – PARRD** Parity Error on L2 Data RAM, Read

**Bit 1 – PARRT** Parity Error on L2 Tag RAM, Read

**Bit 0 – ECNTR** Event Counter 1/0 Overflow Increment

### 14.5.15 L2CC Interrupt Clear Register

**Name:** L2CC\_ICR  
**Offset:** 0x220  
**Reset:** 0x00000000  
**Property:** Programmable in Auxiliary Control register.

The following configuration values are valid for all listed bit names of this register:

0: No effect. Read returns zero.

1: Clears the corresponding bit in the Raw Interrupt Status Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
								DECERR
Access								
Reset								0
Bit	7	6	5	4	3	2	1	0
	SLVERR	ERRRD	ERRRT	ERRWD	ERRWT	PARRD	PARRT	ECNTR
Access								
Reset	0	0	0	0	0	0	0	0

- Bit 8 – DECERR** DECERR from L3 memory
- Bit 7 – SLVERR** SLVERR from L3 memory
- Bit 6 – ERRRD** Error on L2 Data RAM, Read
- Bit 5 – ERRRT** Error on L2 Tag RAM, Read
- Bit 4 – ERRWD** Error on L2 Data RAM, Write
- Bit 3 – ERRWT** Error on L2 Tag RAM, Write
- Bit 2 – PARRD** Parity Error on L2 Data RAM, Read
- Bit 1 – PARRT** Parity Error on L2 Tag RAM, Read
- Bit 0 – ECNTR** Event Counter 1/0 Overflow Increment

**14.5.16 L2CC Cache Synchronization Register**

**Name:** L2CC\_CSR  
**Offset:** 0x730  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – C** Cache Synchronization Status

Value	Description
0	No background operation is in progress. When written, must be zero.
1	A background operation is in progress.

### 14.5.17 L2CC Invalidate Physical Address Line Register

**Name:** L2CC\_IPALR  
**Offset:** 0x770  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	TAG[17:10]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	TAG[9:2]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	TAG[1:0]		IDX[8:3]					
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	IDX[2:0]							C
Access	R/W	R/W	R/W					R/W
Reset	0	0	0					0

**Bits 31:14 – TAG[17:0]** Tag Number

**Bits 13:5 – IDX[8:0]** Index Number

**Bit 0 – C** Cache Synchronization Status

Value	Description
0	No background operation is in progress. When written, must be zero.
1	A background operation is in progress.

**14.5.18 L2CC Invalidate Way Register**

**Name:** L2CC\_IWR  
**Offset:** 0x77C  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 0, 1, 2, 3, 4, 5, 6, 7 – WAYx** Invalidate Way Number x

Value	Description
0	The corresponding way is totally invalidated.
1	Invalidates the way. This bit is read as '1' as long as invalidation of the way is in progress.

### 14.5.19 L2CC Clean Physical Address Line Register

**Name:** L2CC\_CPALR  
**Offset:** 0x7B0  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	TAG[17:10]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reset			0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	IDX[2:0]							C
Access	R/W	R/W	R/W					R/W
Reset	0	0	0					0

**Bits 30:28 – WAY[2:0]** Way Number

**Bits 13:5 – IDX[8:0]** Index Number

**Bit 0 – C** Cache Synchronization Status

Value	Description
0	No background operation is in progress. When written, must be zero.
1	A background operation is in progress.

### 14.5.21 L2CC Clean Way Register

**Name:** L2CC\_CWR  
**Offset:** 0x7BC  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8

	WAY7	WAY6	WAY5	WAY4	WAY3	WAY2	WAY1	WAY0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7 – WAYx Clean Way Number x**

Value	Description
0	The corresponding way is totally cleaned.
1	Cleans the way. This bit is read as '1' as long as cleaning of the way is in progress.

### 14.5.22 L2CC Clean Invalidate Physical Address Line Register

**Name:** L2CC\_CIPALR  
**Offset:** 0x7F0  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	TAG[17:10]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**Bits 30:28 – WAY[2:0]** Way Number

**Bits 13:5 – IDX[8:0]** Index Number

**Bit 0 – C** Cache Synchronization Status

Value	Description
0	No background operation is in progress. When written, must be zero.
1	A background operation is in progress.

### 14.5.24 L2CC Clean Invalidate Way Register

**Name:** L2CC\_CIWR  
**Offset:** 0x7FC  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	WAY7	WAY6	WAY5	WAY4	WAY3	WAY2	WAY1	WAY0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7 – WAYx** Clean Invalidate Way Number x

Value	Description
0	The corresponding way is totally invalidated and cleaned.
1	Invalidates and cleans the way. This bit is read as '1' as long as invalidation and cleaning of the way is in progress.

### 14.5.25 L2CC Data Lockdown Register

**Name:** L2CC\_DLKR  
**Offset:** 0x900  
**Reset:** 0x00000000  
**Property:** Programmable in Auxiliary Control register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	DLK7	DLK6	DLK5	DLK4	DLK3	DLK2	DLK1	DLK0
Access								
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7 – DLKx** Data Lockdown in Way Number x

Value	Description
0	Allocation can occur in the corresponding way.
1	There is no allocation in the corresponding way.

### 14.5.26 L2CC Instruction Lockdown Register

**Name:** L2CC\_ILKR  
**Offset:** 0x904  
**Reset:** 0x00000000  
**Property:** Programmable in Auxiliary Control register.

**Bits 0, 1, 2, 3, 4, 5, 6, 7 – ILKx** Instruction Lockdown in Way Number x

Value	Description
0	Allocation can occur in the corresponding way.
1	There is no allocation in the corresponding way.

### 14.5.27 L2CC Debug Control Register

**Name:** L2CC\_DCR  
**Offset:** 0xF40  
**Reset:** 0x00000000  
**Property:** Read/Write in Secure mode, Read-only in Non-secure mode

**Bit 2 – SPNIDEN** SPNIDEN Value  
 Reads value of the SPNIDEN input.

**Bit 1 – DWB** Disable Write-back, Force Write-through

Value	Description
0	Enables write-back behavior. This is the default value.
1	Forces write-through behavior.

**Bit 0 – DCL** Disable Cache Linefill

Value	Description
0	Enables cache linefills. This is the default value.
1	Disables cache linefills.

### 14.5.28 L2CC Prefetch Control Register

**Name:** L2CC\_PCR  
**Offset:** 0xF60  
**Reset:** 0x00000000  
**Property:** Read/Write in Secure mode, Read-only in Non-secure mode

Bit	31	30	29	28	27	26	25	24	
		DLEN	INSPEN	DATPEN	DLFWRDIS			PDEN	
Access									
Reset		0	0	0	0			0	
Bit	23	22	21	20	19	18	17	16	
	IDLEN		NSIDEN						
Access									
Reset	0		0						
Bit	15	14	13	12	11	10	9	8	
Access									
Reset									
Bit	7	6	5	4	3	2	1	0	
				OFFSET[4:0]					
Access									
Reset				0	0	0	0	0	

**Bit 30 – DLEN** Double Linefill Enable

See [14.4.1 Double Linefill Issuing](#) for details on double linefill functionality.

Value	Description
0	The L2CC always issues 4x64-bit read bursts to L3 on reads that miss in the L2 cache. This is the default value.
1	The L2CC issues 8x64-bit read bursts to L3 on reads that miss in the L2 cache.

**Bit 29 – INSPEN** Instruction Prefetch Enable

Value	Description
0	Instruction prefetching is disabled. This is the default value.
1	Instruction prefetching is enabled.

**Bit 28 – DATPEN** Data Prefetch Enable

Value	Description
0	Data prefetching is disabled. This is the default value.
1	Data prefetching is enabled.

**Bit 27 – DLFWRDIS** Double Linefill on WRAP Read Disable

# SAMA5D2 Series

## L2 Cache Controller (L2CC)

Value	Description
0	Double linefill on WRAP read is enabled. This is the default value.
1	Double linefill on WRAP read is disabled.  Note: This bit can only be used if the DLEN bit is set HIGH. See <a href="#">14.4.1 Double Linefill Issuing</a> for details on double linefill functionality.

### Bit 24 – PDEN Prefetch Drop Enable

Value	Description
0	The L2CC does not discard prefetch reads issued to L3. This is the default value.
1	The L2CC discards prefetch reads issued to L3 when there is a resource conflict with explicit reads.

### Bit 23 – IDLEN INCR Double Linefill Enable

This bit can only be used if the DLEN bit is set HIGH. See [14.4.1 Double Linefill Issuing](#) for details on double linefill functionality.

Value	Description
0	The L2CC does not issue INCR 8x64-bit read bursts to L3 on reads that miss in the L2 cache. This is the default value.
1	The L2CC can issue INCR 8x64-bit read bursts to L3 on reads that miss in the L2 cache.

### Bit 21 – NSIDEN Not Same ID on Exclusive Sequence Enable

Value	Description
0	Read and write portions of a non-cacheable exclusive sequence have the same AXI ID when issued to L3. This is the default value.
1	Read and write portions of a non-cacheable exclusive sequence do not have the same AXI ID when issued to L3.

### Bits 4:0 – OFFSET[4:0] Prefetch Offset

Only use the Prefetch offset values of 0 to 7, 15, 23, and 31 for these bits. The L2CC does not support the other values.

### 14.5.29 L2CC Power Control Register

**Name:** L2CC\_POWCR  
**Offset:** 0xF80  
**Reset:** 0x00000000  
**Property:** Read/Write in Secure mode, Read-only in Non-secure mode

#### Bit 1 – DCKGATEN Dynamic Clock Gating Enable

Value	Description
0	Disabled. This is the default value.
1	Enabled.

#### Bit 0 – STBYEN Standby Mode Enable

Value	Description
0	Disabled. This is the default value.
1	Enabled.

## **15. Debug and Test Features**

### **15.1 Description**

The device features a number of complementary debug and test capabilities.

A common JTAG/ICE (In-Circuit Emulator) port is used for standard debugging functions, such as downloading code and single-stepping through programs.

A 2-pin debug port Serial Wire Debug (SWD) replaces the 5-pin JTAG port and provides an easy and risk-free alternative to JTAG as the two signals, SWDIO and SWCLK, are overlaid on the TMS and TCK pins, allowing for bi-modal devices that provide the other JTAG signals. These extra JTAG pins can be switched to other uses when in SWD mode.

A set of dedicated debug and test input/output pins gives direct access to these capabilities from a PC-based test environment.

### **15.2 Embedded Characteristics**

- Cortex-A5 In-circuit Emulator
  - Two real-time watchpoint units
  - Two independent registers: Debug Control Register and Debug Status Register
  - Test access port accessible through JTAG protocol
  - Debug communications channel
  - Serial wire debug
  - Trace
- Chip ID Register
- IEEE1149.1 JTAG Boundary-scan on All Digital Pins
- ETM, ETB: 8-Kbyte Embedded Trace Buffer

**15.3 Debug and Test Block Diagrams**

Figure 15-1. Debug and Test General Block Diagram

Figure 15-2. Debug and Test Interface Block Diagram

## 15.4 Application Examples

### 15.4.1 Debug Environment

The figure below shows a complete debug environment example. The ICE/JTAG interface is used for standard debugging functions, such as downloading code and single-stepping through the program. A software debugger running on a personal computer provides the user interface for configuring a Trace Port interface utilizing the ICE/JTAG interface.

**Figure 15-3. Application Debug and Trace Environment Example**

### 15.4.2 Test Environment

The figure below shows a test environment example. Test vectors are sent and interpreted by the tester. In this example, the “board in test” is designed using a number of JTAG-compliant devices. These devices can be connected to form a single scan chain.

**Figure 15-4. Application Test Environment Example**

## 15.5 Debug and Test Pin Description

**Table 15-1. Debug and Test Pin List**

Pin Name	Function	Type	Active Level
<b>Reset/Test</b>			
NRST	Microprocessor Reset	Input	Low
TST	Test Mode Select	Input	–
NTRST	Test Reset Signal	Input	–
<b>ICE and JTAG</b>			
TCK/SWCLK	Test Clock/Serial Wire Clock	Input	–
TDI	Test Data In	Input	–
TDO	Test Data Out	Output	–
TMS/SWDIO	Test Mode Select/Serial Wire Input/Output	I/O	–
JTAGSEL	JTAG Selection	Input	–

## 15.6 Functional Description

### 15.6.1 Test Pin

One dedicated pin, TST, is used to define the device operating mode. The user must make sure that this pin is tied at low level to ensure normal operating conditions. Other values associated with this pin are reserved for manufacturing test.

### 15.6.2 EmbeddedICE

The Cortex-A5 EmbeddedICE-RT is supported via the ICE/JTAG port. It is connected to a host computer via an ICE interface. The internal state of the Cortex-A5 is examined through an ICE/JTAG port which allows instructions to be serially inserted into the pipeline of the core without using the external data bus. Therefore, when in debug state, a store-multiple (STM) can be inserted into the instruction pipeline. This exports the contents of the Cortex-A5 registers. This data can be serially shifted out without affecting the rest of the system.

There are two scan chains inside the Cortex-A5 processor which support testing, debugging, and programming of the EmbeddedICE-RT. The scan chains are controlled by the ICE/JTAG port.

EmbeddedICE mode is selected when JTAGSEL is low. It is not possible to switch directly between ICE and JTAG operations. A chip reset must be performed after JTAGSEL is changed.

For further details on the EmbeddedICE-RT, see the Arm document *ARM IHI 0031A\_ARM\_debug\_interface\_v5.pdf*

### 15.6.3 JTAG Signal Description

TMS is the Test Mode Select input which controls the transitions of the test interface state machine.

TDI is the Test Data Input line which supplies the data to the JTAG registers (Boundary Scan Register, Instruction Register, or other data registers).

TDO is the Test Data Output line which is used to serially output the data from the JTAG registers to the equipment controlling the test. It carries the sampled values from the boundary scan chain (or other JTAG registers) and propagates them to the next chip in the serial test circuit.

NTRST (optional in IEEE Standard 1149.1) is a Test-ReSeT input which is mandatory in ARM cores and used to reset the debug logic. On Cortex-A5-based cores, NTRST is a Power On Reset output. It is asserted on power on. If necessary, the user can also reset the debug logic with the NTRST pin assertion during 2.5 MCK periods.

TCK is the Test Clock input which enables the test interface. TCK is pulsed by the equipment controlling the test and not by the tested device. It can be pulsed at any frequency.

#### 15.6.4 IEEE 1149.1 JTAG Boundary Scan

IEEE 1149.1 JTAG Boundary Scan allows pin-level access independent of the device packaging technology.

IEEE 1149.1 JTAG Boundary Scan is enabled when JTAGSEL is high. The SAMPLE, EXTEST and BYPASS functions are implemented. In ICE debug mode, the Arm processor responds with a non-JTAG chip ID that identifies the processor to the ICE system. This is not IEEE 1149.1 JTAG-compliant.

It is not possible to switch directly between JTAG and ICE operations. A chip reset must be performed after JTAGSEL is changed.

A Boundary-scan Descriptor Language (BSDL) file is provided for test setup.

### 15.7 Boundary JTAG ID Register

**Name:** Boundary JTAG ID Register

**Property:** Read-only

JTAG ID Code value is 0x05B3F03F.

	Bit	31	30	29	28	27	26	25	24
		VERSION[3:0]				PART NUMBER[15:12]			
Access		R	R	R	R	R	R	R	R

**Bits 31:28 – VERSION[3:0]** Product Version Number  
Set to 0x0.

**Bits 27:12 – PART NUMBER[15:0]** Product Part Number  
Product part number is 0x5B3F.

**Bits 11:1 – MANUFACTURER IDENTITY[10:0]**  
Set to 0x01F.

**Bit 0 – 1**  
Required by IEEE Std. 1149.1. Set to 1.

### 15.8 Cortex-A5 DP Identification Code Register IDCODE

The Identification Code Register is always present on all DP implementations. It provides identification information about the Arm Debug Interface.

### 15.8.1 JTAG Debug Port (JTAG-DP)

**Name:** JTAG Debug Port (JTAG-DP)

**Property:** Read-only

Debug Port JTAG IDCODE value is 0x5BA00477.

	Bit	31	30	29	28	27	26	25	24
		VERSION[3:0]				PART NUMBER[15:12]			
Access		R	R	R	R	R	R	R	R
Reset									
	Bit	23	22	21	20	19	18	17	16
		PART NUMBER[11:4]							
Access		R	R	R	R	R	R	R	R
Reset									
	Bit	15	14	13	12	11	10	9	8

Reset									
	Bit	7	6	5	4	3	2	1	0
		DESIGNER[6:0]							1
Access		R	R	R	R	R	R	R	R
Reset									

**Bits 31:28 – VERSION[3:0]** Product Version Number

Set to 0x5.

**Bits 27:12 – PART NUMBER[15:0]** Product Part Number

Product part number is 0xBA00.

**Bits 11:1 – DESIGNER[10:0]**

Set to 0x23B.

**Bit 0 – 1**

Required by IEEE Std. 1149.1. Set to 1.

### 15.8.2 Serial Wire Debug Port (SW-DP)

**Name:** Serial Wire Debug Port (SW-DP)

**Property:** Read-only

Debug Port Serial Wire IDCODE is 0x5ba02477.

At address 0x0 on read operations when the APnDP bit = 0. Access to the Identification Code Register is not affected by the value of the CTRLSEL bit in the Select Register.

	Bit	31	30	29	28	27	26	25	24
		VERSION[3:0]				PART NUMBER[15:12]			
Access		R	R	R	R	R	R	R	R

**Bits 31:28 – VERSION[3:0]** Product Version Number  
Set to 0x0.

**Bits 27:12 – PART NUMBER[15:0]** Product Part Number  
Product part number is 0xBA01.

**Bits 11:1 – DESIGNER[10:0]**  
Set to 0x23B.

**Bit 0 – 1**  
Required by IEEE Std. 1149.1. Set to 1.

## 16. Standard Boot Strategies

### 16.1 Description

The system always boots from the ROM memory at address 0x0.

The ROM code is a boot program contained in the embedded ROM. It is also called “First level boot loader”.

This microcontroller can be configured to run a Standard Boot mode or a Secure Boot mode. More information on how the Secure Boot mode can be enabled, and how the chip operates in this mode, is provided in the document *SAMA5D2x Secure Boot Strategy*, document no. 44040. To obtain this application note and additional information about the secure boot and related tools, contact a Microchip sales representative.

By default, the chip starts in Standard Boot mode.

### 16.2 Chip Access Using JTAG Connection

The JTAG connection is disabled at reset, and during the ROM Code execution.

It is re-enabled when the ROM code jumps in the boot file copied from an external Flash memory into the internal SRAM, or when the ROM code launches the SAM-BA monitor, when no boot file has been found in any external Flash memory.

### 16.3 Flow Diagram

The ROM code global flow is shown in the figure below.

**Figure 16-1. ROM Code Flow Diagram**

### 16.4 Chip Setup

When the chip is powered on, the processor clock (PCK) and the master clock (MCK) source is the 12 MHz fast RC oscillator.

The ROM code performs a low-level initialization that follows the steps described below:

1. Stack Setup for Arm supervisor mode.
2. PLLA Initialization
3. Master Clock Selection: when the PLLA is stabilized, the Master Clock source is switched from internal 12 MHz RC to PLLA. The PMC Status Register is polled to wait for MCK Ready. PCK and MCK are now the Main Clock.
4. C Variable Initialization: non zero-initialized data is initialized in the RAM (copy from ROM to RAM). Zero-initialized data is set to 0 in the RAM.

For clock frequencies, see the table [Clock Frequencies during External Memory Boot Sequence](#).

**Note:** No external crystal or clock is needed during the external boot memories sequence. An external clock source is checked before the launch of the SAM-BA monitor to get a more accurate clock signal for USB.

### 16.5 Boot Configuration

The boot sequence is controlled using a Boot Configuration Word in the Fuse area or in the backup registers BUREG.

#### 16.5.1 Boot Configuration Word

The Boot Configuration Word allows several customizations of the Boot Sequence:

- To configure the IO Set where the external memories used to boot are connected (see [Hardware and Software Constraints](#) for a description of the IO sets)
- To disable the boot on selected memories
- To configure the UART port used as a terminal console
- To configure the JTAG pins used for debug

See the section [Boot Configuration Word](#) for a detailed description of all the bitfields in this word.

By default, the value of this word is 0x0.

For MRL A and B parts, the ROM code does not try to detect a valid bootable software in any external memory, and runs directly the SAM-BA monitor. See the figure [NVM Bootloader Program Description for MRL A and MRL B Parts](#).

For MRL C parts, the ROM code only tries to boot on SDMMC1 and SDMMC0 memory interfaces and then run the SAM-BA monitor. See the figure [NVM Bootloader Program Description for MRL C Parts](#).

During prototyping phases, the value of this fuse word can be overridden by the content of a backup register. The conditions to enable this feature are as follows:

- The fuse bit DISABLE\_BSCR must not be set (default value).
- The Boot Sequence Controller Configuration register (BSC\_CR) must have the BUREG\_VALID bit set and indicate in BUREG\_INDEX which register has to be used.

Using BUREG allows the user to test several boot configuration options, including Secure Boot Mode, without burning fuses.

**Note:** VDDBU must be connected in order to benefit from this feature. However, in production, it is highly recommended to disable this feature and to write the boot configuration in fuses.

**Figure 16-2. Boot Configuration Loading**

### 16.5.2 Boot Sequence Controller Configuration Register

**Name:** BSC\_CR  
**Offset:** 0xF8048054  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	–
Bit	15	14	13	12	11	10	9	8
	[Reserved]							
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	[Reserved]					BUREG_VALID	BUREG_INDEX[1:0]	
Access						R/W	R/W	R/W
Reset								

**Bits 31:16 – WPKEY[15:0]** Write Protect Key (Write-only)

Value	Name	Description
0x6683	PASSWD	Writing any other value in this field aborts the write operation of the BOOT field. Always reads as 0.

**Bit 2 – BUREG\_VALID** Validate the data in BUREG\_INDEX field

Value	Description
0	No BUREG contains valid Boot Configuration data.
1	The BUREG indicated in BUREG_INDEX contains Boot Configuration data for use in configuring the boot sequence.

**Bits 1:0 – BUREG\_INDEX[1:0]** Select the BUREG where the Boot Configuration data must be read

Value	Name	Description
0	BUREG_0	Use BUREG 0 value
1	BUREG_1	Use BUREG 1 value
2	BUREG_2	Use BUREG 2 value
3	BUREG_3	Use BUREG 3 value

### 16.5.3 Backup Registers (BUREG)

The four BUREGs used to override the Boot Configuration Word in Fuse are at addresses:

- 0xF8045400
- 0xF8045404
- 0xF8045408
- 0xF804540C

### 16.5.4 Boot Configuration Word

**Name:** Boot Configuration Word  
**Reset:** 0x00000000

The Boot Configuration Word comprises the 32 boot configuration bits (see the table [Customer Fuse Matrix](#)).

 **WARNING** To avoid any malfunctioning, the user must not write the “DO NOT USE (DNU)” fuse bits.

Bit	31	30	29	28	27	26	25	24
			SECURE_ MODE	DNU	DNU	DNU	DNU	DISABLE_MON ITOR
Access								
Reset			0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	DNU	DISABLE_BSC R	QSPI_XIP_MO DE	DNU	DNU	EXT_MEM_BO OT_ENABLE	JTAG_IO_SET[1:0]	
Access								
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	UART_CONSOLE[3:0]				SDMMC_1	SDMMC_0	NFC[1:0]	
Access								
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	SPI_1[1:0]		SPI_0[1:0]		QSPI_1[1:0]		QSPI_0[1:0]	
Access								
Reset	0	0	0	0	0	0	0	0

#### Bit 29 – SECURE\_MODE Enable Secure Boot Mode

Value	Description
0	Standard boot sequence
1	Secure boot sequence

#### Bits 25, 26, 27, 28 – DNU DO NOT USE

#### Bit 24 – DISABLE\_MONITOR Disable SAM-BA Monitor

Value	Description
0	If no boot file found, launch SAM-BA Monitor.
1	SAM-BA Monitor never launched.

#### Bit 23 – DNU DO NOT USE

**Bit 22 – DISABLE\_BSCR** Disable Read of BSC\_CR

Value	Description
0	If the BUREG index in the BSC_CR is valid, its data replace Fuse configuration bits.
1	Does not read BSC_CR content, so the Boot settings are those from the Fuse.

**Bit 21 – QSPI\_XIP\_MODE** Enable XIP Mode on QSPI Flash

Value	Description
0	QSPI is accessed in QSPI mode and data copied into internal SRAM.
1	QSPI is accessed in XIP mode, and the bootstrap directly executed from it.

**Bits 19, 20 – DNU** DO NOT USE

**Bit 18 – EXT\_MEM\_BOOT\_ENABLE** Enable Boot on External Memories

Value	Description
0	No external memory boot performed.
1	External memory boot enabled.

**Bits 17:16 – JTAG\_IO\_SET[1:0]** Pin Selection for JTAG Access

Refer to "JTAG\_TCK on IOSET 4 pin has a wrong configuration after boot" in the document *SAMA5D2 Family Silicon Errata and Data Sheet Clarification*, available on [www.microchip.com](http://www.microchip.com).

Value	Name	Description
0	JTAG_IOSET_1	Use JTAG IO Set 1
1	JTAG_IOSET_2	Use JTAG IO Set 2
2	JTAG_IOSET_3	Use JTAG IO Set 3
3	JTAG_IOSET_4	Use JTAG IO Set 4

**Bits 15:12 – UART\_CONSOLE[3:0]** Selects the pins and UART interface used as a console terminal

Value	Name	Description
0	UART_1_IOSET_1	Use UART1 IO Set 1
1	UART_0_IOSET_1	Use UART0 IO Set 1
2	UART_1_IOSET_2	Use UART1 IO Set 2
3	UART_2_IOSET_1	Use UART2 IO Set 1
4	UART_2_IOSET_2	Use UART2 IO Set 2
5	UART_2_IOSET_3	Use UART2 IO Set 3
6	UART_3_IOSET_1	Use UART3 IO Set 1
7	UART_3_IOSET_2	Use UART3 IO Set 2
8	UART_3_IOSET_3	Use UART3 IO Set 3
9	UART_4_IOSET_1	Use UART4 IO Set 1
10	DISABLED	No console terminal
11	DISABLED	No console terminal
12	DISABLED	No console terminal
13	DISABLED	No console terminal
14	DISABLED	No console terminal
15	DISABLED	No console terminal

**Bit 11 – SDMMC\_1** Disable SDCard/e.MMC Boot on SDMMC\_1  
 After the first boot, the boot on SDMMC\_1 can be disabled by setting this bit.

Value	Description
0	Boots on SDMMC_1 using SDMMC_1 PIO Set 1.
1	Disables boot on SDMMC_1.

**Bit 10 – SDMMC\_0** Disable SDCard/e.MMC Boot on SDMMC\_0  
 After the first boot, the boot on SDMMC\_0 can be disabled by setting this bit.

Value	Description
0	Boots on SDMMC_0 using SDMMC_0 PIO Set 1.
1	Disables boot on SDMMC_0.

**Bits 9:8 – NFC[1:0]** Select the PIO Set Used for NFC Boot

Value	Name	Description
0	NFC_IOSET_1	Use NFC IO Set 1
1	NFC_IOSET_2	Use NFC IO Set 2
2	DISABLED	NFC boot is disabled
3	DISABLED	NFC boot is disabled

**Bits 7:6 – SPI\_1[1:0]** Select the PIO Set Used for SPI\_1 Boot

Value	Name	Description
0	SPI_1_IOSET_1	Use SPI_1 IO Set 1
1	SPI_1_IOSET_2	Use SPI_1 IO Set 2
2	SPI_1_IOSET_3	Use SPI_1 IO Set 3
3	DISABLED	SPI boot is disabled

**Bits 5:4 – SPI\_0[1:0]** Select the PIO Set Used for SPI\_0 Boot

Value	Name	Description
0	SPI_0_IOSET_1	Use SPI_0 IO Set 1
1	SPI_0_IOSET_2	Use SPI_0 IO Set 2
2	DISABLED	SPI boot is disabled
3	DISABLED	SPI boot is disabled

**Bits 3:2 – QSPI\_1[1:0]** Select the PIO Set Used for QSPI\_1 Boot

Value	Name	Description
0	QSPI_1_IOSET_1	Use QSPI_1 PIO Set 1
1	QSPI_1_IOSET_2	Use QSPI_1 PIO Set 2
2	QSPI_1_IOSET_3	Use QSPI_1 PIO Set 3
3	DISABLED	QSPI_1 boot is disabled

**Bits 1:0 – QSPI\_0[1:0]** Select the PIO Set Used for QSPI\_0 Boot

Value	Name	Description
0	QSPI_0_IOSET_1	Use QSPI_0 PIO Set 1
1	QSPI_0_IOSET_2	Use QSPI_0 PIO Set 2
2	QSPI_0_IOSET_3	Use QSPI_0 PIO Set 3

---

---

Value	Name	Description
3	DISABLED	QSPI_0 boot is disabled

### 16.5.5 NVM Boot Sequence

The ROM code performs the initialization and valid code detection for the external memories as described below only if those memories are not disabled in the Boot Configuration word.

Figure 16-3. NVM Bootloader Program Description for MRL A and MRL B Parts

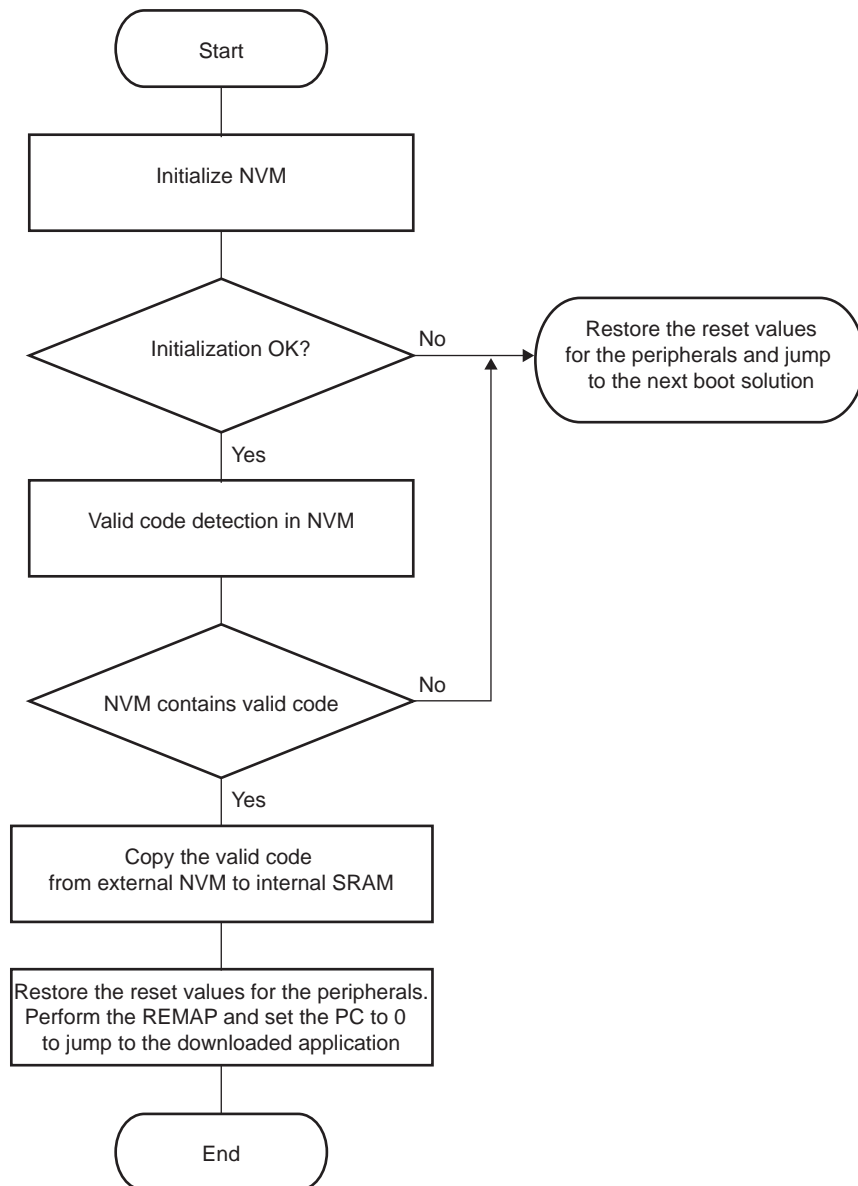

Figure 16-4. NVM Bootloader Program Description for MRL C Parts

**Figure 16-5. NVM Boot Diagram**

The NVM bootloader program first initializes the PIOs related to the NVM device. Then it configures the right peripheral depending on the NVM and tries to access this memory. If the initialization fails, it restores the reset values for the PIO and the peripheral, and then tries to fulfill the same operations on the next NVM of the sequence.

If the initialization is successful, the NVM bootloader program reads the beginning of the NVM and determines if the NVM contains a valid code.

If the NVM does not contain a valid code, the NVM bootloader program restores the reset value for the peripherals and then tries to fulfill the same operations on the next NVM of the sequence.

If a valid code is found, this code is loaded from the NVM into the internal SRAM and executed by branching at address 0x0000\_0000 after remap. This code may be the application code or a second-level bootloader. All the calls to functions are PC-relative and do not use absolute addresses.

**Figure 16-6. Remap Action after Download Completion**

### 16.5.6 Valid Code Detection

There are two kinds of valid code detection, which are described in the following sections.

#### 16.5.6.1 Arm Exception Vectors Check

The NVM bootloader program reads and analyzes the first 28 bytes corresponding to the first seven Arm exception vectors. Except for the sixth vector, these bytes must implement the Arm instructions for either branch or load PC with PC-relative addressing.

**Figure 16-7. LDR Opcode**

31	28	27	24	23	20	19	16	15	12	11	0	
1	1	1	0	0	1	I	P	U	1	W	0	
				Rn				Rd				Offset

**Figure 16-8. B Opcode**

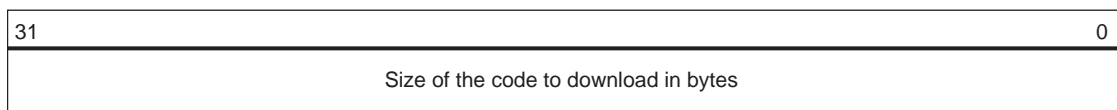

31	28	27	24	23	0
1	1	1	0	1	0
Offset (24 bits)					

Unconditional instruction: 0xE for bits 31 to 28. Load PC with the PC-relative addressing instruction:

- Rn = Rd = PC = 0xF
- I==0 (12-bit immediate value)
- P==1 (pre-indexed)
- U offset added (U==1) or subtracted (U==0)
- W==1

The sixth vector, at the offset 0x14, contains the size of the image to download. The user must replace this vector with the user's own vector. This procedure is described below.

**Figure 16-9. Arm Vector 6 Structure**

The value has to be smaller than 64 Kbytes.

An example of valid vectors:

00	ea000006	B 0x20
04	eaffffffe	B 0x04

```
08          ea00002f          B _main
0c          eaffffff          B 0x0c
10          eaffffff          B 0x10
14          00001234          B 0x14 ← Code size = 4660 bytes
18          eaffffff          B 0x18
```

### 16.5.6.2 boot.bin File Check

This method is the one used on FAT-formatted SD Card and e.MMC. The boot program must be a file named `boot.bin` written in the root directory of the file system. Its size must not exceed the maximum size allowed of 64 Kbytes (0x10000).

### 16.5.7 Detailed Memory Boot Procedures

#### 16.5.7.1 NAND Flash Boot: NAND Flash Detection

After the NAND Flash interface configuration, a reset command is sent to the memory.

Hardware ECC detection and correction are provided by the PMECC peripheral. See the section [PMECC Controller Functional Description](#) for more details.

The Boot Program is able to retrieve NAND Flash parameters and ECC requirements using two methods as follows:

- The detection of a specific header written at the beginning of the first page of the NAND Flash

or

- Through the ONFI parameters for the ONFI-compliant memories

However, it is highly recommended to use the NAND Flash Header method (first bullet above) since it indicates exactly how the PMECC has been configured to write the bootable program in the NAND Flash, and not to rely only on the NAND Flash capabilities.

**Note:** Booting on 16-bit NAND Flash is not possible; only 8-bit NAND Flash memories are supported.

**Figure 16-10. Boot NAND Flash Download**

### 16.5.7.1.1 NAND Flash Specific Header Detection (Recommended Solution)

This is the first method used to determine NAND Flash parameters. After Initialization and Reset command, the Boot Program reads the first page without an ECC check, to determine whether the NAND parameter header is present. The header is made of 52 times the same 32-bit word (for redundancy reasons) which must contain NAND and PMECC parameters used to correctly perform the read of the rest of the data in the NAND. This 32-bit word is described below.

If the header is valid, the Boot Program continues with the detection of a valid code.

**Note:** Booting on 16-bit NAND Flash is not possible; only 8-bit NAND Flash memories are supported.

**[NAND Flash PMECC Register]**

**Name:** NAND Flash PMECC Register

**Bits 31:28 – key[3:0]** Value 0xC Must be Written here to Validate the Content of the Whole Word.

**Bits 26:18 – eccOffset[8:0]** Offset of the First ECC Byte in the Spare Zone  
A value below 2 is not allowed and is considered as 2.

**Bits 17:16 – sectorSize[1:0]** Size of the ECC Sector

Value	Description
0	For 512 bytes
1	For 1024 bytes per sector
Other values	For future use

**Bits 15:13 – eccBitReq[2:0]** Number of ECC Bits Required

Value	Description
0	2-bit ECC
1	4-bit ECC
2	8-bit ECC
3	12-bit ECC
4	24-bit ECC
5	32-bit ECC

**Bits 12:4 – spareSize[8:0]** Size of the Spare Zone in Bytes

**Bits 3:1 – nbSectorPerPage[2:0]** Number of Sectors per Page

**Bit 0 – usePMECC** Use PMECC

Value	Description
0	Do not use PMECC to detect and correct the data.
1	Use PMECC to detect and correct the data.

### **ONFI 2.2 Parameters (Not Recommended)**

In case no valid header is found, the Boot Program checks if the NAND Flash is ONFI-compliant, sending a Read Id command (0x90) with 0x20 as parameter for the address. If the NAND Flash is ONFI-compliant, the Boot Program retrieves the following parameters with the help of the Get Parameter Page command:

- Number of bytes per page (byte 80)
- Number of bytes in spare zone (byte 84)
- Number of ECC bit corrections required (byte 112)
- ECC sector size: by default, set to 512 bytes; or to 1024 bytes if the ECC bit capability above is 0xFF

By default, the ONFI NAND Flash detection turns ON the usePmecc parameter, and the ECC correction algorithm is automatically activated.

Once the Boot Program retrieves the parameter, using one of the two methods described above, it reads the first page again, with or without ECC, depending on the usePmecc parameter. Then it looks for a valid code programmed just after the header offset 0xD0. If the code is valid, the program is copied at the beginning of the internal SRAM.

**Note:** Booting on 16-bit NAND Flash is not possible; only 8-bit NAND Flash memories are supported.

### **16.5.7.2 NAND Flash Boot: PMECC Error Detection and Correction**

NAND Flash boot procedure uses PMECC to detect and correct errors during NAND Flash read operations in two cases:

- When the usePmecc flag is set in a specific NAND header.
- If the flag is not set, no ECC correction is performed during the NAND Flash page read. When the NAND Flash has been detected using ONFI parameters.

The ROM memory embeds the Galois field tables. The user does not need to embed them in his own software.

The Galois field tables are mapped in the ROM just after the ROM code, as illustrated in the figure below.

For a full description and an example of how to use the PMECC detection and correction feature, see the software package dedicated to this device on our website.

**Figure 16-11. Galois Field Table Mapping**

### 16.5.7.3 SDCard/e.MMC Boot

The SDCard/e.MMC boot requires the Card Detect pin to be connected. If the level on the Card Detect pin is low, SDCard/e.MMC access is initiated (IOs toggling). If not, no communication with SDCard/e.MMC is performed (no IOs toggling).

The SDMMC0 and SDMMC1 pin card detect must be left unconnected if the interfaces are used with a non-removable and non-bootable device (wifi module, etc.).

This prevents the ROM code from trying to boot out of these interfaces and avoids a bad behavior of the boot.

In the case of non-removable devices (soldered on board), the card detect can be managed by software (refer to "Force Card Detect" bit) or by hardware by enabling the pull-down resistor on SDMMCx\_CD PIO after the ROM Code execution..

#### Supported SDCard Devices

SDCard Boot supports all SDCard memories compliant with the SD Memory Card Specification V3.0. This includes SDMMC cards.

#### e.MMC with Boot Partition

The ROM code first checks if the e.MMC Boot Partition is enabled. If enabled, the ROM code reads the first 64 Kbytes of the boot partition, and copy them into the internal SRAM.

#### FAT Filesystem boot

If no boot partition is enabled on an e.MMC, the boot process continues with a Standard SDCard/e.MMC detection, and the ROM code looks for a `boot.bin` file in the root directory of a FAT12/16/32 file system.

### 16.5.7.4 SPI Flash Boot

Two types of SPI Flash are supported

- SPI DataFlash

- SPI Serial Flash

The SPI Flash bootloader tries to boot on SPI0, first looking for SPI Serial Flash, and then for SPI DataFlash.

It uses only one valid code detection: analysis of Arm exception vectors.

The SPI Flash read is done by means of a Continuous Read command from the address 0x0. This command is 0xE8 for DataFlash and 0x0B for Serial Flash devices.

#### 16.5.7.4.1 Supported DataFlash Devices

The SPI Flash Boot program supports the DataFlash devices listed in the table below.

Device	Density	Page Size (bytes)	Number of Pages
AT45DB011	1 Mbit	264	512
AT45DB021	2 Mbits	264	1024
AT45DB041	4 Mbits	264	2048
AT45DB081	8 Mbits	264	4096
AT45DB161	16 Mbits	528	4096
AT45DB321	32 Mbits	528	8192
AT45DB642	64 Mbits	1056	8192
AT45DB641	64 Mbits	264	37768

#### 16.5.7.4.2 Supported Serial Flash Devices

The SPI Flash Boot program supports all SPI Serial Flash devices responding correctly to both Get Status and Continuous Read commands.

#### 16.5.7.5 QSPI NOR Flash Boot for MRL A and MRL B

**Important:** This section applies to the devices listed in the table below.

**Table 16-1. SAMA5D2 MRL A and MRL B Parts**

Device Name
ATSAMA5D22A
ATSAMA5D24A
ATSAMA5D27A
ATSAMA5D28A
ATSAMA5D21B
ATSAMA5D22B
ATSAMA5D23B
ATSAMA5D24B

.....continued

Device Name
ATSAMA5D26B
ATSAMA5D27B
ATSAMA5D28B

### 16.5.7.5.1 Definitions (MRL A, MRL B)

SPI x-y-z protocol:

- Command opcode is sent on x I/O data line(s) with x in {1, 2, 4}
- Address is sent on y I/O data line(s) with y in {1, 2, 4}
- Data are sent or received on z I/O data lin(s) with z in {1, 2, 4}

Relevant combinations are shown in the table below:

Protocol	Description
SPI 1-1-1	Legacy SPI protocol using MOSI/IO0 and MISO/IO1 lines
SPI 1-1-2	SPI Dual Output using IO0 and IO1 lines
SPI 1-2-2	SPI Dual I/O using IO0 and IO1 lines
SPI 2-2-2	SPI Dual Command using IO0 and IO1 lines
SPI 1-1-4	SPI Quad Output using IO0, IO1, IO2 and IO3 lines
SPI 1-4-4	SPI Quad I/O using IO0, IO1, IO2 and IO3 lines
SPI 4-4-4	Quad Command using IO0, IO1, IO2 and IO3 lines

### 16.5.7.5.2 Supported QSPI Memory Manufacturers (MRL A, MRL B)

The ROM code only supports the three following manufacturers (manufacturer ID):

- Cypress (01h)
- Micron (20h)
- Macronix (C2h)

Other manufacturer IDs are ignored and the ROM code jumps to the next non-volatile memory in the Boot Sequence.

### 16.5.7.5.3 SPI Clock Frequency, Phase and Polarity (MRL A, MRL B)

The peripheral clock of each QSPI controller is gated from the Master Clock (MCK). The ROM code configures MCK and the QSPI Serial Clock (QSCK). See the table ["Clock Frequencies during External Memory Boot Sequence"](#).

The QSPI controller is configured to use Clock Mode 0: Both CPHA and CPOL are cleared in QSPI\_SCR.

- CPOL = 0: The inactive state value of QSCK is logic level zero.
- CPHA = 0: Data is captured on the leading edge of QSCK and changed on the following edge of QSCK.

### 16.5.7.5.4 QSPI Memory Detection (MRL A, MRL B)

The ROM code probes the QSPI memory using JEDEC Read ID commands. However the opcode and the SPI protocol to be used to read the JEDEC ID of the QSPI memory depend on its Manufacturer and its current internal state.

#### Cypress

Cypress memories do not support the SPI 4-4-4 protocol. The command opcode is always sent on the single MOSI/IO1 data line. Hence when writing the 9Fh opcode on MOSI during the first 8 cycles, Cypress memories should always reply on MISO with their JEDEC ID during the following cycles.

#### Micron

Micron memories provide three modes of operation:

- Extended SPI: standard SPI protocol upgraded with dual (SPI 1-1-2, SPI 1-2-2) and quad (SPI 1-1-4, SPI 1-4-4) operations
- Dual I/O SPI: all commands use the SPI 2-2-2 protocol
- Quad I/O SPI: all commands use the SPI 4-4-4 protocol

The ROM code supports the Extended and Quad I/O SPI modes but not Dual I/O SPI.

In Extended SPI mode, Micron memories replies to the regular Read JEDEC ID opcode using the protocol SPI 1-1-1: the 9Fh opcode is sent on MOSI using eight clock cycles then the JEDEC ID is read from MISO only.

In Quad I/O SPI mode, Micron memories no longer reply to the regular Read JEDEC ID (9Fh) but answer the new Read JEDEC ID Multiple I/O command instead: The AFh op code is sent on the 4 I/O lines using 2 clock cycles, then only the 3 first bytes (1 byte for the Manufacturer ID followed by 2 bytes for the Device ID) of the JEDEC ID are returned by the memory on the 4 I/O lines.

The AFh opcode is not supported in Extended SPI mode.

#### Macronix

Macronix memories provide two modes of operation:

- SPI: standard SPI protocol upgraded with dual (SPI 1-1-2, SPI 1-2-2) and quad (SPI 1-1-4, SPI 1-4-4) operations
- QPI: all commands use the SPI 4-4-4 protocol

The ROM code supports only the Macronix SPI mode.

In SPI mode, Macronix memories reply to the regular Read JEDEC ID opcode using the protocol SPI 1-1-1: The 9Fh opcode is sent on MOSI using 8 clock cycles then the JEDEC ID is read from MISO only.

Hence the ROM code uses the following sequence to read the JEDEC ID:

Step	SPI Protocol	Opcode	Support by Manufacturer Modes
1	1-1-1	9Fh	Cypress, Micron Extended SPI, Macronix SPI
2	1-4-4	AFh	See Note below
3	4-4-4	AFh	Micron Quad I/O SPI

**Note:** Step 2 is a wrong combination but should not change the internal state of any QSPI memory. Indeed, **assuming pull-up resistors are used on the four I/O lines**, sending the AFh op code with SPI

1-x-y protocols (the opcode is sent only to MOSI during eight clock cycles) to a memory in Quad I/O SPI or QPI mode should be harmless (FEh opcode decoded by the memory when in Quad I/O SPI or QPI mode: unknown opcode). See the figure below.

**Figure 16-12. QSPI Transfer Format (CPHA = 0, 8 bits per opcode)**

### 16.5.7.5.5 Allowing Quad I/O Commands (MRL A, MRL B)

On most QSPI memories, some pins are shared between legacy functions such as Write Protect (#WP), Hold (#HOLD) or Reset (#RST) and I/O data lines 2 and 3.

Hence before sending any Quad I/O commands, the ROM code updates the relevant register to reassign those pins to functions IO2 and IO3:

#### Cypress

The ROM code sets the Quad Enable bit (bit1) in the Configuration Register (CR) / Status Register 2 (SR2). The bit is volatile or non-volatile depending on memory versions. This operation is performed using the Write Status command (01h), setting SR1 to 00h and SR2 to 02h.

#### Micron

The ROM code updates the Enhanced Volatile Configuration Register (EVCR) to clear the Quad I/O protocol bit (bit7) hence enabling the Quad I/O protocol. From this point, all commands must use the SPI 4-4-4 protocol.

#### Macronix

The ROM code updates the Status Register (SR1) to set its Quad Enable non-volatile bit (bit6) using the Write Status command (01h).

### 16.5.7.5.6 Configuration of Fast Read Quad I/O (EBh) Operations (MRL A, MRL B)

The ROM code performs all read operations using the Fast Read Quad I/O (EBh) opcode followed by a 3-byte address.

Since we cannot afford to add an exhaustive table of Read JEDEC IDs and to provide support of future products of memory manufacturers, the ROM code only relies on the very first byte of the JEDEC ID, i.e., the Manufacturer ID, to configure read operations. The ROM code matches the Manufacturer ID as shown in the following table.

**Table 16-2. Fast Read Quad I/O (EBh) Configuration by Manufacturer ID**

Manufacturer ID	Manufacturer	SPI Protocol	# of Mode Cycles	# of Dummy Cycles	Mode Cycle Value	
					(no XIP)	(XIP)
01h	Cypress	SPI 1-4-4	2 <sup>(1)</sup>	4 <sup>(1)</sup>	00h	A0h
20h	Micron	SPI 4-4-4	1 <sup>(2)</sup>	9 <sup>(2)</sup>	1h	0h
C2h	Macronix	SPI 1-4-4	2 <sup>(3)</sup>	4 <sup>(3)</sup>	00h	F0h

**Note:**

- The ROM code **expects** the Latency Control non-volatile bits of the Cypress Status Register 3 (SR3) / Control Register 1 (CR1) to be zero (LC = 0). The ROM code **does not update** this value.
- The ROM code sets the number of mode/dummy cycles for Micron memories updating bits [7:4] of their Volatile Configuration Register (VCR) with the 81h opcode. During this update of the VCR:
  - ROM code v1.1 always clears bit3 to enable XIP.
  - ROM code v1.2 clears bit3 to enable XIP if and only if XIP bit is set in the Boot Config word, otherwise it sets bit3 to disable XIP.
- The ROM code configures the number of mode/dummy cycles for Macronix memories by clearing the volatile DC0 and DC1 bits (bits [7:6]) in the Configuration Register (CR) / Status Register 2 (SR2). It also clears the 4-byte volatile bit (bit5), resulting in the memory going back to its 3-byte address mode. This register updated (read, modify, write) using a Write Status command (01h).

### 16.5.7.5.7 Miscellaneous Information (MRL A, MRL B)

#### Pull-up Resistors

The ROM code removes the internal pull-up resistors when it configures PIO controller to mux the QSPI controller I/O lines. Therefore the probing step may fail if the Quad I/O mode of the memory has not been enabled yet and if this memory does not embed an internal pull-up resistor on #HOLD or #RESET pin.

This is why we recommend to add external pull-up resistors if needed on the four I/O data lines MOSI/IO0, MISO/IO1, #WP/IO2 and #HOLD/IO3.

Another solution is to update the Quad Enable non-volatile bit in the relevant register to reassign #WP and #HOLD/#RESET pins to functions IO2 and IO3.

#### 4-byte Address Mode (> 16 MB memories)

Except for Macronix, the ROM code never sends any command to the memory to leave its 4-byte address mode or to select its first memory bank.

The ROM code expects to read from the very beginning of the QSPI memory using the Fast Read Quad I/O (EBh) command with a 3-byte address. Therefore we recommend that the customer application does not change the internal state of the QSPI memory but uses 4-byte opcodes when needed instead. Hence the ROM code can still read from the QSPI memory after a reset of the SoCs.

### 16.5.7.6 QSPI NOR Flash Boot for MRL C

**Important:** This section applies to the devices listed in the table below:

Device Name
ATSAMA5D21C
ATSAMA5D22C
ATSAMA5D23C
ATSAMA5D24C
ATSAMA5D26C
ATSAMA5D27C
ATSAMA5D28C

#### 16.5.7.6.1 Supported QSPI Memories by Manufacturer (MRL C)

**Table 16-3. QSPI NOR Memories Tested with and Supported by MRL C ROM Code (non exhaustive)**

Manufacturer	Memories
Microchip (SST)	SST26VF016B
	SST26VF032B
	SST26VF032BA
	SST26VF064B
Micron	N25Q128A
	N25Q128A13ESF
	N25Q256A13ESF
	N25Q512A13

	MX66L1G45GMI-08G
Spansion	S25FL127 (normal boot only; XIP fails)
	S25FL164
	S25FL512
Winbond	Limited support. Refer to <a href="#">Note</a> .

### 16.5.7.6.2 Hardware Considerations (MRL C)

The ROM code configures the hardware so that:

- the QSPI controller uses SPI Mode 0 (CPOL = 0 and CPHA = 0),
- the QSPIx\_SCK clock frequency is  $\leq 50$  MHz,
- QSPIx\_SCK and QSPIx\_CS do not use any internal pull-up/pull-down resistor,
- each QSPIx\_IO{0,1,2,3} uses the PIO controller's internal pull-up resistor.

### 16.5.7.6.3 Software Considerations (MRL C)

Before reading any data, the ROM code sends a software reset to the QSPI NOR memory. Then the ROM code looks for the Serial Flash Discoverable Parameters (SFDP) of the QSPI NOR memory, if available, to learn the parameters (instruction op code, timing settings) required to read the user-programmed boot file.

If SFDP tables are not available, the ROM code uses hard-coded values as fallback settings to read the boot file.

The ROM code supports any QSPI NOR memory which can provide its Serial Flash Discoverable Parameters (SFDP) as defined in the JEDEC JESD216B standard.

The supported revisions of this JEDEC standard are:

- JESD216 (version 1.0)

- JESD216 rev. A (version 1.5)
- JESD216 rev. B (version 1.6)

Refer to the datasheet of the QSPI NOR memory to check compliance with any of the above JEDEC JESD216 standard revisions/versions.

**QSPI NOR memories with SFDP (JEDEC JESD216x compliant)**

The ROM code reads the memory SFDP tables to learn the factory settings (instruction op code, number of dummy cycles, etc.). The ROM code also reads bits[22:20] in DWORD15 from the Basic Flash Parameter Table (refer to JEDEC JESD216B specification) to select and then execute the relevant procedure, if any, to set the Quad Enable (QE) bit in some internal register of the QSPI NOR memory.

For most memory manufacturers, this QE bit is nonvolatile and must be set before performing any Quad SPI command. This is the only persistent setting that the ROM code may change in the internal registers of the QSPI NOR memory. All other settings are kept unchanged.

**Note:** Values 001b and 100b for bits[22:20] in DWORD15 are not correctly supported by ROM code rev. C. Consequently, booting from memories using one the above values in their SFDP tables is likely to fail. Almost all Winbond QSPI NOR memories suffer from this issue.

Refer to the datasheet of the QSPI NOR memory to find which value was chosen by the memory manufacturer and written into the SFDP tables.

Finally, the ROM code reads the boot file from the data area of the QSPI NOR memory, and then continues its boot procedure.

**QSPI NOR memories without SFDP**

This section only applies when the ROM code fails to read the SFDP tables from the QSPI NOR memory.

The ROM code reads the JEDEC ID of the QSPI NOR memory, and then selects the read settings based on the manufacturer ID (first byte of the JEDEC ID) from the following hard-coded values:

	Cypress (01h)	Micron (20h)	Macronix (C2h)	Winbond (EFh)	Others
Fast Read protocol	SPI 1-4-4	SPI 1-4-4	SPI 1-4-4	SPI 1-4-4	SPI 1-1-1
Fast Read op code	EBh	EBh	EBh	EBh	0Bh
Address width	24 bits	24 bits	24 bits	24 bits	24 bits
Number of mode clock cycles	2	1	2	2	0
Number of wait states	4	9	4	4	8
Value of mode cycles to enter the 0-4-4 mode (XIP)	A0h	0h The ROM code first sets XIP bit[3] in the Volatile Configuration Register (VCR)	0Fh	A5h	N/A
Value of mode cycles to exit the 0-4-4 mode (normal read)	00h	1h	00h	FFh	N/A
XIP supported	Yes	Yes	Yes	Yes	No

Those hard-coded parameters give a last chance to the ROM code to boot from a QSPI NOR memory in either normal mode or XIP (continuous read) mode.

### 16.5.8 Hardware and Software Constraints

The table below provides clock frequencies configured by the ROM code during boot.

**Table 16-4. Clock Frequencies during External Memory Boot Sequence**

Clock	MRL A	MRL B	MRL C
PLLA	792 MHz	792 MHz	756 MHz
PCK	396 MHz	396 MHz	378 MHz
MCK	132 MHz	132 MHz	126 MHz
SDMMC (init/operational)	400 kHz / 25 MHz	400 kHz / 25 MHz	400 kHz / 25 MHz
SPI	6 MHz	12 MHz	12 MHz
QSPI	25 MHz	50 MHz	50 MHz

The NVM drivers use several PIOs in Peripheral mode to communicate with external memory devices. Care must be taken when these PIOs are used by the application. The connected devices could be unintentionally driven at boot time, and thus electrical conflicts between the output pins used by the NVM drivers and the connected devices could occur.

To ensure the correct functionality, it is recommended to plug in critical devices to other pins not used by the NVM.

The table below contains a list of pins that are driven during the boot program execution. These pins are driven during the boot sequence for a period of less than 1 second if no correct boot program is found. For MRL C parts only, the drive strength of some I/O pins is set to 'medium' while the pins are used in peripheral mode by the ROM code. For MRL A and B, drive strength is always low.

Before performing the jump to the application in the internal SRAM, all the PIOs and peripherals used in the boot program are set to their reset state.

**Table 16-5. PIO Driven during Boot Program Execution**

NVM Bootloader	Peripheral	IO Set	Pin	PIO Line	Drive Strength (MRL C only)
SD Card / e.MMC	SDMMC_0	1	SDMMC0_CK	PIOA0	low
			SDMMC0_CMD	PIOA1	medium
			SDMMC0_DAT0	PIOA2	medium
			SDMMC0_DAT1	PIOA3	medium
			SDMMC0_DAT2	PIOA4	medium
			SDMMC0_DAT3	PIOA5	medium
			SDMMC0_DAT4	PIOA6	low
			SDMMC0_DAT5	PIOA7	low
			SDMMC0_DAT6	PIOA8	low
			SDMMC0_DAT7	PIOA9	low
			SDMMC0_RSTN	PIOA10	medium
			SDMMC0_1V8SEL	PIOA11	low
			SDMMC0_WP	PIOA12	medium
			SDMMC0_CD	PIOA13	medium
	SDMMC_1	1	SDMMC1_DAT0	PIOA18	medium
			SDMMC1_DAT1	PIOA19	medium
			SDMMC1_DAT2	PIOA20	medium
			SDMMC1_DAT3	PIOA21	medium
			SDMMC1_CK	PIOA22	low
			SDMMC1_RSTN	PIOA27	medium
			SDMMC1_CMD	PIOA28	medium
			SDMMC1_WP	PIOA29	medium
			SDMMC1_CD	PIOA30	medium

# SAMA5D2 Series

## Standard Boot Strategies

.....continued

NVM Bootloader	Peripheral	IO Set	Pin	PIO Line	Drive Strength (MRL C only)

## 16.6 SAM-BA Monitor

This part of the ROM code is executed when no valid code is found in any NVM during the NVM boot sequence, and if the DISABLE\_MONITOR Fuse bit is not set.

The Main Oscillator is enabled and set in Bypass mode. If the MOSCSELS bit rises, an external clock is connected. If not, the Bypass mode is cleared to attempt external quartz detection. This detection is successful when the MOSCXTS and MOSCSELS bits rise, else the internal 12 MHz fast RC oscillator is used as the Main Clock.

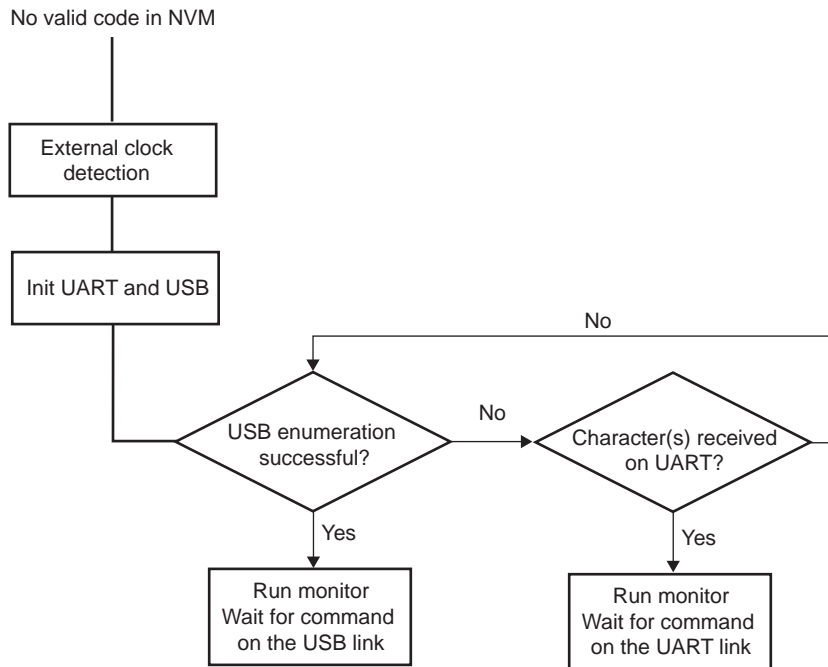

If an external clock or crystal frequency is found, then the PLLA is configured to allow communication on the USB link for the SAM-BA Monitor, else the Main Clock is switched back to the internal 12 MHz fast RC oscillator and USB is not activated. The SAM-BA Monitor steps are:

- Initialize UART and USB.
- Check if USB Device enumeration occurred.
- Check if characters are received on the UART.

Once the communication interface is identified, the application runs in an infinite loop waiting for different commands as listed in the table "Commands Available through the SAM-BA Monitor".

**Figure 16-13. SAM-BA Monitor**

### 16.6.1 Command List

**Table 16-6. Commands Available through the SAM-BA Monitor**

Command	Action	Argument(s)	Example
N	Set Normal Mode	No argument	N#
T	Set Terminal Mode	No argument	T#
O	Write a byte	Address, Value#	O200001,CA#
o	Read a byte	Address,#	o200001,#
H	Write a half word	Address, Value#	H200002,CAFE#
h	Read a half word	Address,#	h200002,#
W	Write a word	Address, Value#	W200000,CAFEBECA#
w	Read a word	Address,#	w200000,#
S	Send a file	Address,#	S200000,#
R	Receive a file	Address, NbOfBytes#	R200000,1234#
G	Go	Address#	G200200#
V	Display version	No argument	V#

- Mode commands:
  - Normal mode configures SAM-BA Monitor to send / receive data in binary format,

- Terminal mode configures SAM-BA Monitor to send / receive data in ASCII format.
- Write commands: Writes a byte (O), a halfword (H) or a word (W) to the target
  - Address: Address in hexadecimal
  - Value: Byte, halfword or word to write in hexadecimal
  - Output: '>'
- Read commands: Reads a byte (o), a halfword (h) or a word (w) from the target
  - Address: Address in hexadecimal
  - Output: The byte, halfword or word read in hexadecimal followed by '>'
- Send a file (S): Sends a file to a specified address
  - Address: Address in hexadecimal
  - Output: '>'
  - Note:** There is a timeout on this command which is reached when the prompt '>' appears before the end of the command execution.
- Receive a file (R): Receives data into a file from a specified address
  - Address: Address in hexadecimal
  - NbOfBytes: Number of bytes in hexadecimal to receive
  - Output: '>'
- Go (G): Jumps to a specified address and executes the code
  - Address: Address to jump to in hexadecimal
  - Output: '>' once returned from the program execution. If the executed program does not handle the link register at its entry and does not return, the prompt is not displayed.
- Get Version (V): Returns the Boot Program version
  - Output: version, date and time of ROM code followed by '>'

### 16.6.2 UART Port

Communication is performed through the UART port initialized to 115,200 bauds, 8 bits of data, no parity, 1 stop bit.

### 16.6.3 Xmodem Protocol

The Send and Receive File commands use the Xmodem protocol to communicate. Any terminal using this protocol can be used to send the application file to the target. The size of the binary file to send depends on the SRAM size embedded in the product. In all cases, the size of the binary file must be lower than the SRAM size because the Xmodem protocol requires some SRAM memory in order to work.

The Xmodem protocol supported is the 128-byte length block. This protocol uses a two-character CRC16 to guarantee detection of maximum bit errors.

The Xmodem protocol with CRC is supported by successful transmission reports provided both by a sender and by a receiver. Each transfer block is as follows:

<SOH><blk #><255-blk #><--128 data bytes--><checksum> in which:

- <SOH> = 01 hex
- <blk #> = binary number, starts at 01, increments by 1, and wraps 0FFH to 00H (not to 01)
- <255-blk #> = 1's complement of the blk#.
- <checksum> = 2 bytes CRC16

The figure below shows a transmission using this protocol.

**Figure 16-14. Xmodem Transfer Example**

### 16.6.4 USB Device Port

#### 16.6.4.1 Supported External Crystal / External Clocks

The SAM-BA Monitor only supports an external crystal or external clock frequency at 12 MHz to allow USB communication.

#### 16.6.4.2 Supported External Crystal / External Clocks

The device uses the USB Communication Device Class (CDC) drivers to take advantage of the installed PC Serial Communication software to talk over the USB. The CDC is implemented in all releases of Windows®, starting from Windows 98SE®. The CDC document, available at [www.usb.org](http://www.usb.org), describes how to implement devices such as ISDN modems and virtual COM ports.

Vendor ID is 0x03EB. The product ID is 0x6124. These references are used by the host operating system to mount the correct driver. On Windows systems, INF files contain the correspondence between vendor ID and product ID.

#### 16.6.4.3 Supported External Crystal / External Clocks

The USB protocol is a master/slave protocol. The host starts the enumeration, sending requests to the device through the control endpoint. The device handles standard requests as defined in the USB Specification.

**Table 16-7. Handled Standard Requests**

Request	Definition
GET_DESCRIPTOR	Returns the current device configuration value
SET_ADDRESS	Sets the device address for all future device access
SET_CONFIGURATION	Sets the device configuration
GET_CONFIGURATION	Returns the current device configuration value
GET_STATUS	Returns status for the specified recipient
SET_FEATURE	Used to set or enable a specific feature

.....continued	
Request	Definition
CLEAR_FEATURE	Used to clear or disable a specific feature

The device also handles some class requests defined in the CDC class.

**Table 16-8. Handled Class Requests**

Request	Definition
SET_LINE_CODING	Configures DTE rate, stop bits, parity and number of character bits
GET_LINE_CODING	Requests current DTE rate, stop bits, parity and number of character bits
SET_CONTROL_LINE_STATE	RS-232 signal used to indicate to the DCE device that the DTE device is now present

Unhandled requests are stalled.

### 16.6.4.4 Communication Endpoints

Endpoint 0 is used for the enumeration process.

Endpoint 1 (64-byte Bulk OUT) and endpoint 2 (64-byte Bulk IN) are used as communication endpoints.

SAM-BA Boot commands are sent by the host through Endpoint 1. If required, the message is split into several data payloads by the host driver.

If the command requires a response, the host sends IN transactions to pick up the response.

## 16.7 Fuse Box Controller

Read/write access to the fuse bits requires that the internal 12 MHz RC oscillator is enabled.

### 16.7.1 Fuse Bit Mapping

One 32-bit word is reserved for boot configuration.

512 fuse bits are available for customer needs.

Writing a '1' to SFR\_SECURE.FUSE disables access to the Secure Fuse Controller (SFC).

To avoid any malfunctioning, the user must not write the "DO NOT USE (DNU)" fuse bits in the Boot Configuration area.

**Table 16-9. Customer Fuse Matrix**

SFC_DR	Bits	Use		
16	[543:512]	JTAG_DIS[543]	SEC_DEBUG_DIS[542]	Boot Configuration bits[541:512] <sup>(1)</sup>

.....continued

SFC_DR	Bits	Use
15	[511:480]	USER_DATA[511:0]

2	[95:64]	
1	[63:32]	
0	[31:0]	

**Note:** See section [Boot Configuration Word](#) for details on the contents of these bits.

**Table 16-10. Special Function Bits**

JTAG Disable (Fuse bit 543)	Secure Debug Disable (Fuse bit 542)	Description
0	0	Full JTAG debug allowed in Secure and Normal modes
0	1	JTAG debug allowed in Normal mode only (not in Secure mode)
1	X	JTAG debug disabled

## **17. AXI Matrix (AXIMX)**

### **17.1 Description**

The AXI Matrix comprises the embedded Advanced Extensible Interface (AXI) bus protocol which supports separate address/control and data phases, unaligned data transfers using byte strobes, burst-based transactions with only start address issued, separate read and write data channels to enable low-cost DMA, ability to issue multiple outstanding addresses, out-of-order transaction completion, and easy addition of register stages to provide timing closure.

### **17.2 Embedded Characteristics**

- High-Performance AXI Network Interconnect
- One Master
  - Cortex-A5 Core
- Two Slaves
  - ROM
  - AXI/AHB bridge to AHB Matrix
- Single-Cycle Arbitration
- Full Pipelining to Prevent Master Stalls
- One Remap State

### **17.3 Operation**

#### **17.3.1 Remap**

Remap states are managed in the AXI Matrix Remap register (AXIMX\_REMAP):  
AXIMX\_REMAP.REMAP0 (register bit 0) is used to remap RAM @ addr 0x00000000.

The number of remap states can be defined using eight bits of the AXIMX\_REMAP register, and a bit in AXIMX\_REMAP controls each remap state.

Each remap state can be used to control the address decoding for one or more slave interfaces. If a slave interface is affected by two remap states that are both asserted, the remap state with the lowest remap bit number takes precedence.

Each slave interface can be configured independently so that a remap state can perform different functions for different masters.

A remap state can:

- Alias a memory region into two different address ranges
- Move an address region
- Remove an address region

Because of the nature of the distributed register subsystem, the masters receive the updated remap bit states in sequence, and not simultaneously.

A slave interface does not update to the latest remap bit setting until:

- The address completion handshake accepts any transaction that is pending
- Any current lock sequence completes

At powerup, ROM is seen at address 0. After powerup, the internal SRAM can be moved down to address 0 by means of the remap bits.

**17.4 Register Summary**

Offset	Name	Bit Pos.							
0x00	AXIMX_REMAP	7:0							REMAP0
		15:8							
		23:16							
		31:24							

### 17.4.1 AXI Matrix Remap Register

**Name:** AXIMX\_REMAP  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

**Bit 0 – REMAP0** Remap State 0

SRAM is seen at address 0x00000000 (through AHB slave interface) instead of ROM.

## **18. Matrix (H64MX/H32MX)**

### **18.1 Description**

The system embeds three system bus matrixes: one based on the AXI protocol (AXIMX) and two based on the AHB protocol (H64MX and H32MX). This section describes the implementation of the 64-bit Matrix (H64MX) and the 32-bit Matrix (H32MX).

For details on the AXIMX matrix, refer to the section “AXI Matrix (AXIMX)”.

Each matrix implements a multilayer system bus, which enables parallel access paths between multiple masters and slaves in a system, thus increasing the overall bandwidth. The normal latency to connect a master to a slave is one cycle, except for the default master of the accessed slave which is connected directly (zero cycle latency).

**Note:** When a master and a slave are on different bus matrixes (AXIMX, H64MX, or H32MX), both matrixes (H64MX and H32MX) and the bridge between the bus matrixes must be configured accordingly.

### **18.2 Embedded Characteristics**

- 32-bit or 64-bit Data Bus
- 64-bit Matrix (H64MX) Providing 12 Masters and 15 Slaves
- 32-bit Matrix (H32MX) Providing 8 Masters and 6 Slaves
- One Address Decoder for Each Master
- Support for Long Bursts of Length 32, 64, 128 and Up to the Limit of 256-bit Burst Beats of Words
- Enhanced Programmable Mixed Arbitration for Each Slave:
  - Round-robin
  - Fixed priority
  - Latency quality of service
- Programmable Default Master for Each Slave:
  - No default master
  - Last accessed default master
  - Fixed default master
- Deterministic Maximum Access Latency for Masters
- Zero or One Cycle Arbitration Latency for the First Access of a Burst
- Bus Lock Forwarding to Slaves
- One Special Function Register for Each Slave (not dedicated)
- Register Write Protection
- ARM TrustZone Technology

### **18.3 64-bit Matrix (H64MX)**

#### **18.3.1 Matrix Masters**

The H64MX manages 12 masters, which means that each master can perform an access, concurrently with others, to an available slave.

This matrix operates at MCK.

Each master has its own decoder, which is defined specifically for each master. In order to simplify the addressing, all the masters have the same decodings.

**Table 18-1. List of H64MX Masters**

Master No.	Name	Security Type
0	Bridge from AXI Matrix (Core)	Not applicable
1, 2	DMA Controller 0	Peripheral Securable
3, 4	DMA Controller 1	Peripheral Securable
5, 6	LCDC DMA	Peripheral Securable
7	SDMMC0	Peripheral Securable
8	SDMMC1	Peripheral Securable
9	ISC DMA	Peripheral Securable
10	AESB	Not applicable <sup>(1)</sup>
11	Bridge from H32MX to H64MX	Not applicable

**Note:**

1. Master signals secure/not secure are propagated through the AES bridge.

### 18.3.2 Matrix Slaves

The H64MX manages 15 slaves. Each slave has its own arbiter providing a dedicated arbitration per slave.

**Table 18-2. List of H64MX Slaves**

Slave No.	Description	TrustZone Access Management
0	Bridge from H64MX to H32MX	Not applicable
1	H64MX Peripheral Bridge	HSEL0: not applicable
	SDMMC0	HSEL1: Internal Securable to Peripheral: 1 region <sup>(1)</sup>
	SDMMC1	HSEL2: Internal Securable to Peripheral: 1 region <sup>(1)</sup>
2	DDR2 Port 0 - AESB	Scalable Securable: 4 regions <sup>(2)</sup>
3	DDR2 Port 1	Scalable Securable: 4 regions <sup>(2)</sup>
4	DDR2 Port 2	Scalable Securable: 4 regions <sup>(2)</sup>
5	DDR2 Port 3	Scalable Securable: 4 regions <sup>(2)</sup>
6	DDR2 Port 4	Scalable Securable: 4 regions <sup>(2)</sup>
7	DDR2 Port 5	Scalable Securable: 4 regions <sup>(2)</sup>
8	DDR2 Port 6	Scalable Securable: 4 regions <sup>(2)</sup>
9	DDR2 Port 7	Scalable Securable: 4 regions <sup>(2)</sup>

.....continued

Slave No.	Description	TrustZone Access Management
10	Internal SRAM 128K	Internal Securable: 1 region
11	Internal SRAM 128K (Cache L2)	Internal Securable: 1 region
12	QSPI0	Internal Securable: 1 region
13	QSPI1	Internal Securable: 1 region
14	AESB	Not applicable

**Note:**

- For each SDMMCx, see “[Security Types of SDMMC System Bus Slaves](#)” for Internal Securable to Peripheral type configuration. A consistent configuration must be done for:
  - the slave port,
  - MATRIX\_SPSELSR for the general interrupt and the master port,
  - MATRIX\_SPSELSR for the TIMER interrupt.
- For consistency, each DDR2 port must have the same TrustZone access management configuration.

### 18.3.3 Master to Slave Access

The following table shows how masters and slaves interconnect. Writing in a register or field not dedicated to a master or a slave has no effect.

**Table 18-3. Master to Slave Access on H64MX**

		MASTER										
		0	1	2	3	4	5	6	7	8	9	10
SLAVE		Bridge from AXIMX (Core)	XDMAC0	XDMAC1	LCDC DMA		SDMMC0 DMA	SDMMC1 DMA	ISC DMA	AESB	Bridge from H32MX	
0	Bridge from H64MX to H32MX	X	X	X	X	X	–	–	–	–	–	–
1	H64MX Peripheral Bridge	X	X	X	X	X	–	–	–	–	–	X

3	DDR2 Port 1	X	–	–	–	–	–	–	–	–	–	–
4	DDR2 Port 2	–	–	–	–	–	X	–	–	–	–	–
5	DDR2 Port 3	–	–	–	–	–	–	X	–	–	–	–
6	DDR2 Port 4	–	–	–	–	–	–	–	X	X	X	–

.....continued

		MASTER											
		0	1	2	3	4	5	6	7	8	9	10	11
SLAVE		Bridge from AXIMX (Core)	XDMAC0	XDMAC1		LCDC DMA		SDMMC0 DMA	SDMMC1 DMA	ISC DMA	AESB	Bridge from H32MX	
7	DDR2 Port 5	–	X	–	X	–	–	–	–	–	–	–	
8	DDR2 Port 6	–	–	X	–	X	–	–	–	–	–	–	
9	DDR2 Port 7	–	–	–	–	–	–	–	–	–	–	X	
10	Internal SRAM	X	X	X	X	X	X	X	X	X	X	–	
11	L2C SRAM	X	X	X	X	X	X	X	X	X	X	–	
12	QSPI0	X	X	X	X	X	–	–	–	–	–	X <sup>(1)</sup>	
13	QSPI1	X	X	X	X	X	–	–	–	–	–	X <sup>(1)</sup>	
14	AESB	X	X	X	X	X	–	–	–	–	–	X	

**Note:**

1. To avoid deadlock when accessing the AESB slave, the QSPI0, QSPI1 and DDR2 Port 0 Slave Configuration registers (MATRIX\_SCFGx) must be configured either with DEFMSTR\_TYPE = NONE ('0') or with DEFMSTR\_TYPE = FIXED ('2') and FIXED\_DEFMSTR = 10.

## 18.4 32-bit Matrix (H32MX)

### 18.4.1 Matrix Masters

The H32MX manages eight masters, which means that each master can perform an access, concurrently with others, to an available slave.

This matrix can operate at MCK if MCK is lower than 83 MHz, or at MCK/2 if MCK is higher than 83 MHz. Refer to the section “Power Management Controller (PMC)” for more details.

Each master has its own decoder, which is defined specifically for each master. In order to simplify the addressing, all the masters have the same decodings.

**Table 18-4. List of H32MX Masters**

Master No.	Name	Security Type
0	Bridge from H64MX to H32MX	Not applicable
1	Integrity Check Monitor (ICM)	Peripheral Securable
2	UHPHS EHCI DMA	Peripheral Securable
3	UHPHS OHCI DMA	Peripheral Securable
4	UDPHS DMA	Peripheral Securable
5	GMAC DMA	Peripheral Securable

.....continued

Master No.	Name	Security Type
6	CAN0 DMA	Peripheral Securable
7	CAN1 DMA	Peripheral Securable

### 18.4.2 Matrix Slaves

The H32MX manages six slaves. Each slave has its own arbiter providing a dedicated arbitration per slave.

**Table 18-5. List of H32MX Slaves**

Slave No.	Description	TZ Access Management
0	Bridge from H32MX to H64MX	Not applicable
1	H32MX Peripheral Bridge 0	Not applicable
2	H32MX Peripheral Bridge 1	Not applicable
3	External Bus Interface	External Securable: 7 regions: HSEL0: 0x10000000 128 MB CS0 HSEL1: 0x18000000 128 MB CS0 HSEL2: 0x60000000 128 MB CS1 HSEL3: 0x68000000 128 MB CS1 HSEL4: 0x70000000 128 MB CS2 HSEL5: 0x78000000 128 MB CS2 HSEL6: 0x80000000 128 MB CS3
	NFC Command Register	Internal Securable to Peripheral: 1 region HSEL7: 0xC0000000 256 MB NFCCMD
4	NFC SRAM	Internal Securable: 1 region
5	USB Device High Speed (UDPHS) Dual Port RAM (DPR)	HSEL0: Internal Securable: 1 region
	USB Host (UHPHS) OHCI registers	HSEL1: Internal Securable to Peripheral: 1 region <sup>(Note)</sup>
	USB Host (UHPHS) EHCI registers	HSEL2: Internal Securable to Peripheral: 1 region <sup>(Note)</sup>
6	Peripheral Touch Controller (PTC)	Internal Securable: 1 region

**Note:** UHPHS: Consistent configuration must be done on:

- Slave UHPHS OHCI Internal Securable Peripheral,
- Slave UHPHS EHCI Internal Securable Peripheral,
- MATRIX\_SPSELSR for Interrupt and Master

### 18.4.3 Master to Slave Access

The following table shows how masters and slaves interconnect. Writing in a register or field not dedicated to a master or a slave has no effect.

**Table 18-6. Master to Slave Access on H32MX**

SLAVE		MASTER										
		0 (Through Bridge from H64MX)					1	2	3	4	5	6

## 18.5 Memory Mapping

The MATRIX provides one decoder for every master interface. The decoder offers each master several memory mappings. Each memory area can be assigned to several slaves. Booting at the same address while using different slaves (i.e., external RAM, internal ROM or internal Flash, etc.) becomes possible.

## 18.6 Special Bus Granting Mechanism

The MATRIX provides some speculative bus granting techniques in order to anticipate access requests from masters. This mechanism reduces latency at first access of a burst, or for a single transfer, as long as the slave is free from any other master access. It does not provide any benefit if the slave is

continuously accessed by more than one master, since arbitration is pipelined and has no negative effect on the slave bandwidth or access latency.

This bus granting mechanism sets a different default master for every slave.

At the end of the current access, if no other request is pending, the slave remains connected to its associated default master. A slave can be associated with three kinds of default masters:

- No default master
- Last access master
- Fixed default master

To change from one type of default master to another, the user interface provides Slave Configuration registers (MATRIX\_SCFGx), one for every slave, which set a default master for each slave. MATRIX\_SCFGx contains two fields to manage master selection: DEFMSTR\_TYPE and FIXED\_DEFMSTR. The 2-bit DEFMSTR\_TYPE field selects the default master type (no default, last access master, fixed default master), whereas the 4-bit FIXED\_DEFMSTR field selects a fixed default master provided that DEFMSTR\_TYPE is set to fixed default master. See [“Bus Matrix Slave Configuration Registers”](#).

### 18.7 No Default Master

After the end of the current access, if no other request is pending, the slave is disconnected from all masters.

This configuration incurs one latency clock cycle for the first access of a burst after bus Idle. Arbitration without default master can be used for masters that perform significant bursts or several transfers with no Idle in between, or if the slave bus bandwidth is widely used by one or more masters.

This configuration provides no benefit on access latency or bandwidth when reaching maximum slave bus throughput regardless of the number of requesting masters.

### 18.8 Last Access Master

After the end of the current access, if no other request is pending, the slave remains connected to the last master that performed an access request.

This allows the MATRIX to remove the one latency cycle for the last master that accessed the slave. Other nonprivileged masters still get one latency clock cycle if they need to access the same slave. This technique is used for masters that mainly perform single accesses or short bursts with some Idle cycles in between.

This configuration provides no benefit on access latency or bandwidth when reaching maximum slave bus throughput whatever is the number of requesting masters.

### 18.9 Fixed Default Master

After the end of the current access, if no other request is pending, the slave connects to its fixed default master. Unlike the last access master, the fixed default master does not change unless the user modifies it by software (FIXED\_DEFMSTR field of the related MATRIX\_SCFG).

This allows the MATRIX arbiters to remove the one latency clock cycle for the fixed default master of the slave. All requests attempted by the fixed default master do not cause any arbitration latency, whereas

other nonprivileged masters will get one latency cycle. This technique is used for a master that mainly performs single accesses or short bursts with Idle cycles in between.

This configuration provides no benefit on access latency or bandwidth when reaching maximum slave bus throughput, regardless of the number of requesting masters.

## 18.10 Arbitration

The MATRIX provides an arbitration mechanism that reduces latency when conflicts occur, i.e., when two or more masters try to access the same slave at the same time. One arbiter per slave is provided, thus arbitrating each slave specifically.

The user can choose between two arbitration types or mix them for each slave:

- Round-robin Arbitration (default)
- Fixed Priority Arbitration

The resulting algorithm may be complemented by selecting a default master configuration for each slave.

When re-arbitration must be done, specific conditions apply. See [“Arbitration Scheduling”](#).

### 18.10.1 Arbitration Scheduling

Each arbiter has the ability to arbitrate between two or more master requests. In order to avoid burst breaking and also to provide the maximum throughput for slave interfaces, arbitration takes place during the following cycles:

- Idle Cycles: when a slave is not connected to any master or is connected to a master which is not currently accessing it.
- Single Cycles: when a slave is currently performing a single access.
- End of Burst Cycles: when the current cycle is the last cycle of a burst transfer. For defined burst length, predicted end of burst matches the size of the transfer but is managed differently for undefined burst length. See [“Undefined Length Burst Arbitration”](#).
- Slot Cycle Limit: when the slot cycle counter has reached the limit value indicating that the current master access is too long and must be broken. See [“Slot Cycle Limit Arbitration”](#).

#### 18.10.1.1 Undefined Length Burst Arbitration

To prevent long burst lengths that can lock the access to the slave for an excessive period of time, the user can trigger the re-arbitration before the end of the incremental bursts. The re-arbitration period can be selected from the following Undefined Length Burst Type (ULBT) possibilities:

- Unlimited: no predetermined end of burst is generated. This value enables 1 Kbyte burst lengths.
- 1-beat bursts: predetermined end of burst is generated at each single transfer during the INCR transfer.
- 4-beat bursts: predetermined end of burst is generated at the end of each 4-beat boundary during INCR transfer.
- 8-beat bursts: predetermined end of burst is generated at the end of each 8-beat boundary during INCR transfer.
- 16-beat bursts: predetermined end of burst is generated at the end of each 16-beat boundary during INCR transfer.
- 32-beat bursts: predetermined end of burst is generated at the end of each 32-beat boundary during INCR transfer.

- 64-beat bursts: predetermined end of burst is generated at the end of each 64-beat boundary during INCR transfer.
- 128-beat bursts: predetermined end of burst is generated at the end of each 128-beat boundary during INCR transfer.

Undefined-length bursts lower than 8 beats should not be used since this may decrease the overall bus bandwidth due to arbitration and slave latencies at each first access of a burst.

However, if the length of undefined-length bursts is known for a master, it is recommended to configure MATRIX\_MCFG.ULBT accordingly.

### 18.10.1.2 Slot Cycle Limit Arbitration

The MATRIX contains specific logic to break long accesses, such as very long bursts on a very slow slave (e.g., an external low speed memory). At each arbitration time, a counter is loaded with the value previously written in the SLOT\_CYCLE field of the related Slave Configuration Register (MATRIX\_SCFG) and decreased at each clock cycle. When the counter elapses, the arbiter has the ability to re-arbitrate at the end of the current system bus access cycle.

Unless a master has a very tight access latency constraint, which could lead to data overflow or underflow due to a badly undersized internal FIFO with respect to its throughput, the Slot Cycle Limit should be disabled (SLOT\_CYCLE = 0) or set to its default maximum value in order not to inefficiently break long bursts performed by some masters.

In most cases, this feature is not needed and should be disabled for power saving.

This feature cannot prevent any slave from locking its access indefinitely.

### 18.10.2 Arbitration Priority Scheme

The MATRIX arbitration scheme is organized in priority pools, each corresponding to an access criticality class as shown in the “Latency Quality of Service” column in the following table.

**Table 18-7. Arbitration Priority Pools**

Priority Pool	Latency Quality of Service
3	Latency Critical
2	Latency Sensitive
1	Bandwidth Sensitive
0	Background Transfers

Round-robin priority is used in the highest and lowest priority pools 3 and 0, whereas fixed level priority is used between priority pools and in the intermediate priority pools 2 and 1. See “[Round-robin Arbitration](#)” .

For each slave, each master is assigned to one of the slave priority pools through the priority registers for slaves (MxPR fields of MATRIX\_PRAS and MATRIX\_PRBS). When evaluating master requests, this priority pool level always takes precedence.

After reset, most of the masters belong to the lowest priority pool (MxPR = 0, Background Transfer) and are therefore granted bus access in a true round-robin order.

The highest priority pool must be specifically reserved for masters requiring very low access latency. If more than one master belongs to this pool, they will be granted bus access in a biased round-robin manner which allows tight and deterministic maximum access latency from system bus requests. In the worst case, any currently occurring high-priority master request will be granted after the current bus master access has ended and other high priority pool master requests, if any, have been granted once each.

The lowest priority pool shares the remaining bus bandwidth between masters.

Intermediate priority pools allow fine priority tuning. Typically, a latency-sensitive master or a bandwidth-sensitive master will use such a priority level. The higher the priority level (MxPR value), the higher the master priority.

To optimize processor performance, it is recommended configure CPU priority with the default reset value 2 (Latency Sensitive).

All combinations of MxPR values are allowed for all masters and slaves. For example, some masters might be assigned the highest priority pool (round-robin), and remaining masters the lowest priority pool (round-robin), with no master for intermediate fixed priority levels.

### 18.10.2.1 Fixed Priority Arbitration

Fixed priority arbitration algorithm is the first and only arbitration algorithm applied between masters from distinct priority pools. It is also used in priority pools other than the highest and lowest priority pools (intermediate priority pools).

Fixed priority arbitration allows the MATRIX arbiters to dispatch the requests from different masters to the same slave by using the fixed priority defined by the user in the MxPR field for each master in the registers MATRIX\_PRAS and MATRIX\_PRBS. If two or more master requests are active at the same time, the master with the highest priority MxPR number is serviced first.

In intermediate priority pools, if two or more master requests with the same priority are active at the same time, the master with the highest number is serviced first.

### 18.10.2.2 Round-robin Arbitration

This algorithm is only used in the highest and lowest priority pools. It allows the MATRIX arbiters to properly dispatch requests from different masters to the same slave. If two or more master requests are active at the same time in the priority pool, they are serviced in a round-robin increasing master number order.

## 18.11 Register Write Protection

To prevent any single software error from corrupting MATRIX behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [Write Protection Mode Register](#) (MATRIX\_WPMR).

If a write access to a write-protected register is detected, the WPVS bit in the [Write Protection Status Register](#) (MATRIX\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS flag is reset by writing the Write Protect Mode Register (MATRIX\_WPMR) with the appropriate access key WPKEY.

The following registers can be write-protected:

- [Bus Matrix Master Configuration Registers](#)

- [Bus Matrix Slave Configuration Registers](#)
- [Bus Matrix Priority Registers A For Slaves](#)
- [Bus Matrix Priority Registers B For Slaves](#)
- [Master Error Interrupt Enable Register](#)
- [Master Error Interrupt Disable Register](#)
- [Security Slave Registers](#)
- [Security Areas Split Slave Registers](#)
- [Security Region Top Slave Registers](#)
- [Security Peripheral Select x Registers](#)

## 18.12 TrustZone Technology

TrustZone secure software is supported through the filtering of each slave access with master security bit extension signals.

TrustZone technology adds the ability to manage the access rights for secure and non-secure accesses. The access rights are defined through the hardware and software configuration of the device. The operating mode is as follows:

- Masters transmit requests with the secure or non-secure Security option.
- The MATRIX, according to its configuration and the request, grants or denies the access.

The slave address space is divided into one or more slave regions. The slave regions are generally contiguous parts of the slave address space. The slave region is potentially split into an access denied area (upper part) and a security region which can be split (lower part), unless the slave security region occupies the whole slave region. The security region itself can be split into one secure area and one non-secure area. The secure area may be independently secure for read access and for write access.

For one slave region, the following characteristics are configured by hardware or software:

- Base Address of the slave region
- Max size of the slave region: the maximum size for the region's physical content
- Top size of the slave security region: the actually programmed or fixed size for the region's physical content
- Split size of the slave security region: the size of the lower security area of the region.

The following figure shows how the terms defined here are implemented in a slave address space.

**Figure 18-1. Generic Partitioning of the AHB Slave Address Space**

A set of security registers allows to specify, for each slave, the slave security region or slave security area, the security mode required to access this slave, slave security region or slave security area.

Additional Bus Matrix security registers allow to specify, for each peripheral bus slave, the security mode required to access this slave (see [“Security Peripheral Select x Registers”](#)).

See [“Security Slave Registers”](#).

These registers can only be accessed in Secure mode.

The MATRIX propagates the security bit down to the slaves to let them perform additional security checks, and the MATRIX itself allows or denies the access to the slaves by means of its TrustZone embedded controller.

Access violations may be reported either by a slave through the bus error response (example from the AHB/APB Bridge), or by the Bus Matrix embedded TrustZone controller. In both cases, a bus error response is sent to the offending master and the error is flagged in the [Master Error Status Register](#). An interrupt can be sent to the Secure world, if it has been enabled for that master by writing into the [Master Error Interrupt Enable Register](#). Thus, the offending master is identified. The offending address is registered in the [Master Error Address Registers](#), so that the slave and the targeted security region are also known.

Depending on the hardware parameters and software configuration, the address space of each slave security region may or may not be split into two parts, one belonging to the Secure world and the other one to the Normal world.

Five different security types of slaves are supported. The number of security regions is set by design for each slave, independently, from 1 to 8, totalling from 1 up to 16 security areas for security configurable slaves.

### 18.12.1 Security Types of Slaves

#### 18.12.1.1 Principles

The MATRIX supports five different security types of slaves: two fixed types and three configurable types. The security type of a slave is set at hardware design among the following:

- Never Secure
- Always Secure
- Internal Securable
- External Securable
- Scalable Securable

The security type is set at hardware design on a per-master and a per-slave basis. **Never Secure** and **Always Secure** security types are not software configurable.

The different security types have the following characteristics:

- **Never Secure** slaves have no security mode access restriction. Their address space is precisely set by design. Any out-of-address range access is denied and reported.
- **Always Secure** slaves can only be accessed by a secure master request. Their address space is precisely set by design. Any non-secure or out-of-address range access is denied and reported.
- **Internal Securable** is intended for internal RAM. The Internal Securable slave has one slave region which has a hardware fixed base address and Security Region Top. This slave region may be split through software configuration into one Non-secure area plus one Secure area. Inside the slave security region, the split boundary is programmable in powers of 2 from 4 Kbytes up to the full slave security region address space. The security area located below the split boundary may be configured as the Non-secure or the Secure one. The Securable area may be independently configured as Read Secured and/or Write Secured. Any access with security or address range violation is denied and reported.
- **External Securable** is intended for external memories on the EBI, such as DDR, SDRAM, external ROM or NAND Flash. The External Securable slave has identical features as the Internal Securable slave, plus the ability to configure each of its slave security region address space sizes according to the external memory parts used. This avoids mirroring Secure areas into Non-secure areas, and further restricts the overall accessible address range. Any access with security or configured address range violation is denied and reported.

- **Scalable Securable** is intended for external memories with a dedicated slave, such as DDR. The Scalable Securable slave is divided into a fixed number of scalable, equally sized, and contiguous security regions. Each of them can be split in the same way as for Internal or External Securable slaves. The security region size must be configured by software, so that the equally-sized regions fill the actual available memory. This avoids mirroring Secure areas into Non-secure areas, and further restricts the overall accessible address range. Any access with security or configured address range violation is denied and reported.

As the security type is set at hardware design on a per-master and per-slave basis, it is possible to set some slave access security as configurable from one or some particular masters, and to set the access as Always Secure from all the other masters.

As the security type is set by design at the slave region level, different security region types can be mixed inside a single slave.

Likewise, the mapping base address and the accessible address range of each slave or slave region may have been hardware-restricted on a per-master basis from no access to full slave address space.

### 18.12.1.2 Examples

The following table shows an example of Security Type settings.

**Table 18-8. Security Type Setting Example**

Slave	Master0	Master1	Master2
Slave0 Internal Memory	Never Secure	Internal Securable 1 region	Internal Securable 1 region
Slave1 EBI	External Securable 2 regions	Always Secure	External Securable 2 regions

This example is constructed with the following characteristics:

- Slave0 is an Internal Memory containing one region:
  - The Access from Master0 to Slave0 is Never Secure
  - The access from Master1 and Master2 to Slave0 is Internal Securable with one region and with the same software configuration (Choice of SASPLIT0 and the security configuration bits LANSECH, RDNSECH, WRNSECH).
- Slave1 is an EBI containing two regions:
  - The Access from Master1 to Slave1 is Always Secure
  - The access from Master0 and Master2 to Slave1 is External Securable with two regions and with the same software configuration (Choice of SRTOP0, SRTOP1, SASPLIT0, SASPLIT1 and the security configuration bits LANSECH, RDNSECH, WRNSECH).

The figure below shows an Internal Securable slave example. This example is constructed with the following hypothesis:

- The slave is an Internal Memory containing one region. The Slave region max size is 4 Mbytes.
- The slave region 0 base address equals 0x10000000. Its top size is 512 Kbytes (hardware configuration).
- The slave software configuration is:
  - SASPLIT0 is set to 256 Kbytes
  - LANSECH0 is set to 0, the low area of region 0 is the securable one

- RDNSECH0 is set to 0, region 0 Securable area is secured for reads
- WRNSECH0 is set to 0, region 0 Securable area is secured for writes

**Figure 18-2. Partitioning Example of an Internal Securable Slave Featuring 1 Security Region of 512 Kbytes Split into 1 or 2 Security Areas of 4 Kbytes to 512 Kbytes**

**Note:** The slave security areas split inside the security region are configured by writing into the [Security Areas Split Slave Registers](#).

The figure below shows an External Securable slave example. This example is constructed with the following hypothesis:

- The slave is an interface with the external bus (EBI) containing two regions. The slave size is 2 × 256 Mbytes. Each slave region max size is 256 Mbytes.

- The slave region 0 base address equals 0x10000000. It is connected to a 32 Mbyte memory, for example an external DDR. The slave region 0 top size must be set to 32 Mbytes.
- The slave region 1 base address equals 0x20000000. It is connected to a 2 Mbyte memory, for example an external NAND Flash. The slave region 1 top size must be set to 2 Mbytes.
- The slave software configuration is:
  - SRTOP0 is set to 32 Mbytes
  - SRTOP1 is set to 2 Mbytes
  - SASPLIT0 is set to 4 Mbytes
  - SASPLIT1 is set to 1 Mbyte
  - LANSECH0 is set to 1, the low area of region 0 is the non-securable one
  - RDNSECH0 is set to 0, region 0 Securable area is secured for reads
  - WRNSECH0 is set to 0, region 0 Securable area is secured for writes
  - LANSECH1 is set to 0, the low area of region 1 is the Securable one
  - RDNSECH1 is set to 1, region 1 Securable area is non-secured for reads
  - WRNSECH1 is set to 0, region 1 Securable area is secured for writes

**Figure 18-3. Partitioning Example of an External Securable Slave Featuring 2 Security Regions of 4 Kbytes to 128 Mbytes each and up to 4 Security Areas of 4 Kbytes to 128 Mbytes**

**Note:** The slave region sizes are configured by writing into the [Security Region Top Slave Registers](#).

The slave security area split inside each region is configured by writing into the [Security Areas Split Slave Registers](#).

The figure below shows a Scalable Securable slave example. This example is constructed with the following hypothesis:

- The slave is an external memory with dedicated slave containing four regions, for example an external DDR.
- The slave size is 512 Mbytes.
- The slave base address equals 0x40000000. It is connected to a 256-Mbyte external memory.
- As the connected memory size is 256 Mbytes and there are four regions, the size of each region is 64 Mbytes. This gives the value of the slave region max size and top size. The slave region 0 top size must be configured to 64 Mbytes.
- The slave software configuration is:
  - SRTOP0 is set to 64 Mbytes
  - SASPLIT0 is set to 4 Kbytes
  - SASPLIT1 is set to 64 Mbytes, so its low area occupies the whole region 1
  - SASPLIT2 is set to 4 Kbytes
  - SASPLIT3 is set to 32 Mbytes
  - LANSECH0 is set to 0, the low area of region 0 is the Securable one
  - RDNSECH0 is set to 1, region 0 Securable area is non-secured for reads
  - WRNSECH0 is set to 0, region 0 Securable area is secured for writes
  - LANSECH1 is set to 1, the low area of region 1 is the non-securable one
  - RDNSECH1 is 'don't care' since the low area occupies the whole region 1
  - WRNSECH1 is 'don't care' since the low area occupies the whole region 1
  - LANSECH2 is set to 1, the low area of region 2 is the non-securable one
  - RDNSECH2 is set to 0, region 2 Securable area is secured for reads
  - WRNSECH2 is set to 0, region 2 Securable area is secured for writes
  - LANSECH3 is set to 0, the low area of region 3 is the Securable one
  - RDNSECH3 is set to 0, region 3 Securable area is secured for reads
  - WRNSECH3 is set to 0, region 3 Securable area is secured for writes

**Figure 18-4. Partitioning Example of a Scalable Securable Slave Featuring 4 Equally-sized Security Regions of 1 Mbytes to 128 Mbytes each and up to 8 Security Areas of 4 Kbytes to 128 Mbytes**

**Note:** The slaves' generic security regions sizes are configured by writing into field SRTOP0 of the [Security Region Top Slave Registers](#) and the custom slave security areas splits inside each region is configured by writing into the [Security Areas Split Slave Registers](#).

### 18.12.2 Security Types of SDMMC System Bus Slaves

The SDMMC user interface is connected as a system bus slave, and must be configured as Internal Securable to Peripheral (ISP).

Each region in the “Internal Securable to Peripheral” slave type must be programmed with the following characteristics:

- The region must be programmed to be entirely secure or entirely non-secure. This is done with:
  - The split offset must be equal to the maximum size of 128 Mbytes so that the whole peripheral user interface is in the low area below the split. Code sample:  
MATRIX\_SASSRx.SASPLITy = 0xF
  - The bits WRNSECH and RDNSECH must be set respectively to 0=“write secured” and 0=“read secured”. Code sample: MATRIX\_SSRx.WRNSECHy = 0;  
MATRIX\_SSRx.RDNSECHy = 0;
  - To set the peripheral to “secure”: the bit LANSECHy must be set to 0 (low area according to RDNSECH0 and WRNSECH0, hence secure).
  - To set the peripheral to “non-secure”: the bit LANSECHy must be set to 1 (low area is non-secure).  
**Note:** The MATRIX\_SRTSRx register is not applicable for the “Internal Securable to Peripheral” type.
- The Security Peripheral Select registers (MATRIX\_SPSELRx) must be set to the same security attributes for the corresponding Peripheral identifiers: MATRIX\_SPSELRx.NSECPy.

### 18.12.3 Security Types of System Bus Masters

Masters send requests to the MATRIX with a security attribute that depends on the master security type, which is identical to the security type of the slave user interface.

For DMA, the TrustZone security attribute can be selected for each channel. Refer to the XDMAC user interface description.

### 18.12.4 Security of Peripheral Bus Slaves

The security type of an APB slave is set at hardware design among the following:

- Always Secure (AS)
- Never Secure (NS)
- Programmable Secure (PS)

To configure the security mode required for accessing a peripheral bus slave connected to the system-to-peripheral bus bridge (HBRIDGE), the MATRIX features three 32-bit [Security Peripheral Select x Registers](#). Some of these bits may have been set to a secure or a non-secure value by design, whereas others are programmed by software (see “[Security Peripheral Select x Registers](#)”).

Peripheral security state, “secure” or “non-secure” is an AND operation between H32MX MATRIX\_SPSELRx and H64MX MATRIX\_SPSELRx for the bit corresponding to the peripheral.

As a general rule:

- The peripheral security state is applied to the corresponding peripheral interrupt line. Exceptions may occur on some peripherals (PIO Controller, etc.). In such case, refer to the peripheral description.
- The peripheral security state is applied to the peripheral master part, if any. Exceptions may occur on some peripherals. In such case, refer to the peripheral description. See “[Security Types of AHB Master Peripherals](#)”.

MATRIX\_SPSELRx bits in the H32MX or H64MX user interface are respectively read/write or read-only to '1' depending on whether the peripheral is connected or not, on the matrix.

All bit values in the following table except those marked 'UD' (User Defined) are read-only and cannot be changed. Values marked 'UD' can be changed. Refer to the following examples.

- Example for GMAC, Peripheral ID 5, which is connected to the H32MX Matrix
  - H64MX MATRIX\_SPSELR1[5] = 1 (read-only); no influence on the security configuration
  - H32MX MATRIX\_SPSELR1[5] can be written by user to program the security.
- Example for LCD, Peripheral ID 45, which is connected to the H64MX Matrix
  - H64MX MATRIX\_SPSELR2[13] can be written by user to program the security.
  - H32MX MATRIX\_SPSELR2[13] = 1 (read-only); no influence on the security configuration
- Example for AIC, Peripheral ID 49, which is connected to the H32MX Matrix
  - H64MX MATRIX\_SPSELR2[17] = 1 (read-only); sets the peripheral as Non-secure by hardware, also called "Never Secure"
  - H32MX MATRIX\_SPSELR2[17] = 1 (read-only); no influence on the security configuration
- Example for SAIC, Peripheral ID 0, which is connected to the H32MX Matrix
  - H64MX MATRIX\_SPSELR1[0] = 1 (read-only); no influence on the security configuration
  - H32MX MATRIX\_SPSELR1[0] = 0 (read-only); sets the peripheral as Secure by hardware, also called "Always Secure"

**Table 18-9. Peripheral Identifiers**

Instance ID	Instance Name	Internal Interrupt	PMC Clock Control	Instance Description	Clock Type	Security <sup>(1)</sup>	In Matrix	MATRIX_SPSELRx Bit	Bit Value in H32MX	Bit Value in H64MX

78	CHIPID	–	–	Chip ID	–	PS	H32MX	MATRIX_SPSELR3[14]	UD	1

**Note:**

1. AS = Always Secure; PS = Programmable Secure; NS = Never Secure.
2. For security purposes, there is no matching clock but a peripheral ID only.
3. The PIT, RSTC and WDT are controlled by the RTC. They are in Secure mode if the RTC is in Secure mode; they are in Non-secure mode if the RTC is in Non-secure mode.

The system-to-peripheral bus bridge compares the incoming master request security bit with the required security mode for the selected peripheral, and accepts or denies access. In the last case, its bus error response is internally flagged in the [Master Error Status Register](#); the offending address is registered in the [Master Error Address Registers](#) so that the slave and the targeted protected region are also known.

### 18.13 Register Summary

The user interface below is constructed with the maximum numbers of masters, slaves and regions by slave that are possible on the two product matrixes. The exact number of these elements must be used to deduce the exact register description of the Matrix user interface.

The exact numbers of these elements can be found in the following sections:

- [“64-bit Matrix \(H64MX\)”](#)
- [“32-bit Matrix \(H32MX\)”](#)

### 18.13.1 Bus Matrix Master Configuration Registers

**Name:** MATRIX\_MCFGx  
**Offset:** 0x00 + x\*0x04 [x=0..11]  
**Reset:** 0x00000004  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

#### Bits 2:0 – ULBT[2:0] Undefined Length Burst Type

Value	Name	Description
0	UNLIMITED	Unlimited Length Burst—No predicted end of burst is generated, therefore INCR bursts coming from this master can only be broken if the Slave Slot Cycle Limit is reached. If the Slot Cycle Limit is not reached, the burst is normally completed by the master, at the latest, on the next system bus 1 Kbyte address boundary, allowing up to 256-beat word bursts or 128-beat double-word bursts.  This value should not be used in the very particular case of a master capable of performing back-to-back undefined length bursts on a single slave, since this could indefinitely freeze the slave arbitration and thus prevent another master from accessing this slave.
1	SINGLE	Single Access—The undefined length burst is treated as a succession of single accesses, allowing re arbitration at each beat of the INCR burst or bursts sequence.
2	4_BEAT	4-beat Burst—The undefined length burst or bursts sequence is split into 4-beat bursts or less, allowing re arbitration every 4 beats.
3	8_BEAT	8-beat Burst—The undefined length burst or bursts sequence is split into 8-beat bursts or less, allowing re arbitration every 8 beats.

# SAMA5D2 Series

## Matrix (H64MX/H32MX)

Value	Name	Description
4	16_BEAT	16-beat Burst—The undefined length burst or bursts sequence is split into 16-beat bursts or less, allowing re arbitration every 16 beats.
5	32_BEAT	32-beat Burst—The undefined length burst or bursts sequence is split into 32-beat bursts or less, allowing re arbitration every 32 beats.
6	64_BEAT	64-beat Burst—The undefined length burst or bursts sequence is split into 64-beat bursts or less, allowing re arbitration every 64 beats.
7	128_BEAT	128-beat Burst—The undefined length burst or bursts sequence is split into 128-beat bursts or less, allowing re arbitration every 128 beats.  Unless duly needed, the ULBT should be left at its default 0 value for power saving.

### 18.13.2 Bus Matrix Slave Configuration Registers

**Name:** MATRIX\_SCFGx  
**Offset:** 0x40 + x\*0x04 [x=0..14]  
**Reset:** 0x00000004  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Greyed out bits]		FIXED_DEFMSTR[3:0]				DEFMSTR_TYPE[1:0]	
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	[Greyed out bits]							SLOT_CYCLE[8:8]
Access								R/W
Reset								0
Bit	7	6	5	4	3	2	1	0
	SLOT_CYCLE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	1	0	0

**Bits 21:18 – FIXED\_DEFMSTR[3:0]** Fixed Default Master

This is the number of the Default Master for this slave. Only used if DEFMSTR\_TYPE value = 2. Specifying the number of a master which is not connected to the selected slave is equivalent to clearing DEFMSTR\_TYPE.

**Bits 17:16 – DEFMSTR\_TYPE[1:0]** Default Master Type

Value	Name	Description
0	NONE	No Default Master—At the end of the current slave access, if no other master request is pending, the slave is disconnected from all masters.  This results in a one clock cycle latency for the first access of a burst transfer or for a single access.
1	LAST	Last Default Master—At the end of the current slave access, if no other master request is pending, the slave stays connected to the last master having accessed it.  This results in not having one clock cycle latency when the last master tries to access the slave again.

Value	Name	Description
2	FIXED	Fixed Default Master—At the end of the current slave access, if no other master request is pending, the slave connects to the fixed master the number that has been written in the FIXED_DEFMSTR field.  This results in not having one clock cycle latency when the fixed master tries to access the slave again.

### Bits 8:0 – SLOT\_CYCLE[8:0] Maximum Bus Grant Duration for Masters

When SLOT\_CYCLE system bus clock cycles have elapsed since the last arbitration, a new arbitration takes place to let another master access this slave. If another master is requesting the slave bus, then the current master burst is broken.

If SLOT\_CYCLE = 0, the Slot Cycle Limit feature is disabled and bursts always complete unless broken according to the ULBT.

This limit has been placed in order to enforce arbitration so as to meet potential latency constraints of masters waiting for slave access.

This limit must not be too small. Unreasonably small values break every burst and the MATRIX arbitrates without performing any data transfer. The default maximum value is usually an optimal conservative choice.

In most cases, this feature is not needed and should be disabled for power saving.

See [“Slot Cycle Limit Arbitration”](#) for details.

### 18.13.3 Bus Matrix Priority Registers A For Slaves

**Name:** MATRIX\_PRASx  
**Offset:** 0x80 + x\*0x08 [x=0..14]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

	Bit	31	30	29	28	27	26	25	24
		M7PR[1:0]				M6PR[1:0]			
Access				R/W	R/W			R/W	R/W
Reset				0	0			0	0
	Bit	23	22	21	20	19	18	17	16

Access				R/W	R/W			R/W	R/W
Reset				0	0			0	0

**Bits 0:1, 4:5, 8:9, 12:13, 16:17, 20:21, 24:25, 28:29 – MPR Master x Priority**

Fixed priority of Master x for accessing the selected slave. The higher the number, the higher the priority.

All the masters programmed with the same MxPR value for the slave make up a priority pool.

Round-robin arbitration is used in the lowest (MxPR = 0) and highest (MxPR = 3) priority pools.

Fixed priority is used in intermediate priority pools (MxPR = 1) and (MxPR = 2).

See [“Arbitration Priority Scheme”](#) for details.

### 18.13.4 Bus Matrix Priority Registers B For Slaves

**Name:** MATRIX\_PRBSx  
**Offset:** 0x84 + x\*0x08 [x=0..14]  
**Reset:** 0  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

**Bits 0:1, 4:5, 8:9, 12:13 – MPR Master x Priority**

Fixed priority of Master x for accessing the selected slave. The higher the number, the higher the priority.

All the masters programmed with the same MxPR value for the slave make up a priority pool.

Round-robin arbitration is used in the lowest (MxPR = 0) and highest (MxPR = 3) priority pools.

Fixed priority is used in intermediate priority pools (MxPR = 1) and (MxPR = 2).

See [“Arbitration Priority Scheme”](#) for details.

**18.13.5 Master Error Interrupt Enable Register**

**Name:** MATRIX\_MEIER  
**Offset:** 0x0150  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – WRNSECHx** Write Non-secured for HSELx Security Region Securable Area access rights:

WRNSECHx / RDNSECHx	Non-secure Access	Secure Access
00	Denied	Read/Write
01	Read	Read/Write
10	Write	Read/Write
11	Read/Write	Read/Write

Value	Description
0	The HSELx AHB slave security region is split into one write secured and one write non-secured area, according to LANSECHx and MATRIX_SASSR.SASPLITx. That is, the so-defined secure high or low area is secured for Write access.
1	The HSELx AHB slave security region is non-secured for Write access.

**Bits 8, 9, 10, 11, 12, 13, 14, 15 – RDNSECHx** Read Non-secured for HSELx Security Region

# SAMA5D2 Series

## Matrix (H64MX/H32MX)

Value	Description
0	The HSELx AHB slave security region is split into one read secured and one read non-secured area, according to LANSECHx and MATRIX_SASSR.SASPLITx. That is, the so-defined secure high or low area is secured for Read access.
1	The HSELx AHB slave security region is non-secure for Read access.

### Bits 0, 1, 2, 3, 4, 5, 6, 7 – LANSECHx Low Area Non-secure in HSELx Security Region

Value	Description
0	The security of the HSELx AHB slave area lying below the corresponding MATRIX_SASSR.SASPLITx boundary is configured according to RDNSECHx and WRNSECHx. The entire remaining HSELx upper address space is configured as Non-secure access.
1	The HSELx AHB slave address area lying below the corresponding MATRIX_SASSR.SASPLITx boundary is configured as Non-secure access, and the entire remaining upper address space according to RDNSECHx and WRNSECHx.

### 18.13.13 Security Areas Split Slave Registers

**Name:** MATRIX\_SASSRx  
**Offset:** 0x0240 + x\*0x04 [x=0..14]  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

**Bits 0:3, 4:7, 8:11, 12:15, 16:19, 20:23, 24:27, 28:31 – SASPLITx** Security Areas Split for HSELx Security Region

This field defines the boundary address offset where the HSELx slave security region splits into two Security Areas with access controlled according to the corresponding MATRIX\_SSR. It also defines the Security Low Area size inside the HSELx region.

If this Low Area size is set at or above the HSELx Region Size, then the Security High Area is no longer available and the MATRIX\_SSR settings for the Low Area apply to the entire HSELx Security Region.

When applicable to a slave region, the initial value of MATRIX\_SASSRx.SASPLITy is 0xF. When not applicable to a slave region, the initial value of MATRIX\_SASSRx.SASPLITy is 0x0.

SASPLITx	Split Offset	Security Low Area Size
0000	0x00001000	4 Kbytes
0001	0x00002000	8 Kbytes
0010	0x00004000	16 Kbytes
0011	0x00008000	32 Kbytes
0100	0x00010000	64 Kbytes
0101	0x00020000	128 Kbytes

# SAMA5D2 Series

## Matrix (H64MX/H32MX)

.....continued

SASPLITx	Split Offset	Security Low Area Size
0110	0x00040000	256 Kbytes

**Bits 0:3, 4:7, 8:11, 12:15, 16:19, 20:23, 24:27, 28:31 – SRTOPx** HSELx Security Region Top

This field defines the size of the HSELx security region address space. Invalid sizes for the slave region must never be programmed. Valid sizes and number of security regions are product-, slave- and slave-configuration dependent.

**Note:** The slaves featuring multiple scalable contiguous security regions have a single SRTOP0 field for all the security regions.

If this HSELx security region size is set at or below the HSELx low area size, then there is no Security High Area and the MATRIX\_SSR settings for the Low Area apply to the whole HSELx security region.

SRTOPx	Top Offset	Security Region Size

### 18.13.15 Security Peripheral Select x Registers

**Name:** MATRIX\_SPSELRx  
**Offset:** 0x02C0 + x\*0x04 [x=0..2]  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

The actual number of peripherals implemented is device-specific; refer to the “Peripheral Identifiers” section for details.

Each MATRIX\_SPSELR can configure the access security type for up to 32 peripherals:

- MATRIX\_SPSELR1 configures the access security type for peripheral identifiers 0–31 (bits NSECP0–NSECP31).
- MATRIX\_SPSELR2 configures the access security type for peripheral identifiers 32–63 (bits NSECP0–NSECP31).
- MATRIX\_SPSELR3 configures the access security type for peripheral identifiers 64–95 (bits NSECP0–NSECP31).

Reset values are as follows:

- MATRIX\_SPSELR1: 0x000D2504 for H32MX, 0xFFF2DAFB for H64MX
- MATRIX\_SPSELR2: 0x011C0000 for H32MX, 0xFFE7FFFF for H64MX
- MATRIX\_SPSELR3: 0xFFFFFFFF for H32MX, 0xFFFFFE7 for H64MX

Value	Description
0	The selected peripheral address space is configured as “Secured” access (value of ‘0’ has no effect if the peripheral security type is “Peripheral Always Non-secured”).

# SAMA5D2 Series

## Matrix (H64MX/H32MX)

Value	Description
1	The selected peripheral address space is configured as “Non-secured” access (value of ‘1’ has no effect if the peripheral security type is “Peripheral Always Secured”).

## **19. Special Function Registers (SFR)**

### **19.1 Description**

Special Function Registers (SFR) manage specific aspects of the integrated memory, bridge implementations, processor and other functionality not controlled elsewhere.

### **19.2 Embedded Characteristics**

- 32-bit Special Function Registers Control Specific Behavior of the Product

### 19.3.1 DDR Configuration Register

**Name:** SFR\_DDRCFG  
**Offset:** 0x04  
**Reset:** 0x00000001  
**Property:** Read/Write

**Bit 17 – FDQSIEN** Force DDR\_DQS Input Buffer Always On  
 FDQSIEN = 1 is used to force the selection of the analog comparator inside the IO. If this bit is cleared, the DDR controller automatically manages the selection of the analog comparator. Forcing the bit to 0 reduces power consumption.

Value	Description
0	DDR_DQS input buffer controlled by DDR controller.
1	DDR_DQS input buffer always on.

**Bit 16 – FDQIEN** Force DDR\_DQ Input Buffer Always On  
 FDQIEN = 1 is used to force the selection of the analog comparator inside the IO. If this bit is cleared, the DDR controller automatically manages the selection of the analog comparator. Forcing the bit to 0 reduces power consumption.

Value	Description
0	DDR_DQ input buffer controlled by DDR controller.
1	DDR_DQ input buffer always on.

### 19.3.2 OHCI Interrupt Configuration Register

**Name:** SFR\_OHCIICR  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24	
					HSIC_SEL				
Access					R/W				
Reset					0				
Bit	23	22	21	20	19	18	17	16	
	UDPPUDIS								
Access	R/W								
Reset	0								
Bit	15	14	13	12	11	10	9	8	
						SUSPEND_C	SUSPEND_B	SUSPEND_A	
Access						R/W	R/W	R/W	
Reset						0	0	0	
Bit	7	6	5	4	3	2	1	0	
			APPSTART	ARIE			RES2	RES1	RES0
Access							R/W	R/W	R/W
Reset			0	0			0	0	0

**Bit 27 – HSIC\_SEL** Reserved

Value	Description
0	Must write 0.

**Bit 23 – UDPPUDIS** USB DEVICE PULLUP DISABLE

Value	Description
0	USB device pullup connection is enabled.
1	USB device pullup connection is disabled.

**Bit 10 – SUSPEND\_C** USB PORT C

Value	Description
0	Suspends controlled by EHCI-OHCI.
1	Forces the suspend for PORTC.

**Bit 9 – SUSPEND\_B** USB PORT B

Value	Description
0	Suspend controlled by EHCI-OHCI.
1	Forces the suspend for PORTB.

---

---

**Bit 8 – SUSPEND\_A** USB PORT A

Value	Description
0	Suspends controlled by EHCI-OHCI.
1	Forces the suspend for PORTA.

**Bit 5 – APPSTART** Reserved

Value	Description
0	Must write 0.

**Bit 4 – ARIE** OHCI Asynchronous Resume Interrupt Enable

Value	Description
0	Interrupt disabled.
1	Interrupt enabled.

**Bits 0, 1, 2 – RESx** USB PORTx RESET

Value	Description
0	Resets USB Port.
1	Usable USB Port.

### 19.3.3 OHCI Interrupt Status Register

**Name:** SFR\_OHCIISR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Read/Write

**Bit 0 – RISx** OHCI Resume Interrupt Status Port x

Value	Description
0	OHCI port resume not detected.
1	OHCI port resume detected.

### 19.3.4 Security Configuration Register

**Name:** SFR\_SECURE  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 8 – FUSE** Disable Access to Fuse Controller

This bit is writable once only. When the Fuse Controller is secured, only a reset signal can clear this bit.

Value	Description
0	Fuse Controller is enabled.
1	Fuse Controller is disabled.

**Bit 0 – ROM** Disable Access to ROM Code

This bit is writable once only. When the ROM is secured, only a reset signal can clear this bit.

Value	Description
0	ROM is enabled.
1	ROM is disabled.

### 19.3.5 UTMI Clock Trimming Register

**Name:** SFR\_UTMICKTRIM  
**Offset:** 0x30  
**Reset:** 0x00010000  
**Property:** Read/Write

**Bits 17:16 – VBG[1:0]** UTMI Band Gap Voltage Trimming

**Bits 1:0 – FREQ[1:0]** UTMI Reference Clock Frequency

Value	Name	Description
0	12	12 MHz reference clock
1	16	16 MHz reference clock
2	24	24 MHz reference clock
3	12	12 MHz reference clock

### 19.3.6 UTMI High-Speed Trimming Register

**Name:** SFR\_UTMIHSTRIM  
**Offset:** 0x34  
**Reset:** 0x00044433  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
						SLOPE2[2:0]		
Access						R/W	R/W	R/W
Reset						1	0	0
Bit	15	14	13	12	11	10	9	8
		SLOPE1[2:0]				SLOPE0[2:0]		
Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		1	0	0		1	0	0
Bit	7	6	5	4	3	2	1	0
		DISC[2:0]				SQUELCH[2:0]		
Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		0	1	1		0	1	1

**Bits 8:10, 12:14, 16:18 – SLOPE<sub>x</sub>** UTMI HS PORT<sub>x</sub> Transceiver Slope Trimming  
 Calibration bits to adjust HS Transceiver output slope for PORT<sub>x</sub>.

**Bits 6:4 – DISC[2:0]** UTMI Disconnect Voltage Trimming  
 Calibration bits to adjust disconnect threshold.

**Bits 2:0 – SQUELCH[2:0]** UTMI HS SQUELCH Voltage Trimming  
 Calibration bits to adjust squelch threshold.

### 19.3.7 UTMI Full-Speed Trimming Register

**Name:** SFR\_UTMIFSTRIM  
**Offset:** 0x38  
**Reset:** 0x00430211  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
			ZP[2:0]					ZN[2:0]	
Access		R/W	R/W	R/W		R/W	R/W	R/W	
Reset		1	0	0		0	1	1	
Bit	15	14	13	12	11	10	9	8	
							XCVR[1:0]		
Access							R/W	R/W	
Reset							1	0	
Bit	7	6	5	4	3	2	1	0	
			FALL[2:0]					RISE[2:0]	
Access		R/W	R/W	R/W		R/W	R/W	R/W	
Reset		0	0	1		0	0	1	

**Bits 22:20 – ZP[2:0]** FS Transceiver PMOS Impedance Trimming  
Calibration bits to adjust the FS transceiver PMOS output impedance.

**Bits 18:16 – ZN[2:0]** FS Transceiver NMOS Impedance Trimming  
Calibration bits to adjust the FS transceiver NMOS output impedance.

**Bits 9:8 – XCVR[1:0]** FS Transceiver Crossover Voltage Trimming  
Calibration bits to adjust the FS transceiver crossover voltage.

**Bits 6:4 – FALL[2:0]** FS Transceiver Output Falling Slope Trimming  
Calibration bits to adjust the FS transceiver output falling slope.

**Bits 2:0 – RISE[2:0]** FS Transceiver Output Rising Slope Trimming  
Calibration bits to adjust the FS transceiver output rising slope.

### 19.3.8 UMTI DP/DM Pin Swapping Register

**Name:** SFR\_UTMISWAP  
**Offset:** 0x3C  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 0, 1, 2 – PORTx** PORT x DP/DM Pin Swapping

0 (NORMAL): DP/DM normal pinout.

1 (SWAPPED): DP/DM swapped pinout.

### 19.3.9 CAN Memories Address-based Register

**Name:** SFR\_CAN  
**Offset:** 0x48  
**Reset:** 0x00200020  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
EXT_MEM_CAN1_ADDR[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
EXT_MEM_CAN1_ADDR[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	1	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
EXT_MEM_CAN0_ADDR[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
EXT_MEM_CAN0_ADDR[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	1	0	0	0	0	0

**Bits 31:16 – EXT\_MEM\_CAN1\_ADDR[15:0] MSB CAN1 DMA Base Address**

Gives the 16-bit MSB of the CAN1 DMA base address. The 16-bit LSB must be programmed in the CAN1 user interface.

**Bits 15:0 – EXT\_MEM\_CAN0\_ADDR[15:0] MSB CAN0 DMA Base Address**

Gives the 16-bit MSB of the CAN0 DMA base address. The 16-bit LSB must be programmed in the CAN0 user interface.

### 19.3.10 Serial Number 0 Register

**Name:** SFR\_SN0  
**Offset:** 0x4C  
**Reset:** –  
**Property:** Read-only

This register is used to read the first 32 bits of the 64-bit Serial Number (unique ID).

Bit	31	30	29	28	27	26	25	24
	SN0[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16

Access	R	R	R	R	R	R	R	R
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	SN0[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	SN0[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	–	–	–	–	–	–	–	–

**Bits 31:0 – SN0[31:0] Serial Number 0**

### 19.3.11 Serial Number 1 Register

**Name:** SFR\_SN1  
**Offset:** 0x50  
**Reset:** –  
**Property:** Read-only

This register is used to read the last 32 bits of the 64-bit Serial Number (unique ID).

Bit	31	30	29	28	27	26	25	24
	SN1[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	SN1[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	SN1[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	SN1[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	–	–	–	–	–	–	–	–

**Bits 31:0 – SN1[31:0]** Serial Number 1

**19.3.12 AIC Interrupt Redirection Register**

**Name:** SFR\_AICREDIR  
**Offset:** 0x54  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
AICREDIRKEY[30:23]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
AICREDIRKEY[22:15]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
AICREDIRKEY[14:7]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
AICREDIRKEY[6:0]								NSAIC
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:1 – AICREDIRKEY[30:0] Unlock Key**

Value is a XOR between 0xb6d81c4d and SN1[31:0] but only field [31:1] of the result must be written in this field. In case of set in Secure mode by fuse configuration, this register is read\_only 0 (it is not possible to redirect secure interrupts on non-secure AIC for products set in secure mode for security reasons).

After three tries, entering a wrong key results in locking the NSAIC bit. A reset is needed.

**Bit 0 – NSAIC Interrupt Redirection to Non-Secure AIC**

Value	Description
0	Interrupts are managed by the AIC corresponding to the Secure State of the peripheral (secure AIC or non-secure AIC).
1	All interrupts are managed by the non-secure AIC.

### 19.3.13 HRAMC L2CC Register

**Name:** SFR\_L2CC\_HRAMC  
**Offset:** 0x58  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is used to configure the L2 cache to be used as an internal SRAM.

#### Bit 0 – SRAM\_SEL SRAM Selector

Value	Description
0	Selects SRAM.
1	Selects L2CC.

### 19.3.14 I2S Register

**Name:** SFR\_I2SCLKSEL  
**Offset:** 0x90  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 1 – CLKSEL1** Clock Selection 1

Value	Description
0	Selects PCLK (peripheral clock).
1	Selects GCLK.

**Bit 0 – CLKSEL0** Clock Selection 0

Value	Description
0	Selects PCLK (peripheral clock).
1	Selects GCLK.

### 19.3.15 QSPI Clock Pad Supply Select Register

**Name:** QSPICLK\_REG  
**Offset:** 0x94  
**Reset:** 0x1  
**Property:** Read/Write

#### Bit 0 – SUP\_SEL Supply Selection

Value	Description
0	1.8V supply selected.
1	3.3V supply selected.

## **20. Special Function Registers Backup (SFRBU)**

### **20.1 Description**

Special Function Registers Backup (SFRBU) manages specific aspects of the integrated memory, bridge implementations, processor and other functionality not controlled elsewhere.

### **20.2 Embedded Characteristics**

- 32-bit Special Function Registers Backup Controls Specific Behavior of the Product

### 20.3 Register Summary

Offset	Name	Bit Pos.									
0x00	SFRBU_PSWBUCT RL	7:0					STATE	SMCTRL	SSWCTRL	SCTRL	
		15:8	KEY_PSW_MODE[7:0]								
		23:16	KEY_PSW_MODE[15:8]								
		31:24	KEY_PSW_MODE[23:16]

### 20.3.1 SFRBU Power Switch BU Control Register

**Name:** SFRBU\_PSWBUCTRL  
**Offset:** 0x00  
**Reset:** 0x09  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	KEY_PSW_MODE[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	KEY_PSW_MODE[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	KEY_PSW_MODE[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
					STATE	SMCTRL	SSWCTRL	SCTRL
Access					R	R/W	R/W	R/W
Reset					1	0	0	1

**Bits 31:8 – KEY\_PSW\_MODE[23:0]** Specific value mandatory to allow writing of other register bits (Write-only)

This field is a security key to prevent power switch changes due to software error or malicious code.

Value	Description
0x4BD20C	SFRBU_PSWBUCTRL register write possible.
Other values	SFRBU_PSWBUCTRL register write impossible.

**Bit 3 – STATE** Power Switch BU state (Read-only)

Reflects the power switch BU supply source selection in real time. After a switching request, the user must wait for the analog cell switching time to have an updated status (see the section "Electrical Characteristics").

Value	Description
0	LDO BU Supply source is VDDBU.
1	LDO BU Supply source is VDDANA.

**Bit 2 – SMCTRL** Allow Power Switch BU Control by Security Module Autobackup (Hardware)

Enables automatic selection of the VDDBU source when the security module enters Backup mode.

# SAMA5D2 Series

## Special Function Registers Backup (SFRBU)

This automatic supply source switching is independent from the SCTRL and SSWCTRL bits.

Value	Description
0	Reset value. No automatic supply source switching from security module.
1	Automatic supply source switching from security module activated.

### Bit 1 – SSWCTRL Power Switch BU Source Selection

Has an action only if SCTRL bit value is “1”.

Value	Description
0	Reset value. LDO Supply source is VDDBU.
1	LDO Supply source is VDDANA.

### Bit 0 – SCTRL Power Switch BU Software Control

Used to control the Power Switch BU state by software in addition to the SSWCTRL bit.

Value	Description
0	Power Switch BU is controlled by hardware (SSWCTRL bit has no action).
1	Reset value. Power Switch BU is controlled by software (SSWCTRL bit has an action).

### 20.3.2 SFRBU Temperature Sensor Range Configuration Register

**Name:** SFRBU\_TSRANGECFG  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bit 0 – TSHRSEL Temperature Sensor Range Selection

Value	Description
0	Reset value. Temperature sensor high triggering level is +105°C (internal transistor junction temperature).
1	Temperature sensor high triggering level is +115°C (internal transistor junction temperature).

### 20.3.3 SFRBU DDR BU Mode Control Register

**Name:** SFRBU\_DDRBUMCR  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – BUMEN** DDR BU Mode Enable

Isolates the DDR pads from the CPU domain (VDDCORE).

Must be set after enabling the Self-refresh mode on the DDR memory and before powering down on VDDCORE.

To enable Self-refresh mode, refer to the MPDDRC Low-power register (MPDDRC\_LPR) in the section "Multi-port DDR-SDRAM Controller" and to "Backup Mode with DDR in Self-refresh" in the section "Electrical Characteristics".

Value	Description
0	Reset value. DDR Backup mode disabled. The DDR pads are not isolated from CPU domain.
1	DDR Backup mode enabled. The DDR pads are isolated from CPU domain (IOs are in memory state).

### 20.3.4 SFRBU RXLP Pull-Up Control Register

**Name:** SFRBU\_RXLPPUCR  
**Offset:** 0x14  
**Reset:** 0x01  
**Property:** Read/Write

**Bit 0 – RXDPUCTRL** RXLP RXD Pull-Up Control

If the RXLP is not used, it is recommended to clear this bit (enable the pull-up) to avoid power consumption on the VDDBU rail.

Value	Description
0	Reset value. Pull-up enabled on RXD IO.
1	Pull-up disabled on RXD IO.

## 21. Advanced Interrupt Controller (AIC)

### 21.1 Description

The Advanced Interrupt Controller (AIC) is an 8-level priority, individually maskable, vectored interrupt controller providing handling of up to one hundred and twenty-eight interrupt sources. It is designed to substantially reduce the software and real-time overhead in handling internal and external interrupts.

The AIC drives the nFIQ (fast interrupt request) and the nIRQ (standard interrupt request) inputs of an ARM processor. Inputs of the AIC are either internal peripheral interrupts or external interrupts coming from the product's pins.

The 8-level Priority Controller allows the user to define the priority for each interrupt source, thus permitting higher priority interrupts to be serviced even if a lower priority interrupt is being processed.

Internal interrupt sources can be programmed to be level-sensitive or edge-triggered. External interrupt sources can be programmed to be rising-edge or falling-edge triggered or high-level or low-level sensitive.

### 21.2 Embedded Characteristics

- Controls the Interrupt Lines (nIRQ and nFIQ) of an ARM Processor
- 128 Individually Maskable and Vectored Interrupt Sources
  - Source 0 is reserved for the fast interrupt input (FIQ)
  - Source 74 is reserved for system peripheral interrupts
  - Sources 2 to 73 and Sources 75 to 127 control up to 125 embedded peripheral interrupts or external interrupts
  - Programmable edge-triggered or level-sensitive internal sources
  - Programmable rising/falling edge-triggered or high/low level-sensitive external sources
- 8-level Priority Controller
  - Drives the normal interrupt of the processor
  - Handles priority of the interrupt sources 1 to 127
  - Higher priority interrupts can be served during service of lower priority interrupt
- Vectoring
  - Optimizes interrupt service routine branch and execution
  - One 32-bit vector register for all interrupt sources
  - Interrupt vector register reads the corresponding current interrupt vector
- Protect Mode
  - Easy debugging by preventing automatic operations when protect models are enabled
- General Interrupt Mask
  - Provides processor synchronization on events without triggering an interrupt
- Register Write Protection
- AIC0 is Non-Secure AIC, AIC1 is Secure AIC
- AIC0 manages nIRQ line, AIC1 manages nFIQ line

## 21.5 AIC Detailed Block Diagram

Figure 21-3. AIC Detailed Block Diagram

## 21.6 I/O Line Description

Table 21-1. I/O Line Description

Pin Name	Pin Description	Type
FIQ	Fast Interrupt	Input
IRQ0–IRQn	Interrupt 0–Interrupt n	Input

## 21.7 Product Dependencies

### 21.7.1 I/O Lines

The interrupt signals FIQ and IRQ0 to IRQn are normally multiplexed through the PIO controllers. Depending on the features of the PIO controller used in the product, the pins must be programmed in accordance with their assigned interrupt functions. This is not applicable when the PIO controller used in the product is transparent on the input path.

### 21.7.2 Power Management

The AIC is continuously clocked. The Power Management Controller has no effect on the AIC behavior.

The assertion of the AIC outputs, either nIRQ or nFIQ, wakes up the ARM processor while it is in Idle mode. The General Interrupt Mask feature enables the AIC to wake up the processor without asserting the interrupt line of the processor, thus providing synchronization of the processor on an event.

### 21.7.3 Interrupt Sources

FIQ always drives Interrupt Source 0.

The System Controller interrupt drives Interrupt Source 74.

The System Controller interrupt is the result of the OR-wiring of the System Controller interrupt lines. When a System Controller interrupt occurs, the service routine must first distinguish the cause of the interrupt. This is performed by reading successively the status registers of the System Controller peripherals.

Interrupt sources 2 to 73 and 75 to 127 can either be connected to the interrupt outputs of an embedded user peripheral, or to external interrupt lines. The external interrupt lines can be connected either directly or through the PIO Controller.

PIO controllers are considered as user peripherals in the scope of interrupt handling. Accordingly, the PIO controller interrupt lines are connected to interrupt sources 2 to 73 and 75 to 127.

The peripheral identification defined at the product level corresponds to the interrupt source number (as well as the bit number controlling the clock of the peripheral). Consequently, to simplify the description of the functional operations and the user interface, the interrupt sources are named FIQ, SYS, and PID2 to PID73 and PID75 to PID127.

AIC0 manages all Non-Secure Interrupts including IRQn; AIC1 manages all Secure Interrupts including FIQ.

Each AIC has its own User Interface. The user should pay attention to use the relevant user interface for each source.

## 21.8 Functional Description

### 21.8.1 Interrupt Source Control

#### 21.8.1.1 Interrupt Source Mode

The AIC independently programs each interrupt source. The SRCTYPE field of the Source Mode register (AIC\_SMR) selects the interrupt condition of the interrupt source selected by the INTSEL field of the Source Select register (AIC\_SSR).

**Note:** Configuration registers such as AIC\_SMR and AIC\_SSR return the values corresponding to the interrupt source selected by INTSEL.

The internal interrupt sources wired on the interrupt outputs of the embedded peripherals can be programmed either in Level-Sensitive mode or in Edge-Triggered mode. The active level of the internal interrupts is not important for the user.

The external interrupt sources can be programmed either in High Level-Sensitive or Low Level-Sensitive modes, or in Rising Edge-Triggered or Negative Edge-Triggered modes.

#### 21.8.1.2 Interrupt Source Enabling

Each interrupt source, including the FIQ in source 0, can be enabled or disabled by using the command registers Interrupt Enable Command register (AIC\_IECR) and Interrupt Disable Command register (AIC\_IDCR). The interrupt mask of the selected interrupt source can be read in the Interrupt Mask register (AIC\_IMR). A disabled interrupt does not affect servicing of other interrupts.

#### 21.8.1.3 Interrupt Clearing and Setting

All interrupt sources programmed to be edge-triggered (including the FIQ in source 0) can be individually set or cleared by writing respectively the Interrupt Set Command register (AIC\_ISCR) and Interrupt Clear

Command register (AIC\_ICCR). Clearing or setting interrupt sources programmed in Level-Sensitive mode has no effect.

The clear operation is perfunctory, as the software must perform an action to reset the “memorization” circuitry activated when the source is programmed in Edge-Triggered mode. However, the set operation is available for auto-test or software debug purposes. It can also be used to execute an AIC-implementation of a software interrupt.

The AIC features an automatic clear of the current interrupt when AIC\_IVR (Interrupt Vector register) is read. Only the interrupt source being detected by the AIC as the current interrupt is affected by this operation. (See the section “Priority Controller”.) The automatic clear reduces the operations required by the interrupt service routine entry code to read AIC\_IVR.

The automatic clear of interrupt source 0 is performed when the FIQ Vector register (AIC\_FVR) is read.

### 21.8.1.4 Interrupt Status

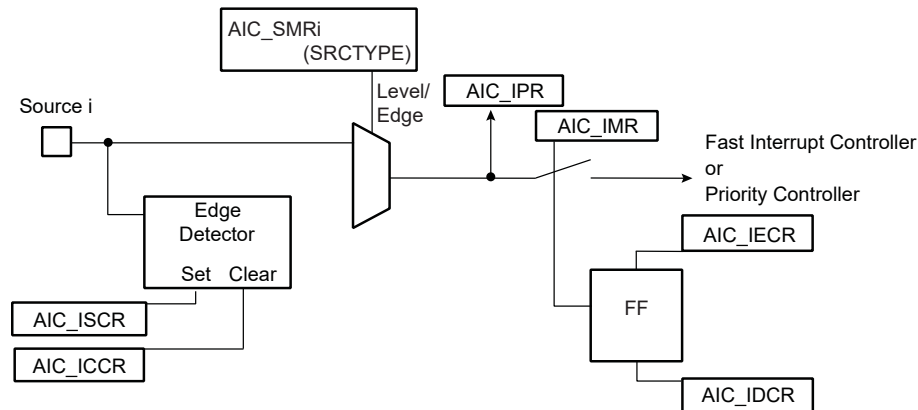

Interrupt Pending registers (AIC\_IPR) represent the state of the interrupt lines, whether they are masked or not. AIC\_IMR can be used to define the mask of the interrupt lines.

The Interrupt Status register (AIC\_ISR) reads the number of the current interrupt (see the section “Priority Controller”) and the Core Interrupt Status register (AIC\_CISR) gives an image of the nIRQ and nFIQ signals driven on the processor.

Each status referred to above can be used to optimize the interrupt handling of the systems.

### 21.8.1.5 Internal Interrupt Source Input Stage

**Figure 21-4. Internal Interrupt Source Input Stage**

**21.8.1.6 External Interrupt Source Input Stage**

**Figure 21-5. External Interrupt Source Input Stage**

**21.8.2 Interrupt Latencies**

Global interrupt latencies depend on several parameters, including:

- The time the software masks the interrupts
- Occurrence, either at the processor level or at the AIC level
- The execution time of the instruction in progress when the interrupt occurs
- The treatment of higher priority interrupts and the resynchronization of the hardware signals

This section addresses hardware resynchronizations only. It gives details about the latency times between the events on an external interrupt leading to a valid interrupt (edge or level) or the assertion of an internal interrupt source and the assertion of the nIRQ or nFIQ line on the processor. The resynchronization time depends on the programming of the interrupt source and on its type (internal or external). For the standard interrupt, resynchronization times are given assuming there is no higher priority in progress.

The PIO Controller multiplexing has no effect on the interrupt latencies of the external interrupt sources.

**21.8.2.1 External Interrupt Edge Triggered Source**

**Figure 21-6. External Interrupt Edge Triggered Source**

**21.8.2.2 External Interrupt Level Sensitive Source**

**Figure 21-7. External Interrupt Level Sensitive Source**

**21.8.2.3 Internal Interrupt Edge Triggered Source**

**Figure 21-8. Internal Interrupt Edge Triggered Source**

**21.8.2.4 Internal Interrupt Level Sensitive Source**

**Figure 21-9. Internal Interrupt Level Sensitive Source**

**21.8.3 Normal Interrupt**

**21.8.3.1 Priority Controller**

An 8-level priority controller drives the nIRQ line of the processor, depending on the interrupt conditions occurring on the interrupt sources 1 to 127.

Each interrupt source has a programmable priority level of 7 to 0, which is user-definable by writing AIC\_SMR.PRIOR. Level 7 is the highest priority and level 0 the lowest.

As soon as an interrupt condition occurs, as defined by AIC\_SMR.SRCTYPE, the nIRQ line is asserted. As a new interrupt condition might have happened on other interrupt sources since the nIRQ has been asserted, the priority controller determines the current interrupt at the time AIC\_IVR is read. The read of

AIC\_IVR is the entry point of the interrupt handling which allows the AIC to consider that the interrupt has been taken into account by the software.

The current priority level is defined as the priority level of the current interrupt.

If several interrupt sources of equal priority are pending and enabled when AIC\_IVR is read, the interrupt with the lowest interrupt source number is serviced first.

The nIRQ line can be asserted only if an interrupt condition occurs on an interrupt source with a higher priority. If an interrupt condition happens (or is pending) during the interrupt treatment in progress, it is delayed until the software indicates to the AIC the end of the current service by writing AIC\_EOICR (End of Interrupt Command register). The write of AIC\_EOICR is the exit point of the interrupt handling.

### 21.8.3.2 Interrupt Nesting

The priority controller utilizes interrupt nesting in order for the high priority interrupt to be handled during the service of lower priority interrupts. This requires the interrupt service routines of the lower interrupts to re-enable the interrupt at the processor level.

When an interrupt of a higher priority happens during an already occurring interrupt service routine, the nIRQ line is re-asserted. If the interrupt is enabled at the core level, the current execution is interrupted and the new interrupt service routine should read AIC\_IVR. At this time, the current interrupt number and its priority level are pushed into an embedded hardware stack, so that they are saved and restored when the higher priority interrupt servicing is finished and AIC\_EOICR is written.

The AIC is equipped with an 8-level wide hardware stack in order to support up to eight interrupt nestings to match the eight priority levels.

### 21.8.3.3 Interrupt Handlers

This section gives an overview of the fast interrupt handling sequence when using the AIC. It is assumed that the programmer understands the architecture of the ARM processor, and especially the Processor Interrupt modes and the associated status bits.

It is assumed that:

1. The AIC has been programmed, AIC\_SVR registers are loaded with corresponding interrupt service routine addresses and interrupts are enabled.
2. The instruction at the ARM interrupt exception vector address is required to work with the vectoring. Load the PC with the absolute address of the interrupt handler.

When nIRQ is asserted, if the bit "I" of CPSR is 0, the sequence is as follows:

1. The CPSR is stored in SPSR\_irq, the current value of the Program Counter is loaded in the Interrupt link register (R14\_irq) and the Program Counter (R15) is loaded with 0x18. In the following cycle during fetch at address 0x1C, the ARM core adjusts R14\_irq, decrementing it by four.
2. The ARM core enters Interrupt mode, if it has not already done so.
3. When the instruction loaded at address 0x18 is executed, the program counter is loaded with the value read in AIC\_IVR. Reading AIC\_IVR has the following effects:
  - Sets the current interrupt to be the pending and enabled interrupt with the highest priority. The current level is the priority level of the current interrupt.
  - De-asserts the nIRQ line on the processor. Even if vectoring is not used, AIC\_IVR must be read in order to de-assert nIRQ.
  - Automatically clears the interrupt, if it has been programmed to be edge-triggered.
  - Pushes the current level and the current interrupt number on to the stack.
  - Returns the value written in AIC\_SVR corresponding to the current interrupt.

4. The previous step has the effect of branching to the corresponding interrupt service routine. This should start by saving the link register (R14\_irq) and SPSR\_IRQ. The link register must be decremented by four when it is saved if it is to be restored directly into the program counter at the end of the interrupt. For example, the instruction `SUB PC, LR, #4` may be used.
5. Further interrupts can then be unmasked by clearing the “I” bit in CPSR, allowing re-assertion of the nIRQ to be taken into account by the core. This can happen if an interrupt with a higher priority than the current interrupt occurs.
6. The interrupt handler can then proceed as required, saving the registers that will be used and restoring them at the end. During this phase, an interrupt of higher priority than the current level will restart the sequence from step 1.  
**Note:** If the interrupt is programmed to be level-sensitive, the source of the interrupt must be cleared during this phase.
7. The “I” bit in CPSR must be set in order to mask interrupts before exiting to ensure that the interrupt is completed in an orderly manner.
8. AIC\_EOICR must be written in order to indicate to the AIC that the current interrupt is finished. This causes the current level to be popped from the stack, restoring the previous current level if one exists on the stack. If another interrupt is pending, with lower or equal priority than the old current level but with higher priority than the new current level, the nIRQ line is re-asserted, but the interrupt sequence does not immediately start because the “I” bit is set in the core. SPSR\_irq is restored. Finally, the saved value of the link register is restored directly into the PC. This has the effect of returning from the interrupt to whatever was being executed before, and of loading the CPSR with the stored SPSR, masking or unmasking the interrupts depending on the state saved in SPSR\_irq.  
**Note:** The “I” bit in SPSR is significant. If it is set, it indicates that the ARM core was on the verge of masking an interrupt when the mask instruction was interrupted. Hence, when SPSR is restored, the mask instruction is completed (interrupt is masked).

### 21.8.4 Fast Interrupt

#### 21.8.4.1 Fast Interrupt Source

Interrupt source 0 is the only source which can raise a fast interrupt request to the processor. Interrupt source 0 is generally connected to a FIQ pin of the product, either directly or through a PIO Controller.

#### 21.8.4.2 Fast Interrupt Control

The fast interrupt logic of the AIC has no priority controller. The mode of interrupt source 0 is programmed with AIC\_SMR and INTSEL = 0; the PRIOR field of this register is not used even if it reads what has been written. AIC\_SMR.SRCTYPE enables programming the fast interrupt source to be rising-edge triggered or falling-edge triggered or high-level sensitive or low-level sensitive.

Writing 0x1 in AIC\_IECR and AIC\_IDCR respectively enables and disables the fast interrupt when INTSEL = 0. Bit 0 of AIC\_IMR indicates whether the fast interrupt is enabled or disabled.

#### 21.8.4.3 Fast Interrupt Handlers

This section gives an overview of the fast interrupt handling sequence when using the AIC. It is assumed that the programmer understands the architecture of the ARM processor, and especially the Processor Interrupt modes and associated status bits.

Assuming that:

1. The AIC has been programmed, AIC\_SVR is loaded with the fast interrupt service routine address, and interrupt source 0 is enabled.

2. The Instruction at address 0x1C (FIQ exception vector address) is required to vector the fast interrupt. Load the PC with the absolute address of the interrupt handler.
3. The user does not need nested fast interrupts.

When nFIQ is asserted, if bit “F” of CPSR is 0, the sequence is:

1. The CPSR is stored in SPSR\_fiq, the current value of the program counter is loaded in the FIQ link register (R14\_fiq) and the program counter (R15) is loaded with 0x1C. In the following cycle, during fetch at address 0x20, the ARM core adjusts R14\_fiq, decrementing it by four.
2. The ARM core enters FIQ mode.
3. The routine must read AIC1\_CISR to know if the interrupt is the FIQ or a Secure Internal interrupt.

```
ldr r1, =REG_SAIC_CISR
ldr r1, [r1]
cmp r1, #AIC_CISR_NFIQ
beq get_fiqvec_addr
```

If FIQ is active, it is processed in priority, even if another interrupt is active.

```
get_irqvec_addr
ldr r14, =REG_SAIC_IVR
b read_vec
get_fiqvec_addr
ldr r14, =REG_SAIC_FVR
read_vec
ldr r0, [r14]
```

Now r0 contains the correct vector address, IVR for a Secure Internal interrupt or FVR for FIQ.

The system can branch to the routine pointed to by r0.

```
FIQ_Handler_Branch
mov r14, pc
bx r0
```

4. The previous step enables branching to the corresponding interrupt service routine. It is not necessary to save the link register R14\_fiq and SPSR\_fiq if nested fast interrupts are not needed.
5. The Interrupt Handler can then proceed as required. It is not necessary to save registers R8 to R13 because the FIQ mode has its own dedicated registers and registers R8 to R13 are banked. The other registers, R0 to R7, must be saved before being used, and restored at the end (before the next step).  
**Note:** If the fast interrupt is programmed to be level-sensitive, the source of the interrupt must be cleared during this phase in order to de-assert interrupt source 0.
6. Finally, Link register R14\_fiq is restored into the PC after decrementing it by four (with instruction SUB PC, LR, #4 for example). This has the effect of returning from the interrupt to whatever was being executed before, loading the CPSR with the SPSR and masking or unmasking the fast interrupt depending on the state saved in the SPSR.  
**Note:** The “F” bit in SPSR is significant. If it is set, it indicates that the ARM core was just about to mask FIQ interrupts when the mask instruction was interrupted. Hence, when the SPSR is restored, the interrupted instruction is completed (FIQ is masked).

Another way to handle the fast interrupt is to map the interrupt service routine at the address of the ARM vector 0x1C. This method does not use vectoring, so that reading AIC\_FVR must be performed at the very beginning of the handler operation. However, this method saves the execution of a branch instruction.

### 21.8.5 Protect Mode

The Protect mode is used to read the Interrupt Vector register without performing the associated automatic operations. This is necessary when working with a debug system. When a debugger, working either with a Debug Monitor or the ARM processor's ICE, stops the applications and updates the opened windows, it might read the AIC User Interface and thus the IVR. This has adverse consequences:

- If an enabled interrupt with a higher priority than the current one is pending, it is stacked.
- If there is no enabled pending interrupt, the spurious vector is returned.

In either case, an End of Interrupt command is necessary to acknowledge and restore the context of the AIC. This operation is generally not performed by the debug system, as the debug system would become strongly intrusive and cause the application to enter an undesired state.

This is avoided by using the Protect mode. Writing PROT in the Debug Control register (AIC\_DCR) at 0x1 enables the Protect mode.

When the Protect mode is enabled, the AIC performs interrupt stacking only when a write access is performed on AIC\_IVR. Therefore, the Interrupt Service Routines must write (arbitrary data) to AIC\_IVR just after reading it. The new context of the AIC, including the value of AIC\_ISR, is updated with the current interrupt only when AIC\_IVR is written.

An AIC\_IVR read on its own (e.g., by a debugger) modifies neither the AIC context nor AIC\_ISR. Extra AIC\_IVR reads perform the same operations. However, it is recommended to not stop the processor between the read and the write of AIC\_IVR of the interrupt service routine to make sure the debugger does not modify the AIC context.

To summarize, in normal operating mode, the read of AIC\_IVR performs the following operations within the AIC:

1. Calculates active interrupt (higher than current or spurious).
2. Determines and returns the vector of the active interrupt.
3. Memorizes the interrupt.
4. Pushes the current priority level onto the internal stack.
5. Acknowledges the interrupt.

However, while the Protect mode is activated, only operations 1 to 3 are performed when AIC\_IVR is read. Operations 4 and 5 are only performed by the AIC when AIC\_IVR is written.

Software that has been written and debugged using the Protect mode runs correctly in normal mode without modification. However, in normal mode, the AIC\_IVR write has no effect and can be removed to optimize the code.

### 21.8.6 Spurious Interrupt

The AIC features a protection against spurious interrupts. A spurious interrupt is defined as being the assertion of an interrupt source long enough for the AIC to assert the nIRQ, but no longer present when AIC\_IVR is read. This is most prone to occur when:

- An external interrupt source is programmed in Level-Sensitive mode and an active level occurs for only a short time.
- An internal interrupt source is programmed in level-sensitive and the output signal of the corresponding embedded peripheral is activated for a short time (as is the case for the watchdog).
- An interrupt occurs just a few cycles before the software begins to mask it, thus resulting in a pulse on the interrupt source.

The AIC detects a spurious interrupt at the time AIC\_IVR is read while no enabled interrupt source is pending. When this happens, the AIC returns the value stored by the programmer in the Spurious Vector register (AIC\_SPU). The programmer must store the address of a spurious interrupt handler in AIC\_SPU as part of the application, to enable an as fast as possible return to the normal execution flow. This handler writes in AIC\_EOICR and performs a return from interrupt.

### 21.8.7 General Interrupt Mask

The AIC features a General Interrupt Mask bit (AIC\_DCR.GMSK) to prevent interrupts from reaching the processor. Both the nIRQ and the nFIQ lines are driven to their inactive state if AIC\_DCR.GMSK is set. However, this mask does not prevent waking up the processor if it has entered Idle mode. This function facilitates synchronizing the processor on a next event and, as soon as the event occurs, performs subsequent operations without having to handle an interrupt. It is strongly recommended to use this mask with caution.

### 21.8.8 Register Write Protection

To prevent any single software error from corrupting AIC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the AIC Write Protection Mode Register (AIC\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the AIC Write Protection Status Register (AIC\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading AIC\_WPSR.

The following registers can be write-protected:

- AIC Source Mode Register
- AIC Source Vector Register
- AIC Spurious Interrupt Vector Register
- AIC Debug Control Register

## 21.9 Register Summary

Offset	Name	Bit Pos.								
0x00	AIC_SSR	7:0	INTSEL[6:0]

### 21.9.1 AIC Source Select Register

**Name:** AIC\_SSR  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 6:0 – INTSEL[6:0]** Interrupt Line Selection

0–127 = Selects the interrupt line to handle.

See the section "Interrupt Source Mode".

### 21.9.2 AIC Source Mode Register

**Name:** AIC\_SMR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the AIC Write Protection Mode Register.

#### Bits 6:5 – SRCTYPE[1:0] Interrupt Source Type

The active level or edge is not programmable for the internal interrupt source selected by INTSEL.

Value	Name	Description
0	INT_LEVEL_SENSITIVE	High-level sensitive for internal source. Low-level sensitive for external source.
1	EXT_NEGATIVE_EDGE	Negative-edge triggered for external source.
2	EXT_HIGH_LEVEL	High-level sensitive for internal source. High-level sensitive for external source.
3	EXT_POSITIVE_EDGE	Positive-edge triggered for external source.

#### Bits 2:0 – PRIOR[2:0] Priority Level

Programs the priority level of the source selected by INTSEL except FIQ source (source 0).

The priority level can be between 0 (lowest) and 7 (highest).

The priority level is not used for the FIQ.

### 21.9.3 AIC Source Vector Register

**Name:** AIC\_SVR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the AIC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	VECTOR[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – VECTOR[31:0] Source Vector**

The user may store in this register the address of the corresponding handler for the interrupt source selected by INTSEL.

**21.9.4 AIC Interrupt Vector Register**

**Name:** AIC\_IVR  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	IRQV[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	IRQV[23:16]							
Access	R	R	R	R	R	R	R	R

Bit	7	6	5	4	3	2	1	0
	IRQV[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – IRQV[31:0] Interrupt Vector Register**

The Interrupt Vector Register contains the vector programmed by the user in the Source Vector Register corresponding to the current interrupt.

The Source Vector Register is indexed using the current interrupt number when the Interrupt Vector Register is read.

When there is no current interrupt, the Interrupt Vector Register reads the value stored in AIC\_SPU.

### 21.9.5 AIC FIQ Vector Register

**Name:** AIC\_FVR  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read-only

	Bit	31	30	29	28	27	26	25	24
		FIQV[31:24]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		FIQV[23:16]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		FIQV[15:8]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		FIQV[7:0]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0

**Bits 31:0 – FIQV[31:0] FIQ Vector Register**

The FIQ Vector Register contains the vector programmed by the user in the Source Vector Register when INTSEL = 0. When there is no fast interrupt, the FIQ Vector Register reads the value stored in AIC\_SPU.

**21.9.6 AIC Interrupt Status Register**

**Name:** AIC\_ISR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

**Bits 6:0 – IRQID[6:0]** Current Interrupt Identifier  
 The Interrupt Status Register returns the current interrupt source number.

### 21.9.7 AIC Interrupt Pending Register 0

**Name:** AIC\_IPR0  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read-only

The reset value of this register depends on the level of the external interrupt source. All other sources are cleared at reset, thus not pending.

Bit	31	30	29	28	27	26	25	24
	PID31	PID30	PID29	PID28	PID27	PID26	PID25	PID24
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	PID23	PID22	PID21	PID20	PID19	PID18	PID17	PID16
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8

	PID7	PID6	PID5	PID4	PID3	PID2	PID1	FIQ
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32 – PIDx** Interrupt Pending

PID2...PID31 refer to the identifiers as defined in the Peripheral Identifiers section.

Value	Description
0	The corresponding interrupt is not pending.
1	The corresponding interrupt is pending.

**Bit 0 – FIQ** Interrupt Pending

Value	Description
0	The corresponding interrupt is not pending.
1	The corresponding interrupt is pending.

### 21.9.8 AIC Interrupt Pending Register 1

**Name:** AIC\_IPR1  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** Read-only

The reset value of this register depends on the level of the external interrupt source. All other sources are cleared at reset, thus not pending.

PID32...PID63 refer to the identifiers as defined in the Peripheral Identifiers section.

Bit	31	30	29	28	27	26	25	24
	PID63	PID62	PID61	PID60	PID59	PID58	PID57	PID56
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	PID55	PID54	PID53	PID52	PID51	PID50	PID49	PID48
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	PID47	PID46	PID45	PID44	PID43	PID42	PID41	PID40
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – PIDx Interrupt Pending**

Value	Description
0	The corresponding interrupt is not pending.
1	The corresponding interrupt is pending.

### 21.9.9 AIC Interrupt Pending Register 2

**Name:** AIC\_IPR2  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	PID95	PID94	PID93	PID92	PID91	PID90	PID89	PID88
Access	R	R	R	R	R	R	R	R

	PID71	PID70	PID69	PID68	PID67	PID66	PID65	PID64
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – PIDx** Interrupt Pending

Value	Description
0	The corresponding interrupt is not pending.
1	The corresponding interrupt is pending.

**Bit 10 – SYS** Interrupt Pending

Value	Description
0	The corresponding interrupt is not pending.
1	The corresponding interrupt is pending.

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9 – PIDx** Interrupt Pending

Value	Description
0	The corresponding interrupt is not pending.
1	The corresponding interrupt is pending.

### 21.9.10 AIC Interrupt Pending Register 3

**Name:** AIC\_IPR3  
**Offset:** 0x2C  
**Reset:** 0x00000000  
**Property:** Read-only

The reset value of this register depends on the level of the external interrupt source. All other sources are cleared at reset, thus not pending.

PID96...PID127 bit fields refer to the identifiers as defined in the Peripheral Identifiers section.

Bit	31	30	29	28	27	26	25	24
	PID127	PID126	PID125	PID124	PID123	PID122	PID121	PID120

Bit	7	6	5	4	3	2	1	0
	PID103	PID102	PID101	PID100	PID99	PID98	PID97	PID96
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – PIDx Interrupt Pending**

Value	Description
0	The corresponding interrupt is not pending.
1	The corresponding interrupt is pending.

**21.9.11 AIC Interrupt Mask Register**

**Name:** AIC\_IMR  
**Offset:** 0x30  
**Reset:** 0x00000000  
**Property:** Read-only

**Bit 0 – INTM** Interrupt Mask

Value	Description
0	The interrupt source selected by AIC_SSR.INTSEL is disabled.
1	The interrupt source selected by AIC_SSR.INTSEL is enabled.

**21.9.12 AIC Core Interrupt Status Register**

**Name:** AIC\_CISR  
**Offset:** 0x34  
**Reset:** 0x00000000  
**Property:** Read-only

**Bit 1 – NIRQ NIRQ Status**

Value	Description
0	nNIRQ line is deactivated.
1	nNIRQ line is active.

**Bit 0 – NFIQ NFIQ Status**

Value	Description
0	nNFIQ line is deactivated.
1	nNFIQ line is active.

**21.9.13 AIC End of Interrupt Command Register**

**Name:** AIC\_EOICR  
**Offset:** 0x38  
**Reset:** –  
**Property:** Write-only

**Bit 0 – ENDIT** Interrupt Processing Complete Command

The End of Interrupt Command Register is used by the interrupt routine to indicate that the interrupt treatment is complete. Any value can be written because it is only necessary to make a write to this register location to signal the end of interrupt treatment.

**21.9.14 AIC Spurious Interrupt Vector Register**

**Name:** AIC\_SPU  
**Offset:** 0x3C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the AIC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	SIVR[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	SIVR[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	SIVR[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	SIVR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – SIVR[31:0] Spurious Interrupt Vector Register**

The user may store the address of a spurious interrupt handler in this register. The written value is returned in AIC\_IVR in case of a spurious interrupt, or in AIC\_FVR in case of a spurious fast interrupt.

### 21.9.15 AIC Interrupt Enable Command Register

**Name:** AIC\_IECR  
**Offset:** 0x40  
**Reset:** –  
**Property:** Write-only

#### Bit 0 – INTEN Interrupt Enable

Value	Description
0	No effect.
1	Enables the interrupt source selected by AIC_SSR.INTSEL.

**21.9.16 AIC Interrupt Disable Command Register**

**Name:** AIC\_IDCR  
**Offset:** 0x44  
**Reset:** –  
**Property:** Write-only

**Bit 0 – INTD** Interrupt Disable

Value	Description
0	No effect.
1	Disables the interrupt source selected by AIC_SSR.INTSEL.

### 21.9.17 AIC Interrupt Clear Command Register

**Name:** AIC\_ICCR  
**Offset:** 0x48  
**Reset:** –  
**Property:** Write-only

**Bit 0 – INTCLR** Interrupt Clear

Clears one the following depending on the setting of AIC\_SSR.INTSEL: FIQ, SYS, PID2-PID73 and PID75-PID127

Value	Description
0	No effect.
1	Clears the interrupt source selected by AIC_SSR.INTSEL.

**21.9.18 AIC Interrupt Set Command Register**

**Name:** AIC\_ISCR  
**Offset:** 0x4C  
**Reset:** –  
**Property:** Write-only

**Bit 0 – INTSET** Interrupt Set

Value	Description
0	No effect.
1	Sets the interrupt source selected by INTSEL.

### 21.9.19 AIC Debug Control Register

**Name:** AIC\_DCR  
**Offset:** 0x6C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the AIC Write Protection Mode Register.

#### Bit 1 – GMSK General Interrupt Mask

Value	Description
0	The nIRQ and nFIQ lines are normally controlled by the AIC.
1	The nIRQ and nFIQ lines are tied to their inactive state.

#### Bit 0 – PROT Protection Mode

Value	Description
0	The Protection mode is disabled.
1	The Protection mode is enabled.

**21.9.20 AIC Write Protection Mode Register**

**Name:** AIC\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

	Bit	31	30	29	28	27	26	25	24

**Bits 23:8 – WPVSR[15:0]** Write Protection Violation Source  
 When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of AIC_WPSR.
1	A write protection violation has occurred since the last read of AIC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

## 22. Watchdog Timer (WDT)

### 22.1 Description

The Watchdog Timer (WDT) is used to prevent system lock-up if the software becomes trapped in a deadlock. It features a 12-bit down counter that allows a watchdog period of up to 16 seconds (slow clock around 32 kHz). It can generate a general reset or a processor reset only. In addition, it can be stopped while the processor is in Debug mode or Sleep mode (Idle mode).

### 22.2 Embedded Characteristics

- 12-bit Key-protected Programmable Counter
- Watchdog Clock is Independent from Processor Clock
- Provides Reset or Interrupt Signals to the System
- Counter May Be Stopped while the Processor is in Debug State or in Idle Mode

### 22.3 Block Diagram

Figure 22-1. Watchdog Timer Block Diagram

### 22.4 Functional Description

The Watchdog Timer is used to prevent system lock-up if the software becomes trapped in a deadlock. It is supplied with VDDCORE. It restarts with initial values on processor reset.

The watchdog is built around a 12-bit down counter, which is loaded with the value defined in the field WDV of the Mode Register (WDT\_MR). The Watchdog Timer uses the slow clock divided by 128 to establish the maximum watchdog period to be 16 seconds (with a typical slow clock of 32.768 kHz).

After a processor reset, the value of WDV is 0xFFF, corresponding to the maximum value of the counter with the external reset generation enabled (field WDRSTEN at 1 after a backup reset). This means that a default watchdog is running at reset, i.e., at power-up. The user can either disable the WDT by setting bit WDT\_MR.WDDIS or reprogram the WDT to meet the maximum watchdog period the application requires.

When setting the WDDIS bit, and while it is set, the fields WDV and WDD must not be modified.

If the watchdog is restarted by writing into the Control Register (WDT\_CR), WDT\_MR must not be programmed during a period of time of three slow clock periods following the WDT\_CR write access. In any case, programming a new value in WDT\_MR automatically initiates a restart instruction.

WDT\_MR can be written until a LOCKMR command is issued in WDT\_CR. Only a processor reset resets it. Writing WDT\_MR reloads the timer with the newly programmed mode parameters.

In normal operation, the user reloads the watchdog at regular intervals before the timer underflow occurs, by setting bit WDT\_CR.WDRSTT. The watchdog counter is then immediately reloaded from WDT\_MR and restarted, and the slow clock 128 divider is reset and restarted. WDT\_CR is write-protected. As a result, writing WDT\_CR without the correct hard-coded key has no effect. If an underflow does occur, the “wdt\_fault” signal to the Reset Controller is asserted if bit WDT\_MR.WDRSTEN is set. Moreover, the bit WDUNF is set in the Status Register (WDT\_SR).

The reload of the watchdog must occur while the watchdog counter is within a window between 0 and WDD. WDD is defined in WDT\_MR.

Any attempt to restart the watchdog while the watchdog counter is between WDV and WDD results in a watchdog error, even if the watchdog is disabled. The bit WDT\_SR.WDERR is updated and the “wdt\_fault” signal to the Reset Controller is asserted.

Note that this feature can be disabled by programming a WDD value greater than or equal to the WDV value. In such a configuration, restarting the Watchdog Timer is permitted in the whole range [0; WDV] and does not generate an error. This is the default configuration on reset (the WDD and WDV values are equal).

The status bits WDUNF (Watchdog Underflow) and WDERR (Watchdog Error) trigger an interrupt, provided the bit WDT\_MR.WDFIEN is set. The signal “wdt\_fault” to the Reset Controller causes a watchdog reset if the WDRSTEN bit is set as already explained in the Reset Controller documentation. In this case, the processor and the Watchdog Timer are reset, and the WDERR and WDUNF flags are reset.

If a reset is generated or if WDT\_SR is read, the status bits are reset, the interrupt is cleared, and the “wdt\_fault” signal to the reset controller is deasserted.

Writing WDT\_MR reloads and restarts the down counter.

While the processor is in debug state or in Sleep mode, the counter may be stopped depending on the value programmed for the bits WDIDLEHLT and WDDBGHLT in WDT\_MR.

**Figure 22-2. Watchdog Behavior**

### 22.5 Register Summary

Offset	Name	Bit Pos.								
0x00	WDT_CR	7:0				LOCKMR			WDRSTT

		31:24								

### 22.5.1 Watchdog Timer Control Register

**Name:** WDT\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

The WDT\_CR register values must not be modified within three slow clock periods following a restart of the watchdog performed by a write access in WDT\_CR. Any modification will cause the watchdog to trigger an end of period earlier than expected.

Bit	31	30	29	28	27	26	25	24	
	KEY[7:0]								
Access	W	W	W	W	W	W	W	W

Bit	7	6	5	4	3	2	1	0	
				LOCKMR				WDRSTT	
Access				W				W	
Reset				–				–	

#### Bits 31:24 – KEY[7:0] Password

Value	Name	Description
0xA5	PASSWD	Writing any other value in this field aborts the write operation.

#### Bit 4 – LOCKMR Lock Mode Register Write Access

Value	Description
0	No effect.
1	Locks the Mode Register (WDT_MR) if KEY is written to 0xA5, write access to WDT_MR has no effect.

#### Bit 0 – WDRSTT Watchdog Restart

Value	Description
0	No effect.
1	Restarts the watchdog if KEY is written to 0xA5.

### 22.5.2 Watchdog Timer Mode Register

**Name:** WDT\_MR  
**Offset:** 0x04  
**Reset:** 0x3FFF2FFF  
**Property:** Read/Write

Write access to this register has no effect if the LOCKMR command is issued in WDT\_CR (unlocked on hardware reset).

The WDT\_MR register values must not be modified within three slow clock periods following a restart of the watchdog performed by a write access in WDT\_CR. Any modification will cause the watchdog to trigger an end of period earlier than expected.

Bit	31	30	29	28	27	26	25	24
			WDIDLEHLT	WDDBGHLT	WDD[11:8]			
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			1	1	1	1	1	1
Bit	23	22	21	20	19	18	17	16
	WDD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1
Bit	15	14	13	12	11	10	9	8
	WDDIS		WDRSTEN	WDFIEN	WDV[11:8]			
Access	R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset	0		1	0	1	1	1	1
Bit	7	6	5	4	3	2	1	0
	WDV[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

#### Bit 29 – WDIDLEHLT Watchdog Idle Halt

Value	Description
0	The watchdog runs when the system is in idle state.
1	The watchdog stops when the system is in idle state.

#### Bit 28 – WDDBGHLT Watchdog Debug Halt

Value	Description
0	The watchdog runs when the processor is in debug state.
1	The watchdog stops when the processor is in debug state.

#### Bits 27:16 – WDD[11:0] Watchdog Delta Value

Defines the permitted range for reloading the Watchdog Timer.

If the Watchdog Timer value is less than or equal to WDD, setting bit WDT\_CR.WDRSTT restarts the timer.

If the Watchdog Timer value is greater than WDD, setting bit WDT\_CR.WDRSTT causes a watchdog error.

### Bit 15 – WDDIS Watchdog Disable

When setting the WDDIS bit, and while it is set, the fields WDV and WDD must not be modified.

Value	Description
0	Enables the Watchdog Timer.
1	Disables the Watchdog Timer.

### Bit 13 – WDRSTEN Watchdog Reset Enable

Value	Description
0	A watchdog fault (underflow or error) has no effect on the resets.
1	A watchdog fault (underflow or error) triggers a watchdog reset.

### Bit 12 – WDFIEN Watchdog Fault Interrupt Enable

Value	Description
0	A watchdog fault (underflow or error) has no effect on interrupt.
1	A watchdog fault (underflow or error) asserts interrupt.

### Bits 11:0 – WDV[11:0] Watchdog Counter Value

Defines the value loaded in the 12-bit watchdog counter.

### 22.5.3 Watchdog Timer Status Register

**Name:** WDT\_SR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read-only

**Bit 1 – WDERR** Watchdog Error (cleared on read)

Value	Description
0	No watchdog error occurred since the last read of WDT_SR.
1	At least one watchdog error occurred since the last read of WDT_SR.

**Bit 0 – WDUNF** Watchdog Underflow (cleared on read)

Value	Description
0	No watchdog underflow occurred since the last read of WDT_SR.
1	At least one watchdog underflow occurred since the last read of WDT_SR.

## 23. Reset Controller (RSTC)

### 23.1 Description

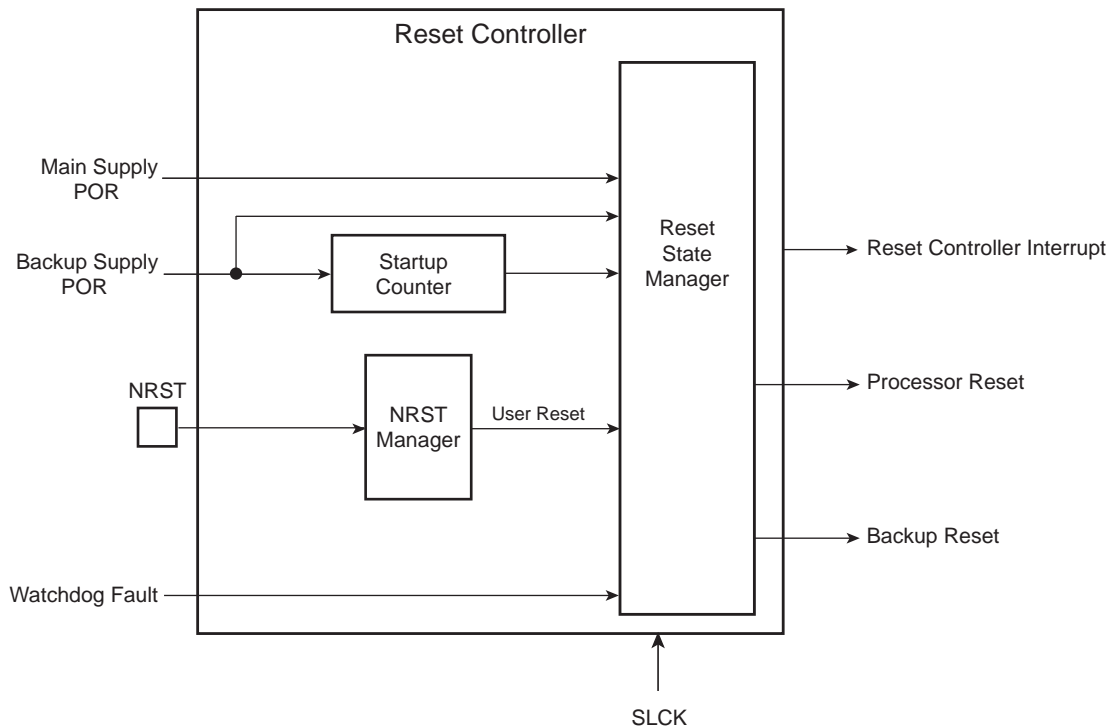

The Reset Controller (RSTC), based on power-on reset cells, handles all the resets of the system without any external components. It reports which reset occurred last.

### 23.2 Embedded Characteristics

- Manages All Resets of the System, Including
  - Processor reset
  - Backed-up peripheral reset
- Based on Two Embedded Power-on Reset Cells
- Reset Source Status
  - Status of the last reset
  - Either general reset, wake-up reset, software reset, user reset, watchdog reset

### 23.3 Block Diagram

**Figure 23-1. Reset Controller Block Diagram**

## 23.4 Functional Description

### 23.4.1 Reset Controller Overview

The Reset Controller (RSTC) is made up of an NRST manager, a startup counter and a reset state manager. It runs at Slow Clock and generates the following reset signals:

- Processor reset—Resets the processor and the entire set of embedded peripherals.
- Backup reset—Resets all the peripherals powered by VDDBU.

These reset signals are asserted by the RSTC, either on external events or on software action. The reset state manager controls the generation of reset signals.

The startup counter waits for the complete crystal oscillator startup. The wait delay is given by the crystal oscillator startup time maximum value that can be found in the section “Crystal Oscillator Characteristics” in “Electrical Characteristics”.

The Mode register (RSTC\_MR), used to configure the reset controller, is powered with VDDBU, so that its configuration is saved as long as VDDBU is on.

### 23.4.2 NRST Manager

The NRST manager samples the NRST input pin and drives this pin low when required by the reset state manager. The figure below shows the block diagram of the NRST manager.

**Figure 23-2. NRST Manager**

#### 23.4.2.1 NRST Signal or Interrupt

The NRST manager samples the NRST pin at Slow Clock speed. When the line is detected low, a user reset is reported to the reset state manager.

However, the NRST manager can be programmed to not trigger a reset when an assertion of NRST occurs. Writing a zero to RSTC\_MR.URSTEN disables the user reset trigger.

The level of the pin NRST can be read at any time in the bit NRSTL (NRST level) in the Status register (RSTC\_SR). As soon as the pin NRST is asserted, RSTC\_SR.URSTS is set. This bit clears only when RSTC\_SR is read.

The RSTC can also be programmed to generate an interrupt instead of generating a reset. To do so, RSTC\_MR.URSTIEN must be set.

### 23.4.3 Reset States

The reset state manager handles the different reset sources and generates the internal reset signals. It reports the reset status in RSTC\_SR.RSTTYP. The update of RSTTYP is performed when the processor reset is released.

### 23.4.3.1 General Reset

A general reset occurs when VDDDBU and VDDCORE are powered on. The backup supply POR cell output rises and is filtered with a startup counter, which operates at Slow Clock. The purpose of this counter is to make sure the Slow Clock oscillator is stable before starting up the device. The length of startup time is hardcoded to comply with the Slow Clock Oscillator startup time.

After this time, the processor clock is released at Slow Clock and all the other signals remain valid for two cycles for proper processor and logic reset. Then, all the reset signals are released and RSTC\_SR.RSTTYP reports a general reset.

When VDDDBU is detected low by the backup supply POR cell, all resets signals are immediately asserted, even if the main supply POR cell does not report a main supply shutdown.

VDDDBU only activates the backup reset signal.

Backup reset must be released so that any other reset can be generated by VDDCORE (main supply POR output).

The figure below shows how the general reset affects the reset signals.

**Figure 23-3. General Reset State**

### 23.4.3.2 Wake-up Reset

The wake-up reset occurs when the main supply is down. When the main supply POR output is active, all the reset signals are asserted except backup reset. When the main supply powers up, the POR output is resynchronized on Slow Clock. The processor clock is then re-enabled during two Slow Clock cycles, depending on the requirements of the ARM processor.

At the end of this delay, the processor and other reset signals rise. RSTC\_SR.RSTTYP is updated to report a wake-up reset.

When the main supply is detected falling, the reset signals are immediately asserted. This transition is synchronous with the output of the main supply POR.

**Figure 23-4. Wake-up Reset**

### 23.4.3.3 User Reset

The user reset is entered when a low level is detected on the NRST pin and RSTC\_MR.URSTEN is at 1. The NRST input signal is resynchronized with SLCK to ensure proper behavior of the system.

The processor reset and the peripheral reset are asserted.

The user reset is left when NRST rises, after a two-cycle resynchronization time and a two-cycle processor startup. The processor clock is re-enabled as soon as NRST is confirmed high.

When the processor reset signal is released, RSTC\_SR.RSTTYP is loaded with the value 0x4, indicating a user reset.

**Figure 23-5. User Reset State**

### 23.4.3.4 Software Reset

The RSTC offers several commands used to assert the different reset signals. These commands are performed by writing the Control register (RSTC\_CR) with the following bits at 1:

- PROCRRST—Writing PROCRRST at 1 resets the processor, the watchdog timer and all the embedded peripherals, including the memory system, and, in particular, the remap command.

The software reset is entered if at least one of these bits is set by the software. All these commands can be performed independently or simultaneously. The software reset lasts two Slow Clock cycles.

The internal reset signals are asserted as soon as the register write is performed. This is detected on the Master Clock (MCK). They are released when the software reset is left, i.e., synchronously to SLCK.

If and only if RSTC\_CR.PROCRST is set, the RSTC reports the software status in RSTC\_SR.RSTTYP. Other software resets are not reported in RSTTYP.

As soon as a software operation is detected, RSTC\_SR.SRCMP is set. It is cleared as soon as the software reset is left. No other software reset can be performed while RSTC\_SR.SRCMP is set, and writing any value in RSTC\_CR has no effect.

**Figure 23-6. Software Reset**

### 23.4.3.5 Watchdog Reset

The watchdog reset is entered when a watchdog fault occurs. This state lasts two Slow Clock cycles.

The watchdog timer is reset by the processor reset signal. As the watchdog fault always causes a processor reset if WDT\_MR.WDRSTEN is set, the watchdog timer is always reset after a watchdog reset and the watchdog is enabled by default and with a period set to a maximum.

When WDT\_MR.WDRSTEN is reset, the watchdog fault has no impact on the reset controller.

**Figure 23-7. Watchdog Reset**

### 23.4.4 Reset State Priorities

The reset state manager manages the following priorities between the different reset sources, given in descending order:

- Backup reset
- Wake-up reset
- Watchdog reset
- Software reset
- User reset

Particular cases are listed below:

- When in user reset:
  - A watchdog event is impossible because the watchdog timer is being reset by the processor reset signal.
  - A software reset is impossible, since the processor reset is being activated.
- When in software reset:
  - A watchdog event has priority over the current state.
  - The NRST has no effect.
- When in watchdog reset:
  - The processor reset is active and so a software reset cannot be programmed.
  - A user reset cannot be entered.

### 23.5 Register Summary

Offset	Name	Bit Pos.							
0x00	RSTC_CR	7:0							PROCRST
		15:8							
		23:16							
		31:24	KEY[7:0]

Reset									
	Bit	15	14	13	12	11	10	9	8
Access									
Reset									
	Bit	7	6	5	4	3	2	1	0
									PROCRST
Access									W
Reset									–

**Bits 31:24 – KEY[7:0] Write Access Password**

Value	Name	Description
0xA5	PASSWD	Writing any other value in this field aborts the write operation. Always reads as 0.

**Bit 0 – PROCRST Processor Reset**

Value	Description
0	No effect.
1	If KEY value = 0xA5, resets the processor and the peripherals

### 23.5.2 Reset Controller Status Register

**Name:** RSTC\_SR  
**Offset:** 0x04  
**Reset:** See Note  
**Property:** Read-only

**Note:** Register reset values are:  
 0x00000100 only when VDDCORE is rising

0x00000000 when both power supplies VDDCORE and VDDBU are rising (backup reset)

**Bit 17 – SRCMP** Software Reset Command in Progress

Value	Description
0	No software command is being performed by the RSTC. The RSTC is ready for a software command.
1	A software reset command is being performed by the RSTC. The RSTC is busy.

**Bit 16 – NRSTL** NRST Pin Level

Records the level of the NRST pin sampled on each Master Clock (MCK) rising edge.

**Bits 10:8 – RSTTYP[2:0]** Reset Type

Reports the cause of the last processor reset. Reading RSTC\_SR does not reset this field.

Value	Name	Description
0	GENERAL_RST	Both VDDCORE and VDDBU rising
1	WKUP_RST	VDDCORE rising
2	WDT_RST	Watchdog fault occurred
3	SOFT_RST	Processor reset required by the software

# SAMA5D2 Series

## Reset Controller (RSTC)

Value	Name	Description
4	USER_RST	NRST pin detected low

### Bit 0 – URSTS User Reset Status

Value	Description
0	No high-to-low edge on NRST happened since the last read of RSTC_SR.
1	At least one high-to-low transition of NRST has been detected since the last read of RSTC_SR. Reading the RSTC_SR resets URSTS and clears the interrupt.

### 23.5.3 Reset Controller Mode Register

**Name:** RSTC\_MR  
**Offset:** 0x08  
**Reset:** See Note  
**Property:** Read/Write

**Note:**

Backup reset value is 0x00000000

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

**Bits 31:24 – KEY[7:0]** Write Access Password

Value	Name	Description
0xA5	PASSWD	Writing any other value in this field aborts the write operation. Always reads as 0.

**Bit 4 – URSTIEN** User Reset Interrupt Enable

Value	Description
0	RSTC_SR.USRTS at 1 has no effect on the RSTC interrupt.
1	RSTC_SR.USRTS at 1 asserts the RSTC interrupt if URSTEN = 0.

**Bit 0 – URSTEN** User Reset Enable

Value	Description
0	The detection of a low level on the pin NRST does not trigger a user reset.
1	The detection of a low level on the pin NRST triggers a user reset.

## 24. Shutdown Controller (SHDWC)

### 24.1 Description

The Shutdown Controller (SHDWC) controls the VDDIO and VDDCORE power supplies and the wakeup detection on debounced input lines.

### 24.2 Embedded Characteristics

- Shutdown Logic
  - Software Assertion of the Shutdown Output Pin (SHDN)
  - Programmable De-assertion from the PIOBU, WKUP Input Pins
- Wakeup Logic
  - Programmable Assertion from the PIOBU, WKUP Input Pins, and Internal Wakeup Event from RTC, RXLP, ACC, Security Module

### 24.3 Block Diagram

**Figure 24-1. Shutdown Controller Block Diagram**

## 24.4 I/O Lines Description

**Table 24-1. I/O Lines Description**

Name	Description	Type
WKUP0	Wakeup inputs	Input
PIOBU 0-7	Wakeup inputs, WKUP(2-9)	Input
SHDN	Shutdown output	Output

## 24.5 Product Dependencies

### 24.5.1 Power Management

The Shutdown Controller is continuously clocked by the Slow Clock (SLCK). The Power Management Controller has no effect on the behavior of the Shutdown Controller.

## 24.6 Functional Description

The Shutdown Controller manages the main power supply. To do so, it is supplied with VDDBU and manages wakeup input pins and one output pin, SHDN.

A typical application connects the pin SHDN to the shutdown input of the DC/DC Converter providing the main power supplies of the system, and especially VDDCORE and/or VDDIO. The wakeup inputs (WKUPn) connect to any push-buttons or signal that wake up the system.

The software is able to control the pin SHDN by writing the Shutdown Control Register (SHDW\_CR) with the bit SHDW at 1. The shutdown is taken into account only two slow clock cycles after the write of SHDW\_CR. This register is password-protected and so the value written should contain the correct key for the command to be taken into account. As a result, the system should be powered down.

### 24.6.1 Wakeup Inputs

Any level change on a PIOBUx, WKUP pin, or Security Module event, can trigger a wakeup. Wakeup is configured in the Shutdown Mode Register (SHDW\_MR) and Shutdown Wakeup Inputs Register (SHDW\_WUIR). The transition detector can be programmed to detect either a positive or negative transition on any PIOBUx, WKUP pin. The detection can also be disabled. Programming is performed by enabling the Wakeup Input (WKUPENx bit) and defining the Wakeup Input Type (WKUPTx bit) in the SHDW\_WUIR.

Moreover, a debouncing circuit can be programmed for PIOBUx, WKUP. The debouncing circuit filters pulses on PIOBUx, WKUP shorter than the programmed value in the WKUPDBC field in SHDW\_MR. If the programmed level change is detected on a pin, a counter starts. When the counter reaches the value programmed in the corresponding field WKUPDBC, the SHDN pin is released. If a new input change is detected before the counter reaches the corresponding value, the counter is stopped and cleared. One counter is shared among all PIOBUx, WKUP inputs and all programmed level detection is merged into this counter. The WKUPIsx bit of the Status Register (SHDW\_SR) reports the detection of the programmed events on PIOBUx, WKUP with a reset after the read of SHDW\_SR.

**Figure 24-2. Entering and Exiting Backup Mode with a PIOBUx, WKUP Pin**

WKUPDBC > 0

WKUPTx=0

The Shutdown Controller can be programmed so as to activate the wakeup using the RTC alarm, RXLP event, ACC comparison event, security module event (detection of the rising edge event is synchronized with SLCK). This is done by writing the SHDW\_MR using the RTCWKEN bit, RXLPWKEN bit and ACCWKEN bit. When enabled, the detection of RTC alarm, RXLP event, ACC comparison event, security module event is reported in the RTCWK bit, RXLPWK and ACCWK bits of SHDW\_SR. They are cleared after reading SHDW\_SR. When using the RTC alarm to wake up the system, the user must ensure that RTC alarm, RXLPWK and ACCWK status flags are cleared before shutting down the system. Otherwise, no rising edge of the status flags may be detected and the wakeup will fail.

### 24.7 Register Summary

Offset	Name	Bit Pos.								
0x00	SHDW_CR	7:0								SHDW
		15:8								
		23:16								
		31:24	KEY[7:0]

									SHDW
Access									W
Reset									–

**Bits 31:24 – KEY[7:0] Password**

Value	Name	Description
0xA5	PASSWD	Writing any other value in this field aborts the write operation.

**Bit 0 – SHDW Shutdown Command**

Value	Description
0	No effect.
1	If KEY value is correct, asserts the SHDN pin.

### 24.7.2 Shutdown Controller Mode Register

**Name:** SHDW\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
						WKUPDBC[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	0
Bit	23	22	21	20	19	18	17	16
					RXLPWKEN	ACCWKEN	RTCWKEN	
Access					W	W	R/W

#### Bits 26:24 – WKUPDBC[2:0] Wakeup Inputs Debouncer Period

Value	Name	Description
0	IMMEDIATE	Immediate, no debouncing, detected active at least on one Slow Clock edge
1	3_SLCK	PIOBUx shall be in its active state for at least 3 SLCK periods
2	32_SLCK	PIOBUx shall be in its active state for at least 32 SLCK periods
3	512_SLCK	PIOBUx shall be in its active state for at least 512 SLCK periods
4	4096_SLCK	PIOBUx shall be in its active state for at least 4,096 SLCK periods
5	32768_SLCK	PIOBUx shall be in its active state for at least 32,768 SLCK periods

#### Bit 19 – RXLPWKEN Debug Unit Wakeup Enable

Value	Description
0	The Backup RX UART Comparison event has no effect on the Shutdown Controller.
1	The Backup RX UART Comparison event forces the de-assertion of the SHDN pin.

#### Bit 18 – ACCWKEN Analog Comparator Controller Wakeup Enable

Value	Description
0	The Analog comparator alarm signal has no effect on the Shutdown Controller.

# SAMA5D2 Series

## Shutdown Controller (SHDWC)

---

---

Value	Description
1	The Analog comparator alarm signal forces the de-assertion of the SHDN pin.

### Bit 17 – RTCWKEN Real-time Clock Wakeup Enable

Value	Description
0	The RTC Alarm signal has no effect on the Shutdown Controller.
1	The RTC Alarm signal forces the de-assertion of the SHDN pin.

### 24.7.3 Shutdown Controller Status Register

**Name:** SHDW\_SR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read-only

	Bit	31	30	29	28	27	26	25	24	
								WKUPIS9	WKUPIS8	
Access								R	R	
Reset								0	0	
	Bit	23	22	21	20	19	18	17	16	
		WKUPIS7	WKUPIS6	WKUPIS5	WKUPIS4	WKUPIS3	WKUPIS2	WKUPIS1	WKUPIS0	
Access		R	R	R	R	R	R	R	R	
Reset		0	0	0	0	0	0	0	0	
	Bit	15	14	13	12	11	10	9	8	
Access										
Reset										
	Bit	7	6	5	4	3	2	1	0	
		RXLPWK	ACCWK	RTCWK						WKUPS
Access		R	R	R						R
Reset		0	0	0						0

**Bits 16, 17, 18, 19, 20, 21, 22, 23, 24, 25 – WKUPIS** Wakeup 0 to 9 Input Status

0 (DISABLE): The corresponding wakeup input is disabled, or was inactive at the time the debouncer triggered a wakeup event.

1 (ENABLE): The corresponding wakeup input was active at the time the debouncer triggered a wakeup event.

**Bit 7 – RXLPWK** Debug Unit Wakeup

Value	Description
0	No wakeup alarm from the Backup RX UART Comparison unit (RXLP) occurred since the last read of SHDW_SR.
1	At least one wakeup alarm from the Backup RX UART Comparison unit (RXLP) occurred since the last read of SHDW_SR.

**Bit 6 – ACCWK** Analog Comparator Controller Wakeup

Value	Description
0	No wakeup alarm from the ACC occurred since the last read of SHDW_SR.
1	At least one wakeup alarm from the ACC occurred since the last read of SHDW_SR.

**Bit 5 – RTCWK** Real-time Clock Wakeup

# SAMA5D2 Series

## Shutdown Controller (SHDWC)

Value	Description
0	No wakeup alarm from the RTC occurred since the last read of SHDW_SR.
1	At least one wakeup alarm from the RTC occurred since the last read of SHDW_SR.

### Bit 0 – WKUPS PIOBU, WKUP Wakeup Status

WKUPIS1 reports the status of the Security Module event.

0 (NO): No wakeup due to the assertion of the PIOBU, WKUP pins has occurred since the last read of SHDW\_SR.

1 (PRESENT): At least one wakeup due to the assertion of the PIOBU, WKUP pins has occurred since the last read of SHDW\_SR.

Value	Description
0	No wakeup alarm from the RTT occurred since the last read of SHDW_SR.
1	At least one wakeup alarm from the RTT occurred since the last read of SHDW_SR.

### 24.7.4 Shutdown Controller Wakeup Inputs Register

**Name:** SHDW\_WUIR  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
							WKUPT9	WKUPT8
Access							R/W	R/W
Reset							0	0
Bit	23	22	21	20	19	18	17	16
	WKUPT7	WKUPT6	WKUPT5	WKUPT4	WKUPT3	WKUPT2	WKUPT1	WKUPT0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
							WKUPEN9	WKUPEN8
Access							R/W	R/W
Reset							0	0

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 16, 17, 18, 19, 20, 21, 22, 23, 24, 25 – WKUPT** Wakeup 0 to 9 Input Type

0 (LOW): A falling edge followed by a low level, for a period defined by WKUPDBC, on the corresponding wakeup input forces the wakeup of the core power supply.

1 (HIGH): A rising edge followed by a high level, for a period defined by WKUPDBC, on the corresponding wakeup input forces the wakeup of the core power supply.

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9 – WKUPEN** Wakeup 0 to 9 Input Enable

0 (DISABLE): The corresponding wakeup input has no wakeup effect.

1 (ENABLE): The corresponding wakeup input forces the wakeup of the core power supply.

## 25. Periodic Interval Timer (PIT)

### 25.1 Description

The Periodic Interval Timer (PIT) provides the operating system's scheduler interrupt. It is designed to offer maximum accuracy and efficient management, even for systems with long response time.

### 25.2 Embedded Characteristics

- 20-bit Programmable Counter plus 12-bit Interval Counter
- Reset-on-read Feature
- Both Counters Work on Master Clock/16

### 25.3 Block Diagram

Figure 25-1. Periodic Interval Timer

### 25.4 Functional Description

The Periodic Interval Timer provides periodic interrupts for use by operating systems.

The PIT provides a programmable overflow counter and a reset-on-read feature. It is built around two counters: a 20-bit CPIV counter and a 12-bit PICNT counter. Both counters work at Master Clock /16.

The first 20-bit CPIV counter increments from 0 up to a programmable overflow value set in the field PIV of the Mode Register (PIT\_MR). When the counter CPIV reaches this value, it resets to 0 and increments

# SAMA5D2 Series

## Periodic Interval Timer (PIT)

the Periodic Interval Counter, PICNT. The status bit PITS in the Status Register (PIT\_SR) rises and triggers an interrupt, provided the interrupt is enabled (PITIEN in PIT\_MR).

Writing a new PIV value in PIT\_MR does not reset/restart the counters.

When CPIV and PICNT values are obtained by reading the Periodic Interval Value Register (PIT\_PIVR), the overflow counter (PICNT) is reset and the PITS bit is cleared, thus acknowledging the interrupt. The value of PICNT gives the number of periodic intervals elapsed since the last read of PIT\_PIVR.

When CPIV and PICNT values are obtained by reading the Periodic Interval Image Register (PIT\_PIIR), there is no effect on the counters CPIV and PICNT, nor on the bit PITS. For example, a profiler can read PIT\_PIIR without clearing any pending interrupt, whereas a timer interrupt clears the interrupt by reading PIT\_PIVR.

The PIT may be enabled/disabled using the PITEN bit in the PIT\_MR register (disabled on reset). The PITEN bit only becomes effective when the CPIV value is 0. The figure below illustrates the PIT counting. After the PIT Enable bit is reset (PITEN = 0), the CPIV goes on counting until the PIV value is reached, and is then reset. PIT restarts counting, only if the PITEN is set again.

The PIT is stopped when the core enters debug state.

**Figure 25-2. Enabling/Disabling PIT with PITEN**

### 25.5 Register Summary

Offset	Name	Bit Pos.									
0x00	PIT_MR	7:0	PIV[7:0]								
		15:8	PIV[15:8]

### 25.5.1 Periodic Interval Timer Mode Register

**Name:** PIT\_MR  
**Offset:** 0x00  
**Reset:** 0x00FFFFFF  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
							PITIEN	PITEN
Access							R/W	R/W
Reset							0	0
Bit	23	22	21	20	19	18	17	16
					PIV[19:16]			
Access					R/W	R/W	R/W	R/W
Reset					1	1	1	1
Bit	15	14	13	12	11	10	9	8
	PIV[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1
Bit	7	6	5	4	3	2	1	0
	PIV[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

#### Bit 25 – PITIEN Period Interval Timer Interrupt Enable

Value	Description
0	The bit PITS in PIT_SR has no effect on the interrupt.
1	The bit PITS in PIT_SR asserts an interrupt.

#### Bit 24 – PITEN Period Interval Timer Enabled

Value	Description
0	The Periodic Interval Timer is disabled when the PIV value is reached.
1	The Periodic Interval Timer is enabled.

#### Bits 19:0 – PIV[19:0] Periodic Interval Value

Defines the value compared with the primary 20-bit counter of the Periodic Interval Timer (CPIV). The period is equal to (PIV + 1).

### 25.5.2 Periodic Interval Timer Status Register

**Name:** PIT\_SR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bit 0 – PITS Periodic Interval Timer Status

Value	Description
0	The Periodic Interval timer has not reached PIV since the last read of PIT_PIVR.
1	The Periodic Interval timer has reached PIV since the last read of PIT_PIVR.

### 25.5.3 Periodic Interval Timer Value Register

**Name:** PIT\_PIVR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read-only

Reading this register clears PITS in PIT\_SR.

	Bit	31	30	29	28	27	26	25	24
		PICNT[11:4]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		PICNT[3:0]				CPIV[19:16]			
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		CPIV[15:8]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		CPIV[7:0]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0

**Bits 31:20 – PICNT[11:0]** Periodic Interval Counter

Returns the number of occurrences of periodic intervals since the last read of PIT\_PIVR.

**Bits 19:0 – CPIV[19:0]** Current Periodic Interval Value

Returns the current value of the periodic interval timer.

### 25.5.4 Periodic Interval Timer Image Register

**Name:** PIT\_PIIR  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read-only

	Bit	31	30	29	28	27	26	25	24
		PICNT[11:4]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		PICNT[3:0]				CPIV[19:16]			
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		CPIV[15:8]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		CPIV[7:0]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0

**Bits 31:20 – PICNT[11:0]** Periodic Interval Counter  
 Returns the number of occurrences of periodic intervals since the last read of PIT\_PIVR.

**Bits 19:0 – CPIV[19:0]** Current Periodic Interval Value  
 Returns the current value of the periodic interval timer.

## **26. Real-time Clock (RTC)**

### **26.1 Description**

The Real-time Clock (RTC) peripheral is designed for very low power consumption. For optimal functionality, the RTC requires an accurate external 32.768 kHz clock, which can be provided by a crystal oscillator.

It combines a complete time-of-day clock with alarm and a Gregorian or Persian calendar, complemented by a programmable periodic interrupt. The alarm and calendar registers are accessed by a 32-bit data bus.

The RTC can also be configured for the UTC time format.

The time and calendar values are coded in binary-coded decimal (BCD) format. The time format can be 24-hour mode or 12-hour mode with an AM/PM indicator.

Updating time and calendar fields and configuring the alarm fields are performed by a parallel capture on the 32-bit data bus. An entry control is performed to avoid loading registers with incompatible BCD format data or with an incompatible date according to the current month/year/century.

A clock divider calibration circuitry can be used to compensate for crystal oscillator frequency variations.

Timestamping capability reports the first and last occurrences of tamper events.

### **26.2 Embedded Characteristics**

- Full Asynchronous Design for Ultra Low Power Consumption
- Gregorian, UTC and Persian Modes Supported
- Programmable Periodic Interrupt
- Safety/security Features:
  - Valid Time and Date Programming Check
  - On-The-Fly Time and Date Validity Check
- Counters Calibration Circuitry to Compensate for Crystal Oscillator Variations
- Waveform Generation for Trigger Event
- Tamper Timestamping Registers
- Register Write Protection

## 26.3 Block Diagram

Figure 26-1. Real-time Clock Block Diagram

## 26.4 Product Dependencies

### 26.4.1 Power Management

The Real-time Clock is continuously clocked at 32.768 kHz. The Power Management Controller has no effect on RTC behavior.

### 26.4.2 Interrupt

Within the System Controller, the RTC interrupt is OR-wired with all the other module interrupts.

Only one System Controller interrupt line is connected on one of the internal sources of the interrupt controller.

RTC interrupt requires the interrupt controller to be programmed first.

When a System Controller interrupt occurs, the service routine must first determine the cause of the interrupt. This is done by reading each status register of the System Controller peripherals successively.

## 26.5 Functional Description

The RTC provides a full binary-coded decimal (BCD) clock that includes century (19/20), year (with leap years), month, date, day, hours, minutes and seconds reported in [RTC Time Register \(RTC\\_TIMR\)](#) and [RTC Calendar Register \(RTC\\_CALR\)](#).

The RTC can operate in UTC mode, giving the number of seconds elapsed since a reference time defined by the user (the UTC standard—ISO 8601—reference time is the 30th of June 1972). In this mode, the timefield is 32 bits wide and coded in hexadecimal format.

The valid year range is up to 2099 in Gregorian mode (or 1300 to 1499 in Persian mode).

The RTC can operate in 24-hour mode or in 12-hour mode with an AM/PM indicator.

Corrections for leap years are included (all years divisible by 4 being leap years except 1900). This is correct up to the year 2099.

The RTC can generate events to trigger ADC measurements.

### 26.5.1 Reference Clock

The reference clock is the Slow Clock (SLCK) which can be driven internally or by an external 32.768 kHz crystal.

During low-power modes of the processor, the oscillator runs and power consumption is critical. The crystal selection must consider the current consumption for power saving and the frequency drift due to temperature effect on the circuit for time accuracy.

### 26.5.2 Timing

In Gregorian and Persian modes, the RTC is updated in real time at one-second intervals in Normal mode for the counters of seconds, at one-minute intervals for the counter of minutes and so on.

In UTC mode, the RTC is updated in real time at one-second intervals (32-bit UTC counter default configuration).

Due to the asynchronous operation of the RTC with respect to the rest of the chip, to be certain that the value read in the RTC registers (century, year, month, date, day, hours, minutes, seconds) are valid and stable, it is necessary to read these registers twice. If the data is the same both times, then it is valid. Therefore, a minimum of two and a maximum of three accesses are required.

### 26.5.3 Alarm

In Gregorian and Persian modes, the RTC has five programmable fields: month, date, hours, minutes and seconds.

Each of these fields can be enabled or disabled to match the alarm condition:

- If all the fields are enabled, an alarm flag is generated (the corresponding flag is asserted and an interrupt generated if enabled) at a given month, date, hour/minute/second.
- If only the “seconds” field is enabled, then an alarm is generated every minute.

Depending on the combination of fields enabled, a large number of possibilities are available to the user ranging from minutes to 365/366 days.

Hour, minute and second matching alarms (SECEN, MINEN, HOUREN) can be enabled independently of SEC, MIN, HOUR fields.

**Note:** To change one of the SEC, MIN, HOUR, DATE, MONTH fields, it is recommended to disable the field before changing the value and then re-enable it after the change has been made. This requires up to three accesses to the RTC\_TIMALR or RTC\_CALALR. The first access clears the enable corresponding to the field to change (SECEN, MINEN, HOUREN, DATEEN, MTHEN). If the field is already cleared, this access is not required. The second access performs the change of the value (SEC, MIN, HOUR, DATE, MONTH). The third access is required to re-enable the field by writing 1 in SECEN, MINEN, HOUREN, DATEEN, MTHEN fields.

In UTC mode, RTC\_TIMALR must be configured to set the UTC alarm value and bit 0 in RTC\_CALALR must be used to enable or disable the UTC alarm. If the UTC alarm is enabled, the alarm is generated once the UTC time matches the programmed UTC\_TIME alarm field.

To change the UTC\_TIME alarm field, proceed as follows:

1. Disable the UTC alarm by clearing the UTCEN bit in RTC\_CALALR if it is not already cleared.
2. Change the UTC\_TIME alarm value in RTC\_TIMALR.
3. Re-enable the UTC alarm by setting the UTCEN bit in RTC\_CALALR.

### 26.5.4 Error Checking when Programming

Verification on user interface data is performed when accessing the century, year, month, date, day, hours, minutes, seconds and alarms. A check is performed on illegal BCD entries such as illegal date of the month with regard to the year and century configured.

If one of the time fields is not correct, the data is not loaded into the register/counter and a flag is set in the validity register. The user can not reset this flag. It is reset as soon as an acceptable value is programmed. This avoids any further side effects in the hardware. The same procedure is followed for the alarm.

The following checks are performed:

1. Century (check if it is in range 19–20 or 13–14 in Persian mode)
2. Year (BCD entry check)
3. Date (check range 01–31)
4. Month (check if it is in BCD range 01–12, check validity regarding “date”)
5. Day (check range 1–7)
6. Hour (BCD checks: in 24-hour mode, check range 00–23 and check that AM/PM flag is not set if RTC is set in 24-hour mode; in 12-hour mode check range 01–12)
7. Minute (check BCD and range 00–59)
8. Second (check BCD and range 00–59)

**Note:** If the 12-hour mode is selected by means of the RTC Mode Register (RTC\_MR), a 12-hour value can be programmed and the returned value on RTC\_TIMR will be the corresponding 24-hour value. The entry control checks the value of the AM/PM indicator (bit 22 of RTC\_TIMR) to determine the range to be checked.

**Note:** In UTC mode, no check is performed on the entries. The RTC does not report any failure.

### 26.5.5 RTC Internal Free Running Counter Error Checking

To improve the reliability and security of the RTC, a permanent check is performed on the internal free running counters to report non-BCD or invalid date/time values.

An error is reported by TDERR bit in the status register (RTC\_SR) if an incorrect value has been detected. The flag can be cleared by setting the TDERRCLR bit in the Status Clear Command Register (RTC\_SCCR).

The TDERR error flag will be set again if the source of the error has not been cleared before clearing the TDERR flag. The clearing of the source of such error can be done by reprogramming a correct value on RTC\_CALR and/or RTC\_TIMR.

The RTC internal free running counters may automatically clear the source of TDERR due to their roll-over (i.e., every 10 seconds for SECONDS[3:0] field in RTC\_TIMR). In this case the TDERR is held high until a clear command is asserted by TDERRCLR bit in RTC\_SCCR.

### 26.5.6 Updating Time/Calendar

#### 26.5.6.1 Gregorian and Persian Modes

The update of the time/calendar must be synchronized on a second periodic event by either polling the RTC\_SR.SEC status bit or by enabling the SECEN interrupt in the RTC\_IER register.

Once the second event occurs, the user must stop the RTC by setting the corresponding field in the Control Register (RTC\_CR). Bit UPDTIM must be set to update time fields (hour, minute, second) and bit UPDCAL must be set to update calendar fields (century, year, month, date, day).

The ACKUPD bit must then be read to 1 by either polling the RTC\_SR or by enabling the ACKUPD interrupt in the RTC\_IER. Once ACKUPD is read to 1, it is mandatory to clear this flag by writing the corresponding bit in the RTC\_SCCR, after which the user can write to the Time Register, the Calendar Register, or both.

Once the update is finished, the user must write UPDTIM and/or UPDCAL to 0 in the RTC\_CR.

The timing sequence of the time/calendar update is described in the figure below.

When entering the programming mode of the calendar fields, the time fields remain enabled and both the time and the calendar fields are stopped. This is due to the location of the calendar logical circuitry (downstream for low-power considerations). It is highly recommended to prepare all the fields to be updated before entering programming mode. In successive update operations, the user must wait for at least one second after resetting the UPDTIM/UPDCAL bit in the RTC\_CR before setting these bits again. This is done by waiting for the SEC flag in the RTC\_SR before setting the UPDTIM/UPDCAL bit. After resetting UPDTIM/UPDCAL, the SEC flag must also be cleared.

**Figure 26-2. Time/Calendar Update Timing Diagram**

**Figure 26-3. Gregorian and Persian Modes Update Sequence**

**26.5.6.2 UTC Mode**

The update of the UTC time field must be synchronized on a second periodic event by either polling the RTC\_SR.SEC status bit or by enabling the SECEN interrupt in the RTC\_IER.

Once the second event occurs, the user must stop the RTC by setting the UPDTIM field in the Control Register (RTC\_CR).

The ACKUPD bit must then be read to 1 by either polling the RTC\_SR or by enabling the ACKUPD interrupt in the RTC\_IER. Once ACKUPD is read to 1, it is mandatory to clear this flag by writing the corresponding bit in the RTC\_SCCR, after which the user can write to the Time Register.

Once the update is finished, the user must write UPDTIM to 0 in the RTC\_CR.

The timing sequence of the UTC time update is described in the figure below.

In successive update operations, the user must wait for at least one second after resetting the UPDTIM bit in the RTC\_CR before setting this bit again. This is done by waiting for the SEC flag in the RTC\_SR before setting UPDTIM bit. After resetting UPDTIM, the SEC flag must also be cleared.

**Figure 26-4. UTC Time Update Timing Diagram**

**Figure 26-5. UTC Mode Update Sequence**

**26.5.7 RTC Accurate Clock Calibration**

The crystal oscillator that drives the RTC may not be as accurate as expected mainly due to temperature variation. The RTC is equipped with circuitry able to correct slow clock crystal drift.

To compensate for possible temperature variations over time, this accurate clock calibration circuitry can be programmed on-the-fly and also programmed during application manufacturing, in order to correct the crystal frequency accuracy at room temperature (20–25°C). The typical clock drift range at room temperature is ±20 ppm.

In the device operating temperature range, the 32.768 kHz crystal oscillator clock inaccuracy can be up to -200 ppm.

The RTC clock calibration circuitry allows positive or negative correction in a range of 1.5 ppm to 1950 ppm.

The calibration circuitry is fully digital. Thus, the configured correction is independent of temperature, voltage, process, etc., and no additional measurement is required to check that the correction is effective.

If the correction value configured in the calibration circuitry results from an accurate crystal frequency measure, the remaining accuracy is bounded by the values listed below:

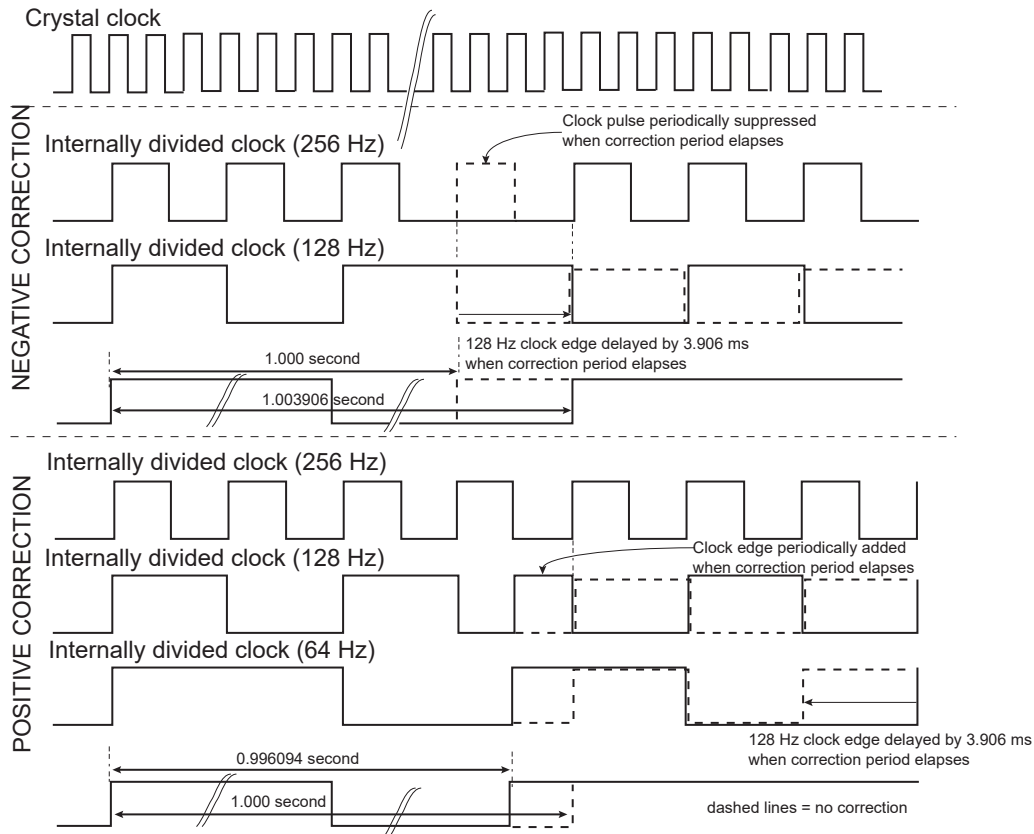

- Below 1 ppm, for an initial crystal drift between 1.5 ppm up to 20 ppm, and from 30 ppm to 90 ppm
- Below 2 ppm, for an initial crystal drift between 20 ppm up to 30 ppm, and from 90 ppm to 130 ppm
- Below 5 ppm, for an initial crystal drift between 130 ppm up to 200 ppm

The calibration circuitry does not modify the 32.768 kHz crystal oscillator clock frequency but it acts by slightly modifying the 1 Hz clock period from time to time. The correction event occurs every  $1 + [(20 - (19 \times \text{HIGHPPM})) \times \text{CORRECTION}]$  seconds. When the period is modified, depending on the sign of the correction, the 1 Hz clock period increases or reduces by around 4 ms. Depending on the CORRECTION, NEGPPM and HIGHPPM values configured in RTC\_MR, the period interval between two correction events differs.

**Figure 26-6. Calibration Circuitry**

**Figure 26-7. Calibration Circuitry Waveforms**

The inaccuracy of a crystal oscillator at typical room temperature ( $\pm 20$  ppm at 20–25 °C) can be compensated if a reference clock/signal is used to measure such inaccuracy. This kind of calibration operation can be set up during the final product manufacturing by means of measurement equipment embedding such a reference clock. The correction of value must be programmed into the (RTC\_MR), and this value is kept as long as the circuitry is powered (backup area). Removing the backup power supply cancels this calibration. This room temperature calibration can be further processed by means of the networking capability of the target application.

Note that this adjustment does not take into account the temperature variation.

The frequency drift (up to -200 ppm) due to temperature variation can be compensated using a reference time if the application can access such a reference. If a reference time cannot be used, a temperature sensor can be placed close to the crystal oscillator in order to get the operating temperature of the crystal oscillator. Once obtained, the temperature may be converted using a lookup table (describing the accuracy/temperature curve of the crystal oscillator used) and RTC\_MR configured accordingly. The calibration can be performed on-the-fly. This adjustment method is not based on a measurement of the crystal frequency/drift and therefore can be improved by means of the networking capability of the target application.

If no crystal frequency adjustment has been done during manufacturing, it is still possible to do it. In the case where a reference time of the day can be obtained through LAN/WAN network, it is possible to calculate the drift of the application crystal oscillator by comparing the values read on RTC Time Register (RTC\_TIMR) and programming the HIGHPPM and CORRECTION fields on RTC\_MR according to the difference measured between the reference time and those of RTC\_TIMR.

### 26.5.8 Waveform Generation

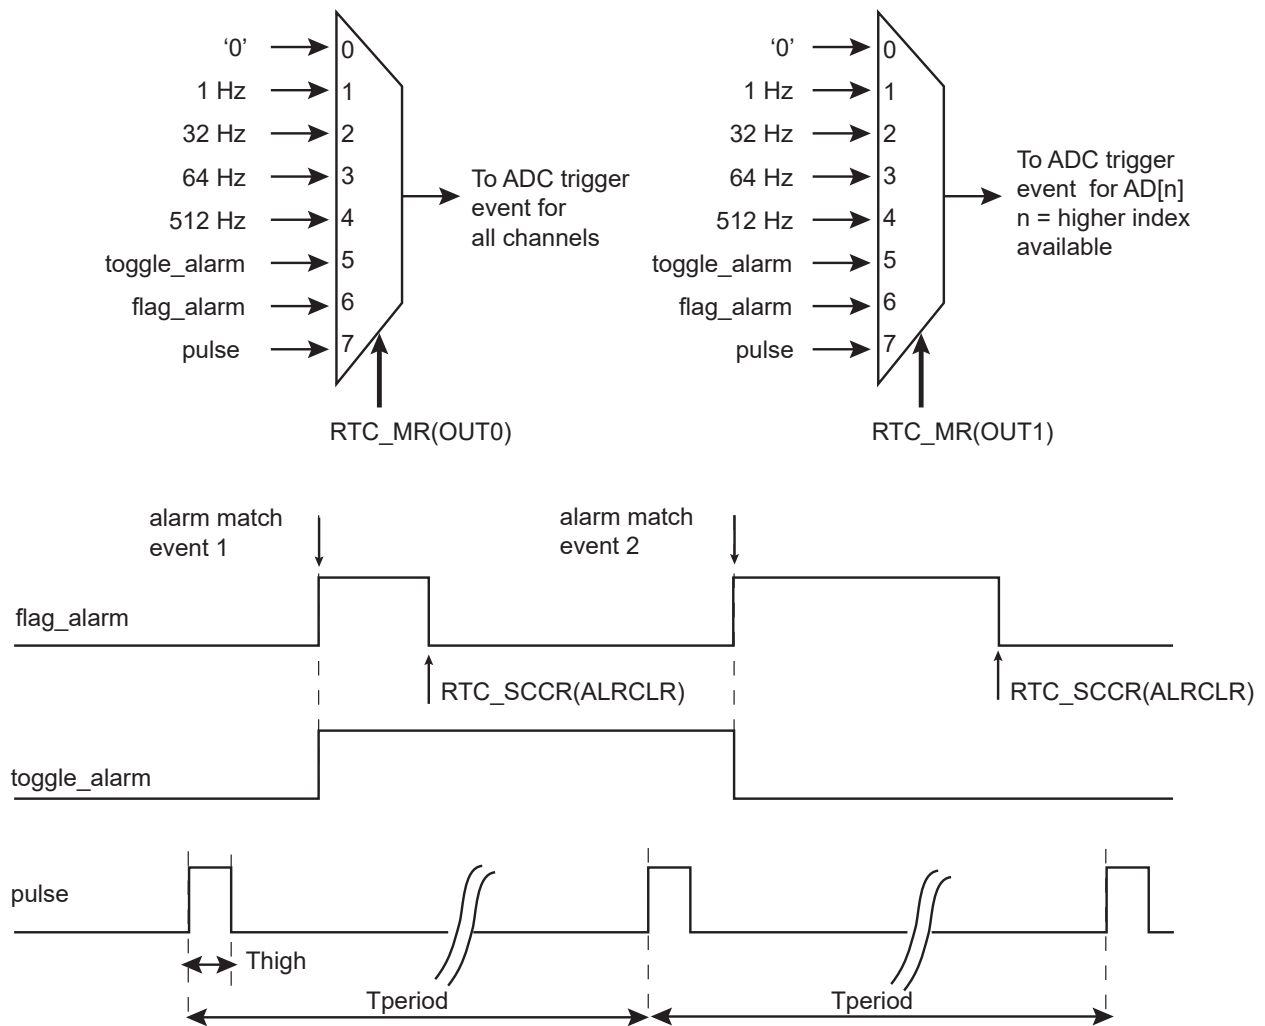

Waveforms can be generated in order to take advantage of the RTC inherent prescalers while the RTC is the only powered circuitry (Low-power mode of operation, Backup mode) or in any active mode. Entering Backup or Low-power operating modes does not affect the waveform generation outputs.

The RTC waveforms are internally routed to ADC trigger events. These events can be configured to provide several types of waveforms. The figure below illustrates the different signals available to generate the waveforms. Two different triggers can be generated at a time. The first is configured in RTC\_MR.OUT0 while the second is configurable in RTC\_MR.OUT1. OUT0 manages the trigger for channel AD[n:0] (where n is the higher index available (last channel)), while OUT1 manages the channel AD[n] only for specific modes. See the section "Analog to Digital Converter (ADC)" for selection of the measurement triggers and associated modes of operation.

The first selection choice sticks the associated output at 0. (This is the reset value and it can be used at any time to disable the waveform generation).

Selection choices 1 to 4 respectively select 1 Hz, 32 Hz, 64 Hz and 512 Hz.

**Figure 26-8. Waveform Generation for ADC Trigger Event**

### 26.5.9 Tamper Timestamping

As soon as a tamper is detected, the tamper counter is incremented and the RTC stores the time of the day, the date and the source of the tamper event in registers located in the backup area. Up to two tamper events can be stored.

In UTC mode, only the UTC time is stored. The date information is not relevant.

The tamper counter saturates at 15. Once this limit is reached, the exact number of tamper occurrences since the last read of stamping registers cannot be known.

The first set of timestamping registers (RTC\_TSTR0, RTC\_TSDR0, RTC\_TSSR0) cannot be overwritten, so once they have been written all data are stored until the registers are reset. Therefore these registers are storing the first tamper occurrence after a read.

The second set of timestamping registers (RTC\_TSTR1, RTC\_TSDR1, RTC\_TSSR1) are overwritten each time a tamper event is detected. Thus the date and the time data of the first and the second stamping registers may be equal. This occurs when the tamper counter value carried on field TEVCNT in RTC\_TSTR0 equals 1. Thus this second set of registers stores the last occurrence of tamper before a read.

Reading a set of timestamping registers requires three accesses, one for the time of the day, one for the date and one for the tamper source.

Reading the third part (RTC\_TSSR0/1) of a timestamping register set clears the whole content of the registers (time, date and tamper source) and makes the timestamping registers available to store a new event.

### 26.6 Register Summary

Offset	Name	Bit Pos.								
0x00	RTC_CR	7:0						UPDCAL	UPDTIM	
		15:8						TIMEVSEL[1:0]

### 26.6.1 RTC Control Register

**Name:** RTC\_CR  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

**Bits 17:16 – CALEVSEL[1:0]** Calendar Event Selection

The event that generates the flag CALEV in RTC\_SR depends on the value of CALEVSEL.

In UTC mode, this field has no effect on the RTC\_SR.

Value	Name	Description
0	WEEK	Week change (every Monday at time 00:00:00)
1	MONTH	Month change (every 01 of each month at time 00:00:00)
2	YEAR	Year change (every January 1 at time 00:00:00)
3	YEAR	Reserved

**Bits 9:8 – TIMEVSEL[1:0]** Time Event Selection

The event that generates the flag TIMEV in RTC\_SR depends on the value of TIMEVSEL.

In UTC mode, this field has no effect on the RTC\_SR.

Value	Name	Description
0	MINUTE	Minute change
1	HOUR	Hour change
2	MIDNIGHT	Every day at midnight
3	NOON	Every day at noon

---

**Bit 1 – UPDCAL** Update Request Calendar Register

Calendar counting consists of day, date, month, year and century counters. Calendar counters can be programmed once this bit is set and acknowledged by the bit ACKUPD of the RTC\_SR.

In UTC mode, this bit has no effect on the RTC behavior.

Value	Description
0	No effect or, if UPDCAL has been previously written to 1, stops the update procedure.
1	Stops the RTC calendar counting.

**Bit 0 – UPDTIM** Update Request Time Register

Time counting consists of second, minute and hour counters. Time counters can be programmed once this bit is set and acknowledged by the bit ACKUPD of the RTC\_SR.

Value	Description
0	No effect or, if UPDTIM has been previously written to 1, stops the update procedure.
1	Stops the RTC time counting.

### 26.6.2 RTC Mode Register

**Name:** RTC\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24		
			TPERIOD[1:0]				THIGH[2:0]			
Access			R/W	R/W		R/W	R/W	R/W		
Reset			0	0		0	0	0		
Bit	23	22	21	20	19	18	17	16		
			OUT1[2:0]					OUT0[2:0]		
Access		R/W	R/W	R/W		R/W	R/W	R/W		
Reset		0	0	0		0	0	0		
Bit	15	14	13	12	11	10	9	8		
	HIGHPPM		CORRECTION[6:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W		
Reset	0	0	0	0	0	0	0	0		
Bit	7	6	5	4	3	2	1	0		
					NEGPPM			UTC	PERSIAN	HRMOD
Access				R/W		R/W	R/W	R/W		
Reset				0		0	0	0		

**Bits 29:28 – TPERIOD[1:0]** Period of the Output Pulse

Value	Name	Description
0	P_1S	1 second
1	P_500MS	500 ms
2	P_250MS	250 ms
3	P_125MS	125 ms

**Bits 26:24 – THIGH[2:0]** High Duration of the Output Pulse

Value	Name	Description
0	H_31MS	31.2 ms
1	H_16MS	15.6 ms
2	H_4MS	3.91 ms
3	H_976US	976 $\mu$ s
4	H_488US	488 $\mu$ s
5	H_122US	122 $\mu$ s
6	H_30US	30.5 $\mu$ s
7	H_15US	15.2 $\mu$ s

### Bits 22:20 – OUT1[2:0] ADC Last Channel Trigger Event Source Selection

Value	Name	Description
0	NO_WAVE	No waveform, stuck at '0'
1	FREQ1HZ	1 Hz square wave
2	FREQ32HZ	32 Hz square wave
3	FREQ64HZ	64 Hz square wave
4	FREQ512HZ	512 Hz square wave
5	ALARM_TOGGLE	Output toggles when alarm flag rises
6	ALARM_FLAG	Output is a copy of the alarm flag
7	PROG_PULSE	Duty cycle programmable pulse

### Bits 18:16 – OUT0[2:0] All ADC Channel Trigger Event Source Selection

Value	Name	Description
0	NO_WAVE	No waveform, stuck at '0'
1	FREQ1HZ	1 Hz square wave
2	FREQ32HZ	32 Hz square wave
3	FREQ64HZ	64 Hz square wave
4	FREQ512HZ	512 Hz square wave
5	ALARM_TOGGLE	Output toggles when alarm flag rises
6	ALARM_FLAG	Output is a copy of the alarm flag
7	PROG_PULSE	Duty cycle programmable pulse

### Bit 15 – HIGHPPM HIGH PPM Correction

If the absolute value of the correction to be applied is lower than 30 ppm, it is recommended to clear HIGHPPM. HIGHPPM set to 1 is recommended for 30 ppm correction and above.

#### Formula:

If HIGHPPM = 0, then the clock frequency correction range is from 1.5 ppm up to 98 ppm. The RTC accuracy is less than 1 ppm for a range correction from 1.5 ppm up to 30 ppm.

The correction field must be programmed according to the required correction in ppm; the formula is as follows:

$$\text{CORRECTION} = \frac{3906}{20 \times \text{ppm}} - 1$$

The value obtained must be rounded to the nearest integer prior to being programmed into CORRECTION field.

If HIGHPPM = 1, then the clock frequency correction range is from 30.5 ppm up to 1950 ppm. The RTC accuracy is less than 1 ppm for a range correction from 30.5 ppm up to 90 ppm.

The correction field must be programmed according to the required correction in ppm; the formula is as follows:

$$\text{CORRECTION} = \frac{3906}{\text{ppm}} - 1$$

The value obtained must be rounded to the nearest integer prior to be programmed into CORRECTION field.

If NEGPPM is set to 1, the ppm correction is negative (used to correct crystals that are faster than the nominal 32.768 kHz).

Value	Description
0	Lower range ppm correction with accurate correction.
1	Higher range ppm correction with accurate correction.

### Bits 14:8 – CORRECTION[6:0] Slow Clock Correction

Value	Description
0	No correction
1-127	The slow clock will be corrected according to the formula given in HIGHPPM description.

### Bit 4 – NEGPPM Negative PPM Correction

See CORRECTION and HIGHPPM field descriptions.

NEGPPM must be cleared to correct a crystal slower than 32.768 kHz.

Value	Description
0	Positive correction (the divider will be slightly higher than 32768).
1	Negative correction (the divider will be slightly lower than 32768).

### Bit 2 – UTC UTC Time Format

It is forbidden to write a one to the UTC and PERSIAN bits at the same time.

Value	Description
0	Gregorian or Persian calendar.
1	UTC format.

### Bit 1 – PERSIAN PERSIAN Calendar

Value	Description
0	Gregorian calendar.
1	Persian calendar.

### Bit 0 – HRMOD 12-/24-hour Mode

Value	Description
0	24-hour mode is selected.
1	12-hour mode is selected.

### 26.6.3 RTC Time Register

**Name:** RTC\_TIMR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

In UTC mode, this register view is not relevant, see [26.6.7 RTC\\_TIMALR \(UTC\\_MODE\)](#).

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
			AMPM		HOUR[5:0]				
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset		0	0	0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	
			MIN[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset		0	0	0	0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
			SEC[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset		0	0	0	0	0	0	0	

**Bit 22 – AMPM** Ante Meridiem Post Meridiem Indicator  
 This bit is the AM/PM indicator in 12-hour mode.

Value	Description
0	AM.
1	PM.

**Bits 21:16 – HOUR[5:0]** Current Hour  
 The range that can be set is 1–12 (BCD) in 12-hour mode or 0–23 (BCD) in 24-hour mode.

**Bits 14:8 – MIN[6:0]** Current Minute  
 The range that can be set is 0–59 (BCD).  
 The lowest four bits encode the units. The higher bits encode the tens.

**Bits 6:0 – SEC[6:0]** Current Second  
 The range that can be set is 0–59 (BCD).  
 The lowest four bits encode the units. The higher bits encode the tens.

### 26.6.4 RTC Time Register (UTC\_MODE)

**Name:** RTC\_TIMR (UTC\_MODE)  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

This configuration is relevant only if UTC = 1 in RTC\_MR.

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
UTC_TIME[31:24]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
UTC_TIME[23:16]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
UTC_TIME[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
UTC_TIME[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – UTC\_TIME[31:0]** Current UTC Time  
 Any value can be set.

### 26.6.5 RTC Calendar Register

**Name:** RTC\_CALR  
**Offset:** 0x0C  
**Reset:** 0x01E11220  
**Property:** Read/Write

In UTC mode, values read in this register are not relevant.

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
			DATE[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	1
Bit	23	22	21	20	19	18	17	16
	DAY[2:0]			MONTH[4:0]				
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	0	0	0	0	1
Bit	15	14	13	12	11	10	9	8
	YEAR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	1	0	0	1	0
Bit	7	6	5	4	3	2	1	0
		CENT[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	1	0	0	0	0	0

**Bits 29:24 – DATE[5:0]** Current Day in Current Month  
The range that can be set is 01–31 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

**Bits 23:21 – DAY[2:0]** Current Day in Current Week  
The range that can be set is 1–7 (BCD).

The coding of the number (which number represents which day) is user-defined as it has no effect on the date counter.

**Bits 20:16 – MONTH[4:0]** Current Month  
The range that can be set is 01–12 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

**Bits 15:8 – YEAR[7:0]** Current Year  
The range that can be set is 00–99 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

**Bits 6:0 – CENT[6:0]** Current Century

The range that can be set is 19–20 (Gregorian) or 13–14 (Persian) (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

### 26.6.6 RTC Time Alarm Register

**Name:** RTC\_TIMALR  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

To change one of the SEC, MIN, HOUR fields, it is recommended to disable the field before changing the value and then re-enable it after the change has been made. This requires up to three accesses to the RTC\_TIMALR. The first access clears the enable corresponding to the field to change (SECEN, MINEN, HOUREN). If the field is already cleared, this access is not required. The second access performs the change of the value (SEC, MIN, HOUR). The third access is required to re-enable the field by writing 1 in SECEN, MINEN, HOUREN fields.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	HOUREN	AMPM	HOUR[5:0]					
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bit 23 – HOUREN Hour Alarm Enable

Value	Description
0	The hour-matching alarm is disabled.
1	The hour-matching alarm is enabled.

#### Bit 22 – AMPM AM/PM Indicator

This field is the alarm field corresponding to the BCD-coded hour counter.

#### Bits 21:16 – HOUR[5:0] Hour Alarm

This field is the alarm field corresponding to the BCD-coded hour counter.

#### Bit 15 – MINEN Minute Alarm Enable

---

---

Value	Description
0	The minute-matching alarm is disabled.
1	The minute-matching alarm is enabled.

**Bits 14:8 – MIN[6:0]** Minute Alarm

This field is the alarm field corresponding to the BCD-coded minute counter.

**Bit 7 – SECEN** Second Alarm Enable

Value	Description
0	The second-matching alarm is disabled.
1	The second-matching alarm is enabled.

**Bits 6:0 – SEC[6:0]** Second Alarm

This field is the alarm field corresponding to the BCD-coded second counter.

### 26.6.7 RTC Time Alarm Register (UTC\_MODE)

**Name:** RTC\_TIMALR (UTC\_MODE)  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

This configuration is relevant only if UTC = 1 in RTC\_MR.

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
UTC_TIME[31:24]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
UTC_TIME[23:16]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
UTC_TIME[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
UTC_TIME[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – UTC\_TIME[31:0] UTC\_TIME Alarm

This field is the alarm field corresponding to the UTC time counter. To change it, proceed as follows:

1. Disable the UTC alarm by clearing the UTCEN bit in RTC\_CALALR if it is not already cleared.
2. Change the UTC\_TIME alarm value.
3. Enable the UTC alarm by setting the UTCEN bit in RTC\_CALALR.

### 26.6.8 RTC Calendar Alarm Register

**Name:** RTC\_CALALR  
**Offset:** 0x14  
**Reset:** 0x01010000  
**Property:** Read/Write

In UTC mode, this register view is not relevant, see [26.6.9 RTC\\_CALALR \(UTC\\_MODE\)](#).

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

To change one of the DATE, MONTH fields, it is recommended to disable the field before changing the value and then re-enable it after the change has been made. This requires up to three accesses to the RTC\_CALALR. The first access clears the enable corresponding to the field to change (DATEEN, MTHEN). If the field is already cleared, this access is not required. The second access performs the change of the value (DATE, MONTH). The third access is required to re-enable the field by writing 1 in DATEEN, MTHEN fields.

	Bit	31	30	29	28	27	26	25	24
		DATEEN		DATE[5:0]					
Access		R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset		0		0	0	0	0	0	1
	Bit	23	22	21	20	19	18	17	16
		MTHEN		MONTH[4:0]					
Access		R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset		0		0	0	0	0	0	1
	Bit	15	14	13	12	11	10	9	8
Access									
Reset									
	Bit	7	6	5	4	3	2	1	0
Access									
Reset									

#### Bit 31 – DATEEN Date Alarm Enable

Value	Description
0	The date-matching alarm is disabled.
1	The date-matching alarm is enabled.

#### Bits 29:24 – DATE[5:0] Date Alarm

This field is the alarm field corresponding to the BCD-coded date counter.

#### Bit 23 – MTHEN Month Alarm Enable

# SAMA5D2 Series

## Real-time Clock (RTC)

Value	Description
0	The month-matching alarm is disabled.
1	The month-matching alarm is enabled.

### Bits 20:16 – MONTH[4:0] Month Alarm

This field is the alarm field corresponding to the BCD-coded month counter.

**26.6.9 RTC Calendar Alarm Register (UTC\_MODE)**

**Name:** RTC\_CALALR (UTC\_MODE)  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

**Bit 0 – UTCEN** UTC Alarm Enable

Value	Description
0	The UTC-matching alarm is disabled.
1	The UTC-matching alarm is enabled.

### 26.6.10 RTC Status Register

**Name:** RTC\_SR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
			TDERR	CALEV	TIMEV	SEC	ALARM	ACKUPD
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

#### Bit 5 – TDERR Time and/or Date Free Running Error

If the RTC is configured in UTC mode, the value returned by this field is not relevant.

Value	Name	Description
0	CORRECT	The internal free running counters are carrying valid values since the last read of the Status Register (RTC_SR).
1	ERR_TIMEDATE	The internal free running counters have been corrupted (invalid date or time, non-BCD values) since the last read and/or they are still invalid.

#### Bit 4 – CALEV Calendar Event

The calendar event is selected in the CALEVSEL field in the Control Register (RTC\_CR) and can be any one of the following events: week change, month change and year change. If the RTC is configured in UTC mode, the value returned by this field is not relevant.

Value	Name	Description
0	NO_CALEVENT	No calendar event has occurred since the last clear.
1	CALEVENT	At least one calendar event has occurred since the last clear.

#### Bit 3 – TIMEV Time Event

The time event is selected in the TIMEVSEL field in the Control Register (RTC\_CR) and can be any one of the following events: minute change, hour change, noon, midnight (day change). If the RTC is configured in UTC mode, the value returned by this field is not relevant.

# SAMA5D2 Series

## Real-time Clock (RTC)

Value	Name	Description
0	NO_TIMEEVENT	No time event has occurred since the last clear.
1	TIMEEVENT	At least one time event has occurred since the last clear.

### Bit 2 – SEC Second Event

Value	Name	Description
0	NO_SECEVENT	No second event has occurred since the last clear.
1	SECEVENT	At least one second event has occurred since the last clear.

### Bit 1 – ALARM Alarm Flag

Value	Name	Description
0	NO_ALARMEVENT	No alarm matching condition occurred.
1	ALARMEVENT	An alarm matching condition has occurred.

### Bit 0 – ACKUPD Acknowledge for Update

Value	Name	Description
0	FREERUN	Time and calendar registers cannot be updated.
1	UPDATE	Time and calendar registers can be updated.

### 26.6.11 RTC Status Clear Command Register

**Name:** RTC\_SCCR  
**Offset:** 0x1C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Clears the corresponding status flag in the Status register (RTC\_SR).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
			TDERRCLR	CALCLR	TIMCLR	SECCLR	ALRCLR	ACKCLR
Access			W	W	W	W	W	W
Reset			–	–	–	–	–	–

**Bit 5 – TDERRCLR** Time and/or Date Free Running Error Clear  
 If the RTC is configured in UTC mode, this bit has no effect.

**Bit 4 – CALCLR** Calendar Clear  
 If the RTC is configured in UTC mode, this bit has no effect.

**Bit 3 – TIMCLR** Time Clear  
 If the RTC is configured in UTC mode, this bit has no effect.

**Bit 2 – SECCLR** Second Clear

**Bit 1 – ALRCLR** Alarm Clear

**Bit 0 – ACKCLR** Acknowledge Clear

### 26.6.12 RTC Interrupt Enable Register

**Name:** RTC\_IER  
**Offset:** 0x20  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
			TDERREN	CALEN	TIMEN	SECEN	ALREN	ACKEN
Access			W	W	W	W	W	W
Reset			–	–	–	–	–	–

**Bit 5 – TDERREN** Time and/or Date Error Interrupt Enable  
 If the RTC is configured in UTC mode, this bit has no effect.

**Bit 4 – CALEN** Calendar Event Interrupt Enable  
 If the RTC is configured in UTC mode, this bit has no effect.

**Bit 3 – TIMEN** Time Event Interrupt Enable  
 If the RTC is configured in UTC mode, this bit has no effect.

**Bit 2 – SECEN** Second Event Interrupt Enable

**Bit 1 – ALREN** Alarm Interrupt Enable

**Bit 0 – ACKEN** Acknowledge Update Interrupt Enable

### 26.6.13 RTC Interrupt Disable Register

**Name:** RTC\_IDR  
**Offset:** 0x24  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
			TDERRDIS	CALDIS	TIMDIS	SECDIS	ALRDIS	ACKDIS
Access			W	W	W	W	W	W
Reset			–	–	–	–	–	–

**Bit 5 – TDERRDIS** Time and/or Date Error Interrupt Disable  
 If the RTC is configured in UTC mode, this bit has no effect.

**Bit 4 – CALDIS** Calendar Event Interrupt Disable  
 If the RTC is configured in UTC mode, this bit has no effect.

**Bit 3 – TIMDIS** Time Event Interrupt Disable  
 If the RTC is configured in UTC mode, this bit has no effect.

**Bit 2 – SECDIS** Second Event Interrupt Disable

**Bit 1 – ALRDIS** Alarm Interrupt Disable

**Bit 0 – ACKDIS** Acknowledge Update Interrupt Disable

### 26.6.14 RTC Interrupt Mask Register

**Name:** RTC\_IMR  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
			TDERR	CAL	TIM	SEC	ALR	ACK
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

**Bit 5 – TDERR** Time and/or Date Error Mask

If the RTC is configured in UTC mode, this bit has no effect.

**Bit 4 – CAL** Calendar Event Interrupt Mask

If the RTC is configured in UTC mode, this bit is not relevant.

**Bit 3 – TIM** Time Event Interrupt Mask

If the RTC is configured in UTC mode, this bit is not relevant.

**Bit 2 – SEC** Second Event Interrupt Mask

**Bit 1 – ALR** Alarm Interrupt Mask

**Bit 0 – ACK** Acknowledge Update Interrupt Mask

**26.6.15 RTC Valid Entry Register**

**Name:** RTC\_VER  
**Offset:** 0x2C  
**Reset:** 0x00000000  
**Property:** Read-only

If the RTC is configured in UTC mode, the values returned by this register are not relevant.

**Bit 3 – NVCALALR** Non-valid Calendar Alarm

Value	Description
0	No invalid data has been detected in RTC_CALALR (Calendar Alarm Register).
1	RTC_CALALR has contained invalid data since it was last programmed.

**Bit 2 – NVTIMALR** Non-valid Time Alarm

Value	Description
0	No invalid data has been detected in RTC_TIMALR (Time Alarm Register).
1	RTC_TIMALR has contained invalid data since it was last programmed.

**Bit 1 – NVCAL** Non-valid Calendar

Value	Description
0	No invalid data has been detected in RTC_CALR (Calendar Register).
1	RTC_CALR has contained invalid data since it was last programmed.

**Bit 0 – NVTIM** Non-valid Time

Value	Description
0	No invalid data has been detected in RTC_TIMR (Time Register).

# SAMA5D2 Series

## Real-time Clock (RTC)

---

---

Value	Description
1	RTC_TIMR has contained invalid data since it was last programmed.

### 26.6.16 RTC TimeStamp Time Register 0

**Name:** RTC\_TSTR0  
**Offset:** 0xB0  
**Reset:** 0x00000000  
**Property:** Read-only

These fields are valid for non-UTC mode only.

RTC\_TSTR0 reports the timestamp of the first tamper event after reading RTC\_TSSR0.

	Bit	31	30	29	28	27	26	25	24
		BACKUP			TEVCNT[3:0]				
Access		R				R	R	R	R
Reset		0				0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		AMPM		HOUR[5:0]					
Access			R	R	R	R	R	R	R
Reset			0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		MIN[6:0]							
Access			R	R	R	R	R	R	R
Reset			0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		SEC[6:0]							
Access			R	R	R	R	R	R	R
Reset			0	0	0	0	0	0	0

**Bit 31 – BACKUP** System Mode of the Tamper (cleared by reading RTC\_TSSR0)

Value	Description
0	The state of the system is different from Backup mode when the tamper event occurs.
1	The system is in Backup mode when the tamper event occurs.

**Bits 27:24 – TEVCNT[3:0]** Tamper Events Counter (cleared by reading RTC\_TSSR0)

Each time a tamper event occurs, this counter is incremented. This counter saturates at 15. Once this value is reached, it is no more possible to know the exact number of tamper events.

If this field is not null, this implies that at least one tamper event occurs since last register reset and that the values stored in timestamping registers are valid.

**Bit 22 – AMPM** AM/PM Indicator of the Tamper (cleared by reading RTC\_TSSR0)

**Bits 21:16 – HOUR[5:0]** Hours of the Tamper (cleared by reading RTC\_TSSR0)

**Bits 14:8 – MIN[6:0]** Minutes of the Tamper (cleared by reading RTC\_TSSR0)

**Bits 6:0 – SEC[6:0]** Seconds of the Tamper (cleared by reading RTC\_TSSR0)

**26.6.17 RTC TimeStamp Time Register 0 (UTC\_MODE)**

**Name:** RTC\_TSTR0 (UTC\_MODE)  
**Offset:** 0xB0  
**Reset:** 0x00000000  
**Property:** Read-only

RTC\_TSTR0 reports the timestamp of the first tamper event after reading RTC\_TSSR0.

**Bit 31 – BACKUP** System Mode of the Tamper (cleared by reading RTC\_TSSR0)

Value	Description
0	The state of the system is different from Backup mode when the tamper event occurs.
1	The system is in Backup mode when the tamper event occurs.

**Bits 27:24 – TEVCNT[3:0]** Tamper Events Counter (cleared by reading RTC\_TSSR0)

Each time a tamper event occurs, this counter is incremented. This counter saturates at 15. Once this value is reached, it is no more possible to know the exact number of tamper events.

If this field is not null, this implies that at least one tamper event occurs since last register reset and that the values stored in timestamping registers are valid.

### 26.6.18 RTC TimeStamp Time Register 1

**Name:** RTC\_TSTR1  
**Offset:** 0xBC  
**Reset:** 0x00000000  
**Property:** Read-only

These fields are valid for non-UTC mode only.

RTC\_TSTR1 reports the timestamp of the last tamper event after reading RTC\_TSSR1.

	Bit	31	30	29	28	27	26	25	24
		BACKUP							
Access		R							
Reset		0							
	Bit	23	22	21	20	19	18	17	16
		AMPM		HOUR[5:0]					
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		MIN[6:0]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		SEC[6:0]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0

**Bit 31 – BACKUP** System Mode of the Tamper (cleared by reading RTC\_TSSR1)

Value	Description
0	The state of the system is different from Backup mode when the tamper event occurs.
1	The system is in Backup mode when the tamper event occurs.

**Bit 22 – AMPM** AM/PM Indicator of the Tamper (cleared by reading RTC\_TSSR1)

**Bits 21:16 – HOUR[5:0]** Hours of the Tamper (cleared by reading RTC\_TSSR1)

**Bits 14:8 – MIN[6:0]** Minutes of the Tamper (cleared by reading RTC\_TSSR1)

**Bits 6:0 – SEC[6:0]** Seconds of the Tamper (cleared by reading RTC\_TSSR1)

**26.6.19 RTC TimeStamp Time Register 1 (UTC\_MODE)**

**Name:** RTC\_TSTR1 (UTC\_MODE)  
**Offset:** 0xBC  
**Reset:** 0x00000000  
**Property:** Read-only

RTC\_TSTR1 reports the timestamp of the last tamper event after reading RTC\_TSSR1.

**Bit 31 – BACKUP** System Mode of the Tamper (cleared by reading RTC\_TSSR1)

Value	Description
0	The state of the system is different from Backup mode when the tamper event occurs.
1	The system is in Backup mode when the tamper event occurs.

### 26.6.20 RTC TimeStamp Date Register

**Name:** RTC\_TSDRx  
**Offset:** 0xB4 + x\*0x0C [x=0..1]  
**Reset:** 0x00000000  
**Property:** Read-only

These fields contain the date and the source of a tamper occurrence if RTC\_TSTR0.TEVCNT is not null.

These fields are relevant for non-UTC mode only.

RTC\_TSDR0 reports the timestamp of the first tamper event after reading RTC\_TSSR0, and RTC\_TSDR1 reports the timestamp of the last tamper event.

	31	30	29	28	27	26	25	24	
			DATE[5:0]						
Access			R	R	R	R	R	R	
Reset			0	0	0	0	0	0

		CENT[6:0]							
Access		R	R	R	R	R	R	R	
Reset		0	0	0	0	0	0	0	

**Bits 29:24 – DATE[5:0]** Date of the Tamper (cleared by reading RTC\_TSSRx)

**Bits 23:21 – DAY[2:0]** Day of the Tamper (cleared by reading RTC\_TSSRx)

**Bits 20:16 – MONTH[4:0]** Month of the Tamper (cleared by reading RTC\_TSSRx)

**Bits 15:8 – YEAR[7:0]** Year of the Tamper (cleared by reading RTC\_TSSRx)

**Bits 6:0 – CENT[6:0]** Century of the Tamper (cleared by reading RTC\_TSSRx)

### 26.6.21 RTC TimeStamp Date Register (UTC\_MODE)

**Name:** RTC\_TSDRx (UTC\_MODE)  
**Offset:** 0xB4  
**Reset:** 0x00000000  
**Property:** Read-only

RTC\_TSDR0 reports the timestamp of the first tamper event after reading RTC\_TSSR0, and  
 RTC\_TSDR1 reports the timestamp of the last tamper event.  
 This register is cleared by reading RTC\_TSSRx.

	31	30	29	28	27	26	25	24
	UTC_TIME[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – UTC\_TIME[31:0]** Time of the Tamper (UTC format)  
 This configuration is relevant only if UTC = 1 in RTC\_MR.

**26.6.22 RTC TimeStamp Source Register**

**Name:** RTC\_TSSRx  
**Offset:** 0xB8 + x\*0x0C [x=0..1]  
**Reset:** 0x00000000  
**Property:** Read-only

This register is cleared after read and the read access also performs a clear on RTC\_TSTRx and RTC\_TSDRx.

The following configuration values are valid for all listed bit names of this register:

0: No alarm generated since the last clear.

1: An alarm has been generated by the corresponding monitor since the last clear.

Bit	31	30	29	28	27	26	25	24
Access

Reset					0	0		

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – DETx** PIOBU Intrusion Detector (cleared on read)

**Bit 3 – JTAG** JTAG Pins Monitor (cleared on read)

**Bit 2 – TST** Test Pin Monitor (cleared on read)

## 27. System Controller Write Protection (SYSCWP)

### 27.1 Functional Description

#### 27.1.1 System Controller Peripherals Mapping

**Table 27-1. System Controller Peripherals Mapping**

Offset	System Controller Peripheral	Name
0x000-0x00C	Reset Controller	RSTC
0x010-0x01C	Shutdown Controller	SHDWC
0x030-0x03C	Period Interval Timer	PIT
0x040-0x04C	Watchdog Timer	WDT
0x050-0x05C	Slow Clock Controller	SCKC
0x0B0-0x190	Real Time Clock	RTC
0x194	Write Protection Mode Register	SYSC_WPMR

#### 27.1.2 Register Write Protection

To prevent any single software error from modifying the configuration of the Reset Controller (RSTC), Shutdown Controller (SHDWC), Periodic Interval Timer (PIT), Slow Clock Controller (SCKC), Real-time Clock (RTC) and Watchdog Timer (WDT), some registers of these peripherals can be write-protected by setting the WPEN bit in the System Controller Write Protection Mode register (SYSC\_WPMR).

**Note:** The WDT embeds additional write protection mechanisms.

The following registers can be write-protected when SYSC\_WPMR.WPEN=1:

- WDT Control Register
- WDT Mode Register
- RSTC Mode Register
- SHDWC Mode Register
- SHDWC Wakeup Inputs Register
- PIT Mode Register
- SCKC Configuration Register
- RTC Control Register
- RTC Mode Register
- RTC Time Alarm Register
- RTC Calendar Alarm Register

### 27.2 Register Summary

Offset	Name	Bit Pos.									
0x00	SYSC_WPMR	7:0								WPEN	
		15:8	WPKEY[7:0]								
		23:16	WPKEY[15:8]								
		31:24	WPKEY[23:16]								

# SAMA5D2 Series

## System Controller Write Protection (SYSCWP)

### 27.2.1 SYSC Write Protection Mode Register

**Name:** SYSC\_WPMR  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPEN
Access								R/W
Reset								0

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x535943	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit.
3		Always reads as 0.

#### Bit 0 – WPEN Write Protection Enable

Value	Description
0	Disables the write protection of the configuration registers if WPKEY corresponds to 0x535943 (“SYC” in ASCII).
1	Enables the write protection of the configuration registers if WPKEY corresponds to 0x535943 (“SYC” in ASCII).

## 28. Slow Clock Controller (SCKC)

### 28.1 Description

The System Controller embeds a Slow Clock Controller (SCKC). The SCKC selects the slow clock from one of two sources:

- External 32.768 kHz crystal oscillator
- Embedded 64 kHz (typical) RC oscillator

### 28.2 Embedded Characteristics

- 64 kHz (typical) RC Oscillator or 32.768 kHz Crystal Oscillator Selector
- VDDBU Powered

### 28.3 Block Diagram

Figure 28-1. Block Diagram

### 28.4 Functional Description

The OSCSEL bit is located in the Slow Clock Controller Configuration register (SCKC\_CR), in the backup domain, and its value is kept while VDDBU is present.

The embedded 64 kHz (typical) Slow RC oscillator and the 32.768 kHz crystal oscillator are always enabled as soon as VDDBU is established. The Slow Clock Selector command (OSCSEL bit) selects the slow clock source.

After the VDDBU power-on reset, the default configuration is OSCSEL = 0, allowing the system to start on the embedded 64 kHz (typical) RC oscillator.

The programmer controls the slow clock switching by software, so precautions must be taken during the switching phase.

#### 28.4.1 Switching from Embedded 64 kHz RC Oscillator to 32.768 kHz Crystal Oscillator

The sequence to switch from the embedded 64 kHz (typical) RC oscillator to the 32.768 kHz crystal oscillator is the following:

1. Switch the master clock to a source different from slow clock (PLL or Main Oscillator) through the Power Management Controller.
2. Switch from the embedded 64 kHz (typical) RC oscillator to the 32.768 kHz crystal oscillator by writing a 1 to the OSCSEL bit.
3. Wait 5 slow clock cycles for internal resynchronization.

### 28.4.2 Switching from 32.768 kHz Crystal Oscillator to Embedded 64 kHz RC Oscillator

The sequence to switch from the 32.768 kHz crystal oscillator to the embedded 64 kHz (typical) RC oscillator is the following:

1. Switch the master clock to a source different from slow clock (PLL or Main Oscillator).
2. Switch from the 32.768 kHz crystal oscillator to the embedded RC oscillator by writing a 0 to the OSCSEL bit.
3. Wait 5 slow clock cycles for internal resynchronization.

## 28.5 Register Summary

Offset	Name	Bit Pos.								
0x00	SCKC_CR	7:0					OSCSEL			
		15:8								
		23:16								
		31:24								

### 28.5.1 Slow Clock Controller Configuration Register

**Name:** SCKC\_CR  
**Offset:** 0x0  
**Reset:** 0x00000001  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode register (SYSC\_WPMR).

#### Bit 3 – OSCSEL Slow Clock Selector

Value	Description
0 (RC)	Slow clock is the embedded 64 kHz (typical) RC oscillator.
1 (XTAL)	Slow clock is the 32.768 kHz crystal oscillator.

## 29. Peripheral Touch Controller (PTC)

### 29.1 Description

The QTouch Peripheral Touch Controller (PTC) subsystem offers built-in hardware for capacitive touch measurement on sensors that function as buttons, sliders and wheels. The PTC subsystem supports both mutual and self-capacitance measurement without the need for any external component. It offers sensitivity and noise tolerance, as well as self-calibration, and minimizes the sensitivity tuning effort by the user.

The PTC subsystem is intended for autonomously performing capacitive touch sensor measurements. The external capacitive touch sensor is typically formed on a PCB, and the sensor electrodes are connected to the analog charge integrator of the PTC using the device I/O pins. The PTC supports mutual capacitance sensors organized as capacitive touch matrices in different X-Y configurations. In Mutual Capacitance mode, the PTC requires one pin per X line (drive line) and one pin per Y line (sense line). In Self-capacitance mode, the PTC requires only one pin with a Y-line driver for each self-capacitance sensor.

### 29.2 Embedded Characteristics

- Implements Low-power, High-sensitivity, Environmentally-robust Capacitive Touch Buttons, Sliders, and Wheels
  - One Pin per Electrode – No External Components
  - Zero Drift over Temperature and supply/reference ranges
  - No Need for Temperature or supply/reference compensation
- “On demand” or “Timed” measurement
- Supports Mutual Capacitance and Self-capacitance Sensing
  - Up to 8 Buttons in Self-capacitance Mode
  - Up to 64 Buttons in Mutual Capacitance Mode
  - Supports Lumped Mode Configuration<sup>(1)</sup>
- Calibration
  - Load Compensating Charge Sensing
  - Parasitic capacitance compensation together with the electrode capacitance
- Adjustable Gain for Higher Sensitivity
  - Analog Gain 1 to 16
  - Digital Gain 1 to 32
- Noise Immunity
  - Hardware Noise Filtering by Accumulation 1 to 64
  - Adjacent Key Suppression (AKS), Removal of False Detection<sup>(2)</sup>
  - Frequency Hopping: Noise Signal Desynchronization for High Conducted Immunity<sup>(3)</sup>
- Provided PTC Subsystem Firmware<sup>(4)</sup>
- Acquisition Module (Node Definitions, pPP and PTC Management) is Product-dependent, which implements all Hardware-dependent Operations for Configuration and Measurement of Capacitive Touch or Proximity Sensors

# SAMA5D2 Series

## Peripheral Touch Controller (PTC)

- Signal Conditioning Module (Frequency Hopping) applies Algorithmic and Feedback Control Methods to improve the Quality of Measurement Data captured by an Acquisition Module
- Post-processing Modules (Key, Scroller) interpret Measurement Data in the Context of a Capacitive Touch or Proximity Sensor
- Scroller Module defines Slider and Wheels Configuration and Data, based on Keys Module Setting

**Note:**

1. A lumped sensor is implemented as a combination of multiple sense lines (self-capacitance measurement) or multiple drive and sense lines (mutual capacitance measurement) to act as one single button sensor. This provides the application developer with greater flexibility in the touch sensor implementation.
2. The PTC incorporates the Adjacent Key Suppression (AKS) technology, which can be selected on a per-key basis. The AKS technology is used to suppress multiple key presses based on relative signal strength. This feature assists in solving the problem of surface moisture which can bridge a key touch to an adjacent key, causing multiple key presses.
3. This PTC subsystem supports frequency hopping, which tries to select a sampling frequency that does not clash with noise at specific frequencies elsewhere in products or product operating environments. Frequency Hopping tries to hop away from the noise.
4. It is necessary to use the firmware provided by Microchip in order to use the PTC subsystem.

### 29.3 Block Diagram

Figure 29-1. PTC Block Diagram

**Note:** QTM is the QTouch Manager firmware interface.

### 29.4 Signal Description

Table 29-1. Signal Description

Name	Type	Description
PTC_X[n..0]	Output	8 X-lines with n=7 Transmit lines in Mutual Capacitance mode.

.....continued

Name	Type	Description
PTC_Y[m..0]	Input	8 Y-lines with m=7 Receive lines in Mutual/Self-capacitance mode.
SCLK	Input	Connection to the product system 32 kHz slow clock
RC12MHZ_PTC	Input	Direct connection to the 12 MHz RC oscillator
RC12MHZ_REQ	Output	Request to supply the RC12MHz PTC subsystem clock
Periph_CLK_PTC	Input	Peripheral clock enabled by the PTC ID (max 83 MHz)
Periph_CLK_REQ	Output	Request to supply the peripheral clock
PTC_IRQ	Output	One PTC IRQ rises for host flag (28, 29, 30 or 31).

## 29.5 Product Dependencies

The PTC subsystem needs to have some other peripherals of the Arm system configured correctly, as described in the following sections. Those peripherals are the PIO Controller (PIO), the Advanced Interrupt Controller (AIC) and the Power Management Controller (PMC).

### 29.5.1 Power Management

The PTC Controller is not continuously clocked. The programmer must first enable the PTC Controller peripheral clock in the Power Management Controller (PMC) before using the PTC Controller. However, if the application does not require PTC operations, the PTC Controller clock can be stopped when not needed and restarted when necessary. Configuring the PTC Controller requires the PTC Controller clock to be enabled.

**Figure 29-2. PTC Subsystem Clock Sources**

The PTC subsystem operates both from a peripheral clock synchronous to the master clock of the system and from an asynchronous clock source directly connected to the embedded 12 MHz RC oscillator. The selected clocks must be enabled in the PMC before they can be used by the PTC. By default, the 12 MHz RC oscillator is enabled at startup of the product.

The various clock sources are as follows:

- PERIPH\_CLK\_PTC

This clock source is dedicated to the picoPower processor. It is located in the PMC as `Periph_clk[PID]=PCLOCK_LS`. This clock is synchronous with the AHB/APB matrix controlling the host interface and the mailbox. The clock frequency is between 12 MHz and 83 MHz. The same clock is used for the Arm interface connected as an APB slave via an AHB/APB bridge. It is also used to program the code/data SRAM and to access the mailbox SRAM.

- RC12MHZ

A different clock is used for the PTC digital controller. This clock can be divided internally in the pPP before being used. There is also a small local prescaler in the PTC digital controller to allow lower clock rates. Thus, the PTC operates from an asynchronous clock source and the operation is independent from the main system clock and its derivative clocks, such as the peripheral bus clock (PERIPH\_CLK\_PTC).

- SCLK

For the timers, a 32 kHz clock is used and divided internally down to a 1 kHz clock for counting the timer interrupt.

**Figure 29-3. PTC Subsystem Clock Schematic**

The RC12MHZ clock is internally divided by 3 in the PTC subsystem, and so a 4 MHz clock is provided to the PTC digital controller. This controller can divide the clock further by 1, 2, 4 or 8 to slow down the PTC clock.

- ADC\_CLK

The prescaled clock `PTC_CLK` is divided by 4 to supply an `ADC_CLK` to the PTC analog front end.

The ADC data rate is defined by the controller. The typical value is about 33 kHz to 66 kHz depending on the timing configuration.

### 29.5.2 I/O Lines

The pins used for interfacing the PTC may be multiplexed with GPIO lines. When the PTC subsystem is activated and the X-Y lines selected, the GPIO switches automatically to analog state. The ADC modules

possibly hanging on the same PTC analog lines should not use the same GPIO for ADC conversion. Adjacent GPIO lines to PTC lines must not be used to output high speed signals to avoid crosstalk with PTC sensing.

When a line is disabled, the corresponding I/O pin is not reserved for the PTC subsystem, and it can be used for some alternative I/O function.

There is an individual selection bit for each Y or X line. In normal cases, just one line should be active at the same time. For more advanced uses, like proximity sensing, several lines may be selected in parallel. The input and output functionality, such as charging and sensing pulses of the selected line, is controlled automatically by the PTC digital controller sequencer in various operating modes. The I/O lines used for analog PTC\_X lines and PTC\_Y lines must be connected to external capacitive touch sensor electrodes. External components are not required for normal operation.

### 29.5.3 Interrupt Sources

The PTC\_IRQ interrupt line is connected on one of the internal sources of the host processor interrupt controller (AIC). Using the PTC\_IRQ interrupt requires the interrupt controller to be programmed first.

Four interrupts (IRQ0,1,2,3) can be generated in the host interface register. The PTC\_IRQ line is a logical “OR” between the four IRQ0, IRQ1, IRQ2 and IRQ3.

## 29.6 Functional Description

The PTC analog front end (AFE) and the digital controller are not managed directly by the Cortex-A5 processor. An intermediate processor (pPP) is introduced to manage all functionalities of the PTC. A pPP program, a “firmware”, is needed. This program is loaded by the Arm (host) in a shared SRAM area. The firmware embeds many software functionalities and algorithms to ensure an efficient touch detection.

### 29.6.1 picoPower Processor (pPP)

The picoPower Processor (pPP) is a small processor dedicated to handling the PTC and to processing its data in order to offload the main host Arm processor.

The pPP uses a unified memory architecture where instructions and data share the address space. The pPP embeds a 16 Kbytes SRAM block. When the processor is stopped, the 16 Kbytes SRAM block can be used by the Arm processor.

The pPP has single-cycle access to instructions and data that reside in the SRAM.

Loads and stores go to the local code/data SRAM, the shared mailbox SRAM or the local I/O space.

Accesses to the mailbox enter a wait state for every other access cycle.

Accesses to code/data SRAM and local I/O space never enter wait states.

### 29.6.2 Shared Memories

The SRAM memory space contains context save, interrupt vectors and a unified instruction/data space that can be used for stacks and instructions.

On top of the SRAM space is the shared mailbox SRAM.

**Figure 29-4. Memory Map**

### 29.6.2.1 Mailbox

The mailbox (4 Kbytes) is used to indicate to the pPP the X and Y topology as well as the number of sensors implemented.

The mailbox can also be used, for example, to pass the parameters required by an application to adjust the analog or digital gain, the filtering functions and some touch operation timing values.

The mailbox is the main way to control the PTC digital and analog components. The pPP firmware reads the mailbox and performs the tasks requested. After execution, some data are fed back to the mailbox to be read by the main processor, such as touch button confirmation or touch position on the slider or wheel.

### 29.6.2.2 SRAM Data Area

The pPP uses the SRAM data area for its own needs and to work with the firmware local variables. This SRAM section is not used to communicate with the Arm.

### 29.6.2.3 Firmware in SRAM Code Area

The firmware contains all PTC subsystem functionalities, allowing PTC measurement in the different conditions of parameters and configurations. The firmware is a binary file copied to the SRAM code area at the address defined by the memory map. The firmware makes the pPP work properly with some peripherals like the timer, a clock generator and obviously the PTC digital controller and the PTC analog front end. The firmware embeds all QTML (QTouch Modular Library) functionalities. Those modules are not modifiable by the application developer. The QTML functionalities configuration and data are controllable by the mailbox. The host has read and write accesses to the mailbox.

### 29.6.2.4 Host Interface

The pPP can be controlled by the host processor through an APB interface and the user interface registers. This is referred to as the “host interface”. Some configurations are only accessible when the pPP is stopped. The host interface includes pPP flags, which are also called host flags on the firmware, for interprocessor communications. The user interface registers can run, stop and reset the pPP and read the IRQ host flags. Nevertheless, the mailbox remains the main means of communication.

#### 29.6.2.4.1 Processor Command Registers

The CMD field is part of the host interface and is used to start, stop and reset the pPP. Writing a valid command to this field changes the internal state of the pPP. After a number of cycles, this state change is reflected in the processor state register.

When a START command is issued, the host is no longer able to write to host interface registers which are marked as run-time write-locked. The pPP RAM block is also locked by this command. The host interface registers and RAM block can be unlocked by using the STOP or RESET commands. The lock is released when the processor state register reflects this state.

### 29.6.3 PTC Digital Controller

The PTC digital controller is a peripheral of the pPP. It is intended for acquiring capacitive touch sensor and capacitive proximity sensor signals under limited firmware control by the controlling processor. The PTC digital controller consists of an Analog Charge Integrator and a 10-bit ADC Controller, 16-bit Digital Accumulator for the ADC results and a State Machine taking care of sensor sampling and digital accumulation sequence.

#### 29.6.3.1 PTC Digital Controller Operations

- Sensing mode (mutual or self)
- Control of the ADC 10-bit SAR state machine single ADC conversion or free run mode (comparator and ADC data/accumulator register)
- Digital gain up to 32 and averaging up to 64 ADC codes
- Selection of the filtering resistance (0, 20, 50 or 100 k $\Omega$ )
- Adjustment of the compensation capacitor up to 30 pF
- Adjustment of the integration capacitor up to 30 pF
- Frequency hopping<sup>(1)</sup> implementation (modification of the sampling rate to avoid synchronous parasitic noise)
- Channel Change Delay Selection CDS<sup>(2)</sup> (settling time)
- Prescaling (1, 1/2, 1/4, 1/8), 4 MHz down to ADC\_CLK

#### Note:

1. A programmable sampling delay can be used to choose (modify) the sampling frequency that is best suited in an application where other periodic noise sources may otherwise disturb the sampling. Frequency hopping can also be modified automatically from one sampling cycle to another, by setting the software driver parameters.
2. CDS bits define the delay when changing input channels. The delay allows the analog circuits to settle on a new (Y) channel or channel pair (X-Y). The delay is application-dependent, and therefore this option enables the user to select a suitable delay. The delay is expressed as a number of PTC clock cycles.

### 29.6.4 PTC Analog Front End (AFE)

The analog front end consists of X-line drivers, a sensor capacitance compensation circuit and a parasitic capacitance insensitive analog Switched Capacitor Charge Integrator (SCCI). The integrator is connected to sensor Y-lines via an analog multiplexer. When the PTC digital controller is enabled, the SCCI output is automatically connected to the ADC input.

The external capacitive touch sensor is typically formed on a PCB and the sensor electrodes are connected to the Analog Charge Integrator of the PTC AFE via MCU I/O port pins. The PTC AFE supports mutual capacitance sensors organized as capacitive touch matrices in different X-Y configurations (QTouch Surface). The PTC AFE requires one pin per X-line and one pin per Y-line. No external components are needed.

The PTC AFE also supports “self-capacitance touch sensors” (QTouch). In Self-capacitance mode, the PTC AFE requires just one Y-line pin per self-capacitance sensor.

Figure 29-5. PTC Analog Front End

### 29.6.5 Operations in Mutual Capacitance

A mutual capacitance sensor is formed between two I/O lines, a PTC\_X electrode for transmitting, and a PTC\_Y electrode for receiving. The mutual capacitance between the PTC\_X and PTC\_Y electrodes is calibrated and measured by the PTC. It is not necessary to connect all X and Y lines; when unused, they can be left unconnected.

Figure 29-6. Mutual Capacitance Sensor Arrangement

### 29.6.6 Operations in Self-capacitance

The self-capacitance sensor is connected to a single pin on the PTC through the PTC\_Ym electrodes to receive the signal. The sensor electrode capacitance is measured by the PTC.

**Figure 29-7. Self-capacitance Sensor Arrangement**

### 29.7 Register Summary

Offset	Name	Bit Pos.								
0x28	<a href="#">PTC_CMD</a>	7:0					CMD[3:0]			
0x29	Reserved									
...										
0x2F										
0x30	<a href="#">PTC_ISR</a>	7:0	IRQ3	IRQ2	IRQ1	IRQ0				NOTIFY0
0x31	Reserved									
...										
0x34										
0x35	<a href="#">PTC_IED</a>	7:0	IER3	IER2	IER1	IER0				

### 29.7.1 PTC Command Register

**Name:** PTC\_CMD  
**Offset:** 0x28  
**Reset:** –  
**Property:** Write-only

Bit	7	6	5	4	3	2	1	0
					CMD[3:0]			
Access					W	W	W	W
Reset					–	–	–	–

**Bits 3:0 – CMD[3:0]** Host Command  
 Issues commands to the pPP.

Value	Name	Description
0x0	NO_ACTION	–
0x1	STOP	Waits for ongoing execution to complete, then stops.
0x2	RESET	Stops and resets.
0x3	Reserved	–
0x4	ABORT	Stops without waiting for ongoing execution to complete.
0x5	RUN	Starts execution (from stopped state).
0x6–0xF	Reserved	–

### 29.7.2 PTC Interrupt Status Register

**Name:** PTC\_ISR  
**Offset:** 0x30  
**Reset:** 0x00  
**Property:** Read/Write

Bit	7	6	5	4	3	2	1	0
	IRQ3	IRQ2	IRQ1	IRQ0				NOTIFY0
Access	R/W	R/W	R/W	R/W				R/W
Reset	0	0	0	0				0

**Bits 4, 5, 6, 7 – IRQx** Interrupt to the Host

Used for communications between the host processor and the pPP. The firmware can set an IRQ event in fields IRQ0 to IRQ3. Any of the pPP IRQ0 to IRQ3 fields automatically rises the PTC\_IRQ signal.

**Bit 0 – NOTIFY0** Notification to the Firmware

Used for communications between the host processor and the pPP. The firmware is notified when a command is used.

### 29.7.3 PTC Enable Register

**Name:** PTC\_IED  
**Offset:** 0x35  
**Reset:** –  
**Property:** Write-only

Bit	7	6	5	4	3	2	1	0
	IER3	IER2	IER1	IER0				
Access	W	W	W	W				
Reset	–	–	–	–				

**Bits 4, 5, 6, 7 – IERx** Interrupt Enable

Value	Description
0	No effect.
1	Enables interrupt for device-to-host interrupt.

## 30. Low Power Asynchronous Receiver (RXLP)

### 30.1 Description

The Low Power Asynchronous Receiver (RXLP) is a low-power UART with a slow clock. It works only in Receive mode. It features a Receive Data (RXD) pin that can be used to wake up the system. The wake-up occurs only on data matching. Expected data can be a single value, two values, or a range of values.

The RXLP operates on a slow clock domain to reduce power consumption.

### 30.2 Embedded Characteristics

- Exit from Backup Mode on Comparison Match
- Programmable Baud Rate Generator
- Even, Odd, Mark or Space Parity Check
- Parity and Framing Error Detection
- Digital Filter on Receive Line
- Comparison Function on Received Character
- Register Write Protection

### 30.3 Block Diagram

Figure 30-1. Block Diagram

Table 30-1. Pin Description

Pin Name	Description	Type
RXD	RXLP Receive Data	Input

## 30.4 Product Dependencies

### 30.4.1 Power Management

The peripheral clock is not managed by the PMC. It is automatically activated when the RXLP is enabled and receive line is active. The peripheral clock is automatically de-activated after transmission of the wakeup signal.

## 30.5 Functional Description

The RXLP features an RS232 receive-only circuitry able to decode and compare data and parity while the system is in Backup mode. If a matching comparison occurs, the RXLP instructs the system to wake up (if enabled).

The RXLP operates in Asynchronous mode only and supports only 8-bit character handling (with or without parity).

The RXLP is made up of a receiver and a baud rate generator. Receiver timeout is not implemented and there is no interrupt line.

### 30.5.1 Baud Rate Generator

The baud rate generator provides the bit period clock named baud rate clock to the receiver.

The baud rate clock is the 32.768 kHz clock from the crystal oscillator, divided by 16 times the value (CD) written in the Baud Rate Generator register (RXLP\_BRGR). If RXLP\_BRGR is set to 0, the baud rate clock is disabled and the RXLP remains inactive. The maximum allowable baud rate is 32.768 kHz clock divided by 16. The minimum allowable baud rate is 32.768 kHz clock divided by (16 × 3).

$$\text{Baud Rate} = \frac{f_{32.768 \text{ kHz clock}}}{16 \times \text{CD}}$$

**Figure 30-2. Baud Rate Generator**

### 30.5.2 Receiver

#### 30.5.2.1 Receiver Reset, Enable and Disable

After device reset, the RXLP is disabled and must be enabled before being used. The receiver can be enabled by setting bit RXEN in the Control register (RXLP\_CR). At this command, the receiver starts looking for a start bit.

The programmer can disable the receiver by setting bit RXLP\_CR.RXDIS. If the receiver is waiting for a start bit, it is immediately stopped. However, if the receiver has already detected a start bit and is receiving the data, it waits for the stop bit before actually stopping its operation.

The receiver can be put in reset state by setting bit `RXLP_CR.RSTRX`. In this case, the receiver immediately stops its current operations and is disabled, whatever its current state. If `RSTRX` is applied when data is being processed, this data is lost. After initiating a reset it is mandatory to clear bit `RXLP_CR.RSTRX`.

### 30.5.2.2 Start Detection and Data Sampling

The RXLP only supports asynchronous operations, and this affects only its receiver. The RXLP detects the start of a received character by sampling the `RXD` signal until it detects a valid start bit. A low level (space) on `RXD` is interpreted as a valid start bit if it is detected for more than seven cycles of the sampling clock, which is 16 times the baud rate. Hence, a space that is longer than  $7/16$  of the bit period is detected as a valid start bit. A space which is  $7/16$  of a bit period or shorter is ignored and the receiver continues to wait for a valid start bit.

When a valid start bit has been detected, the receiver samples the `RXD` at the theoretical midpoint of each bit. It is assumed that each bit lasts 16 cycles of the sampling clock (1-bit period) so the bit sampling point is eight cycles (0.5-bit period) after the start of the bit. The first sampling point is therefore 24 cycles (1.5-bit periods) after detecting the falling edge of the start bit.

Each subsequent bit is sampled 16 cycles (1-bit period) after the previous one.

#### Figure 30-3. Character Reception

Example: 8-bit, parity enabled 1 stop

### 30.5.2.3 Parity Error

Each time a character is received, the receiver calculates the parity of the received data bits, in accordance with the field `PAR` in the Mode register (`RXLP_MR`). It then compares the result with the received parity bit. If different, the received character is ignored and the receiver continues to wait for a new valid start bit.

### 30.5.2.4 Receiver Framing Error

When a start bit is detected, it generates a character reception when all the data bits have been sampled. The stop bit is also sampled and when it is detected at 0, the received character is ignored and the receiver continues to wait for a new valid start bit.

### 30.5.2.5 Receiver Digital Filter

The RXLP embeds a digital filter on the receive line. It is disabled by default and can be enabled by writing a logical 1 in `RXLP_MR.FILTER`. When enabled, the receive line is sampled using the 16x bit clock and a three-sample filter (majority 2 over 3) determines the value of the line.

### 30.5.3 Comparison Function on Received Character

Each time a valid character is received (without parity error and without frame error) it is compared to the wake-up trigger values. If the received character matches to the condition of wake-up, it is stored in the Receiver Holding register (`RXLP_RHR`), a system wake-up is generated and the RXLP is automatically disabled. If the character received does not match, it is ignored and the receiver continues to wait for a new valid start bit.

RXLP\_CMPR (see [RXLP Comparison Register](#)) can be programmed to provide three different comparison methods:

- VAL1 equals VAL2—the comparison is performed on a single value and the wake-up request is generated if the received character equals VAL1.
- VAL1 is strictly lower than VAL2—any value between VAL1 and VAL2 generates a wake-up request.
- VAL1 is strictly higher than VAL2—the wake-up request is generated if either received character equals VAL1 or VAL2.

### 30.5.4 Register Write Protection

To prevent any single software error from corrupting RXLP behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [RXLP Write Protection Mode Register](#) (RXLP\_WPMR).

The following registers can be write-protected:

- [RXLP Mode Register](#)

## Low Power Asynchronous Receiver (RXLP)

### 30.6 Register Summary

Offset	Name	Bit Pos.							
0x00	RXLP_CR	7:0			RXDIS	RXEN		RSTRX	
		15:8							
		23:16							
		31:24							
0x04	RXLP_MR	7:0				FILTER			
		15:8					PAR[2:0]		
		23:16							
		31:24							
0x08 ... 0x17	Reserved								
0x18	RXLP_RHR	7:0	RXCHR[7:0]						
		15:8							
		23:16							
		31:24							
0x1C ... 0x1F	Reserved								
0x20	RXLP_BRGR	7:0						CD[1:0]	
		15:8							
		23:16							
		31:24							
0x24	RXLP_CMPR	7:0	VAL1[7:0]						
		15:8							
		23:16	VAL2[7:0]						
		31:24							
0x28 ... 0xE3	Reserved								
0xE4	RXLP_WPMR	7:0							WPEN
		15:8	WPKEY[7:0]						
		23:16	WPKEY[15:8]						
		31:24	WPKEY[23:16]						

### 30.6.1 RXLP Control Register

**Name:** RXLP\_CR  
**Offset:** 0x0000  
**Reset:** –  
**Property:** Write-only

**Bit 5 – RXDIS** Receiver Disable

Value	Description
0	No effect.
1	The receiver is disabled. If a character is being processed and RSTRX is not set, the character is completed before the receiver is stopped.

**Bit 4 – RXEN** Receiver Enable

Value	Description
0	No effect.
1	The receiver is enabled if RXDIS is 0.

**Bit 2 – RSTRX** Reset Receiver

Value	Description
0	Deactivates the reset of the receiver logic.
1	The receiver logic is reset and disabled. If a character is being received, the reception is aborted. The receiver logic remains in reset state until RSTRX is written to 0.

# SAMA5D2 Series

## Low Power Asynchronous Receiver (RXLP)

### 30.6.2 RXLP Mode Register

**Name:** RXLP\_MR  
**Offset:** 0x0004  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 11:9 – PAR[2:0] Parity Type

Value	Name	Description
0	EVEN	Even parity
1	ODD	Odd parity
2	SPACE	Parity forced to 0
3	MARK	Parity forced to 1
4	NO	No parity

#### Bit 4 – FILTER Receiver Digital Filter

Value	Name	Description
0	DISABLED	RXLP does not filter the receive line.
1	ENABLED	RXLP filters the receive line using a three-sample filter (16x-bit clock) (2 over 3 majority).

### 30.6.3 RXLP Receiver Holding Register

**Name:** RXLP\_RHR  
**Offset:** 0x0018  
**Reset:** 0x00000000  
**Property:** Read-only

**Bits 7:0 – RXCHR[7:0]** Received Character  
 Last received character

### 30.6.4 RXLP Baud Rate Generator Register

**Name:** RXLP\_BRGR  
**Offset:** 0x0020  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 1:0 – CD[1:0] Clock Divisor

Value	Description
0	Baud rate clock is disabled
1	$f_{32.768 \text{ kHz clock}} / (CD \times 16)$
2	$f_{32.768 \text{ kHz clock}} / (CD \times 16)$
3	$f_{32.768 \text{ kHz clock}} / (CD \times 16)$

**30.6.5 RXLP Comparison Register**

**Name:** RXLP\_CMPR  
**Offset:** 0x0024  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	VAL2[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	VAL1[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 23:16 – VAL2[7:0]** Second Comparison Value for Received Character  
0 to 255.

The received character must be lower or equal to the value of VAL2 and higher or equal to VAL1 to request a system wake-up.

**Bits 7:0 – VAL1[7:0]** First Comparison Value for Received Character  
0 to 255.

The received character must be higher or equal to the value of VAL1 and lower or equal to VAL2 to request a system wake-up.

### 30.6.6 RXLP Write Protection Mode Register

**Name:** RXLP\_WPMR  
**Offset:** 0x00E4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPEN
Access								R/W
Reset								0

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x52584C	PASSWD	Writing any other value in this field aborts the write operation. Always reads as 0.

#### Bit 0 – WPEN Write Protection Enable

See [Register Write Protection](#) for the list of registers that can be protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x52584C (RXL in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x52584C (RXL in ASCII).

## 31. Clock Generator

### 31.1 Description

The Clock Generator User Interface is embedded within the Power Management Controller and is described in [32.22 Register Summary](#). However, the Clock Generator registers are named CKGR\_.

### 31.2 Embedded Characteristics

The Clock Generator is made up of:

- A low-power 32.768 kHz crystal oscillator
- A low-power embedded 64 kHz (typical) RC oscillator generating the 32 kHz source clock
- A 8 to 24 MHz crystal oscillator or a 12 to 48 MHz XRCGB crystal resonator with Bypass mode
- A 12 MHz RC oscillator
- A 480 MHz UTMI PLL providing a clock for the USB High-speed Device Controller
- A 600 to 1200 MHz programmable PLL (input from 8 to 50 MHz), provides the clock to the processor and to the peripherals
- A 700 MHz fractional-N programmable audio PLL, with 22-bit frequency resolution and two independent programmable post dividers to drive the CLK\_AUDIO output pin and the internal peripherals (AUDIOPLLCLK)

The Clock Generator provides the following clocks:

- SLCK—Slow clock. The only permanent clock within the system.
- MAINCK—Output of the Main clock oscillator selection: either 8 to 24 MHz crystal oscillator or 12 MHz RC oscillator
- PLLACK—Output of the divider and the 600 to 1200 MHz programmable PLL (PLLA)
- AUDIOPLLCLK—Output of the first Audio PLL post-divider, with a frequency range from 24 to 125 MHz
- AUDIOPINCLK—Output of the second Audio PLL post-divider, with a frequency range from 8 to 30 MHz
- UPLLCK—Output of the 480 MHz UTMI PLL (UPLL)

The Power Management Controller also provides the following operations on clocks:

- 8 to 24 MHz crystal oscillator clock failure detector
- 32.768 kHz crystal oscillator frequency monitor
- Frequency counter on Main clock and an on-the-fly adjustable 12 MHz RC oscillator frequency

### 31.3 Block Diagram

Figure 31-1. Clock Generator Block Diagram

### 31.4 Slow Clock

The Slow Clock Controller embeds a Slow clock generator that is supplied with the VDDBU power supply. As soon as VDDBU is supplied, both the 32.768 kHz crystal oscillator and the embedded 64 kHz (typical) RC oscillator are powered, but only the RC oscillator is enabled.

The Slow clock is generated either by the 32.768 kHz crystal oscillator or by the embedded 64 kHz (typical) RC oscillator divided by two.

The selection of the Slow clock source is made via the OSCSEL bit in the Slow Clock Controller Configuration register (SCKC\_CR).

SCKC\_CR.OSCSEL and PMC\_SR.OSCSELS report which oscillator is selected as the Slow clock source. PMC\_SR.OSCSELS informs when the switch sequence initiated by a new value written in SCKC\_CR.OSCSEL is done.

### 31.4.1 Embedded 64 kHz (typical) RC Oscillator

By default, the embedded 64 kHz (typical) RC oscillator is enabled and selected as a source of SLCK. The user has to take into account the possible drifts of this oscillator. Refer to the section “DC Characteristics”.

### 31.4.2 32.768 kHz Crystal Oscillator

The Clock Generator integrates a low-power 32.768 kHz crystal oscillator. To use this oscillator, the XIN32 and XOUT32 pins must be connected to a 32.768 kHz crystal. Refer to the section “Electrical Characteristics” for appropriate loading capacitor selection on XIN32 and XOUT32.

Note that the user is not obliged to use the 32.768 kHz crystal oscillator and can use the 64 kHz (typical) RC oscillator instead.

The 32.768 kHz crystal oscillator provides a more accurate frequency than the 64 kHz (typical) RC oscillator.

To select the 32.768 kHz crystal oscillator as the source of the Slow clock, the bit SCKC\_CR.OSCSEL must be set. This results in a sequence which enables the 32.768 kHz crystal oscillator. The switch of the Slow clock source is glitch-free.

## 31.5 Main Clock

The Main clock has two sources:

- a 12 MHz RC oscillator with a fast start-up time and used at start-up
- a 8 to 24 MHz crystal oscillator with Bypass mode

**Figure 31-2. Main Clock Block Diagram**

### 31.5.1 12 MHz RC Oscillator

After reset, the 12 MHz RC oscillator is enabled and selected as the source of MAINCK and MCK. MCK is the default clock selected to start up the system.

Refer to the table “DC Characteristics”.

The software can disable or enable the 12 MHz RC oscillator with the MOSCRGEN bit in the Clock Generator Main Oscillator register (CKGR\_MOR).

When disabling the Main clock by clearing CKGR\_MOR.MOSCRGEN, PMC\_SR.MOSCRCS is automatically cleared, indicating the Main clock is OFF.

Setting the MOSCRCS bit in the Power Management Controller Interrupt Enable register (PMC\_IER) triggers an interrupt to the processor.

### 31.5.2 12 MHz RC Oscillator Clock Frequency Adjustment

It is possible for the user to adjust the 12 MHz RC oscillator frequency through the PMC Oscillator Calibration Register (PMC\_OCR). By default, PMC\_OCR.SEL is low, so the RC oscillator is driven with fuse calibration bits which are programmed during the chip production.

The user can adjust the trimming of the 12 MHz RC oscillator through PMC\_OCR in order to obtain more accurate frequency (to compensate derating factors such as temperature and voltage).

In order to calibrate the main oscillator frequency, SEL must be set to 1 and a correct frequency value must be configured in the CAL field.

---

It is possible to restart, at anytime, a measurement of the frequency of the selected clock by means of the RCMEAS bit in the Clock Generator Main Clock Frequency register (CKGR\_MCFR). Thus, when MAINFRDY flag reads 1, another read access on CKGR\_MCFR provides an image of the frequency of the Main clock on MAINF field. The software can calculate the error with an expected frequency and correct PMC\_OCR.CAL accordingly. This may be used to compensate frequency drift due to derating factors such as temperature and/or voltage.

### 31.5.3 8 to 24 MHz Crystal Oscillator

After reset, the 8 to 24 MHz crystal oscillator is disabled and is not selected as the source of MAINCK.

As the source of MAINCK, the 8 to 24 MHz crystal oscillator provides an accurate frequency. The software enables or disables this oscillator in order to reduce power consumption via CKGR\_MOR.MOSCXTEN.

When disabling this oscillator by clearing the CKGR\_MOR.MOSCXTEN bit, the PMC\_SR.MOSCXTS bit is automatically cleared, indicating the 8 to 24 MHz crystal oscillator is off.

When enabling this oscillator, the user must initiate the start-up time counter. This start-up time depends on the characteristics of the external device connected to this oscillator. Refer to the section “Electrical Characteristics” for the start-up time.

When CKGR\_MOR.MOSCXTEN and CKGR\_MOR.MOSCXTST are written to enable this oscillator, the PMC\_SR.MOSCXTS bit is cleared and the counter starts counting down on the Slow clock divided by 8 from the MOSCXTST value. When the counter reaches 0, the PMC\_SR.MOSCXTS is set, indicating that the 8 to 24 MHz crystal oscillator is stabilized. Setting MOSCXTS in the PMC Interrupt Mask register (PMC\_IMR) triggers an interrupt to the processor.

### 31.5.4 Main Clock Source Selection

The source of the Main clock can be selected from the following:

- embedded 12 MHz RC oscillator
- 8 to 24 MHz crystal oscillator
- an XRCGB crystal resonator

The advantage of the Main RC oscillator is its fast start-up time. By default, this oscillator is selected to start the system and it must be selected prior to entering Wait mode.

The advantage of the Main crystal oscillator is its high level of accuracy.

The selection is made by writing CKGR\_MOR.MOSCSEL. The switch of the Main clock source is glitch-free, so there is no need to run out of SLCK or PLLACK in order to change the selection. PMC\_SR.MOSCSELS indicates when the switch sequence is done.

Setting PMC\_IMR.MOSCSELS triggers an interrupt to the processor.

The 8 to 24 MHz crystal oscillator can be bypassed by setting CKGR\_MOR.MOSCXTBY to accept an external Main clock on XIN (see [31.5.5 Bypassing the 8 to 24 MHz Crystal Oscillator](#)).

MOSCRcen, MOSCSEL, MOSCXTEN and MOSCXTBY bits are located in the PMC Clock Generator Main Oscillator Register (CKGR\_MOR).

After a VDDBU power-on reset, the default configuration is MOSCRcen = 1, MOSCXTEN = 0 and MOSCSEL = 0, allowing the 12 MHz RC oscillator to start as Main clock.

**Figure 31-3. Main Clock Source Selection**

### 31.5.5 Bypassing the 8 to 24 MHz Crystal Oscillator

Prior to bypassing the 8 to 24 MHz crystal oscillator, the external clock frequency provided on the XIN pin must be stable and within the values specified in the XIN clock characteristics. Refer to the section “Electrical Characteristics”.

The sequence to bypass the crystal oscillator is as follows:

1. Ensure that an external clock is connected on XIN.
2. Enable the bypass by setting CKGR\_MOR.MOSCXTBY.
3. Disable the 8 to 24 MHz crystal oscillator by clearing CKGR\_MOR.MOSCXTEN.

### 31.5.6 Main Frequency Counter

The main frequency counter measures the Main RC oscillator and the Main crystal oscillator against the SLCK and is managed by CKGR\_MCFR.

During the measurement period, the main frequency counter increments at the speed of the clock defined by the bit CKGR\_MCFR.CCSS.

A measurement is started in the following cases:

- When CKGR\_MCFR.RCMEAS is written to ‘1’.
- When the 12 MHz RC oscillator is selected as the source of the Main clock and when this oscillator becomes stable (i.e., when the MOSCRCS bit is set)
- When the 8 to 24 MHz crystal oscillator is selected as the source of the Main clock and when this oscillator becomes stable (i.e., when the MOSCXTS bit is set)
- When the Main clock source selection is modified

The measurement period ends at the 16th falling edge of the Slow clock, CKGR\_MCFR.MAINFRDY is set and the counter stops counting. Its value can be read in the CKGR\_MCFR.MAINF and gives the number of Main clock cycles during 16 periods of Slow clock, so that the frequency of the 12 MHz RC oscillator or the crystal oscillator can be determined.

**Figure 31-4. Main Frequency Counter Block Diagram**

### 31.5.7 Switching Main Clock Between the RC Oscillator and the Crystal Oscillator

When switching the source of the Main clock between the RC oscillator and the crystal oscillator, both oscillators must be enabled. After completion of the switch, the unused oscillator can be disabled.

If switching to the crystal oscillator, a check must be carried out to ensure that the oscillator is present and that its frequency is valid. Follow the sequence below:

1. Enable the crystal oscillator by setting CKGR\_MOR.MOSCXTEN. Configure the CKGR\_MOR.MOSCXTST field with the crystal oscillator start-up time as defined in the section “Electrical Characteristics”.
2. Wait for PMC\_SR.MOSCXTS flag to rise, indicating the end of a start-up period of the crystal oscillator.
3. Select the crystal oscillator as the source clock of the frequency meter by setting CKGR\_MCFR.CCSS
4. Initiate a frequency measurement by setting CKGR\_MCFR.RCMEAS.
5. Read CKGR\_MCFR.MAINFRDY until its value equals 1.
6. Read CKGR\_MCFR.MAINF and compute the value of the crystal frequency.
  - If the MAINF value is valid, the Main clock can be switched to the crystal oscillator.

### 31.6 Divider and PLLA Block

The PLLA embeds an input divider to increase the accuracy of the resulting clock signals. However, the user must respect the PLLA minimum input frequency when programming the divider.

The following figure shows the block diagram of the divider and PLLA block.

**Figure 31-5. Divider and PLLA Block Diagram**

### 31.6.1 Divider and Phase Lock Loop Programming

The PLLA allows multiplication of the divider's outputs. The PLLA clock signal has a frequency that depends on the respective source signal frequency and on the parameters DIVA and MULA. The factor applied to the source signal frequency is  $(MULA + 1)/DIVA$ . When MULA is written to 0, the PLLA is disabled and its power consumption is saved. Re-enabling the PLLA can be performed by writing a value higher than 0 in the MUL field.

Whenever the PLLA is re-enabled or one of its parameters is changed, PMC\_SR.LOCKA is automatically cleared. The values written in the PLLACOUNT field in the Clock Generator PLLA register (CKGR\_PLLAR) are loaded in the PLLA counter. The PLLA counter then decrements at the speed of the Slow clock until it reaches 0. At this time, PMC\_SR.LOCKA is set and can trigger an interrupt to the processor. The user has to load the number of Slow clock cycles required to cover the PLLA transient time into CKGR\_PLLACOUNT.

The PLLA clock must be divided by 2 by writing PMC\_MCKR.PLLADIV2, if the ratio between Processor clock (PCK) and MCK is 3 (MDIV = 3).

## 31.7 UTMI PLL Clock

The source of the UTMI PLL (UPLL) is the Main clock (MAINCK). MAINCK must select the Main crystal oscillator to meet the frequency accuracy required by USB.

The crystal frequency selection among 12, 16 or 24 MHz must be configured to the correct value in the field SFR\_UTMICKTRIM.FREQ, in order to apply the correct multiplier, x40, x30 or x20, respectively.

**Figure 31-6. UTMI PLL Block Diagram**

Whenever the UTMI PLL is enabled by writing UPLLEN in the UTMI Clock register (CKGR\_UCKR), PMC\_SR.LOCKU is automatically cleared. The values written in CKGR\_UCKR.UPLLCOUNT are loaded in the UTMI PLL counter. The UTMI PLL counter then decrements at the speed of the Slow clock divided by 8 until it reaches 0. At this time, the PMC\_SR.LOCKU is set in and can trigger an interrupt to the

processor. The user has to load the number of Slow clock cycles required to cover the UTMI PLL transient time into CKGR\_UCKR.UPLLCOUNT.

### 31.8 Audio PLL

The Audio PLL is a high-resolution fractional-N digital PLL specifically designed for low jitter operation.

In audio applications, the CLK\_AUDIO output pin typically serves as the Master clock frequency generator for external components such as Audio DAC, Audio ADCs, or Audio Codecs, thus saving one crystal on the board.

The reference clock of the Audio PLL is the fast crystal oscillator. The PLL core operating frequency is defined as:

$$f_{\text{AUDIOCORECLK}} = f_{\text{ref}} \left( \text{ND} + 1 + \frac{\text{FRACR}}{2^{22}} \right)$$

where  $f_{\text{ref}}$  is the frequency of the main crystal oscillator. Refer to the section “PLL Characteristics” for the limits of  $f_{\text{AUDIOCORECLK}}$ .

The PLL core features two post-dividers enabling the generation of two output clock signals, AUDIOPLLCLK and AUDIOPINCLK. AUDIOPLLCLK is dedicated to the PMC and can be sent to the GCLK input of peripherals or to the Programmable clock outputs PCKx. AUDIOPINCLK is dedicated to driving the external audio pin CLK\_AUDIO.

The AUDIOPLLCLK frequency is defined by the following formula:

$$f_{\text{AUDIOPLLCLK}} = \frac{f_{\text{AUDIOCORECLK}}}{(\text{QDPMC} + 1)}$$

The AUDIOPINCLK frequency is defined by the following formula:

$$f_{\text{AUDIOPINCLK}} = \frac{f_{\text{AUDIOCORECLK}}}{(\text{DIV} \times \text{QDAUDIO})}$$

The typical programming sequence of the audio PLL is the following:

1. Disable the PLL by writing ‘0’ in bits PLEN and RESETN in the Audio PLL Control register 0 (PMC\_AUDIO\_PLL0).
2. Release the reset of the PLL by writing ‘1’ in PMC\_AUDIO\_PLL0.RESETN.
3. Configure the PLL frequency by writing QDPMC and ND in PMC\_AUDIO\_PLL0, QDAUDIO, DIV and FRACR in PMC\_AUDIO\_PLL1. ND and FRACR must be configured so as to set AUDIOCORECLK frequency in its authorized range. Refer to the “Electrical Characteristics” section.
4. Enable the PLL by writing ‘1’ in PMC\_AUDIO\_PLL0.PLEN, PMC\_AUDIO\_PLL0.PADEN and PMC\_AUDIO\_PLL0.PMCEN.
5. Wait for the start-up time of this PLL. Refer to the “Electrical Characteristics” section.
6. If needed, ND or FRACR can be adjusted at any time. The typical frequency settling time of this PLL is indicated in the “Electrical Characteristics” section.

**Figure 31-7. Audio PLL**

## **32. Power Management Controller (PMC)**

### **32.1 Description**

The Power Management Controller (PMC) optimizes power consumption by controlling all system and user peripheral clocks. The PMC enables/disables the clock inputs to many of the peripherals and the Core.

### **32.2 Embedded Characteristics**

The Power Management Controller provides the following clocks:

- Master Clock (MCK)—programmable from a few hundred Hz to the maximum operating frequency of the device. It is available to the modules running permanently.
- Processor Clock (PCK)—must be switched off when processor is entering Idle mode
- HS USB Device Clock (UDPCK)
- H64MX Matrix Clock (MCK) and H32MX Matrix Clock (MCK or MCK/2)
- Peripheral Clocks—provided to the embedded peripherals and independently controllable
- Programmable Clock Outputs—can be selected from the clocks provided by the Clock Generator and driven on the PCKx pins
- Generic Clock (GCLK)—for peripherals that can accept a second clock source
- Asynchronous Partial Wake-up (SleepWalking)—for FLEXCOMx, SPIx, TWIx, UARTx and ADC

### 32.3 Block Diagram

Figure 32-1. General Clock Block Diagram

### 32.4 Master Clock Controller

The Master Clock Controller provides selection and division of the Master clock (MCK). MCK is the source clock of the peripheral clocks.

The Master clock is selected from one of the clocks provided by the Clock Generator. Selecting the Slow clock provides a Slow clock signal to the whole device. Selecting the Main clock saves power consumption of the PLLs.

The Master Clock Controller is made up of a clock selector and a prescaler. It also contains a Master clock divider which allows the processor clock to be faster than the Master clock.

The Master clock selection is made by writing the CSS (Clock Source Selection) field in the Master Clock register (PMC\_MCKR). The prescaler supports the division by a power of 2 of the selected clock between 1 and 64, and the division by 6. PMC\_MCKR.PRES programs the prescaler.

**Note:** It is forbidden to modify MDIV and CSS at the same access. Each field must be modified separately with a wait for MCKRDY flag between the first field modification and the second field modification.

Each time PMC\_MCKR is written to define a new Master clock, PMC\_SR.MCKRDY is cleared. It reads 0 until the Master clock is established. Then, the MCKRDY bit is set and can trigger an interrupt to the processor. This feature is useful when switching from a high-speed clock to a lower one to inform the software when the change is actually done.

**Figure 32-2. Master Clock Controller**

### 32.5 Processor Clock Controller

The PMC features a Processor Clock (PCK) Controller that implements the processor Idle mode.

The Processor clock can be disabled by executing the WFI (WaitForInterrupt) processor instruction or the WFE (WaitForEvent) processor instruction while the LPM bit is at 0 in the PMC Fast Startup Mode register (PMC\_FSMR).

The Processor clock can be disabled by writing the PMC System Clock Disable Register (PMC\_SCDR). The status of this clock (at least for debug purposes) can be read in the PMC System Clock Status Register (PMC\_SCSR).

The Processor clock is enabled after a reset and is automatically re-enabled by any enabled interrupt. The processor Idle mode is entered by disabling the Processor clock, which is automatically re-enabled by any enabled fast or normal interrupt, or by the reset of the product.

When processor Idle mode is entered, the current instruction is finished before the clock is stopped, but this does not prevent data transfers from other masters of the system bus.

### 32.6 Matrix Clock Controller

The AXI Matrix and H64MX 64-bit Matrix clocks are MCK.

The H32MX 32-bit matrix clock is to be configured as MCK if MCK does not exceed 83 MHz (refer to “Master Clock Characteristics” in the section “Electrical Characteristics”); otherwise, this clock is to be configured as MCK/2. Selection is done with the H32MXDIV bit in PMC Master Clock Register.

**Figure 32-3. H32MX 32-bit Matrix Clock Configuration**

### 32.7 Programmable Clock Controller

The PMC controls three signals to be outputs on external pins PCKx. Each signal can be independently programmed via the Programmable Clock registers (PMC\_PCKx).

PCKx can be independently selected between the Slow clock (SLCK), the Master clock (MAINCK), the PLLACK, the UTMI PLL output, the Main clock and the AUDIO PLL (AUDIOPLLCLK) output by writing PMC\_PCKx.CSS. Each output signal can also be divided by a factor between 1 and 256 by writing PMC\_PCKx.PRES.

Each output signal can be enabled and disabled by writing a ‘1’ in the corresponding bits, PMC\_SCER.PCKx and PMC\_SCDR.PCKx, respectively. The status of each active programmable output clocks is given in PMC\_SCSR.PCKx.

The status flag PMC\_SR.PCKRDYx indicates that the Programmable clock programmed in PMC\_PCKx is ready.

As the Programmable Clock Controller does not implement glitch prevention when switching clocks, the PCKx must be disabled before any configuration change (clock source and prescaler) and must be re-enabled after the change is performed.

### 32.8 Core and Bus Independent Clocks for Peripherals

The following table lists the peripherals that can operate while the core, bus and peripheral clock frequencies are modified, thus providing communications at a bit rate which is independent for the core/bus/peripheral clock. This mode of operation is possible by using the internally generated independent clock sources.

**Table 32-1. Clock Assignments**

Peripheral	Specific Clock Requirements
GMAC	–
UDPHS	–
UHPHS	–
CLASSD	GCLK

.....continued	
Peripheral	Specific Clock Requirements
I2SC	GCLK
FLEXCOM (USART, SPI, TWI)	GCLK
ISC	PCK (pad clock)
MCAN	GCLK
TC	GCLK
ADC	GCLK

### 32.9 Peripheral and Generic Clock Controller

The PMC controls the clocks of the embedded peripherals by means of the Peripheral Control register (PMC\_PCR). With this register, the user can enable and disable the different clocks used by the peripherals:

- Peripheral clocks (periph\_clk[.]), routed to every peripheral and derived from the Master clock (MCK), and
- Generic clocks (GCLK[PID]), routed to selected peripherals only (refer to the Peripheral Identifiers table in section Peripherals). These clocks are independent of the core and bus clocks (PCK, MCK and Periph\_clk[PID]).

To configure a peripheral's clocks, PMC\_PCR.CMD must be written to '1' and PMC\_PCR.PID must be written with the index of the corresponding peripheral.

The GCLK[PID] clocks are generated by selection and division of the following sources: SLCK, MAINCK, UPLLCKDIV, PLLACK, AUDIOCKDIV and MCK. The source clock is selected by writing PMC\_PCR.GCKCSS and the source clock divider is configured by writing PMC\_PCR.GCKDIV. To apply a clock source selection and division factor, PID, CMD and GCKDIV, GCKCSS must be written in a single operation.

As the Generic Clock Controller (GCLK[PID]) does not implement glitch prevention when switching clocks, the GCLK[PID] must be disabled (PMC\_PCR.GCKEN=0) before any configuration change (clock source and prescaler) and must be re-enabled after the change is performed.

The peripheral clock (periph\_clk[.]) can be enabled or disabled by writing PMC\_PCR.EN.

The user can also enable and disable these clocks by configuring the Peripheral Clock Enable (PMC\_PCERx) and Peripheral Clock Disable (PMC\_PCDRx) registers. The status of the peripheral clock activity can be read in the Peripheral Clock Status registers (PMC\_PCSRx).

When a peripheral or a generic clock is disabled, it is immediately stopped. These clocks are disabled after a reset.

To stop a peripheral clock, the application software must wait until the peripheral has executed its last programmed operation before disabling the clock. This is to avoid data corruption or erroneous behavior of the system.

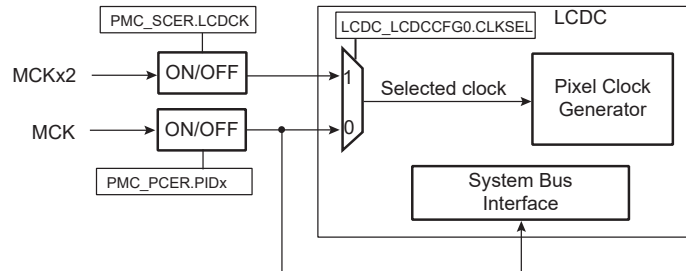

For a peripheral clock (periph\_clk[.]), the bit number in PMC\_PCERx, PMC\_PCDRx, and PMC\_PCSRx is the Peripheral Identifier defined at the product level. The bit number corresponds to the interrupt source number assigned to the peripheral.

To read the current clock configuration of a peripheral, PMC\_PCR.CMD must be written to '0' and PMC\_PCR.PID must be written with the index of the corresponding peripheral regardless of the values of other fields. This write does not modify the configuration of the peripheral. The PMC\_PCR can then be read to know the configuration status of the corresponding PID.

### 32.10 LCDC Clock Controller

In order to have more flexibility on the pixel clock, the LCDC can use MCK, or MCKx2 if LCDCK is set in the PMC System Clock Enable Register (PMC\_SCER).

**Figure 32-4. LCDCLK Clock Configuration**

### 32.11 ISC Clock Controller

In order to have more flexibility on the pixel clock, the ISC can use MCK, or MCKx2 if ISCK is set in the PMC System Clock Enable Register (PMC\_SCER).

**Figure 32-5. ISCKCLK Clock Configuration**

### 32.12 USB Device and Host Clocks

The USB Device and Host High Speed ports (UDPHS and UPHS) clocks are enabled by the corresponding PIDx bits in the Peripheral Clock Enable register (PMC\_PCRx). To save power on this peripheral when they are not used, the user can set these bits in the Peripheral Clock Disable register (PMC\_PCDRx). Corresponding PIDx bits in the Peripheral Clock Status register (PMC\_PCSRx) give the status of these clocks.

The PMC also provides the clocks UHP48M and UHP12M to the USB Host OHCI. The USB Host OHCI clocks are controlled by PMC\_SCER.UHP. To save power on this peripheral when they are not used, the user can set PMC\_SCDR.UHP. PMC\_SCSR.UHP gives the status of this clock. The USB host OHCI requires both the 12/48 MHz signal and the Master clock. The USBDIV field in the USB Clock register (PMC\_USB) is to be programmed to 9 (division by 10) for normal operations.

To further reduce power consumption the user can stop the UTMI PLL. In this case USB high-speed operations are not possible. Nevertheless, as the USB OHCI Input clock can be selected with PMC\_USB.USBS (PLLA or UTMI PLL), OHCI full-speed operation remains possible.

The user must program the USB OHCI Input clock and the USBDIV divider in the PMC\_USB register to generate a 48 MHz and a 12 MHz signal with an accuracy of  $\pm 0.25\%$ .

The USB clock input is to be defined according to main oscillator via the FREQ field in the UTMI Clock Trimming register (SFR\_UTMICKTRIM). Refer to the section “Special Function Registers (SFR)”. This input clock can be 12, 16, or 24 MHz.

### 32.13 DDR2/LPDDR/LPDDR2 Clock Controller

The PMC controls the clocks of the DDR memory.

The DDR clock can be enabled and disabled with the DDRCK bit in PMC\_SCER and PMC\_SDER, respectively. At reset, the DDR clock is disabled to reduce power consumption.

If PMC\_MCKR.MDIV = 0 (PCK = MCK), the DDR clock is not available.

To reduce PLLA power consumption, the user can choose UPLLCK as an input clock for the system. In this case, the DDR Controller can drive LPDDR or LPDDR2 at up to 120 MHz.

### 32.14 Fast Start-up from Ultra-Low-Power (ULP) Mode 0

In Ultra-Low-power (ULP) mode 0, the Main clock (MAINCK) must be running, thus either the 12 MHz crystal oscillator or the Fast RC oscillator must be enabled. The lowest power consumption that can be achieved in ULP Mode 0, can be obtained when dividing the selected oscillator frequency by 64 by writing PMC\_MCKR.PRES to 6. Any interrupt exits the system from ULP Mode. The software must write PMC\_MCKR.PRES to 1 to provide MCK with the fastest clock. If the PLL is used, the start-up procedure must be done prior to writing PMC\_MCKR.PRES to 1. The following figure illustrates an example of start-up phase from ULP Mode 0 without use of PLL.

**Figure 32-6. Fast Start-up from Ultra-Low-Power Mode 0**

The duration of the WKUPx pins active level must be greater than four MAINCK cycles.

### 32.15 Fast Start-up from Ultra-Low-Power (ULP) Mode 1

The device allows the processor to restart in less than 10  $\mu$ s while the device exits Ultra-Low-power (ULP) mode 1 only if the C-code function managing the ULP mode 1 entry and exit is linked to and executed from on-chip SRAM.

Prior to instructing the device to enter ULP mode 1, the RC oscillator must be selected as the Master clock source (PMC\_MCKR.CSS must be written to 1, wait for PMC\_SR.MCKRDY to be set) and the internal sources of wake-up must be cleared. In addition, it must be checked that none of the enabled external wake-up inputs (WKUP) hold an active polarity.

The system enters ULP mode 1 either by setting the CKGR\_MOR.WAITMODE, or by executing the WaitForEvent (WFE) instruction of the processor while PMC\_FSMR.LPM is at 1. Immediately after setting the WAITMODE bit or using the WFE instruction, wait for PMC\_SR.MCKRDY to be set. See the following figure.

**Figure 32-7. Fast Start-up from ULP Mode 1**

A fast start-up is enabled upon any of the following events:

- detection of a programmed level on one of the nine wake-up inputs (WKUP, PIOBUx)
- an active alarm from the RTC
- a resume from the USB Controller
- SDMMC card detect
- backup UART (RXLP) received character comparison match
- an analog comparison (ACC)
- any SleepWalking event coming from TWI, FLEXCOMx, SPI, ADC

The polarity of the nine wake-up inputs is programmable by writing the PMC Fast Startup Polarity register (PMC\_FSPR). All the fast restart event sources except SleepWalking can be individually enabled/disabled by writing in PMC\_FSMR. SleepWalking events can be individually enabled/disabled by writing in PMC\_SLPWK\_ERx/PMC\_SLPWK\_DRx (see [Asynchronous Partial Wake-up \(SleepWalking\)](#)).

The fast start-up circuitry, as shown in the following figure, is fully asynchronous and provides a fast start-up signal to the PMC. As soon as the fast start-up signal is asserted, the embedded 12 MHz RC oscillator restarts automatically.

**Figure 32-8. Fast Start-up Circuitry**

The PMC user interface does not provide the source of the fast start-up, but the user can recover this information by reading the PIO Controller and the status registers of the RTC, ACC, RXLP, and USB Controller.

## 32.16 Asynchronous Partial Wake-up (SleepWalking)

### 32.16.1 Description

The asynchronous partial wake-up (SleepWalking) wakes up a peripheral in a fully asynchronous way when activity is detected on the communication line. Moreover, under some user configurable conditions, the asynchronous partial wake-up can trigger an exit of the system from ULP mode 1 (full system wake-up).

The asynchronous partial wake-up function automatically manages the peripheral clock. It improves the overall power consumption of the system by clocking peripherals only when needed.

Only the following peripherals can be configured with asynchronous partial wake-up: FLEXCOMx, SPIx, TWIx, UARTx and ADC.

The peripheral selected for asynchronous partial wake-up must be first configured so that its clock is enabled by setting the appropriate PIDx bit in PMC\_PCERx.

When the system is in ULP mode 1, all clocks of the system (except SLCK) are stopped. When an asynchronous clock request from a peripheral occurs, the PMC partially wakes up the system to feed the clock only to this peripheral. The rest of the system is not fed with the clock, thus optimizing power consumption. Finally, depending on user-configurable conditions, the peripheral either wakes up the whole system if these conditions are met or stops the peripheral clock until the next clock request. If a wake-up request occurs, the Asynchronous Partial Wake-up mode is automatically disabled until the user instructs the PMC to enable asynchronous partial wake-up. This is done by setting PIDx in the PMC SleepWalking Enable register (PMC\_SLPWK\_ER).

**Figure 32-9. SleepWalking During Ultra-Low-Power Mode 1**

When the system is in Active mode, peripherals enabled for asynchronous partial wake-up have their respective clocks stopped until the peripherals request a clock. When a peripheral requests the clock, the PMC provides the clock without CPU intervention.

The triggering of the peripheral clock request depends on conditions which can be configured for each peripheral. If these conditions are met, the peripheral asserts a request to the PMC. The PMC disables the Asynchronous Partial Wake-up mode of the peripheral and provides the clock to the peripheral until the user instructs the PMC to re-enable partial wake-up on the peripheral. This is done by setting PIDx in PMC\_SLPWK\_ER.

If the conditions are not met, the peripheral clears the clock request and PMC stops the peripheral clock until the clock request is re-asserted by the peripheral.

**Figure 32-10. SleepWalking During Active Mode**

### 32.16.2 Configuration Procedure

Before configuring the asynchronous partial wake-up (SleepWalking) function of a peripheral, check that the peripheral clock is enabled (the PIDx bit in the PMC Peripheral Clock Status register (PMC\_PCSR) must be set).

The procedure to enable the asynchronous partial wake-up (SleepWalking) function of a peripheral is the following:

1. Check that the corresponding PIDx bit in the PMC SleepWalking Activity Status register (PMC\_SLPWK\_ASR) is cleared. This ensures that the peripheral has no activity in progress.
2. Enable the asynchronous partial wake-up function of the peripheral by writing a one to the corresponding PIDx bit in PMC\_SLPWK\_ER.
3. Check that the corresponding PIDx bit in PMC\_SLPWK\_ASR is cleared. This ensures that no activity has started during the enable phase.
4. In PMC\_SLPWK\_ASR, if the corresponding PIDx bit is set, the asynchronous partial wake-up function must be immediately disabled by writing a one to the PIDx bit in the PMC SleepWalking Disable register (PMC\_SLPWK\_DR). Wait for the end of peripheral activity before reinitializing the procedure.

If the corresponding PIDx bit is cleared, then the peripheral clock is disabled and the system can now be placed in ULP mode 1.

Before entering ULP mode 1, check that the AIP bit in the PMC SleepWalking Activity In Progress register (PMC\_SLPWK\_AIPR) is cleared. This ensures that none of the peripherals has any activity in progress.

**Note:** When asynchronous partial wake-up (SleepWalking) of a peripheral is enabled and the core is running (system not in ULP mode 1), the peripheral must not be accessed before a wake-up of the peripheral is performed.

## 32.17 Main Crystal Oscillator Failure Detection

The Main crystal oscillator failure detector monitors the 8 to 24 MHz crystal oscillator or ceramic resonator-based oscillator to identify a possible failure of this oscillator.

The clock failure detector can be enabled or disabled by configuring CKGR\_MOR.CFDEN. The detector is also disabled in either of the following cases:

- after a VDDCORE reset
- when the oscillator is disabled (CKGR\_MOR.MOSCXTEN = 0)

A failure is detected by means of a counter incrementing on the main oscillator clock edge and detection logic is triggered by the 32 kHz generated by the 64 kHz (typical) RC oscillator. This oscillator is automatically enabled when `CKGR_MOR.CFDEN = 1`.

The counter is cleared when the 32 kHz generated by the 64 kHz (typical) RC oscillator clock signal is low, and enabled when the signal is high. Thus, the failure detection time is one RC oscillator period. If, during the high level period of the 32 kHz generated by the 64 kHz (typical) RC oscillator clock signal, less than eight 8 to 24 MHz crystal oscillator clock periods have been counted, then a failure is reported.

If a failure of the Main clock is detected, bit `PMC_SR.CFDEV` indicates a failure event and generates an interrupt if the corresponding interrupt source is enabled. The interrupt remains active until a read occurs in `PMC_SR`. The user can know the status of the clock failure detection at any time by reading bit `PMC_SR.CFDS`.

**Figure 32-11. Clock Failure Detection (Example)**

Note: Ratio of clock periods is for illustration purposes only.

If the 8 to 24 MHz crystal oscillator or ceramic resonator-based oscillator is selected as the source clock of `MAINCK` (`CKGR_MOR.MOSCSEL = 1`), and if `MCK` source is `PLLACK` or `UPLLCK` (`PMC_MCKR.CSS = 2` or `3`), a clock failure detection automatically forces `MAINCK` to be the source clock for the Master clock (`MCK`). Then, regardless of the PMC configuration, a clock failure detection automatically forces the 12 MHz RC oscillator to be the source clock for `MAINCK`. If this oscillator is disabled when a clock failure detection occurs, it is automatically re-enabled by the clock failure detection mechanism.

It takes two 32 kHz (typical) clock cycles to detect and switch from the 8 to 24 MHz crystal oscillator to the 12 MHz RC oscillator if the source Master clock (`MCK`) is Main clock (`MAINCK`), or three 32 kHz (typical) cycles if the source of `MCK` is `PLLACK` or `UPLLCK`.

A clock failure detection activates a fault output that is connected to the Pulse Width Modulator (PWM) Controller. With this connection, the PWM controller is able to force its outputs and to protect the driven device, if a clock failure is detected.

The user can know the status of the clock failure detector at any time by reading bit `PMC_SR.FOS`.

This fault output remains active until the defect is detected and until it is cleared by the bit `FOCLR` in the PMC Fault Output Clear register (`PMC_FOCLR`).

### 32.18 32.768 kHz Crystal Oscillator Frequency Monitor

The frequency of the 32.768 kHz crystal oscillator can be monitored by means of logic driven by the 12 MHz RC oscillator known as a reliable clock source. This function is enabled by configuring the `XT32KFME` bit of `CKGR_MOR`.

The error flag `XT32KERR` in `PMC_SR` is asserted when the 32.768 kHz crystal oscillator frequency is out of the  $\pm 10\%$  nominal frequency value (i.e., 32.768 kHz). The error flag can be cleared only if the Slow clock frequency monitoring is disabled.

The monitored clock frequency is declared invalid if at least four consecutive clock period measurement results are over the nominal period  $\pm 10\%$ .

Due to the possible frequency variation of the embedded 12 MHz RC oscillator acting as reference clock for the monitor logic, any Slow clock crystal frequency deviation over  $\pm 10\%$  of the nominal frequency is systematically reported as an error by means of PMC\_SR.XT32KERR. Between  $-1\%$  and  $-10\%$  and  $+1\%$  and  $+10\%$ , the error is not systematically reported.

Thus, only a crystal running at a 32.768 kHz frequency ensures that the error flag is not asserted. The permitted drift of the crystal is 10000 ppm (1%), which allows any standard crystal to be used.

The error flag can be defined as an interrupt source of the PMC by setting PMC\_IER.XT32KERR.

## 32.19 Programming Sequence

1. If the 8 to 24 MHz crystal oscillator is not required, PLL can be directly configured (begin with [Step 6.](#) or [Step 7.](#)) else this oscillator must be started (begin with [Step 2.](#)).
2. Enable the 8 to 24 MHz crystal oscillator by setting CKGR\_MOR.MOSCXTEN. The user can define a start-up time. This can be achieved by writing a value in CKGR\_MOR.MOSCXTST. Once this register has been correctly configured, the user must wait for PMC\_SR.MOSCXTS to be set. This can be done either by polling MOSCXTS or by waiting for the interrupt line to be raised if the associated interrupt source (MOSCXTS) has been enabled in PMC\_IER.
3. Switch the MAINCK to the 8 to 24 MHz crystal oscillator by setting CKGR\_MOR.MOSCSEL.
4. Wait for PMC\_SR.MOSCSELS to be set to ensure the switchover is complete.
5. Check the Main clock frequency:  
The Main clock frequency can be measured via CKGR\_MCFR.

Read CKGR\_MCFR until the MAINFRDY field is set, after which the user can read the field CKGR\_MCFR.MAINF by performing an additional read. This provides the number of Main clock cycles that have been counted during a period of 16 Slow clock cycles.

If MAINF = 0, switch the MAINCK to the 12 MHz RC oscillator by clearing CKGR\_MOR.MOSCSEL.  
If MAINF  $\neq$  0, proceed to [Step 6.](#)

6. Set the PLLA and divider (if not required, proceed to [Step 7.](#))  
All parameters needed to configure PLLA and the divider are located in CKGR\_PLLAR.

The MULA field is the PLLA multiplier factor. This parameter can be programmed between 0 and 127. If MULA is cleared, PLLA is turned off, otherwise the PLLA output frequency is PLLA input frequency multiplied by (MULA + 1).

The PLLACOUNT field specifies the number of Slow clock cycles before LOCKA bit is set in PMC\_SR after CKGR\_PLLAR has been written.

Once CKGR\_PLLAR has been written, the user must wait for the LOCKA bit to be set in PMC\_SR. This can be done either by polling LOCKA in PMC\_SR or by waiting for the interrupt line to be raised if the associated interrupt source (LOCKA) has been enabled in PMC\_IER. All parameters in CKGR\_PLLAR can be programmed in a single write operation. If at some stage parameter MULA or DIVA is modified, LOCKA bit goes low to indicate that PLLA is not yet ready. When PLLA is locked, LOCKA is set again.

The user must wait for the LOCKA bit to be set before using the PLLA output clock.

7. Set High-speed PLL (UPLL) for UTMI

The UTMI PLL is enabled by setting CKGR\_UCKR.UPLLEN. In some cases, it may be preferable to define a start-up time. This can be achieved by writing a value in CKGR\_UCKR.PLLCOUNT.

Once this register has been correctly configured, the user must wait for PMC\_SR.LOCKU to be set. This can be done either by polling LOCKU in PMC\_SR or by waiting for the interrupt line to be raised if the associated interrupt source (LOCKU) has been enabled in PMC\_IER.

### 8. Select Master Clock and Processor Clock

The Master clock and the Processor clock are configurable via PMC\_MCKR.

The CSS field is used to select the clock source of the Master clock and Processor clock dividers. By default, the selected clock source is the Main clock.

The PRES field is used to define the Processor clock and Master clock prescaler. The user can choose between different values from 1 to 256). Prescaler output is the selected clock source frequency divided by the PRES value.

The MDIV field is used to define the Master clock divider. It is possible to choose between different values (0, 1, 2, 3). The Master clock output is Processor clock frequency divided by 1, 2, 3 or 4, depending on the value programmed in MDIV.

The PMC PLLA clock input must be divided by 2 by writing the PLLADIV2 bit if MDIV is set to 3.

By default, MDIV and PLLADIV2 are cleared, which indicates that Processor clock is equal to the Master clock.

Once PMC\_MCKR has been written, the user must wait for the MCKRDY bit to be set in PMC\_SR. This can be done either by polling MCKRDY in PMC\_SR or by waiting for the interrupt line to be raised if the associated interrupt source (MCKRDY) has been enabled in PMC\_IER.

PMC\_MCKR must not be programmed in a single write operation. The programming sequence for PMC\_MCKR is the following:

If a new value for CSS field corresponds to PLL clock,

- a. Program PMC\_MCKR.PRES.
- b. Wait for PMC\_SR.MCKRDY to be set.
- c. Program PMC\_MCKR.MDIV.
- d. Wait for PMC\_SR.MCKRDY to be set.
- e. Program PMC\_MCKR.CSS.
- f. Wait for PMC\_SR.MCKRDY to be set.

If a new value for CSS field corresponds to Main clock or Slow clock,

- a. Program PMC\_MCKR.CSS.
- b. Wait for PMC\_SR.MCKRDY to be set.
- c. Program PMC\_MCKR.PRES.
- d. Wait for PMC\_SR.MCKRDY to be set.

If CSS, MDIV or PRES are modified at some stage, the MCKRDY bit goes low to indicate that the Master clock and the Processor clock are not yet ready. The user must wait for the MCKRDY bit to be set again before using the Master and Processor clocks.

**Note:** If PLLA clock was selected as the Master clock and the user decides to modify it by writing in CKGR\_PLLR, the MCKRDY flag goes low while PLL is unlocked. Once PLL is locked again, LOCKA goes high and MCKRDY is set.

While PLL is unlocked, the Master clock selection is automatically changed to Slow clock. For further information, see [Clock Switching Waveforms](#).

Code Example:

```
write_register(PMC_MCKR,0x00000001)
```

```
wait (MCKRDY=1)
```

```
write_register(PMC_MCKR,0x00000011)
```

```
wait (MCKRDY=1)
```

The Master clock is Main clock divided by 2.

The Processor clock is the Master clock.

### 9. Select Programmable Clocks

Programmable clocks can be enabled and/or disabled via PMC\_SCER and PMC\_SCDR. 3 programmable clocks can be used. PMC\_SCSR indicates which programmable clock is enabled. By default all programmable clocks are disabled.

PMC\_PCKx registers are used to configure programmable clocks.

The PMC\_PCKx.CSSfield selects the programmable clock divider source. Five clock options are available: Main clock, Slow clock, Master clock, PLLACK, UPLLCK. The Slow clock is the default clock source.

The PRES field is used to control the programmable clock prescaler. It is possible to choose among different values (from 1 to 256). Programmable clock output is prescaler input divided by PRES parameter. By default, the PRES value is cleared which means that PCKx is equal to Slow clock.

Once the PMC\_PCKx register has been configured, The corresponding programmable clock must be enabled and the user is constrained to wait for the PCKRDYx bit to be set in PMC\_SR. This can be done either by polling PCKRDYx in PMC\_SR or by waiting for the interrupt line to be raised if the associated interrupt source (PCKRDYx) has been enabled in PMC\_IER. All parameters in PMC\_PCKx can be programmed in a single write operation.

If the CSS and PRES parameters are to be modified, the corresponding programmable clock must be disabled first. The parameters can then be modified. Once this has been done, the user must re-enable the programmable clock and wait for the PCKRDYx bit to be set.

### 10. Enable Peripheral Clocks

Once all of the previous steps have been completed, the peripheral clocks can be enabled and/or disabled via PMC\_PCERx and PMC\_PCDRx.

## 32.20 Clock Switching Details

### 32.20.1 Master Clock Switching Timings

The following tables give the worst case timings required for the Master clock to switch from one selected clock to another one. This is in the event that the prescaler is deactivated. When the prescaler is activated, an additional time of 64 clock cycles of the new selected clock has to be added.

# SAMA5D2 Series

## Power Management Controller (PMC)

**Table 32-2. Clock Switching Timings (Worst Case)**

To	From		
	Main Clock	SLCK	PLL Clock
Main Clock	–	$4 \times \text{SLCK} + 2.5 \times \text{Main Clock}$	$3 \times \text{PLL Clock} + 4 \times \text{SLCK} + 1 \times \text{Main Clock}$
SLCK	$0.5 \times \text{Main Clock} + 4.5 \times \text{SLCK}$	–	$3 \times \text{PLL Clock} + 5 \times \text{SLCK}$
PLL Clock	$0.5 \times \text{Main Clock} + 4 \times \text{SLCK} + \text{PLLCOUNT} \times \text{SLCK} + 2.5 \times \text{PLL Clock}$	$2.5 \times \text{PLL Clock} + 5 \times \text{SLCK} + \text{PLLCOUNT} \times \text{SLCK}$	$2.5 \times \text{PLL Clock} + 4 \times \text{SLCK} + \text{PLLCOUNT} \times \text{SLCK}$

**Note:** PLL designates either the PLLA or the UPLL Clock. PLLCOUNT designates either PLLACOUNT or UPLLACOUNT.

**Table 32-3. Clock Switching Timings Between Two PLLs (Worst Case)**

To	From	
	PLLA Clock	UPLL Clock
PLLA Clock	$2.5 \times \text{PLLA Clock} + 4 \times \text{SLCK} + \text{PLLACOUNT} \times \text{SLCK}$	$3 \times \text{PLLA Clock} + 4 \times \text{SLCK} + 1.5 \times \text{PLLA Clock}$
UPLL Clock	$3 \times \text{UPLL Clock} + 4 \times \text{SLCK} + 1.5 \times \text{UPLL Clock}$	$2.5 \times \text{UPLL Clock} + 4 \times \text{SLCK} + \text{UPLLACOUNT} \times \text{SLCK}$

### 32.21 Register Write Protection

To prevent any single software error from corrupting PMC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the PMC Write Protection Mode Register (PMC\_WPMR).

If a write access to a write-protected register is detected, the WPVS bit in the PMC Write Protection Status Register (PMC\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading PMC\_WPSR.

The following registers can be write-protected:

- [PMC System Clock Enable Register](#)
- [PMC System Clock Disable Register](#)
- [PMC Peripheral Clock Enable Register 0](#)
- [PMC Peripheral Clock Disable Register 0](#)
- [PMC Clock Generator Main Oscillator Register](#)
- [PMC Clock Generator Main Clock Frequency Register](#)
- [PMC Clock Generator PLLA Register](#)
- [PMC Master Clock Register](#)
- [PMC USB Clock Register](#)
- [PMC Fast Startup Polarity Register](#)
- [PMC Fast Startup Mode Register](#)
- [PLL Charge Pump Current Register](#)
- [PMC Oscillator Calibration Register](#)
- [PMC SleepWalking Enable Register 0](#)
- [PMC SleepWalking Disable Register 1](#)
- [PMC SleepWalking Enable Register 1](#)
- [PMC SleepWalking Disable Register 1](#)
- [PMC SleepWalking Control Register](#)

### 32.22.1 PMC System Clock Enable Register

**Name:** PMC\_SCER  
**Offset:** 0x0000  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
						ISCCK			
Access						W			
Reset						–			
Bit	15	14	13	12	11	10	9	8	
						PCK2	PCK1	PCK0	
Access						W	W	W	
Reset						–	–	–	
Bit	7	6	5	4	3	2	1	0	
	UDP	UHP			LCDCK	DDRCK			
Access	W	W			W	W			
Reset	–	–			–	–			

**Bit 18 – ISCCK** ISC Clock Enable

Value	Description
0	No effect.
1	Enables the ISC clock.

**Bits 8, 9, 10 – PCKx** Programmable Clock x Output Enable

Value	Description
0	No effect.
1	Enables the corresponding Programmable Clock output.

**Bit 7 – UDP** USB Device Clock Enable

Value	Description
0	No effect.
1	Enables the USB Device clock.

**Bit 6 – UHP** USB Host OHCI Clocks Enable

Value	Description
0	No effect.

# SAMA5D2 Series

## Power Management Controller (PMC)

Value	Description
1	Enables the UHP48M and UHP12M OHCI clocks.

### Bit 3 – LCDCK MCK2x Clock Enable

MCK2x is selected as LCD Pixel source clock if LCDC\_LCDCFG0.CLKSEL = 1.

Value	Description
0	No effect.
1	Enables the MCK2x clock.

### Bit 2 – DDRCK DDR Clock Enable

Value	Description
0	No effect.
1	Enables the DDR clock.

### 32.22.2 PMC System Clock Disable Register

**Name:** PMC\_SCDR  
**Offset:** 0x0004  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
						ISCCK			
Access						W			
Reset						–			
Bit	15	14	13	12	11	10	9	8

Access						W	W	W	
Reset						–	–	–	
Bit	7	6	5	4	3	2	1	0	
	UDP	UHP			LCDCK	DDRCK			
Access	W	W			W	W			
Reset	–	–			–	–			

#### Bit 18 – ISCCK ISC Clock Disable

Value	Description
0	No effect.
1	Disables the ISC clock.

#### Bits 8, 9, 10 – PCKx Programmable Clock x Output Disable

Value	Description
0	No effect.
1	Disables the corresponding Programmable Clock output.

#### Bit 7 – UDP USB Device Clock Enable

Value	Description
0	No effect.
1	Disables the USB Device clock.

#### Bit 6 – UHP USB Host OHCI Clock Disable

Value	Description
0	No effect.

# SAMA5D2 Series

## Power Management Controller (PMC)

---

---

Value	Description
1	Disables the UHP48M and UHP12M OHCI clocks.

### Bit 3 – LCDCK MCK2x Clock Disable

Value	Description
0	No effect.
1	Disables the MCK2x clock.

### Bit 2 – DDRCK DDR Clock Disable

Value	Description
0	No effect.
1	Disables the DDR clock.

### Bit 0 – PCK Processor Clock Disable

Value	Description
0	No effect.
1	Disables the Processor clock. This is used to enter the processor in Idle mode.

### 32.22.3 PMC System Clock Status Register

**Name:** PMC\_SCSR  
**Offset:** 0x0008  
**Reset:** 0x00000005  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24	
	[Greyed out bits 31-24]								
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
	[Greyed out bits 23-19]					ISCCK	[Greyed out bits 17-16]		
Access						R			
Reset						0			
Bit	15	14	13	12	11	10	9	8	
	[Greyed out bits 15-13]			[Greyed out bits 12-11]			PCK2	PCK1	PCK0
Access							R	R	R
Reset							0	0	0
Bit	7	6	5	4	3	2	1	0	
	UDP	UHP	[Greyed out bits 5-4]		LCDCK	DDRCK	[Greyed out bits 1-0]		
Access	R	R			R	R			
Reset	0	0			0	1			

#### Bit 18 – ISCCK ISC Clock Status

Value	Description
0	The ISC clock is disabled.
1	The ISC clock is enabled.

#### Bits 8, 9, 10 – PCKx Programmable Clock x Output Status

Value	Description
0	The corresponding Programmable Clock output is disabled.
1	The corresponding Programmable Clock output is enabled.

#### Bit 7 – UDP USB Device Port Clock Status

Value	Description
0	The USB Device clock is disabled.
1	The USB Device clock is enabled.

#### Bit 6 – UHP USB Host Port Clock Status

Value	Description
0	The UHP48M and UHP12M OHCI clocks are disabled.
1	The UHP48M and UHP12M OHCI clocks are enabled.

---

**Bit 3 – LCDCK** MCK2x Clock Status

MCK2x is selected as LCD Pixel source clock if LCDC\_LCDCFG0.CLKSEL = 1.

Value	Description
0	The MCK2x clock is disabled.
1	The MCK2x clock is enabled.

**Bit 2 – DDRCK** DDR Clock Status

Value	Description
0	The DDR clock is disabled.
1	The DDR clock is enabled.

**Bit 0 – PCK** Processor Clock Status

Value	Description
0	The Processor clock is disabled.
1	The Processor clock is enabled.

### 32.22.4 PMC Peripheral Clock Enable Register 0

**Name:** PMC\_PCER0  
**Offset:** 0x0010  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	PID31	PID30	PID29	PID28	PID27	PID26	PID25	PID24
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	PID23	PID22	PID21	PID20	PID19	PID18	PID17	PID16
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	PID15	PID14	PID13	PID12	PID11	PID10	PID9	PID8
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	PID7	PID6	PID5	PID4	PID3	PID2		
Access	W	W	W	W	W	W		
Reset	–	–	–	–	–	–		

**Bits 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – PIDx** Peripheral Clock x Enable

PID2 to PID31 refer to identifiers as defined in section “Peripheral Identifiers”. Other peripherals can be enabled in PMC\_PCER1.

Programming the control bits of the Peripheral ID that are not implemented has no effect on the behavior of the PMC.

Value	Description
0	No effect.
1	Enables the corresponding peripheral clock.

### 32.22.5 PMC Peripheral Clock Disable Register 0

**Name:** PMC\_PCDR0  
**Offset:** 0x0014  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	PID31	PID30	PID29	PID28	PID27	PID26	PID25	PID24
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	PID23	PID22	PID21	PID20	PID19	PID18	PID17	PID16
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	PID15	PID14	PID13	PID12	PID11	PID10	PID9	PID8
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	PID7	PID6	PID5	PID4	PID3	PID2		
Access	W	W	W	W	W	W		
Reset	–	–	–	–	–	–		

**Bits 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – PIDx** Peripheral Clock x Disable

PID2 to PID31 refer to identifiers as defined in section “Peripheral Identifiers”. Other peripherals can be disabled in PMC\_PCDR1.

Value	Description
0	No effect.
1	Disables the corresponding peripheral clock.

### 32.22.6 PMC Peripheral Clock Status Register 0

**Name:** PMC\_PCSR0  
**Offset:** 0x0018  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	PID31	PID30	PID29	PID28	PID27	PID26	PID25	PID24
Access	R	R	R	R	R	R	R	R

Access	R	R	R	R	R	R		
Reset	0	0	0	0	0	0		

**Bits 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – PIDx** Peripheral Clock x Status

PID2 to PID31 refer to identifiers as defined in section “Peripheral Identifiers”. Other peripherals status can be read in PMC\_PCSR1.

Value	Description
0	The corresponding peripheral clock is disabled.
1	The corresponding peripheral clock is enabled.

### 32.22.7 PMC UTMI Clock Configuration Register

**Name:** CKGR\_UCKR  
**Offset:** 0x001C  
**Reset:** 0x10200000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	BIASCOUNT[3:0]							
Access	R/W	R/W	R/W	R/W				
Reset	0	0	0	1				
Bit	23	22	21	20	19	18	17	16
	UPLLCOUNT[3:0]							UPLLEN
Access	R/W	R/W	R/W	R/W				R/W
Reset	0	0	1	0				0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access								
Reset								

**Bits 31:28 – BIASCOUNT[3:0]** UTMI BIAS Start-up Time  
 Specifies the number of slow clock cycles for the UTMI BIAS start-up time.

**Bits 23:20 – UPLLCOUNT[3:0]** UTMI PLL Start-up Time  
 Specifies the number of slow clock cycles multiplied by 8 for the UTMI PLL start-up time.

**Bit 16 – UPLLEN** UTMI PLL Enable  
 When UPLLEN is set, the LOCKU flag is set once the UTMI PLL start-up time is achieved.

Value	Description
0	The UTMI PLL is disabled.
1	The UTMI PLL is enabled.

### 32.22.8 PMC Clock Generator Main Oscillator Register

**Name:** CKGR\_MOR  
**Offset:** 0x0020  
**Reset:** 0x01000021  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24	
							CFDEN	MOSCSEL	
Access							R/W	R/W	
Reset							0	1	
Bit	23	22	21	20	19	18	17	16	
	KEY[7:0]								
Access	W	W	W	W	W	W	W	W	
Reset	0	0	0	0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	
	MOSCXTST[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
			ONE			MOSCRNEN	WAITMODE	MOSCXTBY	MOSCXTEN
Access			R/W			R/W	R/W	R/W	R/W
Reset			1			0	0	0	1

#### Bit 25 – CFDEN Clock Failure Detector Enable

Value	Description
0	The clock failure detector is disabled.
1	The clock failure detector is enabled.

#### Bit 24 – MOSCSEL Main Clock Oscillator Selection

Value	Description
0	The 12 MHz RC oscillator is selected.
1	The 8 to 24 MHz crystal oscillator is selected.

#### Bits 23:16 – KEY[7:0] Password

Value	Name	Description
0x37	PASSWD	Writing any other value in this field aborts the write operation.

#### Bits 15:8 – MOSCXTST[7:0] 8 to 24 MHz Crystal Oscillator Start-up Time

Specifies the number of Slow clock cycles multiplied by 8 for the crystal oscillator start-up time.

**Bit 5 – ONE** Must Be Set to 1

When programming CKGR\_MOR, bit 5 must always be set to 1; bits 6 and 4 must always be set to 0.

**Bit 3 – MOSRCEN** 12 MHz RC Oscillator Enable

When MOSRCEN is set, the MOSCRCS flag is set once the RC oscillator start-up time is achieved.

Value	Description
0	The 12 MHz RC oscillator is disabled.
1	The 12 MHz RC oscillator is enabled.

**Bit 2 – WAITMODE** Wait Mode Command

Value	Description
0	No effect.
1	Puts the device in Wait mode.

**Bit 1 – MOSCXTBY** 8 to 24 MHz Crystal Oscillator Bypass

When MOSCXTBY is set, the MOSCXTS flag in PMC\_SR is automatically set.

Clearing MOSCXTEN and MOSCXTBY bits allows resetting the MOSCXTS flag.

When Main Oscillator Bypass is disabled (MOSCXTBY = 0), the MOSCXTS flag must be read as 0 in PMC\_SR prior to enabling the main crystal oscillator (MOSCXTEN = 1).

Value	Description
0	No effect.
1	The 8 to 24 MHz crystal oscillator is bypassed. MOSCXTEN must be cleared. An external clock must be connected on XIN.

**Bit 0 – MOSCXTEN** 8 to 24 MHz Crystal Oscillator Enable

A crystal must be connected between XIN and XOUT.

When MOSCXTEN is set, the MOSCXTS flag is set once the crystal oscillator startup time is achieved.

Value	Description
0	The 8 to 24 MHz crystal oscillator is disabled.
1	The 8 to 24 MHz crystal oscillator is enabled. MOSCXTBY must be cleared.

Bits 4 and 6 must always be configured to 1.

### 32.22.9 PMC Clock Generator Main Clock Frequency Register

**Name:** CKGR\_MCFR  
**Offset:** 0x0024  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24	
								CCSS	
Access								R/W	
Reset								0	
Bit	23	22	21	20	19	18	17	16	
				RCMEAS					MAINFRDY
Access				R/W					R/W
Reset				0					0
Bit	15	14	13	12	11	10	9	8	
	MAINF[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
	MAINF[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	0	

#### Bit 24 – CCSS Counter Clock Source Selection

Value	Description
0	The clock of the MAINF counter is the RC oscillator.
1	The clock of the MAINF counter is the crystal oscillator.

#### Bit 20 – RCMEAS RC Oscillator Frequency Measure (write-only)

The measure is performed on the main frequency (i.e., not limited to RC oscillator only), but if the Main clock frequency source is the 8 to 24 MHz crystal oscillator, the restart of measuring is not needed because of the well known stability of crystal oscillators.

Value	Description
0	No effect.
1	Restarts measuring of the frequency of the Main clock source. MAINF will carry the new frequency as soon as a low to high transition occurs on the MAINFRDY flag.

#### Bit 16 – MAINFRDY Main Clock Frequency Measure Ready

To ensure that a correct value is read on the MAINF field, the MAINFRDY flag must be read at 1, then another read access must be performed on the register to get a stable value on the MAINF field.

# SAMA5D2 Series

## Power Management Controller (PMC)

Value	Description
0	MAINF value is not valid or the measured oscillator is disabled or a measure has just been started by means of RCMEAS.
1	The measured oscillator has been enabled previously and MAINF value is available.

### Bits 15:0 – MAINF[15:0] Main Clock Frequency

Gives the number of cycles of the clock selected by the bit CCSS within 16 Slow clock periods. To calculate the frequency of the measured clock:

$$f_{\text{SELCK}} = (\text{MAINF} \times f_{\text{SLCK}}) / 16$$

where frequency is in MHz.

### 32.22.10 PMC Clock Generator PLLA Register

**Name:** CKGR\_PLLAR  
**Offset:** 0x0028  
**Reset:** 0x00003F00  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register. Possible limitations on PLL input frequencies and multiplier factors should be checked before using the PMC.

	Bit	31	30	29	28	27	26	25	24
				ONE					MULA[6:6]
Access				R/W					R/W
Reset				0					0
	Bit	23	22	21	20	19	18	17	16
		MULA[5:0]						OUTA[3:2]	
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		OUTA[1:0]		PLLACOUNT[5:0]					
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	1	1	1	1	1	1
	Bit	7	6	5	4	3	2	1	0
									DIVA
Access									R/W
Reset									0

**Bit 29 – ONE** Must Be Set to 1

Bit 29 must always be set to 1 when programming CKGR\_PLLAR.

**Bits 24:18 – MULA[6:0]** PLLA Multiplier

Value	Description
0	The PLLA is disabled.
1-127	The PLLA Clock frequency is the PLLA input frequency multiplied by MULA + 1.

**Bits 17:14 – OUTA[3:0]** PLLA Clock Frequency Range

To be programmed to 0.

**Bits 13:8 – PLLACOUNT[5:0]** PLLA Counter

Specifies the number of Slow clock cycles before the LOCKA bit is set in PMC\_SR after CKGR\_PLLAR is written.

**Bit 0 – DIVA** Divider A

# SAMA5D2 Series

## Power Management Controller (PMC)

Value	Name	Description
0	0	PLLA is disabled.
1	BYPASS	Divider is bypassed and the PLL input entry is Main clock (MAINCK).

### 32.22.11 PMC Master Clock Register

**Name:** PMC\_MCKR  
**Offset:** 0x0030  
**Reset:** 0x00000001  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24	
								H32MXDIV	
Access								R/W	
Reset								0

Access	R/W		R/W			R/W		R/W	
Reset	0		0			0		1	

#### Bit 24 – H32MXDIV AHB 32-bit Matrix Divisor

Value	Name	Description
0	H32MXDIV1	The AHB 32-bit Matrix frequency is equal to the AHB 64-bit Matrix frequency. It is possible only if the AHB 64-bit Matrix frequency does not exceed 83 MHz.
1	H32MXDIV2	The AHB 32-bit Matrix frequency is equal to the AHB 64-bit Matrix frequency divided by 2.

#### Bit 12 – PLLADIV2 PLLA Divisor by 2

Bit PLLADIV2 must always be set to 1 when MDIV is set to 3.

#### Bits 9:8 – MDIV[1:0] Master Clock Division

Value	Name	Description
0	EQ_PCK	Master Clock is Prescaler Output Clock divided by 1.  <b>Warning: DDRCK is not available.</b>
1	PCK_DIV2	Master Clock is Prescaler Output Clock divided by 2. DDRCK is equal to MCK.
2	PCK_DIV4	Master Clock is Prescaler Output Clock divided by 4. DDRCK is equal to MCK.
3	PCK_DIV3	Master Clock is Prescaler Output Clock divided by 3. DDRCK is equal to MCK.

# SAMA5D2 Series

## Power Management Controller (PMC)

### Bits 6:4 – PRES[2:0] Master/Processor Clock Prescaler

Value	Name	Description
0	CLOCK	Selected clock
1	CLOCK_DIV2	Selected clock divided by 2
2	CLOCK_DIV4	Selected clock divided by 4
3	CLOCK_DIV8	Selected clock divided by 8
4	CLOCK_DIV16	Selected clock divided by 16
5	CLOCK_DIV32	Selected clock divided by 32
6	CLOCK_DIV64	Selected clock divided by 64
7	–	Reserved

### Bits 1:0 – CSS[1:0] Master/Processor Clock Source Selection

Value	Name	Description
0	SLOW_CLK	Slow clock is selected
1	MAIN_CLK	Main clock is selected
2	PLLA_CLK	PLLACK is selected
3	UPLL_CLK	UPLL Clock is selected

### 32.22.12 PMC USB Clock Register

**Name:** PMC\_USB  
**Offset:** 0x0038  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Bit	7	6	5	4	3	2	1	0
								USBS
Access								R/W
Reset								0

**Bits 11:8 – USBDIV[3:0]** Divider for USB OHCI Clock  
 USB Clock is Input clock divided by USBDIV + 1.

**Bit 0 – USBS** USB OHCI Input Clock Selection

Value	Description
0	USB Clock Input is PLLA.
1	USB Clock Input is UPLL.

### 32.22.13 PMC Programmable Clock Register

**Name:** PMC\_PCKx  
**Offset:** 0x40 + x\*0x04 [x=0..2]  
**Reset:** 0x00000000  
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	0	0		0	0	0

**Bits 11:4 – PRES[7:0]** Programmable Clock Prescaler  
 Programmable Clock Frequency = Selected Clock Frequency / (PRES + 1)

Value	Name	Description
0	CLOCK	Selected clock
1	CLOCK_DIV2	Selected clock divided by 2
2	CLOCK_DIV4	Selected clock divided by 4
3	CLOCK_DIV8	Selected clock divided by 8
4	CLOCK_DIV16	Selected clock divided by 16
5	CLOCK_DIV32	Selected clock divided by 32
6	CLOCK_DIV64	Selected clock divided by 64
7	–	Reserved

**Bits 2:0 – CSS[2:0]** Master Clock Source Selection

Value	Name	Description
0	SLOW_CLK	Slow clock is selected.
1	MAIN_CLK	Main clock is selected.
2	PLLA_CLK	PLLACK is selected.
3	UPLL_CLK	UPLL clock is selected.

# SAMA5D2 Series

## Power Management Controller (PMC)

Value	Name	Description
4	MCK_CLK	Master clock is selected.
5	AUDIO_CLK	Audio PLL clock is selected.

### 32.22.14 PMC Interrupt Enable Register

**Name:** PMC\_IER  
**Offset:** 0x0060  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16

Bit	7	6	5	4	3	2	1	0	
		LOCKU			MCKRDY		LOCKA	MOSCXTS	
Access		W			W		W	W	
Reset		–			–		–	–	

**Bit 18 – CFDEV** Clock Failure Detector Event Interrupt Enable

**Bit 17 – MOSCRCS** 12 MHz RC Oscillator Status Interrupt Enable

**Bit 16 – MOSCSELS** Main Clock Source Oscillator Selection Status Interrupt Enable

**Bits 10:8 – PCKRDYx[2:0]** Programmable Clock Ready x Interrupt Enable

**Bit 6 – LOCKU** UTMI PLL Lock Interrupt Enable

**Bit 3 – MCKRDY** Master Clock Ready Interrupt Enable

**Bit 1 – LOCKA** PLLA Lock Interrupt Enable

**Bit 0 – MOSCXTS** 8 to 24 MHz Crystal Oscillator Status Interrupt Enable

### 32.22.15 PMC Interrupt Disable Register

**Name:** PMC\_IDR  
**Offset:** 0x0064  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Disables the corresponding interrupt

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16

		LOCKU			MCKRDY		LOCKA	MOSCXTS	
Access		W			W		W	W	
Reset		–			–		–	–	

**Bit 18 – CFDEV** Clock Failure Detector Event Interrupt Disable

**Bit 17 – MOSCRCS** 12 MHz RC Oscillator Status Interrupt Disable

**Bit 16 – MOSCSELS** Main Oscillator Clock Source Selection Status Interrupt Disable

**Bits 10:8 – PCKRDYx[2:0]** Programmable Clock Ready x Interrupt Disable

**Bit 6 – LOCKU** UTMI PLL Lock Interrupt Enable

**Bit 3 – MCKRDY** Master Clock Ready Interrupt Disable

**Bit 1 – LOCKA** PLLA Lock Interrupt Disable

**Bit 0 – MOSCXTS** 8 to 24 MHz Crystal Oscillator Status Interrupt Disable

### 32.22.16 PMC Status Register

**Name:** PMC\_SR  
**Offset:** 0x0068  
**Reset:** 0x00010008  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
								GCKRDY
Access								R
Reset								0
Bit	23	22	21	20	19	18	17	16

Access	R	R			R			R
Reset	0	0			1			0

#### Bit 24 – GCKRDY Generic Clock Status

Value	Description
0	One of the generic clocks is not ready yet.
1	All generic clocks are ready.

#### Bit 20 – FOS Clock Failure Detector Fault Output Status

Value	Description
0	The fault output of the clock failure detector is inactive.
1	The fault output of the clock failure detector is active.

#### Bit 19 – CFDS Clock Failure Detector Status

Value	Description
0	A clock failure of the 8 to 24 MHz crystal oscillator is not detected.
1	A clock failure of the 8 to 24 MHz crystal oscillator is detected.

#### Bit 18 – CFDEV Clock Failure Detector Event

Value	Description
0	No clock failure detection of the 8 to 24 MHz crystal oscillator has occurred since the last read of PMC_SR.

# SAMA5D2 Series

## Power Management Controller (PMC)

Value	Description
1	At least one clock failure detection of the 8 to 24 MHz crystal oscillator has occurred since the last read of PMC_SR.

### Bit 17 – MOSCRCS 12 MHz RC Oscillator Status

Value	Description
0	12 MHz RC oscillator is not stabilized.
1	12 MHz RC oscillator is stabilized.

### Bit 16 – MOSCSELS Main Oscillator Selection Status

Value	Description
0	Selection is in progress.
1	Selection is done.

### Bits 10:8 – PCKRDYx[2:0] Programmable Clock Ready Status

Value	Description
0	Programmable Clock x is not ready.
1	Programmable Clock x is ready.

### Bit 7 – OSCSELS Slow Clock Oscillator Selection

Value	Description
0	Embedded 64 kHz RC oscillator is selected.
1	32.768 kHz crystal oscillator is selected.

### Bit 6 – LOCKU UPLL Clock Status

Value	Description
0	UPLL Clock is not ready.
1	UPLL Clock is ready.

### Bit 3 – MCKRDY Master Clock Status

Value	Description
0	Master Clock is not ready.
1	Master Clock is ready.

### Bit 1 – LOCKA PLLA Lock Status

Value	Description
0	PLLA is not locked.
1	PLLA is locked.

### Bit 0 – MOSCXTS 8 to 24 MHz Crystal Oscillator Status

Value	Description
0	8 to 24 MHz crystal oscillator is not stabilized.
1	8 to 24 MHz crystal oscillator is stabilized.

### 32.22.17 PMC Interrupt Mask Register

**Name:** PMC\_IMR  
**Offset:** 0x006C  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: Corresponding interrupt is not enabled.

1: Corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24	
	[Greyed out bits 31-24]								
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
	[Greyed out bits 23-19]					CFDEV	MOSCRCS	MOSCSELS	
Access						R	R	R	
Reset						0	0	0	
Bit	15	14	13	12	11	10	9	8	
	[Greyed out bits 15-11]					PCKRDYx[2:0]			
Access						R	R	R	
Reset						0	0	0	
Bit	7	6	5	4	3	2	1	0	
	[Greyed out bits 7-4]				MCKRDY	[Greyed out bits 2-1]		LOCKA	MOSCXTS
Access					R			R	R
Reset					0			0	0

**Bit 18 – CFDEV** Clock Failure Detector Event Interrupt Mask

**Bit 17 – MOSCRCS** 12 MHz RC Oscillator Status Interrupt Mask

**Bit 16 – MOSCSELS** Main Oscillator Clock Source Selection Status Interrupt Mask

**Bits 10:8 – PCKRDYx[2:0]** Programmable Clock Ready x Interrupt Mask

**Bit 3 – MCKRDY** Master Clock Ready Interrupt Mask

**Bit 1 – LOCKA** PLLA Lock Interrupt Mask

**Bit 0 – MOSCXTS** 8 to 24 MHz Crystal Oscillator Status Interrupt Mask

### 32.22.18 PMC Fast Startup Polarity Register

**Name:** PMC\_FSPR  
**Offset:** 0x0074  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
						FSTP10	FSTP9	FSTP8
Access						R/W	R/W	R/W
Reset						0	0	0
Bit	7	6	5	4	3	2	1	0
	FSTP7	FSTP6	FSTP5	FSTP4	FSTP3	FSTP2	FSTP1	FSTP0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bit 10 – FSTP10** GMAC Wake-up On LAN Polarity for Fast Start-up  
 If PMC\_FSMR.FSTT10 = 1, FSTP10 must be written to 1.

**Bits 2, 3, 4, 5, 6, 7, 8, 9 – FSTPx** PIOBU0–7 Pin Polarity for Fast Start-up  
 Defines the active polarity of the corresponding PIOBUx input. If the corresponding wake-up input is enabled and at the FSTP level, it enables a fast restart signal.

**Bit 1 – FSTP1** Security Module Polarity for Fast Start-up  
 If PMC\_FSMR.FSTT1 = 1, FSTP1 must be written to 1.

**Bit 0 – FSTP0** WKUP Pin Polarity for Fast Start-up  
 Defines the active polarity of the wake-up input. If the wake-up input is enabled and at the FSTP level, it enables a fast restart signal.

### 32.22.19 PMC Fast Start-up Mode Register

**Name:** PMC\_FSMR  
**Offset:** 0x0070  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24	
							ACC_CE	RXLP_MCE	
Access							R/W	R/W	
Reset							0	0	
Bit	23	22	21	20	19	18	17	16	
				LPM	SDMMC_CD	USBAL	RTCAL		
Access				R/W	R/W	R/W	R/W		
Reset				0	0	0	0		
Bit	15	14	13	12	11	10	9	8	
							FSTT10	FSTT9	FSTT8
Access							R/W	R/W	R/W
Reset							0	0	0
Bit	7	6	5	4	3	2	1	0	
	FSTT7	FSTT6	FSTT5	FSTT4	FSTT3	FSTT2	FSTT1	FSTT0	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	0	

#### Bit 25 – ACC\_CE Fast Start-up from Analog Comparator Controller Comparison Enable

Value	Description
0	The ACC (Analog Comparator Controller) comparison has no effect on the PMC.
1	The ACC (Analog Comparator Controller) comparison can trigger a fast restart signal to the PMC.

#### Bit 24 – RXLP\_MCE Fast Start-up from Backup UART Receive Match Condition Enable

Value	Description
0	The matching condition on the RXLP has no effect on the PMC.
1	The matching condition on the RXLP can trigger a fast restart signal to the PMC.

#### Bit 20 – LPM Low-power Mode

Value	Description
0	The WaitForInterrupt (WFI) or the WaitForEvent (WFE) instruction of the processor instructs the processor to enter Idle mode.
1	The WaitForEvent (WFE) instruction of the processor instructs the system to enter ULP mode 1.

**Bit 19 – SDMMC\_CD** Fast Start-up from SDMMC Card Detect Enable

Value	Description
0	The SDMMC card detect has no effect on the PMC.
1	The SDMMC card detect can trigger a fast restart signal to the PMC.

**Bit 18 – USBAL** Fast Start-up from USB Resume Enable

Value	Description
0	The USB resume has no effect on the PMC.
1	The USB resume can trigger a fast restart signal to the PMC.

**Bit 17 – RTCAL** Fast Start-up from RTC Alarm Enable

Value	Description
0	The RTC alarm has no effect on the PMC.
1	The RTC alarm can trigger a fast restart signal to the PMC.

**Bit 10 – FSTT10** Fast Start-up from GMAC Wake-up On LAN Enable

Value	Description
0	The GMAC_WOL input has no effect on the PMC.
1	The GMAC_WOL input can trigger a fast restart signal to the PMC.

**Bits 2, 3, 4, 5, 6, 7, 8, 9 – FSTTx** Fast Start-up from PIOBU0–7 Input Enable

Value	Description
0	The corresponding PIOBUx input has no effect on the PMC.
1	The corresponding PIOBUx input can trigger a fast restart signal to the PMC.

**Bit 1 – FSTT1** Fast Start-up from Security Module Enable

Value	Description
0	The SECUMOD has no effect on the PMC.
1	The SECUMOD can trigger a fast restart signal to the PMC.

**Bit 0 – FSTT0** Fast Start-up from WKUP Pin Enable

Value	Description
0	The wake-up input (WKUP) has no effect on the PMC.
1	The wake-up input (WKUP) can trigger a fast restart signal to the PMC.

### 32.22.20 PMC Fault Output Clear Register

**Name:** PMC\_FOCR  
**Offset:** 0x0078  
**Reset:** –  
**Property:** Write-only

**Bit 0 – FOCLR** Fault Output Clear  
 Clears the clock failure detector fault output.

### 32.22.21 PLL Charge Pump Current Register

**Name:** PMC\_PLLICPR  
**Offset:** 0x0080  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
							IVCO_PLLU[1:0]	
Access							R/W	R/W
Reset							0	0
Bit	23	22	21	20	19	18	17	16
							ICP_PLLU[1:0]	
Access							R/W	R/W
Reset							0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
							ICP_PLLA[1:0]	
Access							R/W	R/W
Reset							0	0

**Bits 25:24 – IVCO\_PLLU[1:0]** Voltage Control Output Current PLL UTMI  
Should be written to 0.

**Bits 17:16 – ICP\_PLLU[1:0]** Charge Pump Current PLL UTMI  
Should be written to 0.

**Bits 1:0 – ICP\_PLLA[1:0]** Charge Pump Current  
To optimize clock performance, this field must be programmed as specified in “PLL A Characteristics” in the Electrical Characteristics section.

### 32.22.22 PMC Write Protection Mode Register

**Name:** PMC\_WPMR  
**Offset:** 0x00E4  
**Reset:** 0x00000000  
**Property:** Read/Write

	Bit	31	30	29	28	27	26	25	24
		WPKEY[23:16]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		WPKEY[15:8]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		WPKEY[7:0]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		WPEN							
Access									R/W
Reset									0

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x504D43	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit.
3		Always reads as 0.

#### Bit 0 – WPEN Write Protection Enable

See [Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x504D43 (“PMC” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x504D43 (“PMC” in ASCII).

### 32.22.23 PMC Write Protection Status Register

**Name:** PMC\_WPSR  
**Offset:** 0x00E8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	[Greyed out bits]							WPVS
Access								R
Reset								0

**Bits 23:8 – WPVSR[15:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of PMC_WPSR.
1	A write protection violation has occurred since the last read of PMC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

### 32.22.24 PMC Peripheral Clock Enable Register 1

**Name:** PMC\_PCER1  
**Offset:** 0x0100  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	PID63	PID62	PID61	PID60	PID59	PID58	PID57	PID56
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	PID55	PID54	PID53	PID52	PID51	PID50	PID49	PID48
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	PID39	PID38	PID37	PID36	PID35	PID34	PID33	PID32
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – PIDx** Peripheral Clock x Enable

PID32 to PID63 refer to identifiers as defined in the section “Peripheral Identifiers”. Programming the control bits of the Peripheral ID that are not implemented has no effect on the behavior of the PMC.

Value	Description
0	No effect.
1	Enables the corresponding peripheral clock.

### 32.22.25 PMC Peripheral Clock Disable Register 1

**Name:** PMC\_PCDR1  
**Offset:** 0x0104  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	PID63	PID62	PID61	PID60	PID59	PID58	PID57	PID56
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	PID39	PID38	PID37	PID36	PID35	PID34	PID33	PID32
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – PID<sub>x</sub> Peripheral Clock x Disable**

PID32 to PID63 refer to identifiers as defined in the section “Peripheral Identifiers”.

Value	Description
0	No effect.
1	Disables the corresponding peripheral clock.

### 32.22.26 PMC Peripheral Clock Status Register 1

**Name:** PMC\_PCSR1  
**Offset:** 0x0108  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	PID63	PID62	PID61	PID60	PID59	PID58	PID57	PID56
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	PID55	PID54	PID53	PID52	PID51	PID50	PID49	PID48
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	PID39	PID38	PID37	PID36	PID35	PID34	PID33	PID32
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – PIDx** Peripheral Clock x Status  
 PID32 to PID63 refer to identifiers as defined in the section “Peripheral Identifiers”.

Value	Description
0	The corresponding peripheral clock is disabled.
1	The corresponding peripheral clock is enabled.

### 32.22.27 PMC Peripheral Control Register

**Name:** PMC\_PCR  
**Offset:** 0x010C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
			GCKEN	EN	GCKDIV[7:4]			
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	GCKDIV[3:0]

Reset	0	0	0	0				
Bit	15	14	13	12	11	10	9	8
				CMD		GCKCSS[2:0]		
Access				R/W		R/W	R/W	R/W
Reset				0		0	0	0
Bit	7	6	5	4	3	2	1	0
		PID[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

#### Bit 29 – GCKEN Generic Clock Enable

Value	Description
0	The selected generic clock is disabled.
1	The selected generic clock is enabled.

#### Bit 28 – EN Enable

Value	Description
0	The selected peripheral clock is disabled.
1	The selected peripheral clock is enabled.

#### Bits 27:20 – GCKDIV[7:0] Generic Clock Division Ratio

Generic clock is: selected clock period divided by GCKDIV + 1. GCKDIV must not be changed while the peripheral selects GCLK (e.g., bit rate, etc.).

#### Bit 12 – CMD Command

Value	Description
0	Read mode
1	Write mode

# SAMA5D2 Series

## Power Management Controller (PMC)

---

---

### Bits 10:8 – GCKCSS[2:0] Generic Clock Source Selection

Value	Name	Description
0	SLOW_CLK	Slow clock is selected.
1	MAIN_CLK	Main clock is selected.
2	PLLA_CLK	PLLACK is selected.
3	UPLL_CLK	UPLL Clock is selected.
4	MCK_CLK	Master Clock is selected.
5	AUDIO_CLK	Audio PLL clock is selected.

### Bits 6:0 – PID[6:0] Peripheral ID

Peripheral ID selection from PID2 to the maximum PID number. This refers to identifiers as defined in the section “Peripheral Identifiers”.

### 32.22.28 PMC Oscillator Calibration Register

**Name:** PMC\_OCR  
**Offset:** 0x0110  
**Reset:** 0x00404040  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	1	0	0	0	0	0	0

**Bit 7 – SEL** Selection of RC Oscillator Calibration Bits

Value	Description
0	Factory determined value.
1	Value written by user in CAL field of this register.

**Bits 6:0 – CAL[6:0]** 12 MHz RC Oscillator Calibration Bits  
 Calibration bits applied to the RC oscillator when SEL is set.

### 32.22.29 PMC SleepWalking Enable Register 0

**Name:** PMC\_SLPWK\_ER0  
**Offset:** 0x0114  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

	Bit	31	30	29	28	27	26	25	24
			PID30	PID29	PID28	PID27	PID26	PID25	PID24
Access			W	W	W	W	W	W	W

	Bit	7	6	5	4	3	2	1	0
Access									
Reset									

**Bits 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30 – PIDx** Peripheral x SleepWalking Enable

Not all PIDs can be configured with asynchronous partial wake-up.

Only the following PIDs can be configured with asynchronous partial wake-up: FLEXCOMx, SPIx, TWI<sub>x</sub>, UART<sub>x</sub> and ADC.

The clock of the peripheral must be enabled before using its asynchronous partial wake-up (SleepWalking) function (its associated PID<sub>x</sub> field in ISCK: ISC Clock Status or PMC Peripheral Clock Status Register 1 is set to '1').

The values for PID<sub>x</sub> are defined in section “Peripheral Identifiers”.

Value	Description
0	No effect.
1	The asynchronous partial wake-up (SleepWalking) function of the corresponding peripheral is enabled.

### 32.22.30 PMC SleepWalking Disable Register 0

**Name:** PMC\_SLPWK\_DR0  
**Offset:** 0x0118  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
		PID30	PID29	PID28	PID27	PID26	PID25	PID24

Reset								

**Bits 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30 – PIDx** Peripheral x SleepWalking Disable

Not all PIDs can be configured with asynchronous partial wake-up.

Only the following PIDs can be configured with asynchronous partial wake-up: FLEXCOMx, SPIx, TWI<sub>x</sub>, UART<sub>x</sub> and ADC.

The values for PID<sub>x</sub> are defined in the section “Peripheral Identifiers”.

Value	Description
0	No effect.
1	The asynchronous partial wake-up (SleepWalking) function of the corresponding peripheral is disabled.

### 32.22.31 PMC SleepWalking Status Register 0

**Name:** PMC\_SLPWK\_SR0  
**Offset:** 0x011C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
		PID30	PID29	PID28	PID27	PID26	PID25	PID24
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0

Reset								

**Bits 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30 – PIDx Peripheral x SleepWalking Status**

Not all PIDs can be configured with asynchronous partial wake-up.

Only the following PIDs can be configured with asynchronous partial wake-up: FLEXCOMx, SPIx, TWIx, UARTx and ADC.

The values for PIDx are defined in the section “Peripheral Identifiers”.

Value	Description
0	The asynchronous partial wake-up (SleepWalking) function of the peripheral is currently disabled or the peripheral enabled for asynchronous partial wake-up (SleepWalking) cleared the PIDx bit upon detection of a wake-up condition.
1	The asynchronous partial wake-up (SleepWalking) function of the peripheral is currently enabled.

### 32.22.32 PMC SleepWalking Activity Status Register 0

**Name:** PMC\_SLPWK\_ASRO  
**Offset:** 0x0120  
**Reset:** –  
**Property:** Read-Only

Bit	31	30	29	28	27	26	25	24
		PID30	PID29	PID28	PID27	PID26	PID25	PID24
Access		R	R	R	R	R	R	R
Reset		–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16

Access								
Reset								

**Bits 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30 – PIDx Peripheral x Activity Status**

Only the following PIDs can be configured with asynchronous partial wake-up: FLEXCOMx, SPIx, TWIx, UARTx and ADC.

All other PIDs are always read at 0.

The values for PIDx are defined in the section “Peripheral Identifiers”.

Value	Description
0	The peripheral x is not presently active. The asynchronous partial wake-up (SleepWalking) function can be activated.
1	The peripheral x is presently active. The asynchronous partial wake-up (SleepWalking) function must not be activated.

### 32.22.33 PMC SleepWalking Enable Register 1

**Name:** PMC\_SLPWK\_ER1  
**Offset:** 0x0134  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Not all PIDs can be configured with asynchronous partial wake-up.

Only the following PIDs can be configured with asynchronous partial wake-up: FLEXCOMx, SPIx, TWIx, UARTx and ADC.

The clock of the peripheral must be enabled before using its asynchronous partial wake-up (SleepWalking) function (the associated PIDx field in PMC Peripheral Clock Status Register 1 or ISCKK: ISC Clock Status is set to '1').

The values for PIDx are defined in the section “Peripheral Identifiers”.

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: The asynchronous partial wake-up (SleepWalking) function of the corresponding peripheral is enabled.

Bit	31	30	29	28	27	26	25	24	
Access									
Reset

**Bit 8 – PID40** Peripheral 40 SleepWalking Enable

**Bits 1, 2 – PIDx** Peripherals 33, 34 SleepWalking Enable

### 32.22.34 PMC SleepWalking Disable Register 1

**Name:** PMC\_SLPWK\_DR1  
**Offset:** 0x0138  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Not all PIDs can be configured with asynchronous partial wake-up.

Only the following PIDs can be configured with asynchronous partial wake-up: FLEXCOMx, SPIx, TWIx, UARTx and ADC.

The values for PIDx are defined in the section “Peripheral Identifiers”.

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: The asynchronous partial wake-up (SleepWalking) function of the corresponding peripheral is disabled.

Bit	31	30	29	28	27	26	25	24

**Bit 8 – PID40** Peripheral x SleepWalking Disable

**Bits 1, 2 – PIDx** Peripherals 33, 34 SleepWalking Disable

### 32.22.35 PMC SleepWalking Status Register 1

**Name:** PMC\_SLPWK\_SR1  
**Offset:** 0x013C  
**Reset:** 0x00000000  
**Property:** Read-only

Not all PIDs can be configured with asynchronous partial wake-up.

Only the following PIDs can be configured with asynchronous partial wake-up: FLEXCOMx, SPIx, TWIx, UARTx and ADC.

The values for PIDx are defined in the section “Peripheral Identifiers”.

The following configuration values are valid for all listed bit names of this register:

0: The asynchronous partial wake-up (SleepWalking) function of the peripheral is currently disabled or the peripheral enabled for asynchronous partial wake-up (SleepWalking) cleared the PIDx bit upon detection of a wake-up condition.

1: The asynchronous partial wake-up (SleepWalking) function of the peripheral is currently enabled.

**Bit 8 – PID40** Peripheral 40 SleepWalking Status

**Bits 1, 2 – PIDx** Peripherals 33, 34 SleepWalking Status

### 32.22.36 PMC SleepWalking Activity Status Register 1

**Name:** PMC\_SLPWK\_ASR1  
**Offset:** 0x0140  
**Reset:** –  
**Property:** Read-Only

Only the following PIDs can be configured with asynchronous partial wake-up: FLEXCOMx, SPIx, TWI<sub>x</sub>, UART<sub>x</sub> and ADC.

All other PIDs are always read at 0.

The values for PID<sub>x</sub> are defined in the section “Peripheral Identifiers”.

The following configuration values are valid for all listed bit names of this register:

0: The peripheral x is not currently active; the asynchronous partial wake-up (SleepWalking) function can be activated.

1: The peripheral x is currently active; the asynchronous partial wake-up (SleepWalking) function must not be activated.

**Bit 8 – PID40** Peripheral 40 Activity Status

**Bits 1, 2 – PID<sub>x</sub>** Peripherals 33, 34 Activity Status

### 32.22.37 PMC SleepWalking Activity In Progress Register

**Name:** PMC\_SLPWK\_AIPR  
**Offset:** 0x0144  
**Reset:** –  
**Property:** Read-Only

**Bit 0 – AIP** Activity In Progress

Only the following PIDs can be configured with asynchronous partial wake-up: FLEXCOMx, SPIx, TWIx, UARTx and ADC.

Value	Description
0	There is no activity on peripherals. The asynchronous partial wake-up (SleepWalking) function can be activated on one or more peripherals. The device can enter ULP mode 1.
1	One or more peripherals are currently active. The device must not enter ULP mode 1 if the asynchronous partial wake-up is enabled for one of the following PIDs: FLEXCOMx, SPIx, TWIx, UARTx and ADC.

### 32.22.38 PMC SleepWalking Control Register

**Name:** PMC\_SLPWKCR  
**Offset:** 0x0148  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
				SLPWKSR				
Access				R/W

#### Bit 28 – SLPWKSr SleepWalking Status Register

Not all PIDs can be configured with asynchronous partial wake-up.

Only the following PIDs can be configured with asynchronous partial wake-up: FLEXCOMx, SPIx, TWIx, UARTx and ADC.

Value	Description
0	The asynchronous partial wake-up (SleepWalking) function of the peripheral is disabled.
1	The asynchronous partial wake-up (SleepWalking) function of the peripheral is enabled.

#### Bit 16 – ASR Activity Status Register

Not all PIDs can be configured with asynchronous partial wake-up.

Only the following PIDs can be configured with asynchronous partial wake-up: FLEXCOMx, SPIx, TWIx, UARTx and ADC.

Value	Description
0	The peripheral x is not currently active; the asynchronous partial wake-up (SleepWalking) function can be activated.
1	The peripheral x is currently active; the asynchronous partial wake-up (SleepWalking) function must not be activated.

### Bit 12 – CMD Command

Value	Description
0	Read mode
1	Write mode

### Bits 6:0 – PID[6:0] Peripheral ID

Peripheral ID selection from PID2 to the maximum PID number. This refers to identifiers as defined in the section “Peripheral Identifiers”.

### 32.22.39 PMC Audio PLL Control Register 0

**Name:** PMC\_AUDIO\_PLL0  
**Offset:** 0x014C  
**Reset:** 0x000000D0  
**Property:** Read/Write

3	DIV3	Divide by 3

**Bits 21:0 – FRACR[21:0]** Fractional Loop Divider Setting

## 33. Parallel Input/Output Controller (PIO)

### 33.1 Description

The Parallel Input/Output Controller (PIO) manages up to 128 fully programmable input/output lines. Each I/O line may be dedicated as a general purpose I/O or be assigned to a function of an embedded peripheral. This ensures effective optimization of the pins of the product.

Each I/O line of the PIO Controller features:

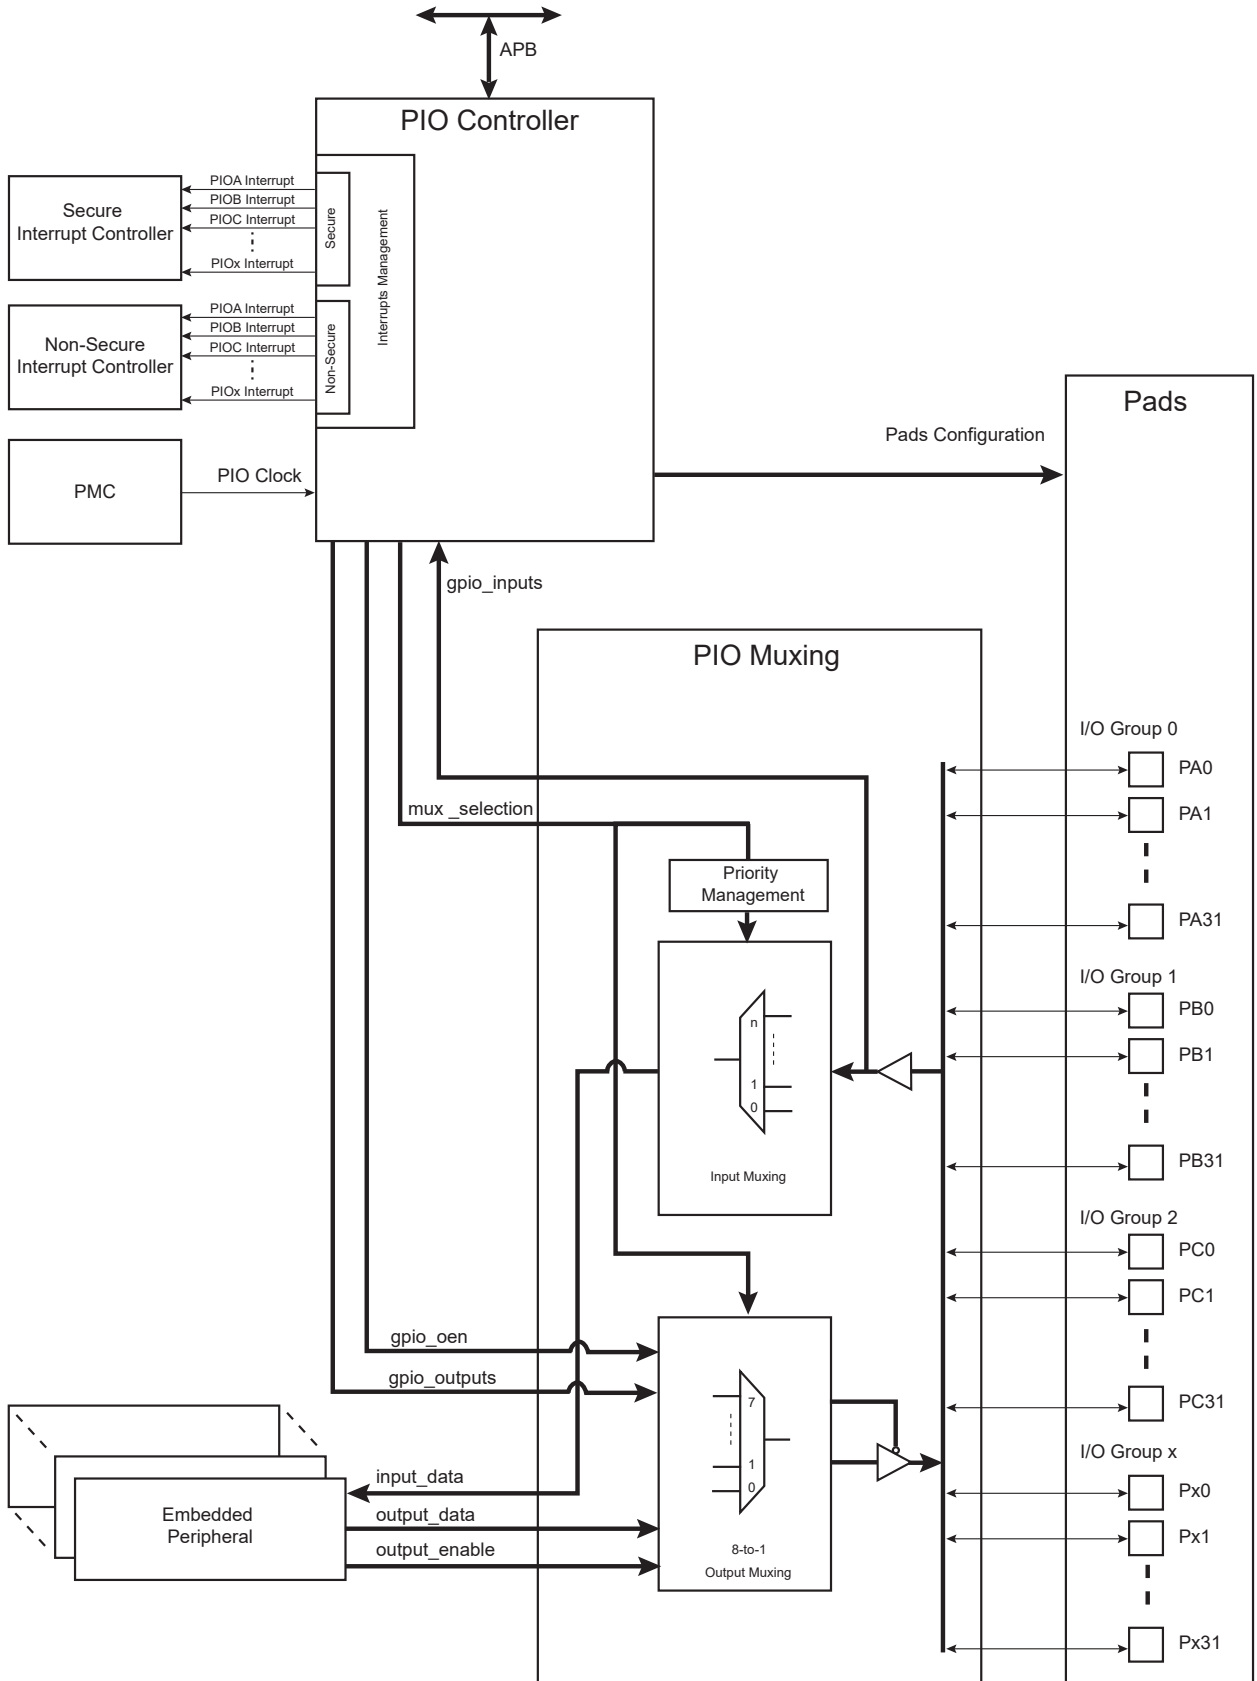

- An input change interrupt enabling level change detection on any I/O line
- Rising edge, falling edge, both edge, low-level or high-level detection on any I/O line
- A glitch filter providing rejection of glitches lower than one-half of PIO clock cycle
- A debouncing filter providing rejection of unwanted pulses from key or push button operations
- Multi-drive capability similar to an open drain I/O line
- Control of the pull-up and pull-down of the I/O line
- Input visibility and output control
- Secure or Non-Secure management of the I/O line

The PIO Controller also features a synchronous output providing up to 32 bits of data output in a single write operation.

### 33.2 Embedded Characteristics

- Up to 128 Programmable I/O Lines
- Multiplexing of up to 6 Peripheral Functions per I/O Line
- For each I/O Line (whether assigned to a peripheral or used as general purpose I/O):
  - Input Change Interrupt
  - Programmable Glitch Filter
  - Programmable Debouncing Filter
  - Multi-drive Option Enables Driving in Open Drain
  - Programmable Pull-Up/Pull-Down on Each I/O Line
  - Pin Data Status Register, Supplies Visibility of the Level on the Pin at Any Time
  - Programmable Event: Rising Edge, Falling Edge, Both edge, Low-Level or High-Level
  - Configuration Lock by the Connected Peripheral
  - Security management of each I/O line
  - Programmable Configuration Lock (Active Until Next  $V_{DDCORE}$  Reset) to protect Against Further Software Modifications (intentional or unintentional)
- Register Write Protection against unintentional software modifications:
  - One configuration bit to enable or disable protection of I/O line settings
  - One configuration bit to enable or disable protection of interrupt settings
- Synchronous Output, possibility to set or clear simultaneously up to 32 I/O Lines in a Single Write
- Programmable Schmitt Trigger Inputs
- Programmable I/O Drive

**33.3 Block Diagram**  
**Figure 33-1. Block Diagram**

**Note:**

1.  $x = 3$  (the number of I/O groups is 4).
2.  $n$  depends on the number of I/O lines affected to the IP input.

## **33.4 Product Dependencies**

### **33.4.1 Pin Multiplexing**

Each pin is configurable, depending on the product, as either a general purpose I/O line only, or as an I/O line multiplexed with up to 6 peripheral I/Os. As the multiplexing is hardware defined and thus product-dependent, the hardware designer and programmer must carefully determine the configuration of the PIO Controllers required by their application. When an I/O line is general purpose only, i.e., not multiplexed with any peripheral I/O, programming of the PIO Controller regarding the assignment to a peripheral has no effect and only the PIO Controller can control how the pin is driven by the product.

### **33.4.2 External Interrupt Lines**

The interrupt signals FIQ and IRQ0 to IRQn are multiplexed through the PIO Controllers.

### **33.4.3 Power Management**

The Power Management Controller (PMC) controls the PIO Controller clock in order to save power. Writing any of the registers of the user interface does not require the PIO Controller clock to be enabled. This means that the configuration of the I/O lines does not require the PIO Controller clock to be enabled.

However, when the clock is disabled, not all of the features of the PIO Controller are available, including glitch filtering. Note that the input change interrupt, the interrupt modes on a programmable event and the read of the pin level require the clock to be validated.

After a hardware reset, the PIO clock is disabled by default.

The user must configure the PMC before any access to the input line information.

### **33.4.4 Interrupt Generation**

For interrupt handling, the PIO Controllers are considered as user peripherals. This means that the PIO Controller interrupt lines are connected among the interrupt sources. The PIO Controller supplies one interrupt signal per I/O group. Refer to the PIO Controller peripheral identifier in the product description to identify the interrupt sources dedicated to the PIO Controller. The PIO Controller can target either the Secure or Non-Secure Interrupt Controller according to security level of the I/O line which triggers the interruption. Using the PIO Controller requires the Interrupt Controller to be programmed first.

The PIO Controller interrupt can be generated only if the PIO Controller clock is enabled.

## **33.5 Functional Description**

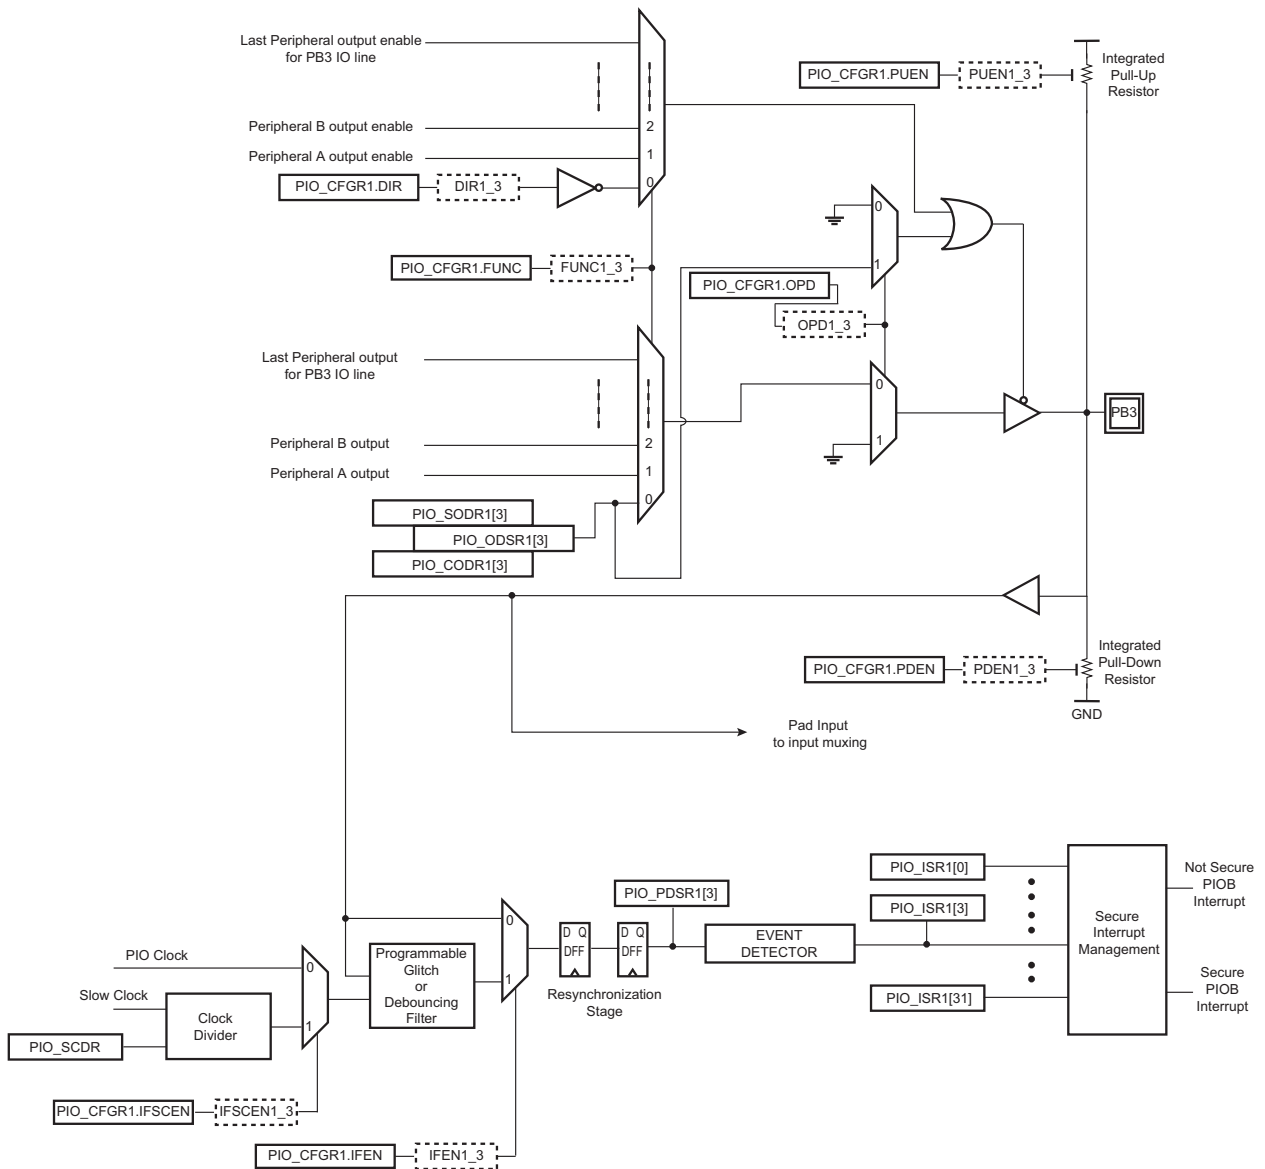

The PIO Controller features up to 512 fully-programmable I/O lines. Most of the control logic associated to each I/O is represented in the following figure, where the I/O line 3 of the PIOB (PB3) is described as an example. In this description each signal shown represents one of up to 512 possible indexes.

# SAMA5D2 Series

## Parallel Input/Output Controller (PIO)

**Figure 33-2. I/O Line Control Logic**

### 33.5.1 I/O Line Configuration Method

The user interface of the PIO Controller provides several sets of registers. Each set of registers interfaces with one I/O group.

**Table 33-1. I/O Group List**

I/O Group Number	PIO
0	PIOA
1	PIOB
...	...
3	PIOD

### 33.5.1.1 Security Management

The user must first define the security level of the I/O line. Each I/O line of each I/O group can be defined as either secure or non-secure lines. Each I/O line of the I/O group x can be set as non-secure I/O line by writing a 1 to the corresponding bit P0–P31 of the Secure PIO Set I/O Non-Secure register (S\_PIO\_SIONRx) of the I/O group x.

To define an I/O line of I/O group x as a secure I/O line, write a 1 to the corresponding bit P0–P31 of the Secure PIO Set I/O Secure register (S\_PIO\_SIOSRx) of the I/O group x.

Examples:

Setting the I/O line PC4 as non-secure line:

Write the value 16 (bit No. 4 at 1) at address 0x10B0 (S\_PIO\_SIONR2)

Setting the I/O line PB3 as secure line:

Write the value 8 (bit No. 3 at 1) at address 0x1074 (S\_PIO\_SIOSR1)

The security level of each I/O line is reported by the Secure PIO I/O Security Status register (S\_PIO\_IOSSRx) of the corresponding I/O group. Reading 0 at the corresponding bit P0–P31 means that the corresponding I/O line of the I/O group is defined as secure. Reading 1 means that this I/O line of the I/O group is non-secure.

The PIO Controller user interface is divided into two register mapping areas:

- The Non-Secure area, located from address 0x0 to 0x1000, can be accessed by any master (Secure or Non-Secure master). This area interfaces with all the I/O lines defined as non-secure. Trying to access to an I/O line defined as secure through this area will have no effect on I/O line and read values will be 0.
- The Secure area, located above address 0xSEC\_GRP\_MSB000, can only be accessed by a Secure master (if the PIO Controller is defined as secure at the HMATRIX level). This area interfaces with all the I/O lines defined as secure. Trying to access to an I/O line defined as non-secure through this area will have no effect on I/O line and read values will be 0.

### 33.5.1.2 Programming I/O Line Configuration

The user must first define which I/O line in the group will be targeted by writing a 1 to the corresponding bit in the [PIO Mask Register](#) (PIO\_MSKRx). Several I/O lines in an I/O group can be configured at the same time by setting the corresponding bits in PIO\_MSKRx. Then, writing the [PIO Configuration Register](#) (PIO\_CFGRx) apply the configuration to the I/O line(s) defined in PIO\_MSKRx. All the I/O lines defined as secure in the S\_PIO\_SIOSRx must be configured by writing the S\_PIO\_CFGRx and S\_PIO\_MSKRx registers.

For more details concerning the I/O line configuration using PIO\_MSKRx and PIO\_CFGRx, see section [I/O Lines Programming Example](#).

### 33.5.1.3 Reading the I/O Line Configuration

As for programming operation, reading configuration requires the user to first define which I/O line in the group x will be targeted by writing a 1 to the corresponding bit in the [PIO Mask Register](#) (PIO\_MSKRx). The value of the targeted I/O line is read in PIO\_CFGRx.

If several bits are set in PIO\_MSKRx, then the read configuration in PIO\_CFGRx is the configuration of the I/O line with the lowest index.

Note that S\_PIO\_MSKRx and S\_PIO\_CFGRx must be used to read the configuration of a secure I/O line.

### 33.5.2 Pull-up and Pull-down Resistor Control

Each I/O line is designed with an embedded pull-up resistor and an embedded pull-down resistor.

The pull-up resistor on the I/O line(s) defined in PIO\_MSKRx can be enabled by setting the PUEN bit in PIO\_CFGRx. Clearing the PUEN bit in PIO\_CFGRx disables the pull-up resistor of I/O lines defined in PIO\_MSKRx.

The pull-down resistor on the I/O line(s) defined in PIO\_MSKRx can be enabled by setting the PDEN bit in PIO\_CFGRx. Clearing the PDEN bit in PIO\_CFGRx disables the pull-down resistor of I/O lines defined in PIO\_MSKRx.

If both PUEN and PDEN bit are set in PIO\_CFGRx, only the pull-up resistor is enabled for I/O line(s) defined in PIO\_MSKRx and the PDEN bit is discarded.

Control of the pull-up resistor is possible regardless of the configuration of the I/O line (Input, Output, Open-drain).

Note that S\_PIO\_MSKRx and S\_PIO\_CFGRx must be used to program the pull-up or pull-down configuration of a secure I/O line.

For more details concerning Pull-up and Pull-down configuration, see [PIO Configuration Register](#) or [Secure PIO Configuration Register](#) for secure I/O line configuration.

The reset value of PUEN and PDEN bits of each I/O line is defined at the product level and depends on the multiplexing of the device.

### 33.5.3 General Purpose or Peripheral Function Selection

The PIO Controller provides multiplexing of up to 6 peripheral functions on a single pin. The selection is performed by writing the FUNC field in PIO\_CFGRx. The selected function is applied to the I/O line(s) defined in PIO\_MSKRx.

When FUNC is 0, no peripheral is selected and the General Purpose PIO (GPIO) mode is selected (in this mode, the I/O line is controlled by the PIO Controller).

When FUNC is not 0, the peripheral selected to control the I/O line depends on the FUNC value.

Note that S\_PIO\_MSKRx and S\_PIO\_CFGRx must be used to program the FUNC field of a secure I/O line.

For more details, see [PIO Configuration Register](#) or [Secure PIO Configuration Register](#) for secure I/O line configuration.

Note that multiplexing of peripheral lines affects both input and output peripheral lines. When a peripheral is not selected on any I/O line, its inputs are assigned with constant default values defined at the product level. The user must ensure that only one I/O line is affected to a peripheral input at a time.

The reset value of the FUNC field of each I/O line is defined at the product level and depends on the multiplexing of the device.

### 33.5.4 Output Control

When the I/O line is assigned to a peripheral function, i.e., the corresponding FUNC field of the line configuration is not 0, the drive of the I/O line is controlled by the peripheral. According to the FUNC value, the selected peripheral determines whether the pin is driven or not.

When the FUNC field of a I/O line is 0, then the I/O line is set in General Purpose mode and the I/O line can be configured to be driven by the PIO Controller instead of the peripheral.

If the DIR bit of the I/O line configuration (PIO\_CFGRx) is set (OUTPUT) then the I/O line can be driven by the PIO Controller. The level driven on an I/O line can be determined by writing in the [PIO Set Output Data Register](#) (PIO\_SODRx) and the [PIO Clear Output Data Register](#) (PIO\_CODRx). These write operations, respectively, set and clear the [PIO Output Data Status Register](#) (PIO\_ODSRx), which represents the data driven on the I/O lines. Writing PIO\_ODSRx directly is possible and only affects the I/O line set to 1 in PIO\_MSKRx (see [Synchronous Data Output](#)).

When the DIR bit of the I/O line configuration is at zero, the corresponding I/O line is used as an input only.

The DIR bit has no effect if the corresponding line is assigned to a peripheral function, but writing the DIR bit is managed whether the pin is configured to be controlled by the PIO Controller or assigned to a peripheral function. This enables configuration of the I/O line prior to setting it to be managed by the PIO Controller.

Similarly, writing in PIO\_SODRx and PIO\_CODRx affects PIO\_ODSRx. This is important as it defines the first level driven on the I/O line.

### 33.5.5 Synchronous Data Output

Clearing one or more PIO line(s) and setting another one or more PIO line(s) synchronously cannot be done by using PIO\_SODRx and PIO\_CODRx. It requires two successive write operations into two different registers. To overcome this, the PIO Controller offers a direct control of PIO outputs by single write access to PIO\_ODSRx. Only I/O lines set to 1 in PIO\_MSKRx are written.

### 33.5.6 Open-Drain Mode

Each I/O can be independently programmed in Open-Drain mode. This feature permits several drivers to be connected on the I/O line which is driven low only by each device. An external pull-up resistor (or enabling of the internal one) is generally required to guarantee a high level on the line.

The Open-Drain mode is controlled by the OPD bit in the I/O line configuration (PIO\_CFGRx). An I/O line is switched in Open-Drain mode by setting the PIO\_CFGRx.OPD bit. The Open-Drain mode can be selected if the I/O line is not controlled by a peripheral (the FUNC field must be cleared in PIO\_CFGRx).

For more details concerning the Open-Drain mode, see [PIO Configuration Register](#) or [Secure PIO Configuration Register](#) for secure I/O line configuration.

After reset, the OPD bit of each I/O line is defined at the product level and depends on the multiplexing of the device.

### 33.5.7 Output Line Timings

The figure below shows how the outputs are driven either by writing PIO\_SODRx or PIO\_CODRx, or by directly writing PIO\_ODSRx. This last case is valid only if the corresponding bit in PIO\_MSKRx is set. The figure also shows when the feedback in the Pin Data Status Register (PIO\_PDSRx) is available.

**Figure 33-3. Output Line Timings**

### 33.5.8 Inputs

The level on each I/O line of the I/O group x can be read through PIO\_PDSRx. This register indicates the level of the I/O lines regardless of their configuration, whether uniquely as an input, or driven by the PIO Controller, or driven by a peripheral.

Reading the I/O line levels requires the clock of the PIO Controller to be enabled, otherwise PIO\_PDSRx reads the levels present on the I/O line at the time the clock was disabled.

### 33.5.9 Input Glitch and Debouncing Filters

Optional input glitch and debouncing filters are independently programmable on each I/O line.

The glitch filter can filter a glitch with a duration of less than 1/2 master clock (MCK) and the debouncing filter can filter a pulse of less than 1/2 period of a programmable divided slow clock.

The selection between glitch filtering or debounce filtering is done by writing the bit IFSCEN in the [PIO Configuration Register](#) (PIO\_CFGRx). The selected filtering mode is applied to the I/O line(s) defined in PIO\_MSKRx.

- If IFSCEN = 0: The glitch filter can filter a glitch with a duration of less than 1/2 master clock period.
- If IFSCEN = 1: The debouncing filter can filter a pulse with a duration of less than 1/2 programmable divided slow clock period.

For the debouncing filter, the period of the divided slow clock is performed by writing in the DIV field of the [Secure PIO Slow Clock Divider Debouncing Register](#) (S\_PIO\_SCDR):  $t_{div\_slck} = ((DIV + 1) \times 2) \times t_{slck}$ .

When the glitch or debouncing filter is enabled, a glitch or pulse with a duration of less than 1/2 selected clock cycle (selected clock represents MCK or divided slow clock depending on IFSCEN bit programming) is automatically rejected, while a pulse with a duration of one selected clock (MCK or divided slow clock) cycle or more is accepted. For pulse durations between 1/2 selected clock cycle and one selected clock cycle, the pulse may or may not be taken into account, depending on the precise timing of its occurrence. Thus for a pulse to be visible, it must exceed one selected clock cycle, whereas for a glitch to be reliably filtered out, its duration must not exceed 1/2 selected clock cycle.

The filters also introduce some latencies, illustrated in the figures below .

The glitch filter of each I/O lines is controlled by the IFEN bit of the [PIO Configuration Register](#) (PIO\_CFGRx). Setting the PIO\_CFGRx.IFEN bit enables the glitch filter of the I/O line(s) defined in PIO\_MSKRx.

When the glitch and/or debouncing filter is enabled, it does not modify the behavior of the inputs on the peripherals. It acts only on the value read in PIO\_PDSRx and on the input change interrupt detection. The glitch and debouncing filters require that the PIO Controller clock is enabled.

**Figure 33-4. Input Glitch Filter Timing**

**Figure 33-5. Input Debouncing Filter Timing**

**Note:**

1. Means IFCSEN bit of the I/O line y of the I/O group x.
2. Means PIO Data Status value of the I/O line y of the I/O group x.
3. Means IFEN bit of the I/O line y of the I/O group x.

### 33.5.10 Input Edge/Level Interrupt

Each I/O group can be programmed to generate an interrupt when it detects an edge or a level on an I/O line. The Input Edge/Level interrupts are controlled by writing the [PIO Interrupt Enable Register](#) (PIO\_IERx) and the [PIO Interrupt Disable Register](#) (PIO\_IDRx), which enable and disable the input change interrupt respectively by setting and clearing the corresponding bit in the [PIO Interrupt Mask Register](#) (PIO\_IMRx). For the Secure I/O lines, the Input Edge/Level interrupts are controlled by writing S\_PIO\_IERx and S\_PIO\_IDRx, which enable and disable input change interrupts respectively by setting and clearing the corresponding bit in the S\_PIO\_IMRx. As input change detection is possible only by comparing two successive samplings of the input of the I/O line, the PIO Controller clock must be enabled. The Input Change interrupt is available regardless of the configuration of the I/O line, i.e., configured as an input only, controlled by the PIO Controller or assigned to a peripheral function.

Each I/O group can generate a Non-Secure interrupt and a Secure interrupt according to the security level of the I/O line which triggers the interrupt.

According to the EVTSEL field value in the [PIO Configuration Register](#) (PIO\_CFGRx) or the [Secure PIO Configuration Register](#) (S\_PIO\_CFGRx) in case of a Secure I/O line, the interrupt signal of the I/O group x can be generated on the following occurrence:

- (S\_)PIO\_CFGRx.EVTSELy = 0: The interrupt signal of the I/O group x is generated on the I/O line y falling edge detection (assuming that (S\_)PIO\_IMRx[y] = 1).
- (S\_)PIO\_CFGRx.EVTSELy = 1: The interrupt signal of the I/O group x is generated on the I/O line y rising edge detection (assuming that (S\_)PIO\_IMRx[y] = 1).
- (S\_)PIO\_CFGRx.EVTSELy = 2: The interrupt signal of the I/O group x is generated on the I/O line y both rising and falling edge detection (assuming that (S\_)PIO\_IMRx[y] = 1).
- (S\_)PIO\_CFGRx.EVTSELy = 3: The interrupt signal of the I/O group x is generated on the I/O line y low level detection (assuming that (S\_)PIO\_IMRx[y] = 1).
- (S\_)PIO\_CFGRx.EVTSELy = 4: The interrupt signal of the I/O group x is generated on the I/O line y high level detection (assuming that (S\_)PIO\_IMRx[y] = 1).

By default, the interrupt can be generated at any time a falling edge is detected on the input.

When an input edge or level is detected on an I/O line, the corresponding bit in the [PIO Interrupt Status Register](#) (PIO\_ISRx), or in the [Secure PIO Interrupt Status Register](#) (S\_PIO\_ISRx) if the I/O line is Secure, is set. For a Non-Secure I/O line, if the corresponding bit in PIO\_IMRx is set, the PIO Controller Non-Secure interrupt line of the I/O group x is asserted. For a Secure I/O line, if the corresponding bit in S\_PIO\_IMRx is set, the PIO Controller Secure interrupt line of the I/O group x is asserted.

When the software reads PIO\_ISRx, all the Non-Secure interrupts of the I/O group x are automatically cleared. When the software reads S\_PIO\_ISRx, all the Secure interrupts of the I/O group x are automatically cleared. This signifies that all the interrupts that are pending when PIO\_ISRx or S\_PIO\_ISRx is read must be handled. When an Interrupt is enabled on a “level”, the interrupt is generated as long as the interrupt source is not cleared, even if some read accesses in PIO\_ISRx or S\_PIO\_ISRx are performed.

**Figure 33-6. Event Detector on Input Lines**

Example of interrupt generation on following lines:

- Rising edge on the Secure PIO line 0 of the I/O group 0 (PIOA)
- Low-level edge on the Secure PIO line 1 of the I/O group 0 (PIOA)
- Rising edge on the Secure PIO line 2 of the I/O group 0 (PIOA)
- High-level on the Secure PIO line 3 of the I/O group 0 (PIOA)
- Low-level on the Non-Secure PIO line 4 of the I/O group 0 (PIOA)
- High-level on the Secure PIO line 0 of the I/O group 1 (PIOB)
- Falling edge on the Secure PIO line 1 of the I/O group 1 (PIOB)

- Rising edge on the Secure PIO line 2 of the I/O group 1 (PIOB)
- Any edge on the other Non-Secure lines of the I/O group 1 (PIOB)

The table below details the required configuration for this example.

**Table 33-2. Configuration for Example Interrupt Generation**

Configuration	Name
PIOA: I/O line security level	Define the I/O lines 0 to 3 of the PIOA as Secure by writing 32'h0000_000F in the S_PIO_SIOSR0 (offset 0x1034) Define the I/O lines 4 of the PIOA as Non-Secure by writing 32'h0000_0010 in the S_PIO_SIONR0 (offset 0x1030)
PIOA: Interrupt Mode	Enable interrupt sources for lines 0 to 3 of PIOA by writing 32'h0000_000F in S_PIO_IER0 (offset 0x1020) Enable interrupt source for the line 4 of PIOA by writing 32'h0000_0010 in PIO_IER0 (offset 0x20)
PIOA: Event Selection	Configure Rising Edge detection for Secure lines 0 and 2: Write 32'h0000_0005 in S_PIO_MSKR0 (offset 0x1000) Write 32'h0100_0000 in S_PIO_CFGR0 (offset 0x1004)
	Configure Low Level detection for Secure line 1: Write 32'h0000_0002 in S_PIO_MSKR0 (offset 0x1000) Write 32'h0300_0000 in S_PIO_CFGR0 (offset 0x1004)
	Configure High Level detection for Secure line 3: Write 32'h0000_0008 in S_PIO_MSKR0 (offset 0x1000) Write 32'h0400_0000 in S_PIO_CFGR0 (offset 0x1004)
	Configure Low Level detection for Non-Secure line 4: Write 32'h0000_0010 in PIO_MSKR0 (offset 0x0) Write 32'h0300_0000 in PIO_CFGR0 (offset 0x4)
PIOB: I/O line security level	Define the I/O lines 0 to 2 of the PIOB as Secure by writing 32'h0000_0007 in the S_PIO_SIOSR1 (offset 0x1074) Define the other I/O lines of the PIOB as Non-Secure by writing 32'hFFFF_FFF8 in the S_PIO_SIONR1 (offset 0x1070)
PIOB: Interrupt Mode	Enable interrupt sources for lines 0 to 2 of PIOB by writing 32'h0000_0007 in S_PIO_IER1 (offset 0x1060) Enable interrupt sources for all other lines of PIOB by writing 32'hFFFF_FFF8 in PIO_IER1 (offset 0x60)

.....continued	
Configuration	Name
PIOB: Event Selection	Configure High Level detection for Secure line 0: Write 32'h0000_0001 in S_PIO_MSKR1 (offset 0x1040)  Write 32'h0400_0000 in S_PIO_CFGR1 (offset 0x1044)
	Configure Falling Edge detection for Secure line 1: Write 32'h0000_0002 in S_PIO_MSKR1 (offset 0x1040)  Write 32'h0000_0000 in S_PIO_CFGR1 (offset 0x1044)
	Configure Rising Edge detection for Secure line 2: Write 32'h0000_0004 in S_PIO_MSKR1 (offset 0x1040)  Write 32'h0100_000 in S_PIO_CFGR1 (offset 0x1044)
	Configure Low Level detection for Non-Secure lines: Write 32'hFFFF_FFF8 in PIO_MSKR1 (offset 0x40)  Write 32'h0200_000 in PIO_CFGR1 (offset 0x44)

**Figure 33-7. Input Change Interrupt Timings When No Additional Interrupt Modes**

### 33.5.11 Interrupt Management

The PIO Controller can drive one secure interrupt signal and one non-secure interrupt signal per I/O group (refer to the block diagram). Secure interrupt signals are connected to the secure interrupt controller of the system. Non-secure interrupt signals are connected to the non-secure interrupt controller of the system.

**Figure 33-8. PIO Interrupt Management**

### 33.5.12 I/O Lines Lock

When an I/O line is controlled by a peripheral (particularly the Pulse Width Modulation Controller PWM), it can become locked by the action of this peripheral via an input of the PIO Controller. When an I/O line is locked, the following fields in  $PIO\_CFGRx$  are locked and cannot be modified:

- FUNC: Peripheral selection cannot be changed when the corresponding I/O line is locked.
- PUEN: Pull-Up configuration cannot be changed when the corresponding I/O line is locked.
- PDEN: Pull-Down configuration cannot be changed when the corresponding I/O line is locked.
- OPD: Open Drain configuration cannot be changed when the corresponding I/O line is locked.

Writing to one of these fields while the corresponding I/O line is locked will have no effect.

The user can know at anytime which I/O line is locked by reading the [PIO Lock Status Register](#) ( $PIO\_LOCKSR$ ) or [Secure PIO Lock Status Register](#) ( $S\_PIO\_LOCKSR$ ) for locked Secure I/O lines. Once an I/O line is locked, the only way to unlock it is to apply a hardware reset to the PIO Controller.

### 33.5.13 Programmable I/O Drive

It is possible to configure the I/O drive for pads PA0 to PD31. The I/O drive of the pad can be programmed by writing the  $DRVSTR$  field in the [PIO Configuration Register](#) ( $PIO\_CFGRx$ ) if the corresponding line is Non-Secure or the [Secure PIO Configuration Register](#) ( $S\_PIO\_CFGRx$ ) if the I/O line is Secure. For any details, refer to the product electrical characteristics.

### 33.5.14 Programmable Schmitt Trigger

It is possible to configure each input for the Schmitt trigger. The Schmitt trigger can be enabled by setting the  $SCHMITT$  bit of the [PIO Configuration Register](#) ( $PIO\_CFGRx$ ) if the corresponding line is Non-Secure

or the [Secure PIO Configuration Register](#) (S\_PIO\_CFGRx) if the I/O line is Secure. By default the Schmitt trigger is active. Disabling the Schmitt trigger is requested when using the QTouch Library.

### 33.5.15 I/O Line Configuration Freeze

#### 33.5.15.1 Software Freeze

Once the I/O line configuration is done, it can be frozen by using the [PIO I/O Freeze Configuration Register](#) (PIO\_IOFRx) of the corresponding group or the [Secure PIO I/O Freeze Configuration Register](#) (S\_PIO\_IOFRx) if the I/O line is Secure.

##### 33.5.15.1.1 Physical Freeze

Setting the FPHY bit of PIO\_IOFRx freezes the following fields of the Non-Secure I/O lines defined in PIO\_MSKRx:

- [FUNC: I/O Line Function](#)
- [DIR: Direction](#)
- [PUEN: Pull-Up Enable](#)
- [PDEN: Pull-Down Enable](#)
- [OPD: Open-Drain](#)
- [SCHMITT: Schmitt Trigger](#)
- [DRVSTR: Drive Strength](#)

For Secure I/O lines, use the FPHY bit of the S\_PIO\_IOFRx and the S\_PIO\_MSKRx to freeze the fields above.

When the physical freeze is currently active on an I/O line, the PCFS flag is set when reading the PIO\_CFGRx of the I/O line (or the S\_PIO\_CFGRx if the I/O line is Secure).

Only a hardware reset can release fields listed above.

##### 33.5.15.1.2 Interrupt Freeze

Setting the FINT bit of the PIO\_IOFRx will freeze the following fields of the Non-Secure I/O lines defined in the PIO\_MSKRx:

- [IFEN: Input Filter Enable](#)
- [IFSCEN: Input Filter Slow Clock Enable](#)
- [EVTSEL: Event Selection](#)

For Secure I/O lines, use the FINT bit of the S\_PIO\_IOFRx and the S\_PIO\_MSKRx to freeze the fields above.

When the "Interrupt Freeze" is currently active on an I/O line, the ICFS flag is set when reading the PIO\_CFGRx of the I/O line (or the S\_PIO\_CFGRx if the I/O line is Secure).

Only a hardware reset can release fields listed above.

### 33.5.16 Register Write Protection

To prevent any single software error from corrupting PIO behavior, certain registers in the address space can be write-protected by setting WPEN in the [PIO Write Protection Mode Register](#) (PIO\_WPMR) or the [Secure PIO Write Protection Mode Register](#) (S\_PIO\_WPMR).

If a write access to a Non-Secure write-protected register is detected, the WPVS flag in the [PIO Write Protection Status Register](#) (PIO\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

If a write access to a Secure write-protected register is detected, the WPVS flag in the [Secure PIO Write Protection Status Register](#) (S\_PIO\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The respective WPVS bit is automatically cleared after reading the PIO\_WPSR or S\_PIO\_WPSR.

The following registers are write-protected when WPEN is set in PIO\_WPMR:

- [PIO Mask Register](#)
- [PIO Configuration Register](#)

The following registers are write-protected when WPEN is set in S\_PIO\_WPMR:

- [Secure PIO Mask Register](#)
- [Secure PIO Configuration Register](#)
- [Secure PIO Slow Clock Divider Debouncing Register](#)

The following registers are write-protected when WPITEN is set in S\_PIO\_WPMR:

- [Secure PIO Interrupt Enable Register](#)
- [Secure PIO Interrupt Disable Register](#)

### 33.6 I/O Lines Programming Example

The programming example shown in the table below is used to obtain the following configurations:

- PIOA Configuration:
  - 4-bit output port on Secure I/O lines 0 to 3, open-drain, with pull-up resistor
  - Four output signals on Non-Secure I/O lines 4 to 7 (to drive LEDs for example), driven high and low, no pull-up resistor, no pull-down resistor
  - Secure I/O lines 16 to 19 assigned to peripheral A functions with pull-up resistor
  - Non-Secure I/O lines 20 to 23 assigned to peripheral B functions with pull-down resistor
- PIOB Configuration:
  - Four input signals on Secure I/O lines 0 to 3 (to read push-button states for example), with pull-up resistors, glitch filters and input change interrupts
  - Four input signals on Non-Secure I/O lines 12 to 15 to read an external device status (polled, thus no input change interrupt), no pull-up resistor, no glitch filter
  - Secure I/O lines 16 to 23 assigned to peripheral B functions with pull-down resistor
  - Non-Secure I/O lines 24 to 27 assigned to peripheral D with Input Change Interrupt, no pull-up resistor and no pull-down resistor

**Table 33-3. Programming Example**

Action	Register	Value to be Written
PIOA: Set I/O lines 0 to 3 and 16 to 19 as Secure	S_PIO_SIOSR0 (offset 0x1034)	0x000F_000F
PIOA: Set I/O lines 4 to 7 and 20 to 23 as Non-Secure	S_PIO_SIONR0 (offset 0x1030)	0x00F0_00F0

### 33.7.1 PIO Mask Register

**Name:** PIO\_MSKRx  
**Offset:** 0x00 + x\*0x40 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PIO Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	MSK31	MSK30	MSK29	MSK28	MSK27	MSK26	MSK25	MSK24
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	MSK23	MSK22	MSK21	MSK20	MSK19	MSK18	MSK17	MSK16
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	MSK15	MSK14	MSK13	MSK12	MSK11	MSK10	MSK9	MSK8
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	MSK7	MSK6	MSK5	MSK4	MSK3	MSK2	MSK1	MSK0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – MSKy** PIO Line y Mask

These bits define the I/O lines to be configured when writing the [PIO Configuration Register](#).

0 (DISABLED): Writing the PIO\_CFGRx, PIO\_ODSRx or PIO\_IOFRx does not affect the corresponding I/O line configuration.

1 (ENABLED): Writing the PIO\_CFGRx, PIO\_ODSRx or PIO\_IOFRx updates the corresponding I/O line configuration.

### 33.7.2 PIO Configuration Register

**Name:** PIO\_CFGRx  
**Offset:** 0x04 + x\*0x40 [x=0..3]  
**Reset:** 0x00000200  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PIO Write Protection Mode Register](#).  
 Writing this register will only affect I/O lines enabled in the PIO\_MSKRx.

Bit	31	30	29	28	27	26	25	24
	ICFS		PCFS			EVTSEL[2:0]		
Access		R	R			R/W	R/W	R/W
Reset		0	0			0	0	0
Bit	23	22	21	20	19	18	17	16
							DRVSTR[1:0]	
Access							R/W	R/W
Reset							0	0
Bit	15	14	13	12	11	10	9	8
	SCHMITT	OPD	IFSCEN	IFEN		PDEN	PUEN	DIR
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	0	0		0	1	0
Bit	7	6	5	4	3	2	1	0
							FUNC[2:0]	
Access						R/W	R/W	R/W
Reset						0	0	0

**Bit 30 – ICFS** Interrupt Configuration Freeze Status (read-only)

This bit gives information about the freeze state of the following fields of the read I/O line configuration:

- [IFEN: Input Filter Enable](#)
- [IFSCEN: Input Filter Slow Clock Enable](#)
- [EVTSEL: Event Selection](#)

0 (NOT\_FROZEN): The fields are not frozen and can be written for this I/O line.

1 (FROZEN): The fields are frozen and cannot be written for this I/O line. Only a hardware reset can release these fields.

**Bit 29 – PCFS** Physical Configuration Freeze Status (read-only)

This bit gives information about the freeze state of the following fields of the read I/O line configuration:

- [FUNC: I/O Line Function](#)
- [DIR: Direction](#)
- [PUEN: Pull-Up Enable](#)
- [PDEN: Pull-Down Enable](#)

- [OPD: Open-Drain](#)
- [SCHMITT: Schmitt Trigger](#)
- [DRVSTR: Drive Strength](#)

0 (NOT\_FROZEN): The fields are not frozen and can be written for this I/O line.

1 (FROZEN): The fields are frozen and cannot be written for this I/O line. Only a hardware reset can release these fields.

### Bits 26:24 – EVTSEL[2:0] Event Selection

This field defines the type of event to detect on the I/O lines of the I/O group x according to the [PIO Mask Register](#).

Value	Name	Description
0	FALLING	Event detection on input falling edge
1	RISING	Event detection on input rising edge
2	BOTH	Event detection on input both edge
3	LOW	Event detection on low level input
4	HIGH	Event detection on high level input
5	–	Reserved
6	–	Reserved
7	–	Reserved

### Bits 17:16 – DRVSTR[1:0] Drive Strength

This field defines the drive strength of the I/O lines of the I/O group x according to the [PIO Mask Register](#).

Value	Name	Description
0	LO	Low drive
1	LO	Low drive
2	ME	Medium drive
3	HI	High drive

### Bit 15 – SCHMITT Schmitt Trigger

This bit defines the Schmitt trigger configuration of the I/O lines of the I/O group x according to the [PIO Mask Register](#).

0 (ENABLED): Schmitt trigger is enabled for the selected I/O lines.

1 (DISABLED): Schmitt trigger is disabled for the selected I/O lines.

### Bit 14 – OPD Open-Drain

This bit defines the open drain configuration of the I/O lines of the I/O group x according to the [PIO Mask Register](#).

0 (DISABLED): The open-drain is disabled for the selected I/O lines. I/O lines are driven at high- and low-level.

1 (ENABLED): The open-drain is enabled for the selected I/O lines. I/O lines are driven at low-level only.

### Bit 13 – IFSCEN Input Filter Slow Clock Enable

This bit defines the clock source of the glitch filtering for the I/O lines of the I/O group x according to the [PIO Mask Register](#).

0 (DISABLED): The glitch filter is able to filter glitches with a duration  $< t_{mck}/2$  for the selected I/O lines.

1 (ENABLED): The debouncing filter is able to filter pulses with a duration  $< t_{div\_sclk}/2$  for the selected I/O lines.

**Bit 12 – IFEN** Input Filter Enable

This bit defines if the glitch filtering is used for the I/O lines of the I/O group x according to the [PIO Mask Register](#).

0 (DISABLED): The input filter is disabled for the selected I/O lines.

1 (ENABLED): The input filter is enabled for the selected I/O lines.

**Bit 10 – PDEN** Pull-Down Enable

This bit defines the pull-down configuration of the I/O lines of the I/O group x according to the [PIO Mask Register](#).

PDEN can be written to 1 only if PUEN is written to 0.

0 (DISABLED): Pull-Down is disabled for the selected I/O lines.

1 (ENABLED): Pull-Down is enabled for the selected I/O lines only if PUEN is 0.

**Bit 9 – PUEN** Pull-Up Enable

This bit defines the pull-up configuration of the I/O lines of the I/O group x according to the [PIO Mask Register](#).

0 (DISABLED): Pull-Up is disabled for the selected I/O lines.

1 (ENABLED): Pull-Up is enabled for the selected I/O lines.

**Bit 8 – DIR** Direction

This bit defines the direction of the I/O lines of the I/O group x according to the [PIO Mask Register](#).

0 (INPUT): The selected I/O lines are pure inputs.

1 (OUTPUT): The selected I/O lines are enabled in output.

**Bits 2:0 – FUNC[2:0]** I/O Line Function

This field defines the function for I/O lines of the I/O group x according to the [PIO Mask Register](#).

Value	Name	Description
0	GPIO	Select the PIO mode for the selected I/O lines.
1	PERIPH_A	Select the peripheral A for the selected I/O lines.
2	PERIPH_B	Select the peripheral B for the selected I/O lines.
3	PERIPH_C	Select the peripheral C for the selected I/O lines.
4	PERIPH_D	Select the peripheral D for the selected I/O lines.
5	PERIPH_E	Select the peripheral E for the selected I/O lines.
6	PERIPH_F	Select the peripheral F for the selected I/O lines.

### 33.7.3 PIO Pin Data Status Register

**Name:** PIO\_PDSRx  
**Offset:** 0x08 + x\*0x40 [x=0..3]  
**Reset:** –  
**Property:** Read-only

Reset value of PIO\_PDSR depends on the level of the I/O lines. Reading the I/O line levels requires the clock of the PIO Controller to be enabled, otherwise PIO\_PDSR reads the levels present on the I/O line at the time the clock was disabled.

Bit	31	30	29	28	27	26	25	24

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – Px Set Output Data**

Value	Description
0	No effect.
1	Sets the data to be driven on the I/O line of I/O group x.

### 33.7.6 PIO Clear Output Data Register

**Name:** PIO\_CODRx  
**Offset:** 0x14 + x\*0x40 [x=0..3]  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – Px** Clear Output Data

Value	Description
0	No effect.
1	Clears the data to be driven on the I/O line of the I/O group x.

### 33.7.7 PIO Output Data Status Register

**Name:** PIO\_ODSRx  
**Offset:** 0x18 + x\*0x40 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

Writing this register will only affect I/O lines enabled in the PIO\_MSKRx.

Bit	31	30	29	28	27	26	25	24
	P31	P30	P29	P28	P27	P26	P25	P24

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – Px** Input Change Interrupt Enable

Value	Description
0	No effect.
1	Enables the Input Change interrupt on the I/O line of the I/O group x.

### 33.7.9 PIO Interrupt Disable Register

**Name:** PIO\_IDRx  
**Offset:** 0x24 + x\*0x40 [x=0..3]  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	P31	P30	P29	P28	P27	P26	P25	P24

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	P7	P6	P5	P4	P3	P2	P1	P0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – Px** Input Change Interrupt Disable

Value	Description
0	No effect.
1	Disables the Input Change interrupt on the I/O line of the I/O group x.

### 33.7.10 PIO Interrupt Mask Register

**Name:** PIO\_IMRx  
**Offset:** 0x28 + x\*0x40 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read-only

	Bit	31	30	29	28	27	26	25	24
		P31	P30	P29	P28	P27	P26	P25	P24

Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – Px** Input Change Interrupt Mask

Value	Description
0	Input Change interrupt is disabled on the I/O line of the I/O group x.
1	Input Change interrupt is enabled on the I/O line of the I/O group x.

### 33.7.11 PIO Interrupt Status Register

**Name:** PIO\_ISRx  
**Offset:** 0x30 + x\*0x40 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read-only

PIO\_ISR is reset at 0x00000000. However, the first read of the register may read a different value as input changes may have occurred.

Bit	31	30	29	28	27	26	25	24
	P31	P30	P29	P28	P27	P26	P25	P24

Value	Description
0	No Input Change has been detected on the I/O line of the I/O group x since PIO_ISRx was last read or since reset.
1	At least one Input Change has been detected on the I/O line of the I/O group since PIO_ISRx was last read or since reset.

### 33.7.12 PIO I/O Freeze Configuration Register

**Name:** PIO\_IOFRx  
**Offset:** 0x3C + x\*0x40 [x=0..3]  
**Reset:** –  
**Property:** Write-only

Writing this register will only affect I/O lines enabled in the PIO\_MSKRx.

Bit	31	30	29	28	27	26	25	24
	FRZKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
							FINT	FPHY
Access							W	W
Reset							–	–

#### Bits 31:8 – FRZKEY[23:0] Freeze Key

Value	Name	Description
0x494F4	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit.
6		

#### Bit 1 – FINT Freeze Interrupt Configuration

Only a hardware reset can reset the FINT bit.

Value	Description
0	No effect.
1	Freezes the following configuration fields of Non-Secure I/O lines if FRZKEY corresponds to 0x494F46 (“IOF” in ASCII): <ul style="list-style-type: none"> <li>• <a href="#">IFEN: Input Filter Enable</a></li> <li>• <a href="#">IFSCEN: Input Filter Slow Clock Enable</a></li> <li>• <a href="#">EVTSEL: Event Selection</a></li> </ul>

#### Bit 0 – FPHY Freeze Physical Configuration

Only a hardware reset can reset the FPHY bit.

# SAMA5D2 Series

## Parallel Input/Output Controller (PIO)

Value	Description
0	No effect.
1	Freezes the following configuration fields of Non-Secure I/O lines if FRZKEY corresponds to 0x494F46 ("IOF" in ASCII): <ul style="list-style-type: none"><li>• FUNC: I/O Line Function</li><li>• DIR: Direction</li><li>• PUEN: Pull-Up Enable</li><li>• PDEN: Pull-Down Enable</li><li>• OPD: Open-Drain</li><li>• SCHMITT: Schmitt Trigger</li><li>• DRVSTR: Drive Strength</li></ul>

### 33.7.13 PIO Write Protection Mode Register

**Name:** PIO\_WPMR  
**Offset:** 0x5E0  
**Reset:** 0x00000000  
**Property:** Read/Write

	Bit	31	30	29	28	27	26	25	24
		WPKEY[23:16]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		WPKEY[15:8]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		WPKEY[7:0]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		WPEN							
Access									R/W
Reset									0

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x50494F	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit.
F		Always reads as 0.

#### Bit 0 – WPEN Write Protection Enable

See [Section 6.18 “Register Write Protection”](#) for the list of registers that can be protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x50494F (“PIO” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x50494F (“PIO” in ASCII).

### 33.7.14 PIO Write Protection Status Register

**Name:** PIO\_WPSR  
**Offset:** 0x5E4  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	[Greyed out bits]							WPVS
Access								R
Reset								0

**Bits 23:8 – WPVSR[15:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of the PIO_WPSR.
1	A write protection violation has occurred since the last read of the PIO_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

### 33.7.15 Secure PIO Mask Register

**Name:** S\_PIO\_MSKRx  
**Offset:** 0x1000 + x\*0x40 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Secure PIO Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	MSK31	MSK30	MSK29	MSK28	MSK27	MSK26	MSK25	MSK24

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – MSK<sub>y</sub> PIO Line y Mask**

These bits define the I/O lines to be configured when writing the [Secure PIO Configuration Register](#).

0 (DISABLED): Writing the S\_PIO\_CFGRx, S\_PIO\_ODSRx or S\_PIO\_IOFRx does not affect the corresponding I/O line configuration.

1 (ENABLED): Writing the S\_PIO\_CFGRx, S\_PIO\_ODSRx or S\_PIO\_IOFRX updates the corresponding I/O line configuration.

### 33.7.16 Secure PIO Configuration Register

**Name:** S\_PIO\_CFGRx  
**Offset:** 0x1004 + x\*0x40 [x=0..3]  
**Reset:** 0x00000200  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Secure PIO Write Protection Mode Register](#).

Writing this register will only affect I/O lines enabled in the S\_PIO\_MSKRx.

	Bit	31	30	29	28	27	26	25	24

Reset							0	0	0

**Bit 30 – ICFS** Interrupt Configuration Freeze Status (read-only)

This bit gives information about the freeze state of the following fields of the read I/O line configuration:

- [IFEN](#): Input Filter Enable
- [IFSCEN](#): Input Filter Slow Clock Enable
- [EVTSEL](#): Event Selection

0 (NOT\_FROZEN): The fields are not frozen and can be written for this I/O line.

1 (FROZEN): The fields are frozen and cannot be written for this I/O line. Only a hardware reset can release these fields.

**Bit 29 – PCFS** Physical Configuration Freeze Status (read-only)

This bit gives information about the freeze state of the following fields of the read I/O line configuration:

- [FUNC](#): I/O Line Function
- [DIR](#): Direction
- [PUEN](#): Pull-Up Enable

- [PDEN: Pull-Down Enable](#)
- [OPD: Open-Drain](#)
- [SCHMITT: Schmitt Trigger](#)
- [DRVSTR: Drive Strength](#)

0 (NOT\_FROZEN): The fields are not frozen and can be written for this I/O line.

1 (FROZEN): The fields are frozen and cannot be written for this I/O line. Only a hardware reset can release these fields.

### Bits 26:24 – EVTSEL[2:0] Event Selection

This field defines the type of event to detect on the I/O lines of the I/O group x according to the [Secure PIO Mask Register](#).

Value	Name	Description
0	FALLING	Event detection on input falling edge
1	RISING	Event detection on input rising edge
2	BOTH	Event detection on input both edge
3	LOW	Event detection on low level input
4	HIGH	Event detection on high level input
5	Reserved	
6	Reserved	
7	Reserved	

### Bits 17:16 – DRVSTR[1:0] Drive Strength

This field defines the drive strength of the I/O lines of the I/O group x according to the [Secure PIO Mask Register](#).

Value	Name	Description
0	LO	Low drive
1	LO	Low drive
2	ME	Medium drive
3	HI	High drive

### Bit 15 – SCHMITT Schmitt Trigger

This bit defines the Schmitt trigger configuration of the I/O lines of the I/O group x according to the [Secure PIO Mask Register](#).

0 (ENABLED): Schmitt trigger is enabled for the selected I/O lines.

1 (DISABLED): Schmitt trigger is disabled for the selected I/O lines.

### Bit 14 – OPD Open-Drain

This bit defines the open drain configuration of the I/O lines of the I/O group x according to the [Secure PIO Mask Register](#).

0 (DISABLED): The open-drain is disabled for the selected I/O lines. I/O lines are driven at high- and low-level.

1 (ENABLED): The open-drain is enabled for the selected I/O lines. I/O lines are driven at low-level only.

**Bit 13 – IFSCEN** Input Filter Slow Clock Enable

This bit defines the clock source of the glitch filtering for the I/O lines of the I/O group x according to the [Secure PIO Mask Register](#).

Value	Description
0	The glitch filter is able to filter glitches with a duration $< t_{mck}/2$ for the selected I/O lines.
1	The debouncing filter is able to filter pulses with a duration $< t_{div\_slck}/2$ for the selected I/O lines.

**Bit 12 – IFEN** Input Filter Enable

This bit defines if the glitch filtering is used for the I/O lines of the I/O group x according to the [Secure PIO Mask Register](#).

0 (DISABLED): The input filter is disabled for the selected I/O lines.

1 (ENABLED): The input filter is enabled for the selected I/O lines.

**Bit 10 – PDEN** Pull-Down Enable

This bit defines the pull-down configuration of the I/O lines of the I/O group x according to the [Secure PIO Mask Register](#).

0 (DISABLED): Pull-Down is disabled for the selected I/O lines.

1 (ENABLED): Pull-Down is enabled for the selected I/O lines only if PUEN is 0<sup>(1)</sup>.

Note: 1. PDEN can be written to 1 only if PUEN is written to 0.

**Bit 9 – PUEN** Pull-Up Enable

This bit defines the pull-up configuration of the I/O lines of the I/O group x according to the [Secure PIO Mask Register](#).

0 (DISABLED): Pull-Up is disabled for the selected I/O lines.

1 (ENABLED): Pull-Up is enabled for the selected I/O lines.

**Bit 8 – DIR** Direction

This bit defines the direction of the I/O lines of the I/O group x according to the [Secure PIO Mask Register](#).

0 (INPUT): The selected I/O lines are pure inputs.

1 (OUTPUT): The selected I/O lines are enabled in output.

**Bits 2:0 – FUNC[2:0]** I/O Line Function

This field defines the function for I/O lines of the I/O group x according to the [Secure PIO Mask Register](#).

Value	Name	Description
0	GPIO	Select the PIO mode for the selected I/O lines.
1	PERIPH_A	Select the peripheral A for the selected I/O lines.
2	PERIPH_B	Select the peripheral B for the selected I/O lines.
3	PERIPH_C	Select the peripheral C for the selected I/O lines.
4	PERIPH_D	Select the peripheral D for the selected I/O lines.
5	PERIPH_E	Select the peripheral E for the selected I/O lines.
6	PERIPH_F	Select the peripheral F for the selected I/O lines.
7	PERIPH_G	Select the peripheral G for the selected I/O lines.

### 33.7.17 Secure PIO Pin Data Status Register

**Name:** S\_PIO\_PDSRx  
**Offset:** 0x1008 + x\*0x40 [x=0..3]  
**Reset:** –  
**Property:** Read-only

Reset value of PIO\_PDSR and S\_PIO\_PDSR depends on the level of the I/O lines. Reading the I/O line levels requires the clock of the PIO Controller to be enabled, otherwise PIO\_PDSR reads the levels present on the I/O line at the time the clock was disabled.

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – Px** Clear Output Data

Value	Description
0	No effect.
1	Clears the data to be driven on the I/O line of the I/O group x.

### 33.7.21 Secure PIO Output Data Status Register

**Name:** S\_PIO\_ODSRx  
**Offset:** 0x1018 + x\*0x40 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

Writing this register will only affect I/O lines enabled in the S\_PIO\_MSKRx.

Value	Description
0	Input Change interrupt is disabled on the I/O line of the I/O group x.
1	Input Change interrupt is enabled on the I/O line of the I/O group x.

### 33.7.25 Secure PIO Interrupt Status Register

**Name:** S\_PIO\_ISRx  
**Offset:** 0x102C + x\*0x40 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read-only

PIO\_ISR and S\_PIO\_ISR are reset at 0x00000000. However, the first read of the register may read a different value as input changes may have occurred.

Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	[Greyed out bits]							WPVS
Access								R
Reset								0

**Bits 23:8 – WPVSR[15:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of the S_PIO_WPSR.
1	A write protection violation has occurred since the last read of the S_PIO_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

## 34. External Memories

The product features:

- Multiport DDR-SDRAM Controller (MPDDRC)
- External Bus Interface (EBI) that embeds a NAND Flash controller and a Static Memory Controller (HSMC)

The MPDDRC is a multiport DDRSDR controller supporting DDR2, DDR3, DDR3L, LPDDR1, LPDDR2-S4 and LPDDR3 devices. The MPDDRC user interface is located at 0xF000C000. All the paths can be scrambled and Port 0 can be connected to an AES encryption/decryption engine.

The HSMC supports Static Memories and MLC/SLC NAND Flash. It embeds MultiBit ECC correction (PMECC). Its user interface is located at 0xF8014000. The HSMC buses can be scrambled.

**Figure 34-1. External Memory Controllers**

### 34.1 Multiport DDR-SDRAM Controller (MPDDRC)

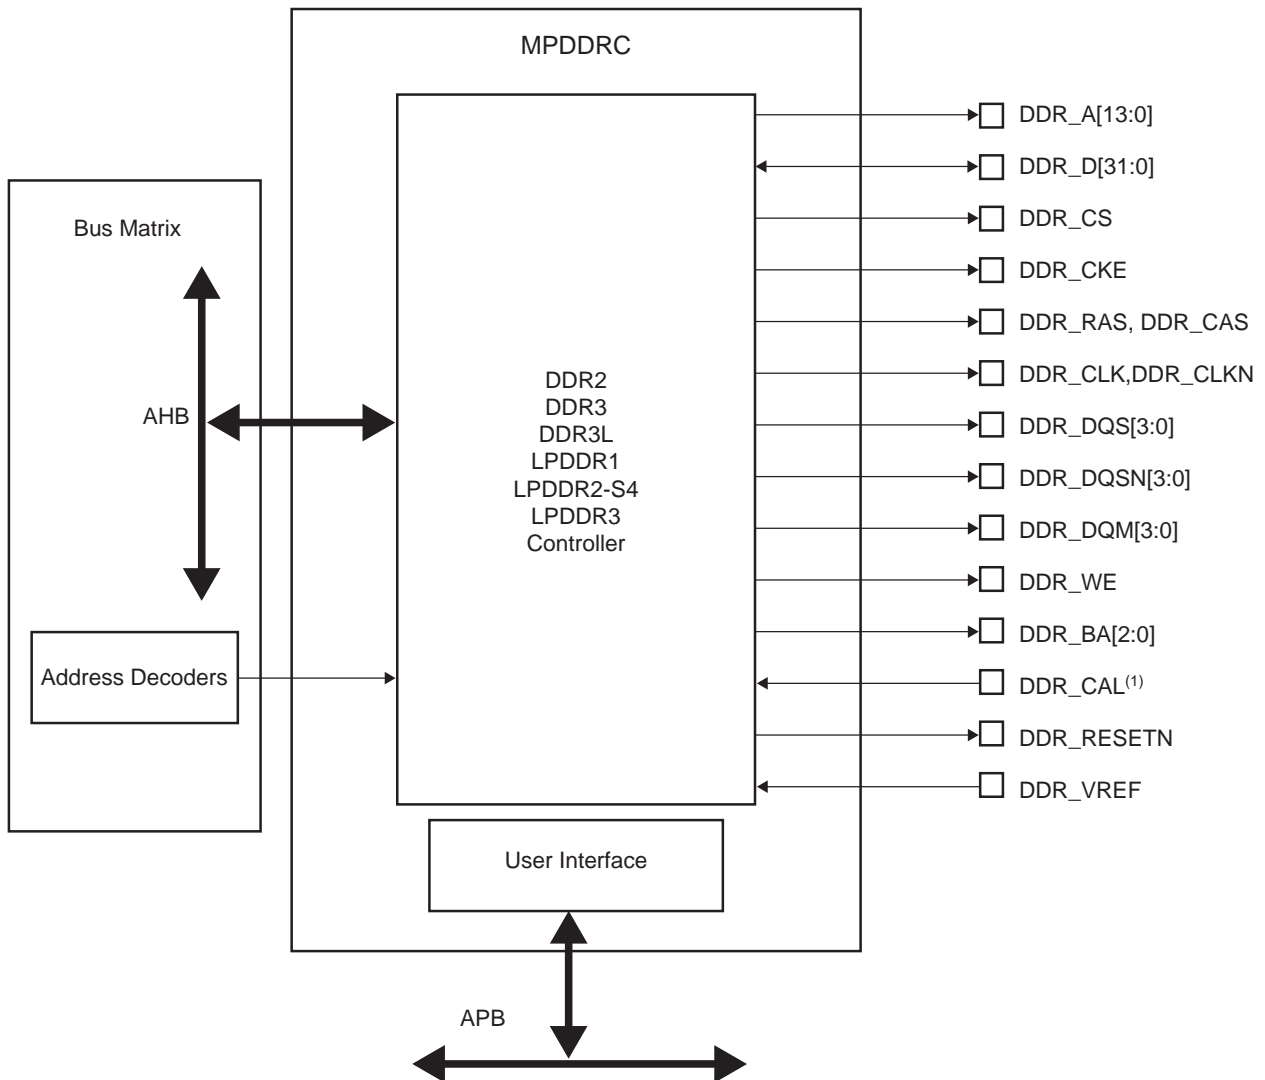

#### 34.1.1 Description

The MPDDRC is an 8-port memory controller supporting DDR-SDRAM and low-power DDR devices. Data transfers are performed through a 16/32-bit data bus on one chip select. The controller operates with a 1.8V power supply for DDR2, DDR3, LPDDR1, 1.35V for DDR3L and 1.2V for LPDDR2, LPDDR3.

For full details, refer to the section “Multiport DDR-SDRAM Controller (MPDDRC)”.

### 34.1.2 MPDDR Controller Block Diagram

Figure 34-2. MPDDRC Block Diagram

**Note:** For more details, refer to the section "DDR and SDRAM I/Os Calibration".

### 34.1.3 IO Lines Description

Table 34-1. DDR/LPDDR I/O Lines Description

Figure 34-10. NOR Flash on NCS0 Hardware Configuration

## **35. AHB Multiport DDR-SDRAM Controller (MPDDRC)**

### **35.1 Description**

The Multiport DDR-SDRAM Controller (MPDDRC) is a multiport memory controller. It comprises eight slave AHB interfaces. All simultaneous accesses (eight independent AHB ports) are interleaved to maximize memory bandwidth and minimize transaction latency due to DDR-SDRAM protocol.

The MPDDRC extends the memory capabilities of a chip by providing the interface to the external 16-bit or 32-bit DDR-SDRAM device. The page size supports ranges from 2048 to 16384 rows and from 256 to 4096 columns. It supports dword (64-bit), word (32-bit), half-word (16-bit), and byte (8-bit) accesses.

The MPDDRC supports a read or write burst length of eight locations. This enables the command and address bus to anticipate the next command, thus reducing latency imposed by the DDR-SDRAM protocol and improving the DDR-SDRAM bandwidth. Moreover, MPDDRC keeps track of the active row in each bank, thus maximizing DDR-SDRAM performance, e.g., the application may be placed in one bank and data in other banks. To optimize performance, avoid accessing different rows in the same bank. The MPDDRC supports a CAS latency of 2, 3, 5 or 6 and optimizes the read access depending on the frequency.

Self-refresh, Powerdown and Deep Powerdown modes minimize the consumption of the DDR-SDRAM device.

OCD (Off-chip Driver) and ODT (On-die Termination) modes are not supported.

The MPDDRC supports DDR3-SDRAM and DDR3L-SDRAM devices with DLL disabled, in DLL Off mode. In this mode, according to JEDEC standard, the maximum clock frequency is 125 MHz. However, check with memory suppliers for higher speed support. DDR3-SDRAM supports high capacity, 1 Gbit and more, and allows to reduce power consumption with a 1.5V supply (DDR3-SDRAM) or a 1.35V supply (DDR3L-SDRAM). The DLL Off mode sets the CAS Read Latency (CRL) and the CAS Write Latency (CWL) to 6. The latency is automatically set by the controller.

### **35.2 Embedded Characteristics**

- Numerous Memory Devices Supported
  - Low-Power DDR1-SDRAM (LPDDR1)
  - Low-Cost LPDDR1 with 2 Internal Banks
  - DDR2-SDRAM
  - Low-Power DDR2-SDRAM-S4 (LPDDR2)
  - Low-Power DDR3-SDRAM (LPDDR3)
  - DDR3-SDRAM (DLL Off mode)
  - DDR3L-SDRAM (DLL Off mode)
- Arbitration Policies: Round-Robin, On Request, Bandwidth
- Eight Advanced High-Performance Bus (AHB) Interfaces, Management of all Accesses Maximizes Memory Bandwidth and Minimizes Transaction Latency
- Bus Transfer: dword, word, half word, byte Access
- Numerous Configurations Supported
  - 2K, 4K, 8K, 16K row address memory parts

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

---

- DDR-SDRAM with two or four internal banks (low-power DDR1-SDRAM)
- DDR-SDRAM with four or eight internal banks (DDR2-SDRAM/Low-power DDR2-SDRAM-S4/DDR3-SDRAM/DDR3L-SDRAM/Low-power DDR3-SDRAM)
- DDR-SDRAM with 16-bit or 32-bit data
- One chip select for SDRAM device (512-Mbyte address space, 256-Mbyte address space with 16-bit data path)
- Programming Facilities
  - Multibank ping-pong access (up to four or eight banks opened at the same time = reduced average latency of transactions)
  - Timing parameters specified by software
  - Automatic refresh operation, refresh rate is programmable
  - Automatic update of DS, TCR and PASR parameters (low-power DDR-SDRAM devices)
- Energy-Saving Capabilities
  - Self-refresh, Powerdown, Active Powerdown and Deep Powerdown modes supported
- DDR-SDRAM Powerup Initialization by Software
- CAS Latency of 2, 3, 5 or 6 Supported
- Reset Function Supported (DDR2-SDRAM)
- Clock Frequency Change in Self-Refresh Mode Supported (Low-power DDR-SDRAM/DDR3-SDRAM/DDR3L-SDRAM)
- Autorefresh per Bank Supported (Low-Power DDR2-SDRAM-S4/Low-Power DDR3-SDRAM)
- Automatic Adjust Refresh Rate (Low-Power DDR2-SDRAM-S4/Low-Power DDR3-SDRAM)
- Autoprecharge Command Not Used
- OCD (Off-chip Driver) Mode, ODT (On-die Termination), Write leveling Are Not Supported
- Dynamic Scrambling with User Key (No Impact on Bandwidth)

### 35.3 Block Diagram

The MPDDRC is partitioned in two blocks (see figure below):

- Interconnect Matrix block that manages concurrent accesses on the AHB bus between four AHB masters and integrates an arbiter
- DDR controller that translates AHB requests (read/write) in the DDR-SDRAM protocol

**Figure 35-1. Block Diagram**

## 35.4 Product Dependencies, Initialization Sequence

### 35.4.1 Low-power DDR1-SDRAM Initialization

The initialization sequence is generated by software.

The low-power DDR1-SDRAM devices are initialized by the following sequence:

1. Program the memory device type in the Memory Device register (MPDDRC\_MD).
2. Program the shift sampling value in the Read Data Path register (MPDDRC\_RD\_DATA\_PATH).
3. Program the features of the low-power DDR1-SDRAM device in the MPDDRC Configuration register (MPDDRC\_CR) (number of columns, rows, banks, CAS latency and output drive strength) and in the Timing Parameter 0 register/Timing Parameter 1 register (MPDDRC\_TPR0/1) (asynchronous timing (TRC, TRAS, etc.)).
4. Program Temperature Compensated Self-refresh (TCR), Partial Array Self-refresh (PASR) and Drive Strength (DS) parameters in the Low-power register (MPDDRC\_LPR).
5. A NOP command is issued to the low-power DDR1-SDRAM. Program the NOP command in the Mode register (MPDDRC\_MR). The application must configure the MODE field to 1 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR1-SDRAM address to acknowledge this command. The clocks which drive the low-power DDR1-SDRAM device are now enabled.
6. A pause of at least 200  $\mu$ s must be observed before a signal toggle.
7. A NOP command is issued to the low-power DDR1-SDRAM. Program the NOP command in the MPDDRC\_MR. The application must configure the MODE field to 1 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

---

access to any low-power DDR1-SDRAM address to acknowledge this command. A calibration request is now made to the I/O pad.

8. An All Banks Precharge command is issued to the low-power DDR1-SDRAM. Program All Banks Precharge command in the MPDDRC\_MR. The application must configure the MODE field to 2 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR1-SDRAM address to acknowledge this command.
9. Two autorefresh (CBR) cycles are provided. Program the Autorefresh command (CBR) in the MPDDRC\_MR. The application must configure the MODE field to 4 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR1-SDRAM location twice to acknowledge these commands.
10. An Extended Mode Register Set (EMRS) cycle is issued to program the low-power DDR1-SDRAM parameters (TCSR, PASR, DS). The application must configure the MODE field to 5 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the SDRAM to acknowledge this command. The write address must be chosen so that signal BA[1] is set to 1 and BA[0] is set to 0. For example: with a 16-bit, 128-Mbit, low-power DDR1-SDRAM (12 rows, 9 columns, 4 banks), the SDRAM write access should be done at the address: `BASE_ADDRESS_DDR + 0x00800000`; with a 32-bit, 1-Gbit, low-power DDR1-SDRAM (14 rows, 10 columns, 4 banks), the SDRAM write access should be done at the address: `BASE_ADDRESS_DDR + 0x08000000`. In the case of low-cost and low-density low-power DDR1-SDRAM (2 internal banks), the write address must be chosen so that signal BA[0] is set to 1. BA[1] is not used.  
**Note:** This address is given as an example only. The real address depends on implementation in the product.
11. A Mode Register Set (MRS) cycle is issued to program parameters of the low-power DDR1-SDRAM devices, in particular CAS latency. The application must configure the MODE field to 3 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the low-power DDR1-SDRAM to acknowledge this command. The write address must be chosen so that signals BA[1:0] are set to 0. For example, the SDRAM write access should be done at the address: `BASE_ADDRESS_DDR`.
12. The application must enter Normal mode, write a zero to the MODE field in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access at any location in the low-power DDR1-SDRAM to acknowledge this command.
13. Write the refresh rate into the COUNT field in the Refresh Timer register (MPDDRC\_RTR). To compute the value, see [MPDDRC Refresh Timer Register](#).

After initialization, the low-power DDR1-SDRAM device is fully functional.

### 35.4.2 DDR2-SDRAM Initialization

The initialization sequence is generated by software. The DDR2-SDRAM devices are initialized by the following sequence:

1. Program the memory device type in the Memory Device register (MPDDRC\_MD).
2. Program the shift sampling value in the Read Data Path register (MPDDRC\_RD\_DATA\_PATH).
3. Program features of the DDR2-SDRAM device in the Configuration register (MPDDRC\_CR) (number of columns, rows, banks, CAS latency and output driver impedance control) and in the Timing Parameter 0 register/Timing Parameter 1 register (MPDDRC\_TPR0/1) (asynchronous timing: TRC, TRAS, etc.).

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

---

4. A NOP command is issued to the DDR2-SDRAM. Program the NOP command in the Mode register (MPDDRC\_MR). The application must configure the MODE field to 1 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR2-SDRAM address to acknowledge this command. The clocks which drive the DDR2-SDRAM device are now enabled.
5. A pause of at least 200  $\mu$ s must be observed before a signal toggle.
6. A NOP command is issued to the DDR2-SDRAM. Program the NOP command in the MPDDRC\_MR. The application must configure the MODE field to 1 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR2-SDRAM address to acknowledge this command. CKE is now driven high.
7. An All Banks Precharge command is issued to the DDR2-SDRAM. Program All Banks Precharge command in the MPDDRC\_MR. The application must configure the MODE field to 2 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR2-SDRAM address to acknowledge this command.
8. An Extended Mode Register Set (EMRS2) cycle is issued to choose between commercial or high temperature operations. The application must configure the MODE field to 5 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[1] is set to 1 and signal BA[0] is set to 0. For example: with a 16-bit, 128-Mbit, DDR2-SDRAM (12 rows, 9 columns, 4 banks), the DDR2-SDRAM write access should be done at the address: `BASE_ADDRESS_DDR + 0x00800000`; with a 32-bit, 1-Gbit, DDR2-SDRAM (14 rows, 10 columns, 8 banks), the SDRAM write access should be done at the address: `BASE_ADDRESS_DDR + 0x08000000`.  
**Note:** This address is given as an example only. The real address depends on implementation in the product.
9. An Extended Mode Register Set (EMRS3) cycle is issued to set the Extended Mode register to 0. The application must configure the MODE field to 5 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[1] is set to 1 and signal BA[0] is set to 1. For example: with a 16-bit, 128-Mbit, DDR2-SDRAM (12 rows, 9 columns, 4 banks), the DDR2-SDRAM write access should be done at the address: `BASE_ADDRESS_DDR + 0x00C00000`; with a 32-bit, 1-Gbit, DDR2-SDRAM (14 rows, 10 columns, 8 banks), the SDRAM write access should be done at the address: `BASE_ADDRESS_DDR + 0x0C000000`
10. An Extended Mode Register Set (EMRS1) cycle is issued to enable DLL and to program D.I.C. (Output Driver Impedance Control). The application must configure the MODE field to 5 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[1] is set to 0 and signal BA[0] is set to 1. For example: with a 16-bit, 128-Mbit, DDR2-SDRAM (12 rows, 9 columns, 4 banks), the DDR2-SDRAM write access should be done at the address: `BASE_ADDRESS_DDR + 0x00400000`; with a 32-bit, 1-Gbit, DDR2-SDRAM (14 rows, 10 columns, 8 banks), the SDRAM write access should be done at the address: `BASE_ADDRESS_DDR + 0x04000000`.
11. An additional 200 cycles of clock are required for locking DLL.
12. Write a '1' to the DLL bit (enable DLL reset) in the Configuration register (MPDDRC\_CR).
13. A Mode Register Set (MRS) cycle is issued to reset DLL. The application must configure the MODE field to 3 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

---

- command. The write address must be chosen so that signals BA[1:0] are set to 0. For example, the SDRAM write access should be done at the address: BASE\_ADDRESS\_DDR.
14. An All Banks Precharge command is issued to the DDR2-SDRAM. Program the All Banks Precharge command in the MPDDRC\_MR. The application must configure the MODE field to 2 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR2-SDRAM address to acknowledge this command.
  15. Two autorefresh (CBR) cycles are provided. Program the Autorefresh command (CBR) in the MPDDRC\_MR. The application must configure the MODE field to 4 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR2-SDRAM location twice to acknowledge these commands.
  16. Write a '0' to the DLL bit (disable DLL reset) in the MPDDRC\_CR.
  17. A Mode Register Set (MRS) cycle is issued to program parameters of the DDR2-SDRAM device, in particular CAS latency and to disable DLL reset. The application must configure the MODE field to 3 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that signals BA[1:0] are set to 0. For example: with a 16-bit, 128-Mbit, DDR2-SDRAM (12 rows, 9 columns, 4 banks) bank address, the SDRAM write access should be done at the address: BASE\_ADDRESS\_DDR; with a 32-bit, 1-Gbit, DDR2-SDRAM (14 rows, 10 columns, 8 banks), the SDRAM write access should be done at the address: BASE\_ADDRESS\_DDR.
  18. Configure the OCD field (default OCD calibration) to 7 in the MPDDRC\_CR.
  19. An Extended Mode Register Set (EMRS1) cycle is issued to the default OCD value. The application must configure the MODE field to 5 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[1] is set to 0 and signal BA[0] is set to 1. For example: with a 16-bit, 128-Mbit, DDR2-SDRAM (12 rows, 9 columns, 4 banks), the DDR2-SDRAM write access should be done at the address: BASE\_ADDRESS\_DDR + 0x00400000; with a 32-bit, 1-Gbit, DDR2-SDRAM (14 rows, 10 columns, 8 banks), the SDRAM write access should be done at the address: BASE\_ADDRESS\_DDR + 0x04000000.
  20. Configure the OCD field (exit OCD calibration mode) to 0 in the MPDDRC\_CR.
  21. An Extended Mode Register Set (EMRS1) cycle is issued to enable OCD exit. The application must configure the MODE field to 5 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[1] is set to 0 and signal BA[0] is set to 1. For example: with a 16-bit, 128-Mbit, DDR2-SDRAM (12 rows, 9 columns, 4 banks) bank address, the DDR2-SDRAM write access should be done at the address: BASE\_ADDRESS\_DDR + 0x00400000; with a 32-bit, 1-Gbit, DDR2-SDRAM (14 rows, 10 columns, 8 banks), the SDRAM write access should be done at the address: BASE\_ADDRESS\_DDR + 0x04000000.
  22. A Normal Mode command is provided. Program the Normal mode in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR2-SDRAM address to acknowledge this command.
  23. Write the refresh rate into the COUNT field in the Refresh Timer register (MPDDRC\_RTR). To compute the value, see [MPDDRC Refresh Timer Register](#).

After initialization, the DDR2-SDRAM devices are fully functional.

### 35.4.3 Low-power DDR2-SDRAM Initialization

The initialization sequence is generated by software.

The low-power DDR2-SDRAM devices are initialized by the following sequence:

1. Program the memory device type in the Memory Device register (MPDDRC\_MD).
2. Program the shift sampling value in the Read Data Path register (MPDDRC\_RD\_DATA\_PATH).
3. Program features of the low-power DDR2-SDRAM device into and in the Configuration register (MPDDRC\_CR) (number of columns, rows, banks, CAS latency and output drive strength) and in the Timing Parameter 0 register/Timing Parameter 1 register (MPDDRC\_TPR0/1) (asynchronous timing: TRC, TRAS, etc.).
4. A NOP command is issued to the low-power DDR2-SDRAM. Program the NOP command in the Mode register (MPDDRC\_MR). The application must configure the MODE field to 1 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The clocks which drive the Low-power DDR2-SDRAM devices are now enabled.
5. A pause of at least 100 ns must be observed before a signal toggle.
6. A NOP command is issued to the low-power DDR2-SDRAM. Program the NOP command in the MPDDRC\_MR. The application must configure the MODE field to 1 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. CKE is now driven high.
7. A pause of at least 200  $\mu$ s must be observed before issuing a Reset command.
8. A Reset command is issued to the low-power DDR2-SDRAM. In MPDDRC\_MR, configure the MODE field to 7 and the MRS field to 63. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The Reset command is now issued.
9. A pause of at least  $t_{INIT5}$  must be observed before issuing any commands.
10. A Calibration command is issued to the low-power DDR2-SDRAM. Program the type of calibration in the Configuration register (MPDDRC\_CR): configure the ZQ field to 3. In MPDDRC\_MR, configure the MODE field to 7 and the MRS field to 10. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The ZQ Calibration command is now issued. Program the type of calibration in the MPDDRC\_CR: configure the ZQ field to 2.
11. A Mode register Write command is issued to the low-power DDR2-SDRAM. In MPDDRC\_MR, configure the MODE field to 7 and the MRS field to 1. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The Mode register Write command is now issued.
12. A Mode register Write command is issued to the low-power DDR2-SDRAM. In the MPDDRC\_MR, configure the MODE field to 7 and the MRS field to 2. The Mode register Write command cycle is issued to program parameters of the low-power DDR2-SDRAM device, in particular CAS latency. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The Mode register Write command is now issued.
13. A Mode register Write command is issued to the low-power DDR2-SDRAM. In MPDDRC\_MR, configure the MODE field to 7 and the MRS field to 3. The Mode register Write command cycle is issued to program parameters of the low-power DDR2-SDRAM device, in particular Drive Strength and Slew Rate. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

---

- the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The Mode register Write command is now issued.
14. A Mode register Write command is issued to the low-power DDR2-SDRAM. In MPDDRC\_MR configure the MODE field to 7 and the MRS field to 16. Mode register Write command cycle is issued to program parameters of the low-power DDR2-SDRAM device, in particular Partial Array Self Refresh (PASR). Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The Mode register Write command is now issued.
  15. In the DDR Configuration register (SFR\_DDRCFG), the application must write a '1' to bits 17 and 16 to open the input buffers (refer to section "Special Function Registers (SFR)").
  16. A NOP command is issued to the low-power DDR2-SDRAM. Program the NOP command in the Mode register (MPDDRC\_MR). The application must configure the MODE field to 1 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command.
  17. A Mode register Read command is issued to the low-power DDR2-SDRAM. In MPDDRC\_MR, configure the MODE field to 7 and the MRS field to 5. The Mode register Read command cycle is used to read the LPDDR2 Manufacturer ID from the low-power DDR2-SDRAM mode registers. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The Mode register Read command is now issued. The LPDDR2 Manufacturer ID is set in MPDDRC\_MD. See [MPDDRC Memory Device Register](#).
  18. A Mode register Read command is issued to the low-power DDR2-SDRAM. In MPDDRC\_MR, configure the MODE field to 7 and the MRS field to 6. The Mode register Read command cycle is used to read Revision ID1 from the low-power DDR2-SDRAM mode registers. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The Mode register Read command is now issued. Revision ID1 is set in register MPDDRC\_MD. See [MPDDRC Memory Device Register](#).
  19. A Mode register Read command is issued to the low-power DDR2-SDRAM. In MPDDRC\_MR, configure the MODE field to 7 and the MRS field to 8. The Mode register Read command cycle is used to read the memory organization (I/O width, Density, Type) from the low-power DDR2-SDRAM mode registers. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The Mode register Read command is now issued. Memory organization is set in register MPDDRC\_MD. See [MPDDRC Memory Device Register](#).
  20. A Mode register Read command is issued to the low-power DDR2-SDRAM. In MPDDRC\_MR, configure the MODE field to 7 and the MRS field to 0. The Mode register Read command cycle is used to read device information (RZQI, DAI) from the low-power DDR2-SDRAM mode registers. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The Mode register Read command is now issued. Device information RZQI is set in register Timing Calibration (see [MPDDRC Low-power DDR2 Low-power DDR3 and DDR3 Timing Calibration Register](#)) and DAI is set in Mode register (see [MPDDRC Mode Register](#)).
  21. A Normal Mode command is provided. Program the Normal mode in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

---

22. In the DDR configuration register (SFR\_DDRCCFG), the application must write a '0' to bits 17 and 16 to close the input buffers. The buffers are then driven by the HMPDDRC controller.
23. Write the refresh rate into the COUNT field in the Refresh Timer register (MPDDRC\_RTR). To compute the value, see [MPDDRC Refresh Timer Register](#).

After initialization, the low-power DDR2-SDRAM devices are fully functional.

### 35.4.4 DDR3-SDRAM/DDR3L-SDRAM Initialization

The initialization sequence is generated by software. The DDR3-SDRAM devices are initialized by the following sequence:

1. Program the memory device type in the Memory Device register (MPDDRC\_MD).
2. Program the shift sampling value in the Read Data Path register (MPDDRC\_RD\_DATA\_PATH)
3. Program features of the DDR3-SDRAM device in the Configuration register (MPDDRC\_CR) (number of columns, rows, banks, CAS latency and output driver impedance control) and in the Timing Parameter 0 register/Timing Parameter 1 register (MPDDRC\_TPR0/1) (asynchronous timing - TRC, TRAS, etc.).
4. A NOP command is issued to the DDR3-SDRAM. Program the NOP command in the Mode register (MPDDRC\_MR). The application must configure the MODE field to 1 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR3-SDRAM address to acknowledge this command. The clocks which drive the DDR3-SDRAM device are now enabled.
5. A pause of at least 500  $\mu$ s must be observed before a signal toggle.
6. A NOP command is issued to the DDR3-SDRAM. Program the NOP command in the MPDDRC\_MR. The application must configure the MODE field to 1 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR3-SDRAM address to acknowledge this command. CKE is now driven high.
7. An Extended Mode Register Set (EMRS2) cycle is issued to choose between commercial or high temperature operations. The application must configure the MODE field to 5 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR3-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[2] is set to 0, BA[1] is set to 1 and signal BA[0] is set to 0. For example: with a 16-bit, 1-Gbit, DDR3-SDRAM (14 rows, 10 columns, 8 banks), the DDR3-SDRAM write access should be done at the address: `BASE_ADDRESS_DDR + 0x04000000`; with a 32-bit, 1-Gbit, DDR3-SDRAM (14 rows, 10 columns, 8 banks), the SDRAM write access should be done at the address: `BASE_ADDRESS_DDR + 0x08000000`.  
**Note:** This address is given as an example only. The real address depends on the implementation in the product.
8. An Extended Mode Register Set (EMRS3) cycle is issued to set the Extended Mode register to 0. The application must configure the MODE field to 5 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR3-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[2] is set to 0, BA[1] is set to 1 and signal BA[0] is set to 1. For example: with a 16-bit, 1-Gbit, DDR3-SDRAM (14 rows, 10 columns, 8 banks), the DDR3-SDRAM write access should be done at the address: `BASE_ADDRESS_DDR + 0x06000000`; with a 32-bit, 1-Gbit, DDR3-SDRAM (14 rows, 10 columns, 8 banks), the SDRAM write access should be done at the address: `BASE_ADDRESS_DDR + 0x0C000000`.
9. An Extended Mode Register Set (EMRS1) cycle is issued to disable and to program ODS (output drive strength). The application must configure the MODE field to 5 in the MPDDRC\_MR. Read the

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR3-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[2:1] is set to 0 and signal BA[0] is set to 1. For example: with a 16-bit, 1-Gbit, DDR3-SDRAM (14 rows, 10 columns, 8 banks), the DDR3-SDRAM write access should be done at the address: `BASE_ADDRESS_DDR + 0x02000000`; with a 32-bit, 1-Gbit, DDR3-SDRAM (14 rows, 10 columns, 8 banks), the SDRAM write access should be done at the address: `BASE_ADDRESS_DDR + 0x04000000`.

10. Write a '1' to the DLL bit (enable DLL reset) in the Configuration register (MPDDRC\_CR).
11. A Mode Register Set (MRS) cycle is issued to reset DLL. The application must configure the MODE field to 3 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR3-SDRAM to acknowledge this command. The write address must be chosen so that signals BA[2:0] are set to 0. For example, the SDRAM write access should be done at the address: `BASE_ADDRESS_DDR`.
12. A Calibration command (MRS) is issued to calibrate RTT and RON values for the Process Voltage Temperature (PVT). The application must configure the MODE field to 6 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR3-SDRAM to acknowledge this command. The write address must be chosen so that signals BA[2:0] are set to 0. For example, the SDRAM write access should be done at the address: `BASE_ADDRESS_DDR`.
13. A Normal Mode command is provided. Program the Normal mode in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR3-SDRAM address to acknowledge this command.
14. Write the refresh rate into the COUNT field in the Refresh Timer register (MPDDRC\_RTR). To compute the value, see [MPDDRC Refresh Timer Register](#).

After initialization, the DDR3-SDRAM devices are fully functional.

### 35.4.5 Low-power DDR3-SDRAM Initialization

The initialization sequence is generated by software. The low-power DDR3-SDRAM devices are initialized by the following sequence:

1. Program the memory device type in the Memory Device register (MPDDRC\_MD).
2. Program the shift sampling value in the Read Data Path register (MPDDRC\_RD\_DATA\_PATH).
3. Program features of the low-power DDR3-SDRAM device into and in the Configuration register (MPDDRC\_CR) (number of columns, rows, banks, CAS latency and output drive strength) and in the Timing Parameter 0 register/Timing Parameter 1 register (MPDDRC\_TPR0/1) (asynchronous timing: TRC, TRAS, etc.).
4. A NOP command is issued to the low-power DDR3-SDRAM. Program the NOP command in the Mode register (MPDDRC\_MR). The application must configure the MODE field to 1 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The clocks which drive the low-power DDR3-SDRAM devices are now enabled.
5. A pause of at least 100 ns must be observed before a signal toggle.
6. A NOP command is issued to the low-power DDR3-SDRAM. Program the NOP command in the MPDDRC\_MR. The application must configure the MODE field to 1 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. CKE is now driven high.
7. A pause of at least 200  $\mu$ s must be observed before issuing a Reset command.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

---

8. A Reset command is issued to the low-power DDR3-SDRAM. In MPDDRC\_MR, configure the MODE field to 7 and the MRS field to 63. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The Reset command is now issued.
9. A pause of at least  $t_{INIT5}$  must be observed before issuing any commands.
10. A Calibration command is issued to the low-power DDR3-SDRAM. Program the type of calibration in the Configuration register (MPDDRC\_CR): set the ZQ field to 3. In MPDDRC\_MR, configure the MODE field to 7 and the MRS field to 10. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The ZQ Calibration command is now issued. Program the type of calibration in the MPDDRC\_CR: set the ZQ field to 2.
11. A Mode register Write command is issued to the low-power DDR3-SDRAM. In MPDDRC\_MR, configure the MODE field to 7 and the MRS field to 1. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The Mode register Write command is now issued.
12. A Mode register Write command is issued to the low-power DDR3-SDRAM. In MPDDRC\_MR, configure the MODE field to 7 and the MRS field to 2. The Mode register Write command cycle is issued to program parameters of the low-power DDR3-SDRAM device, in particular CAS Latency. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The Mode register Write command is now issued.
13. A Mode register Write command is issued to the low-power DDR3-SDRAM. In the MPDDRC\_MR, configure the MODE field 7 and the MRS field to 3. The Mode register Write command cycle is issued to program parameters of the low-power DDR3-SDRAM device, in particular Drive Strength and Slew Rate. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The Mode register Write command is now issued.
14. A Mode register Write command is issued to the low-power DDR3-SDRAM. In MPDDRC\_MR, configure the MODE field to 7 and the MRS field to 16. The Mode register Write command cycle is issued to program parameters of the low-power DDR3-SDRAM device, in particular Partial Array Self Refresh (PASR). Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The Mode register Write command is now issued.
15. In the DDR Configuration register (SFR\_DDRCFG), the application must write a '1' to bits 17 and 16 to open the input buffers.
16. A NOP command is issued to the low-power DDR3-SDRAM. Program the NOP command in the Mode register (MPDDRC\_MR). The application must configure the MODE field to 1 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command.
17. A Mode register Read command is issued to the low-power DDR3-SDRAM. In MPDDRC\_MR, configure the MODE field to 7 and the MRS field to 5. The Mode register Read command cycle is used to read the LPDDR3 Manufacturer ID from the low-power DDR3-SDRAM mode registers. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The Mode register Read command is now issued. The LPDDR3 Manufacturer ID is set in register MPDDRC\_MD. See [MPDDRC Memory Device Register](#).

18. A Mode register Read command is issued to the low-power DDR3-SDRAM. In MPDDRC\_MR, configure the MODE field to 7 and the MRS field to 6. The Mode register Read command cycle is used to read the Revision ID1 from the low-power DDR3-SDRAM mode registers. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The Mode register Read command is now issued. Revision ID1 is set in register MPDDRC\_MD. See [MPDDRC Memory Device Register](#).
19. A Mode register Read command is issued to the low-power DDR3-SDRAM. In MPDDRC\_MR, configure the MODE field to 7 and the MRS field to 8. The Mode register Read command cycle is used to read memory organization (I/O width, Density, Type) from the low-power DDR3-SDRAM mode registers. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The Mode register Read command is now issued. Memory organization is set in register MPDDRC\_MD. See [MPDDRC Memory Device Register](#).
20. A Mode register Read command is issued to the low-power DDR3-SDRAM. In MPDDRC\_MR, configure the MODE field to 7 and the MRS field to 0. The Mode register Read command cycle is used to read the device information (RZQI, DAI) from the low-power DDR3-SDRAM mode registers. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The Mode register Read command is now issued. Device information RZQI is set in register Timing Calibration (see [MPDDRC Low-power DDR2 Low-power DDR3 and DDR3 Timing Calibration Register](#)) and DAI is set in Mode register (see [MPDDRC Mode Register](#)).
21. A Normal Mode command is provided. Program the Normal mode in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command.
22. In the DDR Configuration register (SFR\_DDRCCFG), the application must write a '0' to bits 17 and 16 to close the input buffers. The buffers are then driven by the HMPDDRC controller.
23. Write the refresh rate into the COUNT field in the Refresh Timer register (MPDDRC\_RTR). To compute the value, see [MPDDRC Refresh Timer Register](#).

After initialization, the low-power DDR3-SDRAM devices are fully functional.

## 35.5 Functional Description

### 35.5.1 DDR-SDRAM Controller Write Cycle

The MPDDRC provides burst access or single access in Normal mode (MPDDRC\_MR.MODE = 0). Whatever the access type, the MPDDRC keeps track of the active row in each bank, thus maximizing performance.

The DDR-SDRAM device is programmed with a burst length (bl) equal to 8. This determines the length of a sequential data input by the write command that is set to 8. The latency from write command to data input depends on the memory type, as shown in the following table.

**Table 35-1. CAS Write Latency**

Memory Devices	CAS Write Latency (CWL)
Low-power DDR1-SDRAM	1
Low-power DDR2-SDRAM	1

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

.....continued	
Memory Devices	CAS Write Latency (CWL)
DDR2-SDRAM	2
Low-power DDR3-SDRAM	1/3
DDR3-SDRAM (DLL Off)	6

**Note:** In the case of low-power DDR3-SDRAM, the CAS Write Latency (CWL) of 1 is optional. The MPDDRC supports this feature. Refer to the low-power DDR3-SDRAM datasheet for details.

To initiate a single access, the MPDDRC checks if the page access is already open. If row/bank addresses match with the previous row/bank addresses, the controller generates a write command. If the bank addresses are not identical or if bank addresses are identical but the row addresses are not identical, the controller generates a precharge command, activates the new row and initiates a write command. To comply with DDR-SDRAM timing parameters, additional clock cycles are inserted between precharge/active ( $t_{RP}$ ) commands and active/write ( $t_{RCD}$ ) commands. As the burst length is set to 8, in case of single access, it has to stop the burst, otherwise seven invalid values may be written. In case of the DDR-SDRAM device, the burst stop command is not supported for the burst write operation. Thus, in order to interrupt the write operation, the DM (data mask) input signal must be set to 1 to mask invalid data (see Figures [Single Write Access, Row Closed, DDR-SDRAM Devices](#) and [Burst Write Access, Row Closed, DDR-SDRAM Devices](#)), and DQS must continue to toggle.

To initiate a burst access, the MPDDRC uses the transfer type signal provided by the master requesting the access. If the next access is a sequential write access, writing to the DDR-SDRAM device is carried out. If the next access is a write non-sequential access, then an automatic access break is inserted, the MPDDRC generates a precharge command, activates the new row and initiates a write command. To comply with DDR-SDRAM timing parameters, additional clock cycles are inserted between precharge/active ( $t_{RP}$ ) commands and active/write ( $t_{RCD}$ ) commands.

For the definition of timing parameters, see [MPDDRC Timing Parameter 0 Register](#).

Write accesses to the DDR-SDRAM device are burst oriented and the burst length is programmed to 8. It determines the maximum number of column locations that can be accessed for a given write command. When the write command is issued, eight columns are selected. All accesses for that burst take place within these eight columns, thus the burst wraps within these eight columns if a boundary is reached. These eight columns are selected by  $addr[13:3]$ .  $addr[2:0]$  is used to select the starting location within the block.

In case of incrementing burst (INCR/INCR4/INCR8/INCR16), the addresses can cross the 16-byte boundary of the DDR-SDRAM device. For example, when a transfer (INCR4) starts at address 0x0C, the next access is 0x10, but since the burst length is programmed to 8, the next access is at 0x00. Since the boundary is reached, the burst is wrapped. The MPDDRC takes this feature of the DDR-SDRAM device into account. In case of a transfer starting at address 0x04/0x08/0x0C or starting at address 0x10/0x14/0x18/0x1C, two write commands are issued to avoid wrapping when the boundary is reached. The last write command is subject to DM input logic level. If DM is registered high, the corresponding data input is ignored and the write access is not done. This avoids additional writing.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

**Figure 35-2. Single Write Access, Row Closed, DDR-SDRAM Devices**

**Figure 35-3. Single Write Access, Row Closed, DDR2-SDRAM Devices**

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

**Figure 35-5. Burst Write Access, Row Closed, DDR2-SDRAM Devices**

A write command can be followed by a read command. To avoid breaking the current write burst,  $t_{WTR}/t_{WRD}$  ( $bl/2 + 2 = 6$  cycles) should be met. See the figure below.

**Figure 35-6. Write Command Followed by a Read Command without Burst Write Interrupt, DDR-SDRAM Devices**

In case of a single write access, write operation should be interrupted by a read access but DM must be input 1 cycle prior to the read command to avoid writing invalid data. See the figure below.

### 35.5.2 DDR-SDRAM Controller Read Cycle

The MPDDRC provides burst access or single access in Normal mode (MPDDRC\_MR.MODE = 0). Whatever the access type, the MPDDRC keeps track of the active row in each bank, thus maximizing performance of the MPDDRC.

The DDR-SDRAM devices are programmed with a burst length equal to 8 which determines the length of a sequential data output by the read command that is set to 8. The latency from read command to data output depends on the memory type, as shown in the following table. This value is programmed during the initialization phase (see [Product Dependencies](#), [Initialization Sequence](#)).

**Table 35-2. CAS Read Latency**

Memory Devices	CAS Read Latency
Low-power DDR1-SDRAM	2/3
Low-power DDR2-SDRAM	3
DDR2-SDRAM	3
Low-power DDR3-SDRAM	3/6
DDR3-SDRAM (DLL Off)	5/6

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

---

**Note:** In the case of low-power DDR3-SDRAM, the CAS Read Latency (CRL) of 3 is optional. The MPDDRC supports this feature. Refer to the low-power DDR3-SDRAM datasheet for details.

To initiate a single access, the MPDDRC checks if the page access is already open. If row/bank addresses match with the previous row/bank addresses, the controller generates a read command. If the bank addresses are not identical or if bank addresses are identical but the row addresses are not identical, the controller generates a precharge command, activates the new row and initiates a read command. To comply with DDR-SDRAM timing parameters, additional clock cycles are inserted between precharge/active ( $t_{RP}$ ) commands and active/read ( $t_{RCD}$ ) commands. After a read command, additional wait states are generated to comply with CAS latency. The MPDDRC supports a CAS latency delay of 2, 3, 5 or 6 clock cycles. As the burst length is set to 8, in case of a single access or a burst access inferior to 8 data requests, it has to stop the burst, otherwise an additional seven or X values could be read. The Burst Stop command (BST) is used to stop output during a burst read. If the DDR2-SDRAM Burst Stop command is not supported by the JEDEC standard, in a single read access, an additional seven unwanted data will be read.

To initiate a burst access, the MPDDRC checks the transfer type signal. If the next accesses are sequential read accesses, reading to the SDRAM device is carried out. If the next access is a read non-sequential access, then an automatic page break can be inserted. If the bank addresses are not identical or if bank addresses are identical but the row addresses are not identical, the controller generates a precharge command, activates the new row and initiates a read command. If page access is already open, a read command is generated.

To comply with DDR-SDRAM timing parameters, additional clock cycles are inserted between precharge/active ( $t_{RP}$ ) commands and active/read ( $t_{RCD}$ ) commands. The MPDDRC supports a CAS latency delay of 2, 3, 5 or 6 clock cycles. During this delay, the controller uses internal signals to anticipate the next access and improve the performance of the controller. Depending on the latency, the MPDDRC anticipates 2, 3, 5 or 6 read accesses. In case of burst of specified length, accesses are not anticipated, but if the burst is broken (border, Busy mode, etc.), the next access is treated as an incrementing burst of unspecified length, and depending on the latency, the MPDDRC anticipates 2, 3, 5 or 6 read accesses.

For the definition of timing parameters, see [MPDDRC Configuration Register](#).

Read accesses to the DDR-SDRAM are burst oriented and the burst length is programmed to 8. The burst length determines the maximum number of column locations that can be accessed for a given read command. When the read command is issued, eight columns are selected. All accesses for that burst take place within these eight columns, meaning that the burst wraps within these eight columns if the boundary is reached. These eight columns are selected by `addr[13:3]`; `addr[2:0]` is used to select the starting location within the block.

In case of incrementing burst (INCR/INCR4/INCR8/INCR16), the addresses can cross the 16-byte boundary of the DDR-SDRAM device. For example, when a transfer (INCR4) starts at address 0x0C, the next access is 0x10, but since the burst length is programmed to 8, the next access is 0x00. Since the boundary is reached, the burst wraps. The MPDDRC takes into account this feature of the SDRAM device. In case of the DDR-SDRAM device, transfers start at address 0x04/0x08/0x0C. Two read commands are issued to avoid wrapping when the boundary is reached. The last read command may generate additional reading (1 read cmd = 4 DDR words).

To avoid additional reading, it is possible to use the burst stop command to truncate the read burst and to decrease power consumption. The DDR2-SDRAM devices do not support the burst stop command.

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

**Figure 35-9. Single Read Access, Row Closed, Latency = 2, DDR-SDRAM Devices**

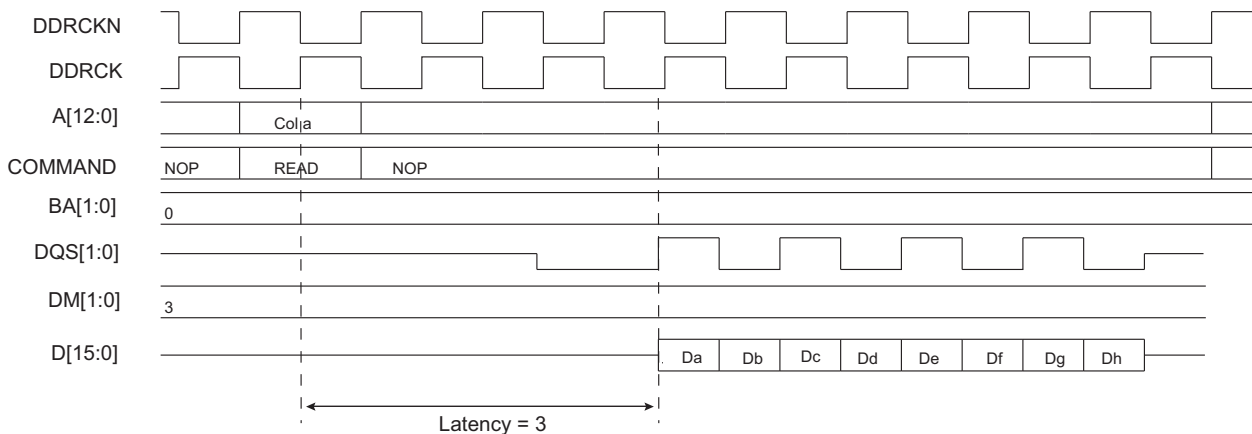

**Figure 35-10. Single Read Access, Row Closed, Latency = 3, DDR2-SDRAM Devices**

**Figure 35-11. Burst Read Access, Latency = 2, DDR-SDRAM Devices**

**Figure 35-12. Burst Read Access, Latency = 3, DDR2-SDRAM Devices**

### 35.5.3 Refresh (Autorefresh Command)

#### 35.5.3.1 All Banks Autorefresh

The All Banks Autorefresh command performs a refresh operation on all banks. An autorefresh command is used to refresh the external device. Refresh addresses are generated internally by the DDR-SDRAM device and incremented after each autorefresh automatically. The MPDDRC generates these autorefresh commands periodically. A timer is loaded in the MPDDRC\_RTR with the value that indicates the number of clock cycles between refresh cycles (see [MPDDRC Refresh Timer Register](#)). When the MPDDRC initiates a refresh of the DDR-SDRAM device, internal memory accesses are not delayed. However, if the CPU tries to access the DDR-SDRAM device, the slave indicates that the device is busy. A refresh request does not interrupt a burst transfer in progress. This feature is activated by setting Per-bank Refresh bit (REF\_PB) to 0 in the MPDDRC\_RTR (see [MPDDRC Refresh Timer Register](#)).

#### 35.5.3.2 Per-bank Autorefresh

The low-power DDR2-SDRAM and low-power DDR3-SDRAM embeds a new Per-bank Refresh command which performs a refresh operation on the bank scheduled by the bank counter in the memory device. The Per-bank Refresh command is executed in a fixed sequence order of round-robin type: “0-1-2-3-4-5-6-7-0-1-...”. The bank counter is automatically cleared upon issuing a RESET command or when exiting from Self-refresh mode, in order to ensure the synchronism between SDRAM memory device and the MPDDRC. The bank addressing for the Per-bank Refresh count is the same as established in the Single-bank Precharge command. This feature is activated by setting the Per-bank Refresh bit (REF\_PB) to 1 in the MPDDRC\_RTR (see [MPDDRC Refresh Timer Register](#)). This feature masks the latency due to the refresh procedure. The target bank is inaccessible during the Per-bank Refresh cycle period ( $t_{RFCpb}$ ), however other banks within the device are accessible and may be addressed during the “Per-bank Refresh” cycle. During the REFpb operation, any bank other than the one being refreshed can be maintained in active state or accessed by a read or a write command. When the “Per-bank Refresh” cycle is completed, the affected bank will be in idle state.

#### 35.5.3.3 Adjust Autorefresh Rate

The low-power DDR2-SDRAM and low-power DDR3-SDRAM embeds an internal register, Mode register 19 (Refresh mode). The content of this register allows to adjust the interval of autorefresh operations according to temperature variation. This feature is activated by setting the Adjust Refresh bit [ADJ\_REF] to 1 in the MPDDRC\_RTR (see [MPDDRC Refresh Timer Register](#)). When this feature is enabled, a Mode Register Read (MRR) command is performed every  $16 \times t_{REFI}$  (average time between REFRESH commands). Depending on the read value, the autorefresh interval will be modified. In case of high temperature, the interval is reduced and in case of low temperature, the interval is increased.

### 35.5.4 Power Management

#### 35.5.4.1 Self-refresh Mode

This mode is activated by configuring the Low-power Command bit (LPCB) to 1 in the [MPDDRC Low-Power Register](#) (MPDDRC\_LPR).

Self-refresh mode is used in Powerdown mode, i.e., when no access to the DDR-SDRAM device is possible. In this case, power consumption is very low. In Self-refresh mode, the DDR-SDRAM device retains data without external clocking and provides its own internal clocking, thus performing its own autorefresh cycles. During the self-refresh period, CKE is driven low. As soon as the DDR-SDRAM device is selected, the MPDDRC provides a sequence of commands and exits Self-refresh mode.

The MPDDRC reenables Self-refresh mode as soon as the DDR-SDRAM device is not selected. It is possible to define when Self-refresh mode is to be enabled by configuring the TIMEOUT field in the MPDDRC\_LPR:

- 0: Self-refresh mode is enabled as soon as the DDR-SDRAM device is not selected.
- 1: Self-refresh mode is enabled 64 clock cycles after completion of the last access.
- 2: Self-refresh mode is enabled 128 clock cycles after completion of the last access.

This controller also interfaces the low-power DDR-SDRAM. To optimize power consumption, the Low Power DDR SDRAM provides programmable self-refresh options comprised of Partial Array Self Refresh (full, half, quarter and 1/8 and 1/16 array).

Disabled banks are not refreshed in Self-refresh mode. This feature permits to reduce the self-refresh current. In case of low-power DDR1-SDRAM, the Extended Mode register controls this feature. It includes Temperature Compensated Self-refresh (TCSR) and Partial Array Self-refresh (PASR) parameters and the drive strength (DS) (see [MPDDRC Low-Power Register](#)). In case of low-power DDR2-SDRAM and low-power DDR3-SDRAM, the Mode Registers 16 and 17 control this feature, including PASR Bank Mask (BK\_MASK) and PASR Segment Mask (SEG\_MASK) parameters and drives strength (DS) (see [MPDDRC Low-power DDR2 Low-power DDR3 Low-power Register](#)). These parameters are set during the initialization phase. After initialization, as soon as the PASR/DS/TCSR fields or BK\_MASK/SEG\_MASK/DS are modified, the memory device Extended Mode register or Mode registers 3/16/17 are automatically accessed. Thus if MPDDRC does not share an external bus with another controller, PASR/DS/TCSR and BK\_MASK/SEG\_MASK/DS bits are updated before entering Self-refresh mode or during a refresh command. If MPDDRC does share an external bus with another controller, PASR/DS/TCSR and BK\_MASK/SEG\_MASK/DS bits are also updated during a pending read or write access. This type of update depends on the UPD\_MR bit (see [MPDDRC Low-Power Register](#)).

The low-power DDR1-SDRAM must remain in Self-refresh mode during the minimum of TRFC periods (see [MPDDRC Timing Parameter 1 Register](#)), and may remain in Self-refresh mode for an indefinite period.

The DDR2-SDRAM must remain in Self-refresh mode during the minimum of  $t_{CKE}$  periods (see the memory device datasheet), and may remain in Self-refresh mode for an indefinite period.

The low-power DDR2-SDRAM and low-power DDR3-SDRAM must remain in Self-refresh mode for the minimum of  $t_{CKESR}$  periods (see the memory device datasheet) and may remain in Self-refresh mode for an indefinite period.

The DDR3-SDRAM must remain in Self-refresh mode for the minimum of  $t_{CKESR}$  periods (see the memory device datasheet) and may remain in Self-refresh mode for an indefinite period.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

**Figure 35-13. Self-refresh Mode Entry, TIMEOUT = 0**

**Figure 35-14. Self-refresh Mode Entry, TIMEOUT = 1 or 2**

**Figure 35-15. Self-refresh Mode Exit**

### 35.5.4.2 Powerdown Mode

This mode is activated by configuring the Low-power Command bit (LPCB) to 2 in the [MPDDRC Low-Power Register](#) (MPDDRC\_LPR).

Powerdown mode is used when no access to the DDR-SDRAM device is possible. In this mode, power consumption is greater than in Self-refresh mode. This state is similar to Normal mode (no Low-power

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

mode/no Self-refresh mode), but the CKE pin is low and the input and output buffers are deactivated as soon the DDR-SDRAM device is no longer accessible. In contrast to Self-refresh mode, the DDR-SDRAM device cannot remain in Low-power mode longer than one refresh period (64 ms/32 ms). As no autorefresh operations are performed in this mode, the MPDDRC carries out the refresh operation. For the low-power DDR-SDRAM devices, a NOP command must be generated for a minimum period defined in the TXP field of the Timing Parameter 1 register (MPDDRC\_TPR1). For DDR-SDRAM devices, a NOP command must be generated for a minimum period defined in the TXP field of MPDDRC\_TPR1 (see [MPDDRC Timing Parameter 1 Register](#)) and in the TXARD and TXARDS fields of MPDDRC\_TPR2 (see [MPDDRC Timing Parameter 2 Register](#)) for DDR2\_SDRAM devices. In addition, low-power DDR-SDRAM and DDR-SDRAM must remain in Powerdown mode for a minimum period corresponding to  $t_{CKE}$ ,  $t_{PD}$ , etc. (refer to the memory device datasheet).

The exit procedure is faster than in Self-refresh mode. See the following figure. The MPDDRC returns to Powerdown mode as soon as the DDR-SDRAM device is not selected. It is possible to define when Powerdown mode is enabled by configuring the TIMEOUT field in the MPDDRC\_LPR:

- 0: Powerdown mode is enabled as soon as the DDR-SDRAM device is not selected.
- 1: Powerdown mode is enabled 64 clock cycles after completion of the last access.
- 2: Powerdown mode is enabled 128 clock cycles after completion of the last access.

**Figure 35-16. Powerdown Entry/Exit, TIMEOUT = 0**

### 35.5.4.3 Deep Powerdown Mode

The Deep Powerdown mode is a feature of low-power DDR-SDRAM. When this mode is activated, all internal voltage generators inside the device are stopped and all data is lost.

Deep Powerdown mode is activated by configuring the Low-power Command bit (LPCB) to 3 in the [MPDDRC Low-Power Register](#) (MPDDRC\_LPR). When this mode is enabled, the MPDDRC leaves Normal mode (MPDDRC\_MR.MODE = 0) and the controller is frozen. The clock can be stopped during Deep Powerdown mode by setting the CLK\_FR field to 1.

Before enabling this mode, the user must make sure there is no access in progress. To exit Deep Powerdown mode, the Low-power Command bit (LPCB) and Clock Frozen bit (CLK\_FR) must be 0 and the initialization sequence must be generated by software. See [Low-power DDR1-SDRAM Initialization](#) or [Low-power DDR2-SDRAM Initialization](#) or [Low-power DDR3-SDRAM Initialization](#).

**Figure 35-17. Deep Powerdown Mode Entry**

#### 35.5.4.4 Change Frequency During Self-Refresh Mode with Low-power DDR-SDRAM Devices and DDR3-SDRAM

To change frequency, Self-refresh mode must be activated. This is done by configuring the Low-power Command bit (LPCB) to 1 and writing a '1' to the Change Frequency Command bit (CHG\_FR) in the Low-power register (MPDDRC\_LPR).

Once the low-power DDR-SDRAM is in Self-refresh mode, the user must make sure there is no access in progress. Then, the user can change the clock frequency. The device input clock frequency changes only within minimum and maximum operating frequencies as specified by the low-power DDR-SDRAM and DDR3-SDRAM providers. Once the input clock frequency is changed, new stable clocks must be provided to the device before exiting from Self-refresh mode.

To exit from Self-refresh mode, the DDR-SDRAM device must be selected. The MPDDRC provides a sequence of commands and exits Self-refresh mode.

During a change frequency procedure, the Change Frequency Command bit (CHG\_FR) is set to 0 automatically.

The Enable Read Measure feature is not supported during a change frequency procedure (see [“ENRDM: Enable Read Measure”](#)).

It is not possible to change the frequency with DDR2-SDRAM devices.

#### 35.5.4.5 Reset Mode

The Reset mode is a feature of DDR2-SDRAM. This mode is activated by configuring the Low-power Command bit (LPCB) to 3 and writing a '1' to the Clock Frozen Command bit (CLK\_FR) in the Low-power register (MPDDRC\_LPR).

When this mode is enabled, the MPDDRC leaves Normal mode (MPDDRC\_MR.MODE = 0) and the controller is frozen. Before enabling this mode, the user must make sure there is no access in progress.

To exit Reset mode, the Low-power Command bit (LPCB) must be configured to 0, the Clock Frozen Command bit (CLK\_FR) must be written to '0' and the initialization sequence must be generated by software (see [DDR2-SDRAM Initialization](#)).

### 35.5.5 Multiport Functionality

The DDR-SDRAM protocol imposes a check of timings prior to performing a read or a write access, thus decreasing system performance. An access to DDR-SDRAM is performed if banks and rows are open (or active). To activate a row in a particular bank, the last open row must be deactivated and a new row must be open. Two DDR-SDRAM commands must be performed to open a bank: Precharge command and

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

Activate command with respect to  $T_{RP}$  timing. Before performing a read or write command,  $T_{RCD}$  timing must be checked.

This operation generates a significant bandwidth loss (see the following figure).

**Figure 35-18.  $T_{RP}$  and  $T_{RCD}$  Timings**

The multiport controller is designed to mask these timings and thus improve the system bandwidth.

The MPDDRC is a multiport controller whereby eight masters can simultaneously reach the controller. This feature improves the bandwidth of the system because it can detect eight requests on the AHB slave inputs and thus anticipate the commands that follow, Precharge command and Activate command in bank X during the current access in bank Y. This masks  $t_{RP}$  and  $t_{RCD}$  timings (see the following figure). In the best case, all accesses are done as if the banks and rows were already open. The best condition is met when the eight masters work in different banks. In the case of eight simultaneous read accesses, when the four or eight banks and associated rows are open, the controller reads with a continuous flow and masks the CAS latency for each access. To allow a continuous flow, the read command must be set at 2, 3, 5 or 6 cycles (CAS latency) before the end of the current access. The arbitration scheme must be changed since the round-robin arbitration cannot be respected. If the controller anticipates a read access, and thus a master with a high priority arises before the end of the current access, then this master will not be serviced.

**Figure 35-19. Anticipate Precharge/Activate Command in Bank 2 during Read Access in Bank 1**

MPDDRC is a multiport controller that embeds three arbitration mechanisms based on round-robin arbitration which allows to share the external device between different masters when two or more masters try to access the DDR-SDRAM device at the same time.

The three arbitration types are round-robin arbitration and two weighted round-robin arbitrations. For weighted round-robin arbitrations, the priority can be given either depending on the number of requests or words per port, or depending on the required bandwidth per port. The type of arbitration can be chosen by setting the ARB field in the Configuration Arbiter register (MPDDRC\_CONF\_ARBITER) (see [MPDDRC Configuration Arbiter Register](#)).

### 35.5.5.1 Round-robin Arbitration

Round-robin arbitration is used when the ARB field is set to 0 (see [MPDDRC Configuration Arbiter Register](#)). This algorithm dispatches the requests from different masters to the DDR-SDRAM device in a round-robin manner. If two or more master requests arise at the same time, the master with the lowest number is serviced first, then the others are serviced in a round-robin manner.

To avoid burst breaking and to provide the maximum throughput for the DDR-SDRAM device, arbitration must only take place during the following cycles:

1. Idle cycles: when no master is connected to the DDR-SDRAM device.
2. Single cycles: when a slave is currently doing a single access.
3. End of Burst cycles: when the current cycle is the last cycle of a burst transfer:
  - For bursts of defined length, predicted end of burst matches the size of the transfer.
  - For bursts of undefined length, predicted end of burst is generated at the end of each four-beat boundary inside the INCR transfer.
4. Anticipated Access: when an anticipated read access is done while the current access is not complete, the arbitration scheme can be changed if the anticipated access is not the next access serviced by the arbitration scheme.

### 35.5.5.2 Request-word Weighted Round-robin Arbitration

In request-word weighted round-robin arbitration, the weight is the number of requests or the number of words per port.

This arbitration scheme is enabled by configuring the ARB field to 1 (see [MPDDRC Configuration Arbiter Register](#)). This algorithm grants a port for  $X^{(1)}$  consecutive first transfer (htrans = NON SEQUENTIAL) of a burst or X single transfer, or for X word transfers. It is possible to choose between an arbitration scheme by request or by word per port by setting the RQ\_WD\_Px field (see [MPDDRC Configuration Arbiter Register](#)).

Note: 1. X is an integer value provided by some master modules to the arbiter.

It is also possible for the user to provide the number of requests or words (by overwriting the information provided by a master) on master basis by configuring the MA\_PR\_Px field. Depending on the application, it is possible to reduce or increase the number of these requests or words by configuring the NRD\_NWD\_BDW\_Px fields (see [MPDDRC Configuration Arbiter Register](#)).

The TIMEOUT\_Px field defines the delay between two accesses on the same port in number of cycles before re-arbitrating the access to another port. This field allows to avoid a timeout on the system because some masters have the particularity to add idle cycles between two consecutive accesses (see [MPDDRC Configuration Arbiter Register](#)).

This algorithm dispatches the requests from different masters to the DDR-SDRAM device in a round-robin manner. If two or more master requests arise at the same time, the master with the lowest number is

serviced first, then the others are serviced in a round-robin manner when the number of requests or words is reached or when the timeout value is reached.

To avoid burst breaking and to provide the maximum throughput for the DDR-SDRAM device, arbitration must only take place during the following cycles:

1. Timeout is reached: the delay between two accesses is equal to TIMEOUT\_Px.
2. Number of requests or words is reached: when the current cycle is the last cycle of a transfer.

### 35.5.5.3 Bandwidth Weighted Round-robin Arbitration

In bandwidth weighted round-robin arbitration, a minimum bandwidth is guaranteed per port.

This arbitration scheme is enabled when the ARB field is set to 2 (see [MPDDRC Configuration Arbiter Register](#)).

This algorithm grants to each port a percentage of the bandwidth. The NRD\_NWD\_BDW\_Px field defines the percentage allocated to each port.

The percentage of the bandwidth is programmed with the NRD\_NWD\_BDW\_Px fields (see [MPDDRC Configuration Arbiter Register](#)).

The TIMEOUT\_Px field defines the delay between two accesses on the same port in number of cycles re-arbitrating the access to another port. This field allows to avoid a timeout on the system because some masters have the particularity to add idle cycles between two consecutive accesses (see [MPDDRC Configuration Arbiter Register](#)).

This algorithm dispatches the requests from different masters to the DDR-SDRAM device in a round-robin manner. If two or more master requests arise at the same time, the master with the lowest number is serviced first, then the others are serviced in a round-robin manner when the allocated bandwidth is reached or when the timeout value is reached.

The BDW\_BURST field allows to arbitrate either when the current master reaches exactly the programmed bandwidth, or when the current master reaches exactly the programmed bandwidth and the current access is ended (see [MPDDRC Configuration Arbiter Register](#)).

To provide the maximum throughput for the DDR-SDRAM device, arbitration must only take place during the following cycles:

1. Timeout is reached: the delay between two accesses is equal to TIMEOUT\_Px.
2. Allocated Bandwidth is reached although the current cycle is not ended.
3. Allocated Bandwidth is reached and the current cycle is the last cycle of a transfer.

### 35.5.6 Scrambling/Unscrambling Function

The external data bus can be scrambled in order to prevent intellectual property data located in off-chip memories from being easily recovered by analyzing data at the package pin level of either the microcontroller or the memory device.

The scrambling and unscrambling are performed on-the-fly without additional wait states.

The scrambling method depends on two user-configurable key registers, KEY1 in the "[MPDDRC OCMS KEY1 Register](#)" and KEY2 in the "[MPDDRC OCMS KEY2 Register](#)". These key registers are only accessible in Write mode.

The key must be securely stored in a reliable non-volatile memory in order to recover data from the off-chip memory. Any data scrambled with a given key cannot be recovered if the key is lost.

The scrambling/unsrambling function can be enabled or disabled by programming the “[MPDDRC OCMS Register](#)”.

### 35.5.7 Register Write Protection

To prevent any single software error from corrupting MPDDRC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [MPDDRC Write Protection Mode Register](#) (MPDDRC\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the MPDDRC Write Protection Status Register (MPDDRC\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading MPDDRC\_WPSR.

The following registers are write-protected when the bit WPEN is set:

- [MPDDRC Mode Register](#)
- [MPDDRC Refresh Timer Register](#)
- [MPDDRC Configuration Register](#)
- [MPDDRC Timing Parameter 0 Register](#)
- [MPDDRC Timing Parameter 1 Register](#)
- [MPDDRC Memory Device Register](#)
- [MPDDRC Low-power DDR2 Low-power DDR3 and DDR3 Calibration and MR4 Register](#)
- [MPDDRC OCMS Register](#)
- [MPDDRC OCMS KEY1 Register](#)
- [MPDDRC OCMS KEY2 Register](#)

### 35.5.8 Monitor

The MPDDRC embeds a monitor which collects bus transaction information from four/eight ports of MPDDRC. This information, such as accumulated latency (MPDDRC Monitor Information Port x Register (TOTAL\_LATENCY)) or number of transfers (MPDDRC Monitor Information Port x Register (NB\_TRANSFERS)), can be used to calculate the average latency for each port.

Configuration registers (“[MPDDRC Monitor Configuration Register](#)”, “[MPDDRC Monitor Address High/Low Port x Register](#)”) are used to define the type of transaction collected (read, write or read/write) and the address range snooped.

Before enabling the monitor, the address range must be defined. This space will be snooped. To enable the monitor, the “[EN\\_MONI: Enable Monitor](#)” bit must be set to 1 and the “[RUN: Control Monitor](#)” bit must be set to 1.

## 35.6 Software Interface/SDRAM Organization, Address Mapping

The DDR-SDRAM address space is organized into banks, rows and columns. The MPDDRC maps different memory types depending on values set in the Configuration register (MPDDRC\_CR) (see [MPDDRC Configuration Register](#)). The tables that follow illustrate the relation between CPU addresses and columns, rows and banks addresses for 16/32-bit memory data bus widths.

The MPDDRC supports address mapping in Linear mode.

Sequential mode is a method for address mapping where banks alternate at each last DDR-SDRAM page of the current bank.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

Interleaved mode is a method for address mapping where banks alternate at each DDR-SDRAM end of page of the current bank.

The MPDDRC makes the DDR-SDRAM device access protocol transparent to the user. The tables that follow illustrate the DDR-SDRAM device memory mapping seen by the user in correlation with the device structure. Various configurations are illustrated.

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7 Register Summary

The User Interface is connected to the APB bus. The MPDDRC is programmed using the registers listed in the following table.

Offset	Name	Bit Pos.								
0x00	MPDDRC_MR	7:0				DAI		MODE[2:0]		
		15:8	MRS[7:0]							
		23:16								
		31:24								
0x04	MPDDRC_RTR	7:0	COUNT[7:0]							
		15:8						COUNT[11:8]		
		23:16		MR4_VALUE[2:0]					REF_PB	ADJ_REF
		31:24								
0x08	MPDDRC_CR	7:0	DLL	CAS[2:0]			NR[1:0]		NC[1:0]	
		15:8		OCD[2:0]			ZQ[1:0]		DIS_DLL	DIC_DS
		23:16	UNAL	DECOD	NDQS	NB	LC_LPDDR1		ENRDM	DQMS
		31:24								
0x0C	MPDDRC_TPR0	7:0	TRCD[3:0]				TRAS[3:0]			
		15:8	TRC[3:0]				TWR[3:0]

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.1 MPDDRC Mode Register

**Name:** MPDDRC\_MR  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [MPDDRC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits 31-24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Greyed out bits 23-16]							
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	MRS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	[Greyed out bits 7-5]			DAI	MODE[2:0]			
Access				R	R/W		R/W	R/W
Reset				0	0		0	0

**Bits 15:8 – MRS[7:0]** Mode Register Select LPDDR2/LPDDR3

Configure this 8-bit field to program all mode registers included in the low-power DDR2-SDRAM device. This field is unique to the low-power DDR2-SDRAM devices and low-power DDR3-SDRAM devices.

**Bit 4 – DAI** Device Auto-initialization Status

This field reports when the device auto-initialization is complete. When Backup mode is used, this information is lost after Backup mode exit.

Value	Name	Description
0	DAI_COMPLETE	DAI complete
1	DAI_IN_PROGESSS	DAI still in progress

**Bits 2:0 – MODE[2:0]** MPDDRC Command Mode

This field defines the command issued by the MPDDRC when the SDRAM device is accessed. This register is used to initialize the SDRAM device and to activate Deep Powerdown mode.

Value	Name	Description
0	NORMAL_CMD	Normal Mode. Any access to the MPDDRC is decoded normally. To activate this mode, the command must be followed by a write to the DDR-SDRAM.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

Value	Name	Description
1	NOP_CMD	The MPDDRC issues a NOP command when the DDR-SDRAM device is accessed regardless of the cycle. To activate this mode, the command must be followed by a write to the DDR-SDRAM.
2	PRCGALL_CMD	The MPDDRC issues the All Banks Precharge command when the DDR-SDRAM device is accessed regardless of the cycle. To activate this mode, the command must be followed by a write to the SDRAM.
3	LMR_CMD	The MPDDRC issues a Load Mode Register command when the DDR-SDRAM device is accessed regardless of the cycle. To activate this mode, the command must be followed by a write to the DDR-SDRAM.
4	RFSH_CMD	The MPDDRC issues an Autorefresh command when the DDR-SDRAM device is accessed regardless of the cycle. Previously, an All Banks Precharge command must be issued. To activate this mode, the command must be followed by a write to the DDR-SDRAM.
5	EXT_LMR_CMD	The MPDDRC issues an Extended Load Mode Register command when the SDRAM device is accessed regardless of the cycle. To activate this mode, the command must be followed by a write to the DDR-SDRAM. The write in the DDR-SDRAM must be done in the appropriate bank.
6	DEEP_CALIB_MD	Deep Power mode: Access to Deep Powerdown mode  Calibration command: to calibrate RTT and RON values for the Process Voltage Temperature (PVT) (DDR3-SDRAM device)
7	LPDDR2_LPDDR3_CMD	The MPDDRC issues an LPDDR2/LPDDR3 Mode Register command when the device is accessed regardless of the cycle. To activate this mode, the Mode Register command must be followed by a write to the low-power DDR2-SDRAM or to the low-power DDR3-SDRAM.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.2 MPDDRC Refresh Timer Register

**Name:** MPDDRC\_RTR  
**Offset:** 0x04  
**Reset:** 0x00300000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [MPDDRC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
	MR4_VALUE[2:0]						REF_PB	ADJ_REF	
Access		R	R	R			R/W	R/W	
Reset		0	1	1			0	0	
Bit	15	14	13	12	11	10	9	8	
	COUNT[11:8]								
Access					R/W	R/W	R/W	R/W	
Reset					0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
	COUNT[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	0	

**Bits 22:20 – MR4\_VALUE[2:0]** Content of MR4 Register

This field gives the content of MR4 register. This field is updated when MRR command is generated and Adjust Refresh.

Rate bit is enabled. Update is done when read value is different from MR4\_VALUE.

This mode is unique to the low-power DDR2-SDRAM devices and LPDDR3 JEDEC memory standards impose derating LPDDR2/LPDDR3 AC timings ( $t_{RCD}$ ,  $t_{RC}$ ,  $t_{RAS}$ ,  $t_{RP}$  and  $t_{RRD}$ ) when the value of MR4 is equal to 6. If the application needs to work in extreme conditions, the derating value must be added to AC timings before the power up sequence.

This mode is unique to the low-power DDR2-SDRAM devices and low-power DDR3-SDRAM devices.

**Bit 17 – REF\_PB** Refresh Per Bank

This mode is unique to the low-power DDR2-SDRAM devices and low-power DDR3-SDRAM devices.

Value	Description
0	Refresh all banks during autorefresh operation.
1	Refresh the scheduled bank by the bank counter in the memory interface.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### Bit 16 – ADJ\_REF Adjust Refresh Rate

This mode is unique to the low-power DDR2-SDRAM devices and low-power DDR3-SDRAM devices.

Value	Description
0	Adjust refresh rate is not enabled.
1	Adjust refresh rate is enabled.

### Bits 11:0 – COUNT[11:0] MPDDRC Refresh Timer Count

This 12-bit field is loaded into a timer which generates the refresh pulse. Each time the refresh pulse is generated, a refresh sequence is initiated.

The SDRAM requires Auto-refresh cycles at an average periodic interval of  $T_{\text{refi}}$ . The value to be loaded depends on the MPDDRC clock frequency MCK (Master Clock) and average periodic interval of  $T_{\text{refi}}$ .

For example, for an SDRAM with  $T_{\text{refi}} = 7.8 \mu\text{s}$  and a 133 MHz (7.5 ns) Master clock, the value of the COUNT field is configured:  $((7.8 \times 10^{-6}) / (7.5 \times 10^{-9})) = 1040$  or 0x0410.

Low-power DDR2-SDRAM and low-power DDR3-SDRAM devices support Per Bank Refresh operation. In this configuration, average time between refresh command is 0.975  $\mu\text{s}$ . The value of the COUNT field is configured depending on this value. For example, the value of a 133 MHz Master clock refresh timer is 130 or 0x82.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.3 MPDDRC Configuration Register

**Name:** MPDDRC\_CR  
**Offset:** 0x08  
**Reset:** 0x00207024  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [MPDDRC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	UNAL	DECOD	NDQS	NB	LC_LPDDR1			DQMS
Access	R/W	R/W	R/W	R/W	R/W			R/W
Reset	0	0	1	0	0			0
Bit	15	14	13	12	11	10	9	8
			OCD[2:0]		ZQ[1:0]		DIS_DLL	DIC_DS
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			1	1	1	0	0	0
Bit	7	6	5	4	3	2	1	0
	DLL	CAS[2:0]		NR[1:0]		NC[1:0]		
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	1	0	0	1	0	0

**Bit 23 – UNAL** This bit must always be written to 1

**Bit 22 – DECOD** Type of Decoding

Value	Name	Description
0	SEQUENTIAL	Method for address mapping where banks alternate at each last DDR-SDRAM page of the current bank.
1	INTERLEAVED	Method for address mapping where banks alternate at each DDR-SDRAM end of page of the current bank.

**Bit 21 – NDQS** Not DQS.

This bit is found only in the DDR2-SDRAM devices.

Value	Name	Description
0	ENABLED	Not DQS is enabled
1	DISABLED	Not DQS is disabled

**Bit 20 – NB** Number of Banks

LC\_LPDDR1 is set to 1, NB is not relevant.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

Value	Name	Description
0	4_BANKS	4-bank memory devices
1	8_BANKS	8 banks. Only possible when using DDR2-SDRAM and low-power DDR2-SDRAM and DDR3-SDRAM and low-power DDR3-SDRAM devices.

### Bit 19 – LC\_LPDDR1 Low-cost Low-power DDR1

Value	Name	Description
0	NOT_2_BANKS	Any type of memory devices except of low cost, low density Low Power DDR1.
1	2_BANKS_LPDDR1	<p>Low-cost and low-density low-power DDR1. These devices have a density of 32 Mbits and are organized as two internal banks. To use this feature, the user has to define the type of memory and the data bus width (see <a href="#">35.7.8 MPDDRC_MD</a>).</p> <p>The 16-bit memory device is organized as 2 banks, 9 columns and 11 rows.</p> <p>The 32-bit memory device is organized as 2 banks, 8 columns and 11 rows.</p> <p>It is impossible to use two 16-bit memory devices (2 x 32 Mbits) for creating one 32-bit memory device (64 Mbits). In this case, it is recommended to use one 32-bit memory device which embeds four internal banks.</p>

### Bit 17 – ENRDM Enable Read Measure

This feature is not supported during a change frequency. See [“CHG\\_FRQ: Change Clock Frequency During Self-refresh Mode”](#).

Value	Name	Description
0	OFF	DQS/DDR_DATA phase error correction is disabled
1	ON	DQS/DDR_DATA phase error correction is enabled

### Bit 16 – DQMS Mask Data is Shared

Value	Name	Description
0	NOT_SHARED	DQM is not shared with another controller
1	SHARED	DQM is shared with another controller

### Bits 14:12 – OCD[2:0] Off-chip Driver

SDRAM Controller supports only two values for OCD (default calibration and exit from calibration). These values MUST always be programmed during the initialization sequence. The default calibration must be programmed first, after which the exit calibration and maintain settings must be programmed.

This field is found only in the DDR2-SDRAM devices.

Value	Name	Description
0	DDR2_EXITCALIB	Exit from OCD Calibration mode and maintain settings
7	DDR2_DEFAULT_CALIB	OCD calibration default

### Bits 11:10 – ZQ[1:0] ZQ Calibration

This parameter is used to calibrate DRAM On resistance (Ron) values over PVT.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

This field is found only in the low-power DDR2-SDRAM devices and low-power DDR3-SDRAM devices.

Value	Name	Description
0	INIT	Calibration command after initialization
1	LONG	Long calibration
2	SHORT	Short calibration
3	RESET	ZQ Reset

### Bit 9 – DIS\_DLL DISABLE DLL

This value is used during the powerup sequence. It is only found in the DDR2-SDRAM devices and DDR3-SDRAM devices and low-power DDR3-SDRAM devices.

Value	Description
0	Enable DLL.
1	Disable DLL.

### Bit 8 – DIC\_DS Output Driver Impedance Control (Drive Strength)

This bit name is described as “DS” in some memory datasheets. It defines the output drive strength. This value is used during the powerup sequence.

For DDR3-SDRAM devices, this field is equivalent to ODS, Output Drive Strength.

This bit is found only in the DDR2-SDRAM devices and DDR3-SDRAM devices.

Value	Name	Description
0	DDR2_NORMALSTRENGTH_DDR3_RZQ_6	Normal drive strength (DDR2) - RZQ_6 (40 [NOM], DDR3)
1	DDR2_WEAKSTRENGTH_DDR3_RZQ_7	Weak drive strength (DDR2) - RZQ_7 (34 [NOM], DDR3)

### Bit 7 – DLL Reset DLL

This bit defines the value of Reset DLL.

This value is used during the powerup sequence.

This bit is found only in the DDR2-SDRAM devices and DDR3-SDRAM devices.

Value	Name	Description
0	RESET_DISABLED	Disable DLL reset
1	RESET_ENABLED	Enable DLL reset

### Bits 6:4 – CAS[2:0] CAS Latency

In the case of DDR3-SDRAM devices, the CAS field must be set to 5 and the SHIFT\_SAMPLING field must be set to 2. See “[SHIFT\\_SAMPLING: Shift Sampling Point of Data](#)”. This field is not used to set the DDR3-SDRAM. In the case of DDR3-SDRAM devices, the DLL Off mode sets the CAS Read Latency (CRL) and the CAS Write Latency (CWL) to 6. The latency is automatically set by the controller.

Value	Name	Description
2	DDR_CAS2	LPDDR1 CAS Latency 2
3	DDR_CAS3	LPDDR3/DDR2/LPDDR2/LPDDR1 CAS Latency 3
5	DDR_CAS5	DDR3 CAS Latency 5
6	DDR_CAS6	DDR3/LPDDR3 CAS Latency 6

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### Bits 3:2 – NR[1:0] Number of Row Bits

Value	Name	Description
0	11_ROW_BITS	11 bits to define the row number, up to 2048 rows
1	12_ROW_BITS	12 bits to define the row number, up to 4096 rows
2	13_ROW_BITS	13 bits to define the row number, up to 8192 rows
3	14_ROW_BITS	14 bits to define the row number, up to 16384 rows

### Bits 1:0 – NC[1:0] Number of Column Bits

Value	Name	Description
0	DDR9_MDDR8_COL_BITS	9 bits to define the column number, up to 512 columns, for DDR2/DDR3/LPDDR2/LPDDR3-SDRAM  8 bits to define the column number, up to 256 columns, for LPDDR1-SDRAM
1	DDR10_MDDR9_COL_BITS	10 bits to define the column number, up to 1024 columns, for DDR2/DDR3/LPDDR2/LPDDR3-SDRAM  9 bits to define the column number, up to 512 columns, for LPDDR1-SDRAM
2	DDR11_MDDR10_COL_BITS	11 bits to define the column number, up to 2048 columns, for DDR2/DDR3/LPDDR2/LPDDR3-SDRAM  SDRAM 10 bits to define the column number, up to 1024 columns, for LPDDR1-SDRAM
3	DDR12_MDDR11_COL_BITS	12 bits to define the column number, up to 4096 columns, for DDR2/DDR3/LPDDR2/LPDDR3-SDRAM  11 bits to define the column number, up to 2048 columns, for LPDDR1-SDRAM

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.4 MPDDRC Timing Parameter 0 Register

**Name:** MPDDRC\_TPR0  
**Offset:** 0x0C  
**Reset:** 0x20227225  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [MPDDRC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	TMRD[3:0]					TWTR[2:0]		
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	1	0		0	0	0
Bit	23	22	21	20	19	18	17	16
	TRRD[3:0]				TRP[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	1	0	0	0	1	0
Bit	15	14	13	12	11	10	9	8
	TRC[3:0]				TWR[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	1	1	1	0	0	1	0

	TRCD[3:0]				TRAS[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	1	0	0	1	0	1

**Bits 31:28 – TMRD[3:0]** Load Mode Register Command to Activate or Refresh Command  
 This field defines the delay between a Load mode register command and an Activate or Refresh command in number of DDRCK clock cycles. The number of cycles is between 0 and 15. For low-power DDR2-SDRAM and low-power DDR3-SDRAM, this field is equivalent to  $t_{MRW}$ .

**Bits 26:24 – TWTR[2:0]** Internal Write to Read Delay  
 This field defines the internal Write to Read command time in number of DDRCK clock cycles. The number of cycles is between 1 and 7.

**Bits 23:20 – TRRD[3:0]** Active BankA to Active BankB  
 This field defines the delay between an Activate command in BankA and an Activate command in BankB in number of DDRCK clock cycles. The number of cycles is between 1 and 15.

**Bits 19:16 – TRP[3:0]** Row Precharge Delay  
 This field defines the delay between a Precharge command and another command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

---

---

**Bits 15:12 – TRC[3:0]** Row Cycle Delay

This field defines the delay between an Activate command and a Refresh command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

**Bits 11:8 – TWR[3:0]** Write Recovery Delay

This field defines the Write Recovery Time in number of DDRCK clock cycles. The number of cycles is between 1 and 15.

**Bits 7:4 – TRCD[3:0]** Row to Column Delay

This field defines the delay between an Activate command and a Read/Write command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

**Bits 3:0 – TRAS[3:0]** Active to Precharge Delay

This field defines the delay between an Activate command and a Precharge command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.5 MPDDRC Timing Parameter 1 Register

**Name:** MPDDRC\_TPR1  
**Offset:** 0x10  
**Reset:** 0x03C80808  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [MPDDRC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	TXP[3:0]							
Access					R/W	R/W	R/W	R/W
Reset					0	0	1	1
Bit	23	22	21	20	19	18	17	16
	TXSRD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	0	0	1	0	0	0
Bit	15	14	13	12	11	10	9	8
	TXSNR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	1	0	0	0
Bit	7	6	5	4	3	2	1	0
	TRFC[6:0]							
Access								
Reset		0	0	0	1	0	0	0

**Bits 27:24 – TXP[3:0]** Exit Powerdown Delay to First Command

This field defines the delay between CKE set high and a valid command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

**Bits 23:16 – TXSRD[7:0]** Exit Self-refresh Delay to Read Command

This field defines the delay between CKE set high and a Read command in number of DDRCK clock cycles. The number of cycles is between 0 and 255.

This field is found only in DDR2-SDRAM and DDR3-SDRAM devices.

In case of DDR3-SDRAM, this field is equivalent to  $t_{XSDLL}$ . In DLL Off mode, this timing is not used. The field must be set to 0.

**Bits 15:8 – TXSNR[7:0]** Exit Self-refresh Delay to Non-Read Command

This field defines the delay between CKE set high and a Non Read command in number of DDRCK clock cycles. The number of cycles is between 0 and 255. This field is used by the DDR-SDRAM devices. In case of low-power DDR-SDRAM, this field is equivalent to  $t_{XSR}$ . In case of DDR3-SDRAM, this field is equivalent to  $t_{XS}$ .

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

---

### **Bits 6:0 – TRFC[6:0]** Row Cycle Delay

This field defines the delay between a Refresh command or a Refresh and Activate command in number of DDRCK clock cycles. The number of cycles is between 0 and 127.

In case of low-power DDR2-SDRAM and low-power DDR3-SDRAM, this field is equivalent to  $t_{RFCab}$ . If the user enables the function “Refresh Per Bank” (see [“REF\\_PB: Refresh Per Bank”](#)), this field is equivalent to  $t_{RFCpb}$ .

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.6 MPDDRC Timing Parameter 2 Register

**Name:** MPDDRC\_TPR2  
**Offset:** 0x14  
**Reset:** 0x00042062  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
					TFAW[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	1	0	0
Bit	15	14	13	12	11	10	9	8
			TRTP[2:0]			TRPA[3:0]		
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	1	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	TXARDS[3:0]				TXARD[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	1	1	0	0	0	1	0

**Bits 19:16 – TFAW[3:0]** Four Active Windows

DDR2 and DDR3 devices with eight banks (1 Gbit or larger) have an additional requirement concerning  $t_{FAW}$  timing. This requires that no more than four Activate commands may be issued in any given  $t_{FAW}$  (MIN) period.

The number of cycles is between 0 and 15.

This field is found only in DDR2-SDRAM and LPDDR2-SDRAM and DDR3-SDRAM and LPDDR3-SDRAM devices.

**Bits 14:12 – TRTP[2:0]** Read to Precharge

This field defines the delay between a Read command and a Precharge command in number of DDRCK clock cycles.

The number of cycles is between 0 and 7.

**Bits 11:8 – TRPA[3:0]** Row Precharge All Delay

This field defines the delay between a Precharge All Banks command and another command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

This field is found only in the DDR2-SDRAM devices.

In the case of LPDDR2-SDRAM and LPDDR3-SDRAM, this field is equivalent to  $t_{RPAB}$ .

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

---

**Bits 7:4 – TXARDS[3:0]** Exit Active Power Down Delay to Read Command in Mode “Slow Exit”  
This field defines the delay between CKE set high and a Read command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

This field is found only in the DDR2-SDRAM devices.

**Bits 3:0 – TXARD[3:0]** Exit Active Power Down Delay to Read Command in Mode “Fast Exit”  
This field defines the delay between CKE set high and a Read command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

This field is found only in the DDR2-SDRAM devices.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.7 MPDDRC Low-Power Register

**Name:** MPDDRC\_LPR  
**Offset:** 0x1C  
**Reset:** 0x00010000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
							SELF_DONE	CHG_FRQ
Access							R	R/W
Reset							0	0
Bit	23	22	21	20	19	18	17	16
			UPD_MR[1:0]					APDE
Access			R/W	R/W			R/W	
Reset			0	0			1	
Bit	15	14	13	12	11	10	9	8
			TIMEOUT[1:0]			DS[2:0]		
Access			R/W	R/W			R/W	R/W
Reset			0	0			0	0
Bit	7	6	5	4	3	2	1	0
			PASR[2:0]		LPDDR2_LPDD R3_PWOFF	CLK_FR	LPCB[1:0]	
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

**Bit 25 – SELF\_DONE** Self-refresh is Done  
 This bit indicates that external device is in Self-refresh mode.

**Bit 24 – CHG\_FRQ** Change Clock Frequency During Self-refresh Mode  
 This mode allows to change the Low-power DDR-DRAM input clock frequency. This mode is unique to the Low-power DDR-DRAM devices.

**Bits 21:20 – UPD\_MR[1:0]** Update Load Mode Register and Extended Mode Register  
 This bit is used to enable or disable automatic update of the Load Mode Register and Extended Mode Register. This update depends on the MPDDRC integration in a system. MPDDRC can either share or not an external bus with another controller.

Value	Name	Description
0	NO_UPDATE	Update of Load Mode and Extended Mode registers is disabled.
1	UPDATE_SHAREDDBUS	MPDDRC shares an external bus. Automatic update is done during a refresh command and a pending read or write access in the SDRAM device.
2	UPDATE_NOSHAREDDBUS	MPDDRC does not share an external bus. Automatic update is done before entering Self-refresh mode.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

Value	Name	Description
3	–	Reserved

### Bit 16 – APDE Active Power Down Exit Time

This mode is unique to the DDR2-SDRAM and DDR3-SDRAM devices.

This mode manages the active Powerdown mode which determines performance versus power saving.

After the initialization sequence, as soon as the APDE field is modified, the Extended Mode Register (located in the memory of the external device) is accessed automatically and APDE bits are updated. Depending on the UPD\_MR bit, update is done before entering Self-refresh mode or during a refresh command and a pending read or write access

Value	Name	Description
0	DDR2_FAST_EXIT	Fast Exit from Power Down. DDR2-SDRAM and DDR3-SDRAM devices only.
1	DDR2_SLOW_EXIT	Slow Exit from Power Down. DDR2-SDRAM and DDR3-SDRAM devices only.

### Bits 13:12 – TIMEOUT[1:0] Time Between Last Transfer and Low-Power Mode

This field defines when Low-power mode is activated.

Value	Name	Description
0	NONE	SDRAM Low-power mode is activated immediately after the end of the last transfer.
1	DELAY_64_CLK	SDRAM Low-power mode is activated 64 clock cycles after the end of the last transfer.
2	DELAY_128_CLK	SDRAM Low-power mode is activated 128 clock cycles after the end of the last transfer.
3	–	Reserved

### Bits 10:8 – DS[2:0] Drive Strength

This field is unique to low-power DDR1-SDRAM. It selects the output drive strength.

After the initialization sequence, as soon as the DS field is modified, the Extended Mode Register is accessed automatically and DS bits are updated. Depending on the UPD\_MR bit, update is done before entering self-refresh mode or during a refresh command and a pending read or write access.

Value	Name	Description
0	DS_FULL	Full drive strength
1	DS_HALF	Half drive strength
2	DS_QUARTER	Quarter drive strength
3	DS_OCTANT	Octant drive strength
4–7	–	Reserved

### Bits 6:4 – PASR[2:0] Partial Array Self-refresh

This field is unique to low-power DDR1-SDRAM. It is used to specify whether only one-quarter, one-half or all banks of the DDR-SDRAM array are enabled. Disabled banks are not refreshed in Self-refresh mode.

The values of this field are dependent on the low-power DDR-SDRAM devices.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

After the initialization sequence, as soon as the PASR field is modified, the Extended Mode Register in the external device memory is accessed automatically and PASR bits are updated. Depending on the UPD\_MR bit, update is done before entering Self-refresh mode or during a refresh command and a pending read or write access.

### Bit 3 – LPDDR2\_LPDDR3\_PWOFF LPDDR2/3 Power Off Bit

LPDDR2/3 power off sequence must be controlled to preserve the LPDDR2/3 device. The power failure is handled at system level (IRQ or FIQ) and the LPDDR2/3 power off sequence is applied using the LPDDR2\_LPDDR3\_PWOFF bit.

LPDDR2\_LPDDR3\_PWOFF bit is used to impose CKE low before a power off sequence. Uncontrolled power off sequence can be applied only up to 400 times in the life of a LPDDR2/3 device.

Value	Name	Description
0	DISABLED	No power-off sequence applied to LPDDR2/3.
1	ENABLED	A power-off sequence is applied to the LPDDR2/3 device. CKE is forced low.

### Bit 2 – CLK\_FR Clock Frozen Command Bit

This field sets the clock low during Powerdown mode. Some DDR-SDRAM devices do not support freezing the clock during Powerdown mode. Refer to the relevant DDR-SDRAM device datasheet for details.

Value	Name	Description
0	DISABLED	Clock(s) is/are not frozen.
1	ENABLED	Clock(s) is/are frozen.

### Bits 1:0 – LPCB[1:0] Low-power Command Bit

Value	Name	Description
0	NOLOWPOWER	Low-power feature is inhibited. No Powerdown, Self-refresh and Deep power modes are issued to the DDR-SDRAM device.
1	SELFREFRESH	The MPDDRC issues a self-refresh command to the DDR-SDRAM device, the clock(s) is/are deactivated and the CKE signal is set low. The DDR-SDRAM device leaves the Self-refresh mode when accessed and reenters it after the access.
2	POWERDOWN	The MPDDRC issues a Powerdown command to the DDR-SDRAM device after each access, the CKE signal is set low. The DDR-SDRAM device leaves the Powerdown mode when accessed and reenters it after the access.
3	DEEPPOWERDOWN	The MPDDRC issues a Deep Powerdown command to the low-power DDR-SDRAM device.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.8 MPDDRC Memory Device Register

**Name:** MPDDRC\_MD  
**Offset:** 0x20  
**Reset:** 0x00000013  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [MPDDRC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	IO_WIDTH[1:0]		DENSITY[3:0]			TYPE[1:0]

#### Bits 31:30 – IO\_WIDTH[1:0] Width of Memory

This field gives the width of the memory. This field is unique to low-power DDR2-SDRAM and low-power DDR3-SDRAM. When Backup mode is used, this information is lost after Backup mode exit.

Value	Name	Description
0	WIDTH_32	The data bus width is 32 bits.
1	WIDTH_16	The data bus width is 16 bits.
2	WIDTH_8	The data bus width is 8 bits.
3	NOT_USED	–

#### Bits 29:26 – DENSITY[3:0] Density of Memory

This field is unique to low-power DDR2-SDRAM and low-power DDR3-SDRAM. When Backup mode is used, this information is lost after Backup mode exit

This field gives the density of the memory.

Value	Name	Description
0	DENSITY_64MBITS	The device density is 64 Mbits.
1	DENSITY_128MBITS	The device density is 128 Mbits.
2	DENSITY_256MBITS	The device density is 256 Mbits.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

Value	Name	Description
3	DENSITY_512MBITS	The device density is 512 Mbits.
4	DENSITY_1GBITS	The device density is 1 Gbit.
5	DENSITY_2GBITS	The device density is 2 Gbits.
6	DENSITY_4GBITS	The device density is 4 Gbits.
7	DENSITY_8GBITS	The device density is 8 Gbits.
8	DENSITY_16GBITS	The device density is 16 Gbits.
9	DENSITY_32GBITS	The device density is 32 Gbits.

### Bits 25:24 – TYPE[1:0] DRAM Architecture

This field gives the DRAM architecture. This field is unique to low-power DDR2-SDRAM and low-power DDR3-SDRAM. When Backup mode is used, this information is lost after Backup mode exit.

Value	Name	Description
0	S4_SDRAM	4n prefetch architecture
1	S2_SDRAM	2n prefetch architecture
2	NVM	Non-volatile device
3	S8_SDRAM	8n prefetch architecture

### Bits 23:16 – REV\_ID[7:0] Revision Identification

This field gives the revision ID. This field is unique to low-power DDR2-SDRAM and low-power DDR3-SDRAM. When Backup mode is used, this information is lost after Backup mode exit.

### Bits 15:8 – MANU\_ID[7:0] Manufacturer Identification

This field gives information concerning the Manufacturer ID. For more information concerning the Manufacturer ID, Refer to document JC-42.6 “Manufacturer Identification (ID) Code for Low Power Memories”. This field is unique to low-power DDR2-SDRAM and low-power DDR3-SDRAM. When Backup mode is used, this information is lost after Backup mode exit.

### Bit 7 – RL3 Read Latency 3 Option Support

This field gives information concerning the read latency supported. Read latency 3 has been defined per Jedec for frequency  $\leq$  166 MHz. This feature is optional. If the LPDDR3 device does not support this feature, a CAS latency of 6 is used. This field is unique to low-power DDR3-SDRAM. When Backup mode is used, this information is lost after Backup mode exit.

Value	Name	Description
0	RL3_SUPPORT	Read latency of 3 is supported
1	RL3_NOT_SUPPORTED	Read latency of 3 is not supported

### Bit 6 – WL Write Latency

This field gives the write latency supported by the memory device. This field is unique to low-power DDR3-SDRAM. When Backup mode is used, this information is lost after Backup mode exit.

Value	Name	Description
0	WL_SETA	Write Latency Set A
1	WL_SETB	Write Latency Set B

### Bit 4 – DBW Data Bus Width

Value	Name	Description
0	DBW_32_BITS	Data bus width is 32 bits

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

Value	Name	Description
1	DBW_16_BITS	Data bus width is 16 bits.

### Bits 2:0 – MD[2:0] Memory Device

Value	Name	Description
3	LPDDR_SDRAM	Low-power DDR1-SDRAM
4	DDR3_SDRAM	DDR3-SDRAM
5	LPDDR3_SDRAM	Low-power DDR3-SDRAM
6	DDR2_SDRAM	DDR2-SDRAM
7	LPDDR2_SDRAM	Low-power DDR2-SDRAM

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.9 MPDDRC Low-power DDR2 Low-power DDR3 Low-power Register

**Name:** MPDDRC\_LPDDR23\_LPR  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
					DS[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	23	22	21	20	19	18	17	16
	SEG_MASK[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	SEG_MASK[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	BK_MASK_PASR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 27:24 – DS[3:0] Drive Strength

After the initialization sequence, as soon as the DS field is modified, Mode Register 3 is accessed automatically and DS bits are updated. Depending on the UPD\_MR bit, update is done before entering Self-refresh mode or during a refresh command and a pending read or write access.

This field is unique to low-power DDR2-SDRAM and low-power DDR3-SDRAM. It selects the I/O drive strength as shown in the table below.

In case of low-power DDR2-SDRAM or low-power DDR3-SDRAM, the RDIV field in the MPDDRC\_IO\_CALIBR register must be set to same value of DS field.

Value	Name	Description
0	–	Reserved
1	DS_34_3	34.3 ohm typical
2	DS_40	40 ohm typical (default)
3	DS_48	48 ohm typical
4	DS_60	60 ohm typical
5	–	Reserved
6	DS_80	80 ohm typical
7	DS_120	120 ohm typical
8–15	–	Reserved

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### Bits 23:8 – SEG\_MASK[15:0] Segment Mask Bit

After the initialization sequence, as soon as the SEG\_MASK field is modified, Mode Register 17 is accessed automatically and SEG\_MASK bits are updated. Depending on the UPD\_MR bit, update is done before entering Self-refresh mode or during a refresh command and a pending read or write access.

This mode is unique to the low-power DDR2-SDRAM-S4 and low-power DDR3-SDRAM devices. The number of Segment Mask bits differs with the density. For 1 Gbit density, 8 segments are used. In Self-refresh mode, when the Segment Mask bit is configured, the refresh operation is masked in the segment.

Value	Description
0	Segment is refreshed (= unmasked).
1	Segment is not refreshed (= masked).

### Bits 7:0 – BK\_MASK\_PASR[7:0] Bank Mask Bit/PASR

Partial Array Self-Refresh (low-power DDR2-SDRAM-S4 devices and low-power DDR3-SDRAM only)

After the initialization sequence, as soon as the BK\_MASK\_PASR field is modified, Mode Register 16 is accessed automatically and BK\_MASK\_PASR bits are updated. Depending on the UPD\_MR bit, update is done before entering Self-refresh mode or during a refresh command and a pending read or write access.

This mode is unique to the low-power DDR2-SDRAM-S4 and low-power DDR3-SDRAM devices. In Self-refresh mode, each bank of LPDDR2/LPDDR3 can be independently configured whether a self-refresh operation is taking place or not.

After the initialization sequence, as soon as the BK\_MASK\_PASR field is modified, the Extended Mode Register is accessed automatically and BK\_MASK\_PASR bits are updated. Depending on the UPD\_MR bit, update is done before entering Self-refresh mode or during a refresh command and a pending read or write access.

Value	Description
0	Refresh is enabled (= unmasked).
1	Refresh is disabled (= masked).

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.10 MPDDRC Low-power DDR2 Low-power DDR3 and DDR3 Calibration and MR4 Register

**Name:** MPDDRC\_LPDDR2\_LPDDR3\_DDR3\_CAL\_MR4  
**Offset:** 0x2C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [MPDDRC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	MR4_READ[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	MR4_READ[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	COUNT_CAL[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	COUNT_CAL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:16 – MR4\_READ[15:0] Mode Register 4 Read Interval

MR4\_READ defines the time period between MR4 reads (for LPDDR2-SDRAM). The formula is  $(MR4\_READ+1) \times t_{REF}$ . The value to be loaded depends on the average time between REFRESH commands,  $t_{REF}$ . For example, for an LPDDR2-SDRAM with the time between refresh of 7.8  $\mu$ s, if the MR4\_READ value is 2, the time period between MR4 reads is 23.4  $\mu$ s.

The LPDDR2-SDRAM and LPDDR3-SDRAM devices feature a temperature sensor whose status can be read from MR4 register. This sensor can be used to determine an appropriate refresh rate. Temperature sensor data may be read from MR4 register using the Mode Register Read protocol. The Adjust Refresh Rate bit (ADJ\_REF) in the Refresh Timer Register (MPDDRC\_RTR) must be written to a one to activate these reads.

#### Bits 15:0 – COUNT\_CAL[15:0] LPDDR2 LPDDR3 and DDR3 Calibration Timer Count

This 16-bit field is loaded into a timer which generates the calibration pulse. Each time the calibration pulse is generated, a ZQCS calibration sequence is initiated.

The ZQCS Calibration command is used to calibrate DRAM Ron values over PVT.

One ZQCS command can effectively correct at least 1.5% of output impedance errors within  $T_{zqcs}$ .

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

---

One method for calculating the interval between ZQCS commands gives the temperature ( $T_{\text{driftrate}}$ ) and voltage ( $V_{\text{driftrate}}$ ) drift rates to which the SDRAM is subject in the application. The interval could be defined by the following formula:

$$\text{ZQCorrection}/((T_{\text{Sens}} \times T_{\text{driftrate}}) + (V_{\text{Sens}} \times V_{\text{driftrate}}))$$

where  $T_{\text{Sens}} = \max(\text{dRONdTM})$  and  $V_{\text{Sens}} = \max(\text{dRONdVM})$  define the SDRAM temperature and voltage sensitivities.

For example, if  $T_{\text{Sens}} = 0.75\%/C$ ,  $V_{\text{Sens}} = 0.2\%/mV$ ,  $T_{\text{driftrate}} = 1C/\text{sec}$  and  $V_{\text{driftrate}} = 15 \text{ mV/s}$ , then the interval between ZQCS commands is calculated as:

$$1.5/((0.75 \times 1) + (0.2 \times 15)) = 0.4\text{s}$$

In this example, the devices require a calibration every 0.4s. The value to be loaded depends on average time between REFRESH commands,  $t_{\text{REF}}$ .

For example, for a device with the time between refresh of 7.8  $\mu\text{s}$ , the value of the Calibration Timer Count field is programmed:  $(0.4/7.8 \times 10^{-6}) = 0xC852$ .

$T_{\text{Sens}}$  and  $V_{\text{Sens}}$  are given by the manufacturer (Output Driver Sensitivity definition).  $T_{\text{driftrate}}$  and  $V_{\text{driftrate}}$  are defined by the end user.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.11 MPDDRC Low-power DDR2 Low-power DDR3 and DDR3 Timing Calibration Register

**Name:** MPDDRC\_LPDDR2\_LPDDR3\_DDR3\_TIM\_CAL  
**Offset:** 0x30  
**Reset:** 0x00000006  
**Property:** Read/Write

**Bits 17:16 – RZQI[1:0]** Built-in Self-Test for RZQ Information

This field indicates whether the device has detected a resistor connection to the ZQ pin.

This mode is unique to low-power DDR3-SDRAM devices.

Value	Name	Description
0	RZQ_NOT_SUPPORTED	RZQ self test not supported
1	ZQ_VDDCA_FLOAT	The ZQ pin can be connected to VDDCA or left floating.
2	ZQ_SHORTED_GROUND	The ZQ pin can be shorted to ground.
3	ZQ_SELF_TEST_OK	ZQ pin self test complete; no error condition detected

**Bits 7:0 – ZQCS[7:0]** ZQ Calibration Short

This field defines the delay between the ZQ Calibration command and any valid command in number of DDRCK clock cycles.

The number of cycles is between 0 and 255. This field applies to LPDDR2, LPDDR3 and DDR3 devices.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.12 MPDDRC I/O Calibration Register

**Name:** MPDDRC\_IO\_CALIBR  
**Offset:** 0x34  
**Reset:** 0x00870000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits 31-24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	CALCODEN[3:0]				CALCODEP[3:0]			
Access	R	R	R	R	R	R	R	R
Reset	1	0	0	0	0	1	1	1
Bit	15	14	13	12	11	10	9	8
	TZQIO[6:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	[Greyed out bits 7-5]			EN_CALIB	[Greyed out bits 3-2]		RDIV[2:0]	
Access				R/W			R/W	R/W
Reset				0			0	0

**Bits 23:20 – CALCODEN[3:0]** Number of N-type Transistors  
 This value gives the number of N-type transistors to perform the calibration.

**Bits 19:16 – CALCODEP[3:0]** Number of P-type Transistors  
 This value gives the number of P-type transistors to perform the calibration.

**Bits 14:8 – TZQIO[6:0]** IO Calibration  
 This field defines the delay between the start up of the amplifier and the beginning of the calibration in number of DDRCK clock cycles. The value of this field must be set to 600 ns.  
 The number of cycles is between 0 and 127.

The TZQIO configuration code must be set correctly depending on the clock frequency using the following formula:

$$TZQIO = (DDRCK \times 600e-9) + 1$$

where DDRCK frequency is in Hz.

For example, for a frequency of 176 MHz, the value of the TZQIO field is configured  $(176 \times 10e6) \times (600e-9) + 1$ .

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### Bit 4 – EN\_CALIB Enable Calibration

This field enables calibration for the LPDDR1 and DDR2 devices. When the calibration is enabled, it is recommended to define the COUNT\_CAL field (see “[COUNT\\_CAL: LPDDR2 LPDDR3 and DDR3 Calibration Timer Count](#)”).

This 16-bit field is loaded into a timer which generates the calibration pulse. Each time the calibration pulse is generated, a calibration sequence is initiated.

Value	Name	Description
0	DISABLE_CALIBRATION	Calibration is disabled.
1	ENABLE_CALIBRATION	Calibration is enabled.

### Bits 2:0 – RDIV[2:0] Resistor Divider, Output Driver Impedance

RDIV is used with the external precision resistor RZQ to define the output driver impedance. The value of RZQ is either 24K ohms (LPDDR2/LPDDR3 device) or 23K ohms (DDR3L device) or 22K ohms (DDR3 device) or 21K ohms (DDR2/LPDDR1 device).

Value	Name	Description
0	Reserved	Reserved
2	RZQ_40_RZQ_38_RZQ_37_RZQ_35	LPDDR2 serial impedance line = 40 ohms, LPDDR3 serial impedance line = 38 ohms, DDR3 serial impedance line = 37 ohms, DDR2/LPDDR1 serial impedance line = 35 ohms
3	RZQ_48_RZQ_46_RZQ_44_RZQ_43	LPDDR2 serial impedance line = 48 ohms, LPDDR3 serial impedance line = 46 ohms, DDR3 serial impedance line = 44 ohms, DDR2/LPDDR1 serial impedance line = 43 ohms
4	RZQ_60_RZQ_57_RZQ_55_RZQ_52	LPDDR2 serial impedance line = 60 ohms, LPDDR3 serial impedance line = 57 ohms, DDR3 serial impedance line = 55 ohms, DDR2/LPDDR1 serial impedance line = 52 ohms
6	RZQ_80_RZQ_77_RZQ_73_RZQ_70	LPDDR2 serial impedance line = 80 ohms, LPDDR3 serial impedance line = 77 ohms, DDR3 serial impedance line = 73 ohms, DDR2/LPDDR1 serial impedance line = 70 ohms
7	RZQ_120_RZQ_115_RZQ_110_RZQ_105	LPDDR2 serial impedance line = 120 ohms, LPDDR3 serial impedance line = 115 ohms, DDR3 serial impedance line = 110 ohms, DDR2/LPDDR1 serial impedance line = 105 ohms

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.13 MPDDRC OCMS Register

**Name:** MPDDRC\_OCMS  
**Offset:** 0x38  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [MPDDRC Write Protection Mode Register](#).

#### Bit 0 – SCR\_EN Scrambling Enable

Value	Description
0	Disables “Off-chip” scrambling for SDRAM access.
1	Enables “Off-chip” scrambling for SDRAM access.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.14 MPDDRC OCMS KEY1 Register

**Name:** MPDDRC\_OCMS\_KEY1  
**Offset:** 0x3C  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [MPDDRC Write Protection Mode Register](#). The register can only be written once.

**Bits 24, 25, 26, 27, 28, 29, 30, 31 – BDW\_BURST\_Px** Bandwidth Arbitration Mode on Port X

Value	Description
0	The arbitration is done when the bandwidth limit defined in MPDDRC_BDW_PORT_0123/4567.BDW_Px is reached. If the bandwidth limit is reached during a burst access, the burst is completed.
1	The arbitration is done when the bandwidth limit defined in MPDDRC_BDW_PORT_0123/4567.BDW_Px is reached. If the bandwidth limit is reached during a burst access, the burst is broken.

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – MA\_PR\_Px** Master or Software Provide Information

Value	Description
0	Number of requests or words is provided by the master, if the master supports this feature.
1	Number of requests or words is provided by software, see <a href="#">“NRQ_NWD_BDW_Px: Number of Requests, Number of Words or Bandwidth Allocation from Port 0-1-2-3”</a> .

**Bits 8, 9, 10, 11, 12, 13, 14, 15 – RQ\_WD\_Px** Request or Word from Port X

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

Value	Description
0	Number of requests is selected.
1	Number of words is selected.

**Bit 3 – BDW\_MAX\_CUR** Bandwidth Max or Current

This field displays the maximum of the bandwidth or the current bandwidth for each port.

The maximum of the bandwidth is computed when at least two ports of MPDDRC are used.

That information is given in [MPDDRC Current/Maximum Bandwidth Port 0-1-2-3 Register](#) and [MPDDRC Current/Maximum Bandwidth Port 4-5-6-7 Register](#).

Value	Description
0	Current bandwidth is displayed.
1	Maximum of the bandwidth is displayed.

**Bits 1:0 – ARB[1:0]** Type of Arbitration

This field allows to choose the type of arbitration: round-robin, number of requests per port or bandwidth per port.

Value	Name	Description
0	ROUND	Round-Robin Policy
1	NB_REQUEST	Request Policy
2	BANDWIDTH	Bandwidth Policy
3	–	Reserved

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.17 MPDDRC Timeout Register

**Name:** MPDDRC\_TIMEOUT  
**Offset:** 0x48  
**Reset:** 0x00000000  
**Property:** Read/Write

	Bit	31	30	29	28	27	26	25	24
		TIMEOUT_P7[3:0]				TIMEOUT_P6[3:0]			
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		TIMEOUT_P5[3:0]				TIMEOUT_P4[3:0]			
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		TIMEOUT_P3[3:0]				TIMEOUT_P2[3:0]			
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		TIMEOUT_P1[3:0]				TIMEOUT_P0[3:0]			
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0

**Bits 0:3, 4:7, 8:11, 12:15, 16:19, 20:23, 24:27, 28:31 – TIMEOUT\_Px** Timeout for Ports 0, 1, 2, 3, 4, 5, 6, 7

Some masters have the particularity to insert idle state between two accesses. This field defines the delay between two accesses on the same port in number of DDRCK clock cycles before arbitration and handling the access over to another port.

This field is not used with round-robin and bandwidth arbitrations.

The number of cycles is between 1 and 15.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.18 MPDDRC Request Port 0-1-2-3 Register

**Name:** MPDDRC\_REQ\_PORT\_0123  
**Offset:** 0x4C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	NRQ_NWD_BDW_P3[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	NRQ_NWD_BDW_P2[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	NRQ_NWD_BDW_P1[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	NRQ_NWD_BDW_P0[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 0:7, 8:15, 16:23, 24:31 – NRQ\_NWD\_BDW\_Px** Number of Requests, Number of Words or Bandwidth Allocation from Port 0-1-2-3

The number of requests corresponds to the number of start transfers. For example, setting this field to 2 performs two burst accesses regardless of the burst type (INCR4, INCR8, etc.). The number of words corresponds exactly to the number of accesses; setting this field to 2 performs two accesses. In this example, burst accesses will be broken.

These values depend on scheme arbitration (see [MPDDRC Configuration Arbiter Register](#)).

In case of round-robin arbitration, this field is not used. In case of “bandwidth arbitration”, this field corresponds to percentage allocated for each port. In case of “request” arbitration, this field corresponds to number of start transfers or to number of accesses allocated for each port.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.19 MPDDRC Request Port 4-5-6-7 Register

**Name:** MPDDRC\_REQ\_PORT\_4567  
**Offset:** 0x50  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
NRQ_NWD_BDW_P7[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### 35.7.22 MPDDRC Read Data Path Register

**Name:** MPDDRC\_RD\_DATA\_PATH  
**Offset:** 0x5C  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 1:0 – SHIFT\_SAMPLING[1:0]** Shift Sampling Point of Data

Shifts the sampling point of data coming from the memory device. The higher the memory device clock frequency, the higher the SHIFT\_SAMPLING value. Refer to the section "Electrical Characteristics".

Value	Name	Description
0	NO_SHIFT	Initial sampling point.
1	SHIFT_ONE_CYCLE	Sampling point is shifted by one cycle.
2	SHIFT_TWO_CYCLES	Sampling point is shifted by two cycles.
3	SHIFT_THREE_CYCLES	Sampling point is shifted by three cycles, unique for LPDDR2 and DDR3 and LPDDR3.
		Not applicable for DDR2 and LPDDR1 devices.

	[Greyed out bits 7-5]			RUN	[Greyed out bits 3-2]		SOFT_RESET	EN_MONI
Access				R/W			R/W	R/W
Reset				0			0	0

#### Bits 12:11 – INFO[1:0] Information Type

This field reports information such as latency and the number of transfers monitored on port x [x = 0..7].

Value	Name	Description
0	MAX_WAIT	Information concerning the transfer with the longest waiting time
1	NB_TRANSFERS	Number of transfers on the port
2	TOTAL_LATENCY	Total latency on the port
3	–	Reserved

#### Bit 10 – REFR\_CALIB Refresh Calibration

Value	Description
0	Monitoring does not depend on Autorefresh mode, Self-refresh mode, Powerdown mode, DLL nor calibration impact.
1	Monitoring depends on Autorefresh mode, Self-refresh mode, Powerdown mode, DLL and calibration impact.

#### Bits 9:8 – READ\_WRITE[1:0] Read/Write Access

This field is used to monitor different types of access.

Value	Name	Description
0	TRIG_RD_WR	Read and Write accesses are triggered.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

Value	Name	Description
1	TRIG_WR	Only Write accesses are triggered.
2	TRIG_RD	Only Read accesses are triggered.
3	–	Reserved

### Bit 4 – RUN Control Monitor

Value	Description
0	Monitoring is halted. All counters are stopped.
1	Monitoring is launched.

### Bit 1 – SOFT\_RESET Soft Reset

Value	Description
0	Soft reset is not performed.
1	Soft reset is performed.

### Bit 0 – EN\_MONI Enable Monitor

Value	Description
0	Monitor is disabled.
1	Monitor is enabled.

# SAMA5D2 Series

Reset	0	0	0	0	0	0	0	0

**Bits 31:16 – ADDR\_HIGH\_PORTx[15:0]** Address High on Port x  
 Address high which defines the interval to be monitored on port x [x = 0..7]. This address must be programmed according to the memory mapping of the product.

**Bits 15:0 – ADDR\_LOW\_PORTx[15:0]** Address Low on Port x  
 Address low which defines the interval to be monitored on port x [x = 0..7]. This address must be programmed according to the memory mapping of the product.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.25 MPDDRC Monitor Information Port x Register (MAX\_WAIT)

**Name:** MPDDRC\_MINFOx (MAX\_WAIT)  
**Offset:** 0x84 + x\*0x04 [x=0..7]  
**Reset:** 0x00000000  
**Property:** Read-only

The following fields can be read if the INFO field in the MPDDRC Monitor Configuration register is set to 0.

Bit	31	30	29	28	27	26	25	24	
								READ_WRITE	
Access								R	
Reset								0	
Bit	23	22	21	20	19	18	17	16	
			SIZE[2:0]					BURST[2:0]	
Access		R	R	R		R	R	R	
Reset		0	0	0		0	0	0	
Bit	15	14	13	12	11	10	9	8	
	MAX_PORTx_WAITING[15:8]								
Access	R	R	R	R	R	R	R	R	
Reset	0	0	0	0	0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
	MAX_PORTx_WAITING[7:0]								
Access	R	R	R	R	R	R	R	R	
Reset	0	0	0	0	0	0	0	0	

**Bit 24 – READ\_WRITE** Read or Write Access on Port x  
 This field reports the transfer direction for the maximum waiting time.

Value	Description
0	Read transfer
1	Write transfer

**Bits 22:20 – SIZE[2:0]** Transfer Size on Port x  
 This field reports the size of the transfer for the maximum waiting time.

Value	Name	Description
0	8BITS	Byte transfer
1	16BITS	Halfword transfer
2	32BITS	Word transfer
3	64BITS	Dword transfer

**Bits 18:16 – BURST[2:0]** Type of Burst on Port x  
 This field reports the type of burst for the maximum waiting time.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

Value	Name	Description
0	SINGLE	Single transfer
1	INCR	Incrementing burst of unspecified length
2	WRAP4	4-beat wrapping burst
3	INCR4	4-beat incrementing burst
4	WRAP8	8-beat wrapping burst
5	INCR8	8-beat incrementing burst
6	WRAP16	16-beat wrapping burst
7	INCR16	16-beat incrementing burst

**Bits 15:0 – MAX\_PORTx\_WAITING[15:0]** Address High on Port x

This field reports the maximum waiting time and the associated type of transfer (burst, size, read or write).

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.26 MPDDRC Monitor Information Port x Register (NB\_TRANSFERS)

**Name:** MPDDRC\_MINFO<sub>x</sub> (NB\_TRANSFERS)  
**Offset:** 0x84 + x\*0x04 [x=0..7]  
**Reset:** 0x00000000  
**Property:** Read-only

The following fields can be read if the INFO field in the MPDDRC Monitor Configuration register is set to 1.

Bit	31	30	29	28	27	26	25	24
	Px_NB_TRANSFERS[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	Px_NB_TRANSFERS[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	Px_NB_TRANSFERS[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	Px_NB_TRANSFERS[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – Px\_NB\_TRANSFERS[31:0]** Number of Transfers on Port x

This field can be read if the INFO field is set to 1. This field reports the number of transfers performed within an interval (ADDR\_HIGH\_PORT and ADDR\_LOW\_PORT) when the port is used.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.27 MPDDRC Monitor Information Port x Register (TOTAL\_LATENCY)

**Name:** MPDDRC\_MINFO<sub>x</sub> (TOTAL\_LATENCY)  
**Offset:** 0x84 + x\*0x04 [x=0..7]  
**Reset:** 0x00000000  
**Property:** Read-only

The following fields can be read if the INFO field in the MPDDRC Monitor Configuration register is set to 2.

Bit	31	30	29	28	27	26	25	24
	Px_TOTAL_LATENCY[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	Px_TOTAL_LATENCY[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	Px_TOTAL_LATENCY[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	Px_TOTAL_LATENCY[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – Px\_TOTAL\_LATENCY[31:0]** Total Latency on Port x

This field can be read if the INFO field is set to 2. This field reports the total latency within an interval (ADDR\_HIGH\_PORT and ADDR\_LOW\_PORT) when the port is used.

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.28 MPDDRC Write Protection Mode Register

**Name:** MPDDRC\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

See [35.5.7 Register Write Protection](#) for the list of registers that can be protected.

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPEN
Access								R/W
Reset								0

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x44445	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit.
2		Always reads as 0.

#### Bit 0 – WPEN Write Protection Enable

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x444452 (“DDR” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x444452 (“DDR” in ASCII).

# SAMA5D2 Series

## AHB Multiport DDR-SDRAM Controller (MPDDRC)

### 35.7.29 MPDDRC Write Protection Status Register

**Name:** MPDDRC\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPVS
Access								R
Reset								0

**Bits 23:8 – WPVSR[15:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Enable

Value	Description
0	No write protection violation occurred since the last read of this register (MPDDRC_WPSR).
1	A write protection violation occurred since the last read of this register (MPDDRC_WPSR). If this violation is an unauthorized attempt to write a control register, the associated violation is reported into the WPVSR field.

## **36. Static Memory Controller (SMC)**

### **36.1 Description**

This Static Memory Controller (SMC) is capable of handling several types of external memory and peripheral devices, such as SRAM, PSRAM, PROM, EPROM, EEPROM, LCD Module, NOR Flash and NAND Flash.

The SMC generates the signals that control the access to external memory devices or peripheral devices. It has 4 Chip Selects and a 26-bit address bus. The 16-bit data bus can be configured to interface with 8- or 16-bit external devices. Separate read and write control signals allow for direct memory and peripheral interfacing. Read and write signal waveforms are fully parametrizable.

The SMC can manage wait requests from external devices to extend the current access. The SMC is provided with an automatic Slow Clock mode. In Slow Clock mode, it switches from user-programmed waveforms to slow-rate specific waveforms on read and write signals.

The SMC embeds a NAND Flash Controller (NFC). The NFC can handle automatic transfers, sending the commands and address cycles to the NAND Flash and transferring the contents of the page (for read and write) to the NFC SRAM. It minimizes the CPU overhead.

The SMC includes programmable hardware error correcting code with one-bit error correction capability and supports two-bit error detection. In order to improve the overall system performance, the DATA phase of the transfer can be DMA-assisted.

The External Data Bus can be scrambled/unscrambled by means of user keys.

### **36.2 Embedded Characteristics**

- 64-Mbyte Address Space per Chip Select
- 8- or 16-bit Data Bus
- Word, Halfword, Byte Transfers
- Byte Write or Byte Select Lines
- Programmable Setup, Pulse and Hold Time for Read Signals per Chip Select
- Programmable Setup, Pulse and Hold Time for Write Signals per Chip Select
- Programmable Data Float Time per Chip Select
- External Data Bus Scrambling/Unscrambling Function
- External Wait Request
- Automatic Switch to Slow Clock Mode
- Hardware Configurable Number of Chip Selects from 1 to 4
- Programmable Timing on a per Chip Select Basis
- NAND Flash Controller Supporting NAND Flash with Multiplexed Data/Address Buses
- Supports SLC and MLC NAND Flash Technology
- Supports NAND Flash Devices with 8 or 16-bit Data Paths
- Multibit Error Correcting Code (ECC) supporting NAND Flash devices with 8-bit only Data Path
- ECC Algorithm Based on Binary Shortened Bose, Chaudhuri and Hocquenghem (BCH) Codes
- Programmable Error Correcting Capability: 2, 4, 8, 12, 24 and 32 bits of Errors per Block

- 9 Kbytes NFC SRAM
- Programmable Block Size: 512 bytes or 1024 bytes
- Programmable Number of Blocks per Page: 1, 2, 4 or 8 Blocks of Data per Page
- Programmable Spare Area Size up to 512 bytes
- Supports Spare Area ECC Protection
- Supports 8 Kbytes Page Size Using 1024 bytes/block and 4 Kbytes Page Size Using 512 bytes/block
- Multibit Error Detection Is Interrupt Driven
- Provides Hardware Acceleration for Determining Roots of Polynomials Defined over a Finite Field
- Programmable Finite Field GF(2<sup>13</sup>) or GF(2<sup>14</sup>)
- Finds Roots of Error-locator Polynomial
- Programmable Number of Roots
- Register Write Protection

### 36.3 Block Diagram

### 36.4 I/O Lines Description

Table 36-1. I/O Line Description

Name	Description	Type	Active Level
NCS[3:0]	Static Memory Controller Chip Select Lines	Output	Low
NRD	Read Signal	Output	Low
NWR0/NWE	Write 0/Write Enable Signal	Output	Low
A0/NBS0	Address Bit 0/Byte 0 Select Signal	Output	Low
NWR1/NBS1	Write 1/Byte 1 Select Signal	Output	Low
A[25:1]	Address Bus	Output	–

.....continued

Name	Description	Type	Active Level
D[15:0]	Data Bus	I/O	–
NWAIT	External Wait Signal	Input	Low
NANDRDY	NAND Flash Ready/Busy	Input	–
NANDWE	NAND Flash Write Enable	Output	Low
NANDOE	NAND Flash Output Enable	Output	Low
NANDALE	NAND Flash Address Latch Enable	Output	–
NANDCLE	NAND Flash Command Latch Enable	Output	–

### 36.5 Multiplexed Signals

**Table 36-2. Static Memory Controller (SMC) Multiplexed Signals**

Multiplexed Signals		Related Function
NWR0	NWE	Byte-write or Byte-select access, see <a href="#">“Byte Write Access”</a> and <a href="#">“Byte Select Access”</a>
A0	NBS0	8-bit or 16-bit data bus, see <a href="#">“Data Bus Width”</a>
A22	NANDCLE	NAND Flash Command Latch Enable
A21	NANDALE	NAND Flash Address Latch Enable
NWR1	NBS1	Byte-write or Byte-select access, see <a href="#">“Byte Write Access”</a> and <a href="#">“Byte Select Access”</a>
A1	–	8-/16-bit data bus, see <a href="#">“Data Bus Width”</a> Byte-write or Byte-select access, see <a href="#">“Byte Write Access”</a> and <a href="#">“Byte Select Access”</a>

### 36.6 Application Example

#### 36.6.1 Hardware Interface

**Figure 36-2. SMC Connections to Static Memory Devices**

### 36.7 Product Dependencies

#### 36.7.1 I/O Lines

The pins used for interfacing the Static Memory Controller are multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the Static Memory Controller pins to their peripheral function. If I/O lines of the SMC are not used by the application, they can be used for other purposes by the PIO controller.

#### 36.7.2 Power Management

The SMC is clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the SMC clock.

#### 36.7.3 Interrupt Sources

The SMC has an interrupt line connected to the interrupt controller. Handling the SMC interrupt requires programming the interrupt controller before configuring the SMC.

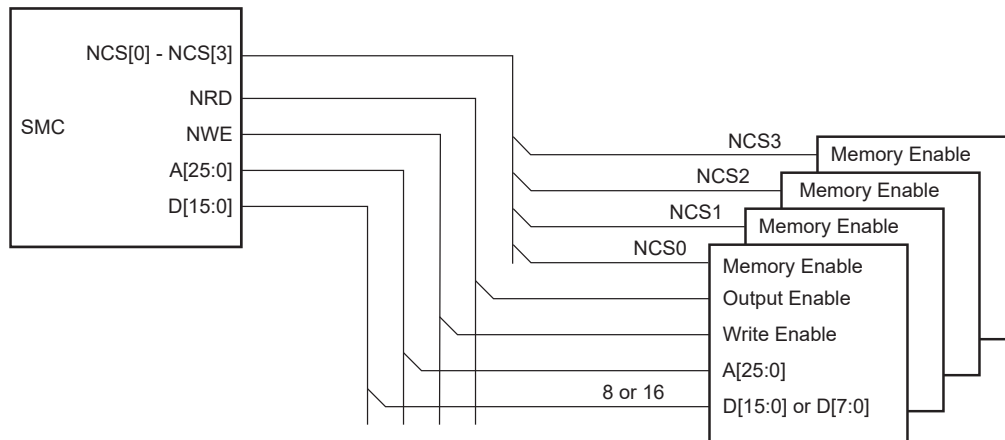

### 36.8 External Memory Mapping

The SMC provides up to 26 address lines, A[25:0]. This allows each chip select line to address up to 64 Mbytes of memory.

If the physical memory device connected on one chip select is smaller than 64 Mbytes, it wraps around and appears to be repeated within this space. The SMC correctly handles any valid access to the memory device within the page. See the figure below.

A[25:0] is only significant for 8-bit memory; A[25:1] is used for 16-bit memory.

**Figure 36-3. Memory Connections for External Devices**

## 36.9 Connection to External Devices

### 36.9.1 Data Bus Width

A data bus width of 8 or 16 bits can be selected for each chip select. This option is controlled by the bit DBW in the SMC Mode Register (HSMC\_MODE) for the corresponding chip select.

“[Memory Connection for an 8-bit Data Bus](#)” shows how to connect a 512 KB x 8-bit memory on NCS2. “[Memory Connection for a 16-bit Data Bus](#)” shows how to connect a 512 KB x 16-bit memory on NCS2.

**Figure 36-4. Memory Connection for an 8-bit Data Bus**

**Figure 36-5. Memory Connection for a 16-bit Data Bus**

### 36.9.2 Byte Write or Byte Select Access

Each chip select with a 16-bit data bus can operate with one of two different types of write access: Byte Write or Byte Select. This is controlled by the BAT bit of the HSMC\_MODE register for the corresponding chip select.

#### 36.9.2.1 Byte Write Access

Byte Write Access is used to connect 2 x 8-bit devices as a 16-bit memory, and supports one write signal per byte of the data bus and a single read signal.

Note that the SMC does not allow boot in Byte Write Access mode.

For 16-bit devices, the SMC provides NWR0 and NWR1 write signals for respectively Byte0 (lower byte) and Byte1 (upper byte) of a 16-bit bus. One single read signal (NRD) is provided.

#### 36.9.2.2 Byte Select Access

Byte Select Access is used to connect one 16-bit device. In this mode, read/write operations can be enabled/disabled at Byte level. One Byte-select line per byte of the data bus is provided. One NRD and one NWE signal control read and write.

For 16-bit devices, the SMC provides NBS0 and NBS1 selection signals for respectively Byte0 (lower byte) and Byte1 (upper byte) of a 16-bit bus.

**Figure 36-6. Connection of 2 x 8-bit Devices on a 16-bit Bus: Byte Write Option**

#### 36.9.2.3 Signal Multiplexing

Depending on the Byte Access Type (BAT), only the write signals or the byte select signals are used. To save IOs at the external bus interface, control signals at the SMC interface are multiplexed. The table below shows signal multiplexing depending on the data bus width and the Byte Access Type.

For 16-bit devices, bit A0 of address is unused. When Byte Select Option is selected, NWR1 is unused. When Byte Write option is selected, NBS0 is unused.

**Table 36-3. SMC Multiplexed Signal Translation**

Device Type	Signal Name		
	16-bit Bus		8-bit Bus
	1 x 16-bit	2 x 8-bit	1 x 8-bit
Byte Access Type (BAT)	Byte Select	Byte Write	–
NBS0_A0	NBS0	–	A0
NWE_NWR0	NWE	NWR0	NWE
NBS1_NWR1	NBS1	NWR1	–
A1	A1	A1	A1

### 36.10 Standard Read and Write Protocols

In the following sections, the Byte Access Type is not considered. Byte select lines (NBS0 to NBS1) always have the same timing as the A address bus. NWE represents either the NWE signal in byte select access type or one of the byte write lines (NWR0 to NWR1) in byte write access type. NWR0 to NWR1 have the same timings and protocol as NWE. In the same way, NCS represents one of the NCS[0..3] chip select lines.

#### 36.10.1 Read Waveforms

The read cycle is shown in the figure below.

The read cycle starts with the address setting on the memory address bus, i.e.,:

- {A[25:2], A1, A0} for 8-bit devices
- {A[25:2], A1} for 16-bit devices

**Figure 36-7. Standard Read Cycle**

### 36.10.1.1 NRD Waveform

The NRD signal is characterized by a setup timing, a pulse width and a hold timing:

1. NRD\_SETUP: The NRD setup time is defined as the setup of address before the NRD falling edge.
2. NRD\_PULSE: The NRD pulse length is the time between NRD falling edge and NRD rising edge.
3. NRD\_HOLD: The NRD hold time is defined as the hold time of address after the NRD rising edge.

### 36.10.1.2 NCS Waveform

Similar to the NRD signal, the NCS signal can be divided into a setup time, pulse length and hold time:

- NCS\_RD\_SETUP: The NCS setup time is defined as the setup time of address before the NCS falling edge.
- NCS\_RD\_PULSE: The NCS pulse length is the time between NCS falling edge and NCS rising edge.
- NCS\_RD\_HOLD: The NCS hold time is defined as the hold time of address after the NCS rising edge.

### 36.10.1.3 Read Cycle

The NRD\_CYCLE time is defined as the total duration of the read cycle, that is, from the time where address is set on the address bus to the point where address may change. The total read cycle time is defined as:

- $NRD\_CYCLE = NRD\_SETUP + NRD\_PULSE + NRD\_HOLD$ ,

as well as

- $NRD\_CYCLE = NCS\_RD\_SETUP + NCS\_RD\_PULSE + NCS\_RD\_HOLD$

All NRD and NCS timings are defined separately for each chip select as an integer number of Master Clock cycles. The NRD\_CYCLE field is common to both the NRD and NCS signals, thus the timing period is of the same duration.

NRD\_CYCLE, NRD\_SETUP, and NRD\_PULSE implicitly define the NRD\_HOLD value as:

- $NRD\_HOLD = NRD\_CYCLE - NRD\_SETUP - NRD\_PULSE$

NRD\_CYCLE, NCS\_RD\_SETUP, and NCS\_RD\_PULSE implicitly define the NCS\_RD\_HOLD value as:

- $NCS\_RD\_HOLD = NRD\_CYCLE - NCS\_RD\_SETUP - NCS\_RD\_PULSE$

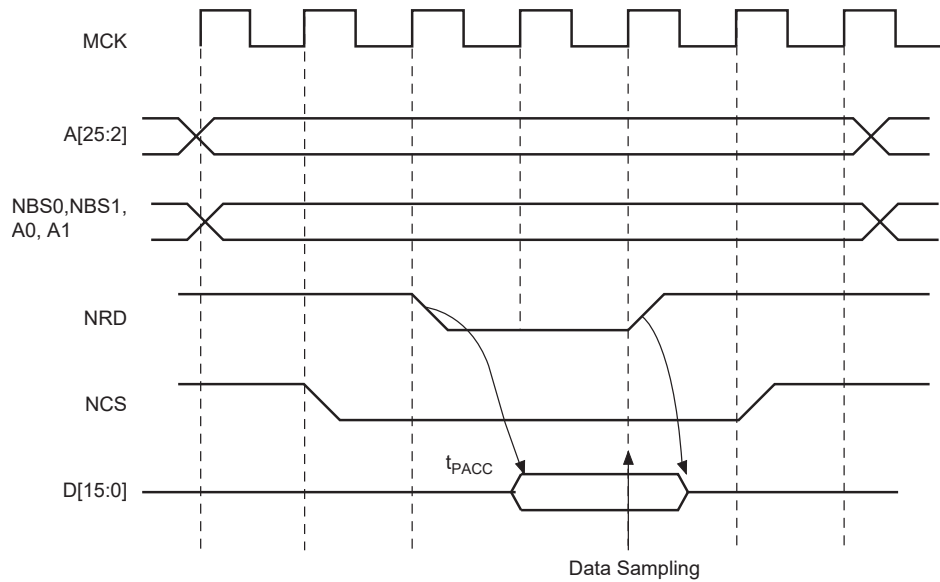

## 36.10.2 Read Mode

As NCS and NRD waveforms are defined independently of one another, the SMC needs to know when the read data is available on the data bus. The SMC does not compare NCS and NRD timings to know which signal rises first. The READ\_MODE parameter in the HSMC\_MODE register of the corresponding chip select indicates which signal of NRD and NCS controls the read operation.

### 36.10.2.1 Read is Controlled by NRD (READ\_MODE = 1)

The figure below shows the waveforms of a read operation of a typical asynchronous RAM. The read data is available  $t_{PACC}$  after the falling edge of NRD, and turns to 'Z' after the rising edge of NRD. In this case, the READ\_MODE must be set to 1 (read is controlled by NRD), to indicate that data is available with the rising edge of NRD. The SMC samples the read data internally on the rising edge of the Master Clock that generates the rising edge of NRD, whatever the programmed waveform of NCS.

**Figure 36-8. READ\_MODE = 1: Data is Sampled by SMC before the Rising Edge of NRD**

### 36.10.2.2 Read is Controlled by NCS (READ\_MODE = 0)

The figure below shows the typical read cycle. The read data is valid  $t_{PACC}$  after the falling edge of the NCS signal and remains valid until the rising edge of NCS. Data must be sampled when NCS is raised. In that case, the READ\_MODE must be configured to 0 (read is controlled by NCS): the SMC internally samples the data on the rising edge of the Master Clock that generates the rising edge of NCS, whatever the programmed waveform of NRD.

**Figure 36-9. READ\_MODE = 0: Data is Sampled by SMC before the Rising Edge of NCS**

### 36.10.3 Write Waveforms

The write protocol is similar to the read protocol. It is depicted in the figure below. The write cycle starts with the address setting on the memory address bus.

#### 36.10.3.1 NWE Waveforms

The NWE signal is characterized by a setup timing, a pulse width and a hold timing:

- **NWE\_SETUP:** The NWE setup time is defined as the setup of address and data before the NWE falling edge.
- **NWE\_PULSE:** The NWE pulse length is the time between NWE falling edge and NWE rising edge.
- **NWE\_HOLD:** The NWE hold time is defined as the hold time of address and data after the NWE rising edge.

The NWE waveforms apply to all byte-write lines in Byte Write Access mode: NWR0 to NWR3.

### 36.10.3.2 NCS Waveforms

The NCS signal waveforms in write operations are not the same as those applied in read operations, but are separately defined:

- **NCS\_WR\_SETUP:** The NCS setup time is defined as the setup time of address before the NCS falling edge.
- **NCS\_WR\_PULSE:** The NCS pulse length is the time between NCS falling edge and NCS rising edge.
- **NCS\_WR\_HOLD:** The NCS hold time is defined as the hold time of address after the NCS rising edge.

**Figure 36-10. Write Cycle**

### 36.10.3.3 Write Cycle

The write cycle time is defined as the total duration of the write cycle, that is, from the time where address is set on the address bus to the point where address may change. The total write cycle time is equal to:

- $NWE\_CYCLE = NWE\_SETUP + NWE\_PULSE + NWE\_HOLD,$

as well as

- $NWE\_CYCLE = NCS\_WR\_SETUP + NCS\_WR\_PULSE + NCS\_WR\_HOLD$

All NWE and NCS (write) timings are defined separately for each chip select as an integer number of Master Clock cycles. The NWE\_CYCLE field is common to both the NWE and NCS signals, thus the timing period is of the same duration.

NWE\_CYCLE, NWE\_SETUP, and NWE\_PULSE implicitly define the NWE\_HOLD value as:

- $NWE\_HOLD = NWE\_CYCLE - NWE\_SETUP - NWE\_PULSE$

NWE\_CYCLE, NCS\_WR\_SETUP, and NCS\_WR\_PULSE implicitly define the NCS\_WR\_HOLD value as:

- $NCS\_WR\_HOLD = NWE\_CYCLE - NCS\_WR\_SETUP - NCS\_WR\_PULSE$

### 36.10.4 Write Mode

The WRITE\_MODE parameter in the HSMC\_MODE register of the corresponding chip select indicates which signal controls the write operation.

#### 36.10.4.1 Write is Controlled by NWE (WRITE\_MODE = 1)

The figure below shows the waveforms of a write operation with WRITE\_MODE set to 1. The data is put on the bus during the pulse and hold steps of the NWE signal. The internal data buffers are switched to Output mode after the NWE\_SETUP time, and until the end of the write cycle, regardless of the programmed waveform on NCS.

**Figure 36-11. WRITE\_MODE = 1. The write operation is controlled by NWE**

#### 36.10.4.2 Write is Controlled by NCS (WRITE\_MODE = 0)

The figure below shows the waveforms of a write operation with WRITE\_MODE configured to 0. The data is put on the bus during the pulse and hold steps of the NCS signal. The internal data buffers are switched to Output mode after the NCS\_WR\_SETUP time, and until the end of the write cycle, regardless of the programmed waveform on NWE.

**Figure 36-12. WRITE\_MODE = 0. The write operation is controlled by NCS**

### 36.10.5 Coding Timing Parameters

All timing parameters are defined for one chip select and are grouped together in one register according to their type:

- The HSMC\_SETUP register groups the definition of all setup parameters: NRD\_SETUP, NCS\_RD\_SETUP, NWE\_SETUP, NCS\_WR\_SETUP
- The HSMC\_PULSE register groups the definition of all pulse parameters: NRD\_PULSE, NCS\_RD\_PULSE, NWE\_PULSE, NCS\_WR\_PULSE
- The HSMC\_CYCLE register groups the definition of all cycle parameters: NRD\_CYCLE, NWE\_CYCLE

The table below shows how the timing parameters are coded and their permitted range.

**Table 36-4. Coding and Range of Timing Parameters**

Coded Value	Number of Bits	Effective Value	Permitted Range	
			Coded Value	Effective Value
setup [5:0]	6	128 x setup[5] + setup[4:0]	0 ≤ setup ≤ 31	0..31
			32 ≤ setup ≤ 63	128..(128 + 31)
pulse [6:0]	7	256 x pulse[6] + pulse[5:0]	0 ≤ pulse ≤ 63	0..63
			64 ≤ pulse ≤ 127	256..(256 + 63)
cycle[8:0]	9	256 x cycle[8:7] + cycle[6:0]	0 ≤ cycle ≤ 127	0..127
			128 ≤ cycle ≤ 255	256..(256 + 127)
			256 ≤ cycle ≤ 383	512..(512 + 127)
			384 ≤ cycle ≤ 511	768..(768 + 127)

### 36.10.6 Reset Values of Timing Parameters

The table below gives the default value of timing parameters at reset.

**Table 36-5. Reset Values of Timing Parameters**

Register	Reset Value	Description
HSMC_SETUP	0x01010101	All setup timings are set to 1
HSMC_PULSE	0x01010101	All pulse timings are set to 1
HSMC_CYCLE	0x00030003	The read and write operations last three Master Clock cycles and provide one hold cycle.
WRITE_MODE	1	Write is controlled with NWE
READ_MODE	1	Read is controlled with NRD

### 36.10.7 Usage Restriction

The SMC does not check the validity of the user-programmed parameters. If the sum of SETUP and PULSE parameters is larger than the corresponding CYCLE parameter, this leads to an unpredictable behavior of the SMC.

#### 36.10.7.1 For Read Operations

Null but positive setup and hold of address and NRD and/or NCS cannot be guaranteed at the memory interface because of the propagation delay of these signals through external logic and pads. When positive setup and hold values must be verified, then it is strictly recommended to program non-null values so as to cover possible skews between address, NCS and NRD signals.

#### 36.10.7.2 For Write Operations

If a null hold value is programmed on NWE, the SMC can guarantee a positive hold of address, byte select lines, and NCS signal after the rising edge of NWE. This is true for WRITE\_MODE = 1 only. See “Early Read Wait State”.

#### 36.10.7.3 For Read and Write Operations

A null value for pulse parameters is forbidden and may lead to an unpredictable behavior.

In read and write cycles, the setup and hold time parameters are defined in reference to the address bus. For external devices that require setup and hold time between NCS and NRD signals (read), or between NCS and NWE signals (write), these setup and hold times must be converted into setup and hold times in reference to the address bus.

## 36.11 Scrambling/Unscrambling Function

The external data bus D[15:0] can be scrambled in order to prevent intellectual property data located in off-chip memories from being easily recovered by analyzing data at the package pin level of either the microcontroller or the memory device.

The scrambling and unscrambling are performed on-the-fly without additional wait states.

The scrambling method depends on two user-configurable key registers, HSMC\_KEY1 and HSMC\_KEY2. These key registers are only accessible in Write mode.

The key must be securely stored in a reliable nonvolatile memory in order to recover data from the off-chip memory. Any data scrambled with a given key cannot be recovered if the key is lost.

The scrambling/unscrambling function is enabled or disabled by configuring specific bits in the HSMC\_OCMS and the HSMC\_TIMINGSx registers. The bit configuration values to enable memory scrambling are summarized in the table below.

**Table 36-6. Scrambling Function Bit Encoding**

Memories	Bit Values		
	HSMC_OCMS.SMSE	HSMC_OCMS.SRSE	HSMC_TIMINGSx.OCMS
Off-chip Memories	1	0	1
NAND Flash with NFC	0	1	0

When the NAND Flash memory content is scrambled, the on-chip NFC SRAM page buffer associated for the transfer is also scrambled.

### 36.12 Automatic Wait States

Under certain circumstances, the SMC automatically inserts idle cycles between accesses to avoid bus contention or operation conflict.

#### 36.12.1 Chip Select Wait States

The SMC always inserts an idle cycle between two transfers on separate chip selects. This idle cycle ensures that there is no bus contention between the deactivation of one device and the activation of the next one.

During chip select wait state, all control lines are turned inactive: NBS0 to NBS1, NWR0 to NWR1, NCS[0..3], and NRD lines. They are all set to 1.

The figure below illustrates a chip select wait state between access on Chip Select 0 and Chip Select 2.

**Figure 36-13. Chip Select Wait State between a Read Access on NCS0 and a Write Access on NCS2**

### 36.12.2 Early Read Wait State

In some cases, the SMC inserts a wait state cycle between a write access and a read access to allow time for the write cycle to end before the subsequent read cycle begins. This wait state is not generated in addition to a chip select wait state. The early read cycle thus only occurs between a write and read access to the same memory device (same chip select).

An early read wait state is automatically inserted if at least one of the following conditions is valid:

- if the write controlling signal has no hold time and the read controlling signal has no setup time (see figure “Early Read Wait State: Write with No Hold Followed by Read with No Setup”).
- in NCS Write Controlled mode (WRITE\_MODE = 0), if there is no hold timing on the NCS signal and the NCS\_RD\_SETUP parameter is configured to 0, regardless of the Read mode (see figure “Early Read Wait State: NCS Controlled Write with No Hold Followed by a Read with No NCS Setup”). The write operation must end with an NCS rising edge. Without an Early Read Wait State, the write operation could not complete properly.
- in NWE Controlled mode (WRITE\_MODE = 1) and if there is no hold timing (NWE\_HOLD = 0), the feedback of the write control signal is used to control address, data, chip select and byte select lines. If the external write control signal is not inactivated as expected due to load capacitances, an Early Read Wait State is inserted and address, data and control signals are maintained one more cycle. See figure “Early Read Wait State: NWE-controlled Write with No Hold Followed by a Read with One Setup Cycle”.

**Figure 36-14. Early Read Wait State: Write with No Hold Followed by Read with No Setup**

**Figure 36-15. Early Read Wait State: NCS Controlled Write with No Hold Followed by a Read with No NCS Setup**

**Figure 36-16. Early Read Wait State: NWE-controlled Write with No Hold Followed by a Read with One Setup Cycle**

### 36.12.3 Reload User Configuration Wait State

The user may change any of the configuration parameters by writing the SMC user interface.

When detecting that a new user configuration has been written in the user interface, the SMC inserts a wait state before starting the next access. The so called "Reload User Configuration Wait State" is used by the SMC to load the new set of parameters to apply to next accesses.

The Reload Configuration Wait State is not applied in addition to the Chip Select Wait State. If accesses before and after reprogramming the user interface are made to different devices (Chip Selects), then one single Chip Select Wait State is applied.

On the other hand, if accesses before and after writing the user interface are made to the same device, a Reload Configuration Wait State is inserted, even if the change does not concern the current Chip Select.

### 36.12.3.1 User Procedure

To insert a Reload Configuration Wait State, the SMC detects a write access to any HSMC\_MODE register of the user interface. If only the timing registers are modified (HSMC\_SETUP, HSMC\_PULSE, HSMC\_CYCLE registers) in the user interface, the user must validate the modification by writing the HSMC\_MODE register, even if no change was made on the mode parameters.

### 36.12.3.2 Slow Clock Mode Transition

A Reload Configuration Wait State is also inserted when the Slow Clock Mode is entered or exited, after the end of the current transfer (see [“Slow Clock Mode”](#)).

### 36.12.4 Read to Write Wait State

Due to an internal mechanism, a wait cycle is always inserted between consecutive read and write SMC accesses.

This wait cycle is referred to as a read to write wait state in this document.

This wait cycle is applied in addition to chip select and reload user configuration wait states when they are to be inserted. See figure [“Chip Select Wait State between a Read Access on NCS0 and a Write Access on NCS2”](#).

## 36.13 Data Float Wait States

Some memory devices are slow to release the external bus. For such devices, it is necessary to add wait states (data float wait states) after a read access:

- before starting a read access to a different external memory
- before starting a write access to the same device or to a different external one.

The Data Float Output Time ( $t_{DF}$ ) for each external memory device is programmed in the TDF\_CYCLES field of the HSMC\_MODE register for the corresponding chip select. The value of TDF\_CYCLES indicates the number of data float wait cycles (between 0 and 15) before the external device releases the bus, and represents the time allowed for the data output to go to high impedance after the memory is disabled.

Data float wait states do not delay internal memory accesses. Hence, a single access to an external memory with long  $t_{DF}$  will not slow down the execution of a program from internal memory.

The data float wait states management depends on the READ\_MODE and the TDF\_MODE bits of the HSMC\_MODE register for the corresponding chip select.

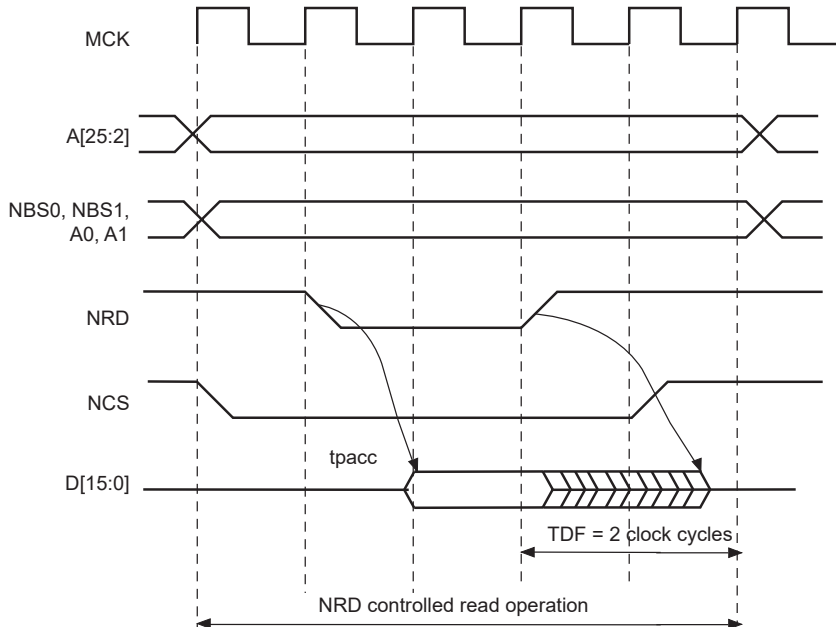

### 36.13.1 READ\_MODE

Setting READ\_MODE to 1 indicates to the SMC that the NRD signal is responsible for turning off the tri-state buffers of the external memory device. The Data Float Period then begins after the rising edge of the NRD signal and lasts TDF\_CYCLES MCK cycles.

When the read operation is controlled by the NCS signal (READ\_MODE = 0), the TDF\_CYCLES field in HSMC\_MODEEx gives the number of MCK cycles during which the data bus remains busy after the rising edge of NCS.

The figure “TDF Period in NRD Controlled Read Access (TDF = 2)” illustrates the Data Float Period in NRD-controlled mode (READ\_MODE = 1), assuming a data float period of two cycles (TDF\_CYCLES = 2). The figure “TDF Period in NCS Controlled Read Operation (TDF = 3)” shows the read operation when controlled by NCS (READ\_MODE = 0) and the TDF\_CYCLES parameter equals 3.

**Figure 36-17. TDF Period in NRD Controlled Read Access (TDF = 2)**

**Figure 36-18. TDF Period in NCS Controlled Read Operation (TDF = 3)**

### 36.13.2 TDF Optimization Enabled (TDF\_MODE = 1)

When the TDF\_MODE of the HSMC\_MODE register is set to 1 (TDF optimization is enabled), the SMC takes advantage of the setup period of the next access to optimize the number of wait states cycle to insert.

The figure below shows a read access controlled by NRD, followed by a write access controlled by NWE, on Chip Select 0. Chip Select 0 has been programmed with:

NRD\_HOLD = 4; READ\_MODE = 1 (NRD controlled)

NWE\_SETUP = 3; WRITE\_MODE = 1 (NWE controlled)

TDF\_CYCLES = 6; TDF\_MODE = 1 (optimization enabled).

**Figure 36-19. TDF Optimization: No TDF wait states are inserted if the TDF period is over when the next access begins**

### 36.13.3 TDF Optimization Disabled (TDF\_MODE = 0)

When optimization is disabled, TDF wait states are inserted at the end of the read transfer, so that the data float period ends when the second access begins. If the hold period of the read1 controlling signal overlaps the data float period, no additional TDF wait states will be inserted.

The figures below illustrate the cases:

- read access followed by a read access on another chip select,
- read access followed by a write access on another chip select,
- read access followed by a write access on the same chip select,

with no TDF optimization.

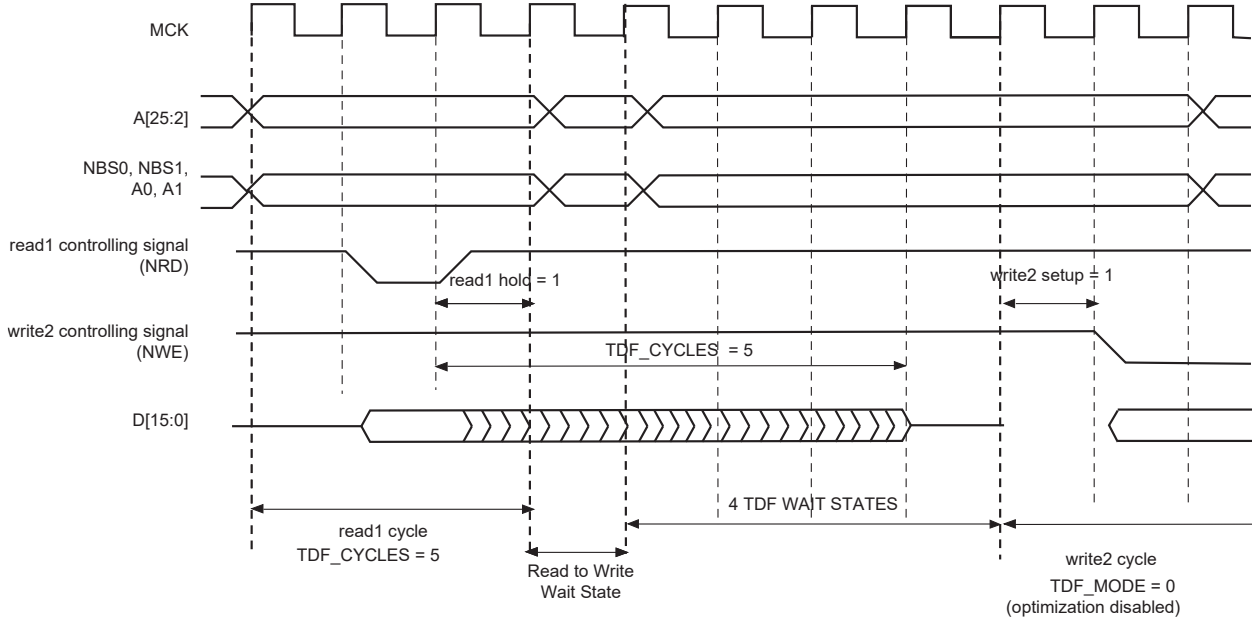

**Figure 36-20. TDF Optimization Disabled (TDF Mode = 0). TDF wait states between 2 read accesses on different chip selects**

**Figure 36-21. TDF Mode = 0: TDF wait states between a read and a write access on different chip selects**

**Figure 36-22. TDF Mode = 0: TDF wait states between read and write accesses on the same chip select**

### 36.14 External Wait

Any access can be extended by an external device using the NWAIT input signal of the SMC. The EXNW\_MODE field of the HSMC\_MODE register on the corresponding chip select must be set to either '10' (Frozen mode) or '11' (Ready mode). When the EXNW\_MODE is set to '00' (disabled), the NWAIT signal is simply ignored on the corresponding chip select. The NWAIT signal delays the read or write operation in regards to the read or write controlling signal, depending on the Read and Write modes of the corresponding chip select.

#### 36.14.1 Restriction

When one of the EXNW\_MODE is enabled, it is mandatory to program at least one hold cycle for the read/write controlling signal. For that reason, the NWAIT signal cannot be used in Slow Clock Mode (see "Slow Clock Mode").

The NWAIT signal is assumed to be a response of the external device to the read/write request of the SMC. NWAIT is then examined by the SMC in the pulse state of the read or write controlling signal. The assertion of the NWAIT signal outside the expected period has no impact on the SMC behavior.

#### 36.14.2 Frozen Mode

When the external device asserts the NWAIT signal (active low), and after an internal synchronization of this signal, the SMC state is frozen, i.e., SMC internal counters are frozen, and all control signals remain unchanged. When the resynchronized NWAIT signal is deasserted, the SMC completes the access, resuming the access from the point where it was stopped. See the figure below. This mode must be selected when the external device uses the NWAIT signal to delay the access and to freeze the SMC.

The assertion of the NWAIT signal outside the expected period is ignored as illustrated in the figure "Read Access with NWAIT Assertion in Frozen Mode (EXNW\_MODE = 10)".

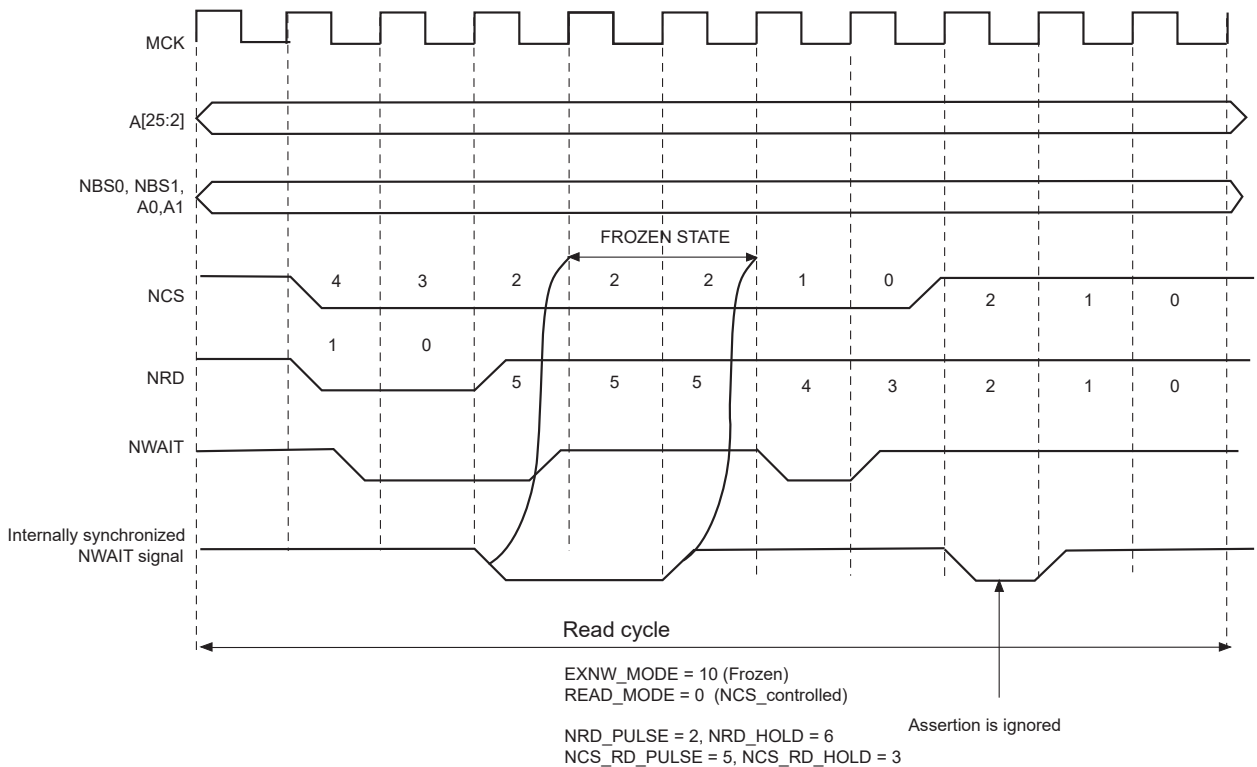

# SAMA5D2 Series

## Static Memory Controller (SMC)

**Figure 36-23. Write Access with NWAIT Assertion in Frozen Mode (EXNW\_MODE = 10)**

**Figure 36-24. Read Access with NWAIT Assertion in Frozen Mode (EXNW\_MODE = 10)**

### 36.14.3 Ready Mode

In Ready mode (EXNW\_MODE = 11), the SMC behaves differently. Normally, the SMC begins the access by down counting the setup and pulse counters of the read/write controlling signal. In the last cycle of the pulse phase, the resynchronized NWAIT signal is examined.

If asserted, the SMC suspends the access as shown in the figures below. After deassertion, the access is completed: the hold step of the access is performed.

This mode must be selected when the external device uses deassertion of the NWAIT signal to indicate its ability to complete the read or write operation.

If the NWAIT signal is deasserted before the end of the pulse, or asserted after the end of the pulse of the controlling read/write signal, it has no impact on the access length as shown in the figure “[NWAIT Assertion in Read Access: Ready Mode \(EXNW\\_MODE = 11\)](#)”.

**Figure 36-25. NWAIT Assertion in Write Access: Ready Mode (EXNW\_MODE = 11)**

**Figure 36-26. NWAIT Assertion in Read Access: Ready Mode (EXNW\_MODE = 11)**

### 36.14.4 NWAIT Latency and Read/Write Timings

There may be a latency between the assertion of the read/write controlling signal and the assertion of the NWAIT signal by the device. The programmed pulse length of the read/write controlling signal must be at least equal to this latency plus the 2 cycles of resynchronization + 1 cycle. Otherwise, the SMC may enter the hold state of the access without detecting the NWAIT signal assertion. This is true in Frozen mode as well as in Ready mode. This is illustrated in the figure below.

When EXNW\_MODE is enabled (ready or frozen), the user must program a pulse length of the read and write controlling signal of at least:

$$\text{minimal pulse length} = \text{NWAIT latency} + 2 \text{ resynchronization cycles} + 1 \text{ cycle}$$

**Figure 36-27. NWAIT Latency**

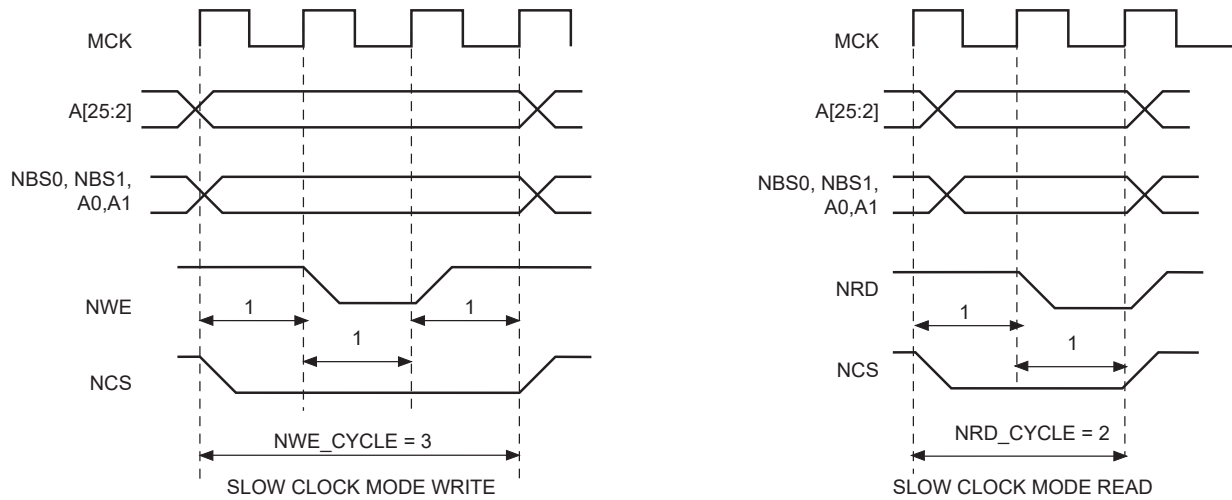

### 36.15 Slow Clock Mode

The SMC is able to automatically apply a set of “Slow Clock mode” read/write waveforms when an internal signal driven by the Power Management Controller is asserted because MCK has been turned to a very slow clock rate (typically 32 kHz clock rate). In this mode, the user-programmed waveforms are ignored and the Slow Clock mode waveforms are applied. This mode is provided so as to avoid reprogramming the User Interface with appropriate waveforms at very slow clock rate. When activated, the Slow mode is active on all chip selects.

#### 36.15.1 Slow Clock Mode Waveforms

The figure below illustrates the read and write operations in Slow Clock mode. They are valid on all chip selects. The table below indicates the value of read and write parameters in Slow Clock mode.

**Figure 36-28. Write/Read Cycles in Slow Clock Mode**

**Table 36-7. Read and Write Timing Parameters in Slow Clock Mode**

Read Parameters	Duration (cycles)	Write Parameters	Duration (cycles)
NRD_SETUP	1	NWE_SETUP	1
NRD_PULSE	1	NWE_PULSE	1
NCS_RD_SETUP	0	NCS_WR_SETUP	0
NCS_RD_PULSE	2	NCS_WR_PULSE	3
NRD_CYCLE	2	NWE_CYCLE	3

### 36.15.2 Switching from (to) Slow Clock Mode to (from) Normal Mode

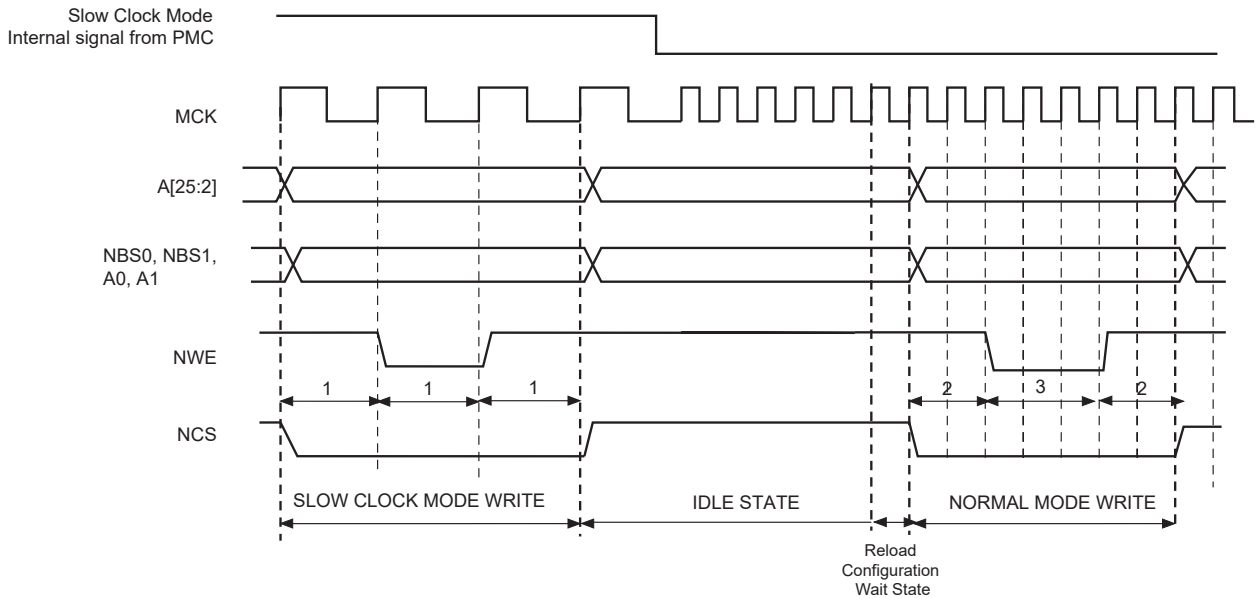

When switching from Slow Clock mode to Normal mode, the current Slow Clock mode transfer is completed at high clock rate, with the set of Slow Clock mode parameters. See the figure [“Clock Rate Transition occurs while the SMC is performing a Write Operation”](#). The external device may not be fast enough to support such timings.

The figure [“Recommended Procedure to Switch from Slow Clock Mode to Normal Mode or from Normal Mode to Slow Clock Mode”](#) illustrates the recommended procedure to properly switch from one mode to the other.

**Figure 36-29. Clock Rate Transition occurs while the SMC is performing a Write Operation**

**Figure 36-30. Recommended Procedure to Switch from Slow Clock Mode to Normal Mode or from Normal Mode to Slow Clock Mode**

### 36.16 Register Write Protection

To prevent any single software error that may corrupt SMC behavior, selected registers can be write-protected by setting the WPEN bit in the [Write Protection Mode Register \(HSMC\\_WPMR\)](#).

If a write access in a write-protected register is detected, then the WPVS flag in the [Write Protection Status Register](#) (HSMC\_WPSR) is set and the field WPVSR indicates in which register the write access has been attempted.

The WPVS flag is automatically reset after reading the HSMC\_WPSR.

The following registers can be write-protected:

- [Setup Register](#)
- [Pulse Register](#)
- [Cycle Register](#)
- [Timings Register](#)
- [Mode Register](#)

## 36.17 NFC Operations

### 36.17.1 NFC Overview

The NFC handles all the command, address and data sequences of the NAND low level protocol. An SRAM is used as an internal read/write buffer when data is transferred from or to the NAND.

### 36.17.2 NFC Control Registers

NAND Flash Read and NAND Flash Program operations can be performed through the NFC Command Registers. In order to minimize CPU intervention and latency, commands are posted in a command buffer. This buffer provides zero wait state latency.

The NFC handles an automatic transfer between the external NAND Flash and the chip via the NFC SRAM. The transfer is done by programming NFC Command Registers.

The NFC Command Registers are very efficient to use. When writing to these registers:

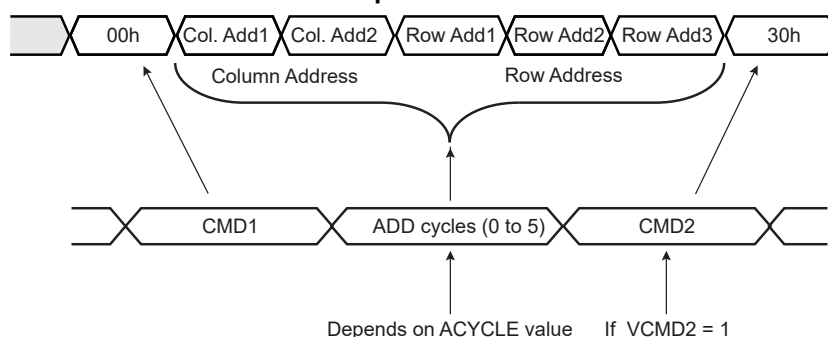

- the address of the register (NFCADDR\_CMD) is the command used
- the data of the register (NFCDATA\_ADDT) is the address to be sent to the NAND Flash

In one single access the command is sent and immediately executed by the NFC. Two commands can even be programmed within a single access (CMD1, CMD2) depending on the VCMD2 value.

The NFC can send up to five address cycles.

The figure below shows a typical NAND Flash Page Read Command of a NAND Flash Memory and correspondence with NFC Address Command Register.

**Figure 36-31. NFC/NAND Flash Access Example**

For more details, refer to [36.17.2.2 NFCADDR\\_CMD](#).

Reading the NFC Command Register (to any address) will give the status of the NFC. This is especially useful to know if the NFC is busy, for example.

### 36.17.2.1 Building NFC Address Command Example

The base address is made of HOST\_ADDR address.

Page read operation example:

```
// Build the Address Command (NFCADDR_CMD)
AddressCommand = (HOST_ADDR |
  NFCWR=0      | // NFC Read Data from NAND Flash
  DATAEN=1    | // NFC Data phase Enable.
  CSID=1       | // Chip Select ID = 1
  ACYCLE= 5    | // Number of address cycle.
  VCMD2=1     | // CMD2 is sent after Address Cycles
  CMD2=0x30   | // CMD2 = 30h
  CMD1=0x0) // CMD1 = Read Command = 00h
// Set the Address for Cycle 0
HSMC_ADDR = Col. Add1
// Write command with the Address Command built above
*AddressCommand = (Col. Add2 | // ADDR_CYCLE1
  Row Add1   | // ADDR_CYCLE2
  Row Add2   | // ADDR_CYCLE3
  Row Add3 ) // ADDR_CYCLE4
```

### 36.17.2.2 NFC Address Command

**Name:** NFCADDR\_CMD

**Property:** Read/Write

	Bit	31	30	29	28	27	26	25	24	
								NFCWR	DATAEN	CSID[2:2]
Access								R/W	R/W	R/W
Reset										
	Bit	23	22	21	20	19	18	17	16	
		CSID[1:0]		ACYCLE[2:0]			VCMD2	CMD2[7:6]		
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset										
	Bit	15	14	13	12	11	10	9	8	
		CMD2[5:0]						CMD1[7:6]		
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset										
	Bit	7	6	5	4	3	2	1	0	
		CMD1[5:0]								
Access		R/W	R/W	R/W	R/W	R/W	R/W			
Reset										

#### Bit 26 – NFCWR NFC Write Enable

Value	Description
0	NFC reads data from the NAND Flash.
1	NFC writes data into the NAND Flash.

#### Bit 25 – DATAEN NFC Data Phase Enable

When set to true, the NFC will automatically read or write data after the command.

#### Bits 24:22 – CSID[2:0] Chip Select Identifier

Chip select used.

#### Bits 21:19 – ACYCLE[2:0] Number of Address Required for the Current Command

When ACYCLE field is different from zero, ACYCLE Address cycles are performed after Command Cycle 1. The maximum number of cycles is 5.

#### Bit 18 – VCMD2 Valid Cycle 2 Command

When set to true, the CMD2 field is issued after the address cycle.

#### Bits 17:10 – CMD2[7:0] Command Register Value for Cycle 2

When a write access occurs with the VCMD2 field set, the NFC sends this command after CMD1.

#### Bits 9:2 – CMD1[7:0] Command Register Value for Cycle 1

When a write access occurs, the NFC sends this command.

### 36.17.2.3 NFC Data Address

**Name:** NFCDATA\_ADDT  
**Property:** Write-only

If five address cycles are used, the first address cycle is ADDR\_CYCLE0. Refer to HSMC\_ADDR register.

Bit	31	30	29	28	27	26	25	24
	ADDR_CYCLE4[7:0]							
Access	W	W	W	W	W	W	W	W
Reset								
Bit	23	22	21	20	19	18	17	16
	ADDR_CYCLE3[7:0]							
Access	W	W	W	W	W	W	W	W
Reset								
Bit	15	14	13	12	11	10	9	8
	ADDR_CYCLE2[7:0]							
Access	W	W	W	W	W	W	W	W
Reset								
Bit	7	6	5	4	3	2	1	0
	ADDR_CYCLE1[7:0]							
Access	W	W	W	W	W	W	W	W
Reset								

**Bits 31:24 – ADDR\_CYCLE4[7:0]** NAND Flash Array Address Cycle 4  
 When less than five address cycles are used, ADDR\_CYCLE4 is the fourth byte written to the NAND Flash.  
 When five address cycles are used, ADDR\_CYCLE4 is the fifth byte written to NAND Flash.

**Bits 23:16 – ADDR\_CYCLE3[7:0]** NAND Flash Array Address Cycle 3  
 When less than five address cycles are used, ADDR\_CYCLE3 is the third byte written to the NAND Flash.  
 When five address cycles are used, ADDR\_CYCLE3 is the fourth byte written to NAND Flash.

**Bits 15:8 – ADDR\_CYCLE2[7:0]** NAND Flash Array Address Cycle 2  
 When less than five address cycles are used, ADDR\_CYCLE2 is the second byte written to the NAND Flash.  
 When five address cycles are used, ADDR\_CYCLE2 is the third byte written to NAND Flash.

**Bits 7:0 – ADDR\_CYCLE1[7:0]** NAND Flash Array Address Cycle 1  
 When less than five address cycles are used, ADDR\_CYCLE1 is the first byte written to the NAND Flash.  
 When five address cycles are used, ADDR\_CYCLE1 is the second byte written to NAND Flash.

### 36.17.2.4 NFC Data Status

**Name:** NFCDATA\_STATUS

**Property:** Read-only

	Bit	31	30	29	28	27	26	25	24	
						NFCBUSY	NFCWR	DATAEN	CSID[2:2]	
Access						R	R	R	R	
Reset										
	Bit	23	22	21	20	19	18	17	16	
		CSID[1:0]		ACYCLE[2:0]			VCMD2	CMD2[7:6]		
Access		R	R	R	R	R	R	R	R	
Reset										
	Bit	15	14	13	12	11	10	9	8	
		CMD2[5:0]						CMD1[7:6]		
Access		R	R	R	R	R	R	R	R	
Reset										
	Bit	7	6	5	4	3	2	1	0	
		CMD1[5:0]								
Access		R	R	R	R	R	R			
Reset										

**Bit 27 – NFCBUSY** NFC Busy Status Flag  
If set to true, it indicates that the NFC is busy.

**Bit 26 – NFCWR** NFC Write Enable

Value	Description
0	NFC is in Read mode.
1	NFC is in Write mode.

**Bit 25 – DATAEN** NFC Data Phase Enable  
When set to true, the NFC data phase is enabled.

**Bits 24:22 – CSID[2:0]** Chip Select Identifier  
Chip select used.

**Bits 21:19 – ACYCLE[2:0]** Number of Address Required for the Current Command  
When ACYCLE is different from zero, ACYCLE Address cycles are performed after Command Cycle 1.

**Bit 18 – VCMD2** Valid Cycle 2 Command  
When set to true, the CMD2 field is issued after the address cycle.

**Bits 17:10 – CMD2[7:0]** Command Register Value for Cycle 2  
When VCMD2 bit is set to true, the Physical Memory Interface drives the IO bus with CMD2 field during the Command Latch cycle 2.

**Bits 9:2 – CMD1[7:0]** Command Register Value for Cycle 1

When a Read or Write Access occurs, the Physical Memory Interface drives the IO bus with CMD1 field during the Command Latch cycle 1.

### 36.17.3 NFC Initialization

Prior to any Command and Data Transfer, the SMC User Interface must be configured to meet the device timing requirements.

- Write Enable Configuration

Use NWE\_SETUP, NWE\_PULSE and NWE\_CYCLE to define the write enable waveform according to the external device datasheet.

Use HSMC\_TIMINGS.TADL to configure the timing between the last address latch cycle and the first rising edge of WEN for data input.

**Figure 36-32. Write Enable Timing Configuration**

**Figure 36-33. Write Enable Timing for NAND Flash Device Data Input Mode**

- Read Enable Configuration

Use NRD\_SETUP, NRD\_PULSE and NRD\_CYCLE to define the read enable waveform according to the external device datasheet.

Use HSMC\_TIMINGS.TAR to configure the timings between the address latch enable falling edge to read the enable falling edge.

Use HSMC\_TIMINGS.TCLR to configure the timings between the command latch enable falling edge to read the enable falling edge.

**Figure 36-34. Read Enable Timing Configuration Working with NAND Flash Device**

- Ready/Busy Signal Timing Configuration with a NAND Flash Device

Use HSMC\_TIMINGS.TWB to configure the maximum elapsed time between the rising edge of the wen signal and the falling edge of the Ready/Busy signal. Use TRR field in the HSMC\_TIMINGS register to program the number of clock cycles between the rising edge of the Ready/Busy signal and the falling edge of the ren signal.

**Figure 36-35. Ready/Busy Timing Configuration**

### 36.17.3.1 NFC Timing Engine

When the NFC Command register is written, the NFC issues a NAND Flash Command and optionally performs a data transfer between the NFC SRAM and the NAND Flash device. The NFC Timing Engine guarantees valid NAND Flash timings, depending on the set of parameters decoded from the address bus. These timings are defined in the HSMC\_TIMINGS register.

For information on the timing used depending on the command, see the figure below.

**Figure 36-36. NFC Timing Engine**

See the register descriptions [36.17.2.2 NFCADDR\\_CMD](#) and [36.20.36 HSMC\\_TIMINGSx](#).

### 36.17.4 NFC SRAM

#### 36.17.4.1 NFC SRAM Mapping

If the NFC is used to read and write data from and to the NAND Flash, the configuration depends on the page size (PAGESIZE field in HSMC\_CFG register). See the tables below for detailed mapping.

The NFC can handle the NAND Flash with a page size of 8 Kbytes or lower (such as 2 Kbytes, for example). In case of a 4 Kbyte or lower page size, the NFC SRAM can be split into two banks. The BANK bit in the HSMC\_BANK register is used to select where NAND flash data are written or read. For an 8 Kbyte page size this field is not relevant.

Note that a “Ping-Pong” mode (write or read to a bank while the NFC writes or reads to another bank) is accessible with the NFC (using two different banks).

If the NFC is not used, the NFC SRAM can be used for a general purpose by the application.

**Table 36-8. NFC SRAM Bank Mapping for 512 bytes**

Offset	Use	Access
0x00000000–0x000001FF	Main Area Bank 0	Read/Write
0x00000200–0x000003FF	Spare Area Bank 0	Read/Write
0x00001200–0x000013FF	Main Area Bank 1	Read/Write
0x00001400–0x000015FF	Spare Area Bank 1	Read/Write

**Table 36-9. NFC SRAM Bank Mapping for 1 Kbyte**

Offset	Use	Access
0x00000000–0x000003FF	Main Area Bank 0	Read/Write
0x00000400–0x000005FF	Spare Area Bank 0	Read/Write
0x00001200–0x000015FF	Main Area Bank 1	Read/Write
0x00001600–0x000017FF	Spare Area Bank 1	Read/Write

**Table 36-10. NFC SRAM Bank Mapping for 2 Kbytes**

Offset	Use	Access
0x00000000–0x000007FF	Main Area Bank 0	Read/Write
0x00000800–0x000009FF	Spare Area Bank 0	Read/Write
0x00001200–0x000019FF	Main Area Bank 1	Read/Write
0x00001A00–0x00001BFF	Spare Area Bank 1	Read/Write

**Table 36-11. NFC SRAM Bank Mapping for 4 Kbytes**

Offset	Use	Access
0x00000000–0x00000FFF	Main Area Bank 0	Read/Write
0x00001000–0x000011FF	Spare Area Bank 0	Read/Write
0x00001200–0x000021FF	Main Area Bank 1	Read/Write
0x00002200–0x000023FF	Spare Area Bank 1	Read/Write

**Table 36-12. NFC SRAM Bank Mapping for 8 Kbytes, only one bank is available**

Offset	Use	Access
0x00000000–0x00001FFF	Main Area Bank 0	Read/Write
0x00002000–0x000023FF	Spare Area Bank 0	Read/Write

#### 36.17.4.2 NFC SRAM Access Prioritization Algorithm

When the NFC is reading from or writing to an NFC SRAM bank, the other bank is available. If an NFC SRAM access occurs when the NFC performs a read or write operation in the same bank, then the access is discarded. The write operation is not performed. The read operation returns undefined data. If this situation is encountered, the AWB status flag located in the NFC Status Register is raised and indicates that a shared resource access violation has occurred.

#### 36.17.5 NAND Flash Operations

This section describes the software operations needed to issue commands to the NAND Flash device and to perform data transfers using the NFC.

### 36.17.5.1 Page Read

Figure 36-37. Page Read Flow Chart

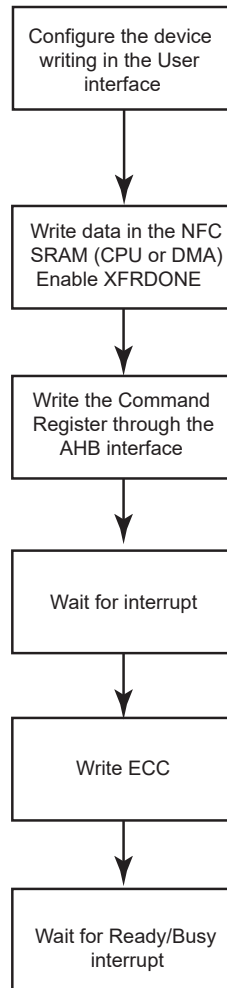

Instead of using the interrupt, the NFCBUSY flag can be polled.

For more information on the NFC Control register, see [36.17.2.2 NFCADDR\\_CMD](#).

### 36.17.5.2 Program Page

Figure 36-38. Program Page Flow Chart

Writing the ECC cannot be done using the NFC; it needs to be done “manually”.

Instead of using the interrupt, the NFCBUSY flag can be polled.

For more information on the NFC Control register, see [36.17.2.2 NFCADDR\\_CMD](#) .

## 36.18 PMECC Controller Functional Description

The Programmable Multibit Error Correcting Code (PMECC) controller is a programmable binary BCH (Bose, Chaudhuri and Hocquenghem) encoder/decoder. This controller can be used to generate redundancy information for both SLC and MLC NAND devices. It supports redundancy for correction of 2, 4, 8, 12, 24, or 32 errors per sector of data. The sector size is programmable and can be set to 512 bytes or 1024 bytes. The PMECC module generates redundancy at encoding time, when a NAND write page operation is performed. The redundancy is appended to the page and written in the spare area. This operation is performed by the processor. It moves the content of the PMECCX registers into the NAND flash memory. The number of registers depends on the selected error correction capability (see the table “[Relevant Redundancy Registers](#)”). This operation shall be executed for each sector. At decoding time, the PMECC module generates the remainders of the received codeword by the minimal polynomials.

When all remainders for a given sector are set to zero, no error occurred. When the remainders are different from zero, the codeword is corrupted and further processing is required.

The PMECC module generates an interrupt indicating that an error occurred. The processor must read the PMECC Interrupt Status Register (HSMC\_PMECCISR). This register indicates which sector is corrupted.

The processor must execute the following decoding steps to find the error location within a sector:

1. Syndrome computation.
2. Finding the error location polynomial.
3. Finding the roots of the error location polynomial.

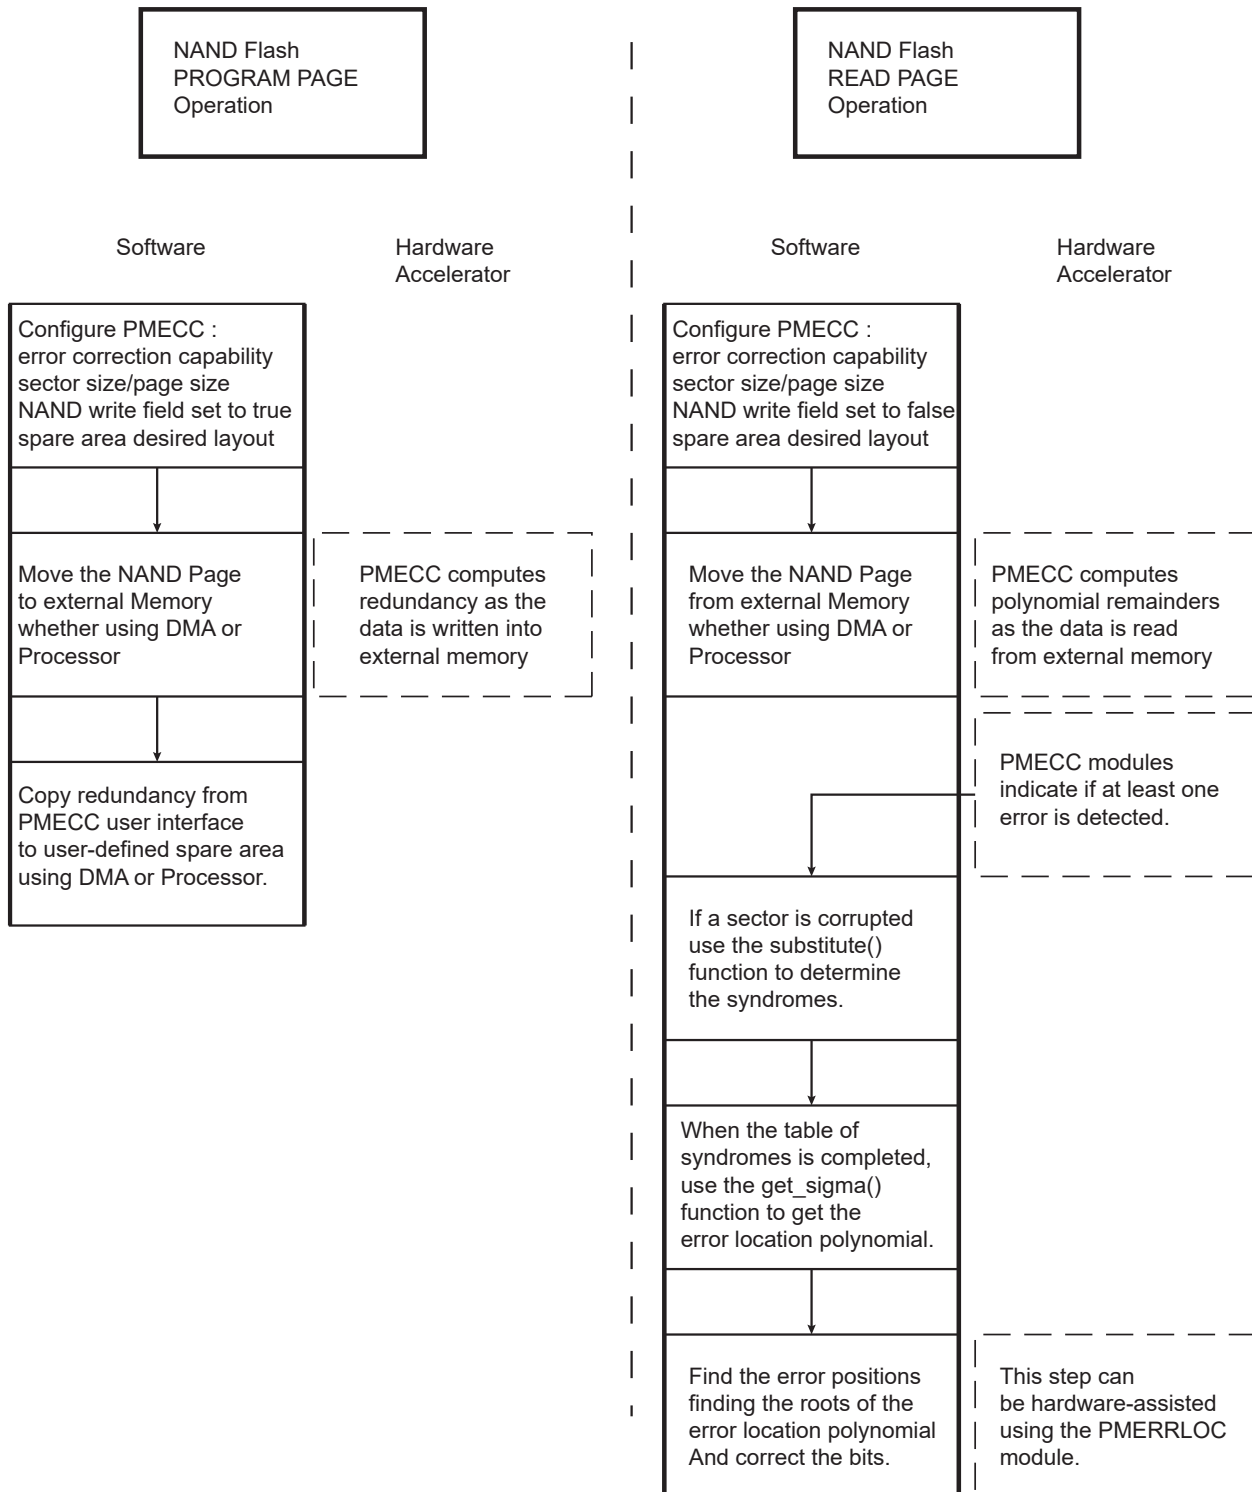

All decoding steps involve finite field computation. It means that a library of finite field arithmetic must be available to perform addition, multiplication and inversion. These arithmetic operations can be performed through the use of a memory mapped lookup table, or direct software implementation. The software implementation presented is based on lookup tables. Two tables named `gf_log` and `gf_antilog` are used. If  $\alpha$  is the primitive element of the field, then a power of  $\alpha$  is in the field. Assuming that  $\beta = \alpha^{\text{index}}$ , then  $\beta$  belongs to the field, and  $\text{gf\_log}(\beta) = \text{gf\_log}(\alpha^{\text{index}}) = \text{index}$ . The `gf_antilog` table provides exponent inverse of the element; if  $\beta = \alpha^{\text{index}}$ , then  $\text{gf\_antilog}(\text{index}) = \beta$ .

The first step consists in the syndrome computation. The PMECC module computes the remainders and the software must substitute the power of the primitive element. The procedure implementation is given in the section [“Remainder Substitution Procedure”](#).

The second step is the most software intensive. It is the Berlekamp’s iterative algorithm for finding the error-location polynomial. The procedure implementation is given in the section [“Finding the Error Location Polynomial  \$\Sigma\(x\)\$ ”](#).

The Last step is finding the root of the error location polynomial. This step can be very software intensive. Indeed there is no straightforward method of finding the roots, except evaluating each element of the field in the error location polynomial. However, a hardware accelerator can be used to find the roots of the polynomial. The PMERRLOC module provides this kind of hardware acceleration.

**Figure 36-39. Software Hardware Multibit Error Correction Dataflow**

### 36.18.1 MLC/SLC Write Page Operation Using PMECC

When an MLC write page operation is performed, the PMECC controller is configured with the NANDWR bit of the PMECCFG register set to one. When the NAND spare area contains file system information and redundancy (PMECCx), the spare area is error protected, then the SPAREEN bit of the PMECCFG

register is set. When the NAND spare area contains only redundancy information, the SPAREEN bit is cleared.

When the write page operation is terminated, the user writes the redundancy in the NAND spare area. This operation can be done with DMA assistance.

**Table 36-13. Relevant Redundancy Registers**

BCH_ERR Field	Sector Size Set to 512 Bytes	Sector Size Set to 1024 Bytes
0	PMECC0	PMECC0
1	PMECC0, PMECC1	PMECC0, PMECC1
2	PMECC0, PMECC1, PMECC2, PMECC3	PMECC0, PMECC1, PMECC2, PMECC3
3	PMECC0, PMECC1, PMECC2, PMECC3, PMECC4, PMECC5, PMECC6	PMECC0, PMECC1, PMECC2, PMECC3, PMECC4, PMECC5, PMECC6
4	PMECC0, PMECC1, PMECC2, PMECC3, PMECC4, PMECC5, PMECC6, PMECC7, PMECC8, PMECC9	PMECC0, PMECC1, PMECC2, PMECC3, PMECC4, PMECC5, PMECC6, PMECC7, PMECC8, PMECC9, PMECC10
5	PMECC0, PMECC1, PMECC2, PMECC3, PMECC4, PMECC5, PMECC6, PMECC7, PMECC8, PMECC9, PMECC10, PMECC11, PMECC12	PMECC0, PMECC1, PMECC2, PMECC3, PMECC4, PMECC5, PMECC6, PMECC7, PMECC8, PMECC9, PMECC10, PMECC11, PMECC12, PMECC13

**Table 36-14. Number of Relevant ECC Bytes per Sector, Copied from LSByte to MSByte**

BCH_ERR Field	Sector Size Set to 512 Bytes	Sector Size Set to 1024 Bytes
0	4 bytes	4 bytes
1	7 bytes	7 bytes
2	13 bytes	14 bytes
3	20 bytes	21 bytes
4	39 bytes	42 bytes
5	52 bytes	56 bytes

### 36.18.1.1 SLC/MLC Write Operation with Spare Enable Bit Set

When the SPAREEN bit of the PMECCFG register is set, the spare area of the page is encoded with the stream of data of the last sector of the page. This mode is entered by setting the DATA bit of the PMECCCTRL register. When the encoding process is over, the redundancy shall be written to the spare area in User mode. The USER bit of the PMECCCTRL register must be set.

**Figure 36-40. NAND Write Operation with Spare Encoding**

Write NAND operation with SPAREEN = 1

### 36.18.1.2 SLC/MLC Write Operation with Spare Disable

When the SPAREEN bit of PMECCFG is cleared, the spare area is not encoded with the stream of data. This mode is entered by setting the DATA bit of the PMECCCTRL register.

**Figure 36-41. NAND Write Operation**

Write NAND operation with SPAREEN = 0

### 36.18.2 MLC/SLC Read Page Operation Using PMECC

**Table 36-15. Relevant Remainder Registers**

BCH_ERR Field	Sector Size Set to 512 Bytes	Sector Size Set to 1024 Bytes
0	PMECCREM0	PMECCREM0
1	PMECCREM0, PMECCREM1	PMECCREM0, PMECCREM1
2	PMECCREM0, PMECCREM1, PMECCREM2, PMECCREM3,	PMECCREM0, PMECCREM1, PMECCREM2, PMECCREM3

### 36.18.2.1 MLC/SLC Read Operation with Spare Decoding

When the spare area is protected, it contains valid data. As the redundancy may be included in the middle of the information stream, the user shall program the start address and the end address of the ECC area. This mode is entered writing a 1 in the DATA bit of the PMECTRL register. When the page has been fully retrieved from the NAND, the ECC area shall be read using the User mode, writing a 1 to the USER bit of the PMECTRL register.

**Figure 36-42. Read Operation with Spare Decoding**

Read NAND operation with SPAREEN set to One and AUTO set to Zero

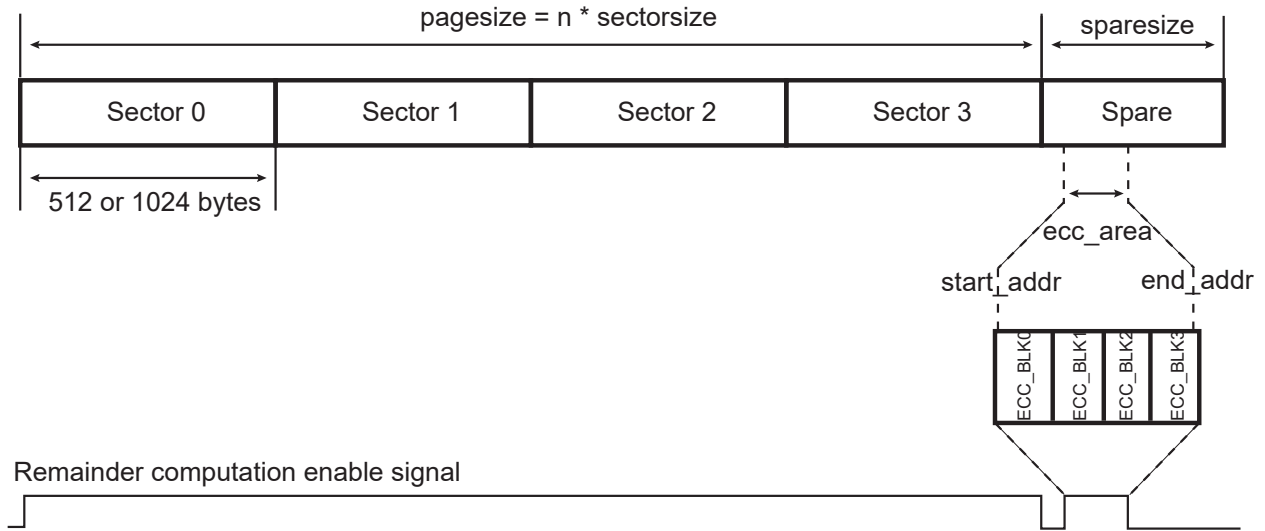

### 36.18.2.2 MLC/SLC Read Operation

If the spare area is not protected with the error correcting code, the redundancy area is retrieved directly. This mode is entered writing a 1 in the DATA bit of the PMECTRL register. When AUTO field is set to one, the ECC is retrieved automatically; otherwise, the ECC must be read using the User mode.

**Figure 36-43. Read Operation**

Read NAND operation with SPAREEN set to Zero and AUTO set to One

### 36.18.2.3 MLC/SLC User Read ECC Area

This mode allows a manual retrieve of the ECC. It is entered writing a 1 in the USER field of the PMECCCTRL register.

**Figure 36-44. Read User Mode**

### 36.18.2.4 MLC Controller Working with NFC

**Table 36-16. MLC Controller Configuration when the Host Controller is Used**

Transfer Type	NFC		PMECC		
	RSPARE	WSPARE	SPAREEN	AUTO	User Mode
Program Page main area is protected, spare is not protected, spare is written manually	0	0	0	0	Not used

.....continued					
Transfer Type	NFC		PMECC		
	RSPARE	WSPARE	SPAREEN	AUTO	User Mode
Program Page main area is protected, spare is protected, spare is written by NFC	0	1	1	0	Not used
Read Page main area is protected, spare is not protected, spare is not retrieved by NFC	0	0	0	0	Used
Read Page main area is protected, spare is not protected, spare is retrieved by NFC	1	0	0	1	Not used
Read Page main area is protected, spare is protected, spare is retrieved by NFC	1	0	1	0	Used

## 36.19 Software Implementation

### 36.19.1 Remainder Substitution Procedure

The substitute function evaluates the remainder polynomial, with different values of the field primitive element. The addition arithmetic operation is performed with the exclusive OR. The multiplication arithmetic operation is performed through the `gf_log` and `gf_antilog` lookup tables.

The `REM2NP1` and `REM2NP3` fields of the `PMECCREMN` registers contain only odd remainders. Each bit indicates whether the coefficient of the remainder polynomial is set to zero or not.

`NB_ERROR_MAX` defines the maximum value of the error correcting capability.

`NB_ERROR` defines the error correcting capability selected at encoding/decoding time.

`NB_FIELD_ELEMENTS` defines the number of elements in the field.

`si[]` is a table that holds the current syndrome value. An element of that table belongs to the field. This is also a shared variable for the next step of the decoding operation.

`oo[]` is a table that contains the degree of the remainders.

```
int substitute()
{
    int i;
    int j;
    for (i = 1; i < 2 * NB_ERROR_MAX; i++)
    {
        si[i] = 0;
    }
    for (i = 1; i < 2*NB_ERROR; i++)
    {
        for (j = 0; j < oo[i]; j++)
        {
            if (REM2NPX[i][j])
            {
                si[i] = gf_antilog[(i * j)%NB_FIELD_ELEMENTS] ^ si[i];
            }
        }
    }
}
```

```

    }
}
return 0;
}

```

### 36.19.2 Finding the Error Location Polynomial Sigma(x)

The sample code below gives a Berlekamp iterative procedure for finding the value of the error location polynomial.

The input of the procedure is the `si[]` table defined in the remainder substitution procedure.

The output of the procedure is the error location polynomial named `smu` (sigma mu). The polynomial coefficients belong to the field. The `smu[NB_ERROR+1][i]` is a table that contains all these coefficients.

`NB_ERROR_MAX` defines the maximum value of the error correcting capability.

`NB_ERROR` defines the error correcting capability selected at encoding/decoding time.

`NB_FIELD_ELEMENTS` defines the number of elements in the field.

```

int get_sigma()
{
    int i;
    int j;
    int k;
    /* mu */
    int mu[NB_ERROR_MAX+2];
    /* sigma ro */
    int sro[2*NB_ERROR_MAX+1];
    /* discrepancy */
    int dmu[NB_ERROR_MAX+2];
    /* delta order */
    int delta[NB_ERROR_MAX+2];
    /* index of largest delta */
    int ro;
    int largest;
    int diff;
    /*      */
    /*      First Row      */
    /*      */
    /* Mu */
    mu[0] = -1; /* Actually -1/2 */
    /* Sigma(x) set to 1 */
    for (i = 0; i < (2*NB_ERROR_MAX+1); i++)
        smu[0][i] = 0;
    smu[0][0] = 1;
    /* discrepancy set to 1 */
    dmu[0] = 1;
    /* polynom order set to 0 */
    lmu[0] = 0;
    /* delta set to -1 */
    delta[0] = (mu[0] * 2 - lmu[0]) >> 1;
    /*      */
    /*      Second Row      */
    /*      */
    /* Mu */
    mu[1] = 0;
    /* Sigma(x) set to 1 */
    for (i = 0; i < (2*NB_ERROR_MAX+1); i++)
        smu[1][i] = 0;
    smu[1][0] = 1;
    /* discrepancy set to Syndrome 1 */
    dmu[1] = si[1];
    /* polynom order set to 0 */
    lmu[1] = 0;
    /* delta set to 0 */
    delta[1] = (mu[1] * 2 - lmu[1]) >> 1;
    for (i=1; i <= NB_ERROR; i++)
    {

```

# SAMA5D2 Series

## Static Memory Controller (SMC)

```
mu[i+1] = i << 1;
/*****
/*
/*
/*      Compute Sigma (Mu+1)
/*      And L(mu)
/* check if discrepancy is set to 0 */
if (dmu[i] == 0)
{
/* copy polynom */
for (j=0; j<2*NB_ERROR_MAX+1; j++)
{
smu[i+1][j] =
smu[i][j];
}
/* copy previous polynom order to the next */
lmu[i+1] = lmu[i];
}
else
{
ro      = 0;
largest = -1;
/* find largest delta with dmu != 0 */
for (j=0; j<i; j++)
{
if (dmu[j])
{
if (delta[j] > largest)
{
largest = delta[j];
ro      = j;
}
}
}
}
/* initialize signal ro */
for (k = 0; k < 2*NB_ERROR_MAX+1; k ++)
{
sro[k] = 0;
}
/* compute difference */
diff = (mu[i] - mu[ro]);
/* compute X ^ (2(mu-ro)) */
for (k = 0; k < (2*NB_ERROR_MAX+1); k ++)
{
sro[k+diff] = smu[ro][k];
}
/* multiply by dmu * dmu[ro]^-1 */
for (k = 0; k < 2*NB_ERROR_MAX+1; k ++)
{
/* dmu[ro] is not equal to zero by definition */
/* check that operand are different from 0 */
if (sro[k] && dmu[i])
{
/* galois inverse */
sro[k] = gf_antilog[(gf_log[dmu[i]] + (NB_FIELD_ELEMENTS-gf_log[dmu[ro]]) +
gf_log[sro[k]]) %
NB_FIELD_ELEMENTS];
}
}
/* multiply by dmu * dmu[ro]^-1 */
for (k = 0; k < 2*NB_ERROR_MAX+1; k++)
{
smu[i+1][k] = smu[i][k] ^ sro[k];
if (smu[i+1][k])
{
/* find the order of the polynom */
lmu[i+1] = k << 1;
}
}
}
/*
/*
/*      End Compute Sigma (Mu+1)
/*      And L(mu)
/*****
/* In either case compute delta */
```

```

delta[i+1] = (mu[i+1] * 2 - lmu[i+1]) >> 1;
/* In either case compute the discrepancy */
for (k = 0 ; k <= (lmu[i+1]>>1); k++)
{
    if (k == 0)
        dmu[i+1] = si[2*(i-1)+3];
    /* check if one operand of the multiplier is null, its index is -1 */
    else if (smu[i+1][k] && si[2*(i-1)+3-k])
        dmu[i+1] = gf_antilog[(gf_log[smu[i+1][k]] + gf_log[si[2*(i-1)+3-k]])%nn] ^ dmu[i+1];
    }
}
return 0;
}

```

### 36.19.3 Finding the Error Position

The output of the `get_sigma()` procedure is a polynomial stored in the `smu[NB_ERROR+1][i]` table. The error positions are the roots of that polynomial. The degree of that polynomial is a very important information, as it gives the number of errors. PMERRLOC module provides hardware accelerator for that step.

#### 36.19.3.1 Error Location

The PMECC Error Location controller provides hardware acceleration for determining roots of polynomials over two finite fields:  $GF(2^{13})$  and  $GF(2^{14})$ . It integrates 32 fully programmable coefficients. These coefficients belong to  $GF(2^{13})$  or  $GF(2^{14})$ . The coefficient programmed in the `PMERRLOC{i}` is the coefficient of  $X^i$  in the polynomial.

The search operation is started as soon as a write access is detected in the ELEN register and can be disabled writing to the ELDIS register. The ENINIT field of the ELEN register shall be initialized with the number of galois field elements to test. The set of the roots can be limited to a valid range.

**Table 36-17. ENINIT Field Value for a Sector Size of 512 Bytes**

Error Correcting Capability	ENINIT Value
2	4122
4	4148
8	4200

24	8528
32	8640

# SAMA5D2 Series

## Static Memory Controller (SMC)

---

When the PMECC engine is searching for roots, the BUSY field of the ELSR register remains asserted. An interrupt is asserted at the end of the computation, and the DONE bit of the PMECC Error Location Interrupt Status Register (HSMC\_ELSIR) is set. The ERR\_CNT field of the HSMC\_ELISR indicates the number of errors. The error position can be read in the PMERRLOCKX registers.

### 36.20.1 NFC Configuration Register

**Name:** HSMC\_CFG  
**Offset:** 0x000  
**Reset:** 0x00000000  
**Property:** Read/Write

	Bit	31	30	29	28	27	26	25	24	
		NFCSPARESIZE[6:0]								
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset		0	0	0	0	0	0	0	0	
	Bit	23	22	21	20	19	18	17	16	
		DTOMUL[2:0]				DTCYC[3:0]				
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset		0	0	0	0	0	0	0	0	
	Bit	15	14	13	12	11	10	9	8	
				RBEDGE	EDGECTRL			RSPARE	WSPARE	
Access				R/W	R/W			R/W	R/W	
Reset				0	0			0	0	
	Bit	7	6	5	4	3	2	1	0	
									PAGESIZE[2:0]	
Access							R/W	R/W	R/W	
Reset							0	0	0	

**Bits 30:24 – NFCSPARESIZE[6:0]** NAND Flash Spare Area Size Retrieved by the Host Controller  
 The spare size is set to  $(\text{NFCSPARESIZE} + 1) * 4$  bytes. The spare area is only retrieved when RSPARE or WSPARE is activated.

**Bits 22:20 – DTOMUL[2:0]** Data Timeout Multiplier  
 These fields determine the maximum number of Master Clock cycles that the SMC waits until the detection of a rising edge on Ready/Busy signal.

If the data timeout set by DTCYC and DTOMUL has been exceeded, the Data Timeout Error flag (DTOE) in the NFC Status Register (NFC\_SR) raises.

Data Timeout Multiplier is defined by DTOMUL as shown in the following table:

Value	Name	Description
0	X1	DTCYC
1	X16	DTCYC x 16
2	X128	DTCYC x 128
3	X256	DTCYC x 256
4	X1024	DTCYC x 1024
5	X4096	DTCYC x 4096
6	X65536	DTCYC x 65536
7	X1048576	DTCYC x 1048576

**Bits 19:16 – DTOCYC[3:0]** Data Timeout Cycle Number

**Bit 13 – RBEDGE** Ready/Busy Signal Edge Detection

Value	Description
0	Indicates the level of the Ready/Busy line.
1	Indicates that a transition has occurred on the Ready/Busy line.

**Bit 12 – EDGECTRL** Rising/Falling Edge Detection Control

Value	Description
0	Rising edge is detected.
1	Falling edge is detected.

**Bit 9 – RSPARE** Read Spare Area

Value	Description
0	The NFC skips the spare area in Read mode.
1	The NFC reads both main area and spare area in Read mode.

**Bit 8 – WSPARE** Write Spare Area

Value	Description
0	The NFC skips the spare area in Write mode.
1	The NFC writes both main area and spare area in Write mode.

**Bits 2:0 – PAGESIZE[2:0]** Page Size of the NAND Flash Device

Value	Name	Description
0	PS512	Main area 512 bytes
1	PS1024	Main area 1024 bytes
2	PS2048	Main area 2048 bytes
3	PS4096	Main area 4096 bytes
4	PS8192	Main area 8192 bytes

### 36.20.2 NFC Control Register

**Name:** HSMC\_CTRL  
**Offset:** 0x004  
**Reset:** –  
**Property:** Write-only

**Bit 1 – NFCDIS** NAND Flash Controller Disable

Value	Description
0	No effect.
1	Disables the NAND Flash controller.

**Bit 0 – NFCEN** NAND Flash Controller Enable

Value	Description
0	No effect.
1	Enables the NAND Flash controller.

### 36.20.3 NFC Status Register

**Name:** HSMC\_SR  
**Offset:** 0x008  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24	
								RB_EDGE0	
Access								R	
Reset								0	
Bit	23	22	21	20	19	18	17	16	
	NFCASE	AWB	UNDEF	DTOE			CMDDONE	XFRDONE	
Access	R	R	R	R			R	R	
Reset	0	0	0	0			0	0	
Bit	15	14	13	12	11	10	9	8	
			NFCSID[2:0]			NFCWR			NFCBUSY
Access			R	R	R			R	
Reset			0	0	0			0	
Bit	7	6	5	4	3	2	1	0	
			RB_FALL	RB_RISE					SMCSTS
Access			R	R					R
Reset			0	0					0

**Bit 24 – RB\_EDGE0** Ready/Busy Line 0 Edge Detected

If set to one, this flag indicates that an edge has been detected on the Ready/Busy Line 0. Depending on HSMC\_CFG.EDGECTRL, only rising or falling edge is detected. This flag is reset after a status read operation.

**Bit 23 – NFCASE** NFC Access Size Error

If set to one, this flag indicates that an illegal access has been detected in the NFC Memory Area. Only Word Access is allowed within the NFC memory area. This flag is reset after a status read operation.

**Bit 22 – AWB** Accessing While Busy

If set to one, this flag indicates that an AHB master has performed an access during the busy phase. This flag is reset after a status read operation.

**Bit 21 – UNDEF** Undefined Area Error

When set to one, this flag indicates that the processor performed an access in an undefined memory area. This flag is reset after a status read operation.

**Bit 20 – DTOE** Data Timeout Error

When set to one, this flag indicates that the Data timeout set by DTOMUL and DTOCYC has been exceeded. This flag is reset after a status read operation.

**Bit 17 – CMDDONE** Command Done

When set to one, this flag indicates that the NFC has terminated the Command. This flag is reset after a status read operation.

**Bit 16 – XFRDONE** NFC Data Transfer Terminated

When set to one, this flag indicates that the NFC has terminated the Data Transfer. This flag is reset after a status read operation.

**Bits 14:12 – NFCSID[2:0]** NFC Chip Select ID (this field cannot be reset)

When a command is issued, this field indicates the value of the targeted chip select.

**Bit 11 – NFCWR** NFC Write/Read Operation (this field cannot be reset)

When a command is issued, this field indicates the current Read or Write Operation.

**Bit 8 – NFCBUSY** NFC Busy (this field cannot be reset)

When set to one, this flag indicates that the Controller is activated and accesses the memory device.

**Bit 5 – RB\_FALL** Selected Ready Busy Falling Edge Detected

When set to one, this flag indicates that a falling edge on the Ready/Busy Line has been detected. This flag is reset after a status read operation. The Ready/Busy line is selected through the decoding of field HSMC\_SR.NFCSID.

**Bit 4 – RB\_RISE** Selected Ready Busy Rising Edge Detected

When set to one, this flag indicates that a rising edge on the Ready/Busy Line has been detected. This flag is reset after a status read operation. The Ready/Busy line is selected through the decoding of field HSMC\_SR.NFCSID.

**Bit 0 – SMCSTS** NAND Flash Controller Status (this field cannot be reset)

Value	Description
0	NAND Flash Controller disabled.
1	NAND Flash Controller enabled.

### 36.20.4 NFC Interrupt Enable Register

**Name:** HSMC\_IER  
**Offset:** 0x00C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
								RB_EDGE0
Access								W
Reset								–
Bit	23	22	21	20	19	18	17	16
	NFCASE	AWB	UNDEF	DTOE			CMDDONE	XFRDONE
Access	W	W	W	W			W	W
Reset	–	–	–	–			–	–
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
			RB_FALL	RB_RISE				
Access			W	W				
Reset			–	–				

**Bit 24 – RB\_EDGE0** Ready/Busy Line 0 Interrupt Enable

**Bit 23 – NFCASE** NFC Access Size Error Interrupt Enable

**Bit 22 – AWB** Accessing While Busy Interrupt Enable

**Bit 21 – UNDEF** Undefined Area Access Interrupt Enable

**Bit 20 – DTOE** Data Timeout Error Interrupt Enable

**Bit 17 – CMDDONE** Command Done Interrupt Enable

**Bit 16 – XFRDONE** Transfer Done Interrupt Enable

**Bit 5 – RB\_FALL** Ready Busy Falling Edge Detection Interrupt Enable

**Bit 4 – RB\_RISE** Ready Busy Rising Edge Detection Interrupt Enable

### 36.20.5 NFC Interrupt Disable Register

**Name:** HSMC\_IDR  
**Offset:** 0x010  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
								RB_EDGE0
Access								W
Reset								–
Bit	23	22	21	20	19	18	17	16
	NFCASE	AWB	UNDEF	DTOE			CMDDONE	XFRDONE
Access	W	W	W	W			W	W
Reset	–	–	–	–			–	–
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
			RB_FALL	RB_RISE				
Access			W	W				
Reset			–	–				

**Bit 24 – RB\_EDGE0** Ready/Busy Line 0 Interrupt Disable

**Bit 23 – NFCASE** NFC Access Size Error Interrupt Disable

**Bit 22 – AWB** Accessing While Busy Interrupt Disable

**Bit 21 – UNDEF** Undefined Area Access Interrupt Disable

**Bit 20 – DTOE** Data Timeout Error Interrupt Disable

**Bit 17 – CMDDONE** Command Done Interrupt Disable

**Bit 16 – XFRDONE** Transfer Done Interrupt Disable

**Bit 5 – RB\_FALL** Ready Busy Falling Edge Detection Interrupt Disable

**Bit 4 – RB\_RISE** Ready Busy Rising Edge Detection Interrupt Disable

### 36.20.6 NFC Interrupt Mask Register

**Name:** HSMC\_IMR  
**Offset:** 0x014  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: Disables the corresponding interrupt.

1: Enables the corresponding interrupt.

	Bit	31	30	29	28	27	26	25	24
									RB_EDGE0
Access									R
Reset									0
	Bit	23	22	21	20	19	18	17	16
		NFCASE	AWB	UNDEF	DTOE			CMDDONE	XFRDONE
Access		R	R	R	R			R	R
Reset		0	0	0	0			0	0
	Bit	15	14	13	12	11	10	9	8
Access									
Reset									
	Bit	7	6	5	4	3	2	1	0
				RB_FALL	RB_RISE				
Access				R	R				
Reset				0	0				

**Bit 24 – RB\_EDGE0** Ready/Busy Line 0 Interrupt Mask

**Bit 23 – NFCASE** NFC Access Size Error Interrupt Mask

**Bit 22 – AWB** Accessing While Busy Interrupt Mask

**Bit 21 – UNDEF** Undefined Area Access Interrupt Mask5

**Bit 20 – DTOE** Data Timeout Error Interrupt Mask

**Bit 17 – CMDDONE** Command Done Interrupt Mask

**Bit 16 – XFRDONE** Transfer Done Interrupt Mask

**Bit 5 – RB\_FALL** Ready Busy Falling Edge Detection Interrupt Mask

**Bit 4 – RB\_RISE** Ready Busy Rising Edge Detection Interrupt Mask

### 36.20.7 NFC Address Cycle Zero Register

**Name:** HSMC\_ADDR  
**Offset:** 0x018  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 7:0 – ADDR\_CYCLE0[7:0]** NAND Flash Array Address Cycle 0

When five address cycles are used, ADDR\_CYCLE0 is the first byte written to the NAND Flash (used by the NFC).

### 36.20.8 NFC Bank Register

**Name:** HSMC\_BANK  
**Offset:** 0x01C  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – BANK** Bank Identifier

Value	Description
0	Bank 0 is used.
1	Bank 1 is used.

### 36.20.9 PMECC Configuration Register

**Name:** HSMC\_PMECCFG  
**Offset:** 0x070  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
				AUTO					
Access				R/W				R/W	
Reset				0				0	
Bit	15	14	13	12	11	10	9	8	
				NANDWR				PAGESIZE[1:0]	
Access				R/W				R/W	R/W
Reset				0				0	0
Bit	7	6	5	4	3	2	1	0	
				SECTORSZ				BCH_ERR[2:0]	
Access				R/W					
Reset				0				0	0

#### Bit 20 – AUTO Automatic Mode Enable

This bit is only relevant in NAND Read Mode, when spare enable is activated.

Value	Description
0	Indicates that the spare area is not protected. In that case, the ECC computation takes into account the ECC area located in the spare area. (within the start address and the end address).
1	Indicates that the spare area is error protected. In this case, the ECC computation takes into account the whole spare area minus the ECC area in the ECC computation operation.

#### Bit 16 – SPAREEN Spare Enable

For NAND write access:

0: The spare area is skipped

1: The spare area is protected with the last sector of data.

For NAND read access:

0: The spare area is skipped.

1: The spare area contains protected data or only redundancy information.

#### Bit 12 – NANDWR NAND Write Access

# SAMA5D2 Series

## Static Memory Controller (SMC)

Value	Description
0	NAND read access.
1	NAND write access.

**Bits 9:8 – PAGESIZE[1:0]** Number of Sectors in the Page

Value	Name	Description
0	PAGESIZE_1SEC	1 sector for main area (512 or 1024 bytes).
1	PAGESIZE_2SEC	2 sectors for main area (1024 or 2048 bytes).
2	PAGESIZE_4SEC	4 sectors for main area (2048 or 4096 bytes).
3	PAGESIZE_8SEC	8 sectors for main area (4096 or 8192 bytes).

**Bit 4 – SECTORSZ** Sector Size

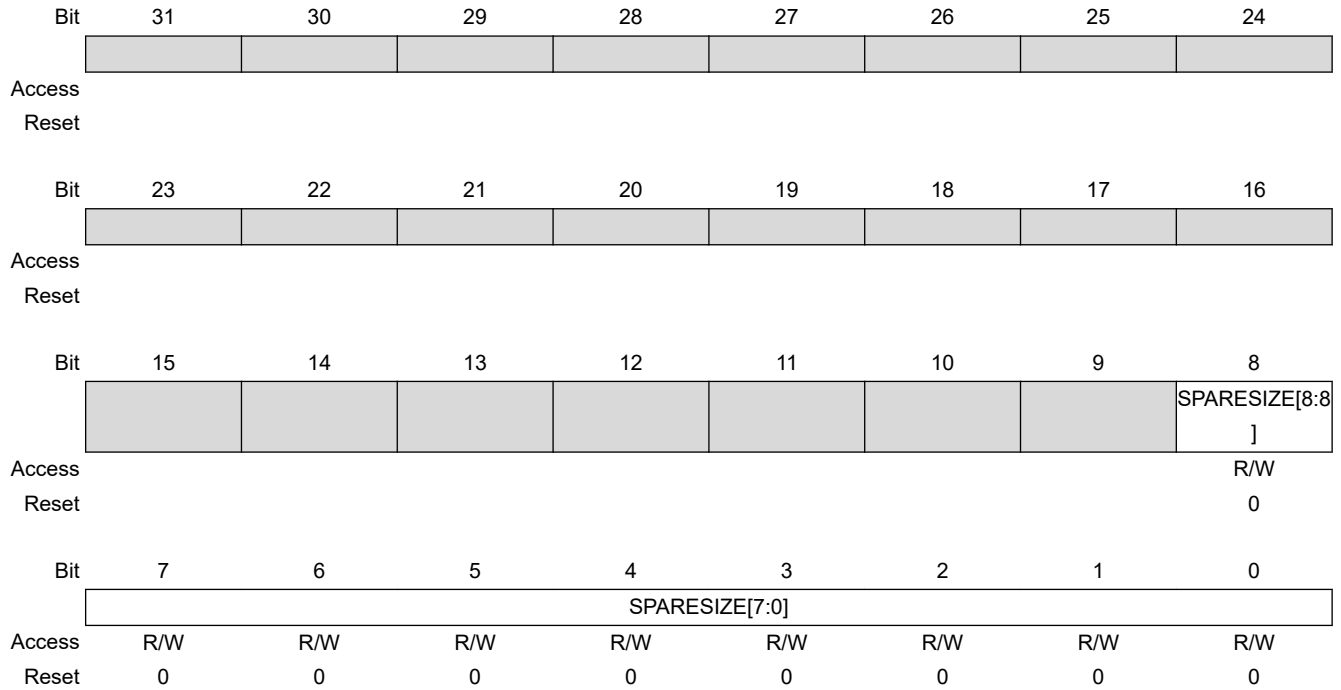

Value	Description
0	The ECC computation is based on a sector of 512 bytes.
1	The ECC computation is based on a sector of 1024 bytes.

**Bits 2:0 – BCH\_ERR[2:0]** Error Correcting Capability

Value	Name	Description
0	BCH_ERR2	2 errors
1	BCH_ERR4	4 errors
2	BCH_ERR8	8 errors
3	BCH_ERR12	12 errors
4	BCH_ERR24	24 errors
5	BCH_ERR32	32 errors

### 36.20.10 PMECC Spare Area Size Register

**Name:** HSMC\_PMECCSAREA  
**Offset:** 0x074  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 8:0 – SPARESIZE[8:0] Spare Area Size**

Number of bytes in the spare area. The spare area size is equal to (SPARESIZE + 1) bytes.

### 36.20.11 PMECC Start Address Register

**Name:** HSMC\_PMECCSADDR  
**Offset:** 0x078  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 8:0 – STARTADDR[8:0] ECC Area Start Address**

This register is programmed with the start ECC start address. When STARTADDR is equal to 0, then the first ECC byte is located at the first byte of the spare area.

### 36.20.12 PMECC End Address Register

**Name:** HSMC\_PMECCADDR  
**Offset:** 0x07C  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 8:0 – ENDADDR[8:0] ECC Area End Address**

This register is programmed with the start ECC end address. When ENDADDR is equal to N, then the first ECC byte is located at byte N of the spare area.

### 36.20.13 PMECC Control Register

**Name:** HSMC\_PMECCCTRL  
**Offset:** 0x084  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
Access									
Reset									
Bit	15	14	13	12	11	10	9	8	
Access									
Reset									
Bit	7	6	5	4	3	2	1	0	
			DISABLE	ENABLE			USER	DATA	RST
Access			W	W			W	W	W
Reset			–	–			–	–	–

#### Bit 5 – DISABLE PMECC Enable

Value	Description
0	No effect.
1	Disables the PMECC controller.

#### Bit 4 – ENABLE PMECC Enable

Value	Description
0	No effect.
1	Enables the PMECC controller.

#### Bit 2 – USER Start a User Mode Phase

Value	Description
0	No effect.
1	The PMECC controller enters a User mode phase.

#### Bit 1 – DATA Start a Data Phase

Value	Description
0	No effect.
1	The PMECC controller enters a Data phase.

# SAMA5D2 Series

## Static Memory Controller (SMC)

---

---

**Bit 0 – RST** Reset the PMECC Module

Value	Description
0	No effect.
1	Resets the PMECC controller.

### 36.20.14 PMECC Status Register

**Name:** HSMC\_PMECCSR  
**Offset:** 0x088  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bit 4 – ENABLE PMECC Enable Bit

Value	Description
0	PMECC controller disabled.
1	PMECC controller enabled.

#### Bit 0 – BUSY PMECC Kernel is Busy

Value	Description
0	PMECC controller finite state machine reached idle state.
1	PMECC controller finite state machine is processing the incoming byte stream.

### 36.20.15 PMECC Interrupt Enable Register

**Name:** HSMC\_PMECCIER  
**Offset:** 0x08C  
**Reset:** –  
**Property:** Write-only

#### Bit 0 – ERRIE Error Interrupt Enable

Value	Description
0	No effect.
1	The Multibit error interrupt is enabled. An interrupt will be raised if at least one error is detected in at least one sector.

### 36.20.16 PMECC Interrupt Disable Register

**Name:** HSMC\_PMECCIDR  
**Offset:** 0x090  
**Reset:** –  
**Property:** Write-only

**Bit 0 – ERRID** Error Interrupt Disable

Value	Description
0	No effect.
1	Multibit error interrupt disabled.

### 36.20.17 PMECC Interrupt Mask Register

**Name:** HSMC\_PMECCIMR  
**Offset:** 0x094  
**Reset:** 0x00000000  
**Property:** Read-only

**Bit 0 – ERRIM** Error Interrupt Mask

Value	Description
0	Multibit error disabled.
1	Multibit error enabled.

### 36.20.18 PMECC Interrupt Status Register

**Name:** HSMC\_PMECCISR  
**Offset:** 0x098  
**Reset:** 0x00000000  
**Property:** Read-only

**Bits 7:0 – ERRIS[7:0]** Error Interrupt Status Register

When set to one, bit i of the HSMC\_PMECCISR indicates that sector i is corrupted.

### 36.20.19 PMECC Redundancy x Register

**Name:** HSMC\_PMECCx  
**Offset:** 0xB0 + x\*0x04 [x=0..13]  
**Reset:** 0x00000000  
**Property:** Read-only

**Note:** The block of registers HSMC\_PMECCx[x=0..13] is instanced 8 times in the user interface.

Bit	31	30	29	28	27	26	25	24
	ECC[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	ECC[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	ECC[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	ECC[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – ECC[31:0] BCH Redundancy

This register contains the remainder of the division of the codeword by the generator polynomial.

### 36.20.20 PMECC Remainder x Register

**Name:** HSMC\_REMx  
**Offset:** 0x02B0 + x\*0x04 [x=0..15]  
**Reset:** 0x00000000  
**Property:** Read-only

**Note:** The block of registers HSMC\_REMx[x=0..15] is instanced 8 times in the user interface.

	Bit	31	30	29	28	27	26	25	24
		REM2NP3[13:8]							
Access				R	R	R	R	R	R
Reset				0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		REM2NP3[7:0]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		REM2NP1[13:8]							
Access				R	R	R	R	R	R
Reset				0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		REM2NP1[7:0]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0

**Bits 29:16 – REM2NP3[13:0]** BCH Remainder  $2 * N + 3$

When sector size is set to 512 bytes, bit REM2NP3[29] is not used and read as zero.

If bit  $i$  of the REM2NP3 field is set to one, then the coefficient of the  $X^i$  is set to one; otherwise, the coefficient is zero.

**Bits 13:0 – REM2NP1[13:0]** BCH Remainder  $2 * N + 1$

When sector size is set to 512 bytes, bit REM2NP1[13] is not used and read as zero.

If bit  $i$  of the REM2NP1 field is set to one, then the coefficient of the  $X^i$  is set to one; otherwise, the coefficient is zero.

### 36.20.21 PMECC Error Location Configuration Register

**Name:** HSMC\_ELCFG  
**Offset:** 0x500  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 20:16 – ERRNUM[4:0]** Number of Errors

**Bit 0 – SECTORSZ** Sector Size

Value	Description
0	The ECC computation is based on a 512-byte sector.
1	The ECC computation is based on a 1024-byte sector.

### 36.20.22 PMECC Error Location Primitive Register

**Name:** HSMC\_ELPRIM  
**Offset:** 0x504  
**Reset:** 0x401A  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits 31-24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Greyed out bits 23-16]

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	1	1	0	1	0

**Bits 15:0 – PRIMITIV[15:0]** Primitive Polynomial  
 This field indicates the Primitive Polynomial used in the ECC computation.

### 36.20.23 PMECC Error Location Enable Register

**Name:** HSMC\_ELEN  
**Offset:** 0x508  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
			ENINIT[13:8]					
Access			W	W	W	W	W	W
Reset			–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	ENINIT[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 13:0 – ENINIT[13:0]** Error Location Enable  
 Initial bit number in the codeword.

### 36.20.24 PMECC Error Location Disable Register

**Name:** HSMC\_ELDIS  
**Offset:** 0x50C  
**Reset:** –  
**Property:** Write-only

**Bit 0 – DIS** Disable Error Location Engine

Value	Description
0	No effect.
1	Disables the Error location engine.

### 36.20.25 PMECC Error Location Status Register

**Name:** HSMC\_ELSR  
**Offset:** 0x510  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bit 0 – BUSY Error Location Engine Busy

Value	Description
0	Error location engine is disabled.
1	Error location engine is enabled and is finding roots of the polynomial.

### 36.20.26 PMECC Error Location Interrupt Enable Register

**Name:** HSMC\_ELIER  
**Offset:** 0x514  
**Reset:** –  
**Property:** Write-only

**Bit 0 – DONE** Computation Terminated Interrupt Enable

Value	Description
0	No effect.
1	Enables the interrupt.

### 36.20.27 PMECC Error Location Interrupt Disable Register

**Name:** HSMC\_ELIDR  
**Offset:** 0x518  
**Reset:** –  
**Property:** Write-only

**Bit 0 – DONE** Computation Terminated Interrupt Disable

Value	Description
0	No effect.
1	Disables the interrupt.

### 36.20.28 PMECC Error Location Interrupt Mask Register

**Name:** HSMC\_ELIMR  
**Offset:** 0x51C  
**Reset:** 0x00000000  
**Property:** Read-only

**Bit 0 – DONE** Computation Terminated Interrupt Mask

Value	Description
0	Computation Terminated interrupt disabled.
1	Computation Terminated interrupt enabled.

### 36.20.29 PMECC Error Location Interrupt Status Register

**Name:** HSMC\_ELISR  
**Offset:** 0x520  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24	
	[Greyed out bits 31-24]								
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
	[Greyed out bits 23-16]								
Access									
Reset									
Bit	15	14	13	12	11	10	9	8	
			ERR_CNT[5:0]						
Access			R	R	R	R	R	R	
Reset			0	0	0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
	[Greyed out bits 7-1]							DONE	
Access								R	
Reset								0	

**Bits 13:8 – ERR\_CNT[5:0]** Error Counter value  
 This field indicates the number of roots of the polynomial.

**Bit 0 – DONE** Computation Terminated Interrupt Status  
 When set to one, this indicates that the error location engine has completed the root finding algorithm.

### 36.20.30 PMECC Error Location SIGMA0 Register

**Name:** HSMC\_SIGMA0  
**Offset:** 0x528  
**Reset:** 0x00000001  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
			SIGMA0[13:8]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	SIGMA0[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	1

**Bits 13:0 – SIGMA0[13:0]** Coefficient of degree 0 in the SIGMA polynomial  
 SIGMA0 belongs to the finite field  $GF(2^{13})$  when the sector size is set to 512 bytes.  
 SIGMA0 belongs to the finite field  $GF(2^{14})$  when the sector size is set to 1024 bytes.

### 36.20.31 PMECC Error Location SIGMAx Register

**Name:** HSMC\_SIGMAx  
**Offset:** 0x052C + x\*0x04 [x=0..31]  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 13:0 – SIGMAx[13:0]** Coefficient of degree x in the SIGMA polynomial  
 SIGMAx belongs to the finite field GF(2<sup>13</sup>) when the sector size is set to 512 bytes.  
 SIGMAx belongs to the finite field GF(2<sup>14</sup>) when the sector size is set to 1024 bytes.

### 36.20.32 PMECC Error Location x Register

**Name:** HSMC\_ERRLOCx  
**Offset:** 0x05AC + x\*0x04 [x=0..31]  
**Reset:** 0x00000000  
**Property:** Read-only

	Bit	31	30	29	28	27	26	25	24
		[Greyed out bits 31-24]							
Access									
Reset									
	Bit	23	22	21	20	19	18	17	16
		[Greyed out bits 23-16]							
Access									
Reset									
	Bit	15	14	13	12	11	10	9	8
		[Greyed out bits 15-14]		ERRLOCN[13:8]					
Access				R	R	R	R	R	R
Reset				0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		ERRLOCN[7:0]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0

**Bits 13:0 – ERRLOCN[13:0]** Error Position within the Set {sector area, spare area}  
 ERRLOCN points to 1 when the first bit of the main area is corrupted.

If the sector size is set to 512 bytes, the ERRLOCN points to 4096 when the last bit of the sector area is corrupted.

If the sector size is set to 1024 bytes, the ERRLOCN points to 8192 when the last bit of the sector area is corrupted.

If the sector size is set to 512 bytes, the ERRLOCN points to 4097 when the first bit of the spare area is corrupted.

If the sector size is set to 1024 bytes, the ERRLOCN points to 8193 when the first bit of the spare area is corrupted.

### 36.20.33 Setup Register

**Name:** HSMC\_SETUPx  
**Offset:** 0x0700 + x\*0x14 [x=0..3]  
**Reset:** 0x01010101  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

	Bit	31	30	29	28	27	26	25	24
		NCS_RD_SETUP[5:0]							
Access				W	W	W	W	W	W
Reset				0	0	0	0	0	1
	Bit	23	22	21	20	19	18	17	16
		NRD_SETUP[5:0]							
Access				W	W	W	W	W	W
Reset				0	0	0	0	0	1
	Bit	15	14	13	12	11	10	9	8
		NCS_WR_SETUP[5:0]							
Access				W	W	W	W	W	W
Reset				0	0	0	0	0	1
	Bit	7	6	5	4	3	2	1	0
		NWE_SETUP[5:0]							
Access				W	W	W	W	W	W
Reset				0	0	0	0	0	1

**Bits 29:24 – NCS\_RD\_SETUP[5:0]** NCS Setup Length in Read Access

In Read access, the NCS signal setup length is defined as:

$$\text{NCS setup length} = (128 * \text{NCS\_RD\_SETUP}[5] + \text{NCS\_RD\_SETUP}[4:0]) \text{ clock cycles.}$$

**Bits 21:16 – NRD\_SETUP[5:0]** NRD Setup Length

The NRD signal setup length is defined as:

$$\text{NRD setup length} = (128 * \text{NRD\_SETUP}[5] + \text{NRD\_SETUP}[4:0]) \text{ clock cycles.}$$

**Bits 13:8 – NCS\_WR\_SETUP[5:0]** NCS Setup Length in Write Access

In write access, the NCS signal setup length is defined as:

$$\text{NCS setup length} = (128 * \text{NCS\_WR\_SETUP}[5] + \text{NCS\_WR\_SETUP}[4:0]) \text{ clock cycles.}$$

**Bits 5:0 – NWE\_SETUP[5:0]** NWE Setup Length

The NWE signal setup length is defined as:

$$\text{NWE setup length} = (128 * \text{NWE\_SETUP}[5] + \text{NWE\_SETUP}[4:0]) \text{ clock cycles.}$$

### 36.20.34 Pulse Register

**Name:** HSMC\_PULSEx  
**Offset:** 0x0704 + x\*0x14 [x=0..3]  
**Reset:** 0x01010101  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

	Bit	31	30	29	28	27	26	25	24
		NCS_RD_PULSE[6:0]							
Access			W	W	W	W	W	W	W
Reset			0	0	0	0	0	0	1
	Bit	23	22	21	20	19	18	17	16
		NRD_PULSE[6:0]							
Access			W	W	W	W	W	W	W
Reset			0	0	0	0	0	0	1
	Bit	15	14	13	12	11	10	9	8
		NCS_WR_PULSE[6:0]							
Access			W	W	W	W	W	W	W
Reset			0	0	0	0	0	0	1
	Bit	7	6	5	4	3	2	1	0
		NWE_PULSE[6:0]							
Access			W	W	W	W	W	W	W
Reset			0	0	0	0	0	0	1

**Bits 30:24 – NCS\_RD\_PULSE[6:0]** NCS Pulse Length in READ Access

In READ mode, The NCS signal pulse length is defined as:

$$\text{NCS pulse length} = (256 * \text{NCS\_RD\_PULSE}[6] + \text{NCS\_RD\_PULSE}[5:0]) \text{ clock cycles.}$$

**Bits 22:16 – NRD\_PULSE[6:0]** NRD Pulse Length

The NRD signal pulse length is defined as:

$$\text{NRD pulse length} = (256 * \text{NRD\_PULSE}[6] + \text{NRD\_PULSE}[5:0]) \text{ clock cycles.}$$

The NRD pulse width must be as least 1 clock cycle.

**Bits 14:8 – NCS\_WR\_PULSE[6:0]** NCS Pulse Length in WRITE Access

In Write access, The NCS signal pulse length is defined as:

$$\text{NCS pulse length} = (256 * \text{NCS\_WR\_PULSE}[6] + \text{NCS\_WR\_PULSE}[5:0]) \text{ clock cycles.}$$

The NCS pulse must be at least one clock cycle.

**Bits 6:0 – NWE\_PULSE[6:0]** NWE Pulse Length

The NWE signal pulse length is defined as:

$$\text{NWE pulse length} = (256 * \text{NWE\_PULSE}[6] + \text{NWE\_PULSE}[5:0]) \text{ clock cycles.}$$

The NWE pulse must be at least one clock cycle.

### 36.20.35 Cycle Register

**Name:** HSMC\_CYCLEx  
**Offset:** 0x0708 + x\*0x14 [x=0..3]  
**Reset:** 0x00030003  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
								NRD_CYCLE[8: 8]
Access								R/W
Reset								0
Bit	23	22	21	20	19	18	17	16
	NRD_CYCLE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	1	1
Bit	15	14	13	12	11	10	9	8
								NWE_CYCLE[8: :8]
Access								R/W
Reset								0
Bit	7	6	5	4	3	2	1	0
	NWE_CYCLE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	1	1

**Bits 24:16 – NRD\_CYCLE[8:0] Total Read Cycle Length**

The total read cycle length is the total duration in clock cycles of the read cycle. It is equal to the sum of the setup, pulse and hold steps of the NRD and NCS signals. It is defined as:

$$\text{Read cycle length} = (\text{NRD\_CYCLE}[8:7] * 256) + \text{NRD\_CYCLE}[6:0] \text{ clock cycles.}$$

**Bits 8:0 – NWE\_CYCLE[8:0] Total Write Cycle Length**

The total write cycle length is the total duration in clock cycles of the write cycle. It is equal to the sum of the setup, pulse and hold steps of the NWE and NCS signals. It is defined as:

$$\text{Write cycle length} = (\text{NWE\_CYCLE}[8:7] * 256) + \text{NWE\_CYCLE}[6:0] \text{ clock cycles.}$$

### 36.20.36 Timings Register

**Name:** HSMC\_TIMINGSx  
**Offset:** 0x070C + x\*0x14 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

	Bit	31	30	29	28	27	26	25	24
		NFSEL					TWB[3:0]		
Access		R/W				R/W	R/W	R/W	R/W
Reset		0				0	0	0	0
	Bit	23	22	21	20	19	18	17	16
						TRR[3:0]			
Access					R/W	R/W	R/W	R/W	R/W
Reset					0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
					OCMS		TAR[3:0]		
Access				R/W	R/W	R/W	R/W	R/W	R/W
Reset				0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		TADL[3:0]			TCLR[3:0]				
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0

**Bit 31 – NFSEL** NAND Flash Selection

If this bit is set to one, the chip select is assigned to NAND Flash write enable and read enable lines drive the Error Correcting Code module.

**Bits 27:24 – TWB[3:0]** WEN High to REN to Busy

Write Enable rising edge to Ready/Busy falling edge timing.

Write Enable to Read/Busy = (TWB[3] \* 64) + TWB[2:0] clock cycles.

**Bits 19:16 – TRR[3:0]** Ready to REN Low Delay

Ready/Busy signal to Read Enable falling edge timing.

Read to REN = (TRR[3] \* 64) + TRR[2:0] clock cycles.

**Bit 12 – OCMS** Off Chip Memory Scrambling Enable

When set to one, the memory scrambling is activated. (Value must be zero if external memory is NAND Flash and NFC is used).

**Bits 11:8 – TAR[3:0]** ALE to REN Low Delay

Address Latch Enable falling edge to Read Enable falling edge timing.

Address Latch Enable to Read Enable = (TAR[3] \* 64) + TAR[2:0] clock cycles.

**Bits 7:4 – TADL[3:0] ALE to Data Start**

Last address latch cycle to the first rising edge of WEN for data input.

Last address latch to first rising edge of WEN =  $(TADL[3] * 64) + TADL[2:0]$  clock cycles.

**Bits 3:0 – TCLR[3:0] CLE to REN Low Delay**

Command Latch Enable falling edge to Read Enable falling edge timing.

Latch Enable Falling to Read Enable Falling =  $(TCLR[3] * 64) + TCLR[2:0]$  clock cycles.

### 36.20.37 Mode Register

**Name:** HSMC\_MODEx  
**Offset:** 0x0710 + x\*0x14 [x=0..3]  
**Reset:** 0x00001003  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24	
	[Greyed out bits]								
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
	[Greyed out bits]			TDF_MODE	TDF_CYCLES[3:0]				[Greyed out bits]
Access				R/W	R/W	R/W	R/W	R/W	
Reset				0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	
	[Greyed out bits]			DBW	[Greyed out bits]			BAT	
Access				R/W				R/W	
Reset				1				0	
Bit	7	6	5	4	3	2	1	0	
	[Greyed out bits]		EXNW_MODE[1:0]		[Greyed out bits]		WRITE_MODE	READ_MODE	
Access			R/W	R/W			R/W	R/W	
Reset			0	0			1	1	

#### Bit 20 – TDF\_MODE TDF Optimization

Value	Description
0	TDF optimization disabled – The number of TDF wait states is inserted before the next access begins.
1	TDF optimization enabled – The number of TDF wait states is optimized using the setup period of the next read/write access.

#### Bits 19:16 – TDF\_CYCLES[3:0] Data Float Time

This field gives the integer number of clock cycles required by the external device to release the data after the rising edge of the read controlling signal. The SMC always provide one full cycle of bus turnaround after the TDF\_CYCLES period. The external bus cannot be used by another chip select during TDF\_CYCLES + 1 cycles. From 0 up to 15 TDF\_CYCLES can be set.

#### Bit 12 – DBW Data Bus Width

Value	Name	Description
0	BIT_8	8-bit bus
1	BIT_16	16-bit bus

### Bit 8 – BAT Byte Access Type

This field is used only if DBW defines a 16-bit data bus.

Value	Name	Description
0	BYTE_SELECT	Byte select access type: - Write operation is controlled using NCS, NWE, NBS0, NBS1. - Read operation is controlled using NCS, NRD, NBS0, NBS1.
1	BYTE_WRITE	Byte write access type: - Write operation is controlled using NCS, NWR0, NWR1. - Read operation is controlled using NCS and NRD.

### Bits 5:4 – EXNW\_MODE[1:0] NWAIT Mode

The NWAIT signal is used to extend the current read or write signal. It is only taken into account during the pulse phase Read and Write controlling signal. When the use of NWAIT is enabled, at least one cycle hold duration must be programmed for the read and write controlling signal.

Value	Name	Description
0	DISABLED	Disabled—The NWAIT input signal is ignored on the corresponding Chip Select.
1	–	Reserved
2	FROZEN	Frozen Mode—If asserted, the NWAIT signal freezes the current read or write cycle. After deassertion, the read/write cycle is resumed from the point where it was stopped.
3	READY	Ready Mode—The NWAIT signal indicates the availability of the external device at the end of the pulse of the controlling read or write signal, to complete the access. If high, the access normally completes. If low, the access is extended until NWAIT returns high.

### Bit 1 – WRITE\_MODE Selection of the Control Signal for Write Operation

Value	Name	Description
0	NCS_CTRL	The Write operation is controller by the NCS signal.
1	NWE_CTRL	The Write operation is controlled by the NWE signal

### Bit 0 – READ\_MODE Selection of the Control Signal for Read Operation

Value	Name	Description
0	NCS_CTRL	The Read operation is controlled by the NCS signal.
1	NRD_CTRL	The Read operation is controlled by the NRD signal.

### 36.20.38 Off Chip Memory Scrambling Register

**Name:** HSMC\_OCMS  
**Offset:** 0x7A0  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 1 – SRSE** NFC Internal SRAM Scrambling Enable

Value	Description
0	Disable Scrambling for NFC internal SRAM access.
1	Enable Scrambling for NFC internal SRAM access. (OCMS bit must be cleared in the corresponding HSMC_TIMINGSx register.)

**Bit 0 – SMSE** Static Memory Controller Scrambling Enable

Value	Description
0	Disable “Off Chip” Scrambling for SMC access.
1	Enable “Off Chip” Scrambling for SMC access. (If OCMS bit is set in the corresponding HSMC_TIMINGSx register.)

### 36.20.39 Off Chip Memory Scrambling Key1 Register

**Name:** HSMC\_KEY1  
**Offset:** 0x7A4  
**Reset:** 0x00000000  
**Property:** Write-once

Bit	31	30	29	28	27	26	25	24
KEY1[31:24]								
Access	W-Once	W-Once	W-Once	W-Once	W-Once	W-Once	W-Once	W-Once

Access	W-Once	W-Once	W-Once	W-Once	W-Once	W-Once	W-Once	W-Once
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – KEY1[31:0]** Off Chip Memory Scrambling (OCMS) Key Part 1  
 When Off Chip Memory Scrambling is enabled by setting the HSMC\_OCMS and HSMC\_TIMINGS registers in accordance, the data scrambling depends on KEY1 and KEY2 values.

### 36.20.40 Off Chip Memory Scrambling Key2 Register

**Name:** HSMC\_KEY2  
**Offset:** 0x7A8  
**Reset:** 0x00000000  
**Property:** Write-once

Bit	31	30	29	28	27	26	25	24
KEY2[31:24]								
Access	W-once	W-once	W-once	W-once	W-once	W-once	W-once	W-once
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
KEY2[23:16]								
Access	W-once	W-once	W-once	W-once	W-once	W-once	W-once	W-once
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
KEY2[15:8]								
Access	W-once	W-once	W-once	W-once	W-once	W-once	W-once	W-once
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
KEY2[7:0]								
Access	W-once	W-once	W-once	W-once	W-once	W-once	W-once	W-once
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – KEY2[31:0]** Off Chip Memory Scrambling (OCMS) Key Part 2  
 When Off Chip Memory Scrambling is enabled by setting the HSMC\_OCMS and HSMC\_TIMINGS registers in accordance, the data scrambling depends on KEY2 and KEY1 values.

### 36.20.41 Write Protection Mode Register

**Name:** HSMC\_WPMR  
**Offset:** 0x7E4  
**Reset:** 0x00000000  
**Property:** Read/Write

	Bit	31	30	29	28	27	26	25	24
		WPKEY[23:16]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		WPKEY[15:8]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0

Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		WPEN							
Access									R/W
Reset									0

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x534D43	PASSWD	Writing any other value in this field aborts the write operation of bit WPEN. Always reads as 0.

#### Bit 0 – WPEN Write Protection Enable

See [Section 1.16 “Register Write Protection”](#) for list of write-protected registers.

Value	Description
0	Disables write protection if WPKEY value corresponds to 0x534D43 (“SMC” in ASCII)
1	Enables write protection if WPKEY value corresponds to 0x534D43 (“SMC” in ASCII)

### 36.20.42 Write Protection Status Register

**Name:** HSMC\_WPSR  
**Offset:** 0x7E8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	[Grayed out bits]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	[Grayed out bits]							WPVS
Access								R
Reset								0

**Bits 23:8 – WPVSR[15:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

Value	Description
0	No write protect violation has occurred since the last read of the HSMC_WPSR.
1	A write protect violation has occurred since the last read of the HSMC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

## **37. DMA Controller (XDMAC)**

### **37.1 Description**

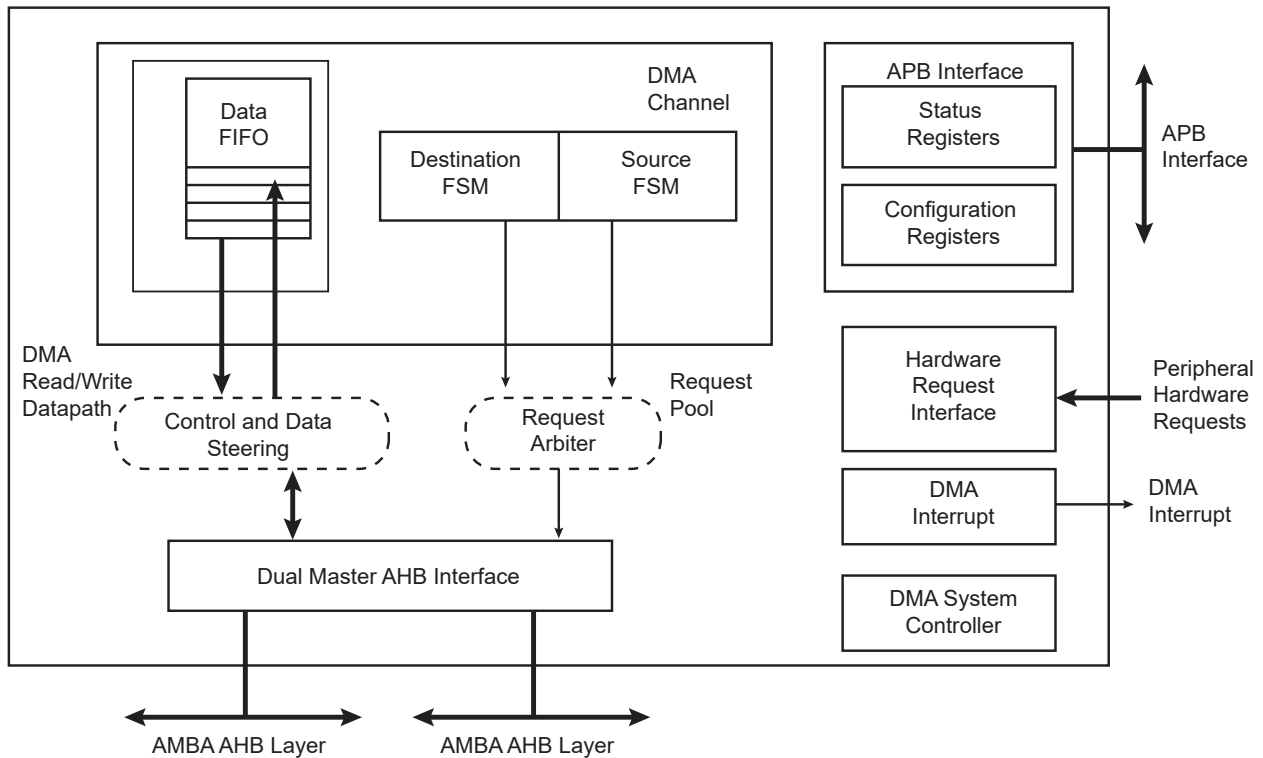

The DMA Controller (XDMAC) is a AHB-protocol central direct memory access controller. It performs peripheral data transfer and memory move operations over one or two bus ports through the unidirectional communication channel. Each channel is fully programmable and provides both peripheral or memory-to-memory transfers. The channel features are configurable at implementation.

### **37.2 Embedded Characteristics**

- 2 Master Interfaces
- 16 DMA Channels
- 51 Hardware Requests
- 4 Kbytes Embedded FIFO
- Supports Peripheral-to-Memory, Memory-to-Peripheral, or Memory-to-Memory Transfer Operations
- Peripheral DMA Operation Runs on Bytes (8-bit), Half-Word (16-bit) and Word (32-bit)
- Memory DMA Operation Runs on Bytes (8 bit), Half-Word (16-bit), Word (32-bit) and Double-Word (64-bit)
- Supports Hardware and Software Initiated Transfers
- Supports Linked List Operations
- Supports Incrementing or Fixed Addressing Mode
- Supports Programmable Independent Data Striding for Source and Destination
- Supports Programmable Independent Microblock Striding for Source and Destination
- Configurable Priority Group and Arbitration Policy
- Programmable AHB Burst Length
- Configuration Interface Accessible through APB Interface
- XDMAC Architecture Includes Multiport FIFO
- Supports Multiple View Channel Descriptor
- Automatic Flush of Channel Trailing Bytes
- Automatic Coarse-Grain and Fine-Grain Clock Gating
- Hardware Acceleration of Memset Pattern

### 37.3 Block Diagram

Figure 37-1. DMA Controller (XDMAC) Block Diagram

### 37.4 DMA Controller Peripheral Connections

The SAMA5D2 features two DMACs: XDMAC0 and XDMAC1. Both have the same features:

- Programmable secure access
- Two 64-bit masters
- 16 channels and 55 hardware requests embedded
- Sixteen 64-bit-word FIFOs on all channels
- Linked list support with status write back operation at end of transfer
- Word, half-word, byte transfer support
- Memory-to-memory transfer
- Peripheral-to-memory transfer
- Memory-to-peripheral transfer

The DMA controller can handle the transfer between peripherals and memory and so receives the triggers from the peripherals below.

The following table gives an overview of the different access when secure/non-secure DMA needs to access a secure/non-secure peripheral, and when a secure/non-secure peripheral needs to access secure/non-secure DMA.

**Table 37-1. DMA Configuration vs. Peripheral**

Peripheral	DMA	
	Secure	Non-secure
Secure	x	–
Non-secure	x	x

DMA Controller 0 manages transfers between peripherals and memory, and receives the triggers from the peripherals listed in the following table.

**Table 37-2. DMA Channels Definition (XDMAC0)**

Instance Name	Channel T/R	Interface Number	XDMAC_CCx.CSIZE Required Value

## 37.5 Functional Description

### 37.5.1 Basic Definitions

**Source Peripheral:** Slave device, memory mapped on the interconnection network, from where the XDMAC reads data. The source peripheral teams up with a destination peripheral to form a channel. A data read operation is scheduled when the peripheral transfer request is asserted.

**Destination Peripheral:** Slave device, memory mapped on the interconnection network, to which the XDMAC writes. A write data operation is scheduled when the peripheral transfer request is asserted.

**Channel:** The data movement between source and destination creates a logical channel.

**Stride:** Number of address locations between successive elements/data measured in bytes.

**Transfer Type:** The transfer is hardware-synchronized when it is paced by the peripheral hardware request, otherwise the transfer is self-triggered (memory to memory transfer).

**XDMAC Master Transfer:** The Master Transfer is composed of a linked list of blocks. The channel address, control and configuration registers can be modified at the inter block boundary. The descriptor structure modifies the channel registers conditionally. Interrupts can be generated on a per block basis or when the end of linked list event occurs.

**XDMAC Block:** An XDMAC block is composed of a programmable number of microblocks. The channel configuration registers remain unchanged at the inter microblock boundary. The source and destination addresses are conditionally updated with a programmable signed number.

**XDMAC Microblock:** The microblock is composed of a programmable number of data. The channel configuration registers remain unchanged at the data boundary. The data address may be fixed (a FIFO location, a peripheral transmit or receive register), incrementing (a memory-mapped area) by a programmable signed number.

**XDMAC Burst and Incomplete Burst:** In order to improve the overall performance when accessing dynamic external memory, burst access is mandatory. Each data of the microblock is considered as a part of a memory burst. The programmable burst value indicates the largest memory burst allowed on a per channel basis. When the microblock length is not an integral multiple of the burst size, an incomplete burst is performed to read or write the last trailing bytes.

**XDMAC Chunk and Incomplete Chunk:** When a peripheral synchronized transfer is activated, the microblock splits into a number of data chunks. The chunk size is programmable. The larger the chunk is, the better the performance is. When the transfer size is not a multiple of the chunk size, the last chunk may be incomplete.

### 37.5.2 Data Striding Diagram

Figure 37-2. Data Striding Diagram

**37.5.3 Transfer Hierarchy Diagrams**

**Figure 37-3. XDMAC Memory Transfer Hierarchy**

**Figure 37-4. XDMAC Peripheral Transfer Hierarchy**

**37.5.4 Peripheral Synchronized Transfer**

A peripheral hardware request interface is used to control the pace of the chunk transfer. When a peripheral is ready to transmit or receive a chunk of data, it asserts its request line and the DMA Controller transfers a data to or from the memory to the peripheral.

**37.5.4.1 Software Triggered Synchronized Transfer**

The Peripheral hardware request can be software controlled using the SWREQ field of the XDMAC Global Channel Software Request Register (XDMAC\_GSWR). The peripheral synchronized transfer is paced using a processor write access in the XDMAC\_GSWR. Each bit of that register triggers a transfer

request. The XDMAC Global Channel Software Request Status Register (XDMAC\_GSWS) indicates the status of the request; when set, the request is still pending.

### 37.5.5 XDMAC Transfer Software Operation

#### Note:

When a memory-to-memory transfer is performed, configure the field XDMAC\_CCx.PERID (where 'x' is the index of the channel used for transfer) to an unused peripheral ID (refer to table "Peripheral Identifiers").

#### 37.5.5.1 Single Block Transfer With Single Microblock

1. Read the XDMAC Global Channel Status Register (XDMAC\_GS) to select a free channel.
2. Clear the pending Interrupt Status bit(s) by reading the selected XDMAC Channel x Interrupt Status Register (XDMAC\_CISx).
3. Write the XDMAC Channel x Source Address Register (XDMAC\_CSAx) for channel x.
4. Write the XDMAC Channel x Destination Address Register (XDMAC\_CDAx) for channel x.
5. Program field UBLLEN in the XDMAC Channel x Microblock Control Register (XDMAC\_CUBCx) with the number of data.
6. Program the XDMAC Channel x Configuration Register (XDMAC\_CCx):
  - 6.1. Clear XDMAC\_CCx.TYPE for a memory-to-memory transfer, otherwise set this bit.
  - 6.2. Configure XDMAC\_CCx.MBSIZE to the memory burst size used.
  - 6.3. Configure XDMAC\_CCx.SAM and DAM to Memory Addressing mode.
  - 6.4. Configure XDMAC\_CCx.DSYNC to select the peripheral transfer direction.
  - 6.5. Set XDMAC\_CCx.PROT to activate a secure channel.
  - 6.6. Configure XDMAC\_CCx.CSIZE to configure the channel chunk size (only relevant for peripheral synchronized transfer).
  - 6.7. Configure XDMAC\_CCx.DWIDTH to configure the transfer data width.
  - 6.8. Configure XDMAC\_CCx.SIF, XDMAC\_CCx.DIF to configure the master interface used to read data and write data, respectively.
  - 6.9. Configure XDMAC\_CCx.PERID to select the active hardware request line (only relevant for a peripheral synchronized transfer).
  - 6.10. Set XDMAC\_CCx.SWREQ to use a software request (only relevant for a peripheral synchronized transfer).
7. Clear the following five registers:
  - XDMAC Channel x Next Descriptor Control Register (XDMAC\_CNDCx)
  - XDMAC Channel x Block Control Register (XDMAC\_CBCx)
  - XDMAC Channel x Data Stride Memory Set Pattern Register (XDMAC\_CDS\_MSPx)
  - XDMAC Channel x Source Microblock Stride Register (XDMAC\_CSUSx)
  - XDMAC Channel x Destination Microblock Stride Register (XDMAC\_CDUSx)This indicates that the linked list is disabled, there is only one block and striding is disabled.
8. Enable the Microblock interrupt by writing a '1' to bit BIE in the XDMAC Channel x Interrupt Enable Register (XDMAC\_CIEx). Enable the Channel x Interrupt Enable bit by writing a '1' to bit IEx in the XDMAC Global Interrupt Enable Register (XDMAC\_GIE).
9. Enable channel x by writing a '1' to bit ENx in the XDMAC Global Channel Enable Register (XDMAC\_GE). XDMAC\_GS.STx (XDMAC Channel x Status bit) is set by hardware.

10. Once completed, the DMA channel sets XDMAC\_CISx.BIS (End of Block Interrupt Status bit) and generates an interrupt. XDMAC\_GS.STx is cleared by hardware. The software can either wait for an interrupt or poll the channel status bit.

#### **37.5.5.2 Single Block Transfer With Multiple Microblock**

1. Read the XDMAC\_GS register to choose a free channel.
2. Clear the pending Interrupt Status bit by reading the chosen XDMAC\_CISx register.
3. Write the XDMAC\_CSx register for channel x.
4. Write the XDMAC\_CDx register for channel x.
5. Program XDMAC\_CUBCx.UBLEN with the number of data.
6. Program XDMAC\_CCx register (see “[Single Block Transfer With Single Microblock](#)”).
7. Program XDMAC\_CBCx.BLEN with the number of microblocks of data.
8. Clear the following registers:
  - XDMAC\_CNDCx
  - XDMAC\_CDS\_MSPx
  - XDMAC\_CSUSx XDMAC\_CDUSxThis indicates that the linked list is disabled and striding is disabled.
9. Enable the Block interrupt by writing a ‘1’ to XDMAC\_CIEx.BIE, enable the Channel x Interrupt Enable bit by writing a ‘1’ to XDMAC\_GIEx.IEx.
10. Enable channel x by writing a ‘1’ to the XDMAC\_GE.ENx. XDMAC\_GS.STx is set by hardware.
11. Once completed, the DMA channel sets XDMAC\_CISx.BIS (End of Block Interrupt Status bit) and generates an interrupt. XDMAC\_GS.STx is cleared by hardware. The software can either wait for an interrupt or poll the channel status bit.

#### **37.5.5.3 Master Transfer**

1. Read the XDMAC\_GS register to choose a free channel.
2. Clear the pending Interrupt Status bit by reading the chosen XDMAC\_CISx register.
3. Build a linked list of transfer descriptors in memory. The descriptor view is programmable on a per descriptor basis. The linked list items structure must be word aligned. MBR\_UBC.NDE must be configured to 0 in the last descriptor to terminate the list.
4. Configure field NDA in the XDMAC Channel x Next Descriptor Address Register (XDMAC\_CNDAx) with the first descriptor address and bit XDMAC\_CNDAx.NDAIF with the master interface identifier.
5. Configure the XDMAC\_CNDCx register:
  - 5.1. Set XDMAC\_CNDCx.NDE to enable the descriptor fetch.
  - 5.2. Set XDMAC\_CNDCx.NDSUP to update the source address at the descriptor fetch time, otherwise clear this bit.
  - 5.3. Set XDMAC\_CNDCx.NDDUP to update the destination address at the descriptor fetch time, otherwise clear this bit.
  - 5.4. Configure XDMAC\_CNDCx.NDVIEW to define the length of the first descriptor.
6. Enable the End of Linked List interrupt by writing a ‘1’ to XDMAC\_CIEx.LIE.
7. Enable channel x by writing a ‘1’ to XDMAC\_GE.ENx. XDMAC\_GS.STx is set by hardware.
8. Once completed, the DMA channel sets XDMAC\_CISx.BIS (End of Block Interrupt Status bit) and generates an interrupt. XDMAC\_GS.STx is cleared by hardware. The software can either wait for an interrupt or poll the channel status bit.

### 37.5.5.4 Disabling A Channel Before Transfer Completion

Under normal operation, the software enables a channel by writing a '1' to XDMAC\_GE.ENx, then the hardware disables a channel on transfer completion by clearing bit XDMAC\_GS.STx. To disable a channel, write a '1' to bit XDMAC\_GD.Dlx and poll the XDMAC\_GS register.

## 37.6 Linked List Descriptor Operation

### 37.6.1 Linked List Descriptor View

#### 37.6.1.1 Channel Next Descriptor View 0–3 Structures

**Table 37-4. Channel Next Descriptor View 0–3 Structures**

#### Bits 28:27 – NVIEW[1:0] Next Descriptor View

Value	Name	Description
0	NDV0	Next Descriptor View 0
1	NDV1	Next Descriptor View 1
2	NDV2	Next Descriptor View 2
3	NDV3	Next Descriptor View 3

#### Bit 26 – NDEN Next Descriptor Destination Update

Value	Description
0	Destination parameters remain unchanged.
1	Destination parameters are updated when the descriptor is retrieved.

#### Bit 25 – NSEN Next Descriptor Source Update

Value	Description
0	Source parameters remain unchanged.
1	Source parameters are updated when the descriptor is retrieved.

#### Bit 24 – NDE Next Descriptor Enable

Value	Description
0	Descriptor fetch is disabled.
1	Descriptor fetch is enabled.

**Bits 23:0 – UBLEN[23:0]** Microblock Length

This field indicates the number of data in the microblock. The microblock contains UBLEN data.

## **37.7 XDMAC Maintenance Software Operations**

### **37.7.1 Disabling a Channel**

A disable channel request occurs when a write operation is performed in the XDMAC\_GD register. If the channel is source peripheral synchronized (bit XDMAC\_CCx.TYPE is set and bit XDMAC\_CCx.DSYNC is cleared), then pending bytes (bytes located in the FIFO) are written to memory and bit XDMAC\_CISx.DIS is set. If the channel is not source peripheral synchronized, the current channel transaction (read or write) is terminated and XDMAC\_CISx.DIS is set. XDMAC\_GS.STx is cleared by hardware when the current transfer is completed. The channel is no longer active and can be reused.

### **37.7.2 Suspending a Channel**

A disable channel request occurs when a write operation is performed in the XDMAC\_GD register. If the channel is source peripheral synchronized (bit XDMAC\_CCx.TYPE is set and bit XDMAC\_CCx.DSYNC is cleared), then pending bytes (bytes located in the FIFO) are written to memory and bit XDMAC\_CISx.DIS is set. If the channel is not source peripheral synchronized, the current channel transaction (read or write) is terminated and XDMAC\_CISx.DIS is set. XDMAC\_GS.STx is cleared by hardware when the current transfer is completed. The channel is no longer active and can be reused.

### **37.7.3 Flushing a Channel**

A FIFO flush command is issued by writing to the XDMAC\_SWF register. The content of the FIFO is written to memory. XDMAC\_CISx.FIS (End of Flush Interrupt Status bit) is set when the last byte is successfully transferred to memory. The channel is not disabled. The flush operation is not blocking, meaning that read operation can be scheduled during the flush write operation. The flush operation is only relevant for peripheral to memory transfer where pending peripheral bytes are buffered into the channel FIFO.

### **37.7.4 Maintenance Operation Priority**

#### **37.7.4.1 Disable Operation Priority**

- When a disable request occurs on a suspended channel, the XDMAC\_GWS.WSx (Channel x Write Suspend bit) is cleared. If the transfer is source peripheral synchronized, the pending bytes are drained to memory. The bit XDMAC\_CISx.DIS is set.
- When a disable request follows a flush request, if the flush last transaction is not yet scheduled, the flush request is discarded and the disable procedure is applied. Bit XDMAC\_CISx.FIS is not set. Bit XDMAC\_CISx.DIS is set when the disable request is completed. If the flush request transaction is already scheduled, the XDMAC\_CISx.FIS is set. XDMAC\_CISx.DIS is also set when the disable request is completed.

#### **37.7.4.2 Flush Operation Priority**

- When a flush request occurs on a suspended channel, if there are pending bytes in the FIFO, they are written out to memory, XDMAC\_CISx.FIS is set. If the FIFO is empty, XDMAC\_CISx.FIS is also set.
- If the flush operation is performed after a disable request, the flush command is ignored. XDMAC\_CISx.FIS is not set.

#### **37.7.4.3 Suspend Operation Priority**

If the suspend operation is performed after a disable request, the write suspend operation is ignored.

### 37.8 XDMAC Software Requirements

- Write operations to channel registers are not be performed in an active channel after the channel is enabled. If any channel parameters must be reprogrammed, this can only be done after disabling the XDMAC channel.
- XDMAC\_CSx and XDMAC\_CDx channel registers must be programmed with a byte, half-word, word or double-word aligned address depending on the Channel x Data Width field (DWIDTH) of the XDMAC Channel x Configuration Register. When a memory-to-peripheral transfer is performed, the XDMAC\_CSx address register has no alignment requirement.
- When a memory-to-memory transfer is performed, configure the field XDMAC\_CCx.PERID (where 'x' is the index of the channel used for the transfer) to an unused peripheral ID (refer to table "Peripheral Identifiers").
- When XDMAC\_CC.INITD is set to 0, XDMAC\_CUBC.UBLEN and XDMAC\_CNDA.NDA field values are unreliable when the descriptor is being updated. The following procedure applies to get the buffer descriptor identifier and the residual bytes:

```

Read XDMAC_CNDAx.NDA(nda0)
Read XDMAC_CCx.INITD(initd0)
Read XDMAC_CCx.INITD(initd0)
Read XDMAC_CUBCx.UBLEN(ublen)
Read XDMAC_CCx.INITD(initd1)
Read XDMA_CNDAx.NDA(nda1)
If (nda0 == nda1 && initd0 == 1 && initd1 == 1).
Then the ublen is correct, the buffer id is nda.
Else retry
    
```

See the figure below.

- Each DMA channel can be configured in either Secure or Non-secure mode independently. When a DMA channel is secure, its configuration registers cannot be modified by non-secure software. The configuration registers of a secure channel are read as zero by non-secure software and the read-only registers are also read as zero.

**Figure 37-5. INITD Timing Diagram**

### 37.9 Register Summary

Offset	Name	Bit Pos.									
0x00	XDMAC_GTYPE	7:0	FIFO_SZ[2:0]			NB_CH[4:0]

	FIFO_SZ[10:3]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	FIFO_SZ[2:0]			NB_CH[4:0]				
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 22:16 – NB\_REQ[6:0]** Number of Peripheral Requests Minus One

**Bits 15:5 – FIFO\_SZ[10:0]** Number of Bytes

**Bits 4:0 – NB\_CH[4:0]** Number of Channels Minus One

### 37.9.2 XDMAC Global Configuration Register

**Name:** XDMAC\_GCFG  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
								BXKBEN
Access								R/W
Reset								0
Bit	7	6	5	4	3	2	1	0
					CGDISIF	CGDISFIFO	CGDISPIPE	CGDISREG
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

#### Bit 8 – BXKBEN Boundary X Kilobyte Enable

Value	Description
0	The 1 Kbyte boundary is used.
1	The controller does not meet the AHB specification.

#### Bit 3 – CGDISIF Bus Interface Clock Gating Disable

Value	Description
0	The automatic clock gating is enabled for the system bus interface.
1	The automatic clock gating is disabled for the system bus interface.

#### Bit 2 – CGDISFIFO FIFO Clock Gating Disable

Value	Description
0	The automatic clock gating is enabled for the main FIFO.
1	The automatic clock gating is disabled for the main FIFO.

#### Bit 1 – CGDISPIPE Pipeline Clock Gating Disable

Value	Description
0	The automatic clock gating is enabled for the main pipeline.
1	The automatic clock gating is disabled for the main pipeline.

**Bit 0 – CGDISREG** Configuration Registers Clock Gating Disable

Value	Description
0	The automatic clock gating is enabled for the configuration registers.
1	The automatic clock gating is disabled for the configuration registers.

### 37.9.3 XDMAC Global Weighted Arbiter Configuration Register

**Name:** XDMAC\_GWAC  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	PW3[3:0]				PW2[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	PW1[3:0]				PW0[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 15:12 – PW3[3:0] Pool Weight 3**

This field indicates the weight of pool 3 in the arbitration scheme of the DMA scheduler.

**Bits 11:8 – PW2[3:0] Pool Weight 2**

This field indicates the weight of pool 2 in the arbitration scheme of the DMA scheduler.

**Bits 7:4 – PW1[3:0] Pool Weight 1**

This field indicates the weight of pool 1 in the arbitration scheme of the DMA scheduler.

**Bits 3:0 – PW0[3:0] Pool Weight 0**

This field indicates the weight of pool 0 in the arbitration scheme of the DMA scheduler.

### 37.9.4 XDMAC Global Interrupt Enable Register

**Name:** XDMAC\_GIE  
**Offset:** 0x0C  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	IE7	IE6	IE5	IE4	IE3	IE2	IE1	IE0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – IE** XDMAC Channel x Interrupt Enable

Value	Description
0	This bit has no effect. The Channel x Interrupt Mask bit (XDMAC_GIM.IMx) is not modified.
1	The corresponding mask bit is set. The XDMAC Channel x Interrupt Status register (XDMAC_GIS) can generate an interrupt.

### 37.9.5 XDMAC Global Interrupt Disable Register

**Name:** XDMAC\_GID  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	ID15	ID14	ID13	ID12	ID11	ID10	ID9	ID8
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	ID7	ID6	ID5	ID4	ID3	ID2	ID1	ID0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – ID XDMAC Channel x Interrupt Disable**

Value	Description
0	This bit has no effect. The Channel x Interrupt Mask bit (XDMAC_GIM.IMx) is not modified.
1	The corresponding mask bit is reset. The Channel x Interrupt Status register interrupt (XDMAC_GIS) is masked.

### 37.9.6 XDMAC Global Interrupt Mask Register

**Name:** XDMAC\_GIM  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read-only

	Bit	31	30	29	28	27	26	25	24
Access									
Reset									
	Bit	23	22	21	20	19	18	17	16
Access									
Reset									
	Bit	15	14	13	12	11	10	9	8
		IM15	IM14	IM13	IM12	IM11	IM10	IM9	IM8
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		IM7	IM6	IM5	IM4	IM3	IM2	IM1	IM0
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – IM** XDMAC Channel x Interrupt Mask

Value	Description
0	This bit indicates that the channel x interrupt source is masked. The interrupt line is not raised.
1	This bit indicates that the channel x interrupt source is unmasked.

### 37.9.7 XDMAC Global Interrupt Status Register

**Name:** XDMAC\_GIS  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

	Bit	31	30	29	28	27	26	25	24
Access									
Reset									
	Bit	23	22	21	20	19	18	17	16
Access									
Reset									
	Bit	15	14	13	12	11	10	9	8
		IS15	IS14	IS13	IS12	IS11	IS10	IS9	IS8
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		IS7	IS6	IS5	IS4	IS3	IS2	IS1	IS0
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – IS** XDMAC Channel x Interrupt Status

Value	Description
0	This bit indicates that either the interrupt source is masked at the channel level or no interrupt is pending for channel x.
1	This bit indicates that an interrupt is pending for the channel x.

### 37.9.8 XDMAC Global Channel Enable Register

**Name:** XDMAC\_GE  
**Offset:** 0x1C  
**Reset:** –  
**Property:** Write-only

	Bit	31	30	29	28	27	26	25	24
Access									
Reset									
	Bit	23	22	21	20	19	18	17	16
Access									
Reset									
	Bit	15	14	13	12	11	10	9	8
		EN15	EN14	EN13	EN12	EN11	EN10	EN9	EN8

Reset		–	–	–	–	–	–	–	–
	Bit	7	6	5	4	3	2	1	0
		EN7	EN6	EN5	EN4	EN3	EN2	EN1	EN0
Access		W	W	W	W	W	W	W	W
Reset		–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – EN XDMAC Channel x Enable**

Value	Description
0	This bit has no effect.
1	Enables channel n. This operation is permitted if the Channel x Status bit (XDMAC_GS.STx) was read as '0'.

### 37.9.9 XDMAC Global Channel Disable Register

**Name:** XDMAC\_GD  
**Offset:** 0x20  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	DI15	DI14	DI13	DI12	DI11	DI10	DI9	DI8
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	DI7	DI6	DI5	DI4	DI3	DI2	DI1	DI0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – DI XDMAC Channel x Disable**

Value	Description
0	This bit has no effect.
1	Disables channel x.

### 37.9.10 XDMAC Global Channel Status Register

**Name:** XDMAC\_GS  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	ST15	ST14	ST13	ST12	ST11	ST10	ST9	ST8
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	ST7	ST6	ST5	ST4	ST3	ST2	ST1	ST0
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – ST XDMAC Channel x Status**

Value	Description
0	This bit indicates that the channel x is disabled.
1	This bit indicates that the channel x is enabled. If a channel disable request is issued, this bit remains asserted until pending transaction is completed.

### 37.9.11 XDMAC Global Channel Read Suspend Register

**Name:** XDMAC\_GRS  
**Offset:** 0x28  
**Reset:** 0x00000000

Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – SWRS** XDMAC Channel x Software Request Status

Value	Description
0	Channel x source request is serviced.
1	Channel x source request is pending.

### 37.9.17 XDMAC Global Channel Software Flush Request Register

**Name:** XDMAC\_GSWF  
**Offset:** 0x40  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	SWF15	SWF14	SWF13	SWF12	SWF11	SWF10	SWF9	SWF8
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	SWF7	SWF6	SWF5	SWF4	SWF3	SWF2	SWF1	SWF0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – SWF<sub>x</sub>** XDMAC Channel x Software Flush Request

Value	Description
0	No effect.
1	Requests a DMA transfer flush for channel x. This bit is only relevant when the transfer is source peripheral synchronized.

### 37.9.18 XDMAC Channel x Interrupt Enable Register [x=0..15]

**Name:** XDMAC\_CIE  
**Offset:** 0x50 + n\*0x40 [n=0..15]  
**Reset:** –  
**Property:** Write-only

#### Bit 6 – ROIE Request Overflow Error Interrupt Enable

Value	Description
0	No effect.
1	Enables request overflow error interrupt.

#### Bit 5 – WBIE Write Bus Error Interrupt Enable

Value	Description
0	No effect.
1	Enables write bus error interrupt.

#### Bit 4 – RBIE Read Bus Error Interrupt Enable

Value	Description
0	No effect.
1	Enables read bus error interrupt.

#### Bit 3 – FIE End of Flush Interrupt Enable

Value	Description
0	No effect.
1	Enables end of flush interrupt.

---

---

**Bit 2 – DIE** End of Disable Interrupt Enable

Value	Description
0	No effect.
1	Enables end of disable interrupt.

**Bit 1 – LIE** End of Linked List Interrupt Enable

Value	Description
0	No effect.
1	Enables end of linked list interrupt.

**Bit 0 – BIE** End of Block Interrupt Enable

Value	Description
0	No effect.
1	Enables end of block interrupt.

### 37.9.19 XDMAC Channel x Interrupt Disable Register [x = 0..15]

**Name:** XDMAC\_CID  
**Offset:** 0x54 + n\*0x40 [n=0..15]  
**Reset:** –  
**Property:** Write-only

#### Bit 6 – ROID Request Overflow Error Interrupt Disable

Value	Description
0	No effect.
1	Disables request overflow error interrupt.

#### Bit 5 – WBEID Write Bus Error Interrupt Disable

Value	Description
0	No effect.
1	Disables bus error interrupt.

#### Bit 4 – RBEID Read Bus Error Interrupt Disable

Value	Description
0	No effect.
1	Disables bus error interrupt.

#### Bit 3 – FID End of Flush Interrupt Disable

Value	Description
0	No effect.
1	Disables end of flush interrupt.

---

---

**Bit 2 – DID** End of Disable Interrupt Disable

Value	Description
0	No effect.
1	Disables end of disable interrupt.

**Bit 1 – LID** End of Linked List Interrupt Disable

Value	Description
0	No effect.
1	Disables end of linked list interrupt.

**Bit 0 – BID** End of Block Interrupt Disable

Value	Description
0	No effect.
1	Disables end of block interrupt.

### 37.9.20 XDMAC Channel x Interrupt Mask Register [x = 0..15]

**Name:** XDMAC\_CIM  
**Offset:** 0x58 + n\*0x40 [n=0..15]  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
		ROIM	WBEIM	RBEIM	FIM	DIM	LIM	BIM
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0

#### Bit 6 – ROIM Request Overflow Error Interrupt Mask

Value	Description
0	Request overflow interrupt is masked.
1	Request overflow interrupt is activated.

#### Bit 5 – WBEIM Write Bus Error Interrupt Mask

Value	Description
0	Bus error interrupt is masked.
1	Bus error interrupt is activated.

#### Bit 4 – RBEIM Read Bus Error Interrupt Mask

Value	Description
0	Bus error interrupt is masked.
1	Bus error interrupt is activated.

#### Bit 3 – FIM End of Flush Interrupt Mask

Value	Description
0	End of flush interrupt is masked.
1	End of flush interrupt is activated.

---

---

**Bit 2 – DIM** End of Disable Interrupt Mask

Value	Description
0	End of disable interrupt is masked.
1	End of disable interrupt is activated.

**Bit 1 – LIM** End of Linked List Interrupt Mask

Value	Description
0	End of linked list interrupt is masked.
1	End of linked list interrupt is activated.

**Bit 0 – BIM** End of Block Interrupt Mask

Value	Description
0	Block interrupt is masked.
1	Block interrupt is activated.

### 37.9.21 XDMAC Channel x Interrupt Status Register [x = 0..15]

**Name:** XDMAC\_CIS  
**Offset:** 0x5C + n\*0x40 [n=0..15]  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bit 6 – ROIS Request Overflow Error Interrupt Status

Value	Description
0	Overflow condition has not occurred.
1	Overflow condition has occurred at least once. (This information is only relevant for peripheral synchronized transfers.)

#### Bit 5 – WBEIS Write Bus Error Interrupt Status

Value	Description
0	Write bus error condition has not occurred.
1	At least one bus error has been detected in a write access since the last read of the Status register.

#### Bit 4 – RBEIS Read Bus Error Interrupt Status

Value	Description
0	Read bus error condition has not occurred.
1	At least one bus error has been detected in a read access since the last read of the Status register.

#### Bit 3 – FIS End of Flush Interrupt Status

---

---

Value	Description
0	End of flush condition has not occurred.
1	End of flush condition has occurred since the last read of the Status register.

**Bit 2 – DIS** End of Disable Interrupt Status

Value	Description
0	End of disable condition has not occurred.
1	End of disable condition has occurred since the last read of the Status register.

**Bit 1 – LIS** End of Linked List Interrupt Status

Value	Description
0	End of linked list condition has not occurred.
1	End of linked list condition has occurred since the last read of the Status register.

**Bit 0 – BIS** End of Block Interrupt Status

Value	Description
0	End of block interrupt has not occurred.
1	End of block interrupt has occurred since the last read of the Status register.

### 37.9.22 XDMAC Channel x Source Address Register [x = 0..15]

**Name:** XDMAC\_CSA  
**Offset:** 0x60 + n\*0x40 [n=0..15]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	SA[31:24]

	NDA[13:6]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	NDA[5:0]							NDAIF
Access	R/W	R/W	R/W	R/W	R/W	R/W		R/W
Reset	0	0	0	0	0	0		0

**Bits 31:2 – NDA[29:0]** Channel x Next Descriptor Address

The 30-bit width of the NDA field represents the next descriptor address range 31:2. The descriptor is word-aligned and the two least significant register bits 1:0 are ignored.

**Bit 0 – NDAIF** Channel x Next Descriptor Interface

Value	Description
0	The channel descriptor is retrieved through system interface 0.
1	The channel descriptor is retrieved through system interface 1.

### 37.9.25 XDMAC Channel x Next Descriptor Control Register [x = 0..15]

**Name:** XDMAC\_CNDC  
**Offset:** 0x6C + n\*0x40 [n=0..15]  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 4:3 – NDVIEW[1:0] Channel x Next Descriptor View

Value	Name	Description
0	NDV0	Next Descriptor View 0
1	NDV1	Next Descriptor View 1
2	NDV2	Next Descriptor View 2
3	NDV3	Next Descriptor View 3

#### Bit 2 – NDDUP Channel x Next Descriptor Destination Update

0 (DST\_PARAMS\_UNCHANGED): Destination parameters remain unchanged.

1 (DST\_PARAMS\_UPDATED): Destination parameters are updated when the descriptor is retrieved.

#### Bit 1 – NDSUP Channel x Next Descriptor Source Update

0 (SRC\_PARAMS\_UNCHANGED): Source parameters remain unchanged.

1 (SRC\_PARAMS\_UPDATED): Source parameters are updated when the descriptor is retrieved.

#### Bit 0 – NDE Channel x Next Descriptor Enable

0 (DSCR\_FETCH\_DIS): Descriptor fetch is disabled.

1 (DSCR\_FETCH\_EN): Descriptor fetch is enabled.

### 37.9.26 XDMAC Channel x Microblock Control Register [x = 0..15]

**Name:** XDMAC\_CUBC  
**Offset:** 0x70 + n\*0x40 [n=0..15]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0

**Bits 23:0 – UBLEN[23:0]** Channel x Microblock Length

This field indicates the number of data in the microblock. The microblock contains UBLEN data.

### 37.9.27 XDMAC Channel x Block Control Register [x = 0..15]

**Name:** XDMAC\_CBC  
**Offset:** 0x74 + n\*0x40 [n=0..15]  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 11:0 – BLEN[11:0]** Channel x Block Length  
 The length of the block is (BLEN+1) microblocks.

### 37.9.28 XDMAC Channel x Configuration Register [x = 0..15]

**Name:** XDMAC\_CC  
**Offset:** 0x78 + n\*0x40 [n=0..15]  
**Reset:** 0x00000000  
**Property:** Read/Write

	Bit	31	30	29	28	27	26	25	24
		PERID[6:0]							
Access		R/W		R/W	R/W	R/W	R/W	R/W	R/W

Access		R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset		0	0	0	0		0	0	0

**Bits 30:24 – PERID[6:0]** Channel x Peripheral Hardware Request Line Identifier

This field contains the peripheral hardware request line identifier. PERID refers to identifiers defined in [“DMA Controller Peripheral Connections”](#).

**Note:** When a memory-to-memory transfer is performed, configure PERID to an unused peripheral ID (refer to table “Peripheral Identifiers”).

**Bit 23 – WRIP** Write in Progress (this bit is read-only)

0 (DONE): No active write transaction on the bus.

1 (IN\_PROGRESS): A write transaction is in progress.

**Bit 22 – RDIP** Read in Progress (this bit is read-only)

0 (DONE): No active read transaction on the bus.

1 (IN\_PROGRESS): A read transaction is in progress.

**Bit 21 – INITD** Channel Initialization Done (this bit is read-only)

0 (IN\_PROGRESS): Channel initialization is in progress.

1 (TERMINATED): Channel initialization is completed.

Note: When set to 0, XDMAC\_CUBC.UBLEN and XDMAC\_CNDA.NDA field values are unreliable each time a descriptor is being updated. See [37.8 XDMAC Software Requirements](#).

### Bits 19:18 – DAM[1:0] Channel x Destination Addressing Mode

Value	Name	Description
0	FIXED_AM	The address remains unchanged.
1	INCREMENTED_AM	The addressing mode is incremented (the increment size is set to the data size).
2	UBS_AM	The microblock stride is added at the microblock boundary.
3	UBS_DS_AM	The microblock stride is added at the microblock boundary; the data stride is added at the data boundary.

### Bits 17:16 – SAM[1:0] Channel x Source Addressing Mode

Value	Name	Description
0	FIXED_AM	The address remains unchanged.
1	INCREMENTED_AM	The addressing mode is incremented (the increment size is set to the data size).
2	UBS_AM	The microblock stride is added at the microblock boundary.
3	UBS_DS_AM	The microblock stride is added at the microblock boundary, the data stride is added at the data boundary.

### Bit 14 – DIF Channel x Destination Interface Identifier

0 (AHB\_IF0): The data is written through system bus interface 0.

1 (AHB\_IF1): The data is written though system bus interface 1.

### Bit 13 – SIF Channel x Source Interface Identifier

0 (AHB\_IF0): The data is read through system bus interface 0.

1 (AHB\_IF1): The data is read through system bus interface 1.

### Bits 12:11 – DWIDTH[1:0] Channel x Data Width

Value	Name	Description
0	BYTE	The data size is set to 8 bits
1	HALFWORD	The data size is set to 16 bits
2	WORD	The data size is set to 32 bits
3	DWORD	The data size is set to 64 bits

### Bits 10:8 – CSIZE[2:0] Channel x Chunk Size

Value	Name	Description
0	CHK_1	1 data transferred
1	CHK_2	2 data transferred
2	CHK_4	4 data transferred
3	CHK_8	8 data transferred
4	CHK_16	16 data transferred

### Bit 7 – MEMSET Channel x Fill Block of Memory

0 (NORMAL\_MODE): Memset is not activated.

1 (HW\_MODE): Sets the block of memory pointed by DA field to the specified value. This operation is performed on 8-, 16- or 32-bit basis.

**Bit 6 – SWREQ** Channel x Software Request Trigger

0 (HWR\_CONNECTED): Hardware request line is connected to the peripheral request line.

1 (SWR\_CONNECTED): Software request is connected to the peripheral request line.

**Bit 5 – PROT** Channel x Protection

When a descriptor is loaded, the PROT bit cannot be modified. If PROT=0 for a channel, the configuration and status registers of this channel cannot be modified by unsecure software.

0 (SEC): Channel is secured.

1 (UNSEC): Channel is unsecured.

**Bit 4 – DSYNC** Channel x Synchronization

0 (PER2MEM): Peripheral-to-memory transfer.

1 (MEM2PER): Memory-to-peripheral transfer.

**Bits 2:1 – MBSIZE[1:0]** Channel x Memory Burst Size

Value	Name	Description
0	SINGLE	The memory burst size is set to one.
1	FOUR	The memory burst size is set to four.
2	EIGHT	The memory burst size is set to eight.
3	SIXTEEN	The memory burst size is set to sixteen.

**Bit 0 – TYPE** Channel x Transfer Type

0 (MEM\_TRAN): Self-triggered mode (memory-to-memory transfer).

1 (PER\_TRAN): Synchronized mode (peripheral-to-memory or memory-to-peripheral transfer).

### 37.9.29 XDMAC Channel x Data Stride Memory Set Pattern Register [x = 0..15]

**Name:** XDMAC\_CDS\_MSP  
**Offset:** 0x7C + n\*0x40 [n=0..15]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	DDS_MSP[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	DDS_MSP[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	SDS_MSP[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	SDS_MSP[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:16 – DDS\_MSP[15:0]** Channel x Destination Data Stride or Memory Set Pattern

When XDMAC\_CCx.MEMSET = 0, this field indicates the destination data stride.

Number of bytes for the data stride of channel x (two's complement). If the field is set to zero the data is contiguous (see [Data Striding Diagram](#)).

The DDS\_MSP field is only relevant when XDMAC\_CCx.SAM=UBS\_DS\_AM.

When XDMAC\_CCx.MEMSET = 1, this field indicates the memory set pattern.

**Bits 15:0 – SDS\_MSP[15:0]** Channel x Source Data Stride or Memory Set Pattern

When XDMAC\_CCx.MEMSET = 0, this field indicates the source data stride.

Number of bytes for the data stride of channel x (two's complement). If the field is set to zero the data is contiguous (see [Data Striding Diagram](#)).

The SDS\_MSP field is only relevant when XDMAC\_CCx.SAM=UBS\_DS\_AM.

When XDMAC\_CCx.MEMSET = 1, this field indicates the memory set pattern.

### 37.9.30 XDMAC Channel x Source Microblock Stride Register [x = 0..15]

**Name:** XDMAC\_CSUS  
**Offset:** 0x80 + n\*0x40 [n=0..15]  
**Reset:** 0x00000000  
**Property:** Read/Write

	DUBS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 23:0 – DUBS[23:0]** Channel x Destination Microblock Stride

Number of bytes for the microblock stride for channel x (two's complement). If the field is set to zero the data is contiguous (see [Figure 37-2](#)).

The DUBS field is only relevant when XDMAC\_CCx.SAM=UBS\_AM or XDMAC\_CCx.SAM=UBS\_DS\_AM.

## **38. LCD Controller (LCDC)**

### **38.1 Description**

The LCD Controller (LCDC) consists of logic for transferring LCD image data from an external display buffer to an LCD module. The LCD has one display input buffer per overlay that fetches pixels through the dual AHB master interface and a lookup table to allow palletized display configurations. The LCD controller is programmable on a per overlay basis, and supports different LCD resolutions, window sizes, image formats and pixel depths.

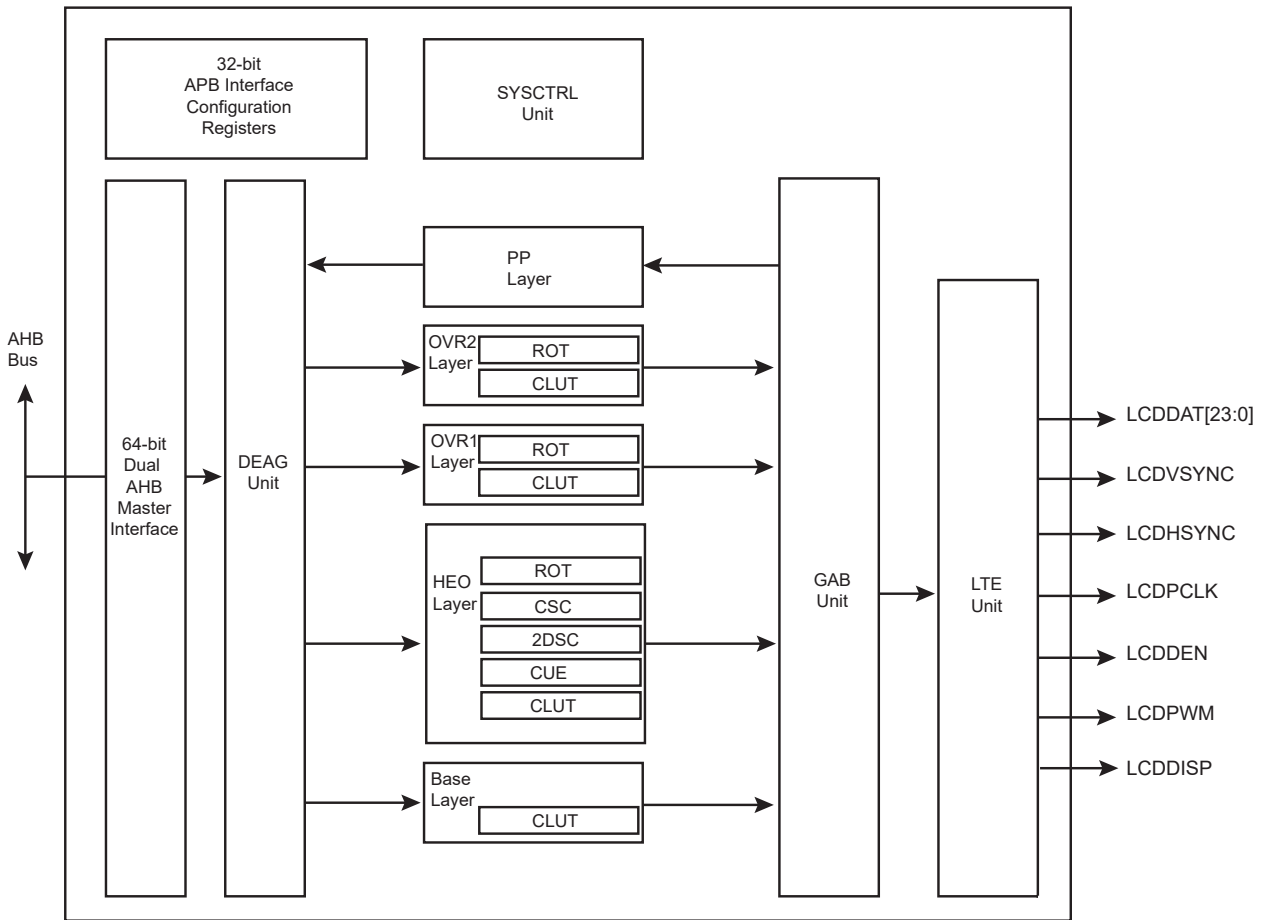

The LCD is connected to the Arm Advanced High Performance Bus (AHB) as a master for reading pixel data. It also integrates an APB interface to configure its registers.

### **38.2 Embedded Characteristics**

- Dual AHB Master Interface
- Supports Single Scan Active TFT Display
- Supports 12-, 16-, 18- and 24-bit Output Mode through the Spatial Dithering Unit
- Asynchronous Output Mode Supported
- 1, 2, 4, 8 bits per Pixel (Palletized)
- 12, 16, 18, 19, 24, 25 and 32 bits per Pixel (Non-palletized)
- Supports One Base Layer (Background)
- Supports One Overlay 1 Layer Window
- Supports One Overlay 2 Layer Window
- Supports One High-End Overlay (HEO) Window
- Little Endian Memory Organization
- Programmable Timing Engine, with Integer Clock Divider
- Programmable Polarity for Data, Line Synchro and Frame Synchro
- Up to 1024x768 (XGA) with Overlay (Application-Dependent). Still Image up to WXGA.
- Color Lookup Table with up to 256 Entries and Predefined 8-bit Alpha
- Programmable Negative and Positive Row Striding for all Layers
- Programmable Negative and Positive Pixel Striding for Layers
- High-End Overlay supports 4:2:0 Planar Mode and Semiplanar Mode
- High-End Overlay supports 4:2:2 Planar Mode, Semiplanar Mode and Packed
- High-End Overlay includes Chroma Upsampling Unit
- Horizontal and Vertical Rescaling Unit with Edge Interpolation and Independent Non-Integer Ratio, up to 1024x768
- Hidden Layer Removal supported
- Integrates Fully Programmable Color Space Conversion
- Blender Function Supports Arbitrary 8-bit Alpha Value and Chroma Keying
- DMA User Interface uses Linked List Structure and Add-to-queue Structure

### 38.3 Block Diagram

### 38.4 I/O Lines Description

Table 38-1. I/O Lines Description

Name	Description	Type
LCDPWM	Contrast control signal, using Pulse Width Modulation	Output
LCDHSYNC	Horizontal Synchronization Pulse	Output
LCDVSYNC	Vertical Synchronization Pulse	Output
LCDDAT[23:0]	LCD 24-bit data bus	Output
LCDDEN	Data Enable	Output

.....continued		
Name	Description	Type
LCDDISP	Display Enable signal	Output
LCDPCLK	Pixel Clock	Output

## 38.5 Product Dependencies

### 38.5.1 I/O Lines

The pins used for interfacing the LCD Controller may be multiplexed with PIO lines. The programmer must first program the PIO Controller to assign the pins to their peripheral function. If I/O lines of the LCD Controller are not used by the application, they can be used for other purposes by the PIO Controller.

### 38.5.2 Power Management

The LCD Controller is not continuously clocked. The user must first enable the LCD Controller clock in the Power Management Controller (PMC\_PCER) before using it.

### 38.5.3 Interrupt Sources

The LCD Controller interrupt line is connected to one of the internal sources of the interrupt controller. Using the LCD Controller interrupt requires prior programming of the interrupt controller.

## 38.6 Functional Description

The LCD module integrates the following digital blocks:

- DMA Engine Address Generation (DEAG)—this block performs data prefetch and requests access to the AHB interface.
- Input Overlay FIFO—stores the stream of pixels
- Color Lookup Table (CLUT)—these 256 RAM-based lookup table entries are selected when the color depth is set to 1, 2, 4 or 8 bpp.
- Chroma Upsampling Engine (CUE)—this block is selected when the input image sampling format is YUV (Y'CbCr) 4:2:0 and converts it to higher quality 4:4:4 image.
- Color Space Conversion (CSC)—changes the color space from YUV to RGB
- Two Dimension Scaler (2DSC)—resizes the image
- Global Alpha Blender (GAB)—performs programmable 256-level alpha blending
- Output FIFO—stores the blended pixel prior to display
- LCD Timing Engine—provides a fully programmable HSYNC-VSYNC interface

The DMA controller reads the image through the AHB master interface. The LCD controller engine formats the display data, then the GAB performs alpha blending if required, and writes the final pixel into the output FIFO. The programmable timing engine drives a valid pixel onto the LCDDAT[23:0] display bus.

### 38.6.1 Timing Engine Configuration

#### 38.6.1.1 Pixel Clock Period Configuration

The pixel clock (LCDPCLK) generated by the timing engine is the source clock divided by the field CLKDIV in the LCDC\_LCDCFG0 register. The source clock can be selected between the system clock and the 2x system clock with the field CLKSEL located in the LCDC\_LCDCFG0 register.

Pixel clock period formula:

$$\text{LCD\_PCLK} = \frac{\text{source clock}}{\text{CLKDIV}+2}$$

The pixel clock polarity is also programmable.

### 38.6.1.2 Horizontal and Vertical Synchronization Configuration

The following fields are used to configure the timing engine:

- LCDC\_LCDCFG1.HSPW
- LCDC\_LCDCFG1.VSPW
- LCDC\_LCDCFG2.VFPW
- LCDC\_LCDCFG2.VBPW
- LCDC\_LCDCFG3.HFPW
- LCDC\_LCDCFG3.HBPW
- LCDC\_LCDCFG4.PPL
- LCDC\_LCDCFG4.RPF

The polarity of output signals is also programmable.

### 38.6.1.3 Timing Engine Powerup Software Operation

The following sequence is used to enable the display:

1. Configure LCD timing parameters, signal polarity and clock period.
2. Enable the pixel clock by writing a one to bit LCDC\_LCDEN.CLKEN.
3. Poll bit LCDC\_LCDSR.CLKSTS to check that the clock is running.
4. Enable Horizontal and Vertical Synchronization by writing a one to bit LCDC\_LCDEN.SYNCEN.
5. Poll bit LCDC\_LCDSR.LCDSTS to check that the synchronization is up.
6. Enable the display power signal by writing a one to bit LCDC\_LCDEN.DISPEN.
7. Poll bit LCDC\_LCDSR.DISPSTS to check that the power signal is activated.

The field LCDC\_LCDCFG5.GUARDTIME is used to configure the number of frames before the assertion of the DISP signal.

### 38.6.1.4 Timing Engine Powerdown Software Operation

The following sequence is used to disable the display:

1. Disable the DISP signal by writing bit LCDC\_LCDDIS.DISPDIS.
2. Poll bit LCDC\_LCDSR.DISPSTS to verify that the DISP is no longer activated.
3. Disable the HSYNC and VSYNC signals by writing a one to bit LCDC\_LCDDIS.SYNCDIS.
4. Poll bit LCDC\_LCDSR.LCDSTS to check that the synchronization is off.
5. Disable the pixel clock by writing a one to bit LCDC\_LCDDIS.CLKDIS.

## 38.6.2 DMA Software Operations

### 38.6.2.1 DMA Channel Descriptor (DSCR) Alignment and Structure

The DMA Channel Descriptor (DSCR) must be aligned on a 64-bit boundary.

The DMA Channel Descriptor structure contains three fields:

- DSCR.CHXADDR: Frame Buffer base address register
- DSCR.CHXCTRL: Transfer Control register

- DSCR.CHXNEXT: Next Descriptor Address register

**Table 38-2. DMA Channel Descriptor Structure**

System Memory	Structure Field for Channel CHX
DSCR + 0x0	ADDR
DSCR + 0x4	CTRL
DSCR + 0x8	NEXT

### 38.6.2.2 Enabling a DMA Channel

Follow the steps below to enable a DMA channel:

1. Check the status of the channel by reading the CHXCHSR register.
2. Write the channel descriptor (DSCR) structure in the system memory by writing DSCR.CHXADDR Frame base address, DSCR.CHXCTRL channel control and DSCR.CHXNEXT next descriptor location.
3. If more than one descriptor is expected, the field DFETCH of DSCR.CHXCTRL is set to '1' to enable the descriptor fetch operation.
4. Write the DSCR.CHXNEXT register with the address location of the descriptor structure and set DFETCH field of the DSCR.CHXCTRL register to '1'.
5. Enable the relevant channel by writing one to the CHEN field of the CHXCHER register.
6. An interrupt may be raised if unmasked when the descriptor has been loaded.

### 38.6.2.3 Disabling a DMA Channel

Follow the steps below to disable a DMA channel:

1. Clearing the DFETCH bit in the DSCR.CHXCTRL field of the DSCR structure disables the channel at the end of the frame.
2. Setting the DSCR.CHXNEXT field of the DSCR structure disables the channel at the end of the frame.
3. Writing one to the CHDIS field of the CHXCHDR register disables the channel at the end of the frame.
4. Writing one to the CHRST field of the CHXCHDR register disables the channel immediately. This may occur in the middle of the image.
5. Polling CHSR field in the CHXCHSR register until the channel is successfully disabled.

### 38.6.2.4 DMA Dynamic Linking of a New Transfer Descriptor

1. Write the new descriptor structure in the system memory.
2. Write the address of the new structure in the CHXHEAD register.
3. Add the new structure to the queue of descriptors by writing one to the A2QEN field of the CHXCHER register.
4. The new descriptor is added to the queue on the next frame.
5. An interrupt is raised if unmasked, when the head descriptor structure has been loaded by the DMA channel.

### 38.6.2.5 DMA Interrupt Generation

The DMA Controller operation sets the following interrupt flags in the Interrupt Status register CHXISR:

- DMA field indicates that the DMA transfer is completed.
- DSCR field indicates that the descriptor structure is loaded in the DMA controller.

- ADD field indicates that a descriptor has been added to the descriptor queue.
- DONE field indicates that the channel transfer has terminated and the channel is automatically disabled.

### 38.6.2.6 DMA Address Alignment Requirements

When programming the DSCR.CHXADDR field of the DSCR structure, the following requirement must be met.

**Table 38-3. DMA Address Alignment when CLUT Mode is Selected**

CLUT Mode	DMA Address Alignment
1 bpp	8 bits
2 bpp	8 bits
4 bpp	8 bits
8 bpp	8 bits

**Table 38-4. DMA Address Alignment when RGB Mode is Selected**

RGB Mode	DMA Address Alignment
12 bpp RGB 444	16 bits
16 bpp ARGB 4444	16 bits
16 bpp RGBA 4444	16 bits
16 bpp RGB 565	16 bits
16 bpp TRGB 1555	16 bits
18 bpp RGB 666	32 bits
18 bpp RGB 666 PACKED	8 bits
19 bpp TRGB 1666	32 bits
19 bpp TRGB 1666	8 bits
24 bpp RGB 888	32 bits
24 bpp RGB 888 PACKED	8 bits
25 bpp TRGB 1888	32 bits
32 bpp ARGB 8888	32 bits
32 bpp RGBA 8888	32 bits

**Table 38-5. DMA Address Alignment when YUV Mode is Selected**

YUV Mode	DMA Address Alignment
32 bpp AYCrCb	32 bits
16 bpp YCrCb 4:2:2	32 bits

.....continued	
YUV Mode	DMA Address Alignment
16 bpp semiplanar YCrCb 4:2:2	Y 8 bits
	CrCb 16 bits
16 bpp planar YCrCb 4:2:2	Y 8 bits
	Cr 8 bits
	Cb 8 bits
12 bpp YCrCb 4:2:0	Y 8 bits
	CrCb 16 bits
12 bpp YCrCb 4:2:0	Y 8 bits
	Cr 8 bits
	Cb 8 bits

### 38.6.3 Overlay Software Configuration

#### 38.6.3.1 System Bus Access Attributes

These attributes are defined to improve bandwidth of the overlay.

- LOCKDIS bit—When set to ‘1’, the AHB lock signal is not asserted when the PSTRIDE value is different from zero (rotation in progress).
- ROTDIS bit—When set to ‘1’, the Pixel Striding optimization is disabled.
- DLBO bit—When set to ‘1’, only defined burst lengths are performed when the DMA channel retrieves the data from the memory.
- BLEN field—Defines the maximum burst length of the DMA channel.
- SIF bit—Defines the targeted DMA interface.

#### 38.6.3.2 Color Attributes

- CLUTMODE field—Selects the Color Lookup Table mode.
- RGBMODE field—Selects the RGB mode.
- YUVMODE field—Selects the Luminance Chrominance mode.

#### 38.6.3.3 Window Position, Size, Scaling and Striding Attributes

- XPOS and YPOS fields—Defines the position of the overlay window.
- XSIZE and YSIZE fields—Defines the size of the displayed window.
- XMEMSIZE and YMEMSIZE fields—Defines the size of the image frame buffer.
- XSTRIDE and PSTRIDE fields—Defines the line and pixel striding.
- XFACTOR and YFACTOR fields—Defines the scaling ratio.

The position and size attributes are to be programmed to keep the window within the display area.

When the Color Lookup Table mode is enabled, the restrictions detailed in the following table apply on the horizontal and vertical window sizes.

**Table 38-6. Color Lookup Table Mode and Window Size**

CLUT Mode	X-Y Size Requirement
1 bpp	Multiple of 8 pixels
2 bpp	Multiple of 4 pixels
4 bpp	Multiple of 2 pixels
8 bpp	Free size

Pixel striding is disabled when CLUT mode is enabled.

When YUV mode is enabled, the restrictions detailed in the following table apply on the window size.

**Table 38-7. YUV Mode and Window Size**

YUV Mode	X-Y Requirement, Scaling Turned Off	X-Y Requirement, Scaling Turned On
AYUV	Free size	X-Y size is greater than 5
YUV 4:2:2 packed	XSIZE is greater than 2 pixels	X-Y size is greater than 5
YUV 4:2:2 semiplanar	XSIZE is greater than 2 pixels	X-Y size is greater than 5
YUV 4:2:2 planar	XSIZE is greater than 2 pixels	X-Y size is greater than 5
YUV 4:2:0 semiplanar	XSIZE is greater that 2 pixels	X-Y size is greater than 5
YUV 4:2:0 planar	XSIZE is greater than 2 pixels	X-Y size is greater than 5

In RGB mode, there is no restriction on the line length.

#### 38.6.3.4 Overlay Blender Attributes

When two or more video layers are used, alpha blending is performed to define the final image displayed. Each window has its own blending attributes.

- CRKEY bit—Enables the chroma keying and match logic.
- INV bit—Performs bit inversion at pixel level.
- ITER2BL bit—When written to ‘1’, the iterated data path is selected.
- ITER bit—When written to ‘1’, the iterated value is used in the iterated data path, otherwise the iterated value is set to 0.
- REVALPHA bit—Uses the reverse alpha value.
- GAEN bit—Enables the global alpha value in the data path.
- LAEN bit—Enables the local alpha value from the pixel.
- OVR bit—When written to ‘1’, the overlay is selected as an input of the blender.
- DMA bit—The DMA data path is activated.
- REP bit—Enables the bit replication to fill the 24-bit internal data path.
- DSTKEY bit—When written to ‘1’, Destination keying is enabled.
- GA field—Defines the global alpha value.

#### 38.6.3.5 Overlay Attributes Software Operation

1. When required, write the overlay attributes configuration registers.
2. Set UPDATEEN field of the CHXCHER register.
3. Poll UPDATESR field in the CHXCHSR, the update applies when that field is reset.

### 38.6.4 RGB Frame Buffer Memory Bitmap

#### 38.6.4.1 1 bpp Through Color Lookup Table

**Table 38-8. 1 bpp Memory Mapping, Little Endian Organization**

Mem addr	0x3								0x2								0x1								0x0

### 38.6.6 Chrominance Upsampling Unit

Both the 4:2:2 and the 4:2:0 input formats are supported by the LCD module. In 4:2:2, the two chrominance components are sampled at half the luminance sample rate. The horizontal chrominance resolution is halved. When this input format is selected, the chrominance upsampling unit uses two chrominances to interpolate the missing component.

In 4:2:0, Cr and Cb components are subsampled at a factor of two vertically and horizontally. When this input mode is selected, the chrominance upsampling unit uses two and four chroma components to generate the missing horizontal and vertical components.

**Figure 38-2. 4:2:2 Upsampling Algorithm**

Vertical and Horizontal upsampling 4:2:2 to 4:4:4 conversion 0 or 180 degrees

**Figure 38-3. 4:2:2 Packed Upsampling Algorithm**

Vertical and Horizontal upsampling 4:2:2 to 4:4:4 conversion 90 or 270 degrees

**Figure 38-4. 4:2:2 Semiplanar and Planar Upsampling Algorithm - 90 or 270 Degree R Rotation Activated**

Vertical and Horizontal upsampling 4:2:2 to 4:4:4 conversion 90 or 270 degrees

**Figure 38-5. 4:2:0 Upsampling Algorithm**

$$\text{Chroma}\left[\frac{x}{2}, 0\right] = \frac{\text{Cr}[0, 0] + \text{Cr}[0, x]}{2}$$

$$\text{Chroma}\left[0, \frac{y}{2}\right] = \frac{\text{Cr}[0, 0] + \text{Cr}[0, y]}{2}$$

$$\text{Chroma}\left[\frac{x}{2}, \frac{y}{2}\right] = \frac{\text{Cr}[0, 0] + \text{Cr}[x, 0] + \text{Cr}[y, 0] + \text{Cr}[x, y]}{4}$$

$$\text{Chroma}\left[x, \frac{y}{2}\right] = \frac{\text{Cr}[x, 0] + \text{Cr}[x, y]}{2}$$

$$\text{Chroma}\left[\frac{x}{2}, y\right] = \frac{\text{Cr}[0, y] + \text{Cr}[x, y]}{2}$$

### 38.6.6.1 Chrominance Upsampling Algorithm

1. Read line n from chrominance cache and interpolate  $[x/2, 0]$  chrominance component filling the 1 x 2 kernel with line n. If the chrominance cache is empty, then fetch the first line from external memory and interpolate from the external memory. Duplicate the last chrominance at the end of line.
2. Fetch line n+1 from external memory, write line n + 1 to chrominance cache, read line n from the chrominance cache. Interpolate  $[0, y/2]$ ,  $[x/2, y/2]$  and  $[x, y/2]$  filling the 2x2 kernel with lines n and n + 1. Duplicate the last chrominance line to generate the last interpolated line.
3. Repeat step 1 and step 2.

### 38.6.7 Line and Pixel Striding

The LCD module includes a technique to increment the memory address by a programmable amount when the end of line has been reached. This offset is referred to as XSTRIDE and is defined on a per overlay basis. Additionally, the PSTRIDE field allows a programmable jump at the pixel level. Pixel stride is the value from one pixel to the next.

#### 38.6.7.1 Line Striding

When the end of line has been reached, the DMA address counter points to the next pixel address. The channel DMA address register is added to the XSTRIDE field, and then updated. If XSTRIDE is set to '0', the DMA address register remains unchanged. The XSTRIDE field of the channel configuration register is aligned to the pixel size boundary. The XSTRIDE field is a two's complement number. The following formula applies at the line boundary and indicates how the DMA controller computes the next pixel address. The function `Sizeof()` returns the number of bytes required to store a pixel.

$$\text{NextPixelAddress} = \text{CurrentPixelAddress} + \text{Sizeof}(\text{pixel}) + \text{XSTRIDE}$$

#### 38.6.7.2 Pixel Striding

The DMA channel engine may optionally fetch non-contiguous pixels. The channel DMA address register is added to the PSTRIDE field and then updated. If PSTRIDE is set to zero, the DMA address register remains unchanged and pixels are contiguous. The PSTRIDE field of the channel configuration register is aligned to the pixel size boundary. The PSTRIDE is a two's complement number. The following formula applies at the pixel boundary and indicates how the DMA controller computes the next pixel address. The function `Sizeof()` returns the number of bytes required to store a pixel.

$$\text{NextPixelAddress} = \text{CurrentPixelAddress} + \text{Sizeof}(\text{pixel}) + \text{PSTRIDE}$$

### 38.6.8 Color Space Conversion Unit

The color space conversion unit converts Luminance Chrominance color space into the Red Green Blue color space. The conversion matrix is defined below and is fully programmable through the LCD user interface.

$$\begin{bmatrix} R \\ G \\ B \end{bmatrix} = \begin{bmatrix} \text{CSCRY} & \text{CSCRU} & \text{CSCRV} \\ \text{CSCGY} & \text{CSCGU} & \text{CSCGV} \\ \text{CSCBY} & \text{CSCBU} & \text{CSCBV} \end{bmatrix} \cdot \begin{bmatrix} Y - \text{Yoff} \\ Cb - \text{Cboff} \\ Cr - \text{Croff} \end{bmatrix}$$

Color space conversion coefficients are defined with the following equation:

$$\text{CSC}_{ij} = \frac{1}{2^7} \cdot \left[ -2^9 \cdot c_9 + \sum_{n=0}^8 c_n \cdot 2^n \right]$$

Color space conversion coefficients are defined with one sign bit, 2 integer bits and 7 fractional bits. The range of the `CSCij` coefficients is defined below with a step of 1/128.

$$-4 \leq \text{CSC}_{ij} \leq 3.9921875$$

Additionally, a set scaling factor {Yoff, Cboff, Croff} can be applied.

### 38.6.9 Two-Dimension Scaler

The High-End Overlay (HEO) data path includes a hardware scaler that allows an image resize in both the horizontal and the vertical directions.

#### 38.6.9.1 Video Scaler Description

The scaling operation is based on a vertical and horizontal resampling algorithm. The sampling rate of the original image is increased when the video is upscaled, and decreased when the video is downscaled. A Vertical resampler is used to perform a vertical interpolation by a factor of `vI`, and a decimation by a factor

of vD. A Horizontal resampler is used to perform a vertical interpolation by a factor of hI, and a decimation by a factor of hD. The horizontal and vertical low pass filters are both designed to minimize the aliasing effect. The frequency response of the low pass filter has the following characteristics:

$$H(\omega) = \begin{cases} I & \text{when } 0 \leq |\omega| \leq \min\left(\frac{\pi}{I}, \frac{\pi}{D}\right) \\ 0 & \text{otherwise} \end{cases}$$

Taking into account the linear phase condition and anticipating the filter length M, the desired frequency response is modified.

$$H(\omega) = \begin{cases} Ie^{-j\omega\frac{M}{2}} & \text{when } 0 \leq |\omega| \leq \min\left(\frac{\pi}{I}, \frac{\pi}{D}\right) \\ 0 & \text{otherwise} \end{cases}$$

**Figure 38-6. Video Resampler Architecture**

The impulse response of the defined low pass filter is:

$$h(n) = \begin{cases} I \times \frac{\omega_c}{\pi} & \text{when } n = 0 \\ I \times \frac{\omega_c}{\pi} \times \frac{\sin\omega_cn}{\omega_cn} & \text{otherwise} \end{cases}$$

Or, for the filter of length M:

$$h(n) = \begin{cases} I \times \frac{\omega_c}{\pi} & \text{when } n = \frac{M}{2} \\ I \times \frac{\omega_c}{\pi} \times \frac{\sin\omega_cn - M/2}{\omega_c(n - \frac{M}{2})} & \text{otherwise} \end{cases}$$

This ideal filter is non-causal and cannot be realized. The unit sample response h(n) is infinite in duration and must be truncated depending on the expected length M of the filter. This truncation is equivalent to the multiplication of the impulse response by a window function w(n).

**Table 38-46. Window Function for a Filter Length M**

Name of Window Function	Time Domain Sequence w(n)
Barlett	$1 - \frac{2 \times  n - \frac{M-1}{2} }{M-1}$
Blackman	$0.42 - 0.5 \times \cos\frac{2\pi n}{M-1} + 0.08 \times \cos\frac{4\pi n}{M-1}$

.....continued	
Name of Window Function	Time Domain Sequence w(n)
Hamming	$0.54 - 0.46 \times \cos \frac{2\pi n}{M-1}$
Hanning	$0.5 - 0.5 \times \cos \frac{2\pi n}{M-1}$

The horizontal resampler includes an 8-phase 5-tap filter equivalent to a 40-tap FIR described in the figure below.

**Figure 38-7. Horizontal Resampler Filter Architecture**

The vertical resampler includes an 8-phase 3-tap filter equivalent to a 24-tap FIR described in the figure below.

**Figure 38-8. Vertical Resampler Filter Architecture**

### 38.6.9.2 Horizontal Scaler

The XMEMSIZE field of the LCDC\_HEOCFG4 register indicates the horizontal size minus one of the image in the system memory. The XSIZE field of the LCDC\_HEOCFG3 register contains the horizontal size minus one of the window. The SCALEN bit of the LCDC\_HEOCFG13 register is set to '1'. The scaling factor is programmed in the XFACTOR field of the LCDC\_HEOCFG13 register. Use the following algorithm to find the XFACTOR value:

$$XFACTOR_{1st} = \text{floor} \left( \frac{8 \times 256 \times XMEMSIZE - 256 \times XPHIDEF}{XSIZE} \right)$$

$$XFACTOR_{1st} = XFACTOR_{1st} + 1$$

$$XMEMSIZE_{max} = \text{floor} \left( \frac{XFACTOR_{1st} \times XSIZE + 256 \times XPHIDEF}{2048} \right)$$

$$\begin{cases} XFACTOR = XFACTOR_{1st} - 1 & \text{when } (XMEMSIZE_{max} > XMEMSIZE) \\ XFACTOR = XFACTOR_{1st} & \text{otherwise} \end{cases}$$

### 38.6.9.3 Vertical Scaler

The YMEMSIZE field of the LCDC\_HEOCFG4 register indicates the vertical size minus one of the image in the system memory. The YSIZE field of the LCDC\_HEOCFG3 register contains the vertical size minus one of the window. The SCALEN bit of the LCDC\_HEOCFG13 register is set to one. The scaling factor is programmed in the YFACTOR field of the LCDC\_HEOCFG13 register.

$$YFACTOR_{1st} = \text{floor}\left(\frac{8 \times 256 \times YMEMSIZE - 256 \times YPHIDEF}{YSIZE}\right)$$

$$YFACTOR_{1st} = YFACTOR_{1st} + 1$$

$$YMEMSIZE_{max} = \text{floor}\left(\frac{YFACTOR_{1st} \times YSIZE + 256 \times YPHIDEF}{2048}\right)$$

$$\left\{ \begin{array}{l} YFACTOR = YFACTOR_{1st} - 1 \text{ when } (YMEMSIZE_{max} > YMEMSIZE) \\ YFACTOR = YFACTOR_{1st} \text{ otherwise} \end{array} \right.$$

### 38.6.10 Color Combine Unit

#### 38.6.10.1 Window Overlay

The LCD module provides hardware support for multiple “overlay plane” that can be used to display windows on top of the image without destroying the image located below. The overlay image can use any color depth. Using the overlay alleviates the need to re-render the occluded portion of the image. When pixels are combined together through the alpha blending unit, a new color is created. This new pixel is called an iterated pixel and is passed to the next blending stage. Then, this pixel may be combined again with another pixel. The VIDPRI bit located in the LCDC\_HEOCFG12 register configures the video priority algorithm used to display the layers. When the VIDPRI bit is written to ‘0’, the OVR1 layer is located above the HEO layer. When the VIDPRI bit is written to ‘1’, OVR1 is located below the HEO layer.

**Figure 38-9. Overlay Example with Two Different Video Prioritization Algorithms**

### 38.6.10.2 Base Layer with Window Overlay Optimization

When the base layer is combined with at least one active overlay, the whole base layer frame is retrieved from the memory though it is not visible. A set of registers is used to disable the Base DMA when this condition is met. These registers are the following:

- LCDC\_BASECFG5:
  - field DISCXPOS (Discard Area Horizontal Position)
  - field DISCYPOS (Discard Area Vertical Position)
- LCDC\_BASECFG6:
  - field DISCXSIZE (Discard Area Horizontal Size)
  - field DISCYSIZE (Discard Area Vertical Size)
- LCDC\_BASECFG4: bit DISCEN (Discard Area Enable)

**Figure 38-10. Base Layer Discard Area**

**38.6.10.3 Overlay Blending**

The blending function requires two pixels (one iterated from the previous blending stage and one from the current overlay color) and a set of blending configuration parameters. These parameters define the color operation.

**Figure 38-11. Alpha Blender Function**

**Figure 38-12. Alpha Blender Database**

**38.6.10.4 Window Blending**

**Figure 38-13. 256-level Alpha Blending**

Video Prioritization Algorithm 1: OVR1 > HEO > BASE

**38.6.10.5 Color Keying**

Color keying involves a method of bit-block image transfer (Blit). This entails blitting one image onto another where not all the pixels are copied. Blitting usually involves two bitmaps: a source bitmap and a destination bitmap. A raster operation (ROP) is performed to define whether the iterated color or the overlay color is to be visible or not.

**38.6.10.5.1 Source Color Keying**

If the masked overlay color matches the color key, the iterated color is selected and Source Color Keying is activated using the following configuration sequence:

1. Select the overlay to blit.
2. Write a '0' to DSTKEY.
3. Activate Color Keying by writing a '1' to CRKEY.
4. Configure the Color Key by writing RKEY, GKEY and BKEY fields.
5. Configure the Color Mask by writing RKEY, GKEY and BKEY fields.

When the field RMASK, GMASK, or BMASK is configured to '0', the comparison is disabled and the raster operation is activated.

### 38.6.10.5.2 Destination Color Keying

If the iterated masked color matches the color key then the overlay color is selected, Destination Color Keying is activated using the following configuration sequence:

1. Select the overlay to blit.
2. Write a '1' to DSTKEY.
3. Activate Color Keying by writing a '1' to CRKEY bit
4. Configure the Color Key by writing RKEY, GKEY and BKEY fields.
5. Configure the Color Mask by writing RKEY, GKEY and BKEY fields.

When the field RMASK, GMASK, or BMASK is configured to '0', the comparison is disabled and the raster operation is activated.

### 38.6.11 LCDC PWM Controller

This block generates the LCD contrast control signal (LCDPWM) to make possible the control of the display's contrast by software. This is an 8-bit PWM (Pulse Width Modulation) signal that can be converted to an analog voltage with a simple passive filter.

The PWM module has a free-running counter whose value is compared against a compare register (PWMCVAL field of the LCDC\_LCDCFG6 register). If the value in the counter is less than that in the register, the output brings the value of the signal polarity (PWMPOL) bit in the PWM control register: LCDC\_LCDCFG6. Otherwise, the opposite value is output. Thus, a periodic waveform with a pulse width proportional to the value in the compare register is generated.

Due to the comparison mechanism, the output pulse has a width between zero and 255 PWM counter cycles. Thus by adding a simple passive filter outside the chip, an analog voltage between 0 and  $(255/256) \times V_{DD}$  can be obtained (for the positive polarity case, or between  $(1/256) \times V_{DD}$  and  $V_{DD}$  for the negative polarity case). Other voltage values can be obtained by adding active external circuitry.

For PWM mode, the counter frequency can be adjusted to four different values using the PWMPS field of the LCDC\_LCDCFG6 register.

The PWM module can be fed with the slow clock or the system clock, depending on the CLKPWMSSEL bit of the LCDC\_CFG0 register.

LCD display panels have different backlight specifications in terms of minimum/maximum values for PWM frequency. If the LCDC PWM frequency range does not match the LCD display panel, it is possible to use the product standalone PWM controller to drive the backlight.

### 38.6.12 Post Processing Controller

The output stream of pixels can be either displayed on the screen or written to the memory using the Post Processing Controller (PPC). When the PPC is used, the screen display is disabled, but synchronization signals remain active (if enabled). The stream of pixel can be written in RGB mode or encoded in YCbCr 422 mode. A programmable color space conversion stage is available.

$$\begin{bmatrix} Y \\ U \\ V \end{bmatrix} = \begin{bmatrix} \text{CSCYR} & \text{CSCYG} & \text{CSCYB} \\ \text{CSCUR} & \text{CSCUG} & \text{CSCUB} \\ \text{CSCVR} & \text{CSCVG} & \text{CSCVB} \end{bmatrix} \cdot \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} \text{Yoff} \\ \text{Uoff} \\ \text{Voff} \end{bmatrix}$$

### 38.6.13 LCD Overall Performance

#### 38.6.13.1 Color Lookup Table (CLUT)

Reset			0			0	0	0	0
Bit	7	6	5	4	3	2	1	0	
					CLKPWMSSEL	CLKSEL			CLKPOL
Access					R/W	R/W			R/W
Reset					0	0			0

**Bits 23:16 – CLKDIV[7:0]** LCD Controller Clock Divider

8-bit width clock divider for pixel clock (LCDPCLK). The pixel clock period formula is:

$$\text{LCDPCLK} = \text{source clock} / (\text{CLKDIV} + 2)$$

where source clock is the system clock when CLKSEL is written to '0', and 2x system\_clock when CLKSEL is written to '1'.

**Bit 13 – CGDISPP** Clock Gating Disable Control for the Post Processing Layer

Value	Description
0	Automatic Clock Gating is enabled for the Post Processing Layer.
1	Clock is running continuously.

**Bit 11 – CGDISHEO** Clock Gating Disable Control for the High-End Overlay

Value	Description
0	Automatic Clock Gating is enabled for the High-End Overlay Layer.
1	Clock is running continuously.

**Bit 10 – CGDISOVR2** Clock Gating Disable Control for the Overlay 2 Layer

Value	Description
0	Automatic Clock Gating is enabled for the Overlay 2 Layer.
1	Clock is running continuously.

**Bit 9 – CGDISOVR1** Clock Gating Disable Control for the Overlay 1 Layer

Value	Description
0	Automatic Clock Gating is enabled for the Overlay 1 Layer.
1	Clock is running continuously.

**Bit 8 – CGDISBASE** Clock Gating Disable Control for the Base Layer

Value	Description
0	Automatic Clock Gating is enabled for the Base Layer.
1	Clock is running continuously.

**Bit 3 – CLKPWMSEL** LCD Controller PWM Clock Source Selection

Value	Description
0	The slow clock is selected and feeds the PWM module.
1	The system clock is selected and feeds the PWM module.

**Bit 2 – CLKSEL** LCD Controller Clock Source Selection

Value	Description
0	The asynchronous output stage of the LCD controller is fed by the System Clock.
1	The asynchronous output state of the LCD controller is fed by the 2x System Clock.

**Bit 0 – CLKPOL** LCD Controller Clock Polarity

Value	Description
0	Data/Control signals are launched on the rising edge of the pixel clock.
1	Data/Control signals are launched on the falling edge of the pixel clock.

### 38.7.2 LCD Controller Configuration Register 1

**Name:** LCDC\_LCDCFG1  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
							VSPW[9:8]	
Access							R/W	R/W
Reset							0	0
Bit	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0

**Bits 25:16 – VSPW[9:0]** Vertical Synchronization Pulse Width  
 Width of the LCDVSYNC pulse, given in number of lines. Width is (VSPW+1) lines.

**Bits 9:0 – HSPW[9:0]** Horizontal Synchronization Pulse Width  
 Width of the LCDHSYNC pulse, given in pixel clock cycles. Width is (HSPW+1) LCDPCLK cycles.

### 38.7.3 LCD Controller Configuration Register 2

**Name:** LCDC\_LCDCFG2  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
							VBPW[9:8]	
Access							R/W	R/W
Reset							0	0
Bit	23	22	21	20	19	18	17	16

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 25:16 – VBPW[9:0]** Vertical Back Porch Width

This field indicates the number of lines at the beginning of the Frame. The blanking interval is equal to VBPW lines.

**Bits 9:0 – VFPW[9:0]** Vertical Front Porch Width

This field indicates the number of lines at the end of the Frame. The blanking interval is equal to (VFPW +1) lines.

### 38.7.4 LCD Controller Configuration Register 3

**Name:** LCDC\_LCDCFG3  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
							HBPW[9:8]	
Access							R/W	R/W
Reset							0	0
Bit	23	22	21	20	19	18	17	16

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 25:16 – HBPW[9:0]** Horizontal Back Porch Width

Number of pixel clock cycles inserted at the beginning of the line. The interval is equal to (HBPW+1) LCDPCLK cycles.

**Bits 9:0 – HFPW[9:0]** Horizontal Front Porch Width

Number of pixel clock cycles inserted at the end of the active line. The interval is equal to (HFPW+1) LCDPCLK cycles.

### 38.7.5 LCD Controller Configuration Register 4

**Name:** LCDC\_LCDCFG4  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
							RPF[10:8]	
Access						R/W	R/W	R/W
Reset						0	0	0

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 26:16 – RPF[10:0]** Number of Active Row Per Frame  
 Number of active lines in the frame. The frame height is equal to (RPF+1) lines.

**Bits 10:0 – PPL[10:0]** Number of Pixels Per Line  
 Number of pixels in the frame. The number of active pixels in the frame is equal to (PPL+1) pixels.

### 38.7.6 LCD Controller Configuration Register 5

**Name:** LCDC\_LCDCFG5  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	
			VSPHO	VSPSU			PP	MODE[1:0]	
Access			R/W	R/W			R/W	R/W	
Reset			0	0			0	0	
Bit	7	6	5	4	3	2	1	0	
	DISPDLY	DITHER			DISPPOL	VSPDLYE	VSPDLYS	VSPOL	HSPOL
Access	R/W	R/W			R/W	R/W	R/W	R/W	
Reset	0	0			0	0	0	0	

**Bits 23:16 – GUARDTIME[7:0]** LCD DISPLAY Guard Time  
 Number of frames inserted during startup before LCDDISP assertion.  
 Number of frames inserted after LCDDISP reset.

**Bit 13 – VSPHO** LCD Controller Vertical synchronization Pulse Hold Configuration

Value	Description
0	The vertical synchronization pulse is asserted synchronously with horizontal pulse edge.
1	The vertical synchronization pulse is held active one pixel clock cycle after the horizontal pulse.

**Bit 12 – VSPSU** LCD Controller Vertical synchronization Pulse Setup Configuration

Value	Description
0	The vertical synchronization pulse is asserted synchronously with horizontal pulse edge.
1	The vertical synchronization pulse is asserted one pixel clock cycle before the horizontal pulse.

**Bit 10 – PP** Post Processing Enable

Value	Description
0	The blended pixel is pushed into the output FIFO.

Value	Description
1	The blended pixel is written back to memory, the post-processing stage is enabled.

### Bits 9:8 – MODE[1:0] LCD Controller Output Mode

Value	Name	Description
0	OUTPUT_12BPP	LCD Output mode is set to 12 bits per pixel
1	OUTPUT_16BPP	LCD Output mode is set to 16 bits per pixel
2	OUTPUT_18BPP	LCD Output mode is set to 18 bits per pixel
3	OUTPUT_24BPP	LCD Output mode is set to 24 bits per pixel

### Bit 7 – DISPDLY LCD Controller Display Power Signal Synchronization

Value	Description
0	The LCDDISP signal is asserted synchronously with the second active edge of the horizontal pulse.
1	The LCDDISP signal is asserted asynchronously with both edges of the horizontal pulse.

### Bit 6 – DITHER LCD Controller Dithering

Value	Description
0	Dithering logical unit is disabled
1	Dithering logical unit is activated

### Bit 4 – DISPPOL Display Signal Polarity

Value	Description
0	Active High
1	Active Low

### Bit 3 – VSPDLYE Vertical Synchronization Pulse End

Value	Description
0	The second active edge of the Vertical synchronization pulse is synchronous with the second edge of the horizontal pulse.
1	The second active edge of the Vertical synchronization pulse is synchronous with the first edge of the horizontal pulse.

### Bit 2 – VSPDLYS Vertical Synchronization Pulse Start

Value	Description
0	The first active edge of the Vertical synchronization pulse is synchronous with the second edge of the horizontal pulse.
1	The first active edge of the Vertical synchronization pulse is synchronous with the first edge of the horizontal pulse.

### Bit 1 – VSPOL Vertical Synchronization Pulse Polarity

Value	Description
0	Active High
1	Active Low

---

---

**Bit 0 – HSPOL** Horizontal Synchronization Pulse Polarity

<b>Value</b>	<b>Description</b>
0	Active High
1	Active Low

### 38.7.7 LCD Controller Configuration Register 6

**Name:** LCDC\_LCDCFG6  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	PVMCVAL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
				PWMPOL	PWMP[2:0]			
Access				R/W	R/W		R/W	R/W
Reset				0	0		0	0

**Bits 15:8 – PVMCVAL[7:0]** LCD Controller PWM Compare Value

PWM compare value. Used to adjust the analog value obtained after an external filter to control the contrast of the display.

**Bit 4 – PWMPOL** LCD Controller PWM Signal Polarity

This bit defines the polarity of the PWM output signal.

Value	Description
0	The output pulses are low level.
1	The output pulses are high level (the output is high whenever the value in the counter is less than value CVAL).

**Bits 2:0 – PWMP[2:0]** PWM Clock Prescaler

Selects the configuration of the counter prescaler module.

Value	Name	Description
000	DIV_1	The counter advances at a rate of $f_{\text{COUNTER}} = f_{\text{PWM\_SELECTED\_CLOCK}}$
001	DIV_2	The counter advances at a rate of $f_{\text{COUNTER}} = f_{\text{PWM\_SELECTED\_CLOCK}}/2$
010	DIV_4	The counter advances at a rate of $f_{\text{COUNTER}} = f_{\text{PWM\_SELECTED\_CLOCK}}/4$
011	DIV_8	The counter advances at a rate of $f_{\text{COUNTER}} = f_{\text{PWM\_SELECTED\_CLOCK}}/8$
100	DIV_16	The counter advances at a rate of $f_{\text{COUNTER}} = f_{\text{PWM\_SELECTED\_CLOCK}}/16$
101	DIV_32	The counter advances at a of rate $f_{\text{COUNTER}} = f_{\text{PWM\_SELECTED\_CLOCK}}/32$

# SAMA5D2 Series

## LCD Controller (LCDC)

---

---

Value	Name	Description
110	DIV_64	The counter advances at a of rate $f_{\text{COUNTER}} = f_{\text{PWM\_SELECTED\_CLOCK}}/64$

### 38.7.8 LCD Controller Enable Register

**Name:** LCDC\_LCDEN  
**Offset:** 0x20  
**Reset:** –  
**Property:** Write-only

#### Bit 3 – PWMEN LCD Controller Pulse Width Modulation Enable

Value	Description
0	No effect
1	PWM is enabled.

#### Bit 2 – DISPEN LCD Controller DISP Signal Enable

Value	Description
0	No effect
1	LCDDISP signal is generated.

#### Bit 1 – SYNCEN LCD Controller Horizontal and Vertical Synchronization Enable

Value	Description
0	No effect
1	Both horizontal and vertical synchronization (LCDVSYNC and LCDHSYNC) signals are generated.

#### Bit 0 – CLKEN LCD Controller Pixel Clock Enable

Value	Description
0	No effect

# SAMA5D2 Series

## LCD Controller (LCDC)

---

---

Value	Description
1	Pixel clock logical unit is activated.

### 38.7.9 LCD Controller Disable Register

**Name:** LCDC\_LCDDIS  
**Offset:** 0x24  
**Reset:** –  
**Property:** Write-only

Access					R/W	R/W	R/W	R/W
Reset					–	–	–	–

#### Bit 11 – PWMRST LCD Controller PWM Reset

Value	Description
0	No effect.
1	Resets the PWM module. The duty cycle may be violated.

#### Bit 10 – DISPRST LCD Controller DISP Signal Reset

Value	Description
0	No effect.
1	Resets the DISP signal.

#### Bit 9 – SYNCRST LCD Controller Horizontal and Vertical Synchronization Reset

Value	Description
0	No effect.
1	Resets the timing engine. The horizontal and vertical pulse widths are both violated.

#### Bit 8 – CLKRST LCD Controller Clock Reset

Value	Description
0	No effect.
1	Resets the pixel clock generator module. The pixel clock duty cycle may be violated.

---

**Bit 3 – PWMDIS** LCD Controller Pulse Width Modulation Disable

Value	Description
0	No effect.
1	Disables the pulse width modulation signal.

**Bit 2 – DISPDIS** LCD Controller DISP Signal Disable

Value	Description
0	No effect.
1	Disables the DISP signal.

**Bit 1 – SYNCDIS** LCD Controller Horizontal and Vertical Synchronization Disable

Value	Description
0	No effect.
1	Disables the synchronization signals after the end of the frame.

**Bit 0 – CLKDIS** LCD Controller Pixel Clock Disable

Value	Description
0	No effect.
1	Disables the pixel clock.

### 38.7.10 LCD Controller Status Register

**Name:** LCDC\_LCDSR  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
				SIPSTS	PWMSTS	DISPSTS	LCDSTS	CLKSTS
Access				R	R	R	R	R
Reset				0	0	0	0	0

#### Bit 4 – SIPSTS Synchronization In Progress

Value	Description
0	Clock domain synchronization is terminated.
1	Synchronization is in progress. Access to the registers LCDC_LCDCCFG[0..6], LCDC_LCDEN and LCDC_LCDDIS has no effect.

#### Bit 3 – PWMSTS LCD Controller PWM Signal Status

Value	Description
0	PWM is disabled.
1	PWM signal is activated.

#### Bit 2 – DISPSTS LCD Controller DISP Signal Status

Value	Description
0	DISP is disabled.
1	DISP signal is activated.

#### Bit 1 – LCDSTS LCD Controller Synchronization status

Value	Description
0	Timing engine is disabled.

# SAMA5D2 Series

## LCD Controller (LCDC)

---

---

Value	Description
1	Timing engine is running.

### Bit 0 – CLKSTS Clock Status

Value	Description
0	Pixel clock is disabled.
1	Pixel clock is running.

### 38.7.11 LCD Controller Interrupt Enable Register

**Name:** LCDC\_LCDIER  
**Offset:** 0x2C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
Access

Bit	7	6	5	4	3	2	1	0	
				FIFOERRIE			DISPIE	DISIE	SOFIE
Access				W			W	W	W
Reset				–			–	–	–

**Bit 13 – PPIE** Post Processing Interrupt Enable

**Bit 11 – HEOIE** High-End Overlay Interrupt Enable

**Bit 10 – OVR2IE** Overlay 2 Interrupt Enable

**Bit 9 – OVR1IE** Overlay 1 Interrupt Enable

**Bit 8 – BASEIE** Base Layer Interrupt Enable

**Bit 4 – FIFOERRIE** Output FIFO Error Interrupt Enable

**Bit 2 – DISPIE** Powerup/Powerdown Sequence Terminated Interrupt Enable

**Bit 1 – DISIE** LCD Disable Interrupt Enable

**Bit 0 – SOFIE** Start of Frame Interrupt Enable

### 38.7.12 LCD Controller Interrupt Disable Register

**Name:** LCDC\_LCDIDR  
**Offset:** 0x30  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:  
 0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16

Bit	7	6	5	4	3	2	1	0	
				FIFOERRID			DISPID	DISID	SOFID
Access				W			W	W	W
Reset				–			–	–	–

**Bit 13 – PPID** Post Processing Interrupt Disable

**Bit 11 – HEOID** High-End Overlay Interrupt Disable

**Bit 10 – OVR2ID** Overlay 2 Interrupt Disable

**Bit 9 – OVR1ID** Overlay 1 Interrupt Disable

**Bit 8 – BASEID** Base Layer Interrupt Disable

**Bit 4 – FIFOERRID** Output FIFO Error Interrupt Disable

**Bit 2 – DISPID** Powerup/Powerdown Sequence Terminated Interrupt Disable

**Bit 1 – DISID** LCD Disable Interrupt Disable

**Bit 0 – SOFID** Start of Frame Interrupt Disable

### 38.7.13 LCD Controller Interrupt Mask Register

**Name:** LCDC\_LCDIMR  
**Offset:** 0x34  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16

Bit	7	6	5	4	3	2	1	0	
				FIFOERRIM			DISPIM	DISIM	SOFIM
Access				R			R	R	R
Reset				0			0	0	0

**Bit 13 – PPIM** Post Processing Interrupt Mask

**Bit 11 – HEOIM** High-End Overlay Interrupt Mask

**Bit 10 – OVR2IM** Overlay 2 Interrupt Mask

**Bit 9 – OVR1IM** Overlay 1 Interrupt Mask

**Bit 8 – BASEIM** Base Layer Interrupt Mask

**Bit 4 – FIFOERRIM** Output FIFO Error Interrupt Mask

**Bit 2 – DISPIM** Powerup/Powerdown Sequence Terminated Interrupt Mask

**Bit 1 – DISIM** LCD Disable Interrupt Mask

**Bit 0 – SOFIM** Start of Frame Interrupt Mask

### 38.7.14 LCD Controller Interrupt Status Register

**Name:** LCDC\_LCDISR  
**Offset:** 0x38  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24		
Access										
Reset										
Bit	23	22	21	20	19	18	17	16		
Access

Bit	15	14	13	12	11	10	9	8		
			PP			HEO	OVR2	OVR1	BASE	
Access			R			R	R	R	R	
Reset			0			0	0	0	0	
Bit	7	6	5	4	3	2	1	0		
					FIFOERR			DISP	DIS	SOF
Access					R			R	R	R
Reset					0			0	0	0

#### Bit 13 – PP Post Processing Raw Interrupt Status

Value	Description
0	No Post Processing interrupt detected since last read of LCDC_PPISR
1	Indicates that Post Processing interrupt is pending. This flag is reset as soon as the LCDC_PPISR is read.

#### Bit 11 – HEO High-End Overlay Raw Interrupt Status

Value	Description
0	No High-End layer interrupt detected since last read of LCDC_HEOISR.
1	Indicates that a High-End layer interrupt is pending. This flag is reset as soon as the LCDC_HEOISR is read.

#### Bit 10 – OVR2 Overlay 2 Raw Interrupt Status

Value	Description
0	No Overlay 2 layer interrupt detected since last read of LCDC_OVR2ISR.
1	Indicates that an Overlay 2 layer interrupt is pending. This flag is reset as soon as the LCDC_OVR2ISR is read.

#### Bit 9 – OVR1 Overlay 1 Raw Interrupt Status

Value	Description
0	No Overlay 1 layer interrupt detected since last read of LCDC_OVR1ISR.
1	Indicates that an Overlay 1 layer interrupt is pending. This flag is reset as soon as the LCDC_OVR1ISR is read.

**Bit 8 – BASE** Base Layer Raw Interrupt Status

Value	Description
0	No base layer interrupt detected since last read of LCDC_BASEISR.
1	Indicates that a base layer interrupt is pending. This flag is reset as soon as the LCDC_BASEISR is read.

**Bit 4 – FIFOERR** Output FIFO Error

Value	Description
0	No underflow has occurred in the output FIFO since last read of LCDC_LCDISR.
1	Indicates that an underflow has occurred in the output FIFO. This flag is reset after a read operation.

**Bit 2 – DISP** Powerup/Powerdown Sequence Terminated Interrupt Status

Value	Description
0	Powerup sequence or powerdown sequence has not yet terminated.
1	Indicates the powerup sequence or powerdown sequence has terminated. This flag is reset after a read operation.

**Bit 1 – DIS** LCD Disable Interrupt Status

Value	Description
0	Horizontal and vertical timing generator has not yet been disabled.
1	Indicates that the horizontal and vertical timing generator has been disabled. This flag is reset after a read operation.

**Bit 0 – SOF** Start of Frame Interrupt Status

Value	Description
0	No detection since last read of LCDC_LCDISR.
1	Indicates that a start of frame event has been detected. This flag is reset after a read operation.

### 38.7.15 LCD Controller Attribute Register

**Name:** LCDC\_ATTR  
**Offset:** 0x3C  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
Access									
Reset									
Bit	15	14	13	12	11	10	9	8	
			PPA2Q		HEOA2Q	OVR2A2Q	OVR1A2Q	BASEA2Q	
Access			W			W	W	W	W
Reset			–			–	–	–	–
Bit	7	6	5	4	3	2	1	0	
			PP		HEO	OVR2	OVR1	BASE	
Access			W			W	W	W	W
Reset			–			–	–	–	–

#### Bit 13 – PPA2Q Post-Processing Update Add To Queue

Value	Description
0	No effect.
1	Add the descriptor pointed to by the LCDC_PPHEAD register to the descriptor list.

#### Bit 11 – HEOA2Q High-End Overlay Update Add To Queue

Value	Description
0	No effect.
1	Add the descriptor pointed to by the LCDC_HEOHEAD register to the descriptor list.

#### Bit 10 – OVR2A2Q Overlay 2 Update Add to Queue

Value	Description
0	No effect.
1	Add the descriptor pointed to by the LCDC_OVR2HEAD register to the descriptor list.

#### Bit 9 – OVR1A2Q Overlay 1 Update Add To Queue

Value	Description
0	No effect.
1	Add the descriptor pointed to by the LCDC_OVR1HEAD register to the descriptor list.

**Bit 8 – BASEA2Q** Base Layer Update Add To Queue

Value	Description
0	No effect.
1	Add the descriptor pointed to by the LCDC_BASEHEAD register to the descriptor list.

**Bit 5 – PP** Post-Processing Update Attribute

Value	Description
0	No effect.
1	Update the PP window attribute.

**Bit 3 – HEO** High-End Overlay Update Attribute

Value	Description
0	No effect.
1	Update the HEO window attribute.

**Bit 2 – OVR2** Overlay 2 Update Attribute

Value	Description
0	No effect.
1	Update the OVR2 window attribute.

**Bit 1 – OVR1** Overlay 1 Update Attribute

Value	Description
0	No effect.
1	Update the OVR1 window attribute.

**Bit 0 – BASE** Base Layer Update Attribute

Value	Description
0	No effect.
1	Update the BASE window attributes.

### 38.7.16 Base Layer Channel Enable Register

**Name:** LCDC\_BASECHER  
**Offset:** 0x00000040  
**Reset:** –  
**Property:** Write-only

#### Bit 2 – A2QEN Add To Queue Enable

Value	Description
0	No effect
1	Indicates that a valid descriptor has been written to memory, its memory location should be written to the DMA head pointer. The A2QSR status bit is set to one, and it is reset by hardware as soon as the descriptor pointed to by the DMA head pointer is added to the list.

#### Bit 1 – UPDATEEN Update Overlay Attributes Enable

Value	Description
0	No effect
1	Updates windows attributes on the next start of frame.

#### Bit 0 – CHEN Channel Enable

Value	Description
0	No effect
1	Enables the DMA channel

**38.7.17 Base Layer Channel Disable Register**

**Name:** LCDC\_BASECHDR  
**Offset:** 0x00000040  
**Reset:** –  
**Property:** Write-only

**Bit 8 – CHRST Channel Reset**

Value	Description
0	No effect
1	Resets the layer immediately. The frame is aborted.

**Bit 0 – CHDIS Channel Disable**

Value	Description
0	No effect
1	Disables the layer at the end of the current frame. The frame is completed.

### 38.7.18 Base Layer Channel Status Register

**Name:** LCDC\_BASECHSR  
**Offset:** 0x00000048  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bit 2 – A2QSR Add To Queue Status

Value	Description
0	Add to queue not pending
1	Add to queue pending

#### Bit 1 – UPDATESR Update Overlay Attributes In Progress Status

Value	Description
0	No update pending
1	Overlay attributes will be updated on the next frame

#### Bit 0 – CHSR Channel Status

Value	Description
0	Layer disabled
1	Layer enabled

**38.7.19 Base Layer Interrupt Enable Register**

**Name:** LCDC\_BASEIER  
**Offset:** 0x0000004C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:  
0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

		OVR	DONE	ADD	DSCR	DMA		
Access		W	W	W	W	W		
Reset		–	–	–	–	–		

**Bit 6 – OVR** Overflow Interrupt Enable

**Bit 5 – DONE** End of List Interrupt Enable

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Enable

**Bit 3 – DSCR** Descriptor Loaded Interrupt Enable

**Bit 2 – DMA** End of DMA Transfer Interrupt Enable

### 38.7.20 Base Layer Interrupt Disable Register

**Name:** LCDC\_BASEIDR  
**Offset:** 0x00000050  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
		OVR	DONE	ADD	DSCR	DMA		
Access		W	W	W	W	W		
Reset		–	–	–	–	–		

**Bit 6 – OVR** Overflow Interrupt Disable

**Bit 5 – DONE** End of List Interrupt Disable

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Disable

**Bit 3 – DSCR** Descriptor Loaded Interrupt Disable

**Bit 2 – DMA** End of DMA Transfer Interrupt Disable

**38.7.21 Base Layer Interrupt Mask Register**

**Name:** LCDC\_BASEIMR  
**Offset:** 0x00000054  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Bit	7	6	5	4	3	2	1	0
		OVR	DONE	ADD	DSCR	DMA		
Access		R	R	R	R	R		
Reset		0	0	0	0	0		

**Bit 6 – OVR** Overflow Interrupt Mask

**Bit 5 – DONE** End of List Interrupt Mask

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Mask

**Bit 3 – DSCR** Descriptor Loaded Interrupt Mask

**Bit 2 – DMA** End of DMA Transfer Interrupt Mask

### 38.7.22 Base Layer Interrupt Status Register

**Name:** LCDC\_BASEISR  
**Offset:** 0x00000058  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access		R	R	R	R	R		
Reset		0	0	0	0	0		

#### Bit 6 – OVR Overflow Detected

Value	Description
0	No overflow occurred since last read of LCDC_BASEISR
1	An overflow occurred. This flag is reset after a read operation.

#### Bit 5 – DONE End of List Detected

Value	Description
0	No End of List condition occurred since last read of LCDC_BASEISR
1	End of List condition has occurred. This flag is reset after a read operation.

#### Bit 4 – ADD Head Descriptor Loaded

Value	Description
0	No descriptor has been loaded since last read of LCDC_BASEISR
1	The descriptor pointed to by the LCDC_BASEHEAD register has been loaded successfully. This flag is reset after a read operation.

#### Bit 3 – DSCR DMA Descriptor Loaded

Value	Description
0	No descriptor has been loaded since last read of LCDC_BASEISR

---

---

Value	Description
1	A descriptor has been loaded successfully. This flag is reset after a read operation.

**Bit 2 – DMA End of DMA Transfer**

Value	Description
0	No end of DMA transfer has been detected since last read of LCDC_BASEISR
1	End of Transfer has been detected. This flag is reset after a read operation.

### 38.7.23 Base DMA Head Register

**Name:** LCDC\_BASEHEAD  
**Offset:** 0x0000005C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
HEAD[29:22]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
HEAD[21:14]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
HEAD[13:6]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
HEAD[5:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W		
Reset	0	0	0	0	0	0		

**Bits 31:2 – HEAD[29:0] DMA Head Pointer**  
 The Head Pointer points to a new descriptor.

### 38.7.24 Base DMA Address Register

**Name:** LCDC\_BASEADDR  
**Offset:** 0x00000060  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
ADDR[31:24]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

#### Bit 5 – DONEIEN End of List Interrupt Enable

Value	Description
0	End of list interrupt is disabled
1	End of list interrupt is enabled

#### Bit 4 – ADDIEN Add Head Descriptor to Queue Interrupt Enable

Value	Description
0	Transfer descriptor added to queue interrupt is enabled
1	Transfer descriptor added to queue interrupt is disabled

#### Bit 3 – DSCRIEN Descriptor Loaded Interrupt Enable

Value	Description
0	Transfer descriptor loaded interrupt is enabled
1	Transfer descriptor loaded interrupt is disabled

#### Bit 2 – DMAIEN End of DMA Transfer Interrupt Enable

Value	Description
0	DMA transfer completed interrupt is enabled
1	DMA transfer completed interrupt is disabled

**Bit 1 – LFETCH** Lookup Table Fetch Enable

Value	Description
0	Lookup Table DMA fetch is disabled
1	Lookup Table DMA fetch is enabled

**Bit 0 – DFETCH** Transfer Descriptor Fetch Enable

Value	Description
0	Transfer Descriptor fetch is disabled
1	Transfer Descriptor fetch is enabled

### 38.7.26 Base DMA Next Register

**Name:** LCDC\_BASENEXT  
**Offset:** 0x00000068  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
NEXT[31:24]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
NEXT[23:16]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
NEXT[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
NEXT[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – NEXT[31:0]** DMA Descriptor Next Address  
 The transfer descriptor address must be aligned on a 64-bit boundary.

### 38.7.27 Base Layer Configuration Register 0

**Name:** LCDC\_BASECFG0  
**Offset:** 0x0000006C  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 8 – DLBO** Defined Length Burst Only For Channel Bus Transaction

Value	Description
0	Undefined length INCR burst is used for a burst of 2 and 3 beats.
1	Only Defined Length burst is used (SINGLE, INCR4, INCR8 and INCR16).

**Bits 5:4 – BLEN[1:0]** AHB Burst Length

Value	Name	Description
0	AHB_SINGLE	AHB Access is started as soon as there is enough space in the FIFO to store one data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.
1	AHB_INCR4	AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 4 data. An AHB INCR4 Burst is used. SINGLE, INCR and INCR4 bursts are used. INCR is used for a burst of 2 and 3 beats.
2	AHB_INCR8	AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 8 data. An AHB INCR8 Burst is used. SINGLE, INCR, INCR4 and INCR8 bursts are used. INCR is used for a burst of 2 and 3 beats.

# SAMA5D2 Series

## LCD Controller (LCDC)

Value	Name	Description
3	AHB_INCR16	AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 16 data. An AHB INCR16 Burst is used. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.

### Bit 0 – SIF Source Interface

Value	Description
0	Base Layer data is retrieved through AHB interface 0.
1	Base Layer data is retrieved through AHB interface 1.

### 38.7.28 Base Layer Configuration Register 1

**Name:** LCDC\_BASECFG1  
**Offset:** 0x00000070  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 9:8 – CLUTMODE[1:0] Color Lookup Table Mode Input Selection

Value	Name	Description
0	CLUT_1BPP	Color Lookup Table mode set to 1 bit per pixel
1	CLUT_2BPP	Color Lookup Table mode set to 2 bits per pixel
2	CLUT_4BPP	Color Lookup Table mode set to 4 bits per pixel
3	CLUT_8BPP	Color Lookup Table mode set to 8 bits per pixel

#### Bits 7:4 – RGBMODE[3:0] RGB Mode Input Selection

Value	Name	Description
0	12BPP_RGB_444	12 bpp RGB 444
1	16BPP_ARGB_4444	16 bpp ARGB 4444
2	16BPP_RGBA_4444	16 bpp RGBA 4444
3	16BPP_RGB_565	16 bpp RGB 565
4	16BPP_TRGB_1555	16 bpp TRGB 1555
5	18BPP_RGB_666	18 bpp RGB 666
6	18BPP_RGB_666PACKED	18 bpp RGB 666 PACKED
7	19BPP_TRGB_1666	19 bpp TRGB 1666
8	19BPP_TRGB_PACKED	19 bpp TRGB 1666 PACKED
9	24BPP_RGB_888	24 bpp RGB 888

# SAMA5D2 Series

## LCD Controller (LCDC)

Value	Name	Description
10	24BPP_RGB_888_PACKED	24 bpp RGB 888 PACKED
11	25BPP_TRGB_1888	25 bpp TRGB 1888
12	32BPP_ARGB_8888	32 bpp ARGB 8888
13	32BPP_RGBA_8888	32 bpp RGBA 8888

**Bit 0 – CLUTEN** Color Lookup Table Mode Enable

Value	Description
0	RGB mode is selected.
1	Color Lookup Table mode is selected.

### 38.7.29 Base Layer Configuration Register 2

**Name:** LCDC\_BASECFG2  
**Offset:** 0x00000074  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
XSTRIDE[31:24]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 23:16 – RDEF[7:0]** Red Default  
 Default Red color when the Base DMA channel is disabled

**Bits 15:8 – GDEF[7:0]** Green Default  
 Default Green color when the Base DMA channel is disabled

**Bits 7:0 – BDEF[7:0]** Blue Default  
 Default Blue color when the Base DMA channel is disabled

### 38.7.31 Base Layer Configuration Register 4

**Name:** LCDC\_BASECFG4  
**Offset:** 0x0000007C  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 11 – DISCEN** Discard Area Enable

Value	Description
0	The whole frame is retrieved from memory.
1	The DMA channel discards the area located at screen coordinate {DISCXPOS, DISCYPOS}.

**Bit 9 – REP** Use Replication logic to expand RGB color to 24 bits

Value	Description
0	When the selected pixel depth is less than 24 bpp the pixel is shifted and least significant bits are set to 0.
1	When the selected pixel depth is less than 24 bpp the pixel is shifted and the least significant bit replicates the msb.

**Bit 8 – DMA** Use DMA Data Path

Value	Description
0	The default color is used on the Base Layer.
1	The DMA channel retrieves the pixels stream from the memory.

**38.7.32 Base Layer Configuration Register 5**

**Name:** LCDC\_BASECFG5  
**Offset:** 0x00000080  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
						DISCYPOS[10:8]		
Access						R/W	R/W	R/W
Reset						0	0	0
Bit	23	22	21	20	19	18	17	16

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 26:16 – DISCYSIZE[10:0]** Discard Area Vertical Size  
 Discard Vertical size in pixels. The Discard size is set to (DISCYSIZE + 1) pixels vertically.

**Bits 10:0 – DISCXSIZ[10:0]** Discard Area Horizontal Size  
 Discard Horizontal size in pixels. The Discard size is set to (DISCXSIZ + 1) pixels horizontally.

### 38.7.34 Overlay 1 Channel Enable Register

**Name:** LCDC\_OVR1CHER  
**Offset:** 0x00000140  
**Reset:** –  
**Property:** Write-only

#### Bit 2 – A2QEN Add To Queue Enable

Value	Description
0	No effect
1	Indicates that a valid descriptor has been written to memory, its memory location should be written to the DMA head pointer. The A2QSR status bit is set to one, and it is reset by hardware as soon as the descriptor pointed to by the DMA head pointer is added to the list.

#### Bit 1 – UPDATEEN Update Overlay Attributes Enable

Value	Description
0	No effect
1	Updates window attributes (size, alpha blending, etc.) on the next start of frame.

#### Bit 0 – CHEN Channel Enable

Value	Description
0	No effect
1	Enables the DMA channel

### 38.7.35 Overlay 1 Channel Disable Register

**Name:** LCDC\_OVR1CHDR  
**Offset:** 0x00000144  
**Reset:** –  
**Property:** Write-only

#### Bit 8 – CHRST Channel Reset

Value	Description
0	No effect
1	Resets the layer immediately. The frame is aborted.

#### Bit 0 – CHDIS Channel Disable

Value	Description
0	No effect
1	Disables the layer at the end of the current frame. The frame is completed.

### 38.7.36 Overlay 1 Channel Status Register

**Name:** LCDC\_OVR1CHSR  
**Offset:** 0x00000148  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
Access									
Reset									
Bit	15	14	13	12	11	10	9	8	
Access									
Reset									
Bit	7	6	5	4	3	2	1	0	
						A2QSR	UPDATESR	CHSR	
Access						R	R	R	
Reset						0	0	0	

#### Bit 2 – A2QSR Add To Queue Status

Value	Description
0	Add to queue not pending
1	Add to queue pending

#### Bit 1 – UPDATESR Update Overlay Attributes In Progress Status

Value	Description
0	No update pending
1	Overlay attributes will be updated on the next frame

#### Bit 0 – CHSR Channel Status

Value	Description
0	Layer disabled
1	Layer enabled

### 38.7.37 Overlay 1 Interrupt Enable Register

**Name:** LCDC\_OVR1IER  
**Offset:** 0x0000014C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Bit	7	6	5	4	3	2	1	0
		OVR	DONE	ADD	DSCR	DMA		
Access		W	W	W	W	W		
Reset		–	–	–	–	–		

**Bit 6 – OVR** Overflow Interrupt Enable

**Bit 5 – DONE** End of List Interrupt Enable

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Enable

**Bit 3 – DSCR** Descriptor Loaded Interrupt Enable

**Bit 2 – DMA** End of DMA Transfer Interrupt Enable

**38.7.38 Overlay 1 Interrupt Disable Register**

**Name:** LCDC\_OVR1IDR  
**Offset:** 0x00000150  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:  
0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Bit	7	6	5	4	3	2	1	0
		OVR	DONE	ADD	DSCR	DMA		
Access		W	W	W	W	W		
Reset		–	–	–	–	–		

**Bit 6 – OVR** Overflow Interrupt Disable

**Bit 5 – DONE** End of List Interrupt Disable

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Disable

**Bit 3 – DSCR** Descriptor Loaded Interrupt Disable

**Bit 2 – DMA** End of DMA Transfer Interrupt Disable

### 38.7.39 Overlay 1 Interrupt Mask Register

**Name:** LCDC\_OVR1IMR  
**Offset:** 0x00000154  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
		OVR	DONE	ADD	DSCR	DMA		
Access		R	R	R	R	R		
Reset		0	0	0	0	0		

**Bit 6 – OVR** Overflow Interrupt Mask

**Bit 5 – DONE** End of List Interrupt Mask

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Mask

**Bit 3 – DSCR** Descriptor Loaded Interrupt Mask

**Bit 2 – DMA** End of DMA Transfer Interrupt Mask

### 38.7.40 Overlay 1 Interrupt Status Register

**Name:** LCDC\_OVR1ISR  
**Offset:** 0x00000158  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access		R	R	R	R	R		
Reset		0	0	0	0	0		

#### Bit 6 – OVR Overflow Detected

Value	Description
0	No overflow occurred since last read of LCDC_OVR1ISR
1	An overflow occurred. This flag is reset after a read operation.

#### Bit 5 – DONE End of List Detected

Value	Description
0	No End of List condition has occurred since last read of LCDC_OVR1ISR
1	End of List condition has occurred. This flag is reset after a read operation.

#### Bit 4 – ADD Head Descriptor Loaded

Value	Description
0	No descriptor has been loaded since last read of LCDC_OVR1ISR
1	The descriptor pointed to by the LCDC_OVR1HEAD register has been loaded successfully. This flag is reset after a read operation.

#### Bit 3 – DSCR DMA Descriptor Loaded

Value	Description
0	No descriptor has been loaded since last read of LCDC_OVR1ISR

---

---

Value	Description
1	A descriptor has been loaded successfully. This flag is reset after a read operation.

**Bit 2 – DMA** End of DMA Transfer

Value	Description
0	No End of Transfer has been detected since last read of LCDC_OVR1ISR
1	End of Transfer has been detected. This flag is reset after a read operation.

**38.7.41 Overlay 1 Head Register**

**Name:** LCDC\_OVR1HEAD  
**Offset:** 0x0000015C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

Access			R/W	R/W					R/W
Reset			0	0					0
Bit	7	6	5	4	3	2	1	0	
			BLEN[1:0]						SIF
Access			R/W	R/W					R/W
Reset			0	0					0

#### Bit 13 – LOCKDIS Hardware Rotation Lock Disable

Value	Description
0	AHB lock signal is asserted when a rotation is performed.
1	AHB lock signal is cleared when a rotation is performed.

#### Bit 12 – ROTDIS Hardware Rotation Optimization Disable

Value	Description
0	Rotation optimization is enabled.
1	Rotation optimization is disabled.

#### Bit 8 – DLBO Defined Length Burst Only for Channel Bus Transaction

Value	Description
0	Undefined length INCR burst is used for a burst of 2 and 3 beats.
1	Only Defined Length burst is used (SINGLE, INCR4, INCR8 and INCR16).

#### Bits 5:4 – BLEN[1:0] AHB Burst Length

# SAMA5D2 Series

## LCD Controller (LCDC)

Value	Name	Description
0	AHB_BLEN_SINGLE	AHB Access is started as soon as there is enough space in the FIFO to store one data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.
1	AHB_BLEN_INCR4	AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 4 data. An AHB INCR4 Burst is used. SINGLE, INCR and INCR4 bursts are used. INCR is used for a burst of 2 and 3 beats.
2	AHB_BLEN_INCR8	AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 8 data. An AHB INCR8 Burst is used. SINGLE, INCR, INCR4 and INCR8 bursts are used. INCR is used for a burst of 2 and 3 beats.
3	AHB_BLEN_INCR16	AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 16 data. An AHB INCR16 Burst is used. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.

### Bit 0 – SIF Source Interface

Value	Description
0	Base Layer data is retrieved through AHB interface 0.
1	Base Layer data is retrieved through AHB interface 1.

### 38.7.46 Overlay 1 Configuration Register 1

**Name:** LCDC\_OVR1CFG1  
**Offset:** 0x00000170  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 9:8 – CLUTMODE[1:0] Color Lookup Table Mode Input Selection

Value	Name	Description
0	CLUT_1BPP	Color Lookup Table mode set to 1 bit per pixel
1	CLUT_2BPP	Color Lookup Table mode set to 2 bits per pixel
2	CLUT_4BPP	Color Lookup Table mode set to 4 bits per pixel
3	CLUT_8BPP	Color Lookup Table mode set to 8 bits per pixel

#### Bits 7:4 – RGBMODE[3:0] RGB Mode Input Selection

Value	Name	Description
0	12BPP_RGB_444	12 bpp RGB 444
1	16BPP_ARGB_4444	16 bpp ARGB 4444
2	16BPP_RGBA_4444	16 bpp RGBA 4444
3	16BPP_RGB_565	16 bpp RGB 565
4	16BPP_TRGB_1555	16 bpp TRGB 1555
5	18BPP_RGB_666	18 bpp RGB 666
6	18BPP_RGB_666PACKED	18 bpp RGB 666 PACKED
7	19BPP_TRGB_1666	19 bpp TRGB 1666
8	19BPP_TRGB_PACKED	19 bpp TRGB 1666 PACKED
9	24BPP_RGB_888	24 bpp RGB 888

# SAMA5D2 Series

## LCD Controller (LCDC)

Value	Name	Description
10	24BPP_RGB_888_PACKED	24 bpp RGB 888 PACKED
11	25BPP_TRGB_1888	25 bpp TRGB 1888
12	32BPP_ARGB_8888	32 bpp ARGB 8888
13	32BPP_RGBA_8888	32 bpp RGBA 8888

**Bit 0 – CLUTEN** Color Lookup Table Mode Enable

Value	Description
0	RGB mode is selected.
1	Color Lookup Table mode is selected.

**38.7.47 Overlay 1 Configuration Register 2**

**Name:** LCDC\_OVR1CFG2  
**Offset:** 0x00000174  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 26:16 – YSIZE[10:0]** Vertical Window Size

Overlay 1 window height in pixels. The window height is set to (YSIZE + 1).

The following constraint must be met:  $YPOS + YSIZE \leq RPF$

**Bits 10:0 – XSIZE[10:0]** Horizontal Window Size

Overlay 1 window width in pixels. The window width is set to (XSIZE + 1).

The following constraint must be met:  $XPOS + XSIZE \leq PPL$

**38.7.49 Overlay 1 Configuration Register 4**

**Name:** LCDC\_OVR1CFG4  
**Offset:** 0x0000017C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
XSTRIDE[31:24]

Reset	0	0	0	0	0	0	0	0

**Bits 23:16 – RDEF[7:0]** Red Default  
 Default Red color when the Overlay 1 DMA channel is disabled.

**Bits 15:8 – GDEF[7:0]** Green Default  
 Default Green color when the Overlay 1 DMA channel is disabled.

**Bits 7:0 – BDEF[7:0]** Blue Default  
 Default Blue color when the Overlay 1 DMA channel is disabled.

### 38.7.52 Overlay 1 Configuration Register 7

**Name:** LCDC\_OVR1CFG7  
**Offset:** 0x00000188  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 23:16 – RKEY[7:0]** Red Color Component Chroma Key  
 Reference Red chroma key used to match the Red color of the current overlay.

**Bits 15:8 – GKEY[7:0]** Green Color Component Chroma Key  
 Reference Green chroma key used to match the Green color of the current overlay.

**Bits 7:0 – BKEY[7:0]** Blue Color Component Chroma Key  
 Reference Blue chroma key used to match the Blue color of the current overlay.

### 38.7.53 Overlay 1 Configuration Register 8

**Name:** LCDC\_OVR1CFG8  
**Offset:** 0x0000018C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

BMASK[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 23:16 – RMASK[7:0]** Red Color Component Chroma Key Mask  
 Red Mask used when the compare function is used. If a bit is set then this bit is compared.

**Bits 15:8 – GMASK[7:0]** Green Color Component Chroma Key Mask  
 Green Mask used when the compare function is used. If a bit is set then this bit is compared.

**Bits 7:0 – BMASK[7:0]** Blue Color Component Chroma Key Mask  
 Blue Mask used when the compare function is used. If a bit is set then this bit is compared.

### 38.7.54 Overlay 1 Configuration Register 9

**Name:** LCDC\_OVR1CFG9  
**Offset:** 0x00000190  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

Reset	0	0	0	0	0	0	0	0

**Bits 23:16 – GA[7:0]** Blender Global Alpha  
 Global alpha blender for the current layer.

**Bit 10 – DSTKEY** Destination Chroma Keying

Value	Description
0	Source Chroma keying is enabled.
1	Destination Chroma keying is used.

**Bit 9 – REP** Use Replication logic to expand RGB color to 24 bits

Value	Description
0	When the selected pixel depth is less than 24 bpp the pixel is shifted and least significant bits are set to 0.
1	When the selected pixel depth is less than 24 bpp the pixel is shifted and the least significant bit replicates the msb.

**Bit 8 – DMA** Blender DMA Layer Enable

Value	Description
0	The default color is used on the Overlay 1 Layer.
1	The DMA channel retrieves the pixels stream from the memory.

### Bit 7 – OVR Blender Overlay Layer Enable

Value	Description
0	Overlay pixel color is set to the default overlay pixel color.
1	Overlay pixel color is set to the DMA channel pixel color.

### Bit 6 – LAEN Blender Local Alpha Enable

Value	Description
0	Local alpha blending coefficient is disabled.
1	Local alpha blending coefficient is enabled.

### Bit 5 – GAEN Blender Global Alpha Enable

Value	Description
0	Global alpha blending coefficient is disabled.
1	Global alpha blending coefficient is enabled.

### Bit 4 – REVALPHA Blender Reverse Alpha

Value	Description
0	Pixel difference is multiplied by alpha.
1	Pixel difference is multiplied by 1 - alpha.

### Bit 3 – ITER Blender Use Iterated Color

Value	Description
0	Pixel difference is set to 0.
1	Pixel difference is set to the iterated pixel value.

### Bit 2 – ITER2BL Blender Iterated Color Enable

Value	Description
0	Final adder stage operand is set to 0.
1	Final adder stage operand is set to the iterated pixel value.

### Bit 1 – INV Blender Inverted Blender Output Enable

Value	Description
0	Iterated pixel is the blended pixel.
1	Iterated pixel is the inverted pixel.

### Bit 0 – CRKEY Blender Chroma Key Enable

Value	Description
0	Chroma key matching is disabled.
1	Chroma key matching is enabled.

### 38.7.55 Overlay 2 Channel Enable Register

**Name:** LCDC\_OVR2CHER  
**Offset:** 0x00000240  
**Reset:** –  
**Property:** Write-only

#### Bit 2 – A2QEN Add To Queue Enable

Value	Description
0	No effect
1	Indicates that a valid descriptor has been written to memory, its memory location should be written to the DMA head pointer. The A2QSR status bit is set to one, and it is reset by hardware as soon as the descriptor pointed to by the DMA head pointer is added to the list.

#### Bit 1 – UPDATEEN Update Overlay Attributes Enable

Value	Description
0	No effect
1	Updates windows attributes on the next start of frame.

#### Bit 0 – CHEN Channel Enable

Value	Description
0	No effect
1	Enables the DMA channel

### 38.7.56 Overlay 2 Channel Disable Register

**Name:** LCDC\_OVR2CHDR  
**Offset:** 0x00000244  
**Reset:** –  
**Property:** Write-only

#### Bit 8 – CHRST Channel Reset

Value	Description
0	No effect
1	Resets the layer immediately. The frame is aborted.

#### Bit 0 – CHDIS Channel Disable

Value	Description
0	No effect
1	Disables the layer at the end of the current frame. The frame is completed.

### 38.7.57 Overlay 2 Channel Status Register

**Name:** LCDC\_OVR2CHSR  
**Offset:** 0x00000248  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bit 2 – A2QSR Add To Queue Status

Value	Description
0	Add to queue not pending
1	Add to queue pending

#### Bit 1 – UPDATESR Update Overlay Attributes In Progress Status

Value	Description
0	No update pending
1	Overlay attributes will be updated on the next frame

#### Bit 0 – CHSR Channel Status

Value	Description
0	Layer disabled
1	Layer enabled

**38.7.58 Overlay 2 Interrupt Enable Register**

**Name:** LCDC\_OVR2IER  
**Offset:** 0x0000024C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:  
0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access		W	W	W	W	W		
Reset		–	–	–	–	–		

**Bit 6 – OVR** Overflow Interrupt Enable

**Bit 5 – DONE** End of List Interrupt Enable

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Enable

**Bit 3 – DSCR** Descriptor Loaded Interrupt Enable

**Bit 2 – DMA** End of DMA Transfer Interrupt Enable

**38.7.59 Overlay 2 Interrupt Disable Register**

**Name:** LCDC\_OVR2IDR  
**Offset:** 0x00000250  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:  
0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
		OVR	DONE	ADD	DSCR	DMA		
Access		R	R	R	R	R		
Reset		0	0	0	0	0		

#### Bit 6 – OVR Overflow Detected

Value	Description
0	No overflow occurred since last read of LCDC_OVR2ISR
1	An overflow occurred. This flag is reset after a read operation.

#### Bit 5 – DONE End of List Detected

Value	Description
0	No End of List condition occurred since last read of LCDC_OVR2ISR
1	End of List condition has occurred. This flag is reset after a read operation.

#### Bit 4 – ADD Head Descriptor Loaded

Value	Description
0	No descriptor has been loaded since last read of LCDC_OVR2ISR
1	The descriptor pointed to by the LCDC_OVR2HEAD register has been loaded successfully. This flag is reset after a read operation.

#### Bit 3 – DSCR DMA Descriptor Loaded

Value	Description
0	No descriptor has been loaded since last read of LCDC_OVR2ISR

# SAMA5D2 Series

## LCD Controller (LCDC)

---

---

Value	Description
1	A descriptor has been loaded successfully. This flag is reset after a read operation.

### Bit 2 – DMA End of DMA Transfer

Value	Description
0	No End of Transfer has been detected since last read of LCDC_OVR2ISR
1	End of Transfer has been detected. This flag is reset after a read operation.

**38.7.62 Overlay 2 Head Register**

#### Bit 5 – DONEIEN End of List Interrupt Enable

Value	Description
0	End of list interrupt is disabled.
1	End of list interrupt is enabled.

#### Bit 4 – ADDIEN Add Head Descriptor to Queue Interrupt Enable

Value	Description
0	Transfer descriptor added to queue interrupt is enabled.
1	Transfer descriptor added to queue interrupt is disabled.

#### Bit 3 – DSCRIEN Descriptor Loaded Interrupt Enable

Value	Description
0	Transfer descriptor loaded interrupt is enabled.
1	Transfer descriptor loaded interrupt is disabled.

#### Bit 2 – DMAIEN End of DMA Transfer Interrupt Enable

Value	Description
0	DMA transfer completed interrupt is enabled.
1	DMA transfer completed interrupt is disabled.

**Bit 1 – LFETCH** Lookup Table Fetch Enable

Value	Description
0	Lookup Table DMA fetch is disabled.
1	Lookup Table DMA fetch is enabled.

**Bit 0 – DFETCH** Transfer Descriptor Fetch Enable

Value	Description
0	Transfer Descriptor fetch is disabled.
1	Transfer Descriptor fetch is enabled.

**38.7.65 Overlay 2 Next Register**

**Name:** LCDC\_OVR2NEXT  
**Offset:** 0x00000268  
**Reset:** 0x00000000  
**Property:** Read/Write

	[Greyed out]		BLEN[1:0]		[Greyed out]		[Greyed out]	
Access			R/W	R/W				
Reset			0	0				

#### Bit 13 – LOCKDIS Hardware Rotation Lock Disable

Value	Description
0	AHB lock signal is asserted when a rotation is performed.
1	AHB lock signal is cleared when a rotation is performed.

#### Bit 12 – ROTDIS Hardware Rotation Optimization Disable

Value	Description
0	Rotation optimization is enabled.
1	Rotation optimization is disabled.

#### Bit 8 – DLBO Defined Length Burst Only For Channel Bus Transaction

Value	Description
0	Undefined length INCR burst is used for 2 and 3 beats burst.
1	Only Defined Length burst is used (SINGLE, INCR4, INCR8 and INCR16).

#### Bits 5:4 – BLEN[1:0] AHB Burst Length

# SAMA5D2 Series

## LCD Controller (LCDC)

Value	Name	Description
0	AHB_SINGLE	AHB Access is started as soon as there is enough space in the FIFO to store one data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.
1	AHB_INCR4	AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 4 data. An AHB INCR4 Burst is used. SINGLE, INCR and INCR4 bursts are used. INCR is used for a burst of 2 and 3 beats.
2	AHB_INCR8	AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 8 data. An AHB INCR8 Burst is used. SINGLE, INCR, INCR4 and INCR8 bursts are used. INCR is used for a burst of 2 and 3 beats.
3	AHB_INCR16	AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 16 data. An AHB INCR16 Burst is used. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.

### 38.7.67 Overlay 2 Configuration Register 1

**Name:** LCDC\_OVR2CFG1  
**Offset:** 0x00000270  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 9:8 – CLUTMODE[1:0] Color Lookup Table Mode Input Selection

Value	Name	Description
0	CLUT_1BPP	Color Lookup Table mode set to 1 bit per pixel
1	CLUT_2BPP	Color Lookup Table mode set to 2 bits per pixel
2	CLUT_4BPP	Color Lookup Table mode set to 4 bits per pixel
3	CLUT_8BPP	Color Lookup Table mode set to 8 bits per pixel

#### Bits 7:4 – RGBMODE[3:0] RGB Mode Input Selection

Value	Name	Description
0	12BPP_RGB_444	12 bpp RGB 444
1	16BPP_ARGB_4444	16 bpp ARGB 4444
2	16BPP_RGBA_4444	16 bpp RGBA 4444
3	16BPP_RGB_565	16 bpp RGB 565
4	16BPP_TRGB_1555	16 bpp TRGB 1555
5	18BPP_RGB_666	18 bpp RGB 666
6	18BPP_RGB_666PACKED	18 bpp RGB 666 PACKED
7	19BPP_TRGB_1666	19 bpp TRGB 1666
8	19BPP_TRGB_PACKED	19 bpp TRGB 1666 PACKED
9	24BPP_RGB_888	24 bpp RGB 888

# SAMA5D2 Series

## LCD Controller (LCDC)

Value	Name	Description
10	24BPP_RGB_888_PACKED	24 bpp RGB 888 PACKED
11	25BPP_TRGB_1888	25 bpp TRGB 1888
12	32BPP_ARGB_8888	32 bpp ARGB 8888
13	32BPP_RGBA_8888	32 bpp RGBA 8888

**Bit 0 – CLUTEN** Color Lookup Table Mode Enable

Value	Description
0	RGB mode is selected.
1	Color Lookup Table mode is selected.

**38.7.68 Overlay 2 Configuration Register 2**

**Name:** LCDC\_OVR2CFG2  
**Offset:** 0x00000274  
**Reset:** 0x00000000  
**Property:** Read/Write

Reset	0	0	0	0	0	0	0	0

**Bits 26:16 – YSIZE[10:0]** Vertical Window Size

Overlay 2 window height in pixels. The window height is set to (YSIZE + 1).

The following constraint must be met:  $YPOS + YSIZE \leq RPF$

**Bits 10:0 – XSIZE[10:0]** Horizontal Window Size

Overlay 2 window width in pixels. The window width is set to (XSIZE + 1).

The following constraint must be met:  $XPOS + XSIZE \leq PPL$

### 38.7.70 Overlay 2 Configuration Register 4

**Name:** LCDC\_OVR2CFG4  
**Offset:** 0x0000027C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

Reset	0	0	0	0	0	0	0	0

**Bits 23:16 – GA[7:0]** Blender Global Alpha  
 Global alpha blender for the current layer.

**Bit 10 – DSTKEY** Destination Chroma Keying

Value	Description
0	Source Chroma keying is enabled.
1	Destination Chroma keying is used.

**Bit 9 – REP** Use Replication logic to expand RGB color to 24 bits

Value	Description
0	When the selected pixel depth is less than 24 bpp the pixel is shifted and least significant bits are set to 0.
1	When the selected pixel depth is less than 24 bpp the pixel is shifted and the least significant bit replicates the msb.

**Bit 8 – DMA** Blender DMA Layer Enable

Value	Description
0	The default color is used on the Overlay 1 Layer.
1	The DMA channel retrieves the pixels stream from the memory.

### Bit 7 – OVR Blender Overlay Layer Enable

Value	Description
0	Overlay pixel color is set to the default overlay pixel color.
1	Overlay pixel color is set to the DMA channel pixel color.

### Bit 6 – LAEN Blender Local Alpha Enable

Value	Description
0	Local alpha blending coefficient is disabled.
1	Local alpha blending coefficient is enabled.

### Bit 5 – GAEN Blender Global Alpha Enable

Value	Description
0	Global alpha blending coefficient is disabled.
1	Global alpha blending coefficient is enabled.

### Bit 4 – REVALPHA Blender Reverse Alpha

Value	Description
0	Pixel difference is multiplied by alpha.
1	Pixel difference is multiplied by 1 - alpha.

### Bit 3 – ITER Blender Use Iterated Color

Value	Description
0	Pixel difference is set to 0.
1	Pixel difference is set to the iterated pixel value.

### Bit 2 – ITER2BL Blender Iterated Color Enable

Value	Description
0	Final adder stage operand is set to 0.
1	Final adder stage operand is set to the iterated pixel value.

### Bit 1 – INV Blender Inverted Blender Output Enable

Value	Description
0	Iterated pixel is the blended pixel.
1	Iterated pixel is the inverted pixel.

### Bit 0 – CRKEY Blender Chroma Key Enable

Value	Description
0	Chroma key matching is disabled.
1	Chroma key matching is enabled.

### 38.7.76 High-End Overlay Channel Enable Register

**Name:** LCDC\_HEOCHER  
**Offset:** 0x00000340  
**Reset:** –  
**Property:** Write-only

#### Bit 2 – A2QEN Add To Queue Enable

Value	Description
0	No effect
1	Indicates that a valid descriptor has been written to memory, its memory location should be written to the DMA head pointer. The A2QSR status bit is set to one, and it is reset by hardware as soon as the descriptor pointed to by the DMA head pointer is added to the list.

#### Bit 1 – UPDATEEN Update Overlay Attributes Enable

Value	Description
0	No effect
1	Updates windows attributes on the next start of frame.

#### Bit 0 – CHEN Channel Enable

Value	Description
0	No effect
1	Enables the DMA channel

**38.7.77 High-End Overlay Channel Disable Register**

**Name:** LCDC\_HEOCHDR  
**Offset:** 0x00000344  
**Reset:** –  
**Property:** Write-only

**Bit 8 – CHRST Channel Reset**

Value	Description
0	No effect
1	Resets the layer immediately. The frame is aborted.

**Bit 0 – CHDIS Channel Disable**

Value	Description
0	No effect
1	Disables the layer at the end of the current frame. The frame is completed.

### 38.7.78 High-End Overlay Channel Status Register

**Name:** LCDC\_HEOCHSR  
**Offset:** 0x00000348  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bit 2 – A2QSR Add To Queue Status

Value	Description
0	Add to queue not pending
1	Add to queue pending

#### Bit 1 – UPDATESR Update Overlay Attributes In Progress Status

Value	Description
0	No update pending
1	Overlay attributes will be updated on the next frame

#### Bit 0 – CHSR Channel Status

Value	Description
0	Layer disabled
1	Layer enabled

### 38.7.79 High-End Overlay Interrupt Enable Register

**Name:** LCDC\_HEOIER  
**Offset:** 0x0000034C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:  
 0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
		VOVR	VDONE	VADD	VDSCR	VDMA		
Access		W	W	W	W	W		
Reset		–	–	–	–	–		
Bit	15	14	13	12	11	10	9	8
		UOVR	UDONE	UADD	UDSCR	UDMA		
Access		W	W	W	W	W		
Reset		–	–	–	–	–		
Bit	7	6	5	4	3	2	1	0
		OVR	DONE	ADD	DSCR	DMA		
Access		W	W	W	W	W		
Reset		–	–	–	–	–		

**Bit 22 – VOVR** Overflow for V Chrominance Interrupt Enable

**Bit 21 – VDONE** End of List for V Chrominance Interrupt Enable

**Bit 20 – VADD** Head Descriptor Loaded for V Chrominance Interrupt Enable

**Bit 19 – VDSCR** Descriptor Loaded for V Chrominance Interrupt Enable

**Bit 18 – VDMA** End of DMA for V Chrominance Transfer Interrupt Enable

**Bit 14 – UOVR** Overflow for U or UV Chrominance Interrupt Enable

**Bit 13 – UDONE** End of List for U or UV Chrominance Interrupt Enable

**Bit 12 – UADD** Head Descriptor Loaded for U or UV Chrominance Interrupt Enable

**Bit 11 – UDSCR** Descriptor Loaded for U or UV Chrominance Interrupt Enable

**Bit 10 – UDMA** End of DMA Transfer for U or UV Chrominance Interrupt Enable

**Bit 6 – OVR** Overflow Interrupt Enable

**Bit 5 – DONE** End of List Interrupt Enable

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Enable

**Bit 3 – DSCR** Descriptor Loaded Interrupt Enable

**Bit 2 – DMA** End of DMA Transfer Interrupt Enable

### 38.7.80 High-End Overlay Interrupt Disable Register

**Name:** LCDC\_HEOISR  
**Offset:** 0x00000350  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:  
 0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
		VOVR	VDONE	VADD	VDSCR	VDMA		
Access		W	W	W	W	W		
Reset		–	–	–	–	–		
Bit	15	14	13	12	11	10	9	8
		UOVR	UDONE	UADD	UDSCR	UDMA		
Access		W	W	W	W	W		
Reset		–	–	–	–	–		
Bit	7	6	5	4	3	2	1	0
		OVR	DONE	ADD	DSCR	DMA		
Access		W	W	W	W	W		
Reset		–	–	–	–	–		

**Bit 22 – VOVR** Overflow for V Chrominance Component Interrupt Disable

**Bit 21 – VDONE** End of List for V Chrominance Component Interrupt Disable

**Bit 20 – VADD** Head Descriptor Loaded for V Chrominance Component Interrupt Disable

**Bit 19 – VDSCR** Descriptor Loaded for V Chrominance Component Interrupt Disable

**Bit 18 – VDMA** End of DMA Transfer for V Chrominance Component Interrupt Disable

**Bit 14 – UOVR** Overflow Interrupt for U or UV Chrominance Component Disable

**Bit 13 – UDONE** End of List Interrupt for U or UV Chrominance Component Disable

**Bit 12 – UADD** Head Descriptor Loaded for U or UV Chrominance Component Interrupt Disable

**Bit 11 – UDSCR** Descriptor Loaded for U or UV Chrominance Component Interrupt Disable

**Bit 10 – UDMA** End of DMA Transfer for U or UV Chrominance Component Interrupt Disable

**Bit 6 – OVR** Overflow Interrupt Disable

**Bit 5 – DONE** End of List Interrupt Disable

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Disable

**Bit 3 – DSCR** Descriptor Loaded Interrupt Disable

**Bit 2 – DMA** End of DMA Transfer Interrupt Disable

### 38.7.81 High-End Overlay Interrupt Mask Register

**Name:** LCDC\_HEOIMR  
**Offset:** 0x00000354  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
		VOVR	VDONE	VADD	VDSCR	VDMA		
Access		R	R	R	R	R		
Reset		0	0	0	0	0		
Bit	15	14	13	12	11	10	9	8
		UOVR	UDONE	UADD	UDSCR	UDMA		
Access		R	R	R	R	R		
Reset		0	0	0	0	0		
Bit	7	6	5	4	3	2	1	0
		OVR	DONE	ADD	DSCR	DMA		
Access		R	R	R	R	R		
Reset		0	0	0	0	0		

**Bit 22 – VOVR** Overflow for V Chrominance Interrupt Mask

**Bit 21 – VDONE** End of List for V Chrominance Component Mask

**Bit 20 – VADD** Head Descriptor Loaded for V Chrominance Component Mask

**Bit 19 – VDSCR** Descriptor Loaded for V Chrominance Component Interrupt Mask

**Bit 18 – VDMA** End of DMA Transfer for V Chrominance Component Interrupt Mask

**Bit 14 – UOVR** Overflow for U Chrominance Interrupt Mask

**Bit 13 – UDONE** End of List for U or UV Chrominance Component Mask

**Bit 12 – UADD** Head Descriptor Loaded for U or UV Chrominance Component Mask

**Bit 11 – UDSCR** Descriptor Loaded for U or UV Chrominance Component Interrupt Mask

**Bit 10 – UDMA** End of DMA Transfer for U or UV Chrominance Component Interrupt Mask

**Bit 6 – OVR** Overflow Interrupt Mask

**Bit 5 – DONE** End of List Interrupt Mask

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Mask

**Bit 3 – DSCR** Descriptor Loaded Interrupt Mask

**Bit 2 – DMA** End of DMA Transfer Interrupt Mask

**38.7.82 High-End Overlay Interrupt Status Register**

**Name:** LCDC\_HEOISR  
**Offset:** 0x00000358  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access		R	R	R	R	R

Reset		0	0	0	0	0		

**Bit 22 – VOVR** Overflow Detected for V Component

Value	Description
0	No overflow occurred since last read of LCDC_HEOISR
1	An overflow occurred. This flag is reset after a read operation.

**Bit 21 – VDONE** End of List Detected for V Component

Value	Description
0	No End of List condition occurred since last read of LCDC_HEOISR
1	End of List condition has occurred. This flag is reset after a read operation.

**Bit 20 – VADD** Head Descriptor Loaded for V Component

Value	Description
0	No descriptor has been loaded since last read of LCDC_HEOISR
1	The descriptor pointed to by the LCDC_HEOVHEAD register has been loaded successfully. This flag is reset after a read operation.

**Bit 19 – VDSCR** DMA Descriptor Loaded for V Component

Value	Description
0	No descriptor has been loaded since last read of LCDC_HEOISR

Value	Description
1	A descriptor has been loaded successfully. This flag is reset after a read operation.

**Bit 18 – VDMA** End of DMA Transfer for V Component

Value	Description
0	No End of Transfer has been detected since last read of LCDC_HEOISR
1	End of Transfer has been detected. This flag is reset after a read operation.

**Bit 14 – UOVR** Overflow Detected for U Component

Value	Description
0	No overflow occurred since last read of LCDC_HEOISR
1	An overflow occurred. This flag is reset after a read operation.

**Bit 13 – UDONE** End of List Detected for U Component

Value	Description
0	No End of List condition occurred since last read of LCDC_HEOISR
1	End of List condition has occurred. This flag is reset after a read operation.

**Bit 12 – UADD** Head Descriptor Loaded for U Component

Value	Description
0	No descriptor has been loaded since last read of LCDC_HEOISR
1	The descriptor pointed to by the LCDC_HEOUHEAD register has been loaded successfully. This flag is reset after a read operation.

**Bit 11 – UDSCR** DMA Descriptor Loaded for U Component

Value	Description
0	No descriptor has been loaded since last read of LCDC_HEOISR
1	A descriptor has been loaded successfully. This flag is reset after a read operation.

**Bit 10 – UDMA** End of DMA Transfer for U Component

Value	Description
0	No End of Transfer has been detected since last read of LCDC_HEOISR
1	End of Transfer has been detected. This flag is reset after a read operation.

**Bit 6 – OVR** Overflow Detected

Value	Description
0	No overflow occurred since last read of LCDC_HEOISR
1	An overflow occurred. This flag is reset after a read operation.

**Bit 5 – DONE** End of List Detected

Value	Description
0	No End of List condition occurred since last read of LCDC_HEOISR
1	End of List condition has occurred. This flag is reset after a read operation.

**Bit 4 – ADD** Head Descriptor Loaded

---

---

Value	Description
0	No descriptor has been loaded since last read of LCDC_HEOISR
1	The descriptor pointed to by the LCDC_HEOHEAD register has been loaded successfully. This flag is reset after a read operation.

**Bit 3 – DSCR** DMA Descriptor Loaded

Value	Description
0	No descriptor has been loaded since last read of LCDC_HEOISR
1	A descriptor has been loaded successfully. This flag is reset after a read operation.

**Bit 2 – DMA** End of DMA Transfer

Value	Description
0	No end of transfer has been detected since last read of LCDC_HEOISR
1	End of Transfer has been detected. This flag is reset after a read operation.

**38.7.83 High-End Overlay DMA Head Register**

**Name:** LCDC\_HEOHEAD  
**Offset:** 0x0000035C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

#### Bit 5 – VDONEIEN End of List Interrupt Enable

Value	Description
0	End of list interrupt is disabled.
1	End of list interrupt is enabled.

#### Bit 4 – VADDIEN Add Head Descriptor to Queue Interrupt Enable

Value	Description
0	Transfer descriptor added to queue interrupt is enabled.
1	Transfer descriptor added to queue interrupt is disabled.

#### Bit 3 – VDSCRIEN Descriptor Loaded Interrupt Enable

Value	Description
0	Transfer descriptor loaded interrupt is enabled.
1	Transfer descriptor loaded interrupt is disabled.

#### Bit 2 – VDMAIEN End of DMA Transfer Interrupt Enable

Value	Description
0	DMA transfer completed interrupt is enabled.
1	DMA transfer completed interrupt is disabled.

---

---

**Bit 0 – VDFETCH** Transfer Descriptor Fetch Enable

Value	Description
0	Transfer Descriptor fetch is disabled.
1	Transfer Descriptor fetch is enabled.

### 38.7.94 High-End Overlay V DMA Next Register

**Name:** LCDC\_HEOVNEXT  
**Offset:** 0x00000388  
**Reset:** 0x00000000  
**Property:** Read/Write

									SIF
Access	R/W	R/W	R/W	R/W					R/W
Reset	0	0	0	0					0

#### Bit 13 – LOCKDIS Hardware Rotation Lock Disable

Value	Description
0	AHB lock signal is asserted when a rotation is performed.
1	AHB lock signal is cleared when a rotation is performed.

#### Bit 12 – ROTDIS Hardware Rotation Optimization Disable

Value	Description
0	Rotation optimization is enabled.
1	Rotation optimization is disabled.

#### Bit 8 – DLBO Defined Length Burst Only For Channel Bus Transaction

Value	Description
0	Undefined length INCR burst is used for a burst of 2 and 3 beats.
1	Only Defined Length burst is used (SINGLE, INCR4, INCR8 and INCR16).

#### Bits 7:6 – BLENUV[1:0] AHB Burst Length for U-V Channel

Value	Name	Description
0	AHB_SINGLE	AHB Access is started as soon as there is enough space in the FIFO to store one data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.
1	AHB_INCR4	AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 4 data. An AHB INCR4 Burst is used. SINGLE, INCR and INCR4 bursts are used. INCR is used for a burst of 2 and 3 beats.
2	AHB_INCR8	AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 8 data. An AHB INCR8 Burst is used. SINGLE, INCR, INCR4 and INCR8 bursts are used. INCR is used for a burst of 2 and 3 beats.
3	AHB_INCR16	AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 16 data. An AHB INCR16 Burst is used. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.

### Bits 5:4 – BLEN[1:0] AHB Burst Length

Value	Name	Description
0	AHB_BLEN_SINGLE	AHB Access is started as soon as there is enough space in the FIFO to store one data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.
1	AHB_BLEN_INCR4	AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 4 data. An AHB INCR4 Burst is used. SINGLE, INCR and INCR4 bursts are used. INCR is used for a burst of 2 and 3 beats.
2	AHB_BLEN_INCR8	AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 8 data. An AHB INCR8 Burst is used. SINGLE, INCR, INCR4 and INCR8 bursts are used. INCR is used for a burst of 2 and 3 beats.
3	AHB_BLEN_INCR16	AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 16 data. An AHB INCR16 Burst is used. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.

### Bit 0 – SIF Source Interface

Value	Description
0	Base Layer data is retrieved through AHB interface 0.
1	Base Layer data is retrieved through AHB interface 1.

### 38.7.96 High-End Overlay Configuration Register 1

**Name:** LCDC\_HEOCFG1  
**Offset:** 0x0000038C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

							YUVEN	CLUTEN
Access	R/W						R/W	R/W
Reset	0						0	0

#### Bit 20 – DSCALEOPT Down Scaling Bandwidth Optimization

Value	Description
0	Scaler Optimization is disabled.
1	Scaler Optimization is enabled; only relevant pixels are retrieved from memory to fill the scaler filter.

#### Bit 17 – YUV422SWP YUV 4:2:2 Swap

Value	Description
0	The two Y components of the YUV 4:2:2 packed data stream are not swapped
1	The two Y components of the YUV 4:2:2 packed data stream are swapped

#### Bit 16 – YUV422ROT YUV 4:2:2 Rotation

This bit is relevant only when a rotation angle of 90 degrees or 270 degrees is used.

Value	Description
0	Chroma Upsampling kernel is configured to use 0 and 180 degrees algorithm
1	Chroma Upsampling kernel is configured to use the 4:2:2 Rotation Algorithm.

#### Bits 15:12 – YUVMODE[3:0] YUV Mode Input Selection

# SAMA5D2 Series

## LCD Controller (LCDC)

Value	Name	Description
0	32BPP_AYCBCR	32 bpp AYCbCr 444
1	16BPP_YCBCR_MODE0	16 bpp Cr(n)Y(n+1)Cb(n)Y(n) 422
2	16BPP_YCBCR_MODE1	16 bpp Y(n+1)Cr(n)Y(n)Cb(n) 422
3	16BPP_YCBCR_MODE2	16 bpp Cb(n)Y(+1)Cr(n)Y(n) 422
4	16BPP_YCBCR_MODE3	16 bpp Y(n+1)Cb(n)Y(n)Cr(n) 422
5	16BPP_YCBCR_SEMIPLANAR	16 bpp Semiplanar 422 YCbCr
6	16BPP_YCBCR_PLANAR	16 bpp Planar 422 YCbCr
7	12BPP_YCBCR_SEMIPLANAR	12 bpp Semiplanar 420 YCbCr
8	12BPP_YCBCR_PLANAR	12 bpp Planar 420 YCbCr

### Bits 9:8 – CLUTMODE[1:0] Color Lookup Table Mode Input Selection

Value	Name	Description
0	CLUT_1BPP	Color Lookup Table mode set to 1 bit per pixel
1	CLUT_2BPP	Color Lookup Table mode set to 2 bits per pixel
2	CLUT_4BPP	Color Lookup Table mode set to 4 bits per pixel
3	CLUT_8BPP	Color Lookup Table mode set to 8 bits per pixel

### Bits 7:4 – RGBMODE[3:0] RGB Mode Input Selection

Value	Name	Description
0	12BPP_RGB_444	12 bpp RGB 444
1	16BPP_ARGB_4444	16 bpp ARGB 4444
2	16BPP_RGBA_4444	16 bpp RGBA 4444
3	16BPP_RGB_565	16 bpp RGB 565
4	16BPP_TRGB_1555	16 bpp TRGB 1555
5	18BPP_RGB_666	18 bpp RGB 666
6	18BPP_RGB_666PACKED	18 bpp RGB 666 PACKED
7	19BPP_TRGB_1666	19 bpp TRGB 1666
8	19BPP_TRGB_PACKED	19 bpp TRGB 1666 PACKED
9	24BPP_RGB_888	24 bpp RGB 888
10	24BPP_RGB_888_PACKED	24 bpp RGB 888 PACKED
11	25BPP_TRGB_1888	25 bpp TRGB 1888
12	32BPP_ARGB_8888	32 bpp ARGB 8888
13	32BPP_RGBA_8888	32 bpp RGBA 8888

### Bit 1 – YUVEN YUV Color Space Enable

Color Space is YUV

Value	Description
0	Color space is RGB
1	Color space is YUV

### Bit 0 – CLUTEN Color Lookup Table Mode Enable

Value	Description
0	RGB mode is selected.
1	Color Lookup Table mode is selected.

**38.7.97 High-End Overlay Configuration Register 2**

**Name:** LCDC\_HEOCFG2  
**Offset:** 0x00000394  
**Reset:** 0x00000000  
**Property:** Read/Write

Reset	0	0	0	0	0	0	0	0

**Bits 26:16 – YSIZE[10:0]** Vertical Window Size

High-End Overlay window height in pixels. The window height is set to (YSIZE + 1).

The following constraint must be met:  $YPOS + YSIZE \leq RPF$

**Bits 10:0 – XSIZE[10:0]** Horizontal Window Size

High-End Overlay window width in pixels. The window width is set to (XSIZE + 1).

The following constraint must be met:  $XPOS + XSIZE \leq PPL$

### 38.7.99 High-End Overlay Configuration Register 4

**Name:** LCDC\_HEOCFG4  
**Offset:** 0x0000039C  
**Reset:** 0x00000000

**Bits 23:16 – RMASK[7:0]** Red Color Component Chroma Key Mask

Red Mask used when the compare function is used. If a bit is set then this bit is compared.

**Bits 15:8 – GMASK[7:0]** Green Color Component Chroma Key Mask

Green Mask used when the compare function is used. If a bit is set then this bit is compared.

**Bits 7:0 – BMASK[7:0]** Blue Color Component Chroma Key Mask

Blue Mask used when the compare function is used. If a bit is set then this bit is compared.

**Bits 23:16 – GA[7:0]** Blender Global Alpha  
 Global alpha blender for the current layer.

**Bit 12 – VIDPRI** Video Priority

Value	Description
0	OVR1 layer is above HEO layer.
1	OVR1 layer is below HEO layer.

**Bit 10 – DSTKEY** Destination Chroma Keying

Value	Description
0	Source Chroma keying is enabled.
1	Destination Chroma keying is used.

**Bit 9 – REP** Use Replication logic to expand RGB color to 24 bits

Value	Description
0	When the selected pixel depth is less than 24 bpp the pixel is shifted and least significant bits are set to 0.
1	When the selected pixel depth is less than 24 bpp the pixel is shifted and the least significant bit replicates the msb.

**Bit 8 – DMA** Blender DMA Layer Enable

Value	Description
0	The default color is used on the Overlay 1 Layer.
1	The DMA channel retrieves the pixels stream from the memory.

**Bit 7 – OVR** Blender Overlay Layer Enable

Value	Description
0	Overlay pixel color is set to the default overlay pixel color.
1	Overlay pixel color is set to the DMA channel pixel color.

**Bit 6 – LAEN** Blender Local Alpha Enable

Value	Description
0	Local alpha blending coefficient is disabled.
1	Local alpha blending coefficient is enabled.

**Bit 5 – GAEN** Blender Global Alpha Enable

Value	Description
0	Global alpha blending coefficient is disabled.
1	Global alpha blending coefficient is enabled.

**Bit 4 – REVALPHA** Blender Reverse Alpha

Value	Description
0	Pixel difference is multiplied by alpha.
1	Pixel difference is multiplied by 1 - alpha.

**Bit 3 – ITER** Blender Use Iterated Color

Value	Description
0	Pixel difference is set to 0.
1	Pixel difference is set to the iterated pixel value.

**Bit 2 – ITER2BL** Blender Iterated Color Enable

Value	Description
0	Final adder stage operand is set to 0.
1	Final adder stage operand is set to the iterated pixel value.

**Bit 1 – INV** Blender Inverted Blender Output Enable

Value	Description
0	Iterated pixel is the blended pixel.
1	Iterated pixel is the inverted pixel.

**Bit 0 – CRKEY** Blender Chroma Key Enable

Value	Description
0	Chroma key matching is disabled.
1	Chroma key matching is enabled.

**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 18:16 – YPHIDEF[2:0]** Vertical Filter Phase Offset

YPHIDEF defines the index of the first coefficient set used when the vertical resampling operation is started.

**Bits 2:0 – XPHIDEF[2:0]** Horizontal Filter Phase Offset

XPHIDEF defines the index of the first coefficient set used when the horizontal resampling operation is started.

### 38.7.137 Post Processing Channel Enable Register

**Name:** LCDC\_PPCHER  
**Offset:** 0x00000540  
**Reset:** –  
**Property:** Write-only

#### Bit 2 – A2QEN Add To Queue Enable

Value	Description
0	No effect
1	Indicates that a valid descriptor has been written to memory, its memory location should be written to the DMA head pointer. The A2QSR status bit is set to one, and it is reset by hardware as soon as the descriptor pointed to by the DMA head pointer is added to the list.

#### Bit 1 – UPDATEEN Update Overlay Attributes Enable

Value	Description
0	No effect
1	Updates windows attributes on the next start of frame.

#### Bit 0 – CHEN Channel Enable

Value	Description
0	No effect
1	Enables the DMA channel

### 38.7.138 Post Processing Channel Disable Register

**Name:** LCDC\_PPCHDR  
**Offset:** 0x00000544  
**Reset:** –  
**Property:** Write-only

#### Bit 8 – CHRST Channel Reset

Value	Description
0	No effect
1	Resets the layer immediately. The frame is aborted.

#### Bit 0 – CHDIS Channel Disable

Value	Description
0	No effect
1	Disables the layer at the end of the current frame. The frame is completed.

### 38.7.139 Post Processing Channel Status Register

**Name:** LCDC\_PPCHSR  
**Offset:** 0x00000548  
**Reset:** 0x00000000  
**Property:** Read-only

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Disable

**Bit 3 – DSCR** Descriptor Loaded Interrupt Disable

**Bit 2 – DMA** End of DMA Transfer Interrupt Disable

### 38.7.142 Post Processing Interrupt Mask Register

**Name:** LCDC\_PPIMR  
**Offset:** 0x00000554  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

**Bit 5 – DONE** End of List Interrupt Mask

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Mask

**Bit 3 – DSCR** Descriptor Loaded Interrupt Mask

**Bit 2 – DMA** End of DMA Transfer Interrupt Mask

### 38.7.143 Post Processing Interrupt Status Register

**Name:** LCDC\_PPISR  
**Offset:** 0x00000558  
**Reset:** 0x00000000  
**Property:** Read-only

**Bit 5 – DONE** End of List Detected

Value	Description
0	No End of List condition has occurred since last read of LCDC_PPISR
1	End of List condition has occurred. This flag is reset after a read operation.

**Bit 4 – ADD** Head Descriptor Loaded

Value	Description
0	No descriptor has been loaded since last read of LCDC_PPISR
1	The descriptor pointed to by the LCDC_PPHEAD register has been loaded successfully. This flag is reset after a read operation.

**Bit 3 – DSCR** DMA Descriptor Loaded

Value	Description
0	No descriptor has been loaded since last read of LCDC_PPISR
1	A descriptor has been loaded successfully. This flag is reset after a read operation.

**Bit 2 – DMA** End of DMA Transfer

Value	Description
0	No End of Transfer has been detected since last read of LCDC_PPISR

# SAMA5D2 Series

## LCD Controller (LCDC)

---

---

Value	Description
1	End of Transfer has been detected. This flag is reset after a read operation.

**38.7.144 Post Processing Head Register**

**Name:** LCDC\_PPHEAD  
**Offset:** 0x0000055C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
HEAD[29:22]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
HEAD[21:14]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
HEAD[13:6]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
HEAD[5:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W		
Reset	0	0	0	0	0	0		

**Bits 31:2 – HEAD[29:0] DMA Head Pointer**  
 The Head Pointer points to a new descriptor.

**38.7.145 Post Processing Address Register**

**Name:** LCDC\_PPADDR  
**Offset:** 0x00000560  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
ADDR[31:24]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
ADDR[23:16]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
ADDR[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
ADDR[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – ADDR[31:0]** DMA Transfer Start Address  
 Post Processing Destination frame buffer address.

### 38.7.146 Post Processing Control Register

**Name:** LCDC\_PPCTRL  
**Offset:** 0x00000564  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
			DONEIEN	ADDIEN	DSCRIEN	DMAIEN		
Access			R/W	R/W	R/W	R/W	R/W	
Reset			0	0	0	0	0	

#### Bit 5 – DONEIEN End of List Interrupt Enable

Value	Description
0	End of list interrupt is disabled.
1	End of list interrupt is enabled.

#### Bit 4 – ADDIEN Add Head Descriptor to Queue Interrupt Enable

Value	Description
0	Transfer descriptor added to queue interrupt is enabled.
1	Transfer descriptor added to queue interrupt is disabled.

#### Bit 3 – DSCRIEN Descriptor Loaded Interrupt Enable

Value	Description
0	Transfer descriptor loaded interrupt is enabled.
1	Transfer descriptor loaded interrupt is disabled.

#### Bit 2 – DMAIEN End of DMA Transfer Interrupt Enable

Value	Description
0	DMA transfer completed interrupt is enabled.
1	DMA transfer completed interrupt is disabled.

**Bit 0 – DFETCH** Transfer Descriptor Fetch Enable

Value	Description
0	Transfer Descriptor fetch is disabled.
1	Transfer Descriptor fetch is enabled.

### 38.7.147 Post Processing Next Register

**Name:** LCDC\_PPNEXT  
**Offset:** 0x00000568  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
NEXT[31:24]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
NEXT[23:16]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
NEXT[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
NEXT[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – NEXT[31:0]** DMA Descriptor Next Address  
 The transfer descriptor address must be aligned on a 64-bit boundary.

### 38.7.148 Post Processing Configuration Register 0

**Name:** LCDC\_PPCFG0  
**Offset:** 0x0000056C  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 8 – DLBO** Defined Length Burst Only For Channel Bus Transaction

Value	Description
0	Undefined length INCR burst is used for 2 and 3 beats burst.
1	Only Defined Length burst is used (SINGLE, INCR4, INCR8 and INCR16).

**Bits 5:4 – BLEN[1:0]** AHB Burst Length

Value	Name	Description
0	AHB_BLEN_SINGLE	AHB Access is started as soon as there is enough space in the FIFO to store one data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.
1	AHB_BLEN_INCR4	AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 4 data. An AHB INCR4 Burst is used. SINGLE, INCR and INCR4 bursts are used. INCR is used for a burst of 2 and 3 beats.
2	AHB_BLEN_INCR8	AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 8 data. An AHB INCR8 Burst is used. SINGLE, INCR, INCR4 and INCR8 bursts are used. INCR is used for a burst of 2 and 3 beats.

# SAMA5D2 Series

## LCD Controller (LCDC)

Value	Name	Description
3	AHB_BLEN_INCR16	AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 16 data. An AHB INCR16 Burst is used. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.

### Bit 0 – SIF Source Interface

Value	Description
0	Base Layer data is retrieved through AHB interface 0.
1	Base Layer data is retrieved through AHB interface 1.

### 38.7.149 Post Processing Configuration Register 1

**Name:** LCDC\_PPCFG1  
**Offset:** 0x00000570  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bit 4 – ITUBT601 Color Space Conversion Luminance

Value	Description
0	Luminance and chrominance range is [0;255]
1	Luminance values are clamped to [16;235] range. Chrominance values are clamped to [16;240] range.

#### Bits 2:0 – PPMODE[2:0] Post Processing Output Format Selection

Value	Name	Description
0	PPMODE_RGB_16BPP	RGB 16 bpp
1	PPMODE_RGB_24BPP_PACKED	RGB 24 bpp PACKED
2	PPMODE_RGB_24BPP_UNPACKED	RGB 24 bpp UNPACKED
3	PPMODE_YCBCR_422_MODE0	YCbCr 422 16 bpp (Mode 0)
4	PPMODE_YCBCR_422_MODE1	YCbCr 422 16 bpp (Mode 1)
5	PPMODE_YCBCR_422_MODE2	YCbCr 422 16 bpp (Mode 2)
6	PPMODE_YCBCR_422_MODE3	YCbCr 422 16 bpp (Mode 3)

### 38.7.150 Post Processing Configuration Register 2

**Name:** LCDC\_PPCFG2  
**Offset:** 0x00000574  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
XSTRIDE[31:24]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
XSTRIDE[23:16]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
XSTRIDE[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
XSTRIDE[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – XSTRIDE[31:0]** Horizontal Stride

XSTRIDE represents the memory offset, in bytes, between two rows of the image memory.

### 38.7.151 Post Processing Configuration Register 3

**Name:** LCDC\_PPCFG3  
**Offset:** 0x00000578  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

Reset	0	0	0	0	0	0	0	0

#### Bit 30 – CSCYOFF Color Space Conversion Luminance Offset

Value	Description
0	The Yoff parameter value is set to 0.
1	The Yoff parameter value is set to 16.

**Bits 29:20 – CSCYB[9:0]** Color Space Conversion B coefficient for Luminance component, signed format, step set to 1/1024  
 Color Space Conversion coefficient format is 1 sign bit, 9 fractional bits.

**Bits 19:10 – CSCYG[9:0]** Color Space Conversion G coefficient for Luminance component, signed format, step set to 1/512  
 Color Space Conversion coefficient format is 1 sign bit, 9 fractional bits.

**Bits 9:0 – CSCYR[9:0]** Color Space Conversion R coefficient for Luminance component, signed format, step set to 1/1024  
 Color Space Conversion coefficient format is 1 sign bit, 9 fractional bits.

### 38.7.152 Post Processing Configuration Register 4

**Name:** LCDC\_PPCFG4  
**Offset:** 0x0000057C  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 30 – CSCUOFF** Color Space Conversion Chrominance B Offset

Value	Description
0	The Cboff parameter value is set to 0.
1	The Cboff parameter value is set to 128.

**Bits 29:20 – CSCUB[9:0]** Color Space Conversion B coefficient for Chrominance B component, signed format. (step 1/512)  
 Color Space Conversion coefficient format is 1 sign bit, 9 fractional bits.

**Bits 19:10 – CSCUG[9:0]** Color Space Conversion G coefficient for Chrominance B component, signed format. (step 1/512)  
 Color Space Conversion coefficient format is 1 sign bit, 9 fractional bits.

**Bits 9:0 – CSCUR[9:0]** Color Space Conversion R coefficient for Chrominance B component, signed format. (step 1/1024)  
 Color Space Conversion coefficient format is 1 sign bit, 9 fractional bits.

### 38.7.153 Post Processing Configuration Register 5

**Name:** LCDC\_PPCFG5  
**Offset:** 0x00000580  
**Reset:** 0x00000000

**Bits 23:16 – RCLUT[7:0]** Red Color Entry  
 This field indicates the 8-bit width Red color of the color lookup table.

**Bits 15:8 – GCLUT[7:0]** Green Color Entry  
 This field indicates the 8-bit width Green color of the color lookup table.

**Bits 7:0 – BCLUT[7:0]** Blue Color Entry  
 This field indicates the 8-bit width Blue color of the color lookup table.

## **39. Ethernet MAC (GMAC)**

### **39.1 Description**

The Ethernet MAC (GEMAC) module implements a 10/100 Mbps Ethernet MAC compatible with the IEEE 802.3 standard. The GEMAC can operate in either half or full duplex mode at all supported speeds. The [GMAC Network Configuration Register](#) is used to select the speed, duplex mode and interface type (MII, RMII).

### **39.2 Embedded Characteristics**

- Compatible with IEEE Standard 802.3
- 10, 100 Mbps Operation
- Full and Half Duplex Operation at all Supported Speeds of Operation
- Statistics Counter Registers for RMON/MIB
- MII/RMII Interface to the Physical Layer
- Integrated Physical Coding
- Direct Memory Access (DMA) Interface to External Memory
- Support for 3 Priority Queues
- 8 Kbytes Transmit RAM and 4 Kbytes Receive RAM (refer to [Table 39-4](#) for queue-specific sizes)
- Programmable Burst Length and Endianism for DMA
- Interrupt Generation to Signal Receive and Transmit Completion, Errors or Other Events
- Automatic Pad and Cyclic Redundancy Check (CRC) Generation on Transmitted Frames
- Automatic Discard of Frames Received with Errors
- Receive and Transmit IP, TCP and UDP Checksum Offload. Both IPv4 and IPv6 Packet Types Supported
- Address Checking Logic for Four Specific 48-bit Addresses, Four Type IDs, Promiscuous Mode, Hash Matching of Unicast and Multicast Destination Addresses and Wake-on-LAN
- Management Data Input/Output (MDIO) Interface for Physical Layer Management
- Support for Jumbo Frames up to 10240 Bytes
- Full Duplex Flow Control with Recognition of Incoming Pause Frames and Hardware Generation of Transmitted Pause Frames
- Half Duplex Flow Control by Forcing Collisions on Incoming Frames
- Support for 802.1Q VLAN Tagging with Recognition of Incoming VLAN and Priority Tagged Frames
- Support for 802.1Qbb Priority-based Flow Control
- Programmable Inter Packet Gap (IPG) Stretch
- Recognition of IEEE 1588 PTP Frames
- IEEE 1588 Timestamp Unit (TSU)
- Support for 802.1AS Timing and Synchronization
- Supports 802.1Qav Traffic Shaping on Two Highest Priority Queues

### 39.3 Block Diagram

Figure 39-1. Block Diagram

### 39.4 Signal Interfaces

The GEMAC includes the following signal interfaces:

- MII, RMII to an external PHY
- MDIO interface for external PHY management
- Slave APB interface for accessing GEMAC registers
- Master AHB interface for memory access
- GTSUCOMP signal for TSU timer count value comparison

Table 39-1. GEMAC Connections in Different Modes

Signal Name	Function	MII	RMII
GTXCK <sup>(1)</sup>	Transmit Clock or Reference Clock	TXCK	REFCK
GTXEN	Transmit Enable	TXEN	TXEN
GTX[3..0]	Transmit Data	TXD[3:0]	TXD[1:0]
GTXER	Transmit Coding Error	TXER	Not Used
GRXCK	Receive Clock	RXCK	Not Used
GRXDV	Receive Data Valid	RXDV	CRSDV
GRX[3..0]	Receive Data	RXD[3:0]	RXD[1:0]

.....continued			
Signal Name	Function	MII	RMII
GRXER	Receive Error	RXER	RXER
GCRS	Carrier Sense and Data Valid	CRS	Not Used
GCOL	Collision Detect	COL	Not Used
GMDC	Management Data Clock	MDC	MDC
GMDIO	Management Data Input/Output	MDIO	MDIO

**Note:**

1. Input only. GTXCK must be provided with a 25 MHz / 50 MHz external crystal oscillator for MII / RMII interfaces, respectively.

## 39.5 Product Dependencies

### 39.5.1 I/O Lines

The pins used for interfacing the GEMAC may be multiplexed with PIO lines. The programmer must first program the PIO Controller to assign the pins to their peripheral function. If I/O lines of the GEMAC are not used by the application, they can be used for other purposes by the PIO Controller.

### 39.5.2 Power Management

The GEMAC is not continuously clocked. The user must first enable the GEMAC clock in the Power Management Controller before using it.

### 39.5.3 Interrupt Sources

The GEMAC interrupt line is connected to one of the internal sources of the interrupt controller. Using the GEMAC interrupt requires prior programming of the interrupt controller.

The GEMAC features 3 interrupt sources. Refer to the table “Peripheral Identifiers” in the section “Peripherals” for the interrupt numbers for GEMAC priority queues.

## 39.6 Functional Description

### 39.6.1 Media Access Controller

The Media Access Controller (MAC) transmit block takes data from FIFO, adds preamble and, if necessary, pad and frame check sequence (FCS). Both half duplex and full duplex Ethernet modes of operation are supported. When operating in half duplex mode, the MAC transmit block generates data according to the carrier sense multiple access with collision detect (CSMA/CD) protocol. The start of transmission is deferred if carrier sense (CRS) is active. If collision (COL) becomes active during transmission, a jam sequence is asserted and the transmission is retried after a random backoff. The CRS and COL signals have no effect in full duplex mode.

The MAC receive block checks for valid preamble, FCS, alignment and length, and presents received frames to the MAC address checking block and FIFO. Software can configure the GMAC to receive jumbo frames up to 10240 bytes. It can optionally strip CRC from the received frame prior to transfer to FIFO.

The address checker recognizes four specific 48-bit addresses, can recognize four different type ID values, and contains a 64-bit Hash register for matching multicast and unicast addresses as required. It can recognize the broadcast address of all ones and copy all frames. The MAC can also reject all frames that are not VLAN tagged and recognize Wake on LAN events.

The MAC receive block supports offloading of IP, TCP and UDP checksum calculations (both IPv4 and IPv6 packet types supported), and can automatically discard bad checksum frames.

### 39.6.2 1588 Timestamp Unit

The 1588 timestamp unit (TSU) is implemented as a 94-bit timer.

The 48 upper bits [93:46] of the timer count seconds and are accessible in the [GMAC 1588 Timer Seconds High Register](#) (GMAC\_TSH) and [GMAC 1588 Timer Seconds Low Register](#) (GMAC\_TSL). The 30 lower bits [45:16] of the timer count nanoseconds and are accessible in the [GMAC 1588 Timer Nanoseconds Register](#) (GMAC\_TN). The lowest 16 bits [15:0] of the timer count sub-nanoseconds.

The 46 lower bits roll over when they have counted to one second. The timer increments by a programmable period (to approximately 15.2 femtoseconds resolution) with each MCK period and can also be adjusted in 1ns resolution (incremented or decremented) through APB register accesses.

### 39.6.3 AHB Direct Memory Access Interface

The GEMAC DMA controller is connected to the MAC FIFO interface and provides a scatter-gather type capability for packet data storage.

The DMA implements packet buffering where dual-port memories are used to buffer multiple frames.

#### 39.6.3.1 Packet Buffer DMA

- Easier to guarantee maximum line rate due to the ability to store multiple frames in the packet buffer, where the number of frames is limited by the amount of packet buffer memory and Ethernet frame size
- Full store and forward, or partial store and forward programmable options (partial store will cater for shorter latency requirements)
- Support for Transmit TCP/IP checksum offload
- Support for priority queueing
- When a collision on the line occurs during transmission, the packet will be automatically replayed directly from the packet buffer memory rather than having to re-fetch through the AHB (full store and forward ONLY)
- Received error packets are automatically dropped before any of the packet is presented to the AHB (full store and forward ONLY), thus reducing AHB activity
- Supports manual RX packet flush capabilities
- Optional RX packet flush when there is lack of AHB resource

#### 39.6.3.2 Partial Store and Forward Using Packet Buffer DMA

The DMA uses SRAM-based packet buffers, and can be programmed into a low latency mode, known as Partial Store and Forward. This allows for a reduced latency as the full packet is not buffered before forwarding. Note that this option is only available when the device is configured for full duplex operation.

This feature is enabled via the programmable TX and RX Partial Store and Forward registers. When the transmit Partial Store and Forward mode is activated, the transmitter will only begin to forward the packet to the MAC when there is enough packet data stored in the packet buffer. Likewise, when the receive Partial Store and Forward mode is activated, the receiver will only begin to forward the packet to the AHB when enough packet data is stored in the packet buffer. The amount of packet data required to activate

the forwarding process is programmable via watermark registers which are located at the same address as the partial store and forward enable bits.

Note that the minimum operational value for the TX partial store and forward watermark is 20. There is no operational limit for the RX partial store and forward watermark. Enabling partial store and forward is a useful means to reduce latency, but there are performance implications.

The GEMAC DMA uses separate transmit and receive lists of buffer descriptors, with each descriptor describing a buffer area in memory. This allows Ethernet packets to be broken up and scattered around the AHB memory space.

### 39.6.3.3 Receive AHB Buffers

Received frames, optionally including FCS, are written to receive AHB buffers stored in memory. The receive buffer depth is programmable in the range of 64 bytes to 16 Kbytes through the DMA Configuration register, with the default being 128 bytes.

The start location for each receive AHB buffer is stored in memory in a list of receive buffer descriptors at an address location pointed to by the receive buffer queue pointer. The base address for the receive buffer queue pointer is configured in software using the Receive Buffer Queue Base Address register.

Each list entry consists of two words. The first is the address of the receive AHB buffer and the second the receive status. If the length of a receive frame exceeds the AHB buffer length, the status word for the used buffer is written with zeroes except for the “start of frame” bit, which is always set for the first buffer in a frame. Bit zero of the address field is written to 1 to show the buffer has been used. The receive buffer manager then reads the location of the next receive AHB buffer and fills that with the next part of the received frame data. AHB buffers are filled until the frame is complete and the final buffer descriptor status word contains the complete frame status. Refer to the table below for details of the receive buffer descriptor list.

Each receive AHB buffer start location is a word address. The start of the first AHB buffer in a frame can be offset by up to three bytes, depending on the value written to bits 14 and 15 of the Network Configuration register. If the start location of the AHB buffer is offset, the available length of the first AHB buffer is reduced by the corresponding number of bytes.

**Table 39-2. Receive Buffer Descriptor Entry**

Bit	Function
Word 0	
31:2	Address of beginning of buffer
1	Wrap—marks last descriptor in receive buffer descriptor list.
0	Ownership—needs to be zero for the GEMAC to write data to the receive buffer. The GEMAC sets this to one once it has successfully written a frame to memory. Software has to clear this bit before the buffer can be used again.
Word 1	
31	Global all ones broadcast address detected
30	Multicast hash match
29	Unicast hash match
28	—

.....continued	
Bit	Function
27	Specific Address Register match found, bit 25 and bit 26 indicate which Specific Address Register causes the match.
26:25	Specific Address Register match. Encoded as follows: 00: Specific Address Register 1 match 01: Specific Address Register 2 match 10: Specific Address Register 3 match 11: Specific Address Register 4 match If more than one specific address is matched only one is indicated with priority 4 down to 1.
24	This bit has a different meaning depending on whether RX checksum offloading is enabled. <b>With RX checksum offloading disabled:</b> (bit 24 clear in Network Configuration Register) Type ID register match found, bit 22 and bit 23 indicate which type ID register causes the match. <b>With RX checksum offloading enabled:</b> (bit 24 set in Network Configuration Register) 0: The frame was not SNAP encoded and/or had a VLAN tag with the Canonical Format Indicator (CFI) bit set. 1: The frame was SNAP encoded and had either no VLAN tag or a VLAN tag with the CFI bit not set.
23:22	This bit has a different meaning depending on whether RX checksum offloading is enabled. <b>With RX checksum offloading disabled:</b> (bit 24 clear in Network Configuration) Type ID register match. Encoded as follows: 00: Type ID register 1 match 01: Type ID register 2 match 10: Type ID register 3 match 11: Type ID register 4 match If more than one Type ID is matched only one is indicated with priority 4 down to 1. <b>With RX checksum offloading enabled:</b> (bit 24 set in Network Configuration Register) 00: Neither the IP header checksum nor the TCP/UDP checksum was checked. 01: The IP header checksum was checked and was correct. Neither the TCP nor UDP checksum was checked. 10: Both the IP header and TCP checksum were checked and were correct. 11: Both the IP header and UDP checksum were checked and were correct.
21	VLAN tag detected—type ID of 0x8100. For packets incorporating the stacked VLAN processing feature, this bit will be set if the second VLAN tag has a type ID of 0x8100

.....continued	
Bit	Function
20	Priority tag detected—type ID of 0x8100 and null VLAN identifier. For packets incorporating the stacked VLAN processing feature, this bit will be set if the second VLAN tag has a type ID of 0x8100 and a null VLAN identifier.
19:17	VLAN priority—only valid if bit 21 is set.
16	Canonical format indicator (CFI) bit (only valid if bit 21 is set).
15	End of frame—when set the buffer contains the end of a frame. If end of frame is not set, then the only valid status bit is start of frame (bit 14).
14	Start of frame—when set the buffer contains the start of a frame. If both bits 15 and 14 are set, the buffer contains a whole frame.
13	<p>This bit has a different meaning depending on whether jumbo frames and ignore FCS modes are enabled. If neither mode is enabled this bit will be zero.</p> <p><b>With jumbo frame mode enabled:</b> (bit 3 set in Network Configuration Register) Additional bit for length of frame (bit[13]), that is concatenated with bits[12:0]</p> <p><b>With ignore FCS mode enabled and jumbo frames disabled:</b> (bit 26 set in Network Configuration Register and bit 3 clear in Network Configuration Register) This indicates per frame FCS status as follows:</p> <p>0: Frame had good FCS</p> <p>1: Frame had bad FCS, but was copied to memory as ignore FCS enabled.</p>
12:0	<p>These bits represent the length of the received frame which may or may not include FCS depending on whether FCS discard mode is enabled.</p> <p><b>With FCS discard mode disabled:</b> (bit 17 clear in Network Configuration Register)</p> <p>Least significant 12 bits for length of frame including FCS. If jumbo frames are enabled, these 12 bits are concatenated with bit[13] of the descriptor above.</p> <p><b>With FCS discard mode enabled:</b> (bit 17 set in Network Configuration Register)</p> <p>Least significant 12 bits for length of frame excluding FCS. If jumbo frames are enabled, these 12 bits are concatenated with bit[13] of the descriptor above.</p>

To receive frames, the AHB buffer descriptors must be initialized by writing an appropriate address to bits 31:2 in the first word of each list entry. Bit 0 must be written with zero. Bit 1 is the wrap bit and indicates the last entry in the buffer descriptor list.

The start location of the receive buffer descriptor list must be written with the receive buffer queue base address before reception is enabled (receive enable in the Network Control register). Once reception is enabled, any writes to the Receive Buffer Queue Base Address register are ignored. When read, it will return the current pointer position in the descriptor list, though this is only valid and stable when receive is disabled.

If the filter block indicates that a frame should be copied to memory, the receive data DMA operation starts writing data into the receive buffer. If an error occurs, the buffer is recovered.

An internal counter within the GEMAC represents the receive buffer queue pointer and it is not visible through the CPU interface. The receive buffer queue pointer increments by two words after each buffer

has been used. It re-initializes to the receive buffer queue base address if any descriptor has its wrap bit set.

As receive AHB buffers are used, the receive AHB buffer manager sets bit zero of the first word of the descriptor to logic one indicating the AHB buffer has been used.

Software should search through the “used” bits in the AHB buffer descriptors to find out how many frames have been received, checking the start of frame and end of frame bits.

When the DMA is configured in the packet buffer Partial Store And Forward mode, received frames are written out to the AHB buffers as soon as enough frame data exists in the packet buffer. For both cases, this may mean several full AHB buffers are used before some error conditions can be detected. If a receive error is detected the receive buffer currently being written will be recovered. Previous buffers will not be recovered. As an example, when receiving frames with cyclic redundancy check (CRC) errors or excessive length, it is possible that a frame fragment might be stored in a sequence of AHB receive buffers. Software can detect this by looking for start of frame bit set in a buffer following a buffer with no end of frame bit set.

To function properly, a 10/100/1000 Ethernet system should have no excessive length frames or frames greater than 128 bytes with CRC errors. Collision fragments will be less than 128 bytes long, therefore it will be a rare occurrence to find a frame fragment in a receive AHB buffer, when using the default value of 128 bytes for the receive buffers size.

When in packet buffer full store and forward mode, only good received frames are written out of the DMA, so no fragments will exist in the AHB buffers due to MAC receiver errors. There is still the possibility of fragments due to DMA errors, for example used bit read on the second buffer of a multi-buffer frame.

If bit zero of the receive buffer descriptor is already set when the receive buffer manager reads the location of the receive AHB buffer, then the buffer has been already used and cannot be used again until software has processed the frame and cleared bit zero. In this case, the “buffer not available” bit in the Receive Status register is set and an interrupt triggered. The Receive Resource Error statistics register is also incremented.

When the DMA is configured in the packet buffer full store and forward mode, the user can optionally select whether received frames should be automatically discarded when no AHB buffer resource is available. This feature is selected via bit 24 of the DMA Configuration register (by default, the received frames are not automatically discarded). If this feature is off, then received packets will remain to be stored in the SRAM-based packet buffer until AHB buffer resource next becomes available. This may lead to an eventual packet buffer overflow if packets continue to be received when bit zero (used bit) of the receive buffer descriptor remains set. Note that after a used bit has been read, the receive buffer manager will re-read the location of the receive buffer descriptor every time a new packet is received. When the DMA is not configured in the packet buffer full store and forward mode and a used bit is read, the frame currently being received will be automatically discarded.

When the DMA is configured in the packet buffer full store and forward mode, a receive overrun condition occurs when the receive SRAM-based packet buffer is full, or because HRESP was not OK. In all other modes, a receive overrun condition occurs when either the AHB bus was not granted quickly enough, or because HRESP was not OK, or because a new frame has been detected by the receive block, but the status update or write back for the previous frame has not yet finished. For a receive overrun condition, the receive overrun interrupt is asserted and the buffer currently being written is recovered. The next frame that is received whose address is recognized reuses the buffer.

In any packet buffer mode, a write to bit 18 of GMAC\_NCR will force a packet from the external SRAM-based receive packet buffer to be flushed. This feature is only acted upon when the RX DMA is not

currently writing packet data out to AHB, i.e., it is in an IDLE state. If the RX DMA is active, a write to this bit is ignored.

### 39.6.3.4 Transmit AHB Buffers

Frames to transmit are stored in one or more transmit AHB buffers. Transmit frames can be between 1 and 16384 bytes long, so it is possible to transmit frames longer than the maximum length specified in the IEEE 802.3 standard. It should be noted that zero length AHB buffers are allowed and that the maximum number of buffers permitted for each transmit frame is 128.

The start location for each transmit AHB buffer is stored in memory in a list of transmit buffer descriptors at a location pointed to by the transmit buffer queue pointer. The base address for this queue pointer is set in software using the Transmit Buffer Queue Base Address register. Each list entry consists of two words. The first is the byte address of the transmit buffer and the second containing the transmit control and status. For the packet buffer DMA, the start location for each AHB buffer is a byte address, the bottom bits of the address being used to offset the start of the data from the data-word boundary (i.e., bits 2,1 and 0 are used to offset the address for 64-bit datapaths).

Frames can be transmitted with or without automatic CRC generation. If CRC is automatically generated, pad will also be automatically generated to take frames to a minimum length of 64 bytes. When CRC is not automatically generated (as defined in word 1 of the transmit buffer descriptor), the frame is assumed to be at least 64 bytes long and pad is not generated.

An entry in the transmit buffer descriptor list is described in the table below.

To transmit frames, the buffer descriptors must be initialized by writing an appropriate byte address to bits [31:0] in the first word of each descriptor list entry.

The second word of the transmit buffer descriptor is initialized with control information that indicates the length of the frame, whether or not the MAC is to append CRC and whether the buffer is the last buffer in the frame.

After transmission the status bits are written back to the second word of the first buffer along with the used bit. Bit 31 is the used bit which must be zero when the control word is read if transmission is to take place. It is written to one once the frame has been transmitted. Bits[29:20] indicate various transmit error conditions. Bit 30 is the wrap bit which can be set for any buffer within a frame. If no wrap bit is encountered the queue pointer continues to increment.

The Transmit Buffer Queue Base Address register can only be updated while transmission is disabled or halted; otherwise any attempted write will be ignored. When transmission is halted the transmit buffer queue pointer will maintain its value. Therefore when transmission is restarted the next descriptor read from the queue will be from immediately after the last successfully transmitted frame. While transmit is disabled (bit 3 of the Network Control register set low), the transmit buffer queue pointer resets to point to the address indicated by the Transmit Buffer Queue Base Address register. Note that disabling receive does not have the same effect on the receive buffer queue pointer.

Once the transmit queue is initialized, transmit is activated by writing to the transmit start bit (bit 9) of the Network Control register. Transmit is halted when a buffer descriptor with its used bit set is read, a transmit error occurs, or by writing to the transmit halt bit of the Network Control register. Transmission is suspended if a pause frame is received while the pause enable bit is set in the Network Configuration register. Rewriting the start bit while transmission is active is allowed. This is implemented with TXGO variable which is readable in the Transmit Status register at bit location 3. The TXGO variable is reset when:

- Transmit is disabled.
- A buffer descriptor with its ownership bit set is read.

- Bit 10, THALT, of the Network Control register is written.
- There is a transmit error such as too many retries or a transmit underrun.

To set TXGO, write TSTART to the bit 9 of the Network Control register. Transmit halt does not take effect until any ongoing transmit finishes.

If the DMA is configured for packet buffer Partial Store and Forward mode and a collision occurs during transmission of a multi-buffer frame, transmission will automatically restart from the first buffer of the frame. For packet buffer mode, the entire contents of the frame are read into the transmit packet buffer memory, so the retry attempt will be replayed directly from the packet buffer memory rather than having to re-fetch through the AHB.

If a used bit is read midway through transmission of a multi-buffer frame, this is treated as a transmit error. Transmission stops, GTXER is asserted and the FCS will be bad.

If transmission stops due to a transmit error or a used bit being read, transmission restarts from the first buffer descriptor of the frame being transmitted when the transmit start bit is rewritten.

**Table 39-3. Transmit Buffer Descriptor Entry**

Bit	Function
Word 0	
31:0	Byte address of buffer
Word 1	
31	Used—must be zero for the GEMAC to read data to the transmit buffer. The GEMAC sets this to one for the first buffer of a frame once it has been successfully transmitted. Software must clear this bit before the buffer can be used again.
30	Wrap—marks last descriptor in transmit buffer descriptor list. This can be set for any buffer within the frame.
29	Retry limit exceeded, transmit error detected
28	Reserved.
27	Transmit frame corruption due to AHB error—set if an error occurs while midway through reading transmit frame from the AHB, including HRESP errors and buffers exhausted mid frame (if the buffers run out during transmission of a frame then transmission stops, FCS shall be bad and GTXER asserted). Also set if single frame is too large for configured packet buffer memory size.
26	Late collision, transmit error detected.
25:23	Reserved

.....continued	
Bit	Function
22:20	Transmit IP/TCP/UDP checksum generation offload errors: 000: No Error.  001: The Packet was identified as a VLAN type, but the header was not fully complete, or had an error in it.  010: The Packet was identified as a SNAP type, but the header was not fully complete, or had an error in it.  011: The Packet was not of an IP type, or the IP packet was invalidly short, or the IP was not of type IPv4/IPv6.  100: The Packet was not identified as VLAN, SNAP or IP.  101: Non supported packet fragmentation occurred. For IPv4 packets, the IP checksum was generated and inserted.  110: Packet type detected was not TCP or UDP. TCP/UDP checksum was therefore not generated. For IPv4 packets, the IP checksum was generated and inserted.  111: A premature end of packet was detected and the TCP/UDP checksum could not be generated.
19:17	Reserved
16	No CRC to be appended by MAC. When set, this implies that the data in the buffers already contains a valid CRC, hence no CRC or padding is to be appended to the current frame by the MAC.  This control bit must be set for the first buffer in a frame and will be ignored for the subsequent buffers of a frame.  Note that this bit must be clear when using the transmit IP/TCP/UDP checksum generation offload, otherwise checksum generation and substitution will not occur.
15	Last buffer, when set this bit will indicate the last buffer in the current frame has been reached.
14	Reserved
13:0	Length of buffer

### 39.6.3.5 DMA Bursting on the AHB

The DMA will always use SINGLE, or INCR type AHB accesses for buffer management operations. When performing data transfers, the AHB burst length used can be programmed using bits 4:0 of the DMA Configuration register so that either SINGLE, INCR or fixed length incrementing bursts (INCR4, INCR8 or INCR16) are used where possible.

When there is enough space and enough data to be transferred, the programmed fixed length bursts will be used. If there is not enough data or space available, for example when at the beginning or the end of a buffer, SINGLE type accesses are used. Also SINGLE type accesses are used at 1024 byte boundaries, so that the 1 Kbyte boundaries are not burst over as per AHB requirements.

The DMA will not terminate a fixed length burst early, unless an error condition occurs on the AHB or if receive or transmit are disabled in the Network Control register.

### 39.6.3.6 DMA Packet Buffer

The DMA uses packet buffers for both transmit and receive paths. This mode allows multiple packets to be buffered in both transmit and receive directions. This allows the DMA to withstand far greater access latencies on the AHB and make more efficient use of the AHB bandwidth. There are two modes of operation—Full Store and Forward and Partial Store and Forward.

As described in section [Partial Store and Forward Using Packet Buffer DMA](#), the DMA can be programmed into a low latency mode, known as Partial Store and Forward.

When the DMA is in full store and forward mode, full packets are buffered which provides the possibility to:

- Discard packets with error on the receive path before they are partially written out of the DMA, thus saving AHB bus bandwidth and driver processing overhead,
- Retry collided transmit frames from the buffer, thus saving AHB bus bandwidth,
- Implement transmit IP/TCP/UDP checksum generation offload.

With the packet buffers included, the structure of the GEMAC data paths is shown in the figure below.

**Figure 39-2. Data Paths with Packet Buffers Included**

### 39.6.3.7 Transmit Packet Buffer

The transmitter packet buffer will continue attempting to fetch frame data from the AHB system memory until the packet buffer itself is full, at which point it will attempt to maintain its full level.

To accommodate the status and statistics associated with each frame, three words per packet are reserved at the end of the packet data. If the packet is bad and requires to be dropped, the status and statistics are the only information held on that packet. Storing the status in the DPRAM is required in order to decouple the DMA interface of the buffer from the MAC interface, to update the MAC status/statistics and to generate interrupts in the order in which the packets that they represent were fetched from the AHB memory.

If any errors occur on the AHB while reading the transmit frame, the fetching of packet data from AHB memory is halted. The MAC transmitter will continue to fetch packet data, thereby emptying the packet buffer and allowing any good non-errored frames to be transmitted successfully. Once these have been fully transmitted, the status/statistics for the errored frame will be updated and software will be informed via an interrupt that an AHB error occurred. This way, the error is reported in the correct packet order.

The transmit packet buffer will only attempt to read more frame data from the AHB when space is available in the packet buffer memory. If space is not available it must wait until the a packet fetched by the MAC completes transmission and is subsequently removed from the packet buffer memory. Note that if full store and forward mode is active and if a single frame is fetched that is too large for the packet buffer memory, the frame is flushed and the DMA halted with an error status. This is because a complete frame must be written into the packet buffer before transmission can begin, and therefore the minimum packet buffer memory size should be chosen to satisfy the maximum frame to be transmitted in the application.

In full store and forward mode, once the complete transmit frame is written into the packet buffer memory, a trigger is sent across to the MAC transmitter, which will then begin reading the frame from the packet buffer memory. Since the whole frame is present and stable in the packet buffer memory an underflow of the transmitter is not possible. The frame is kept in the packet buffer until notification is received from the MAC that the frame data has either been successfully transmitted or can no longer be retransmitted (too many retries in half duplex mode). When this notification is received the frame is flushed from memory to make room for a new frame to be fetched from AHB system memory.

In Partial Store and Forward mode, a trigger is sent across to the MAC transmitter as soon as sufficient packet data is available, which will then begin fetching the frame from the packet buffer memory. If, after this point, the MAC transmitter is able to fetch data from the packet buffer faster than the AHB DMA can fill it, an underflow of the transmitter is possible. In this case, the transmission is terminated early, and the packet buffer is completely flushed. Transmission can only be restarted by writing to the transmit START bit.

In half duplex mode, the frame is kept in the packet buffer until notification is received from the MAC that the frame data has either been successfully transmitted or can no longer be retransmitted (too many retries in half duplex mode). When this notification is received the frame is flushed from memory to make room for a new frame to be fetched from AHB system memory.

In full duplex mode, the frame is removed from the packet buffer on the fly.

Other than underflow, the only MAC related errors that can occur are due to collisions during half duplex transmissions. When a collision occurs the frame still exists in the packet buffer memory so can be retried directly from there. Only once the MAC transmitter has failed to transmit after sixteen attempts is the frame finally flushed from the packet buffer.

### 39.6.3.8 Receive Packet Buffer

The receive packet buffer stores frames from the MAC receiver along with their status and statistics. Frames with errors are flushed from the packet buffer memory, while good frames are pushed onto the DMA AHB interface.

The receiver packet buffer monitors the FIFO write interface from the MAC receiver and translates the FIFO pushes into packet buffer writes. At the end of the received frame the status and statistics are buffered so that the information can be used when the frame is read out. When programmed in full store and forward mode, if the frame has an error the frame data is immediately flushed from the packet buffer memory allowing subsequent frames to utilise the freed up space. The status and statistics for bad frames are still used to update the GEMAC registers.

To accommodate the status and statistics associated with each frame, three words per packet (or two if configured in 64-bit datapath mode) are reserved at the end of the packet data. If the packet is bad and requires to be dropped, the status and statistics are the only information held on that packet.

The receiver packet buffer will also detect a full condition so that an overflow condition can be detected. If this occurs, subsequent packets are dropped and an RX overflow interrupt is raised.

For full store and forward, the DMA only begins packet fetches once the status and statistics for a frame are available. If the frame has a bad status due to a frame error, the status and statistics are passed on to the GEMAC registers. If the frame has a good status, the information is used to read the frame from the packet buffer memory and burst onto the AHB using the DMA buffer management protocol. Once the last frame data has been transferred to the packet buffer, the status and statistics are updated to the GEMAC registers.

If Partial Store and Forward mode is active, the DMA will begin fetching the packet data before the status is available. As soon as the status becomes available, the DMA will fetch this information as soon as possible before continuing to fetch the remainder of the frame. Once the last frame data has been transferred to the packet buffer, the status and statistics are updated to the GEMAC registers.

### 39.6.3.9 Priority Queueing in the DMA

The DMA by default uses a single transmit and receive queue. This means the list of transmit/receive buffer descriptors point to data buffers associated with a single transmit/receive data stream. The GEMAC can select up to 3 priority queues. Each queue has an independent list of buffer descriptors pointing to separate data streams.

The table below gives the DPRAM size associated with each queue:

**Table 39-4. Queue Size**

Queue Number	Queue Size
2	4 KB
1	2 KB
0 (lowest priority)	2 KB

In the transmit direction, higher priority queues are always serviced before lower priority queues, with Q0 as lowest priority and Q2 as highest priority. This strict priority scheme requires the user to ensure that high priority traffic is constrained so that lower priority traffic will have required bandwidth. The GEMAC DMA will determine the next queue to service by initiating a sequence of buffer descriptor reads interrogating the ownership bits of each. The buffer descriptor corresponding to the highest priority queue is read first. As an example, if the ownership bit of this descriptor is set, then the DMA will progress to

reading the 2nd highest priority queue's descriptor. If that ownership bit read of this lower priority queue is set, then the DMA will read the 3rd highest priority queue's descriptor. If all the descriptors return an ownership bit set, then a resource error has occurred, an interrupt is generated and transmission is automatically halted. Transmission can only be restarted by setting the START bit in the Network Control register. The GEMAC DMA will need to identify the highest available queue to transmit from when the START bit in the Network Control register is written to and the TX is in a halted state, or when the last word of any packet has been fetched from external AHB memory.

The GEMAC transmit DMA maximizes the effectiveness of priority queuing by ensuring that high priority traffic be transmitted as early as possible after being fetched from AHB. High priority traffic fetched from AHB will be pushed to the MAC layer, depending on traffic shaping being enabled and the associated credit value for that queue, before any lower priority traffic that may pre-exist in the transmit SRAM-based packet buffer. This is achieved by separating the transmit SRAM-based packet buffer into regions, one region per queue. The size of each region determines the amount of SRAM space allocated per queue.

For each queue, there is an associated Transmit Buffer Queue Base Address register. For the lowest priority queue (or the only queue when only one queue is selected), the Transmit Buffer Queue Base Address is located at address 0x1C. For all other queues, the Transmit Buffer Queue Base Address registers are located at sequential addresses starting at address 0x440.

In the receive direction each packet is written to AHB data buffers in the order that it is received. For each queue, there is an independent set of receive AHB buffers for each queue. There is therefore a separate Receive Buffer Queue Base Address register for each queue. For the lowest priority queue (or the only queue when only one queue is selected), the Receive Buffer Queue Base Address is located at address 0x18. For all other queues, the Receive Buffer Queue Base Address registers are located at sequential addresses starting at address 0x480. Every received packet will pass through a programmable screening algorithm which will allocate a particular queue to that frame. The user interface to the screeners is through two types of programmable registers:

- Screening Type 1 registers—The module features 4 Screening Type 1 registers. Screening Type 1 registers hold values to match against specific IP and UDP fields of the received frames. The fields matched against are DS (Differentiated Services field of IPv4 frames), TC (Traffic class field of IPv6 frames) and/or the UDP destination port.
- Screening Type 2 registers—The module features 8 Screening Type 2 registers GMAC\_ST2RPQ. Screening Type 2 registers operate independently of Screening Type 1 registers and offer additional match capabilities. Screening Type 2 allows a screen to be configured that is the combination of all or any of the following comparisons:
  1. An enable bit VLAN priority, VLANE. A VLAN priority match will be performed if the VLAN priority enable is set. The extracted priority field in the VLAN header is compared against VLANP in the GMAC\_ST2RPQ register itself.
  2. An enable bit EtherType, ETHE. The EtherType field I2ETH inside GMAC\_ST2RPQ maps to one of 4 EtherType match registers, GMAC\_ST2ER. The extracted EtherType is compared against GMAC\_ST2ER designated by this EtherType field.
  3. An enable bit Compare A, COMPAE. This bit is associated with a Screening Type 2 Compare Word 0/1 register x, GMAC\_ST2CW0/1.
  4. An enable bit Compare B, COMPBE. This bit is associated with a Screening Type 2 Compare Word 0/1 register x, GMAC\_ST2CW0/1.
  5. An enable bit Compare C, COMPCE. This bit is associated with a Screening Type 2 Compare Word 0/1 register x, GMAC\_ST2CW0/1.

Each screener type has an enable bit, a match pattern and a queue number. If a received frame matches on an enabled Screening register, then the frame will be tagged with the queue value in the associated Screening register, and forwarded onto the DMA and subsequently into the external memory associated with that queue. If two screeners are matched, then the one which resides at the lowest register address will take priority so care must be taken on the selection of the screener location.

When the priority queuing feature is enabled, the number of interrupt outputs from the GEMAC core is increased to match the number of supported queues. The number of Interrupt Status registers is increased by the same number. Only DMA related events are reported using the individual interrupt outputs, as the GEMAC can relate these events to specific queues. All other events generated within the GEMAC are reported in the interrupt associated with the lowest priority queue. For the lowest priority queue (or the only queue when only 1 queue is selected), the Interrupt Status register is located at address 0x24. For all other queues, the Interrupt Status register is located at sequential addresses starting at address 0x400.

**Note:** The address matching is the first level of filtering. If there is a match, the screeners are the next level of filtering for routing the data to the appropriate queue. See [MAC Filtering Block](#) for more details.

The additional screening done by the functions Compare A, B, and C each have an enable bit and compare register field. COMPA, COMPB and COMPC in GMAC\_ST2RPQ are pointers to a configured offset (OFFSVL), value (COMPVAL), and mask (MASKVAL). If enabled, the compare is true if the data at the offset into the frame, ANDed with MASKVAL, is equal to the value of COMPVAL ANDed with MASKVAL. A 16-bit word comparison is done. The byte at the offset number of bytes from the index start is compared to bits 7:0 of the configured COMPVAL and MASKVAL. The byte at the offset number of bytes + 1 from the index start is compared to bits 15:8 of the configured COMPVAL and MASKVAL.

The offset value in bytes, OFFSVL, ranges from 0 to 127 bytes from either the start of the frame, the byte after the EtherType field, the byte after the IP header (IPv4 or IPv6) or the byte after the TCP/UDP header. Note the logic to decode the IP header or the TCP/UDP header is reused from the TCP/UDP/IP checksum offload logic and therefore has the same restrictions on use (the main limitation is that IP fragmentation is not supported). Refer to the Checksum Offload for IP, TCP and UDP section of this documentation for further details.

Compare A, B, and C use a common set of 24 GMAC\_ST2CW0/1 registers, thus all COMPA, COMPB and COMPC fields in the registers GMAC\_ST2RPQ point to a single pool of 24 GMAC\_ST2CW0/1 registers.

Note that Compare A, B and C together allow matching against an arbitrary 48 bits of data and so can be used to match against a MAC address.

All enabled comparisons are ANDed together to form the overall type 2 screening match.

### 39.6.4 MAC Transmit Block

The MAC transmitter can operate in either half duplex or full duplex mode and transmits frames in accordance with the Ethernet IEEE 802.3 standard. In half duplex mode, the CSMA/CD protocol of the IEEE 802.3 specification is followed.

A small input buffer receives data through the FIFO interface which will extract data in 32-bit form. All subsequent processing prior to the final output is performed in bytes.

Transmit data can be output using the MII interface.

Frame assembly starts by adding preamble and the start frame delimiter. Data is taken from the transmit FIFO interface a word at a time.

If necessary, padding is added to take the frame length to 60 bytes. CRC is calculated using an order 32-bit polynomial. This is inverted and appended to the end of the frame taking the frame length to a minimum of 64 bytes. If the no CRC bit is set in the second word of the last buffer descriptor of a transmit frame, neither pad nor CRC are appended. The no CRC bit can also be set through the FIFO interface.

In full duplex mode (at all data rates), frames are transmitted immediately. Back to back frames are transmitted at least 96 bit times apart to guarantee the interframe gap.

In half duplex mode, the transmitter checks carrier sense. If asserted, the transmitter waits for the signal to become inactive, and then starts transmission after the interframe gap of 96 bit times. If the collision signal is asserted during transmission, the transmitter will transmit a jam sequence of 32 bits taken from the data register and then retry transmission after the backoff time has elapsed. If the collision occurs during either the preamble or Start Frame Delimiter (SFD), then these fields will be completed prior to generation of the jam sequence.

The backoff time is based on an XOR of the 10 least significant bits of the data coming from the transmit FIFO interface and a 10-bit pseudo random number generator. The number of bits used depends on the number of collisions seen. After the first collision 1 bit is used, then the second 2 bits and so on up to the maximum of 10 bits. All 10 bits are used above ten collisions. An error will be indicated and no further attempts will be made if 16 consecutive attempts cause collision. This operation is compliant with the description in Clause 4.2.3.2.5 of the IEEE 802.3 standard which refers to the truncated binary exponential backoff algorithm.

In 10/100 mode, both collisions and late collisions are treated identically, and backoff and retry will be performed up to 16 times. This condition is reported in the transmit buffer descriptor word 1 (late collision, bit 26) and also in the Transmit Status register (late collision, bit 7). An interrupt can also be generated (if enabled) when this exception occurs, and bit 5 in the Interrupt Status register will be set.

In all modes of operation, if the transmit DMA underruns, a bad CRC is automatically appended using the same mechanism as jam insertion and the GTXER signal is asserted. For a properly configured system this should never happen and also it is impossible if configured to use the DMA with packet buffers, as the complete frame is buffered in local packet buffer memory.

By setting when bit 28 is set in the Network Configuration register, the Inter Packet Gap (IPG) may be stretched beyond 96 bits depending on the length of the previously transmitted frame and the value written to the IPG Stretch register (GMAC\_IPGS). The least significant 8 bits of the IPG Stretch register multiply the previous frame length (including preamble). The next significant 8 bits (+1 so as not to get a divide by zero) divide the frame length to generate the IPG. IPG stretch only works in full duplex mode and when bit 28 is set in the Network Configuration register. The IPG Stretch register cannot be used to shrink the IPG below 96 bits.

### 39.6.5 MAC Receive Block

All processing within the MAC receive block is implemented using a 16-bit data path. The MAC receive block checks for valid preamble, FCS, alignment and length, presents received frames to the FIFO interface and stores the frame destination address for use by the address checking block.

If, during the frame reception, the frame is found to be too long, a bad frame indication is sent to the FIFO interface. The receiver logic ceases to send data to memory as soon as this condition occurs.

At end of frame reception the receive block indicates to the DMA block whether the frame is good or bad. The DMA block will recover the current receive buffer if the frame was bad.

Ethernet frames are normally stored in DMA memory complete with the FCS. Setting the FCS remove bit in the network configuration (bit 17) causes frames to be stored without their corresponding FCS. The reported frame length field is reduced by four bytes to reflect this operation.

The receive block signals to the register block to increment the alignment, CRC (FCS), short frame, long frame, jabber or receive symbol errors when any of these exception conditions occur.

If bit 26 is set in the network configuration, CRC errors will be ignored and CRC errored frames will not be discarded, though the Frame Check Sequence Errors statistic register will still be incremented. Additionally, if not enabled for jumbo frames mode, then bit[13] of the receiver descriptor word 1 will be updated to indicate the FCS validity for the particular frame. This is useful for applications such as EtherCAT whereby individual frames with FCS errors must be identified.

Received frames can be checked for length field error by setting the length field error frame discard bit of the Network Configuration register (bit-16). When this bit is set, the receiver compares a frame's measured length with the length field (bytes 13 and 14) extracted from the frame. The frame is discarded if the measured length is shorter. This checking procedure is for received frames between 64 bytes and 1518 bytes in length.

Each discarded frame is counted in the 10-bit Length Field Frame Error statistics register. Frames where the length field is greater than or equal to 0x0600 hex will not be checked.

### 39.6.6 Checksum Offload for IP, TCP and UDP

The GEMAC can be programmed to perform IP, TCP and UDP checksum offloading in both receive and transmit directions, which is enabled by setting bit 24 in the Network Configuration register for receive and bit 11 in the DMA Configuration register for transmit.

IPv4 packets contain a 16-bit checksum field, which is the 16-bit 1's complement of the 1's complement sum of all 16-bit words in the header. TCP and UDP packets contain a 16-bit checksum field, which is the 16-bit 1's complement of the 1's complement sum of all 16-bit words in the header, the data and a conceptual IP pseudo header.

To calculate these checksums in software requires each byte of the packet to be processed. For TCP and UDP this can use a large amount of processing power. Offloading the checksum calculation to hardware can result in significant performance improvements.

For IP, TCP or UDP checksum offload to be useful, the operating system containing the protocol stack must be aware that this offload is available so that it can make use of the fact that the hardware can either generate or verify the checksum.

#### 39.6.6.1 Receiver Checksum Offload

When receive checksum offloading is enabled in the GEMAC, the IPv4 header checksum is checked as per RFC 791, where the packet meets the following criteria:

- If present, the VLAN header must be four octets long and the CFI bit must not be set.
- Encapsulation must be RFC 894 Ethernet Type Encoding or RFC 1042 SNAP Encoding.
- IPv4 packet
- IP header is of a valid length

The GEMAC also checks the TCP checksum as per RFC 793, or the UDP checksum as per RFC 768, if the following criteria are met:

- IPv4 or IPv6 packet
- Good IP header checksum (if IPv4)

- No IP fragmentation
- TCP or UDP packet

When an IP, TCP or UDP frame is received, the receive buffer descriptor gives an indication if the GEMAC was able to verify the checksums. There is also an indication if the frame had SNAP encapsulation. These indication bits will replace the type ID match indication bits when the receive checksum offload is enabled. For details of these indication bits, refer to [Receive Buffer Descriptor Entry](#).

If any of the checksums are verified as incorrect by the GEMAC, the packet is discarded and the appropriate statistics counter incremented.

### 39.6.6.2 Transmitter Checksum Offload

The transmitter checksum offload is only available if the full store and forward mode is enabled. This is because the complete frame to be transmitted must be read into the packet buffer memory before the checksum can be calculated and written back into the headers at the beginning of the frame.

Transmitter checksum offload is enabled by setting bit [11] in the DMA Configuration register. When enabled, it will monitor the frame as it is written into the transmitter packet buffer memory to automatically detect the protocol of the frame. Protocol support is identical to the receiver checksum offload.

For transmit checksum generation and substitution to occur, the protocol of the frame must be recognized and the frame must be provided without the FCS field, by making sure that bit [16] of the transmit descriptor word 1 is clear. If the frame data already had the FCS field, this would be corrupted by the substitution of the new checksum fields.

If these conditions are met, the transmit checksum offload engine will calculate the IP, TCP and UDP checksums as appropriate. Once the full packet is completely written into packet buffer memory, the checksums will be valid and the relevant DPRAM locations will be updated for the new checksum fields as per standard IP/TCP and UDP packet structures.

If the transmitter checksum engine is prevented from generating the relevant checksums, bits [22:20] of the transmitter DMA writeback status will be updated to identify the reason for the error. Note that the frame will still be transmitted but without the checksum substitution, as typically the reason that the substitution did not occur was that the protocol was not recognized.

### 39.6.7 MAC Filtering Block

The filter block determines which frames should be written to the FIFO interface and on to the DMA.

Whether a frame is passed depends on what is enabled in the Network Configuration register, the state of the external matching pins, the contents of the specific address, type and Hash registers and the frame's destination address and type field.

If bit 25 of the Network Configuration register is not set, a frame will not be copied to memory if the GEMAC is transmitting in half duplex mode at the time a destination address is received.

Ethernet frames are transmitted a byte at a time, least significant bit first. The first six bytes (48 bits) of an Ethernet frame make up the destination address. The first bit of the destination address, which is the LSB of the first byte of the frame, is the group or individual bit. This is one for multicast addresses and zero for unicast. The all ones address is the broadcast address and a special case of multicast.

The GEMAC supports recognition of four specific addresses. Each specific address requires two registers, Specific Address Bottom register and Specific Address Top register. Specific Address Bottom register stores the first four bytes of the destination address and Specific Address Top register contains the last two bytes. The addresses stored can be specific, group, local or universal.

# SAMA5D2 Series

## Ethernet MAC (GMAC)

The destination address of received frames is compared against the data stored in the Specific Address registers once they have been activated. The addresses are deactivated at reset or when their corresponding Specific Address Bottom register is written. They are activated when Specific Address Top register is written. If a receive frame address matches an active address, the frame is written to the FIFO interface and on to DMA memory.

Frames may be filtered using the type ID field for matching. Four type ID registers exist in the register address space and each can be enabled for matching by writing a one to the MSB (bit 31) of the respective register. When a frame is received, the matching is implemented as an OR function of the various types of match.

The contents of each type ID register (when enabled) are compared against the length/type ID of the frame being received (e.g., bytes 13 and 14 in non-VLAN and non-SNAP encapsulated frames) and copied to memory if a match is found. The encoded type ID match bits (Word 0, Bit 22 and Bit 23) in the receive buffer descriptor status are set indicating which type ID register generated the match, if the receive checksum offload is disabled.

The reset state of the type ID registers is zero, hence each is initially disabled.

The following example illustrates the use of the address and type ID match registers for a MAC address of 21:43:65:87:A9:CB:

Preamble	55
SFD	D5
DA (Octet 0 - LSB)	21
DA (Octet 1)	43
DA (Octet 2)	65
DA (Octet 3)	87
DA (Octet 4)	A9
DA (Octet 5 - MSB)	CB
SA (LSB)	00 <sup>(1)</sup>
SA	00 <sup>(1)</sup>
SA	00 <sup>(1)</sup>
SA	00 <sup>(1)</sup>
SA	00 <sup>(1)</sup>
SA (MSB)	00 <sup>(1)</sup>
Type ID (MSB)	43
Type ID (LSB)	21

**Note:**

1. Contains the address of the transmitting device.

The sequence above shows the beginning of an Ethernet frame. Byte order of transmission is from top to bottom as shown. For a successful match to specific address 1, the following address matching registers must be set up:

- Specific Address 1 Bottom register (GMAC\_SAB1) (Address 0x088) 0x87654321
- Specific Address 1 Top register (GMAC\_SAT1) (Address 0x08C) 0x0000CBA9

For a successful match to the type ID, the following Type ID Match 1 register must be set up:

- Type ID Match 1 register (GMAC\_TIDM1) (Address 0x0A8) 0x80004321

### 39.6.8 Broadcast Address

Frames with the broadcast address of 0xFFFFFFFF are stored to memory only if the 'no broadcast' bit in the Network Configuration register is set to zero.

### 39.6.9 Hash Addressing

The hash address register is 64 bits long and takes up two locations in the memory map. The least significant bits are stored in Hash Register Bottom and the most significant bits in Hash Register Top.

The unicast hash enable and the multicast hash enable bits in the Network Configuration register enable the reception of hash matched frames. The destination address is reduced to a 6-bit index into the 64-bit Hash register using the following hash function: The hash function is an XOR of every sixth bit of the destination address.

```
hash_index[05] = da[05] ^ da[11] ^ da[17] ^ da[23] ^ da[29] ^ da[35] ^ da[41] ^ da[47]
hash_index[04] = da[04] ^ da[10] ^ da[16] ^ da[22] ^ da[28] ^ da[34] ^ da[40] ^ da[46]
hash_index[03] = da[03] ^ da[09] ^ da[15] ^ da[21] ^ da[27] ^ da[33] ^ da[39] ^ da[45]
hash_index[02] = da[02] ^ da[08] ^ da[14] ^ da[20] ^ da[26] ^ da[32] ^ da[38] ^ da[44]
hash_index[01] = da[01] ^ da[07] ^ da[13] ^ da[19] ^ da[25] ^ da[31] ^ da[37] ^ da[43]
hash_index[00] = da[00] ^ da[06] ^ da[12] ^ da[18] ^ da[24] ^ da[30] ^ da[36] ^ da[42]
da[0]
```

represents the least significant bit of the first byte received, that is, the multicast/unicast indicator, and da[47] represents the most significant bit of the last byte received.

If the hash index points to a bit that is set in the Hash register then the frame will be matched according to whether the frame is multicast or unicast.

A multicast match will be signalled if the multicast hash enable bit is set, da[0] is logic 1 and the hash index points to a bit set in the Hash register.

A unicast match will be signalled if the unicast hash enable bit is set, da[0] is logic 0 and the hash index points to a bit set in the Hash register.

To receive all multicast frames, the Hash register should be set with all ones and the multicast hash enable bit should be set in the Network Configuration register.

### 39.6.10 Copy all Frames (Promiscuous Mode)

If the Copy All Frames bit is set in the Network Configuration register then all frames except those that are too long, too short, have FCS errors or have GRXER asserted during reception will be copied to memory. Frames with FCS errors will be copied if bit 26 is set in the Network Configuration register.

### 39.6.11 Disable Copy of Pause Frames

Pause frames can be prevented from being written to memory by setting the disable copying of pause frames control bit 23 in the Network Configuration register. When set, pause frames are not copied to memory regardless of the Copy All Frames bit, whether a hash match is found, a type ID match is identified or if a destination address match is found.

### 39.6.12 VLAN Support

The following table describes an Ethernet encoded 802.1Q VLAN tag.

**Table 39-5. 802.1Q VLAN Tag**

TPID (Tag Protocol Identifier) 16 bits	TCI (Tag Control Information) 16 bits
0x8100	First 3 bits priority, then CFI bit, last 12 bits VID

The VLAN tag is inserted at the 13th byte of the frame adding an extra four bytes to the frame. To support these extra four bytes, the GEMAC can accept frame lengths up to 1536 bytes by setting bit 8 in the Network Configuration register.

If the VID (VLAN identifier) is null (0x000) this indicates a priority-tagged frame.

The following bits in the receive buffer descriptor status word give information about VLAN tagged frames:-

- Bit 21 set if receive frame is VLAN tagged (i.e., type ID of 0x8100).
- Bit 20 set if receive frame is priority tagged (i.e., type ID of 0x8100 and null VID). (If bit 20 is set, bit 21 will be set also.)
- Bit 19, 18 and 17 set to priority if bit 21 is set.
- Bit 16 set to CFI if bit 21 is set.

The GEMAC can be configured to reject all frames except VLAN tagged frames by setting the discard non-VLAN frames bit in the Network Configuration register.

### 39.6.13 Wake on LAN Support

The receive block supports Wake on LAN by detecting the following events on incoming receive frames:

- Magic packet
- Address Resolution Protocol (ARP) request to the device IP address
- Specific address 1 filter match
- Multicast hash filter match

These events can be individually enabled through bits [19:16] of the Wake on LAN register. Also, for Wake on LAN detection to occur, receive enable must be set in the Network Control register, however a receive buffer does not have to be available.

In case of an ARP request, specific address 1 or multicast filter events will occur even if the frame is errored. For magic packet events, the frame must be correctly formed and error free.

A magic packet event is detected if all of the following are true:

- Magic packet events are enabled through bit 16 of the Wake on LAN register
- The frame's destination address matches specific address 1
- The frame is correctly formed with no errors
- The frame contains at least 6 bytes of 0xFF for synchronization
- There are 16 repetitions of the contents of Specific Address 1 register immediately following the synchronization

An ARP request event is detected if all of the following are true:

- ARP request events are enabled through bit 17 of the Wake on LAN register
- Broadcasts are allowed by bit 5 in the Network Configuration register
- The frame has a broadcast destination address (bytes 1 to 6)
- The frame has a type ID field of 0x0806 (bytes 13 and 14)

- The frame has an ARP operation field of 0x0001 (bytes 21 and 22)
- The least significant 16 bits of the frame's ARP target protocol address (bytes 41 and 42) match the value programmed in bits[15:0] of the Wake on LAN register

The decoding of the ARP fields adjusts automatically if a VLAN tag is detected within the frame. The reserved value of 0x0000 for the Wake on LAN target address value will not cause an ARP request event, even if matched by the frame.

A specific address 1 filter match event will occur if all of the following are true:

- Specific address 1 events are enabled through bit 18 of the Wake on LAN register
- The frame's destination address matches the value programmed in the Specific Address 1 registers

A multicast filter match event will occur if all of the following are true:

- Multicast hash events are enabled through bit 19 of the Wake on LAN register
- Multicast hash filtering is enabled through bit 6 of the Network Configuration register
- The frame destination address matches against the multicast hash filter
- The frame destination address is not a broadcast

### 39.6.14 IEEE 1588 Support

IEEE 1588 is a standard for precision time synchronization in local area networks. It works with the exchange of special Precision Time Protocol (PTP) frames. The PTP messages can be transported over IEEE 802.3/Ethernet, over Internet Protocol Version 4 or over Internet Protocol Version 6 as described in the annex of IEEE P1588.D2.1.

The GEMAC indicates the message timestamp point (asserted on the start packet delimiter and de-asserted at end of frame) for all frames and the passage of PTP event frames (asserted when a PTP event frame is detected and de-asserted at end of frame).

IEEE 802.1AS is a subset of IEEE 1588. One difference is that IEEE 802.1AS uses the Ethernet multicast address 0180C200000E for sync frame recognition whereas IEEE 1588 does not. GEMAC is designed to recognize sync frames with both IEEE 802.1AS and IEEE 1588 addresses and so can support both 1588 and 802.1AS frame recognition simultaneously.

Synchronization between master and slave clocks is a two stage process.

First, the offset between the master and slave clocks is corrected by the master sending a sync frame to the slave with a follow up frame containing the exact time the sync frame was sent. Hardware assist modules at the master and slave side detect exactly when the sync frame was sent by the master and received by the slave. The slave then corrects its clock to match the master clock.

Second, the transmission delay between the master and slave is corrected. The slave sends a delay request frame to the master which sends a delay response frame in reply. Hardware assist modules at the master and slave side detect exactly when the delay request frame was sent by the slave and received by the master. The slave will now have enough information to adjust its clock to account for delay. For example, if the slave was assuming zero delay, the actual delay will be half the difference between the transmit and receive time of the delay request frame (assuming equal transmit and receive times) because the slave clock will be lagging the master clock by the delay time already.

The timestamp is taken when the message timestamp point passes the clock timestamp point. This can generate an interrupt if enabled (GMAC\_IER). However, MAC Filtering configuration is needed to actually 'copy' the message to memory. For Ethernet, the message timestamp point is the SFD and the clock timestamp point is the MII interface. (The IEEE 1588 specification refers to sync and delay\_req messages as event messages as these require timestamping. These events are captured in the registers

GMAC\_EFTx and GMAC\_EFRx, respectively. Follow up, delay response and management messages do not require timestamping and are referred to as general messages.)

1588 version 2 defines two additional PTP event messages. These are the peer delay request (Pdelay\_Req) and peer delay response (Pdelay\_Resp) messages. These events are captured in the registers GMAC\_PEFTx and GMAC\_PEFRx, respectively. These messages are used to calculate the delay on a link. Nodes at both ends of a link send both types of frames (regardless of whether they contain a master or slave clock). The Pdelay\_Resp message contains the time at which a Pdelay\_Req was received and is itself an event message. The time at which a Pdelay\_Resp message is received is returned in a Pdelay\_Resp\_Follow\_Up message.

1588 version 2 introduces transparent clocks of which there are two kinds, peer-to-peer (P2P) and end-to-end (E2E). Transparent clocks measure the transit time of event messages through a bridge and amend a correction field within the message to allow for the transit time. P2P transparent clocks additionally correct for the delay in the receive path of the link using the information gathered from the peer delay frames. With P2P transparent clocks delay\_req messages are not used to measure link delay. This simplifies the protocol and makes larger systems more stable.

The GEMAC recognizes four different encapsulations for PTP event messages:

1. 1588 version 1 (UDP/IPv4 multicast)
2. 1588 version 2 (UDP/IPv4 multicast)
3. 1588 version 2 (UDP/IPv6 multicast)
4. 1588 version 2 (Ethernet multicast)

For 1588 version 1 messages, sync and delay request frames are indicated by the GEMAC if the frame type field indicates TCP/IP, UDP protocol is indicated, the destination IP address is 224.0.1.129/130/131 or 132, the destination UDP port is 319 and the control field is correct.

The control field is 0x00 for sync frames and 0x01 for delay request frames.

For 1588 version 2 messages, the type of frame is determined by looking at the message type field in the first byte of the PTP frame. Whether a frame is version 1 or version 2 can be determined by looking at the version PTP field in the second byte of both version 1 and version 2 PTP frames.

In version 2 messages sync frames have a message type value of 0x0, delay\_req have 0x1, Pdelay\_Req have 0x2 and Pdelay\_Resp have 0x3.

### 39.6.15 Timestamp Unit

The TSU consists of a timer and registers to capture the time at which PTP event frames cross the message timestamp point. An interrupt is issued when a capture register is updated.

The timer is implemented as a 94-bit register with the upper 48 bits counting seconds, the next 30 bits counting nanoseconds and the lowest 16 bits counting sub-nanoseconds. The lower 46 bits rolls over when they have counted to one second. An interrupt is generated when the seconds increment. The timer value can be read, written and adjusted through the APB interface. The timer is clocked by MCK.

The amount by which the timer increments each clock cycle is controlled by the timer increment registers (GMAC\_TI). Bits 7:0 are the default increment value in nanoseconds and an additional 16 bits of sub-nanosecond resolution are available using the Timer Increment Sub-nanoseconds register (GMAC\_TISUBN). If the rest of the register is written with zero, the timer increments by the value in [7:0], plus the value of GMAC\_TISUBN, each clock cycle.

The GMAC\_TISUBN register allows a resolution of approximately 15 femtoseconds.

Bits 15:8 of the increment register are the alternative increment value in nanoseconds and bits 23:16 are the number of increments after which the alternative increment value is used. If 23:16 are zero then the alternative increment value will never be used.

Taking the example of 10.2 MHz, there are 102 cycles every ten microseconds or 51 every five microseconds. So a timer with a 10.2 MHz clock source is constructed by incrementing by 98 ns for fifty cycles and then incrementing by 100 ns ( $98 \times 50 + 100 = 5000$ ). This is programmed by setting the 1588 Timer Increment register to 0x00326462.

For a 49.8 MHz clock source it would be 20 ns for 248 cycles followed by an increment of 40 ns ( $20 \times 248 + 40 = 5000$ ) programmed as 0x00F82814.

Having eight bits for the “number of increments” field allows frequencies up to 50 MHz to be supported with 200 kHz resolution.

Without the alternative increment field the period of the clock would be limited to an integer number of nanoseconds, resulting in supported clock frequencies of 8, 10, 20, 25, 40, 50, 100, 125, 200 and 250 MHz.

There are eight additional 80-bit registers that capture the time at which PTP event frames are transmitted and received. An interrupt is issued when these registers are updated. The TSU timer count value can be compared to a programmable comparison value. For the comparison, the 48 bits of the seconds value and the upper 22 bits of the nanoseconds value are used. A signal (GTSUCOMP) is provided to indicate when the TSU timer count value is equal to the comparison value stored in the TSU timer comparison value registers (0x0DC, 0x0E0, and 0x0E4). The GTSUCOMP signal can be routed to the Timer peripheral to automatically toggle pin TOIA11/PD21. This can be used as the reference clock for an external PLL to regenerate the audio clock in Ethernet AVB. An interrupt can also be generated (if enabled) when the TSU timer count value and comparison value are equal, mapped to bit 29 of the Interrupt Status register.

### 39.6.16 MAC 802.3 Pause Frame Support

**Note:** See Clause 31, and Annex 31A and 31B of the IEEE standard 802.3 for a full description of MAC 802.3 pause operation.

The following table shows the start of a MAC 802.3 pause frame.

**Table 39-14. Start of an 802.3 Pause Frame**

Address		Type (MAC Control Frame)	Pause	
Destination	Source		Opcode	Time
0x0180C2000001	6 bytes	0x8808	0x0001	2 bytes

The GEMAC supports both hardware controlled pause of the transmitter, upon reception of a pause frame, and hardware generated pause frame transmission.

#### 39.6.16.1 802.3 Pause Frame Reception

Bit 13 of the Network Configuration register is the pause enable control for reception. If this bit is set, transmission pauses if a non zero pause quantum frame is received.

If a valid pause frame is received, then the Pause Time register is updated with the new frame's pause time, regardless of whether a previous pause frame is active or not. An interrupt (either bit 12 or bit 13 of the Interrupt Status register) is triggered when a pause frame is received, but only if the interrupt has been enabled (bit 12 and bit 13 of the Interrupt Mask register). Pause frames received with non zero quantum are indicated through the interrupt bit 12 of the Interrupt Status register. Pause frames received with zero quantum are indicated on bit 13 of the Interrupt Status register.

Once the Pause Time register is loaded and the frame currently being transmitted has been sent, no new frames are transmitted until the pause time reaches zero. The loading of a new pause time, and hence the pausing of transmission, only occurs when the GEMAC is configured for full duplex operation. If the GEMAC is configured for half duplex there will be no transmission pause, but the pause frame received interrupt will still be triggered. A valid pause frame is defined as having a destination address that matches either the address stored in Specific Address 1 register or if it matches the reserved address of

0x0180C2000001. It must also have the MAC control frame type ID of 0x8808 and have the pause opcode of 0x0001.

Pause frames that have frame check sequence (FCS) or other errors will be treated as invalid and will be discarded. 802.3 Pause frames that are received after Priority-based Flow Control (PFC) has been negotiated will also be discarded. Valid pause frames received will increment the Pause Frames Received statistic register.

The Pause Time register decrements every 512 bit times once transmission has stopped. For test purposes, the retry test bit can be set (bit 12 in the Network Configuration register) which causes the Pause Time register to decrement every GTXCK cycle once transmission has stopped.

The interrupt (bit 13 in the Interrupt Status register) is asserted whenever the Pause Time register decrements to zero (assuming it has been enabled by bit 13 in the Interrupt Mask register). This interrupt is also set when a zero quantum pause frame is received.

### 39.6.16.2 802.3 Pause Frame Transmission

Automatic transmission of pause frames is supported through the transmit pause frame bits of the Network Control register. If either bit 11 or bit 12 of the Network Control register is written with logic 1, an 802.3 pause frame will be transmitted, providing full duplex is selected in the Network Configuration register and the transmit block is enabled in the Network Control register.

Pause frame transmission will happen immediately if transmit is inactive or if transmit is active between the current frame and the next frame due to be transmitted.

Transmitted pause frames comprise the following:

- A destination address of 01-80-C2-00-00-01
- A source address taken from Specific Address 1 register
- A type ID of 88-08 (MAC control frame)
- A pause opcode of 00-01
- A Pause Quantum register
- Fill of 00 to take the frame to minimum frame length
- Valid FCS

The pause quantum used in the generated frame will depend on the trigger source for the frame as follows:

- If bit 11 is written with a one, the pause quantum will be taken from the Transmit Pause Quantum register. The Transmit Pause Quantum register resets to a value of 0xFFFF giving maximum pause quantum as default.
- If bit 12 is written with a one, the pause quantum will be zero.

After transmission, a pause frame transmitted interrupt will be generated (bit 14 of the Interrupt Status register) and the only the statistics register Pause Frames Transmitted is incremented.

Pause frames can also be transmitted by the MAC using normal frame transmission methods.

### 39.6.17 MAC PFC Priority-based Pause Frame Support

**Note:** Refer to the 802.1Qbb standard for a full description of priority-based pause operation.

The following table shows the start of a Priority-based Flow Control (PFC) pause frame.

**Table 39-15. Start of a PFC Pause Frame**

Address		Type (Mac Control Frame)	Pause Opcode	Priority Enable Vector	Pause Time
Destination	Source				
0x0180C2000001	6 bytes	0x8808	0x1001	2 bytes	8 × 2 bytes

The GEMAC supports PFC priority-based pause transmission and reception. Before PFC pause frames can be received, bit 16 of the Network Control register must be set.

### 39.6.17.1 PFC Pause Frame Reception

The ability to receive and decode priority-based pause frames is enabled by setting bit 16 of the Network Control register. When this bit is set, the GEMAC will match either classic 802.3 pause frames or PFC priority-based pause frames. Once a priority-based pause frame has been received and matched, then from that moment on the GEMAC will only match on priority-based pause frames (this is an 802.1Qbb requirement, known as PFC negotiation). Once priority-based pause has been negotiated, any received 802.3x format pause frames will not be acted upon.

If a valid priority-based pause frame is received then the GEMAC will decode the frame and determine which, if any, of the eight priorities require to be paused. Up to eight Pause Time registers are then updated with the eight pause times extracted from the frame regardless of whether a previous pause operation is active or not. An interrupt (either bit 12 or bit 13 of the Interrupt Status register) is triggered when a pause frame is received, but only if the interrupt has been enabled (bit 12 and bit 13 of the Interrupt Mask register). Pause frames received with non zero quantum are indicated through the interrupt bit 12 of the Interrupt Status register. Pause frames received with zero quantum are indicated on bit 13 of the Interrupt Status register. The loading of a new pause time only occurs when the GEMAC is configured for full duplex operation. If the GEMAC is configured for half duplex, the pause time counters will not be loaded, but the pause frame received interrupt will still be triggered. A valid pause frame is defined as having a destination address that matches either the address stored in Specific Address 1 register or if it matches the reserved address of 0x0180C2000001. It must also have the MAC control frame type ID of 0x8808 and have the pause opcode of 0x0101.

Pause frames that have frame check sequence (FCS) or other errors will be treated as invalid and will be discarded. Valid pause frames received will increment the Pause Frames Received Statistic register.

The Pause Time registers decrement every 512 bit times immediately following the PFC frame reception. For test purposes, the retry test bit can be set (bit 12 in the Network Configuration register) which causes the Pause Time register to decrement every GRXCK cycle once transmission has stopped.

The interrupt (bit 13 in the Interrupt Status register) is asserted whenever the Pause Time register decrements to zero (assuming it has been enabled by bit 13 in the Interrupt Mask register). This interrupt is also set when a zero quantum pause frame is received.

### 39.6.17.2 PFC Pause Frame Transmission

Automatic transmission of pause frames is supported through the transmit priority-based pause frame bit of the Network Control register. If bit 17 of the Network Control register is written with logic 1, a PFC pause frame will be transmitted providing full duplex is selected in the Network Configuration register and the transmit block is enabled in the Network Control register. When bit 17 of the Network Control register is set, the fields of the priority-based pause frame will be built using the values stored in the Transmit PFC Pause register.

Pause frame transmission will happen immediately if transmit is inactive or if transmit is active between the current frame and the next frame due to be transmitted.

Transmitted pause frames comprise the following:

- A destination address of 01-80-C2-00-00-01
- A source address taken from Specific Address 1 register
- A type ID of 88-08 (MAC control frame)
- A pause opcode of 01-01
- A priority enable vector taken from Transmit PFC Pause register
- 8 Pause Quantum registers
- Fill of 00 to take the frame to minimum frame length
- Valid FCS

The Pause Quantum registers used in the generated frame will depend on the trigger source for the frame as follows:

- If bit 17 of the Network Control register is written with a one, then the priority enable vector of the priority-based pause frame will be set equal to the value stored in the Transmit PFC Pause register [7:0]. For each entry equal to zero in the Transmit PFC Pause register [15:8], the pause quantum field of the pause frame associated with that entry will be taken from the Transmit Pause Quantum register. For each entry equal to one in the Transmit PFC Pause register [15:8], the pause quantum associated with that entry will be zero.
- The Transmit Pause Quantum register resets to a value of 0xFFFF giving maximum pause quantum as default.

After transmission, a pause frame transmitted interrupt will be generated (bit 14 of the Interrupt Status register) and the only statistics register that will be incremented will be the Pause Frames Transmitted register.

PFC Pause frames can also be transmitted by the MAC using normal frame transmission methods.

### 39.6.18 Energy-efficient Ethernet Support

IEEE 802.3az adds support for energy efficiency to Ethernet. These are the key features of 802.3az:

- Allows a system's transmit path to enter a low power mode if there is nothing to transmit.
- Allows a PHY to detect whether its link partner's transmit path is in low power mode, therefore allowing the system's receive path to enter low power mode.
- Link remains up during lower power mode and no frames are dropped.
- Asymmetric, one direction can be in low power mode while the other is transmitting normally.
- LPI (Low Power Idle) signaling is used to control entry and exit to and from low power modes.
- LPI signaling can only take place if both sides have indicated support for it through auto-negotiation.

These are the key features of 802.3az operation:

- Low power control is done at the MII (reconciliation sublayer).
- As an architectural convenience in writing the 802.3az it is assumed that transmission is deferred by asserting carrier sense, in practice it will not be done this way. This system will know when it has nothing to transmit and only enter low power mode when it is not transmitting.
- LPI should not be requested unless the link has been up for at least one second.
- LPI is signaled on the transmit path by asserting 0x01 on txd with tx\_en low and tx\_er high.
- A PHY on seeing LPI requested on the MII will send the sleep signal before going quiet. After going quiet it will periodically transmit refresh signals.

- LPI mode ends by transmitting normal idle for the wake time. There is a default time for this but it can be adjusted in software using the Link Layer Discovery Protocol (LLDP) described in Clause 79 of 802.3az.
- LPI is indicated at the receive side when sleep and refresh signaling has been detected.

### 39.6.19 802.1Qav Support - Credit-based Shaping

A credit-based shaping algorithm is available on the two highest priority queues and is defined in the standard 802.1Qav: Forwarding and Queuing Enhancements for Time-Sensitive Streams. This allows traffic on these queues to be limited and to allow other queues to transmit.

Traffic shaping is enabled via the CBS (Credit Based Shaping) Control register. This enables a counter which stores the amount of transmit 'credit', measured in bytes that a particular queue has. A queue may only transmit if it has non-negative credit. If a queue has data to send, but is held off from doing as another queue is transmitting, then credit will accumulate in the credit counter at the rate defined in the IdleSlope register (GMAC\_CBSISQx) for that queue.

**portTransmitRate** is the transmission rate, in bits per second, that the underlying MAC service that supports transmission through the Port provides. The value of this parameter is determined by the operation of the MAC.

**IdleSlope** is the rate of change of increasing credit when waiting to transmit and must be less than the value of the portTransmitRate.

The max value of IdleSlope (or sendSlope) is  $(\text{portTransmitRate} / \text{bits\_per\_MII\_Clock})$ .

In case of 100Mbps, maximum IdleSlope =  $(100\text{Mbps} / 4) = 0x17D7840$ .

When this queue is transmitting, the credit counter is decremented at the rate of sendSlope, which is defined as  $(\text{portTransmitRate} - \text{IdleSlope})$ . A queue can accumulate negative credit when transmitting which will hold off any other transfers from that queue until credit returns to a non-negative value. No transfers are halted when a queue's credit becomes negative; it will accumulate negative credit until the transfer completes.

The highest priority queue always has priority regardless of which queue has the most credit.

### 39.6.20 LPI Operation in the GEMAC

It is best to use firmware to control LPI. LPI operation happens at the system level. Firmware gives maximum control and flexibility of operation. LPI operation is straightforward and firmware should be capable of responding within the required timeframes.

Autonegotiation:

1. Indicate EEE capability using next page autonegotiation.

For the transmit path:

1. If the link has been up for 1 second and there is nothing being transmitted, write to the TXLPIEN bit in the Network Control register.
2. Wake up by clearing the TXLPIEN bit in the Network Control register.

For the receive path:

1. Enable RXLPISBC bit in GMAC\_IER. The bit RXLPIS is set in Network Status Register triggering an interrupt.
2. Wait for an interrupt to indicate that LPI has been received.
3. Disable relevant parts of the receive path if desired.

4. The RXLPIS bit in Network Status Register gets cleared to indicate that regular idle has been received. This triggers an interrupt.
5. Re-enable the receive path.

### 39.6.21 PHY Interface

Different PHY interfaces are supported by the Ethernet MAC:

- MII
- RMII

The MII interface is provided for 10/100 operation and uses txd[3:0] and rxd[3:0]. The RMII interface is provided for 10/100 operation and uses txd[1:0] and rxd[1:0].

### 39.6.22 10/100 Operation

The 10/100Mbps speed bit in the Network Configuration register is used to select between 10Mbps and 100Mbps.

### 39.6.23 Jumbo Frames

The jumbo frames enable bit in the Network Configuration register allows the GEMAC, in its default configuration, to receive jumbo frames up to 10240 bytes in size. This operation does not form part of the IEEE 802.3 specification and is normally disabled. When jumbo frames are enabled, frames received with a frame size greater than 10240 bytes are discarded.

## 39.7 Programming Interface

### 39.7.1 Initialization

#### 39.7.1.1 Configuration

Initialization of the GEMAC configuration (e.g., loop back mode, frequency ratios) must be done while the transmit and receive circuits are disabled. See the description of the Network Control register and Network Configuration register earlier in this document.

To change loop back mode, the following sequence of operations must be followed:

1. Write to Network Control register to disable transmit and receive circuits.
2. Write to Network Control register to change loop back mode.
3. Write to Network Control register to re-enable transmit or receive circuits.

**Note:** These writes to the Network Control register cannot be combined in any way.

#### 39.7.1.2 Receive Buffer List

Receive data is written to areas of data (i.e., buffers) in system memory. These buffers are listed in another data structure that also resides in main memory. This data structure (receive buffer queue) is a sequence of descriptor entries as defined in [Receive Buffer Descriptor Entry](#).

The Receive Buffer Queue Pointer register points to this data structure.

**Figure 39-3. Receive Buffer List**

To create the list of buffers:

1. Allocate a number (N) of buffers of X bytes in system memory, where X is the DMA buffer length programmed in the DMA Configuration register.
2. Allocate an area 8N bytes for the receive buffer descriptor list in system memory and create N entries in this list. Mark all entries in this list as owned by GEMAC, i.e., bit 0 of word 0 set to 0.
3. Mark the last descriptor in the queue with the wrap bit (bit 1 in word 0 set to 1).
4. Write address of receive buffer descriptor list and control information to GEMAC register receive buffer queue pointer
5. The receive circuits can then be enabled by writing to the address recognition registers and the Network Control register.  
**Note:** The queue pointers must be initialized and point to USED descriptors for all queues including those not intended for use.

### 39.7.1.3 Transmit Buffer List

Transmit data is read from areas of data (the buffers) in system memory. These buffers are listed in another data structure that also resides in main memory. This data structure (Transmit Buffer Queue) is a sequence of descriptor entries as defined in [Transmit Buffer Descriptor Entry](#).

The Transmit Buffer Queue Pointer register points to this data structure.

To create this list of buffers:

1. Allocate a number (N) of buffers of between 1 and 2047 bytes of data to be transmitted in system memory. Up to 128 buffers per frame are allowed.
2. Allocate an area 8N bytes for the transmit buffer descriptor list in system memory and create N entries in this list. Mark all entries in this list as owned by GEMAC, i.e., bit 31 of word 1 set to 0.
3. Mark the last descriptor in the queue with the wrap bit (bit 30 in word 1 set to 1).
4. Write address of transmit buffer descriptor list and control information to GEMAC register transmit buffer queue pointer.
5. The transmit circuits can then be enabled by writing to the Network Control register.  
**Note:** The queue pointers must be initialized and point to USED descriptors for all queues including those not intended for use.

### 39.7.1.4 Address Matching

The GEMAC Hash register pair and the four Specific Address register pairs must be written with the required values. Each register pair comprises of a bottom register and top register, with the bottom register being written first. The address matching is disabled for a particular register pair after the bottom register has been written and re-enabled when the top register is written. Each register pair may be written at any time, regardless of whether the receive circuits are enabled or disabled.

As an example, to set Specific Address 1 register to recognize destination address 21:43:65:87:A9:CB, the following values are written to Specific Address 1 Bottom register and Specific Address 1 Top register:

- Specific Address 1 Bottom register bits 31:0 (0x98): 0x8765\_4321.
- Specific Address 1 Top register bits 31:0 (0x9C): 0x0000\_CBA9.

**Note:** The address matching is the first level of filtering. If there is a match, the screeners are the next level of filtering for routing the data to the appropriate queue. See [Priority Queueing in the DMA](#) for more details.

### 39.7.1.5 PHY Maintenance

The PHY Maintenance register is implemented as a shift register. Writing to the register starts a shift operation which is signalled as complete when bit two is set in the Network Status register (about 2000 MCK cycles later when bits 18:16 are set to 010 in the Network Configuration register). An interrupt is generated as this bit is set.

During this time, the MSB of the register is output on the MDIO pin and the LSB updated from the MDIO pin with each Management Data Clock (MDC) cycle. This causes the transmission of a PHY management frame on MDIO. See section 22.2.4.5 of the IEEE 802.3 standard.

Reading during the shift operation will return the current contents of the shift register. At the end of the management operation the bits will have shifted back to their original locations. For a read operation the data bits are updated with data read from the PHY. It is important to write the correct values to the register to ensure a valid PHY management frame is produced.

The Management Data Clock (MDC) should not toggle faster than 2.5 MHz (minimum period of 400 ns), as defined by the IEEE 802.3 standard. MDC is generated by dividing down MCK. Three bits in the Network Configuration register determine by how much MCK should be divided to produce MDC.

### 39.7.1.6 Interrupts

There are 18 interrupt conditions that are detected within the GEMAC. The conditions are ORed to make multiple interrupts. Depending on the overall system design this may be passed through a further level of interrupt collection (interrupt controller). On receipt of the interrupt signal, the CPU enters the interrupt handler. Refer to the device interrupt controller documentation to identify that it is the GEMAC that is generating the interrupt. To ascertain which interrupt, read the Interrupt Status register. Note that in the default configuration this register will clear itself after being read, though this may be configured to be write-one-to-clear if desired.

At reset all interrupts are disabled. To enable an interrupt, write to Interrupt Enable register with the pertinent interrupt bit set to 1. To disable an interrupt, write to Interrupt Disable register with the pertinent interrupt bit set to 1. To check whether an interrupt is enabled or disabled, read Interrupt Mask register. If the bit is set to 1, the interrupt is disabled.

### 39.7.1.7 Transmitting Frames

The procedure to set up a frame for transmission is the following:

1. Enable transmit in the Network Control register.

2. Allocate an area of system memory for transmit data. This does not have to be contiguous, varying byte lengths can be used if they conclude on byte borders.
3. Set-up the transmit buffer list by writing buffer addresses to word zero of the transmit buffer descriptor entries and control and length to word one.
4. Write data for transmission into the buffers pointed to by the descriptors.
5. Write the address of the first buffer descriptor to transmit buffer descriptor queue pointer.
6. Enable appropriate interrupts.
7. Write to the transmit start bit (TSTART) in the Network Control register.

### 39.7.1.8 Receiving Frames

When a frame is received and the receive circuits are enabled, the GEMAC checks the address and, in the following cases, the frame is written to system memory:

- If it matches one of the four Specific Address registers.
- If it matches one of the four Type ID registers.
- If it matches the hash address function.
- If it is a broadcast address (0xFFFFFFFF) and broadcasts are allowed.
- If the GEMAC is configured to “copy all frames”.

The register receive buffer queue pointer points to the next entry in the receive buffer descriptor list and the GEMAC uses this as the address in system memory to write the frame to.

Once the frame has been completely and successfully received and written to system memory, the GEMAC then updates the receive buffer descriptor entry (see [Receive Buffer Descriptor Entry](#)) with the reason for the address match and marks the area as being owned by software. Once this is complete, a receive complete interrupt is set. Software is then responsible for copying the data to the application area and releasing the buffer (by writing the ownership bit back to 0).

If the GEMAC is unable to write the data at a rate to match the incoming frame, then a receive overrun interrupt is set. If there is no receive buffer available, i.e., the next buffer is still owned by software, a receive buffer not available interrupt is set. If the frame is not successfully received, a statistics register is incremented and the frame is discarded without informing software.

### 39.7.2 Statistics Registers

Statistics registers are described in the User Interface beginning with [GMAC Octets Transmitted Low Register](#) and ending with [GMAC UDP Checksum Errors Register](#).

The statistics register block begins at 0x100 and runs to 0x1B0, and comprises the registers listed below.

Octets Transmitted Low Register	Broadcast Frames Received Register
Octets Transmitted High Register	Multicast Frames Received Register
Frames Transmitted Register	Pause Frames Received Register
Broadcast Frames Transmitted Register	64 Byte Frames Received Register
Multicast Frames Transmitted Register	65 to 127 Byte Frames Received Register
Pause Frames Transmitted Register	128 to 255 Byte Frames Received Register
64 Byte Frames Transmitted Register	256 to 511 Byte Frames Received Register
65 to 127 Byte Frames Transmitted Register	512 to 1023 Byte Frames Received Register

## SAMA5D2 Series Ethernet MAC (GMAC)

128 to 255 Byte Frames Transmitted Register	1024 to 1518 Byte Frames Received Register
256 to 511 Byte Frames Transmitted Register	1519 to Maximum Byte Frames Received Register
512 to 1023 Byte Frames Transmitted Register	Undersize Frames Received Register
1024 to 1518 Byte Frames Transmitted Register	Oversize Frames Received Register
Greater Than 1518 Byte Frames Transmitted Register	Jabbers Received Register
Transmit Underruns Register	Frame Check Sequence Errors Register
Single Collision Frames Register	Length Field Frame Errors Register
Multiple Collision Frames Register	Receive Symbol Errors Register
Excessive Collisions Register	Alignment Errors Register
Late Collisions Register	Receive Resource Errors Register
Deferred Transmission Frames Register	Receive Overrun Register
Carrier Sense Errors Register	IP Header Checksum Errors Register
Octets Received Low Register	TCP Checksum Errors Register
Octets Received High Register	UDP Checksum Errors Register
Frames Received Register	

These registers reset to zero on a read and stick at all ones when they count to their maximum value. They should be read frequently enough to prevent loss of data.

The receive statistics registers are only incremented when the receive enable bit (RXEN) is set in the Network Control register.

Once a statistics register has been read, it is automatically cleared. When reading the Octets Transmitted and Octets Received registers, bits 31:0 should be read prior to bits 47:32 to ensure reliable operation.

### 39.8 Register Summary

### 39.8.1 GMAC Network Control Register

**Name:** GMAC\_NCR  
**Offset:** 0x000  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
					TXLPIEN	FNP	TXPBPF	ENPBPR
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	15	14	13	12	11	10	9	8
	SRTSM			TXZQPF	TXPF	THALT	TSTART	BP
Access	R/W			R/W	R/W	R/W	R/W	R/W
Reset	0			0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	WESTAT	INCSTAT	CLRSTAT	MPE	TXEN	RXEN	LBL	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	

**Bit 19 – TXLPIEN** Enable LPI Transmission  
 When set, LPI (low power idle) is immediately transmitted.

**Bit 18 – FNP** Flush Next Packet  
 Flush the next packet from the external RX DPRAM. Writing one to this bit will only have an effect if the DMA is not currently writing a packet already stored in the DPRAM to memory.

**Bit 17 – TXPBPF** Transmit PFC Priority-based Pause Frame  
 Takes the values stored in the Transmit PFC Pause Register.

**Bit 16 – ENPBPR** Enable PFC Priority-based Pause Reception  
 Enables PFC Priority Based Pause Reception capabilities. Setting this bit enables PFC negotiation and recognition of priority-based pause frames.

**Bit 15 – SRTSM** Store Receive Timestamp to Memory

Value	Description
0	Normal operation.
1	Causes the CRC of every received frame to be replaced with the value of the nanoseconds field of the 1588 timer that was captured as the receive frame passed the message timestamp point. Note that bit RFCS in register GMAC_NCFGR may not be set to 1 when the timer should be captured.

**Bit 12 – TXZQPF** Transmit Zero Quantum Pause Frame

Writing one to this bit causes a pause frame with zero quantum to be transmitted.

**Bit 11 – TXPF** Transmit Pause Frame

Writing one to this bit causes a pause frame to be transmitted.

**Bit 10 – THALT** Transmit Halt

Writing one to this bit halts transmission as soon as any ongoing frame transmission ends.

**Bit 9 – TSTART** Start Transmission

Writing one to this bit starts transmission.

**Bit 8 – BP** Back pressure

If set in 10M or 100M half duplex mode, forces collisions on all received frames.

**Bit 7 – WESTAT** Write Enable for Statistics Registers

Setting this bit to one makes the statistics registers writable for functional test purposes.

**Bit 6 – INCSTAT** Increment Statistics Registers

This bit is write-only. Writing a one increments all the statistics registers by one for test purposes.

**Bit 5 – CLRSTAT** Clear Statistics Registers

This bit is write-only. Writing a one clears the statistics registers.

**Bit 4 – MPE** Management Port Enable

Set to one to enable the management port. When zero, forces MDIO to high impedance state and MDC low.

**Bit 3 – TXEN** Transmit Enable

When set, TXEN enables the GMAC transmitter to send data. When reset transmission will stop immediately, the transmit pipeline and control registers will be cleared and the Transmit Queue Pointer Register will reset to point to the start of the transmit descriptor list.

**Bit 2 – RXEN** Receive Enable

When set, RXEN enables the GMAC to receive data. When reset frame reception stops immediately and the receive pipeline will be cleared. The Receive Queue Pointer Register is unaffected.

**Bit 1 – LBL** Loop Back Local

Connects GTX to GRX, GTXEN to GRXDV and forces full duplex mode. GRXCK and GTXCK may malfunction as the GMAC is switched into and out of internal loop back. It is important that receive and transmit circuits have already been disabled when making the switch into and out of internal loop back.

### 39.8.2 GMAC Network Configuration Register

**Name:** GMAC\_NCFGR  
**Offset:** 0x004  
**Reset:** 0x00080000  
**Property:** Read/Write

	Bit	31	30	29	28	27	26	25	24
			IRXER	RXBP	IPGSEN		IRXFCS	EFRHD	RXCOEN
Access			R/W	R/W	R/W		R/W	R/W	R/W
Reset			0	0	0		0	0	0
	Bit	23	22	21	20	19	18	17	16
		DCPF	DBW[1:0]		CLK[2:0]			RFCS	LFERD
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	1	0	0	0
	Bit	15	14	13	12	11	10	9	8
		RXBUFO[1:0]		PEN	RTY				MAXFS
Access		R/W	R/W	R/W	R/W				R/W
Reset		0	0	0	0				0
	Bit	7	6	5	4	3	2	1	0
		UNIHEN	MTIHEN	NBC	CAF	JFRAME	DNVLAN	FD	SPD
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0

**Bit 30 – IRXER** Ignore IPG GRXER

When set, GRXER has no effect on the GMAC's operation when GRXDV is low.

**Bit 29 – RXBP** Receive Bad Preamble

When set, frames with non-standard preamble are not rejected.

**Bit 28 – IPGSEN** IP Stretch Enable

When set, the transmit IPG can be increased above 96 bit times depending on the previous frame length using the IPG Stretch Register.

**Bit 26 – IRXFCS** Ignore RX FCS

When set, frames with FCS/CRC errors will not be rejected. FCS error statistics will still be collected for frames with bad FCS and FCS status will be recorded in frame's DMA descriptor. For normal operation this bit must be set to zero.

**Bit 25 – EFRHD** Enable Frames Received in Half Duplex

Enable frames to be received in half-duplex mode while transmitting.

**Bit 24 – RXCOEN** Receive Checksum Offload Enable

When set, the receive checksum engine is enabled. Frames with bad IP, TCP or UDP checksums are discarded.

**Bit 23 – DCPF** Disable Copy of Pause Frames

Set to one to prevent valid pause frames being copied to memory. When set, pause frames are not copied to memory regardless of the state of the Copy All Frames bit, whether a hash match is found or whether a type ID match is identified. If a destination address match is found, the pause frame will be copied to memory. Note that valid pause frames received will still increment pause statistics and pause the transmission of frames as required.

**Bits 22:21 – DBW[1:0]** Data Bus Width

Should always be written to '0'.

**Bits 20:18 – CLK[2:0]** MDC CLock Division

Set according to MCK speed. These three bits determine the number MCK will be divided by to generate Management Data Clock (MDC). For conformance with the 802.3 specification, MDC must not exceed 2.5 MHz (MDC is only active during MDIO read and write operations).

Value	Name	Description
0	MCK_8	MCK divided by 8 (MCK up to 20 MHz)
1	MCK_16	MCK divided by 16 (MCK up to 40 MHz)
2	MCK_32	MCK divided by 32 (MCK up to 80 MHz)
3	MCK_48	MCK divided by 48 (MCK up to 120 MHz)
4	MCK_64	MCK divided by 64 (MCK up to 160 MHz)
5	MCK_96	MCK divided by 96 (MCK up to 240 MHz)

**Bit 17 – RFCS** Remove FCS

Setting this bit will cause received frames to be written to memory without their frame check sequence (last 4 bytes). The frame length indicated will be reduced by four bytes in this mode.

**Bit 16 – LFERD** Length Field Error Frame Discard

Setting this bit causes frames with a measured length shorter than the extracted length field (as indicated by bytes 13 and 14 in a non-VLAN tagged frame) to be discarded. This only applies to frames with a length field less than 0x0600.

**Bits 15:14 – RXBUFO[1:0]** Receive Buffer Offset

Indicates the number of bytes by which the received data is offset from the start of the receive buffer

**Bit 13 – PEN** Pause Enable

When set, transmission will pause if a non-zero 802.3 classic pause frame is received and PFC has not been negotiated.

**Bit 12 – RTY** Retry Test

Must be set to zero for normal operation. If set to one the backoff between collisions will always be one slot time. Setting this bit to one helps test the too many retries condition. Also used in the pause frame tests to reduce the pause counter's decrement time from 512 bit times, to every GRXCK cycle.

**Bit 8 – MAXFS** 1536 Maximum Frame Size

Setting this bit means the GMAC will accept frames up to 1536 bytes in length. Normally the GMAC would reject any frame above 1518 bytes.

**Bit 7 – UNIHEN** Unicast Hash Enable

When set, unicast frames will be accepted when the 6-bit hash function of the destination address points to a bit that is set in the Hash Register.

**Bit 6 – MTIHEN** Multicast Hash Enable

When set, multicast frames will be accepted when the 6-bit hash function of the destination address points to a bit that is set in the Hash Register.

**Bit 5 – NBC** No Broadcast

When set to logic one, frames addressed to the broadcast address of all ones will not be accepted.

**Bit 4 – CAF** Copy All Frames

When set to logic one, all valid frames will be accepted.

**Bit 3 – JFRAME** Jumbo Frame Size

Set to one to enable jumbo frames up to 10240 bytes to be accepted. The default length is 10240 bytes.

**Bit 2 – DNVLAN** Discard Non-VLAN FRAMES

When set only VLAN tagged frames will be passed to the address matching logic.

**Bit 1 – FD** Full Duplex

If set to logic one, the transmit block ignores the state of collision and carrier sense and allows receive while transmitting.

**Bit 0 – SPD** Speed

Set to logic one to indicate 100 Mbps operation, logic zero for 10 Mbps.

**39.8.3 GMAC Network Status Register**

**Name:** GMAC\_NSR  
**Offset:** 0x008  
**Reset:** 0x000001x0  
**Property:** Read-only

**Bit 7 – RXLPIS** LPI Indication

Low power idle has been detected on receive. This bit is set when LPI is detected and reset when normal idle is detected. An interrupt is generated when the state of this bit changes.

**Bit 2 – IDLE** PHY Management Logic Idle

The PHY management logic is idle (i.e., has completed).

**Bit 1 – MDIO** MDIO Input Status

Returns status of the MDIO pin.

### 39.8.4 GMAC User Register

**Name:** GMAC\_UR  
**Offset:** 0x00C  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bit 0 – RMII Reduced MII Mode

Value	Description
0	MII mode is selected (default).
1	RMII mode is selected.

**39.8.5 GMAC DMA Configuration Register**

**Name:** GMAC\_DCFGR  
**Offset:** 0x010  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
								DDRP
Access								R/W
Reset								0
Bit	23	22	21	20	19	18	17	16
	DRBS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
					TXCOEN	TXPBMS	RXBMS[1:0]	
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	ESPA	ESMA		FBDLO[4:0]				
Access	R/W	R/W		R/W	R/W	R/W	R/W	R/W
Reset	0	0		0	0	0	0	0

**Bit 24 – DDRP** DMA Discard Receive Packets

When set, the GMAC DMA will automatically discard receive packets from the receiver packet buffer memory when no AHB resource is available.

When low, the received packets will remain to be stored in the SRAM based packet buffer until AHB buffer resource next becomes available.

A write to this bit is ignored if the DMA is not configured in the packet buffer full store and forward mode.

**Bits 23:16 – DRBS[7:0]** DMA Receive Buffer Size

DMA receive buffer size in AHB system memory. The value defined by these bits determines the size of buffer to use in main AHB system memory when writing received data.

The value is defined in multiples of 64 bytes, thus a value of 0x01 corresponds to buffers of 64 bytes, 0x02 corresponds to 128 bytes etc.

For example:

- 0x02: 128 bytes
- 0x18: 1536 bytes (1 × max length frame/buffer)
- 0xA0: 10240 bytes (1 × 10K jumbo frame/buffer)

Note that this value should never be written as zero.

### Bit 11 – TXCOEN Transmitter Checksum Generation Offload Enable

Transmitter IP, TCP and UDP checksum generation offload enable. When set, the transmitter checksum generation engine is enabled to calculate and substitute checksums for transmit frames. When clear, frame data is unaffected.

### Bit 10 – TXPBMS Transmitter Packet Buffer Memory Size Select

Having this bit at zero halves the amount of memory used for the transmit packet buffer. This reduces the amount of memory used by the GMAC. It is important to set this bit to one if the full configured physical memory is available. The value in brackets below represents the size that would result for the default maximum configured memory size of 4 Kbytes.

Value	Description
0	Do not use top address bit (2 Kbytes).
1	Use full configured addressable space (4 Kbytes).

### Bits 9:8 – RXBMS[1:0] Receiver Packet Buffer Memory Size Select

The default receive packet buffer size is 4 Kbytes. The table below shows how to configure this memory to FULL, HALF, QUARTER or EIGHTH of the default size.

Value	Name	Description
0	EIGHTH	4/8 Kbyte Memory Size
1	QUARTER	4/4 Kbytes Memory Size
2	HALF	4/2 Kbytes Memory Size
3	FULL	4 Kbytes Memory Size

### Bit 7 – ESPA Endian Swap Mode Enable for Packet Data Accesses

When set, selects swapped endianness for AHB transfers. When clear, selects little endian mode.

### Bit 6 – ESMA Endian Swap Mode Enable for Management Descriptor Accesses

When set, selects swapped endianness for AHB transfers. When clear, selects little endian mode.

### Bits 4:0 – FBDLO[4:0] Fixed Burst Length for DMA Data Operations

Selects the burst length to attempt to use on the AHB when transferring frame data. Not used for DMA management operations and only used where space and data size allow. Otherwise SINGLE type AHB transfers are used.

One-hot priority encoding enforced automatically on register writes as follows, where 'x' represents don't care:

Value	Name	Description
0	–	Reserved
1	SINGLE	00001: Always use SINGLE AHB bursts
2	–	Reserved
4	INCR4	001xx: Attempt to use INCR4 AHB bursts (Default)
8	INCR8	01xxx: Attempt to use INCR8 AHB bursts
16	INCR16	1xxxx: Attempt to use INCR16 AHB bursts

### 39.8.6 GMAC Transmit Status Register

**Name:** GMAC\_TSR  
**Offset:** 0x014  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
								HRESP
Access								R/W
Reset								0
Bit	7	6	5	4	3	2	1	0
			TXCOMP	TFC	TXGO	RLE	COL	UBR
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

**Bit 8 – HRESP** HRESP Not OK  
 Set when the DMA block sees HRESP not OK. Writing a one clears this bit.

**Bit 5 – TXCOMP** Transmit Complete  
 Set when a frame has been transmitted. Writing a one clears this bit.

**Bit 4 – TFC** Transmit Frame Corruption Due to AHB Error  
 Transmit frame corruption due to AHB error. Set if an error occurs while midway through reading transmit frame from the AHB, including HRESP errors and buffers exhausted mid frame (if the buffers run out during transmission of a frame then transmission stops, FCS shall be bad and GTXER asserted).  
 Also set in DMA packet buffer mode if single frame is too large for configured packet buffer memory size.  
 Writing a one clears this bit.

**Bit 3 – TXGO** Transmit Go  
 Transmit go, if high transmit is active. When using the DMA interface, this bit represents the TXGO variable as specified in the transmit buffer description.

**Bit 2 – RLE** Retry Limit Exceeded  
 Writing a one clears this bit.

**Bit 1 – COL** Collision Occurred

Set by the assertion of collision. Writing a one clears this bit. When operating in 10/100 mode, this status indicates either a collision or a late collision.

**Bit 0 – UBR** Used Bit Read

Set when a transmit buffer descriptor is read with its used bit set. Writing a one clears this bit.

### 39.8.7 GMAC Receive Buffer Queue Base Address Register

**Name:** GMAC\_RBQB  
**Offset:** 0x018  
**Reset:** 0x00000000  
**Property:** Read/Write

This register holds the start address of the receive buffer queue (receive buffers descriptor list). The receive buffer queue base address must be initialized before receive is enabled through bit 2 of the Network Control Register. Once reception is enabled, any write to the Receive Buffer Queue Base Address Register is ignored. Reading this register returns the location of the descriptor currently being accessed. This value increments as buffers are used. Software should not use this register for determining where to remove received frames from the queue as it constantly changes as new frames are received. Software should instead work its way through the buffer descriptor queue checking the “used” bits.

In terms of AMBA AHB operation, the descriptors are read from memory using a single 32-bit AHB access. The descriptors should be aligned at 32-bit boundaries and the descriptors are written to using two individual non sequential accesses.

Bit	31	30	29	28	27	26	25	24	
	ADDR[29:22]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	7	6	5	4	3	2	1	0	
	ADDR[5:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W			
Reset	0	0	0	0	0	0			

**Bits 31:2 – ADDR[29:0]** Receive Buffer Queue Base Address  
 Written with the address of the start of the receive queue.

### 39.8.8 GMAC Transmit Buffer Queue Base Address Register

**Name:** GMAC\_TBQB  
**Offset:** 0x01C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register holds the start address of the transmit buffer queue (transmit buffers descriptor list). The Transmit Buffer Queue Base Address Register must be initialized before transmit is started through bit 9 of the Network Control Register. Once transmission has started, any write to the Transmit Buffer Queue Base Address Register is illegal and therefore ignored.

Note that due to clock boundary synchronization, it takes a maximum of four MCK cycles from the writing of the transmit start bit before the transmitter is active. Writing to the Transmit Buffer Queue Base Address Register during this time may produce unpredictable results.

Reading this register returns the location of the descriptor currently being accessed. Since the DMA handles two frames at once, this may not necessarily be pointing to the current frame being transmitted.

In terms of AMBA AHB operation, the descriptors are written to memory using a single 32-bit AHB access. The descriptors should be aligned at 32-bit boundaries and the descriptors are read from memory using two individual non sequential accesses.

	Bit	31	30	29	28	27	26	25	24	
		ADDR[29:22]								
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reset		0	0	0	0	0	0			

**Bits 31:2 – ADDR[29:0]** Transmit Buffer Queue Base Address  
 Written with the address of the start of the transmit queue.

**39.8.9 GMAC Receive Status Register**

**Name:** GMAC\_RSR  
**Offset:** 0x020  
**Reset:** 0x00000000  
**Property:** Read/Write

This register, when read, provides receive status details. Once read, individual bits may be cleared by writing a one to them. It is not possible to set a bit to 1 by writing to the register.

**Bit 3 – HNO** HRESP Not OK

Set when the DMA block sees HRESP not OK. Writing a one clears this bit.

**Bit 2 – RXOVR** Receive Overrun

This bit is set if the receive status was not taken at the end of the frame. This bit is also set if the packet buffer overflows. The buffer will be recovered if an overrun occurs. Writing a one clears this bit.

**Bit 1 – REC** Frame Received

One or more frames have been received and placed in memory. Writing a one clears this bit.

**Bit 0 – BNA** Buffer Not Available

An attempt was made to get a new buffer and the pointer indicated that it was owned by the processor. The DMA will re-read the pointer each time an end of frame is received until a valid pointer is found. This bit is set following each descriptor read attempt that fails, even if consecutive pointers are unsuccessful and software has in the mean time cleared the status flag. Writing a one clears this bit.

**39.8.10 GMAC Interrupt Status Register**

**Name:** GMAC\_ISR  
**Offset:** 0x024  
**Reset:** 0x00000000  
**Property:** Read-only

This register indicates the source of the interrupt. In order that the bits of this register read 1, the corresponding interrupt source must be enabled in the mask register. If any bit is set in this register, the GMAC interrupt signal will be asserted in the system.

Bit	31	30	29	28	27	26	25	24
			TSUTIMCOMP	WOL	RXLPISBC	SRI	PDRSFT	PDRQFT
Access			R	R	R	R	R	R

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bit 29 – TSUTIMCOMP** TSU Timer Comparison

Indicates when TSU timer count value is equal to programmed value. Cleared on read.

**Bit 28 – WOL** Wake On LAN

WOL interrupt. Indicates a WOL event has been received.

**Bit 27 – RXLPISBC** Receive LPI indication Status Bit Change

Receive LPI indication status bit change. Cleared on read.

**Bit 26 – SRI** TSU Seconds Register Increment

Indicates the register has incremented. Cleared on read.

**Bit 25 – PDRSFT** PDelay Response Frame Transmitted

Indicates a PTP pdelay\_resp frame has been transmitted. Cleared on read.

**Bit 24 – PDRQFT** PDelay Request Frame Transmitted

Indicates a PTP pdelay\_req frame has been transmitted. Cleared on read.

**Bit 23 – PDRSFR** PDelay Response Frame Received

Indicates a PTP pdelay\_resp frame has been received. Cleared on read.

**Bit 22 – PDRQFR** PDelay Request Frame Received

Indicates a PTP pdelay\_req frame has been received. Cleared on read.

**Bit 21 – SFT** PTP Sync Frame Transmitted

Indicates a PTP sync frame has been transmitted. Cleared on read.

**Bit 20 – DRQFT** PTP Delay Request Frame Transmitted

Indicates a PTP delay\_req frame has been transmitted. Cleared on read.

**Bit 19 – SFR** PTP Sync Frame Received

Indicates a PTP sync frame has been received. Cleared on read.

**Bit 18 – DRQFR** PTP Delay Request Frame Received

Indicates a PTP delay\_req frame has been received. Cleared on read.

**Bit 14 – PFTR** Pause Frame Transmitted

Indicates a pause frame has been successfully transmitted after being initiated from the Network Control register. Cleared on read.

**Bit 13 – PTZ** Pause Time Zero

Set when either the Pause Time register at address 0x38 decrements to zero, or when a valid pause frame is received with a zero pause quantum field. Cleared on read.

**Bit 12 – PFNZ** Pause Frame with Non-zero Pause Quantum Received

Indicates a valid pause has been received that has a non-zero pause quantum field. Cleared on read.

**Bit 11 – HRESP** HRESP Not OK

Set when the DMA block sees HRESP not OK. Cleared on read.

**Bit 10 – ROVR** Receive Overrun

Set when the receive overrun status bit is set. Cleared on read.

**Bit 7 – TCOMP** Transmit Complete

Set when a frame has been transmitted. Cleared on read.

**Bit 6 – TFC** Transmit Frame Corruption Due to AHB Error

Transmit frame corruption due to AHB error. Set if an error occurs while midway through reading transmit frame from the AHB, including HRESP errors and buffers exhausted mid frame.

**Bit 5 – RLEX** Retry Limit Exceeded

Transmit error. Cleared on read.

**Bit 4 – TUR** Transmit Underrun

This interrupt is set if the transmitter was forced to terminate a frame that it has already began transmitting due to further data being unavailable.

This interrupt is set if a transmitter status write back has not completed when another status write back is attempted.

This interrupt is also set when the transmit DMA has written the SOP data into the FIFO and either the AHB bus was not granted in time for further data, or because an AHB not OK response was returned, or because the used bit was read.

**Bit 3 – TXUBR** TX Used Bit Read

Set when a transmit buffer descriptor is read with its used bit set. Cleared on read.

**Bit 2 – RXUBR** RX Used Bit Read

Set when a receive buffer descriptor is read with its used bit set. Cleared on read.

**Bit 1 – RCOMP** Receive Complete

A frame has been stored in memory. Cleared on read.

**Bit 0 – MFS** Management Frame Sent

The PHY Maintenance Register has completed its operation. Cleared on read.

**39.8.11 GMAC Interrupt Enable Register**

**Name:** GMAC\_IER  
**Offset:** 0x028  
**Reset:** –  
**Property:** Write-only

This register is write-only and when read will return zero.

The following values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
			TSUTIMCOMP	WOL	RXLPISBC	SRI	PDRSFT	PDRQFT

- Bit 14 – PFTR** Pause Frame Transmitted
- Bit 13 – PTZ** Pause Time Zero
- Bit 12 – PFNZ** Pause Frame with Non-zero Pause Quantum Received
- Bit 11 – HRESP** HRESP Not OK
- Bit 10 – ROVR** Receive Overrun
- Bit 7 – TCOMP** Transmit Complete
- Bit 6 – TFC** Transmit Frame Corruption Due to AHB Error
- Bit 5 – RLEX** Retry Limit Exceeded or Late Collision
- Bit 4 – TUR** Transmit Underrun
- Bit 3 – TXUBR** TX Used Bit Read
- Bit 2 – RXUBR** RX Used Bit Read
- Bit 1 – RCOMP** Receive Complete
- Bit 0 – MFS** Management Frame Sent

**39.8.12 GMAC Interrupt Disable Register**

**Name:** GMAC\_IDR  
**Offset:** 0x02C  
**Reset:** –  
**Property:** Write-only

This register is write-only and when read will return zero.

The following values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24

### 39.8.13 GMAC Interrupt Mask Register

**Name:** GMAC\_IMR  
**Offset:** 0x030  
**Reset:** 0x07FFFFFFF  
**Property:** Read/Write

The Interrupt Mask Register is a read-only register indicating which interrupts are masked. All bits are set at reset and can be reset individually by writing to the Interrupt Enable Register or set individually by writing to the Interrupt Disable Register. Having separate address locations for enable and disable saves the need for performing a read modify write when updating the Interrupt Mask Register.

For test purposes there is a write-only function to this register that allows the bits in the Interrupt Status Register to be set or cleared, regardless of the state of the mask register. A write to this register directly affects the state of the corresponding bit in the Interrupt Status Register, causing an interrupt to be generated if a 1 is written.

The following values are valid for all listed bit names of this register when read:

0: The corresponding interrupt is enabled.

1: The corresponding interrupt is not enabled.

	Bit	31	30	29	28	27	26	25	24
				TSUTIMCOMP	WOL	RXLPISBC	SRI	PDRSFT	PDRQFT
Access				R/W	R/W	R/W	R/W	R/W	R/W

- Bit 19 – SFR** PTP Sync Frame Received
- Bit 18 – DRQFR** PTP Delay Request Frame Received
- Bit 15 – EXINT** External Interrupt
- Bit 14 – PFTR** Pause Frame Transmitted
- Bit 13 – PTZ** Pause Time Zero
- Bit 12 – PFNZ** Pause Frame with Non-zero Pause Quantum Received
- Bit 11 – HRESP** HRESP Not OK
- Bit 10 – ROVR** Receive Overrun
- Bit 7 – TCOMP** Transmit Complete
- Bit 6 – TFC** Transmit Frame Corruption Due to AHB Error
- Bit 5 – RLEX** Retry Limit Exceeded
- Bit 4 – TUR** Transmit Underrun
- Bit 3 – TXUBR** TX Used Bit Read
- Bit 2 – RXUBR** RX Used Bit Read
- Bit 1 – RCOMP** Receive Complete
- Bit 0 – MFS** Management Frame Sent

**39.8.14 GMAC PHY Maintenance Register**

**Name:** GMAC\_MAN  
**Offset:** 0x034  
**Reset:** 0x00000000  
**Property:** Read/Write

The PHY Maintenance Register is implemented as a shift register. Writing to the register starts a shift operation which is signalled as complete when bit 2 is set in the Network Status Register. It takes about 2000 MCK cycles to complete, when MDC is set for MCK divide by 32 in the Network Configuration Register. An interrupt is generated upon completion.

During this time, the MSB of the register is output on the MDIO pin and the LSB updated from the MDIO pin with each MDC cycle. This causes transmission of a PHY management frame on MDIO. See Section 22.2.4.5 of the IEEE 802.3 standard.

Reading during the shift operation returns the current contents of the shift register. At the end of management operation, the bits will have shifted back to their original locations. For a read operation, the data bits are updated with data read from the PHY. It is important to write the correct values to the register to ensure a valid PHY management frame is produced.

The MDIO interface can read IEEE 802.3 clause 45 PHYs as well as clause 22 PHYs. To read clause 45 PHYs, bit 30 should be written with a 0 rather than a 1. To write clause 45 PHYs, bits 31:28 should be written as 0x0001. See the table below.

**Table 39-16. Clause 22/Clause 45 PHYs Read/Write Access Configuration (GMAC\_MAN Bits 31:28)**

PHY	Access	Bit Value			
		WZO	CLTTO	OP[1]	OP[0]
Clause 22	Read	0	1	1	0
	Write	0	1	0	1
Clause 45	Read	0	0	1	1
	Write	0	0	0	1
	Read + Address	0	0	1	0

For a description of MDC generation, see [GMAC Network Configuration Register](#).

# SAMA5D2 Series

## Ethernet MAC (GMAC)

Bit	31	30	29	28	27	26	25	24

Reset	0	0	0	0	0	0	0	0

### Bit 31 – WZO Write ZERO

Must be written with 0.

### Bit 30 – CLTTO Clause 22 Operation

Value	Description
0	Clause 45 operation
1	Clause 22 operation

### Bits 29:28 – OP[1:0] Operation

Value	Description
01	Write
10	Read

### Bits 27:23 – PHYA[4:0] PHY Address

**Bits 22:18 – REGA[4:0] Register Address**  
Specifies the register in the PHY to access.

**Bits 17:16 – WTN[1:0] Write Ten**  
Must be written to 10.

**Bits 15:0 – DATA[15:0] PHY Data**  
For a write operation this field is written with the data to be written to the PHY. After a read operation this field contains the data read from the PHY.

### 39.8.15 GMAC Receive Pause Quantum Register

**Name:** GMAC\_RPQ  
**Offset:** 0x038  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	1	1	1	1	1	1	1	1	

**Bits 13:0 – FML[13:0]** Frame Max Length  
 Rx jumbo frame maximum length.

### 39.8.20 GMAC Hash Register Bottom

**Name:** GMAC\_HRB  
**Offset:** 0x080  
**Reset:** 0x00000000  
**Property:** Read/Write

The unicast hash enable (UNIHEN) and the multicast hash enable (MITIHEN) bits in the Network Configuration Register ([GMAC Network Configuration Register](#)) enable the reception of hash matched frames. See [Hash Addressing](#).

**Bits 31:0 – ADDR[31:0] Specific Address 1**

Least significant 32 bits of the destination address, that is, bits 31:0. Bit zero indicates whether the address is multicast or unicast and corresponds to the least significant bit of the first byte received.

### 39.8.23 GMAC Specific Address 1 Top Register

**Name:** GMAC\_SAT1  
**Offset:** 0x08C  
**Reset:** 0x00000000  
**Property:** Read/Write

The addresses stored in the Specific Address Registers are deactivated at reset or when their corresponding Specific Address Register Bottom is written. They are activated when Specific Address Register Top is written.

**Bits 15:0 – ADDR[15:0] Specific Address 1**

The most significant bits of the destination address, that is, bits 47:32.

### 39.8.24 GMAC Specific Address 2 Bottom Register

**Name:** GMAC\_SAB2  
**Offset:** 0x090  
**Reset:** 0x00000000  
**Property:** Read/Write

The addresses stored in the Specific Address Registers are deactivated at reset or when their corresponding Specific Address Register Bottom is written. They are activated when Specific Address Register Top is written.

#### Bits 31:0 – ADDR[31:0] Specific Address 2

Least significant 32 bits of the destination address, that is, bits 31:0. Bit zero indicates whether the address is multicast or unicast and corresponds to the least significant bit of the first byte received.

**39.8.25 GMAC Specific Address 2 Top Register**

**Name:** GMAC\_SAT2  
**Offset:** 0x094  
**Reset:** 0x00000000  
**Property:** Read/Write

The addresses stored in the Specific Address Registers are deactivated at reset or when their corresponding Specific Address Register Bottom is written. They are activated when Specific Address Register Top is written.

**Bits 15:0 – ADDR[15:0] Specific Address 2**

The most significant bits of the destination address, that is, bits 47:32.

### 39.8.26 GMAC Specific Address 3 Bottom Register

**Name:** GMAC\_SAB3  
**Offset:** 0x098  
**Reset:** 0x00000000  
**Property:** Read/Write

The addresses stored in the Specific Address Registers are deactivated at reset or when their corresponding Specific Address Register Bottom is written. They are activated when Specific Address Register Top is written.

**Bit 31 – ENID4** Enable Copying of TID Matched Frames

Value	Description
0	TID is not part of the comparison match.
1	TID is processed for the comparison match.

**Bits 15:0 – TID[15:0]** Type ID Match 4

For use in comparisons with received frames type ID/length frames.

### 39.8.34 GMAC Wake on LAN Register

**Name:** GMAC\_WOL  
**Offset:** 0x0B8  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
					MTI	SA1	ARP	MAG
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bit 19 – MTI** Multicast Hash Event Enable  
 Wake on LAN multicast hash event enable.

**Bit 18 – SA1** Specific Address Register 1 Event Enable  
 Wake on LAN Specific Address Register 1 event enable.

**Bit 17 – ARP** ARP Request Event Enable  
 Wake on LAN ARP request event enable.

**Bit 16 – MAG** Magic Packet Event Enable  
 Wake on LAN magic packet event enable.

**Bits 15:0 – IP[15:0]** ARP Request IP Address  
 Wake on LAN ARP request IP address. Written to define the least significant 16 bits of the target IP address that is matched to generate a Wake on LAN event. A value of zero will not generate an event, even if this is matched by the received frame.

**39.8.35 GMAC IPG Stretch Register**

**Name:** GMAC\_IPGS  
**Offset:** 0x0BC  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 15:0 – FL[15:0] Frame Length**

Bits 7:0 are multiplied with the previously transmitted frame length (including preamble). Bits 15:8 +1 divide the frame length. If the resulting number is greater than 96 and bit 28 is set in the Network Configuration Register then the resulting number is used for the transmit inter-packet-gap. 1 is added to bits 15:8 to prevent a divide by zero. See [MAC Transmit Block](#).

### 39.8.36 GMAC Stacked VLAN Register

**Name:** GMAC\_SVLAN  
**Offset:** 0x0C0  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	ESVLAN							
Access	R/W							
Reset	0							
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	VLAN_TYPE[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	VLAN_TYPE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bit 31 – ESVLAN Enable Stacked VLAN Processing Mode

Value	Description
0	Disable the stacked VLAN processing mode
1	Enable the stacked VLAN processing mode

#### Bits 15:0 – VLAN\_TYPE[15:0] User Defined VLAN\_TYPE Field

User defined VLAN\_TYPE field. When Stacked VLAN is enabled, the first VLAN tag in a received frame will only be accepted if the VLAN type field is equal to this user defined VLAN\_TYPE, OR equal to the standard VLAN type (0x8100). Note that the second VLAN tag of a Stacked VLAN packet will only be matched correctly if its VLAN\_TYPE field equals 0x8100.

**39.8.37 GMAC Transmit PFC Pause Register**

**Name:** GMAC\_TPFCP  
**Offset:** 0x0C4  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 15:8 – PQ[7:0] Pause Quantum**

If bit 17 of the Network Control Register is written with a one then for each entry equal to zero in the Transmit PFC Pause Register[15:8], the PFC pause frame's pause quantum field associated with that entry will be taken from the Transmit Pause Quantum Register. For each entry equal to one in the Transmit PFC Pause Register [15:8], the pause quantum associated with that entry will be zero.

**Bits 7:0 – PEV[7:0] Priority Enable Vector**

If bit 17 of the Network Control Register is written with a one then the priority enable vector of the PFC priority based pause frame will be set equal to the value stored in this register [7:0].

**39.8.38 GMAC Specific Address 1 Mask Bottom Register**

**Name:** GMAC\_SAMB1  
**Offset:** 0x0C8  
**Reset:** 0x00000000  
**Property:** Read/Write

Reset	0	0	0	0	0	0	0	0

**Bits 17:0 – SCOL[17:0] Single Collision**

This register counts the number of frames experiencing a single collision before being successfully transmitted i.e., no underrun.

**39.8.62 GMAC Multiple Collision Frames Register**

**Name:** GMAC\_MCF  
**Offset:** 0x13C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 17:0 – MCOL[17:0] Multiple Collision**

This register counts the number of frames experiencing between two and fifteen collisions prior to being successfully transmitted, i.e., no underrun and not too many retries.

**39.8.63 GMAC Excessive Collisions Register**

**Name:** GMAC\_EC  
**Offset:** 0x140  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 9:0 – XCOL[9:0] Excessive Collisions**

This register counts the number of frames that failed to be transmitted because they experienced 16 collisions.

### 39.8.64 GMAC Late Collisions Register

**Name:** GMAC\_LC  
**Offset:** 0x144  
**Reset:** 0x00000000  
**Property:** Read-only

	Bit	31	30	29	28	27	26	25	24
Access									
Reset									
	Bit	23	22	21	20	19	18	17	16

		LCOL[7:0]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0

**Bits 9:0 – LCOL[9:0] Late Collisions**

This register counts the number of late collisions occurring after the slot time (512 bits) has expired. In 10/100 mode, late collisions are counted twice i.e., both as a collision and a late collision.

### 39.8.65 GMAC Deferred Transmission Frames Register

**Name:** GMAC\_DTF  
**Offset:** 0x148  
**Reset:** 0x00000000  
**Property:** Read-only

	Bit	31	30	29	28	27	26	25	24
Access

	Bit	7	6	5	4	3	2	1	0
		DEFT[7:0]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0

**Bits 17:0 – DEFT[17:0] Deferred Transmission**

This register counts the number of frames experiencing deferral due to carrier sense being active on their first attempt at transmission. Frames involved in any collision are not counted nor are frames that experienced a transmit underrun.

**39.8.66 GMAC Carrier Sense Errors Register**

**Name:** GMAC\_CSE  
**Offset:** 0x14C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	[Register Bits 31:24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Access							R	R
Reset							0	0
Bit	7	6	5	4	3	2	1	0
	CSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 9:0 – CSR[9:0] Carrier Sense Error**

This register counts the number of frames transmitted where carrier sense was not seen during transmission or where carrier sense was deasserted after being asserted in a transmit frame without collision (no underrun). Only incremented in half duplex mode. The only effect of a carrier sense error is to increment this register. The behavior of the other statistics registers is unaffected by the detection of a carrier sense error.

**39.8.67 GMAC Octets Received Low Register**

**Name:** GMAC\_ORLO  
**Offset:** 0x150  
**Reset:** 0x00000000  
**Property:** Read-only

When reading the Octets Transmitted and Octets Received Registers, bits [31:0] should be read prior to bits [47:32] to ensure reliable operation.

Bit	31	30	29	28	27	26	25	24

	RXO[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – RXO[31:0] Received Octets**

Received octets in frame without errors [31:0]. The number of octets received in valid frames of any type. This counter is 48-bits and is read through two registers. This count does not include octets from pause frames, and is only incremented if the frame is successfully filtered and copied to memory.

**39.8.68 GMAC Octets Received High Register**

**Name:** GMAC\_ORHI  
**Offset:** 0x154  
**Reset:** 0x00000000  
**Property:** Read-only

When reading the Octets Transmitted and Octets Received Registers, bits 31:0 should be read prior to bits 47:32 to ensure reliable operation.

**Bits 15:0 – RXO[15:0] Received Octets**

Received octets in frame without errors [47:32]. The number of octets received in valid frames of any type. This counter is 48-bits and is read through two registers. This count does not include octets from pause frames, and is only incremented if the frame is successfully filtered and copied to memory.

**39.8.69 GMAC Frames Received Register**

**Name:** GMAC\_FR  
**Offset:** 0x158  
**Reset:** 0x00000000  
**Property:** Read-only

**Bits 31:0 – NFRX[31:0]** 1519 to Maximum Byte Frames Received without Error

This register counts the number of 1519 byte or above frames successfully received without error. Maximum frame size is determined by the Network Configuration Register bit 8 (1536 maximum frame size) or bit 3 (jumbo frame size). Excludes pause frames, and is only incremented if the frame is successfully filtered and copied to memory. See [GMAC Network Configuration Register](#).

**39.8.80 GMAC Undersized Frames Received Register**

**Name:** GMAC\_UFR  
**Offset:** 0x184  
**Reset:** 0x00000000  
**Property:** Read-only

**Bits 9:0 – UFRX[9:0] Undersize Frames Received**

This register counts the number of frames received less than 64 bytes in length (10/100 mode, full duplex) that do not have either a CRC error or an alignment error.

**39.8.81 GMAC Oversized Frames Received Register**

**Name:** GMAC\_OFR  
**Offset:** 0x188  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	7	6	5	4	3	2	1	0
	FCKR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 9:0 – FCKR[9:0]** Frame Check Sequence Errors

The register counts frames that are an integral number of bytes, have bad CRC and are between 64 and 1518 bytes in length (1536 if bit 8 is set in Network Configuration Register). This register is also incremented if a symbol error is detected and the frame is of valid length and has an integral number of bytes.

This register is incremented for a frame with bad FCS, regardless of whether it is copied to memory due to ignore FCS mode being enabled in bit 26 of the Network Configuration Register. See [GMAC Network Configuration Register](#).

**39.8.84 GMAC Length Field Frame Errors Register**

**Name:** GMAC\_LFFE  
**Offset:** 0x194  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	[Greyed out]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

	LFER[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 9:0 – LFER[9:0] Length Field Frame Errors**

This register counts the number of frames received that have a measured length shorter than that extracted from the length field (bytes 13 and 14). This condition is only counted if the value of the length field is less than 0x0600, the frame is not of excessive length and checking is enabled through bit 16 of the Network Configuration Register. See [GMAC Network Configuration Register](#).

**39.8.85 GMAC Receive Symbol Errors Register**

**Name:** GMAC\_RSE  
**Offset:** 0x198  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24

	RXSE[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 9:0 – RXSE[9:0] Receive Symbol Errors**

This register counts the number of frames that had GRXER asserted during reception. For 10/100 mode symbol errors are counted regardless of frame length checks. Receive symbol errors will also be counted as an FCS or alignment error if the frame is between 64 and 1518 bytes (1536 bytes if bit 8 is set in the Network Configuration Register). If the frame is larger it will be recorded as a jabber error. See [GMAC Network Configuration Register](#).

**39.8.86 GMAC Alignment Errors Register**

**Name:** GMAC\_AE  
**Offset:** 0x19C  
**Reset:** 0x0000'0000  
**Property:** Read-only

**Bits 9:0 – AER[9:0] Alignment Errors**

This register counts the frames that are not an integral number of bytes long and have bad CRC when their length is truncated to an integral number of bytes and are between 64 and 1518 bytes in length (1536 if bit 8 is set in Network Configuration Register). This register is also incremented if a symbol error is detected and the frame is of valid length and does not have an integral number of bytes. See [GMAC Network Configuration Register](#).

**39.8.87 GMAC Receive Resource Errors Register**

**Name:** GMAC\_RRE  
**Offset:** 0x1A0

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 9:0 – RXOVR[9:0] Receive Overruns**

This register counts the number of frames that are address recognized but were not copied to memory due to a receive overrun.

**39.8.89 GMAC IP Header Checksum Errors Register**

**Name:** GMAC\_IHCE  
**Offset:** 0x1A8  
**Reset:** 0x00000000  
**Property:** Read-only

**Bits 7:0 – HCKER[7:0] IP Header Checksum Errors**

This register counts the number of frames discarded due to an incorrect IP header checksum, but are between 64 and 1518 bytes (1536 bytes if bit 8 is set in the Network Configuration Register) and do not have a CRC error, an alignment error, nor a symbol error.

**39.8.90 GMAC TCP Checksum Errors Register**

**Name:** GMAC\_TCE  
**Offset:** 0x1AC  
**Reset:** 0x00000000  
**Property:** Read-only

**Bits 7:0 – TCKER[7:0] TCP Checksum Errors**

This register counts the number of frames discarded due to an incorrect TCP checksum, but are between 64 and 1518 bytes (1536 bytes if bit 8 is set in the Network Configuration Register) and do not have a CRC error, an alignment error, nor a symbol error.

**39.8.91 GMAC UDP Checksum Errors Register**

**Name:** GMAC\_UCE  
**Offset:** 0x1B0  
**Reset:** 0x00000000  
**Property:** Read-only

**Bits 7:0 – UCKER[7:0] UDP Checksum Errors**

This register counts the number of frames discarded due to an incorrect UDP checksum, but are between 64 and 1518 bytes (1536 bytes if bit 8 is set in the Network Configuration Register) and do not have a CRC error, an alignment error, nor a symbol error.

**39.8.92 GMAC 1588 Timer Increment Sub-nanoseconds Register**

**Name:** GMAC\_TISUBN  
**Offset:** 0x1BC  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 15:0 – LSBTIR[15:0]** Lower Significant Bits of Timer Increment Register

Lower significant bits of Timer Increment Register[15:0] giving a 24-bit timer\_increment counter. These bits are the sub-ns value which the 1588 timer will be incremented each clock cycle. Bit n =  $2^{(n-16)}$  nsec giving a resolution of approximately  $15.2E^{-15}$  sec.

### 39.8.93 GMAC 1588 Timer Seconds High Register

**Name:** GMAC\_TSH  
**Offset:** 0x1C0  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 31:2 – RXBQBA[29:0]** Receive Buffer Queue Base Address  
 Written with the address of the start of the receive queue.

**39.8.113 GMAC Receive Buffer Size Register Priority Queue x**

**Name:** GMAC\_RBSRPQx  
**Offset:** 0x049C + x\*0x04 [x=0..1]  
**Reset:** 0x00000002  
**Property:** Read/Write

**Bits 15:0 – RBS[15:0] Receive Buffer Size**

DMA receive buffer size in AHB system memory. The value defined by these bits determines the size of buffer to use in main AHB system memory when writing received data.

The value is defined in multiples of 64 bytes such that a value of 0x01 corresponds to buffers of 64 bytes, 0x02 corresponds to 128 bytes etc.

For example:

0x02: 128bytes

0x18: 1536bytes (1 × max length frame/buffer)

0xA0: 10240bytes (1 × 10K jumbo frame/buffer)

Note that this value should never be written as zero.

**39.8.114 GMAC Credit-Based Shaping Control Register**

**Name:** GMAC\_CBSCR  
**Offset:** 0x4BC  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 1 – QAE** Queue A CBS Enable

Value	Description
0	Credit-based shaping on the second highest priority queue (queue A) is disabled.
1	Credit-based shaping on the second highest priority queue (queue A) is enabled.

**Bit 0 – QBE** Queue B CBS Enable

Value	Description
0	Credit-based shaping on the highest priority queue (queue B) is disabled.
1	Credit-based shaping on the highest priority queue (queue B) is enabled.

**39.8.115 GMAC Credit-Based Shaping IdleSlope Register for Queue A**

**Name:** GMAC\_CBSISQA  
**Offset:** 0x4C0  
**Reset:** 0x00000000  
**Property:** Read/Write

Credit-based shaping must be disabled in GMAC\_CBSCR before updating this register.

Bit	31	30	29	28	27	26	25	24
	IS[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – IS[31:0] IdleSlope**

IdleSlope value for queue A in bytes/second.

The IdleSlope value is defined as the rate of change of credit when a packet is waiting to be sent. This must not exceed the port transmit rate which is dependent on the speed of operation, e.g., 100 Mb/second = 32'h017D7840

If 50% of bandwidth was to be allocated to a particular queue in 100 Mb/second mode, then the IdleSlope value for that queue would be calculated as 32'h017D7840 / 2.

**39.8.116 GMAC Credit-Based Shaping IdleSlope Register for Queue B**

**Name:** GMAC\_CBSISQB  
**Offset:** 0x4C4  
**Reset:** 0x00000000  
**Property:** Read/Write

Credit-based shaping must be disabled in GMAC\_CBSCR before updating this register.

**Bits 31:0 – IS[31:0] IdleSlope**

IdleSlope value for queue B in bytes/second.

The IdleSlope value is defined as the rate of change of credit when a packet is waiting to be sent. This must not exceed the port transmit rate which is dependent on the speed of operation, e.g., 100 Mb/second = 32'h017D7840.

If 50% of bandwidth was to be allocated to a particular queue in 100 Mb/second mode, then the IdleSlope value for that queue would be calculated as 32'h017D7840 / 2.

### 39.8.117 GMAC Screening Type 1 Register x Priority Queue

**Name:** GMAC\_ST1RPQx  
**Offset:** 0x0500 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

Screening type 1 registers are used to allocate up to 3 priority queues to received frames based on certain IP or UDP fields of incoming frames.

Bit	31	30	29	28	27	26	25	24
			UDPE	DSTCE	UDPM[15:12]			
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	UDPM[11:4]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	UDPM[3:0]				DSTCM[7:4]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	DSTCM[3:0]					QNB[2:0]		
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	0	0		0	0	0

**Bit 29 – UDPE** UDP Port Match Enable

When UDP port match enable is set (bit 29), the UDP Destination Port of the received UDP frame is matched against bits 27:12.

**Bit 28 – DSTCE** Differentiated Services or Traffic Class Match Enable

When DS/TC match enable is set (bit 28), the DS (differentiated services) field of the received IPv4 header or TC field (traffic class) of IPv6 headers are matched against bits 11:4.

**Bits 27:12 – UDPM[15:0]** UDP Port Match

When UDP port match enable is set (bit 29), the UDP Destination Port of the received UDP frame is matched against bits 27:12.

**Bits 11:4 – DSTCM[7:0]** Differentiated Services or Traffic Class Match

When DS/TC match enable is set (bit 28), the DS (differentiated services) field of the received IPv4 header or TC field (traffic class) of IPv6 headers are matched against bits 11:4.

**Bits 2:0 – QNB[2:0]** Queue Number (0–2)

If a match is successful, then the queue value programmed in bits 2:0 is allocated to the frame.

### 39.8.118 GMAC Screening Type 2 Register x Priority Queue

**Name:** GMAC\_ST2RPQx  
**Offset:** 0x0540 + x\*0x04 [x=0..7]  
**Reset:** 0x00000000  
**Property:** Read/Write

Screening type 2 registers are used to allocate up to 3 priority queues to received frames based on the VLAN priority field of received ethernet frames.

Bit	31	30	29	28	27	26	25	24
		COMPCE	COMPC[4:0]				COMPBE	
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
		VLANP[2:0]				QNB[2:0]		
Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		0	0	0		0	0	0

#### Bit 30 – COMPCE Compare C Enable

Value	Description
0	Comparison via the register designated by index COMPC is disabled.
1	Comparison via the register designated by index COMPC is enabled.

**Bits 29:25 – COMPC[4:0]** Index of Screening Type 2 Compare Word 0/Word 1 register x  
 COMPC is a pointer to the compare registers GMAC\_ST2CW0x and GMAC\_ST2CW1x. When COMPCE is set, the compare is true if the data at the frame offset ANDed with the value MASKVAL is equal to the value of COMPVAL ANDed with the value of MASKVAL.

#### Bit 24 – COMPBE Compare B Enable

Value	Description
0	Comparison via the register designated by index COMPB is disabled.
1	Comparison via the register designated by index COMPB is enabled.

**Bits 23:19 – COMPB[4:0]** Index of Screening Type 2 Compare Word 0/Word 1 register x  
 COMPB is a pointer to the compare registers GMAC\_ST2CW0x and GMAC\_ST2CW1x. When COMPBE is set, the compare is true if the data at the frame offset ANDed with the value MASKVAL is equal to the value of COMPVAL ANDed with the value of MASKVAL.

**Bit 18 – COMPAE** Compare A Enable

Value	Description
0	Comparison via the register designated by index COMPA is disabled.
1	Comparison via the register designated by index COMPA is enabled.

**Bits 17:13 – COMPA[4:0]** Index of Screening Type 2 Compare Word 0/Word 1 register x  
 COMPA is a pointer to the compare registers GMAC\_ST2CW0x and GMAC\_ST2CW1x. When COMPAE is set, the compare is true if the data at the frame offset ANDed with the value MASKVAL is equal to the value of COMPVAL ANDed with the value of MASKVAL.

**Bit 12 – ETHE** EtherType Enable

Value	Description
0	EtherType match with bits 15:0 in the register designated by the value of I2ETH is disabled.
1	EtherType match with bits 15:0 in the register designated by the value of I2ETH is enabled.

**Bits 11:9 – I2ETH[2:0]** Index of Screening Type 2 EtherType register x  
 When ETHE is set (bit 12), the field EtherType (last EtherType in the header if the frame is VLAN tagged) is compared with bits 15:0 in the register designated by the value of I2ETH.

**Bit 8 – VLANE** VLAN Enable

Value	Description
0	VLAN match is disabled.
1	VLAN match is enabled.

**Bits 6:4 – VLANP[2:0]** VLAN Priority  
 When VLAN match enable is set (bit 8), the VLAN priority field of the received frame is matched against bits 7:4 of this register.

**Bits 2:0 – QNB[2:0]** Queue Number (0–2)  
 If a match is successful, then the queue value programmed in QNB is allocated to the frame.

### 39.8.119 GMAC Interrupt Enable Register Priority Queue x

**Name:** GMAC\_IERPQx  
**Offset:** 0x05FC + x\*0x04 [x=0..1]  
**Reset:** –  
**Property:** Write-only

The following values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access

### 39.8.121 GMAC Interrupt Mask Register Priority Queue x

**Name:** GMAC\_IMRPQx  
**Offset:** 0x063C + x\*0x04 [x=0..1]  
**Reset:** 0x00000000  
**Property:** Read/Write

A read of this register returns the value of the receive complete interrupt mask.

A write to this register directly affects the state of the corresponding bit in the Interrupt Status Register, causing an interrupt to be generated if a 1 is written.

The following values are valid for all listed bit names of this register:

0: Corresponding interrupt is enabled.

1: Corresponding interrupt is disabled.

	Bit	31	30	29	28	27	26	25	24

**Bits 31:16 – COMPVAL[15:0] Compare Value**

The byte stored in bits [23:16] is compared against the first byte of the 2 bytes extracted from the frame.

The byte stored in bits [31:24] is compared against the second byte of the 2 bytes extracted from the frame.

**Bits 15:0 – MASKVAL[15:0] Mask Value**

The value of MASKVAL ANDed with the 2 bytes extracted from the frame is compared to the value of MASKVAL ANDed with the value of COMPVAL.

### 39.8.124 GMAC Screening Type 2 Compare Word 1 Register x

**Name:** GMAC\_ST2CW1x  
**Offset:** 0x0704 + x\*0x08 [x=0..23]  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 8:7 – OFFSSTRT[1:0] Ethernet Frame Offset Start

Value	Name	Description
0	FRAMESTART	Offset from the start of the frame
1	ETHERTYPE	Offset from the byte after the EtherType field
2	IP	Offset from the byte after the IP header field
3	TCP_UDP	Offset from the byte after the TCP/UDP header field

#### Bits 6:0 – OFFSVAL[6:0] Offset Value in Bytes

The value of OFFSVAL ranges from 0 to 127 bytes, and is counted from either the start of the frame, the byte after the EtherType field (last EtherType in the header if the frame is VLAN tagged), the byte after the IP header (IPv4 or IPv6) or the byte after the TCP/UDP header.

## **40. USB High Speed Device Port (UDPHS)**

### **40.1 Description**

The USB High Speed Device Port (UDPHS) is compliant with the Universal Serial Bus (USB), rev 2.0 High Speed device specification.

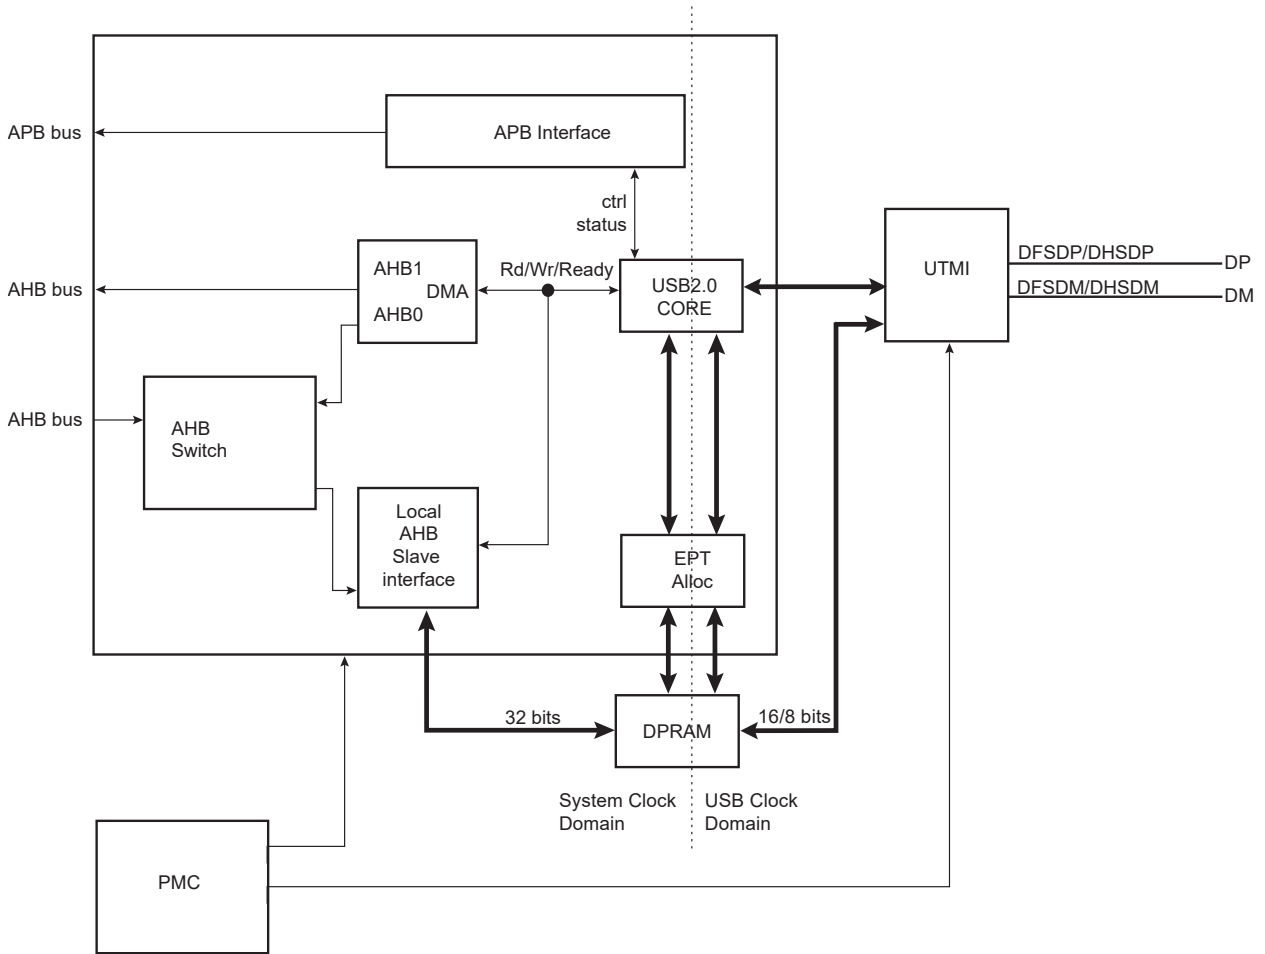

Each endpoint can be configured in one of several USB transfer types. It can be associated with one, two or three banks of a Dual-port RAM used to store the current data payload. If two or three banks are used, one DPR bank is read or written by the processor, while the other is read or written by the USB device peripheral. This feature is mandatory for isochronous endpoints.

### **40.2 Embedded Characteristics**

- 1 High-speed Device
- 1 UTMI transceiver shared between Host and Device
- USB v2.0 High Speed (480 Mbits/s) Compliant
- 16 Endpoints up to 1024 bytes
- Embedded Dual-port RAM for Endpoints
- Suspend/Resume Logic (Command of UTMI)
- Up to Three Memory Banks for Endpoints (Not for Control Endpoint)
- 8 Kbytes of DPRAM

**40.3 Block Diagram**

**Figure 40-1. Block Diagram**

## 40.4 Typical Connection

Figure 40-2. Board Schematic

**Note:**

1. The values shown on the 22 kΩ and 15 kΩ resistors are only valid with 3V3-supplied PIOs.
2. CRPB: Upstream Facing Port Bypass Capacitance of 1 μF to 10 μF (refer to “DC Electrical Characteristics” in Universal Serial Bus Specification Rev. 2)
3. 10 pF capacitor on VBG is a provision and may not be populated.

## 40.5 Product Dependencies

### 40.5.1 Power Management

The UDPHS is not continuously clocked.

To use the UDPHS, the programmer must first enable the UDPHS Clock in the Power Management Controller Peripheral Clock Enable Register (PMC\_PCER), then enable the PLL in the PMC UTMI Clock Configuration Register (CKGR\_UCKR). Finally, the programmer must enable BIAS in CKGR\_UCKR.

However, if the application does not require UDPHS operations, the UDPHS clock can be stopped when not needed and restarted later.

### 40.5.2 Interrupt Sources

The UDPHS interrupt line is connected on one of the internal sources of the interrupt controller. Using the UDPHS interrupt requires the interrupt controller to be programmed first.

## 40.6 Functional Description

### 40.6.1 UTMI Transceivers Sharing

The High Speed USB Host Port A is shared with the High Speed USB Device port and connected to the second UTMI transceiver. The selection between Host Port A and USB Device is controlled by the UDPHS enable bit (EN\_UDPHS) located in the UDPHS\_CTRL register.

**Figure 40-3. USB Selection**

### 40.6.2 USB V2.0 High Speed Device Port Introduction

The USB V2.0 High Speed Device Port provides communication services between host and attached USB devices. Each device is offered with a collection of communication flows (pipes) associated with each endpoint. Software on the host communicates with a USB Device through a set of communication flows.

### 40.6.3 USB V2.0 High Speed Transfer Types

A communication flow is carried over one of four transfer types defined by the USB device.

A device provides several logical communication pipes with the host. To each logical pipe is associated an endpoint. Transfer through a pipe belongs to one of the four transfer types:

- **Control Transfers:** Used to configure a device at attach time and can be used for other device-specific purposes, including control of other pipes on the device.
- **Bulk Data Transfers:** Generated or consumed in relatively large burst quantities and have wide dynamic latitude in transmission constraints.
- **Interrupt Data Transfers:** Used for timely but reliable delivery of data, for example, characters or coordinates with human-perceptible echo or feedback response characteristics.
- **Isochronous Data Transfers:** Occupy a prenegotiated amount of USB bandwidth with a prenegotiated delivery latency. (Also called streaming real time transfers.)

As indicated below, transfers are sequential events carried out on the USB bus.

Endpoints must be configured according to the transfer type they handle.

**Table 40-1. USB Communication Flow**

Transfer	Direction	Bandwidth	Endpoint Size	Error Detection	Retrying
Control	Bidirectional	Not guaranteed	8, 16, 32, 64	Yes	Automatic
Isochronous	Unidirectional	Guaranteed	8–1024	Yes	No
Interrupt	Unidirectional	Not guaranteed	8–1024	Yes	Yes
Bulk	Unidirectional	Not guaranteed	8–512	Yes	Yes

### 40.6.4 USB Transfer Event Definitions

A transfer is composed of one or several transactions as shown in the table below.

**Table 40-2. USB Transfer Events**

Transfer		Transaction
Direction	Type	
CONTROL (bidirectional)	Control Transfer <sup>(1)</sup>	<ul style="list-style-type: none"> <li>• Setup transaction → Data IN transactions → Status OUT transaction</li> <li>• Setup transaction → Data OUT transactions → Status IN transaction</li> <li>• Setup transaction → Status IN transaction</li> </ul>
IN (device toward host)	Bulk IN Transfer	• Data IN transaction → Data IN transaction
	Interrupt IN Transfer	• Data IN transaction → Data IN transaction
	Isochronous IN Transfer <sup>(2)</sup>	• Data IN transaction → Data IN transaction
OUT (host toward device)	Bulk OUT Transfer	• Data OUT transaction → Data OUT transaction
	Interrupt OUT Transfer	• Data OUT transaction → Data OUT transaction
	Isochronous OUT Transfer <sup>(2)</sup>	• Data OUT transaction → Data OUT transaction

**Note:**

1. Control transfer must use endpoints with one bank and can be aborted using a stall handshake.
2. Isochronous transfers must use endpoints configured with two or three banks.

An endpoint handles all transactions related to the type of transfer for which it has been configured.

**Table 40-3. UDPHS Endpoint Description**

Endpoint #	Mnemonic	Nb Bank	DMA	High Band Width	Max. Endpoint Size	Endpoint Type
0	EPT_0	1	N	N	64	Control
1	EPT_1	3	Y	Y	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt
2	EPT_2	3	Y	Y	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt
3	EPT_3	2	Y	N	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt
4	EPT_4	2	Y	N	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt
5	EPT_5	2	Y	N	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt
6	EPT_6	2	Y	N	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt
7	EPT_7	2	Y	N	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt
8	EPT_8	2	N	N	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt
9	EPT_9	2	N	N	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt
10	EPT_10	2	N	N	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt
11	EPT_11	2	N	N	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt

.....continued

Endpoint #	Mnemonic	Nb Bank	DMA	High Band Width	Max. Endpoint Size	Endpoint Type
12	EPT_12	2	N	N	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt
13	EPT_13	2	N	N	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt
14	EPT_14	2	N	N	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt
15	EPT_15	2	N	N	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt

**Note:**

1. In Isochronous (Iso) mode, it is preferable that High Band Width capability is available.

The size of the internal DPRAM is 8 Kbytes.

Suspend and resume are automatically detected by the UDPHS device, which notifies the processor by raising an interrupt.

### 40.6.5 USB V2.0 High Speed BUS Transactions

Each transfer results in one or more transactions over the USB bus.

There are five kinds of transactions flowing across the bus in packets:

1. Setup Transaction
2. Data IN Transaction
3. Data OUT Transaction
4. Status IN Transaction
5. Status OUT Transaction

A status IN or OUT transaction is identical to a data IN or OUT transaction.

**Figure 40-4. Control Read and Write Sequences**

### 40.6.6 Endpoint Configuration

The endpoint 0 is always a control endpoint, it must be programmed and active in order to be enabled when the End Of Reset interrupt occurs.

To configure the endpoints:

- Fill the configuration register (UDPHS\_EPTCFG) with the endpoint size, direction (IN or OUT), type (CTRL, Bulk, IT, ISO) and the number of banks.
- Fill the number of transactions (NB\_TRANS) for isochronous endpoints.

Note: For control endpoints the direction has no effect.

- Verify that the EPT\_MAPD flag is set. This flag is set if the endpoint size and the number of banks are correct for this endpoint and compared to the FIFO maximum capacity and the maximum number of allowed banks.
- Configure control flags of the endpoint and enable it in UDPHS\_EPTCTLENBx according to the section [UDPHS Endpoint Control Disable Register \(Isochronous Endpoint\)](#).

Control endpoints can generate interrupts and use only 1 bank.

All endpoints (except endpoint 0) can be configured either as Bulk, Interrupt or Isochronous. Refer to the table [UDPHS Endpoint Description](#).

The maximum packet size they can accept corresponds to the maximum endpoint size.

**Note:** The endpoint size of 1024 is reserved for isochronous endpoints.

The size of the DPRAM is 8 Kbytes. The DPR is shared by all active endpoints. The memory size required by the active endpoints must not exceed the size of the DPRAM.

SIZE\_DPRAM = SIZE\_EPT0

+ NB\_BANK\_EPT1 x SIZE\_EPT1

+ NB\_BANK\_EPT2 x SIZE\_EPT2

+ NB\_BANK\_EPT3 x SIZE\_EPT3

+ NB\_BANK\_EPT4 x SIZE\_EPT4

+ NB\_BANK\_EPT5 x SIZE\_EPT5

+ NB\_BANK\_EPT6 x SIZE\_EPT6

+... (refer to [UDPHS Endpoint Configuration Register](#))

If a user tries to configure endpoints with a size the sum of which is greater than the DPRAM, then the EPT\_MAPD is not set.

The application has access to the physical block of DPR reserved for the endpoint through a 64-Kbyte logical address space.

The physical block of DPR reserved for the endpoint is remapped all along the 64-Kbyte logical address space. The application can write a 64-Kbyte buffer linearly.

**Figure 40-5. Logical Address Space for DPR Access**

Configuration examples of `UDPHS_EPTCTLx` ([UDPHS Endpoint Control Disable Register \(Isochronous Endpoint\)](#)) for Bulk IN endpoint type follow below.

- With DMA
  - `AUTO_VALID`: Automatically validate the packet and switch to the next bank.
  - `EPT_ENABL`: Enable endpoint.
- Without DMA:
  - `TXRDY`: An interrupt is generated after each transmission.
  - `EPT_ENABL`: Enable endpoint.

Configuration examples of Bulk OUT endpoint type follow below.

- With DMA
  - `AUTO_VALID`: Automatically validate the packet and switch to the next bank.
  - `EPT_ENABL`: Enable endpoint.
- Without DMA
  - `RXRDY_TXKL`: An interrupt is sent after a new packet has been stored in the endpoint FIFO.
  - `EPT_ENABL`: Enable endpoint.

#### 40.6.7 DPRAM Management

Endpoints can only be allocated in ascending order, from the endpoint 0 to the last endpoint to be allocated. The user shall therefore configure them in the same order.

The allocation of an endpoint  $x$  starts when the Number of Banks field in the `UDPHS Endpoint Configuration Register (UDPHS_EPTCFGx.BK_NUMBER)` is different from zero. Then, the hardware allocates a memory area in the DPRAM and inserts it between the  $x - 1$  and  $x + 1$  endpoints. The  $x + 1$  endpoint memory window slides up and its data is lost. Note that the following endpoint memory windows (from  $x + 2$ ) do not slide.

Disabling an endpoint, by writing a one to the Endpoint Disable bit in the `UDPHS Endpoint Control Disable Register (UDPHS_EPTCTLDISx.EPT_DISABL)`, does not reset its configuration:

- Endpoint Banks (UDPHS\_EPTCFGx.BK\_NUMBER)
- Endpoint Size (UDPHS\_EPTCFGx.EPT\_SIZE)
- Endpoint Direction (UDPHS\_EPTCFGx.EPT\_DIR)
- Endpoint Type (UDPHS\_EPTCFGx.EPT\_TYPE)

To free its memory, the user shall write a zero to the UDPHS\_EPTCFGx.BK\_NUMBER field. The x+ 1 endpoint memory window then slides down and its data is lost. Note that the following endpoint memory windows (from x + 2) do not slide.

The following figure illustrates the allocation and reorganization of the DPRAM in a typical example.

**Figure 40-6. Example of DPRAM Allocation and Reorganization**

DPRAM allocation sequence:

1. The endpoints 0 to 5 are enabled, configured and allocated in ascending order. Each endpoint then owns a memory area in the DPRAM.
2. The endpoint 3 is disabled, but its memory is kept allocated by the controller.
3. In order to free its memory, its `UDPHS_EPTCFGx.BK_NUMBER` field is written to zero. The endpoint 4 memory window slides down, but the endpoint 5 does not move.
4. If the user chooses to reconfigure the endpoint 3 with a larger size, the controller allocates a memory area after the endpoint 2 memory area and automatically slides up the endpoint 4 memory window. The endpoint 5 does not move and a memory conflict appears as the memory windows of the endpoints 4 and 5 overlap. The data of these endpoints is potentially lost.

**Note:**

1. There is no way the data of the endpoint 0 can be lost (except if it is de-allocated) as the memory allocation and de-allocation may affect only higher endpoints.
2. Deactivating then reactivating the same endpoint with the same configuration only modifies temporarily the controller DPRAM pointer and size for this endpoint. Nothing changes in the DPRAM, higher endpoints seem not to have been moved and their data is preserved as far as nothing has been written or received into them while changing the allocation state of the first endpoint.
3. When the user writes a value different from zero to the `UDPHS_EPTCFGx.BK_NUMBER` field, the Endpoint Mapped bit (`UDPHS_EPTCFGx.EPT_MAPD`) is set only if the configured size and

number of banks are correct as compared to the endpoint maximal allowed values and to the maximal FIFO size (i.e., the DPRAM size). The UDPHS\_EPTCFGx.EPT\_MAPD value does not consider memory allocation conflicts.

### 40.6.8 Transfer With DMA

USB packets of any length may be transferred when required by the UDPHS device. These transfers always feature sequential addressing.

Packet data AHB bursts may be locked on a DMA buffer basis for drastic overall AHB bus bandwidth performance boost with paged memories. These clock-cycle consuming memory row (or bank) changes will then likely not occur, or occur only once instead of several times, during a single big USB packet DMA transfer in case another AHB master addresses the memory. The locked bursts result in up to 128-word single-cycle unbroken AHB bursts for bulk endpoints and 256-word single-cycle unbroken bursts for isochronous endpoints.

This maximum burst length is then controlled by the lowest programmed USB endpoint size (EPT\_SIZE field in the UDPHS\_EPTCFGx register) and DMA Size (BUFF\_LENGTH field in the UDPHS\_DMACONTROLx register).

The USB 2.0 device average throughput may be up to nearly 60 Mbyte/s. Its internal slave average access latency decreases as burst length increases due to the 0 wait-state side effect of unchanged endpoints. If at least 0 wait-state word burst capability is also provided by the external DMA AHB bus slaves, each of both DMA AHB busses need less than 50% bandwidth allocation for full USB 2.0 bandwidth usage at 30 MHz, and less than 25% at 60 MHz.

The UDPHS DMA Channel Transfer Descriptor is described in the section [UDPHS DMA Channel Transfer Descriptor](#).

**Note:** In case of debug, be careful to address the DMA to an SRAM address even if a remap is done.

**Figure 40-7. Example of DMA Chained List**

### 40.6.9 Transfer Without DMA

**Important:** If the DMA is not to be used, it is necessary to disable it, otherwise it can be enabled by previous versions of software without warning. If this should occur, the DMA can process data before an interrupt without knowledge of the user.

The recommended means to disable DMA are as follows:

```
// Reset IP UDPHS
AT91C_BASE_UDPHS->UDPHS_CTRL &= ~AT91C_UDPHS_EN_UDPHS;
AT91C_BASE_UDPHS->UDPHS_CTRL |= AT91C_UDPHS_EN_UDPHS;//
With OR without DMA !!!
for( i=1; i<=((AT91C_BASE_UDPHS->UDPHS_IPFEATURES &
AT91C_UDPHS_DMA_CHANNEL_NBR)>>4); i++ ) {
// RESET endpoint canal DMA:
// DMA stop channel command
AT91C_BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMACONTROL = 0; // STOP
command
// Disable endpoint
AT91C_BASE_UDPHS->UDPHS_EPT[i].UDPHS_EPTCTLDIS |= 0xFFFFFFFF;
// Reset endpoint config
AT91C_BASE_UDPHS->UDPHS_EPT[i].UDPHS_EPTCTLCFG = 0;
// Reset DMA channel (Buff count and Control field)
AT91C_BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMACONTROL = 0x02; // NON
STOP command
// Reset DMA channel 0 (STOP)
AT91C_BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMACONTROL = 0; // STOP
command
// Clear DMA channel status (read the register for clear it)
AT91C_BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMASTATUS =
AT91C_BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMASTATUS;
}
```

### 40.6.10 Handling Transactions with USB V2.0 Device Peripheral

#### 40.6.10.1 Setup Transaction

The setup packet is valid in the DPR while RX\_SETUP is set. Once RX\_SETUP is cleared by the application, the UDPHS accepts the next packets sent over the device endpoint.

When a valid setup packet is accepted by the UDPHS:

- The UDPHS device automatically acknowledges the setup packet (sends an ACK response)
- Payload data is written in the endpoint
- Sets the RX\_SETUP interrupt
- The BYTE\_COUNT field in the UDPHS\_EPTSTAx register is updated

An endpoint interrupt is generated while RX\_SETUP in the UDPHS\_EPTSTAx register is not cleared. This interrupt is carried out to the microcontroller if interrupts are enabled for this endpoint.

Thus, firmware must detect RX\_SETUP polling UDPHS\_EPTSTAx or catching an interrupt, read the setup packet in the FIFO, then clear the RX\_SETUP bit in the UDPHS\_EPTCLRSTA register to acknowledge the setup stage.

If STALL\_SNT was set to 1, then this bit is automatically reset when a setup token is detected by the device. Then, the device still accepts the setup stage. (See the section [STALL](#)).

#### 40.6.10.2 NYET

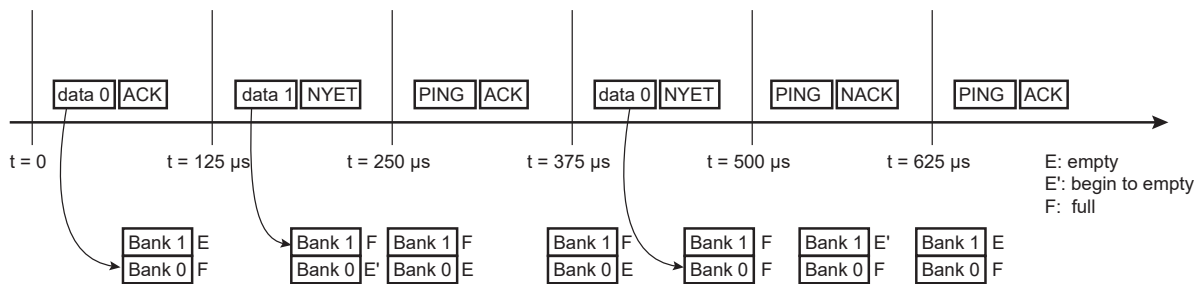

NYET is a High Speed only handshake. It is returned by a High Speed endpoint as part of the PING protocol.

High Speed devices must support an improved NAK mechanism for Bulk OUT and control endpoints (except setup stage). This mechanism allows the device to tell the host whether it has sufficient endpoint space for the next OUT transfer (refer to USB 2.0 spec 8.5.1 NAK Limiting via Ping Flow Control).

The NYET/ACK response to a High Speed Bulk OUT transfer and the PING response are automatically handled by hardware in the UDPHS\_EPTCTLx register (except when the user wants to force a NAK response by using the NYET\_DIS bit).

If the endpoint responds instead to the OUT/DATA transaction with an NYET handshake, this means that the endpoint accepted the data but does not have room for another data payload. The host controller must return to using a PING token until the endpoint indicates it has space available.

**Figure 40-8. NYET Example with Two Endpoint Banks**

### 40.6.10.3 Data IN

- Bulk IN or Interrupt IN

Data IN packets are sent by the device during the data or the status stage of a control transfer or during an (interrupt/bulk/isochronous) IN transfer. Data buffers are sent packet by packet under the control of the application or under the control of the DMA channel.

There are three ways for an application to transfer a buffer in several packets over the USB:

- packet by packet (see [Bulk IN or Interrupt IN: Sending a Packet Under Application Control \(Device to Host\)](#) below)
- 64 Kbytes (see [Bulk IN or Interrupt IN: Sending a Packet Under Application Control \(Device to Host\)](#) below)
- DMA (see [Bulk IN or Interrupt IN: Sending a Buffer Using DMA \(Device to Host\)](#) below)
  - Bulk IN or Interrupt IN: Sending a Packet Under Application Control (Device to Host)
- Bulk IN or Interrupt IN: Sending a Packet Under Application Control (Device to Host)

The application can write one or several banks.

A simple algorithm can be used by the application to send packets regardless of the number of banks associated to the endpoint.

#### Algorithm Description for Each Packet

- The application waits for the TXRDY flag to be cleared in the UDPHS\_EPTSTAx register before it can perform a write access to the DPR.
- The application writes one USB packet of data in the DPR through the 64 Kbytes endpoint logical memory window.
- The application sets TXRDY flag in the UDPHS\_EPTSETSTAx register.

The application is notified that it is possible to write a new packet to the DPR by the TXRDY interrupt. This interrupt can be enabled or masked by setting the TXRDY bit in the UDPHS\_EPTCTLENB/UDPHS\_EPTCTLDIS register.

### Algorithm Description to Fill Several Packets

Using the previous algorithm, the application is interrupted for each packet. It is possible to reduce the application overhead by writing linearly several banks at the same time. The AUTO\_VALID bit in the UDPHS\_EPTCTLx must be set by writing the AUTO\_VALID bit in the UDPHS\_EPTCTLENBx register.

The auto-valid-bank mechanism allows the transfer of data (IN and OUT) without the intervention of the CPU. This means that bank validation (set TXRDY or clear the RXRDY\_TXKL bit) is done by hardware.

- The application checks the BUSY\_BANK\_STA field in the UDPHS\_EPTSTAx register. The application must wait that at least one bank is free.
- The application writes a number of bytes inferior to the number of free DPR banks for the endpoint. Each time the application writes the last byte of a bank, the TXRDY signal is automatically set by the UDPHS.
- If the last packet is incomplete (i.e., the last byte of the bank has not been written) the application must set the TXRDY bit in the UDPHS\_EPTSETSTAx register.

The application is notified that all banks are free, so that it is possible to write another burst of packets by the BUSY\_BANK interrupt. This interrupt can be enabled or masked by setting the BUSY\_BANK flag in the UDPHS\_EPTCTLENB and UDPHS\_EPTCTLDIS registers.

This algorithm must not be used for isochronous transfer. In this case, the ping-pong mechanism does not operate.

A Zero Length Packet can be sent by setting just the TXRDY flag in the UDPHS\_EPTSETSTAx register.

- Bulk IN or Interrupt IN: Sending a Buffer Using DMA (Device to Host)

The UDPHS integrates a DMA host controller. This DMA controller can be used to transfer a buffer from the memory to the DPR or from the DPR to the processor memory under the UDPHS control. The DMA can be used for all transfer types except control transfer.

Example DMA configuration:

1. Program UDPHS\_DMAADDRESS x with the address of the buffer that should be transferred.
2. Enable the interrupt of the DMA in UDPHS\_IEN
3. Program UDPHS\_DMACONTROLx:
  - Size of buffer to send: size of the buffer to be sent to the host.
  - END\_B\_EN: The endpoint can validate the packet (according to the values programmed in the AUTO\_VALID and SHRT\_PCKT fields of UDPHS\_EPTCTLx.) (see section [UDPHS Endpoint Control Disable Register \(Isochronous Endpoint\)](#) and [Figure 40-13](#))
  - END\_BUFFERIT: generate an interrupt when the BUFF\_COUNT in UDPHS\_DMASTATUSx reaches 0.
  - CHANN\_ENB: Run and stop at end of buffer

The auto-valid-bank mechanism allows the transfer of data (IN & OUT) without the intervention of the CPU. This means that bank validation (set TXRDY or clear the RXRDY\_TXKL bit) is done by hardware.

A transfer descriptor can be used. Instead of programming the register directly, a descriptor should be programmed and the address of this descriptor is then given to UDPHS\_DMANXTDSC to be processed after setting the LDNXT\_DSC field (Load Next Descriptor Now) in UDPHS\_DMACONTROLx register.

The structure that defines this transfer descriptor must be aligned.

Each buffer to be transferred must be described by a DMA Transfer descriptor (see section [UDPHS DMA Channel Transfer Descriptor](#)). Transfer descriptors are chained. Before executing transfer of the buffer, the UDPHS may fetch a new transfer descriptor from the memory address pointed by the `UDPHS_DMANTDSCx` register. Once the transfer is complete, the transfer status is updated in the `UDPHS_DMASTATUSx` register.

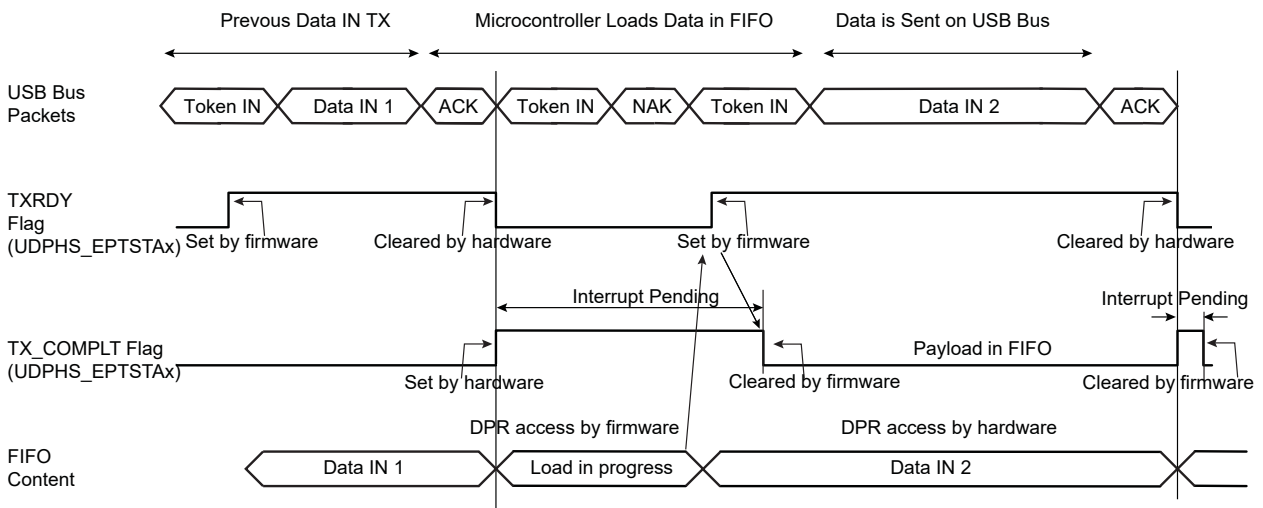

To chain a new transfer descriptor with the current DMA transfer, the DMA channel must be stopped. To do so, `INTDIS_DMA` and `TXRDY` may be set in the `UDPHS_EPTCTLENBx` register. It is also possible for the application to wait for the completion of all transfers. In this case the `LDNXT_DSC` bit in the last transfer descriptor `UDPHS_DMACONTROLx` register must be set to 0 and the `CHANN_ENB` bit set to 1.

Then the application can chain a new transfer descriptor.

The `INTDIS_DMA` can be used to stop the current DMA transfer if an enabled interrupt is triggered. This can be used to stop DMA transfers in case of errors.

The application can be notified at the end of any buffer transfer (`ENB_BUFFIT` bit in the `UDPHS_DMACONTROLx` register).

**Figure 40-9. Data IN Transfer for Endpoint with One Bank**

**Figure 40-10. Data IN Transfer for Endpoint with Two Banks**

**Figure 40-11. Data IN Followed By Status OUT Transfer at the End of a Control Transfer**

**Note:** A NAK handshake is always generated at the first status stage token.

**Figure 40-12. Data OUT Followed by Status IN Transfer**

**Note:** Before proceeding to the status stage, the software should determine that there is no risk of extra data from the host (data stage). If not certain (non-predictable data stage length), then the software should wait for a NAK-IN interrupt before proceeding to the status stage. This precaution should be taken to avoid collision in the FIFO.

**Figure 40-13. Autovalid with DMA**

**Note:** In the illustration above Autovalid validates a bank as full, although this might not be the case, in order to continue processing data and to send to DMA.

- Isochronous IN

Isochronous-IN is used to transmit a stream of data whose timing is implied by the delivery rate. Isochronous transfer provides periodic, continuous communication between host and device.

It guarantees bandwidth and low latencies appropriate for telephony, audio, video, etc.

If the endpoint is not available (TXRDY\_TRER = 0), then the device does not answer to the host. An ERR\_FL\_ISO interrupt is generated in the UDPHS\_EPTSTAx register and once enabled, then sent to the CPU.

The STALL\_SNT command bit is not used for an ISO-IN endpoint.

- High Bandwidth Isochronous Endpoint Handling: IN Example

For high bandwidth isochronous endpoints, the DMA can be programmed with the number of transactions (BUFF\_LENGTH field in UDPHS\_DMACONTROLx) and the system should provide the required number of packets per microframe, otherwise, the host will notice a sequencing problem.

A response should be made to the first token IN recognized inside a microframe under the following conditions:

- If at least one bank has been validated, the correct DATAx corresponding to the programmed Number Of Transactions per Microframe (NB\_TRANS) should be answered. In case of a subsequent missed or corrupted token IN inside the microframe, the USB 2.0 Core available data bank(s) that should normally have been transmitted during that microframe shall be flushed at its end. If this flush occurs, an error condition is flagged (ERR\_FLUSH is set in UDPHS\_EPTSTAx).
- If no bank is validated yet, the default DATA0 ZLP is answered and underflow is flagged (ERR\_FL\_ISO is set in UDPHS\_EPTSTAx). Then, no data bank is flushed at microframe end.
- If no data bank has been validated at the time when a response should be made for the second transaction of NB\_TRANS = 3 transactions microframe, a DATA1 ZLP is answered and underflow is flagged (ERR\_FL\_ISO is set in UDPHS\_EPTSTAx). If and only if remaining untransmitted banks for that microframe are available at its end, they are flushed and an error condition is flagged (ERR\_FLUSH is set in UDPHS\_EPTSTAx).
- If no data bank has been validated at the time when a response should be made for the last programmed transaction of a microframe, a DATA0 ZLP is answered and underflow is flagged (ERR\_FL\_ISO is set in UDPHS\_EPTSTAx). If and only if the remaining untransmitted data bank for that microframe is available at its end, it is flushed and an error condition is flagged (ERR\_FLUSH is set in UDPHS\_EPTSTAx).
- If at the end of a microframe no valid token IN has been recognized, no data bank is flushed and no error condition is reported.

At the end of a microframe in which at least one data bank has been transmitted, if less than NB\_TRANS banks have been validated for that microframe, an error condition is flagged (ERR\_TRANS is set in UDPHS\_EPTSTAx).

#### Cases of Error (in UDPHS\_EPTSTAx)

- ERR\_FL\_ISO: There was no data to transmit inside a microframe, so a ZLP is answered by default.
- ERR\_FLUSH: At least one packet has been sent inside the microframe, but the number of token INs received is less than the number of transactions actually validated (TXRDY\_TRER) and likewise with the NB\_TRANS programmed.

- **ERR\_TRANS:** At least one packet has been sent inside the microframe, but the number of token INs received is less than the number of programmed NB\_TRANS transactions and the packets not requested were not validated.
- **ERR\_FL\_ISO + ERR\_FLUSH:** At least one packet has been sent inside the microframe, but the data has not been validated in time to answer one of the following token INs.
- **ERR\_FL\_ISO + ERR\_TRANS:** At least one packet has been sent inside the microframe, but the data has not been validated in time to answer one of the following token INs and the data can be discarded at the microframe end.
- **ERR\_FLUSH + ERR\_TRANS:** The first token IN has been answered and it was the only one received, a second bank has been validated but not the third, whereas NB\_TRANS was waiting for three transactions.
- **ERR\_FL\_ISO + ERR\_FLUSH + ERR\_TRANS:** The first token IN has been treated, the data for the second Token IN was not available in time, but the second bank has been validated before the end of the microframe. The third bank has not been validated, but three transactions have been set in NB\_TRANS.

#### 40.6.10.4 Data OUT

- Bulk OUT or Interrupt OUT

Like data IN, data OUT packets are sent by the host during the data or the status stage of control transfer or during an interrupt/bulk/isochronous OUT transfer. Data buffers are sent packet by packet under the control of the application or under the control of the DMA channel.

- Bulk OUT or Interrupt OUT: Receiving a Packet Under Application Control (Host to Device)

#### Algorithm Description for Each Packet:

- The application enables an interrupt on RXRDY\_TXKL.
- When an interrupt on RXRDY\_TXKL is received, the application knows that UDPHS\_EPTSTAx register BYTE\_COUNT bytes have been received.
- The application reads the BYTE\_COUNT bytes from the endpoint.
- The application clears RXRDY\_TXKL.  
**Note:** If the application does not know the size of the transfer, it may not be a good option to use AUTO\_VALID. Because if a zero-length-packet is received, the RXRDY\_TXKL is automatically cleared by the AUTO\_VALID hardware and if the endpoint interrupt is triggered, the software will not find its originating flag when reading the UDPHS\_EPTSTAx register.

#### Algorithm to Fill Several Packets

- The application enables the interrupts of BUSY\_BANK and AUTO\_VALID.
- When a BUSY\_BANK interrupt is received, the application knows that all banks available for the endpoint have been filled. Thus, the application can read all banks available.

If the application does not know the size of the receive buffer, instead of using the BUSY\_BANK interrupt, the application must use RXRDY\_TXKL.

- Bulk OUT or Interrupt OUT: Sending a Buffer Using DMA (Host To Device)

To use the DMA setting, the AUTO\_VALID field is mandatory.

See [Bulk IN or Interrupt IN: Sending a Buffer Using DMA \(Device to Host\)](#) for more information.

DMA Configuration Example:

1. First program UDPHS\_DMAADDRESSx with the address of the buffer that should be transferred.

2. Enable the interrupt of the DMA in UDPHS\_IEN
3. Program the DMA Channelx Control Register:
  - Size of buffer to be sent.
  - END\_B\_EN: Can be used for OUT packet truncation (discarding of unbuffered packet data) at the end of DMA buffer.
  - END\_BUFFIT: Generate an interrupt when BUFF\_COUNT in the UDPHS\_DMASTATUSx register reaches 0.
  - END\_TR\_EN: End of transfer enable, the UDPHS device can put an end to the current DMA transfer, in case of a short packet.
  - END\_TR\_IT: End of transfer interrupt enable, an interrupt is sent after the last USB packet has been transferred by the DMA, if the USB transfer ended with a short packet. (Beneficial when the receive size is unknown.)
  - CHANN\_ENB: Run and stop at end of buffer.

For OUT transfer, the bank will be automatically cleared by hardware when the application has read all the bytes in the bank (the bank is empty).

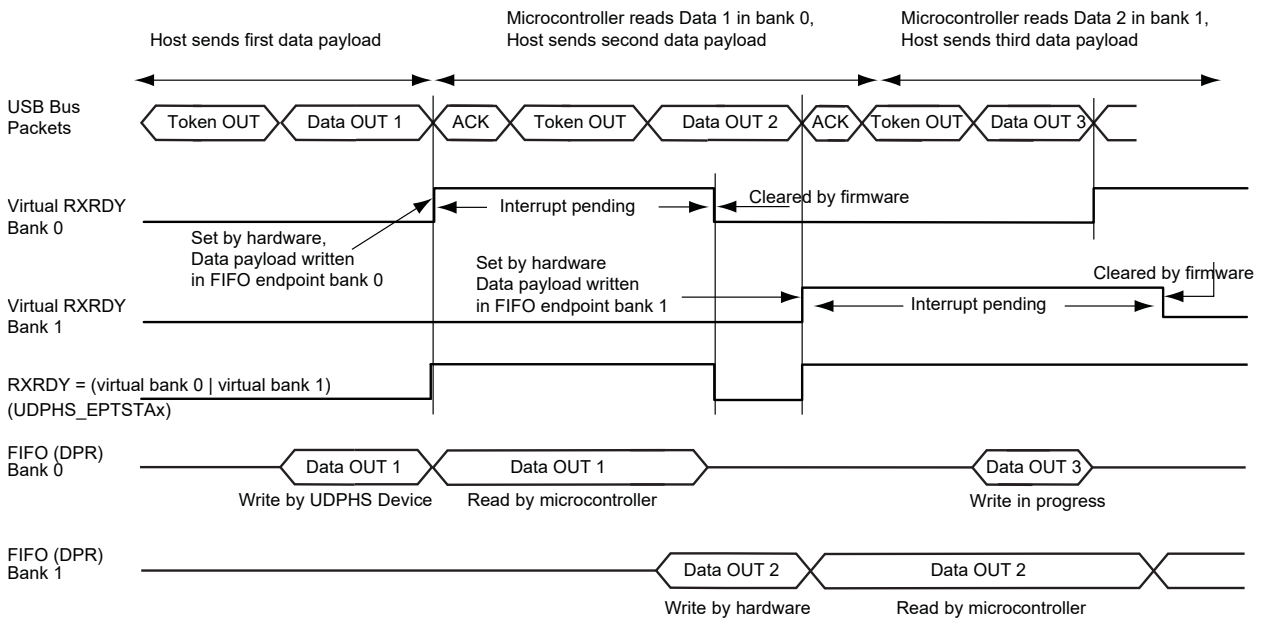

**Note:**

1. When a zero-length-packet is received, RXRDY\_TXKL bit in UDPHS\_EPTSTAx is cleared automatically by AUTO\_VALID, and the application knows of the end of buffer by the presence of the END\_TR\_IT.
2. If the host sends a zero-length packet, and the endpoint is free, then the device sends an ACK. No data is written in the endpoint, the RXRDY\_TXKL interrupt is generated, and the BYTE\_COUNT field in UDPHS\_EPTSTAx is null.

**Figure 40-14. Data OUT Transfer for Endpoint with One Bank**

**Figure 40-15. Data OUT Transfer for an Endpoint with Two Banks**

- High Bandwidth Isochronous Endpoint OUT

USB 2.0 supports individual High Speed isochronous endpoints that require data rates up to 192 Mb/s (24 MB/s): 3x1024 data bytes per microframe.

To support such a rate, two or three banks may be used to buffer the three consecutive data packets. The microcontroller (or the DMA) should be able to empty the banks very rapidly (at least 24 MB/s on average).

NB\_TRANS field in UDPHS\_EPTCFGx register = Number Of Transactions per Microframe.

If NB\_TRANS > 1 then it is High Bandwidth.

Example:

- If NB\_TRANS = 3, the sequence should be either
  - MData0
  - MData0/Data1
  - MData0/Data1/Data2
- If NB\_TRANS = 2, the sequence should be either
  - MData0
  - MData0/Data1
- If NB\_TRANS = 1, the sequence should be
  - Data0

**Figure 40-16. Bank Management, Example of Three Transactions per Microframe**

• **Isochronous Endpoint Handling: OUT Example**

The user can ascertain the bank status (free or busy), and the toggle sequencing of the data packet for each bank with the UDPHS\_EPTSTAx register in the three fields as follows:

- TOGGLESQ\_STA: PID of the data stored in the current bank
- CURBK: Number of the bank currently being accessed by the microcontroller.
- BUSY\_BANK\_STA: Number of busy bank

This is particularly useful in case of a missing data packet.

If the inter-packet delay between the OUT token and the Data is greater than the USB standard, then the ISO-OUT transaction is ignored. (Payload data is not written, no interrupt is generated to the CPU.)

If there is a data CRC (Cyclic Redundancy Check) error, the payload is, none the less, written in the endpoint. The ERR\_CRC\_NTR flag is set in UDPHS\_EPTSTAx register.

If the endpoint is already full, the packet is not written in the DPRAM. The ERR\_FL\_ISO flag is set in UDPHS\_EPTSTAx.

If the payload data is greater than the maximum size of the endpoint, then the ERR\_OVFLW flag is set. It is the task of the CPU to manage this error. The data packet is written in the endpoint (except the extra data).

If the host sends a Zero Length Packet, and the endpoint is free, no data is written in the endpoint, the RXRDY\_TXKL flag is set, and the BYTE\_COUNT field in UDPHS\_EPTSTAx register is null.

The FRCESTALL command bit is unused for an isochronous endpoint.

Otherwise, payload data is written in the endpoint, the RXRDY\_TXKL interrupt is generated and the BYTE\_COUNT in UDPHS\_EPTSTAx register is updated.

**40.6.10.5 STALL**

STALL is returned by a function in response to an IN token or after the data phase of an OUT or in response to a PING transaction. STALL indicates that a function is unable to transmit or receive data, or that a control pipe request is not supported.

- OUT

To stall an endpoint, set the FRCESTALL bit in UDPHS\_EPTSETSTAx register and after the STALL\_SNT flag has been set, set the TOGGLE\_SEG bit in the UDPHS\_EPTCLRSTAx register.

- IN

Set the FRCESTALL bit in UDPHS\_EPTSETSTAx register.

**Figure 40-17. Stall Handshake Data OUT Transfer**

**Figure 40-18. Stall Handshake Data IN Transfer**

### 40.6.11 Speed Identification

The high speed reset is managed by hardware.

At the connection, the host makes a reset which could be a classic reset (full speed) or a high speed reset.

At the end of the reset process (full or high), the ENDRESET interrupt is generated.

Then the CPU should read the SPEED bit in UDPHS\_INTSTAx to ascertain the speed mode of the device.

### 40.6.12 USB V2.0 High Speed Global Interrupt

Interrupts are defined in [UDPHS Interrupt Enable Register \(UDPHS\\_IEN\)](#) and in [UDPHS Interrupt Status Register \(UDPHS\\_INTSTA\)](#).

### 40.6.13 Endpoint Interrupts

Interrupts are enabled in UDPHS\_IEN (see [UDPHS Interrupt Enable Register](#)) and individually masked in UDPHS\_EPTCTLENBx (see [UDPHS Endpoint Control Enable Register \(Control, Bulk, Interrupt Endpoints\)](#)).

**Table 40-4. Endpoint Interrupt Source Masks**

SHRT_PCKT	Short Packet Interrupt
BUSY_BANK	Busy Bank Interrupt
NAK_OUT	NAKOUT Interrupt
NAK_IN/ERR_FLUSH	NAKIN/Error Flush Interrupt

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

STALL_SNT/ERR_CRC_NTR	Stall Sent/CRC error/Number of Transaction Error Interrupt
RX_SETUP/ERR_FL_ISO	Received SETUP/Error Flow Interrupt
TXRDY_TRER	TX Packet Read/Transaction Error Interrupt
TX_COMPLT	Transmitted IN Data Complete Interrupt
RXRDY_TXKL	Received OUT Data Interrupt
ERR_OVFLW	Overflow Error Interrupt
MDATA_RX	MDATA Interrupt
DATAx_RX	DATAx Interrupt

**Figure 40-19. UDPHS Interrupt Control Interface**

### 40.6.14 Power Modes

#### 40.6.14.1 Controlling Device States

A USB device has several possible states. Refer to Chapter 9 (USB Device Framework) of the Universal Serial Bus Specification, Rev 2.0.

**Figure 40-20. UDPHS Device State Diagram**

Movement from one state to another depends on the USB bus state or on standard requests sent through control transactions via the default endpoint (endpoint 0).

After a period of bus inactivity, the USB device enters Suspend mode. Accepting Suspend/Resume requests from the USB host is mandatory. Constraints in Suspend mode are very strict for bus-powered applications; devices may not consume more than 500  $\mu$ A on the USB bus.

While in Suspend mode, the host may wake up a device by sending a resume signal (bus activity) or a USB device may send a wakeup request to the host, e.g., waking up a PC by moving a USB mouse.

The wakeup feature is not mandatory for all devices and must be negotiated with the host.

#### 40.6.14.2 Not Powered State

Self powered devices can detect 5V VBUS using a PIO. When the device is not connected to a host, device power consumption can be reduced by the DETACH bit in UDPHS\_CTRL. Disabling the transceiver is automatically done. HSDM, HSDP, FSDP and FSDP lines are tied to GND pulldowns integrated in the hub downstream ports.

#### 40.6.14.3 Entering Attached State

When no device is connected, the USB FSDP and FSDM signals are tied to GND by 15 K $\Omega$  pulldowns integrated in the hub downstream ports. When a device is attached to an hub downstream port, the device connects a 1.5 K $\Omega$  pullup on FSDP. The USB bus line goes into IDLE state, FSDP is pulled up by the device 1.5 K $\Omega$  resistor to 3.3V and FSDM is pulled down by the 15 K $\Omega$  resistor to GND of the host.

After pullup connection, the device enters the powered state. The transceiver remains disabled until bus activity is detected.

In case of low power consumption need, the device can be stopped. When the device detects the VBUS, the software must enable the USB transceiver by enabling the EN\_UDPHS bit in UDPHS\_CTRL register.

The software can detach the pullup by setting DETACH bit in UDPHS\_CTRL register.

#### 40.6.14.4 From Powered State to Default State (Reset)

After its connection to a USB host, the USB device waits for an end-of-bus reset. The unmasked flag ENDRESET is set in the UDPHS\_IEN register and an interrupt is triggered.

Once the ENDRESET interrupt has been triggered, the device enters Default State. In this state, the UDPHS software must:

- Enable the default endpoint, setting the EPT\_ENABL flag in the UDPHS\_EPTCTLENB[0] register and, optionally, enabling the interrupt for endpoint 0 by writing 1 in EPT\_0 of the UDPHS\_IEN register. The enumeration then begins by a control transfer.
- Configure the Interrupt Mask Register which has been reset by the USB reset detection
- Enable the transceiver.

In this state, the EN\_UDPHS bit in UDPHS\_CTRL register must be enabled.

#### 40.6.14.5 From Default State to Address State (Address Assigned)

After a Set Address standard device request, the USB host peripheral enters the address state.

Before the device enters address state, it must achieve the Status IN transaction of the control transfer, i.e., the UDPHS device sets its new address once the TX\_COMPLT flag in the UDPHS\_EPTCTL[0] register has been received and cleared.

To move to address state, the driver software sets the DEV\_ADDR field and the FADDR\_EN flag in the UDPHS\_CTRL register.

#### 40.6.14.6 From Address State to Configured State (Device Configured)

Once a valid Set Configuration standard request has been received and acknowledged, the device enables endpoints corresponding to the current configuration. This is done by setting the BK\_NUMBER, EPT\_TYPE, EPT\_DIR and EPT\_SIZE fields in the UDPHS\_EPTCFGx registers and enabling them by setting the EPT\_ENABL flag in the UDPHS\_EPTCTLENBx registers, and, optionally, enabling corresponding interrupts in the UDPHS\_IEN register.

#### 40.6.14.7 Entering Suspend State (Bus Activity)

When a Suspend (no bus activity on the USB bus) is detected, the DET\_SUSPD signal in the UDPHS\_STA register is set. This triggers an interrupt if the corresponding bit is set in the UDPHS\_IEN register. This flag is cleared by writing to the UDPHS\_CLRINT register. Then the device enters Suspend mode.

In this state bus powered devices must drain less than 500  $\mu$ A from the 5V VBUS. As an example, the microcontroller switches to slow clock, disables the PLL and main oscillator, and goes into Idle mode. It may also switch off other devices on the board.

The UDPHS device peripheral clocks can be switched off. Resume event is asynchronously detected.

#### 40.6.14.8 Receiving a Host Resume

In Suspend mode, a resume event on the USB bus line is detected asynchronously, transceiver and clocks disabled (however, the pullup should not be removed).

Once the resume is detected on the bus, the signal WAKE\_UP in the UDPHS\_INTSTA is set. It may generate an interrupt if the corresponding bit in the UDPHS\_IEN register is set. This interrupt may be used to wake up the core, enable PLL and main oscillators and configure clocks.

### 40.6.14.9 Sending an External Resume

In Suspend State it is possible to wake up the host by sending an external resume.

The device waits at least 5 ms after being entered in Suspend State before sending an external resume.

The device must force a K state from 1 to 15 ms to resume the host.

### 40.6.15 Test Mode

A device must support the TEST\_MODE feature when in the Default, Address or Configured High Speed device states.

TEST\_MODE can be:

- Test\_J
- Test\_K
- Test\_Packet
- Test\_SEO\_NAK

(See [UDPHS Test Register](#) for definitions of each test mode.)

```
const char test_packet_buffer[] = {
0x00,0x00,0x00,0x00,0x00,0x00,0x00,0x00,0x00,0x00, // JKJKJKJK * 9
0xAA,0xAA,0xAA,0xAA,0xAA,0xAA,0xAA,0xAA, // JKKKJJKK * 8
0xEE,0xEE,0xEE,0xEE,0xEE,0xEE,0xEE,0xEE, // JKKKJJKK * 8
0xFE,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF, // JJJJJJJJKKKKKK * 8
0x7F,0xBF,0xDF,0xEF,0xF7,0xFB,0xFD, // JJJJJJKK * 8
0xFC,0x7E,0xBF,0xDF,0xEF,0xF7,0xFB,0xFD,0x7E // {JKKKKKKK * 10}, JK
};
```

### 40.7 Register Summary

**Note:**

The registers below have two modes: Control, Bulk, Interrupt Endpoints mode and Isochronous Endpoints mode.

In this register summary, both modes are displayed at the same offset.

- UDPHS\_EPTCTLENB
- UDPHS\_EPTCTLDIS
- UDPHS\_EPTCTL
- UDPHS\_EPTSETSTA
- UDPHS\_EPTCLRSTA

### 40.7.1 UDPHS Control Register

**Name:** UDPHS\_CTRL  
**Offset:** 0x00  
**Reset:** 0x00000200  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
					PULLD_DIS	REWAKEUP	DETACH	EN_UDPHS
Access					R/W	R/W	R/W	R/W
Reset					0	0	1	0
Bit	7	6	5	4	3	2	1	0
	FADDR_EN	DEV_ADDR[6:0]						
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bit 11 – PULLD\_DIS** Pulldown Disable (cleared upon USB reset)  
 When set, there is no pulldown on DP & DM. (DM Pulldown = DP Pulldown = 0).

**Note:** If the DETACH bit is also set, device DP & DM are left in high impedance state.  
 (See description of bit “DETACH”.)

DETACH	PULLD_DIS	DP	DM	Condition
0	0	Pullup	Pulldown	Not recommended
0	1	Pullup	High impedance state	VBUS present
1	0	Pulldown	Pulldown	No VBUS
1	1	High impedance state	High impedance state	VBUS present & software disconnect

**Bit 10 – REWAKEUP** Send Remote Wakeup (cleared upon USB reset)  
 An Upstream Resume is sent only after the UDPHS bus has been in SUSPEND state for at least 5 ms.  
 This bit is automatically cleared by hardware at the end of the Upstream Resume.

Value	Description
0	Remote Wakeup is disabled (read), or this bit has no effect (write).

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

Value	Description
1	Remote Wakeup is enabled (read), or this bit forces an external interrupt on the UDPHS controller for Remote Wakeup purposes.

**Bit 9 – DETACH** Detach Command  
See description of bit “PULL\_DIS”.

Value	Description
0	UDPHS is attached (read), or this bit pulls up the DP line (attach command) (write).
1	UDPHS is detached, UTMI transceiver is suspended (read), or this bit simulates a detach on the UDPHS line and forces the UTMI transceiver into suspend state (Suspend M = 0) (write).

**Bit 8 – EN\_UDPHS** UDPHS Enable

Value	Description
0	UDPHS is disabled (read), or this bit disables and resets the UDPHS controller (write). Switch the host to UTMI.
1	UDPHS is enabled (read), or this bit enables the UDPHS controller (write). Switch the host to UTMI.

**Bit 7 – FADDR\_EN** Function Address Enable (cleared upon USB reset)

Value	Description
0	Device is not in address state (read), or only the default function address is used (write).
1	Device is in address state (read), or this bit is set by the device firmware after a successful status phase of a SET_ADDRESS transaction (write). When set, the only address accepted by the UDPHS controller is the one stored in the UDPHS Address field. It will not be cleared afterwards by the device firmware. It is cleared by hardware on hardware reset, or when UDPHS bus reset is received.

**Bits 6:0 – DEV\_ADDR[6:0]** UDPHS Address (cleared upon USB reset)

This field contains the default address (0) after power-up or UDPHS bus reset (read), or it is written with the value set by a SET\_ADDRESS request received by the device firmware (write).

### 40.7.2 UDPHS Frame Number Register

**Name:**        UDPHS\_FNUM  
**Offset:**     0x04  
**Reset:**       0x00000000  
**Property:**   Read-only

Bit	31	30	29	28	27	26	25	24	
	FNUM_ERR								
Access	R								
Reset	0								
Bit	23	22	21	20	19	18	17	16	
Access	R								
Reset	0								
Bit	15	14	13	12	11	10	9	8	
			FRAME_NUMBER[10:5]						
Access			R	R	R	R	R	R	
Reset			0	0	0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
	FRAME_NUMBER[4:0]					MICRO_FRAME_NUM[2:0]			
Access	R	R	R	R	R	R	R	R	
Reset	0	0	0	0	0	0	0	0	

**Bit 31 – FNUM\_ERR** Frame Number CRC Error (cleared upon USB reset)

This bit is set by hardware when a corrupted Frame Number in Start of Frame packet (or Micro SOF) is received.

This bit and the INT\_SOF (or MICRO\_SOF) interrupt are updated at the same time.

**Bits 13:3 – FRAME\_NUMBER[10:0]** Frame Number as defined in the Packet Field Formats (cleared upon USB reset)

This field is provided in the last received SOF packet (see INT\_SOF in the UDPHS Interrupt Status Register).

**Bits 2:0 – MICRO\_FRAME\_NUM[2:0]** Microframe Number (cleared upon USB reset)

Number of the received microframe (0 to 7) in one frame. This field is reset at the beginning of each new frame (1 ms).

One microframe is received each 125 microseconds (1 ms/8).

### 40.7.3 UDPHS Interrupt Enable Register

**Name:** UDPHS\_IEN  
**Offset:** 0x10  
**Reset:** 0x00000010  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	DMA_7	DMA_6	DMA_5	DMA_4	DMA_3	DMA_2	DMA_1	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	
Bit	23	22	21	20	19	18	17	16
	EPT_15	EPT_14	EPT_13	EPT_12	EPT_11	EPT_10	EPT_9	EPT_8
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	EPT_7	EPT_6	EPT_5	EPT_4	EPT_3	EPT_2	EPT_1	EPT_0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	UPSTR_RES	ENDOFRSM	WAKE_UP	ENDRESET	INT_SOF	MICRO_SOF	DET_SUSPD	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	1	0	0	0	

**Bits 25, 26, 27, 28, 29, 30, 31 – DMA\_x** DMA Channel x Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable the interrupts for this channel.
1	Enable the interrupts for this channel.

**Bits 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23 – EPT\_x** Endpoint x Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable the interrupts for this endpoint.
1	Enable the interrupts for this endpoint.

**Bit 7 – UPSTR\_RES** Upstream Resume Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable Upstream Resume Interrupt.
1	Enable Upstream Resume Interrupt.

**Bit 6 – ENDOFRSM** End Of Resume Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable Resume Interrupt.

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

Value	Description
1	Enable Resume Interrupt.

**Bit 5 – WAKE\_UP** Wake Up CPU Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable Wake-up CPU Interrupt.
1	Enable Wake-up CPU Interrupt.

**Bit 4 – ENDRESET** End Of Reset Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable End Of Reset Interrupt.
1	Enable End Of Reset Interrupt. Automatically enabled after USB reset.

**Bit 3 – INT\_SOF** SOF Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable SOF Interrupt.
1	Enable SOF Interrupt.

**Bit 2 – MICRO\_SOF** Micro-SOF Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable Micro-SOF Interrupt.
1	Enable Micro-SOF Interrupt.

**Bit 1 – DET\_SUSPD** Suspend Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable Suspend Interrupt.
1	Enable Suspend Interrupt.

### 40.7.4 UDPHS Interrupt Status Register

**Name:**        UDPHS\_INTSTA  
**Offset:**     0x14  
**Reset:**      0x00000000  
**Property:**   Read-only

Bit	31	30	29	28	27	26	25	24
	DMA_7	DMA_6	DMA_5	DMA_4	DMA_3	DMA_2	DMA_1	
Access	R	R	R	R	R	R	R	
Reset	0	0	0	0	0	0	0	
Bit	23	22	21	20	19	18	17	16
	EPT_15	EPT_14	EPT_13	EPT_12	EPT_11	EPT_10	EPT_9	EPT_8
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	EPT_7	EPT_6	EPT_5	EPT_4	EPT_3	EPT_2	EPT_1	EPT_0
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	UPSTR_RES	ENDOFRSM	WAKE_UP	ENDRESET	INT_SOF	MICRO_SOF	DET_SUSPD	SPEED
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 25, 26, 27, 28, 29, 30, 31 – DMA\_x** DMA Channel x Interrupt

Value	Description
0	Reset when the UDPHS_DMASTATUSx interrupt source is cleared.
1	Set by hardware when an interrupt is triggered by the DMA Channelx and this endpoint interrupt is enabled by the DMA_x bit in UDPHS_IEN.

**Bits 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23 – EPT\_x** Endpoint x Interrupt (cleared upon USB reset)

Value	Description
0	Reset when the UDPHS_EPTSTAx interrupt source is cleared.
1	Set by hardware when an interrupt is triggered by the UDPHS_EPTSTAx register and this endpoint interrupt is enabled by the EPT_x bit in UDPHS_IEN.

**Bit 7 – UPSTR\_RES** Upstream Resume Interrupt

Value	Description
0	Cleared by setting the UPSTR_RES bit in UDPHS_CLRINT.
1	Set by hardware when the UDPHS controller is sending a resume signal called “upstream resume”. This triggers a UDPHS interrupt when the UPSTR_RES bit is set in UDPHS_IEN.

### Bit 6 – ENDOFRSM End Of Resume Interrupt

Value	Description
0	Cleared by setting the ENDOFRSM bit in UDPHS_CLRINT.
1	Set by hardware when the UDPHS controller detects a good end of resume signal initiated by the host. This triggers a UDPHS interrupt when the ENDOFRSM bit is set in UDPHS_IEN.

### Bit 5 – WAKE\_UP Wake Up CPU Interrupt

Value	Description
0	Cleared by setting the WAKE_UP bit in UDPHS_CLRINT.
1	Set by hardware when the UDPHS controller is in SUSPEND state and is re-activated by a filtered non-idle signal from the UDPHS line (not by an upstream resume). This triggers a UDPHS interrupt when the WAKE_UP bit is set in UDPHS_IEN register. When receiving this interrupt, the user has to enable the device controller clock prior to operation.  <b>Note:</b> this interrupt is generated even if the device controller clock is disabled.

### Bit 4 – ENDRESET End Of Reset Interrupt

Value	Description
0	Cleared by setting the ENDRESET bit in UDPHS_CLRINT.
1	Set by hardware when an End Of Reset has been detected by the UDPHS controller. This triggers a UDPHS interrupt when the ENDRESET bit is set in UDPHS_IEN.

### Bit 3 – INT\_SOF Start Of Frame Interrupt

**Note:** The Micro Start Of Frame Interrupt (MICRO\_SOF), and the Start Of Frame Interrupt (INT\_SOF) are not generated at the same time.

Value	Description
0	Cleared by setting the INT_SOF bit in UDPHS_CLRINT.
1	Set by hardware when an UDPHS Start Of Frame PID (SOF) has been detected (every 1 ms) or synthesized by the macro. This triggers a UDPHS interrupt when the INT_SOF bit is set in UDPHS_IEN register. In case of detected SOF, in High Speed mode, the MICRO_FRAME_NUMBER field is cleared in UDPHS_FNUM register and the FRAME_NUMBER field is updated.

### Bit 2 – MICRO\_SOF Micro Start Of Frame Interrupt

**Note:** The Micro Start Of Frame Interrupt (MICRO\_SOF), and the Start Of Frame Interrupt (INT\_SOF) are not generated at the same time.

Value	Description
0	Cleared by setting the MICRO_SOF bit in UDPHS_CLRINT register.
1	Set by hardware when an UDPHS micro start of frame PID (SOF) has been detected (every 125 us) or synthesized by the macro. This triggers a UDPHS interrupt when the MICRO_SOF bit is set in UDPHS_IEN. In case of detected SOF, the MICRO_FRAME_NUM field in UDPHS_FNUM register is incremented and the FRAME_NUMBER field does not change.

### Bit 1 – DET\_SUSPD Suspend Interrupt

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

Value	Description
0	Cleared by setting the DET_SUSPD bit in UDPHS_CLRINT register.
1	Set by hardware when a UDPHS Suspend (Idle bus for three frame periods, a J state for 3 ms) is detected. This triggers a UDPHS interrupt when the DET_SUSPD bit is set in UDPHS_IEN register.

### Bit 0 – SPEED Speed Status

Value	Description
0	Reset by hardware when the hardware is in Full Speed mode.
1	Set by hardware when the hardware is in High Speed mode.

### 40.7.5 UDPHS Clear Interrupt Register

**Name:** UDPHS\_CLRINT  
**Offset:** 0x18  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	UPSTR_RES	ENDOFRSM	WAKE_UP	ENDRESET	INT_SOF	MICRO_SOF	DET_SUSPD	
Access	W	W	W	W	W	W	W	
Reset	–	–	–	–	–	–	–	

**Bit 7 – UPSTR\_RES** Upstream Resume Interrupt Clear

Value	Description
0	No effect.
1	Clear the UPSTR_RES bit in UDPHS_INTSTA.

**Bit 6 – ENDOFRSM** End Of Resume Interrupt Clear

Value	Description
0	No effect.
1	Clear the ENDOFRSM bit in UDPHS_INTSTA.

**Bit 5 – WAKE\_UP** Wake Up CPU Interrupt Clear

Value	Description
0	No effect.
1	Clear the WAKE_UP bit in UDPHS_INTSTA.

**Bit 4 – ENDRESET** End Of Reset Interrupt Clear

Value	Description
0	No effect.
1	Clear the ENDRESET bit in UDPHS_INTSTA.

**Bit 3 – INT\_SOF** Start Of Frame Interrupt Clear

Value	Description
0	No effect.
1	Clear the INT_SOF bit in UDPHS_INTSTA.

**Bit 2 – MICRO\_SOF** Micro Start Of Frame Interrupt Clear

Value	Description
0	No effect.
1	Clear the MICRO_SOF bit in UDPHS_INTSTA.

**Bit 1 – DET\_SUSPD** Suspend Interrupt Clear

Value	Description
0	No effect.
1	Clear the DET_SUSPD bit in UDPHS_INTSTA.

### 40.7.6 UDPHS Endpoints Reset Register

**Name:** UDPHS\_EPTRST  
**Offset:** 0x1C  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	[Greyed out register bits]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Greyed out register bits]							
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	EPT_15	EPT_14	EPT_13	EPT_12	EPT_11	EPT_10	EPT_9	EPT_8
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	EPT_7	EPT_6	EPT_5	EPT_4	EPT_3	EPT_2	EPT_1	EPT_0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – EPT\_x** Endpoint x Reset  
 Setting this bit clears all bits in the Endpoint status UDPHS\_EPTSTAx register except the TOGGLESQ\_STA field.

Value	Description
0	No effect.
1	Reset the Endpointx state.

### 40.7.7 UDPHS Test Register

**Name:** UDPHS\_TST  
**Offset:** 0xE0  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bit 5 – OPMODE2 OpMode2

**Note:** For the Test mode, Test\_SE0\_NAK (refer to Universal Serial Bus Specification, Revision 2.0: 7.1.20, Test Mode Support). Force the device in High Speed mode, and configure a bulk-type endpoint. Do not fill this endpoint for sending NAK to the host.

Upon command, a port's transceiver must enter the High Speed Receive mode and remain in that mode until the exit action is taken. This enables the testing of output impedance, low level output voltage and loading characteristics. In addition, while in this mode, upstream facing ports (and only upstream facing ports) must respond to any IN token packet with a NAK handshake (only if the packet CRC is determined to be correct) within the normal allowed device response time. This enables testing of the device squelch level circuitry and, additionally, provides a general purpose stimulus/response test for basic functional testing.

Value	Description
0	No effect.
1	Set to force the OpMode signal (UTMI interface) to "10", to disable the bit-stuffing and the NRZI encoding.

#### Bit 4 – TST\_PKT Test Packet Mode

Value	Description
0	No effect.

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

Value	Description
1	Set to repetitively transmit the packet stored in the current bank. This enables the testing of rise and fall times, eye patterns, jitter, and any other dynamic waveform specifications.

### Bit 3 – TST\_K Test K Mode

Value	Description
0	No effect.
1	Set to send the K state on the UDPHS line. This enables the testing of the high output drive level on the D- line.

### Bit 2 – TST\_J Test J Mode

Value	Description
0	No effect.
1	Set to send the J state on the UDPHS line. This enables the testing of the high output drive level on the D+ line.

### Bits 1:0 – SPEED\_CFG[1:0] Speed Configuration

Value	Name	Description
0	NORMAL	Normal mode: The macro is in Full Speed mode, ready to make a High Speed identification, if the host supports it and then to automatically switch to High Speed mode.
1	–	Reserved
2	HIGH_SPEED	Force High Speed: Set this value to force the hardware to work in High Speed mode. Only for debug or test purpose.
3	FULL_SPEED	Force Full Speed: Set this value to force the hardware to work only in Full Speed mode. In this configuration, the macro will not respond to a High Speed reset handshake.

### 40.7.8 UDPHS Endpoint Configuration Register

**Name:** UDPHS\_EPTCFGx  
**Offset:** 0x0100 + x\*0x20 [x=0..15]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	EPT_MAPD							
Access	R/W							
Reset	0							
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
							NB_TRANS[1:0]	
Access							R/W	R/W
Reset							0	0
Bit	7	6	5	4	3	2	1	0
	BK_NUMBER[1:0]		EPT_TYPE[1:0]		EPT_DIR	EPT_SIZE[2:0]		
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bit 31 – EPT\_MAPD** Endpoint Mapped (cleared upon USB reset)

Value	Description
0	The user should reprogram the register with correct values.
1	Set by hardware when the endpoint size (EPT_SIZE) and the number of banks (BK_NUMBER) are correct regarding: <ul style="list-style-type: none"> <li>– The max endpoint size for this endpoint</li> <li>– The number of allowed banks for this endpoint</li> <li>– The number of endpoints/banks already allocated</li> <li>– The FIFO max capacity (FIFO_MAX_SIZE in UDPHS_IPFEATURES register)</li> </ul>

**Bits 9:8 – NB\_TRANS[1:0]** Number Of Transactions per Microframe (cleared upon USB reset)  
 The number of transactions per microframe is set by software.

**Note:** Meaningful for high bandwidth isochronous endpoint only.

**Bits 7:6 – BK\_NUMBER[1:0]** Number of Banks (cleared upon USB reset)  
 Set this field according to the endpoint's number of banks (see section [Endpoint Configuration](#)).

Value	Name	Description
0	0	Zero bank, the endpoint is not mapped in memory

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

Value	Name	Description
1	1	One bank (bank 0)
2	2	Double bank (Ping-Pong: bank0/bank1)
3	3	Triple bank (bank0/bank1/bank2)

**Bits 5:4 – EPT\_TYPE[1:0]** Endpoint Type (cleared upon USB reset)

Set this field according to the endpoint type (see section [Endpoint Configuration](#)).

(Endpoint 0 should always be configured as control).

Value	Name	Description
0	CTRL8	Control endpoint
1	ISO	Isochronous endpoint
2	BULK	Bulk endpoint
3	INT	Interrupt endpoint

**Bit 3 – EPT\_DIR** Endpoint Direction (cleared upon USB reset)

For Control endpoints this bit has no effect and should be left at zero.

Value	Description
0	Clear this bit to configure OUT direction for Bulk, Interrupt and Isochronous endpoints.
1	Set this bit to configure IN direction for Bulk, Interrupt and Isochronous endpoints.

**Bits 2:0 – EPT\_SIZE[2:0]** Endpoint Size (cleared upon USB reset)

Set this field according to the endpoint size in bytes (see the section [Endpoint Configuration](#)). Note that 1024 bytes is only for isochronous endpoints.

Value	Name	Description
0	8	8 bytes
1	16	16 bytes
2	32	32 bytes
3	64	64 bytes
4	128	128 bytes
5	256	256 bytes
6	512	512 bytes
7	1024	1024 bytes

### 40.7.9 UDPHS Endpoint Control Enable Register (Control, Bulk, Interrupt Endpoints)

**Name:** UDPHS\_EPTCTLENBx  
**Offset:** 0x0104 + x\*0x20 [x=0..15]  
**Reset:** –  
**Property:** Write-only

This register view is relevant only if EPT\_TYPE = 0x0, 0x2 or 0x3 in UDPHS Endpoint Configuration Register.

For additional information, see UDPHS Endpoint Control Register (Control, Bulk, Interrupt Endpoints).

Bit	31	30	29	28	27	26	25	24	
	SHRT_PCKT								
Access	W								
Reset	–								
Bit	23	22	21	20	19	18	17	16

				NYET_DIS	INTDIS_DMA		AUTO_VALID	EPT_ENABL	
Access				W	W			W	W
Reset				–	–			–	–

**Bit 31 – SHRT\_PCKT** Short Packet Send/Short Packet Interrupt Enable

For IN endpoints: Guarantees short packet at end of DMA Transfer if the UDPHS\_DMACONTROLx register END\_B\_EN and UDPHS\_EPTCTLx register AUTOVALID bits are also set.

For OUT endpoints:

Value	Description
0	No effect.
1	Enable Short Packet Interrupt.

**Bit 18 – BUSY\_BANK** Busy Bank Interrupt Enable

Value	Description
0	No effect.
1	Enable Busy Bank Interrupt.

**Bit 15 – NAK\_OUT** NAKOUT Interrupt Enable

Value	Description
0	No effect.
1	Enable NAKOUT Interrupt.

**Bit 14 – NAK\_IN** NAKIN Interrupt Enable

Value	Description
0	No effect.
1	Enable NAKIN Interrupt.

**Bit 13 – STALL\_SNT** Stall Sent Interrupt Enable

Value	Description
0	No effect.
1	Enable Stall Sent Interrupt.

**Bit 12 – RX\_SETUP** Received SETUP

Value	Description
0	No effect.
1	Enable RX_SETUP Interrupt.

**Bit 11 – TXRDY** TX Packet Ready Interrupt Enable

Value	Description
0	No effect.
1	Enable TX Packet Ready/Transaction Error Interrupt.

**Bit 10 – TX\_COMPLT** Transmitted IN Data Complete Interrupt Enable

Value	Description
0	No effect.
1	Enable Transmitted IN Data Complete Interrupt.

**Bit 9 – RXRDY\_TXKL** Received OUT Data Interrupt Enable

Value	Description
0	No effect.
1	Enable Received OUT Data Interrupt.

**Bit 8 – ERR\_OVFLW** Overflow Error Interrupt Enable

Value	Description
0	No effect.
1	Enable Overflow Error Interrupt.

**Bit 4 – NYET\_DIS** NYET Disable (Only for High Speed Bulk OUT endpoints)

Value	Description
0	No effect.
1	Forces an ACK response to the next High Speed Bulk OUT transfer instead of a NYET response.

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

---

---

### Bit 3 – INTDIS\_DMA Interrupts Disable DMA

Value	Description
0	No effect.
1	If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled.

### Bit 1 – AUTO\_VALID Packet Auto-Valid Enable

Value	Description
0	No effect.
1	Enable this bit to automatically validate the current packet and switch to the next bank for both IN and OUT transfers.

### Bit 0 – EPT\_ENABL Endpoint Enable

Value	Description
0	No effect.
1	Enable endpoint according to the device configuration.

### 40.7.10 UDPHS Endpoint Control Enable Register (Isochronous Endpoints)

**Name:**        UDPHS\_EPTCTLENBx  
**Offset:**      0x0104 + x\*0x20 [x=0..15]  
**Reset:**        –  
**Property:**    Write-only

This register view is relevant only if EPT\_TYPE = 0x1 in UDPHS Endpoint Configuration Register.  
 For additional information, see UDPHS Endpoint Control Register (Isochronous Endpoint).

**Bit 31 – SHRT\_PCKT** Short Packet Send/Short Packet Interrupt Enable  
 For IN endpoints: Guarantees short packet at end of DMA Transfer if the UDPHS\_DMACONTROLx register END\_B\_EN and UDPHS\_EPTCTLx register AUTOVALID bits are also set.

For OUT endpoints:

Value	Description
0	No effect.
1	Enable Short Packet Interrupt.

**Bit 18 – BUSY\_BANK** Busy Bank Interrupt Enable

Value	Description
0	No effect.
1	Enable Busy Bank Interrupt.

**Bit 14 – ERR\_FLUSH** Bank Flush Error Interrupt Enable

Value	Description
0	No effect.
1	Enable Bank Flush Error Interrupt.

**Bit 13 – ERR\_CRC\_NTR** ISO CRC Error/Number of Transaction Error Interrupt Enable

Value	Description
0	No effect.
1	Enable Error CRC ISO/Error Number of Transaction Interrupt.

**Bit 12 – ERR\_FL\_ISO** Error Flow Interrupt Enable

Value	Description
0	No effect.
1	Enable Error Flow ISO Interrupt.

**Bit 11 – TXRDY\_TRER** TX Packet Ready/Transaction Error Interrupt Enable

Value	Description
0	No effect.
1	Enable TX Packet Ready/Transaction Error Interrupt.

**Bit 10 – TX\_COMPLT** Transmitted IN Data Complete Interrupt Enable

Value	Description
0	No effect.
1	Enable Transmitted IN Data Complete Interrupt.

**Bit 9 – RXRDY\_TXKL** Received OUT Data Interrupt Enable

Value	Description
0	No effect.
1	Enable Received OUT Data Interrupt.

**Bit 8 – ERR\_OVFLW** Overflow Error Interrupt Enable

Value	Description
0	No effect.
1	Enable Overflow Error Interrupt.

**Bit 7 – MDATA\_RX** MDATA Interrupt Enable (Only for high bandwidth Isochronous OUT endpoints)

Value	Description
0	No effect.
1	Enable MDATA Interrupt.

**Bit 6 – DATAx\_RX** DATAx Interrupt Enable (Only for high bandwidth Isochronous OUT endpoints)

Value	Description
0	No effect.
1	Enable DATAx Interrupt.

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

### Bit 3 – INTDIS\_DMA Interrupts Disable DMA

Value	Description
0	No effect.
1	If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled.

### Bit 1 – AUTO\_VALID Packet Auto-Valid Enable

Value	Description
0	No effect.
1	Enable this bit to automatically validate the current packet and switch to the next bank for both IN and OUT transfers.

### Bit 0 – EPT\_ENABL Endpoint Enable

Value	Description
0	No effect.
1	Enable endpoint according to the device configuration.

### 40.7.11 UDPHS Endpoint Control Disable Register (Control, Bulk, Interrupt Endpoints)

**Name:** UDPHS\_EPTCTLDISx  
**Offset:** 0x0108 + x\*0x20 [x=0..15]  
**Reset:** –  
**Property:** Write-only

This register view is relevant only if EPT\_TYPE = 0x0, 0x2 or 0x3 in UDPHS Endpoint Configuration Register.

For additional information, see UDPHS Endpoint Control Register (Control, Bulk, Interrupt Endpoints).

**Bit 31 – SHRT\_PCKT** Short Packet Interrupt Disable

For IN endpoints: Never automatically add a zero length packet at end of DMA transfer.

For OUT endpoints:

Value	Description
0	No effect.
1	Disable Short Packet Interrupt.

**Bit 18 – BUSY\_BANK** Busy Bank Interrupt Disable

Value	Description
0	No effect.
1	Disable Busy Bank Interrupt.

**Bit 15 – NAK\_OUT** NAKOUT Interrupt Disable

Value	Description
0	No effect.

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

Value	Description
1	Disable NAKOUT Interrupt.

**Bit 14 – NAK\_IN** NAKIN Interrupt Disable

Value	Description
0	No effect.
1	Disable NAKIN Interrupt.

**Bit 13 – STALL\_SNT** Stall Sent Interrupt Disable

Value	Description
0	No effect.
1	Disable Stall Sent Interrupt.

**Bit 12 – RX\_SETUP** Received SETUP Interrupt Disable

Value	Description
0	No effect.
1	Disable RX_SETUP Interrupt.

**Bit 11 – TXRDY** TX Packet Ready Interrupt Disable

Value	Description
0	No effect.
1	Disable TX Packet Ready/Transaction Error Interrupt.

**Bit 10 – TX\_COMPLT** Transmitted IN Data Complete Interrupt Disable

Value	Description
0	No effect.
1	Disable Transmitted IN Data Complete Interrupt.

**Bit 9 – RXRDY\_TXKL** Received OUT Data Interrupt Disable

Value	Description
0	No effect.
1	Disable Received OUT Data Interrupt.

**Bit 8 – ERR\_OVFLW** Overflow Error Interrupt Disable

Value	Description
0	No effect.
1	Disable Overflow Error Interrupt.

**Bit 4 – NYET\_DIS** NYET Enable (Only for High Speed Bulk OUT endpoints)

Value	Description
0	No effect.
1	Let the hardware handle the handshake response for the High Speed Bulk OUT transfer.

**Bit 3 – INTDIS\_DMA** Interrupts Disable DMA

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

Value	Description
0	No effect.
1	Disable the "Interrupts Disable DMA".

**Bit 1 – AUTO\_VALID** Packet Auto-Valid Disable

Value	Description
0	No effect.
1	Disable this bit to not automatically validate the current packet.

**Bit 0 – EPT\_DISABL** Endpoint Disable

Value	Description
0	No effect.
1	Disable endpoint.

### 40.7.12 UDPHS Endpoint Control Disable Register (Isochronous Endpoint)

**Name:** UDPHS\_EPTCTLDISx  
**Offset:** 0x0108 + x\*0x20 [x=0..15]  
**Reset:** –  
**Property:** Write-only

This register view is relevant only if EPT\_TYPE = 0x1 in UDPHS Endpoint Configuration Register.

1	Disable Error Flow ISO Interrupt.

**Bit 11 – TXRDY\_TRER** TX Packet Ready/Transaction Error Interrupt Disable

Value	Description
0	No effect.
1	Disable TX Packet Ready/Transaction Error Interrupt.

**Bit 10 – TX\_COMPLT** Transmitted IN Data Complete Interrupt Disable

Value	Description
0	No effect.
1	Disable Transmitted IN Data Complete Interrupt.

**Bit 9 – RXRDY\_TXKL** Received OUT Data Interrupt Disable

Value	Description
0	No effect.
1	Disable Received OUT Data Interrupt.

**Bit 8 – ERR\_OVFLW** Overflow Error Interrupt Disable

Value	Description
0	No effect.
1	Disable Overflow Error Interrupt.

**Bit 7 – MDATA\_RX** MDATA Interrupt Disable (Only for High Bandwidth Isochronous OUT endpoints)

Value	Description
0	No effect.
1	Disable MDATA Interrupt.

**Bit 6 – DATAx\_RX** DATAx Interrupt Disable (Only for High Bandwidth Isochronous OUT endpoints)

Value	Description
0	No effect.
1	Disable DATAx Interrupt.

**Bit 3 – INTDIS\_DMA** Interrupts Disable DMA

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

---

---

Value	Description
0	No effect.
1	Disable the "Interrupts Disable DMA".

**Bit 1 – AUTO\_VALID** Packet Auto-Valid Disable

Value	Description
0	No effect.
1	Disable this bit to not automatically validate the current packet.

**Bit 0 – EPT\_DISABL** Endpoint Disable

Value	Description
0	No effect.
1	Disable endpoint.

### 40.7.13 UDPHS Endpoint Control Register (Control, Bulk, Interrupt Endpoints)

**Name:** UDPHS\_EPTCTLx  
**Offset:** 0x010C + x\*0x20 [x=0..15]  
**Reset:** 0x00000000  
**Property:** Read-only

This register view is relevant only if EPT\_TYPE = 0x0, 0x2 or 0x3 in UDPHS Endpoint Configuration Register.

The reset value for UDPHS\_EPTCTL0 is 0x00000001.

	Bit	31	30	29	28	27	26	25	24	
		SHRT_PCKT								
Access		R								
Reset		0								
	Bit	23	22	21	20	19	18	17	16	
								BUSY_BANK		
Access								R		
Reset								0		
	Bit	15	14	13	12	11	10	9	8	
		NAK_OUT	NAK_IN	STALL_SNT	RX_SETUP	TXRDY	TX_COMPLT	RXRDY_TXKL	ERR_OVFLW	
Access		R	R	R	R	R	R	R	R	
Reset		0	0	0	0	0	0	0	0	
	Bit	7	6	5	4	3	2	1	0	
					NYET_DIS	INTDIS_DMA			AUTO_VALID	EPT_ENABL
Access					R	R			R	R
Reset					0	0			0	0

**Bit 31 – SHRT\_PCKT** Short Packet Interrupt Enabled (cleared upon USB reset)

For OUT endpoints: sends an Interrupt when a Short Packet has been received.

For IN endpoints: a Short Packet transmission is guaranteed upon end of the DMA Transfer, thus signaling a BULK or INTERRUPT end of transfer, but only if the UDPHS\_DMACONTROLx register END\_B\_EN and UDPHS\_EPTCTLx register AUTO\_VALID bits are also set.

Value	Description
0	Short Packet Interrupt is masked.
1	Short Packet Interrupt is enabled.

**Bit 18 – BUSY\_BANK** Busy Bank Interrupt Enabled (cleared upon USB reset)

For OUT endpoints: an interrupt is sent when all banks are busy.

For IN endpoints: an interrupt is sent when all banks are free.

Value	Description
0	BUSY_BANK Interrupt is masked.
1	BUSY_BANK Interrupt is enabled.

**Bit 15 – NAK\_OUT** NAKOUT Interrupt Enabled (cleared upon USB reset)

Value	Description
0	NAKOUT Interrupt is masked.
1	NAKOUT Interrupt is enabled.

**Bit 14 – NAK\_IN** NAKIN Interrupt Enabled (cleared upon USB reset)

Value	Description
0	NAKIN Interrupt is masked.
1	NAKIN Interrupt is enabled.

**Bit 13 – STALL\_SNT** Stall Sent Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Stall Sent Interrupt is masked.
1	Stall Sent Interrupt is enabled.

**Bit 12 – RX\_SETUP** Received SETUP Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Received SETUP is masked.
1	Received SETUP is enabled.

**Bit 11 – TXRDY** TX Packet Ready Interrupt Enabled (cleared upon USB reset)

Interrupt source is active as long as the corresponding UDPHS\_EPTSTAx register TXRDY flag remains low. If there are no more banks available for transmitting after the software has set UDPHS\_EPTSTAx/TXRDY for the last transmit packet, then the interrupt source remains inactive until the first bank becomes free again to transmit at UDPHS\_EPTSTAx/TXRDY hardware clear.

Value	Description
0	TX Packet Ready Interrupt is masked.
1	TX Packet Ready Interrupt is enabled.

**Bit 10 – TX\_COMPLT** Transmitted IN Data Complete Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Transmitted IN Data Complete Interrupt is masked.
1	Transmitted IN Data Complete Interrupt is enabled.

**Bit 9 – RXRDY\_TXKL** Received OUT Data Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Received OUT Data Interrupt is masked.
1	Received OUT Data Interrupt is enabled.

**Bit 8 – ERR\_OVFLW** Overflow Error Interrupt Enabled (cleared upon USB reset)

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

Value	Description
0	Overflow Error Interrupt is masked.
1	Overflow Error Interrupt is enabled.

**Bit 4 – NYET\_DIS** NYET Disable (Only for High Speed Bulk OUT Endpoints) (cleared upon USB reset)

**Note:** According to the Universal Serial Bus Specification, Rev 2.0 (8.5.1.1 NAK Responses to OUT/DATA During PING Protocol), a NAK response to an HS Bulk OUT transfer is expected to be an unusual occurrence.

Value	Description
0	Lets the hardware handle the handshake response for the High Speed Bulk OUT transfer.
1	Forces an ACK response to the next High Speed Bulk OUT transfer instead of a NYET response.

**Bit 3 – INTDIS\_DMA** Interrupt Disables DMA (cleared upon USB reset)

If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled regardless of the UDPHS\_IEN register EPT\_x bit for this endpoint. Then, the firmware will have to clear or disable the interrupt source or clear this bit if transfer completion is needed.

If the exception raised is associated with the new system bank packet, then the previous DMA packet transfer is normally completed, but the new DMA packet transfer is not started (not requested).

If the exception raised is not associated to a new system bank packet (NAK\_IN, NAK\_OUT, etc.), then the request cancellation may happen at any time and may immediately stop the current DMA transfer.

This may be used, for example, to identify or prevent an erroneous packet to be transferred into a buffer or to complete a DMA buffer by software after reception of a short packet.

**Bit 1 – AUTO\_VALID** Packet Auto-Valid Enabled (Not for CONTROL Endpoints) (cleared upon USB reset)

Set this bit to automatically validate the current packet and switch to the next bank for both IN and OUT endpoints.

#### For IN Transfer:

If this bit is set, the UDPHS\_EPTSTAx register TXRDY bit is set automatically when the current bank is full and at the end of DMA buffer if the UDPHS\_DMACONTROLx register END\_B\_EN bit is set.

The user may still set the UDPHS\_EPTSTAx register TXRDY bit if the current bank is not full, unless the user needs to send a Zero Length Packet by software.

#### For OUT Transfer:

If this bit is set, the UDPHS\_EPTSTAx register RXRDY\_TXKL bit is automatically reset for the current bank when the last packet byte has been read from the bank FIFO or at the end of DMA buffer if the UDPHS\_DMACONTROLx register END\_B\_EN bit is set. For example, to truncate a padded data packet when the actual data transfer size is reached.

The user may still clear the UDPHS\_EPTSTAx register RXRDY\_TXKL bit, for example, after completing a DMA buffer by software if UDPHS\_DMACONTROLx register END\_B\_EN bit was disabled or in order to cancel the read of the remaining data bank(s).

**Bit 0 – EPT\_ENABL** Endpoint Enable (cleared upon USB reset)

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

Value	Description
0	The endpoint is disabled according to the device configuration. Endpoint 0 should always be enabled after a hardware or UDPHS bus reset and participate in the device configuration.
1	The endpoint is enabled according to the device configuration.

### 40.7.14 UDPHS Endpoint Control Register (Isochronous Endpoint)

**Name:**        UDPHS\_EPTCTLx  
**Offset:**     0x010C + x\*0x20 [x=0..15]  
**Reset:**       0x00000000  
**Property:**   Read-only

This register view is relevant only if EPT\_TYPE = 0x1 in UDPHS Endpoint Configuration Register.  
 The reset value for UDPHS\_EPTCTL0 is 0x00000001.

				ERR_FLUSH	ERR_CRC_NT	ERR_FL_ISO	TXRDY_TRER	TX_COMPLT	RXRDY_TXKL	ERR_OVFLW
Access				R	R	R	R	R	R	R
Reset				0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0	
		MDATA_RX	DATA_X_RX			INTDIS_DMA			AUTO_VALID	EPT_ENABL
Access		R	R			R			R	R
Reset		0	0			0			0	0

**Bit 31 – SHRT\_PCKT** Short Packet Interrupt Enabled (cleared upon USB reset)  
 For OUT endpoints: Send an Interrupt when a Short Packet has been received.

For IN endpoints: A Short Packet transmission is guaranteed upon end of the DMA Transfer, thus signaling an end of isochronous (micro-)frame data, but only if the UDPHS\_DMACONTROLx register END\_B\_EN and UDPHS\_EPTCTLx register AUTO\_VALID bits are also set.

Value	Description
0	Short Packet Interrupt is masked.
1	Short Packet Interrupt is enabled.

**Bit 18 – BUSY\_BANK** Busy Bank Interrupt Enabled (cleared upon USB reset)  
 For OUT endpoints: An interrupt is sent when all banks are busy.

For IN endpoints: An interrupt is sent when all banks are free.

Value	Description
0	BUSY_BANK Interrupt is masked.
1	BUSY_BANK Interrupt is enabled.

**Bit 14 – ERR\_FLUSH** Bank Flush Error Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Bank Flush Error Interrupt is masked.
1	Bank Flush Error Interrupt is enabled.

**Bit 13 – ERR\_CRC\_NTR** ISO CRC Error/Number of Transaction Error Interrupt Enabled (cleared upon USB reset)

Value	Description
0	ISO CRC error/number of Transaction Error Interrupt is masked.
1	ISO CRC error/number of Transaction Error Interrupt is enabled.

**Bit 12 – ERR\_FL\_ISO** Error Flow Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Error Flow Interrupt is masked.
1	Error Flow Interrupt is enabled.

**Bit 11 – TXRDY\_TRER** TX Packet Ready/Transaction Error Interrupt Enabled (cleared upon USB reset)

**⚠ CAUTION** Interrupt source is active as long as the corresponding UDPHS\_EPTSTAx register TXRDY\_TRER flag remains low. If there are no more banks available for transmitting after the software has set UDPHS\_EPTSTAx/TXRDY\_TRER for the last transmit packet, then the interrupt source remains inactive until the first bank becomes free again to transmit at UDPHS\_EPTSTAx/TXRDY\_TRER hardware clear.

Value	Description
0	TX Packet Ready/Transaction Error Interrupt is masked.
1	TX Packet Ready/Transaction Error Interrupt is enabled.

**Bit 10 – TX\_COMPLT** Transmitted IN Data Complete Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Transmitted IN Data Complete Interrupt is masked.
1	Transmitted IN Data Complete Interrupt is enabled.

**Bit 9 – RXRDY\_TXKL** Received OUT Data Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Received OUT Data Interrupt is masked.
1	Received OUT Data Interrupt is enabled.

**Bit 8 – ERR\_OVFLW** Overflow Error Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Overflow Error Interrupt is masked.
1	Overflow Error Interrupt is enabled.

**Bit 7 – MDATA\_RX** MDATA Interrupt Enabled (Only for High Bandwidth Isochronous OUT endpoints) (cleared upon USB reset)

Value	Description
0	No effect.
1	Send an interrupt when an MDATA packet has been received and so at least one packet of the microframe data payload has been received.

**Bit 6 – DATA\_RX** DATAx Interrupt Enabled (Only for High Bandwidth Isochronous OUT endpoints) (cleared upon USB reset)

Value	Description
0	No effect.
1	Send an interrupt when a DATA2, DATA1 or DATA0 packet has been received meaning the whole microframe data payload has been received.

**Bit 3 – INTDIS\_DMA** Interrupt Disables DMA (cleared upon USB reset)

If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled regardless of the UDPHS\_IEN register EPT\_x bit for this endpoint. Then, the firmware will have to clear or disable the interrupt source or clear this bit if transfer completion is needed.

If the exception raised is associated with the new system bank packet, then the previous DMA packet transfer is normally completed, but the new DMA packet transfer is not started (not requested).

If the exception raised is not associated to a new system bank packet (ex: ERR\_FL\_ISO), then the request cancellation may happen at any time and may immediately stop the current DMA transfer.

This may be used, for example, to identify or prevent an erroneous packet to be transferred into a buffer or to complete a DMA buffer by software after reception of a short packet, or to perform buffer truncation on ERR\_FL\_ISO interrupt for adaptive rate.

**Bit 1 – AUTO\_VALID** Packet Auto-Valid Enabled (cleared upon USB reset)

Set this bit to automatically validate the current packet and switch to the next bank for both IN and OUT endpoints.

**For IN Transfer:**

If this bit is set, the UDPHS\_EPTSTAx register TXRDY\_TRER bit is set automatically when the current bank is full and at the end of DMA buffer if the UDPHS\_DMACONTROLx register END\_B\_EN bit is set.

The user may still set the UDPHS\_EPTSTAx register TXRDY\_TRER bit if the current bank is not full, unless the user needs to send a Zero Length Packet by software.

**For OUT Transfer:**

If this bit is set, the UDPHS\_EPTSTAx register RXRDY\_TXKL bit is automatically reset for the current bank when the last packet byte has been read from the bank FIFO or at the end of DMA buffer if the UDPHS\_DMACONTROLx register END\_B\_EN bit is set. For example, to truncate a padded data packet when the actual data transfer size is reached.

The user may still clear the UDPHS\_EPTSTAx register RXRDY\_TXKL bit, for example, after completing a DMA buffer by software if UDPHS\_DMACONTROLx register END\_B\_EN bit was disabled or in order to cancel the read of the remaining data bank(s).

**Bit 0 – EPT\_ENABL** Endpoint Enable (cleared upon USB reset)

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

Value	Description
0	The endpoint is disabled according to the device configuration. Endpoint 0 should always be enabled after a hardware or UDPHS bus reset and participate in the device configuration.
1	The endpoint is enabled according to the device configuration.

### 40.7.15 UDPHS Endpoint Set Status Register (Control, Bulk, Interrupt Endpoints)

**Name:** UDPHS\_EPTSETSTAx  
**Offset:** 0x0114 + x\*0x20 [x=0..15]  
**Reset:** –  
**Property:** Write-only

This register view is relevant only if EPT\_TYPE = 0x0, 0x2 or 0x3 in UDPHS Endpoint Configuration Register.

For additional information, see UDPHS Endpoint Status Register (Control, Bulk, Interrupt Endpoints).

#### Bit 11 – TXRDY TX Packet Ready Set

Value	Description
0	No effect.

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

Value	Description
1	<p>Set this bit after a packet has been written into the endpoint FIFO for IN data transfers</p> <ul style="list-style-type: none"> <li>– This flag is used to generate a Data IN transaction (device to host).</li> <li>– Device firmware checks that it can write a data payload in the FIFO, checking that TXRDY is cleared.</li> <li>– Transfer to the FIFO is done by writing in the “Buffer Address” register.</li> <li>– Once the data payload has been transferred to the FIFO, the firmware notifies the UDPHS device setting TXRDY to one.</li> <li>– UDPHS bus transactions can start.</li> <li>– TXCOMP is set once the data payload has been received by the host.</li> <li>– Data should be written into the endpoint FIFO only after this bit has been cleared.</li> <li>– Set this bit without writing data to the endpoint FIFO to send a Zero Length Packet.</li> </ul>

### Bit 9 – RXRDY\_TXKL KILL Bank Set (for IN Endpoint)

Value	Description
0	No effect.
1	Kill the last written bank.

### Bit 5 – FRCESTALL Stall Handshake Request Set

Refer to chapters 8.4.5 (Handshake Packets) and 9.4.5 (Get Status) of the Universal Serial Bus Specification, Rev 2.0 for more information on the STALL handshake.

Value	Description
0	No effect.
1	Set this bit to request a STALL answer to the host for the next handshake

### 40.7.16 UDPHS Endpoint Set Status Register (Isochronous Endpoint)

**Name:** UDPHS\_EPTSETSTAx  
**Offset:** 0x0114 + x\*0x20 [x=0..15]  
**Reset:** –  
**Property:** Write-only

This register view is relevant only if EPT\_TYPE = 0x1 in UDPHS Endpoint Configuration Register.  
 For additional information, see UDPHS Endpoint Status Register (Isochronous Endpoint).

#### Bit 11 – TXRDY\_TRER TX Packet Ready Set

Value	Description
0	No effect.
1	Set this bit after a packet has been written into the endpoint FIFO for IN data transfers <ul style="list-style-type: none"> <li>– This flag is used to generate a Data IN transaction (device to host).</li> <li>– Device firmware checks that it can write a data payload in the FIFO, checking that TXRDY_TRER is cleared.</li> <li>– Transfer to the FIFO is done by writing in the “Buffer Address” register.</li> <li>– Once the data payload has been transferred to the FIFO, the firmware notifies the UDPHS device setting TXRDY_TRER to one.</li> <li>– UDPHS bus transactions can start.</li> <li>– TXCOMP is set once the data payload has been sent.</li> <li>– Data should be written into the endpoint FIFO only after this bit has been cleared.</li> <li>– Set this bit without writing data to the endpoint FIFO to send a Zero Length Packet.</li> </ul>

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

---

---

**Bit 9 – RXRDY\_TXKL** KILL Bank Set (for IN Endpoint)

Value	Description
0	No effect.
1	Kill the last written bank.

### 40.7.17 UDPHS Endpoint Clear Status Register (Control, Bulk, Interrupt Endpoints)

**Name:**        UDPHS\_EPTCLRSTAx  
**Offset:**     0x0118 + x\*0x20 [x=0..15]  
**Reset:**       –  
**Property:**   Write-only

This register view is relevant only if EPT\_TYPE = 0x0, 0x2 or 0x3 in UDPHS Endpoint Configuration Register.

For additional information, see UDPHS Endpoint Status Register (Control, Bulk, Interrupt Endpoints).

#### Bit 15 – NAK\_OUT NAKOUT Clear

Value	Description
0	No effect.
1	Clear the NAK_OUT flag of UDPHS_EPTSTAx.

#### Bit 14 – NAK\_IN NAKIN Clear

Value	Description
0	No effect.
1	Clear the NAK_IN flags of UDPHS_EPTSTAx.

#### Bit 13 – STALL\_SNT Stall Sent Clear

Value	Description
0	No effect.
1	Clear the STALL_SNT flags of UDPHS_EPTSTAx.

#### Bit 12 – RX\_SETUP Received SETUP Clear

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

Value	Description
0	No effect.
1	Clear the RX_SETUP flags of UDPHS_EPTSTAx.

**Bit 10 – TX\_COMPLT** Transmitted IN Data Complete Clear

Value	Description
0	No effect.
1	Clear the TX_COMPLT flag of UDPHS_EPTSTAx.

**Bit 9 – RXRDY\_TXKL** Received OUT Data Clear

Value	Description
0	No effect.
1	Clear the RXRDY_TXKL flag of UDPHS_EPTSTAx.

**Bit 6 – TOGGLESQ** Data Toggle Clear

For OUT endpoints, the next received packet should be a DATA0.

For IN endpoints, the next packet will be sent with a DATA0 PID.

Value	Description
0	No effect.
1	Clear the PID data of the current bank

**Bit 5 – FRCESTALL** Stall Handshake Request Clear

Value	Description
0	No effect.
1	Clear the STALL request. The next packets from host will not be STALLED.

### 40.7.18 UDPHS Endpoint Clear Status Register (Isochronous Endpoint)

**Name:**        UDPHS\_EPTCLRSTAx  
**Offset:**     0x0118 + x\*0x20 [x=0..15]  
**Reset:**       –  
**Property:**   Write-only

This register view is relevant only if EPT\_TYPE = 0x1 in UDPHS Endpoint Configuration Register.  
 For additional information, see UDPHS Endpoint Status Register (Isochronous Endpoint).

**Bit 14 – ERR\_FLUSH** Bank Flush Error Clear

Value	Description
0	No effect.
1	Clear the ERR_FLUSH flags of UDPHS_EPTSTAx.

**Bit 13 – ERR\_CRC\_NTR** Number of Transaction Error Clear

Value	Description
0	No effect.
1	Clear the ERR_CRC_NTR flags of UDPHS_EPTSTAx.

**Bit 12 – ERR\_FL\_ISO** Error Flow Clear

Value	Description
0	No effect.
1	Clear the ERR_FL_ISO flags of UDPHS_EPTSTAx.

**Bit 10 – TX\_COMPLT** Transmitted IN Data Complete Clear

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

Value	Description
0	No effect.
1	Clear the TX_COMPLT flag of UDPHS_EPTSTAx.

**Bit 9 – RXRDY\_TXKL** Received OUT Data Clear

Value	Description
0	No effect.
1	Clear the RXRDY_TXKL flag of UDPHS_EPTSTAx.

**Bit 6 – TOGGLESQ** Data Toggle Clear

For OUT endpoints, the next received packet should be a DATA0.

For IN endpoints, the next packet will be sent with a DATA0 PID.

Value	Description
0	No effect.
1	Clear the PID data of the current bank

### 40.7.19 UDPHS Endpoint Status Register (Control, Bulk, Interrupt Endpoints)

**Name:** UDPHS\_EPTSTAx  
**Offset:** 0x011C + x\*0x20 [x=0..15]  
**Reset:** 0x00000040  
**Property:** Read-only

This register view is relevant only if EPT\_TYPE = 0x0, 0x2 or 0x3 in UDPHS Endpoint Configuration Register.

Bit	31	30	29	28	27	26	25	24
	SHRT_PCKT		BYTE_COUNT[10:4]					
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	BYTE_COUNT[3:0]			BUSY_BANK_STA[1:0]			CURBK_CTLDIR[1:0]	
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8

Bit	7	6	5	4	3	2	1	0
	TOGGLESQ_STA[1:0]		FRCESTALL					
Access	R	R	R					
Reset	0	1	0					

**Bit 31 – SHRT\_PCKT** Short Packet (cleared upon USB reset)

An OUT Short Packet is detected when the receive byte count is less than the configured UDPHS\_EPTCFGx register EPT\_Size.

This bit is updated at the same time as the BYTE\_COUNT field.

It is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bits 30:20 – BYTE\_COUNT[10:0]** UDPHS Byte Count (cleared upon USB reset)

Byte count of a received data packet.

This field is incremented after each write into the endpoint (to prepare an IN transfer). It is decremented after each reading into the endpoint (OUT transfer).

This field is also updated at RXRDY\_TXKL flag clear with the next bank, and at TXRDY flag set with the next bank.

This field is reset by UDPHS\_EPTRST.EPT\_x.

**Bits 19:18 – BUSY\_BANK\_STA[1:0]** Busy Bank Number (cleared upon USB reset)

These bits are set by hardware to indicate the number of busy banks.

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

IN endpoint: Indicates the number of busy banks filled by the user, ready for IN transfer.

OUT endpoint: Indicates the number of busy banks filled by OUT transaction from the Host.

Value	Name	Description
0	0BUSYBANK	All banks are free
1	1BUSYBANK	1 busy bank
2	2BUSYBANKS	2 busy banks
3	3BUSYBANKS	3 busy banks

**Bits 17:16 – CURBK\_CTLDIR[1:0]** Current Bank/Control Direction (cleared upon USB reset)

**Control Direction (for Control endpoint only):**

0: A Control Write is requested by the Host.

1: A Control Read is requested by the Host.

**Note:**

1. Corresponds to the the 7th bit of the bmRequestType (Byte 0 of the Setup Data).
2. Updated after receiving new setup data.

**Current Bank (not relevant for Control endpoint):**

- Set by hardware to indicate the number of the current bank.
- Reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).
- The current bank is updated each time the user:
  - Sets the TX Packet Ready bit to prepare the next IN transfer and to switch to the next bank.
  - Clears the received OUT data bit to access the next bank.

Value	Name	Description
0	BANK0	Bank 0 (or single bank)
1	BANK1	Bank 1
2	BANK2	Bank 2

**Bit 15 – NAK\_OUT** NAK OUT (cleared upon USB reset)

This bit is set by hardware when a NAK handshake has been sent in response to an OUT or PING request from the Host.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by EPT\_CTL\_DISx (disable endpoint).

**Bit 14 – NAK\_IN** NAK IN (cleared upon USB reset)

This bit is set by hardware when a NAK handshake has been sent in response to an IN request from the Host.

This bit is cleared by software.

**Bit 13 – STALL\_SNT** Stall Sent (cleared upon USB reset)

For Control, Bulk and Interrupt endpoints.

This bit is set by hardware after a STALL handshake has been sent as requested by the UDPHS\_EPTSTAx register FRCESTALL bit.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bit 12 – RX\_SETUP** Received SETUP (cleared upon USB reset)

For Control endpoint only.

This bit is set by hardware when a valid SETUP packet has been received from the host.

It is cleared by the device firmware after reading the SETUP data from the endpoint FIFO.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint), and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bit 11 – TXRDY** TX Packet Ready (cleared upon USB reset)

This bit is cleared by hardware after the host has acknowledged the packet.

For Multi-bank endpoints, this bit may remain clear even after software is set if another bank is available to transmit.

Hardware clear of this bit may generate an interrupt if enabled by the UDPHS\_EPTCTLx register TXRDY bit.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint), and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bit 10 – TX\_COMPLT** Transmitted IN Data Complete (cleared upon USB reset)

This bit is set by hardware after an IN packet has been accepted (ACK'ed) by the host.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint), and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bit 9 – RXRDY\_TXKL** Received OUT Data/KILL Bank (cleared upon USB reset)

**Received OUT Data (for OUT endpoint or Control endpoint):**

- This bit is set by hardware after a new packet has been stored in the endpoint FIFO.
- This bit is cleared by the device firmware after reading the OUT data from the endpoint.
- For multi-bank endpoints, this bit may remain active even when cleared by the device firmware, this if an other packet has been received meanwhile.
- Hardware assertion of this bit may generate an interrupt if enabled by the UDPHS\_EPTCTLx register RXRDY\_TXKL bit.
- This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

**KILL Bank (for IN endpoint):**

- The bank is really cleared or the bank is sent, BUSY\_BANK\_STA is decremented.
- The bank is not cleared but sent on the IN transfer, TX\_COMPLT
- The bank is not cleared because it was empty. The user should wait that this bit is cleared before trying to clear another packet.

**Note:** “Kill a packet” may be refused if at the same time, an IN token is coming and the current packet is sent on the UDPHS line. In this case, the TX\_COMPLT bit is set. Take notice however, that if at least two banks are ready to be sent, there is no problem to kill a packet even if an IN token is coming. In fact, in that case, the current bank is sent (IN transfer) and the last bank is killed.

**Bit 8 – ERR\_OVFLW** Overflow Error (cleared upon USB reset)

This bit is set by hardware when a new too-long packet is received.

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

Example: If the user programs an endpoint 64 bytes wide and the host sends 128 bytes in an OUT transfer, then the Overflow Error bit is set.

This bit is updated at the same time as the BYTE\_COUNT field.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bits 7:6 – TOGGLESQ\_STA[1:0]** Toggle Sequencing (cleared upon USB reset)

In OUT transfer, the Toggle information is meaningful only when the current bank is busy (Received OUT Data = 1).

This field is updated for OUT transfer:

- A new data has been written into the current bank.
- The user has just cleared the Received OUT Data bit to switch to the next bank.

This field is reset to DATA1 by the UDPHS\_EPTCLRSTAx register TOGGLESQ bit, and by UDPHS\_EPTCTLDISx (disable endpoint).

Toggle Sequencing:

- IN endpoint: Indicates the PID Data Toggle that will be used for the next packet sent. This is not relative to the current bank.
- CONTROL and OUT endpoints: Set by hardware to indicate the PID data of the current bank.

Value	Name	Description
0	DATA0	DATA0
1	DATA1	DATA1
2	DATA2	Reserved for High Bandwidth Isochronous Endpoint
3	MDATA	Reserved for High Bandwidth Isochronous Endpoint

**Bit 5 – FRCESTALL** Stall Handshake Request (cleared upon USB reset)

This bit is reset by hardware upon received SETUP.

Value	Description
0	No effect.
1	If set a STALL answer will be done to the host for the next handshake.

### 40.7.20 UDPHS Endpoint Status Register (Isochronous Endpoint)

**Name:**       UDPHS\_EPTSTAx  
**Offset:**     0x011C + x\*0x20 [x=0..15]  
**Reset:**       0x00000040  
**Property:**   Read-only

This register view is relevant only if EPT\_TYPE = 0x1 in “UDPHS Endpoint Configuration Register”.

Reset	0	1						

**Bit 31 – SHRT\_PCKT** Short Packet (cleared upon USB reset)  
 An OUT Short Packet is detected when the receive byte count is less than the configured UDPHS\_EPTCFGx register EPT\_Size.

This bit is updated at the same time as the BYTE\_COUNT field.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bits 30:20 – BYTE\_COUNT[10:0]** UDPHS Byte Count (cleared upon USB reset)  
 Byte count of a received data packet.

This field is incremented after each write into the endpoint (to prepare an IN transfer).

This field is decremented after each reading into the endpoint (OUT transfer).

This field is also updated at RXRDY\_TXKL flag clear with the next bank.

This field is also updated at TXRDY\_TRER flag set with the next bank.

This field is reset by EPT\_x of UDPHS\_EPTRST register.

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

**Bits 19:18 – BUSY\_BANK\_STA[1:0]** Busy Bank Number (cleared upon USB reset)

These bits are set by hardware to indicate the number of busy banks.

IN endpoint: It indicates the number of busy banks filled by the user, ready for IN transfer.

OUT endpoint: It indicates the number of busy banks filled by OUT transaction from the Host.

Value	Name	Description
0	0BUSYBANK	All banks are free
1	1BUSYBANK	1 busy bank
2	2BUSYBANKS	2 busy banks
3	3BUSYBANKS	3 busy banks

**Bits 17:16 – CURBK[1:0]** Current Bank (cleared upon USB reset)

These bits are set by hardware to indicate the number of the current bank.

The current bank is updated each time the user:

- Sets the TX Packet Ready bit to prepare the next IN transfer and to switch to the next bank.
- Clears the received OUT data bit to access the next bank.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

Value	Name	Description
0	BANK0	Bank 0 (or single bank)
1	BANK1	Bank 1
2	BANK2	Bank 2

**Bit 14 – ERR\_FLUSH** Bank Flush Error (cleared upon USB reset)

For High Bandwidth Isochronous IN endpoints.

This bit is set when flushing unsent banks at the end of a microframe.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by EPT\_CTL\_DISx (disable endpoint).

**Bit 13 – ERR\_CRC\_NTR** CRC ISO Error/Number of Transaction Error (cleared upon USB reset)

**CRC ISO Error (for Isochronous OUT endpoints) (Read-only):**

This bit is set by hardware if the last received data is corrupted (CRC error on data).

This bit is updated by hardware when new data is received (Received OUT Data bit).

**Number of Transaction Error (for High Bandwidth Isochronous IN endpoints):**

This bit is set at the end of a microframe in which at least one data bank has been transmitted, if less than the number of transactions per micro-frame banks (UDPHS\_EPTCFGx register NB\_TRANS) have been validated for transmission inside this microframe.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bit 12 – ERR\_FL\_ISO** Error Flow (cleared upon USB reset)

This bit is set by hardware when a transaction error occurs.

- Isochronous IN transaction is missed, the micro has no time to fill the endpoint (underflow).
- Isochronous OUT data is dropped because the bank is busy (overflow).

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bit 11 – TXRDY\_TRER** TX Packet Ready/Transaction Error (cleared upon USB reset)

**TX Packet Ready**

This bit is cleared by hardware, as soon as the packet has been sent.

For Multi-bank endpoints, this bit may remain clear even after software is set if another bank is available to transmit.

Hardware clear of this bit may generate an interrupt if enabled by the UDPHS\_EPTCTLx register TXRDY\_TRER bit.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint), and by UDPHS\_EPTCTLDISx (disable endpoint).

**Transaction Error (for high bandwidth isochronous OUT endpoints) (Read-Only):**

This bit is set by hardware when a transaction error occurs inside one microframe.

If one toggle sequencing problem occurs among the n-transactions (n = 1, 2 or 3) inside a microframe, then this bit is still set as long as the current bank contains one “bad” n-transaction (see CURBK field description). As soon as the current bank is relative to a new “good” n-transactions, then this bit is reset.

**Note:**

1. A transaction error occurs when the toggle sequencing does not comply with the Universal Serial Bus Specification, Rev 2.0 (5.9.2 High Bandwidth Isochronous endpoints) (Bad PID, missing data, etc.)
2. When a transaction error occurs, the user may empty all the “bad” transactions by clearing the Received OUT Data flag (RXRDY\_TXKL).

If this bit is reset, then the user should consider that a new n-transaction is coming.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint), and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bit 10 – TX\_COMPLT** Transmitted IN Data Complete (cleared upon USB reset)

This bit is set by hardware after an IN packet has been sent.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint), and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bit 9 – RXRDY\_TXKL** Received OUT Data/KILL Bank (cleared upon USB reset)

**Received OUT Data (for OUT endpoint or Control endpoint):**

- This bit is set by hardware after a new packet has been stored in the endpoint FIFO.
- This bit is cleared by the device firmware after reading the OUT data from the endpoint.
- For multi-bank endpoints, this bit may remain active even when cleared by the device firmware, this if an other packet has been received meanwhile.
- Hardware assertion of this bit may generate an interrupt if enabled by the UDPHS\_EPTCTLx register RXRDY\_TXKL bit.
- This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

**KILL Bank (for IN endpoint):**

- The bank is really cleared or the bank is sent, BUSY\_BANK\_STA is decremented.

- The bank is not cleared but sent on the IN transfer, TX\_COMPLT
- The bank is not cleared because it was empty. The user should wait that this bit is cleared before trying to clear another packet.  
**Note:** “Kill a packet” may be refused if at the same time, an IN token is coming and the current packet is sent on the UDPHS line. In this case, the TX\_COMPLT bit is set. Take notice however, that if at least two banks are ready to be sent, there is no problem to kill a packet even if an IN token is coming. In fact, in that case, the current bank is sent (IN transfer) and the last bank is killed.

**Bit 8 – ERR\_OVFLW** Overflow Error (cleared upon USB reset)

This bit is set by hardware when a new too-long packet is received.

Example: If the user programs an endpoint 64 bytes wide and the host sends 128 bytes in an OUT transfer, then the Overflow Error bit is set.

This bit is updated at the same time as the BYTE\_COUNT field.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bits 7:6 – TOGGLESQ\_STA[1:0]** Toggle Sequencing (cleared upon USB reset)

In OUT transfer, the Toggle information is meaningful only when the current bank is busy (Received OUT Data = 1).

This field is updated for OUT transfer:

- A new data has been written into the current bank.
- The user has just cleared the Received OUT Data bit to switch to the next bank.

For High Bandwidth Isochronous Out endpoint, it is recommended to check the UDPHS\_EPTSTAx/ TXRDY\_TRER bit to know if the toggle sequencing is correct or not.

This field is reset to DATA1 by the UDPHS\_EPTCLRSTAx register TOGGLESQ bit, and by UDPHS\_EPTCTLDISx (disable endpoint).

Toggle Sequencing:

- IN endpoint: Indicates the PID Data Toggle that will be used for the next packet sent. This is not relative to the current bank.
- OUT endpoint: Set by hardware to indicate the PID data of the current bank:

Value	Name	Description
0	DATA0	DATA0
1	DATA1	DATA1
2	DATA2	Data2 (only for High Bandwidth Isochronous Endpoint)
3	MDATA	MData (only for High Bandwidth Isochronous Endpoint)

### 40.7.21 UDPHS DMA Channel Transfer Descriptor

The DMA channel transfer descriptor is loaded from the memory. Be careful with the alignment of this buffer. The structure of the DMA channel transfer descriptor is defined by three parameters as described below:

- Offset 0:
  - The address must be aligned: 0xXXXXX0
  - Next Descriptor Address Register: UDPHS\_DMANXTDSCx

- Offset 4:
  - The address must be aligned: 0xXXXX4
  - DMA Channelx Address Register: UDPHS\_DMAADDRESSx
- Offset 8:
  - The address must be aligned: 0xXXXX8
  - DMA Channelx Control Register: UDPHS\_DMACONTROLx

To use the DMA channel transfer descriptor, fill the structures with the correct value (as described in the following pages). Then write directly in UDPHS\_DMANXTDSCx the address of the descriptor to be used first. Then write '1' in the LDNXT\_DSC bit of UDPHS\_DMACONTROLx (load next channel transfer descriptor). The descriptor is automatically loaded upon Endpointx request for packet transfer.

### 40.7.22 UDPHS DMA Next Descriptor Address Register

**Name:** UDPHS\_DMANXTDSCx  
**Offset:** 0x0300 + x\*0x10 [x=0..6]  
**Reset:** 0x00000000  
**Property:** Read/Write

Channel 0 is not used.

Bit	31	30	29	28	27	26	25	24
	NXT_DSC_ADD[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	NXT_DSC_ADD[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	NXT_DSC_ADD[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	NXT_DSC_ADD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – NXT\_DSC\_ADD[31:0] Next Descriptor Address**

This field points to the next channel descriptor to be processed. This channel descriptor must be aligned, so bits 0 to 3 of the address must be equal to zero.

### 40.7.23 UDPHS DMA Channel Address Register

**Name:** UDPHS\_DMAADDRESSx  
**Offset:** 0x0304 + x\*0x10 [x=0..6]  
**Reset:** 0x00000000  
**Property:** Read/Write

Channel 0 is not used.

	Bit	31	30	29	28	27	26	25	24
		BUFF_ADD[31:24]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		BUFF_ADD[23:16]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		BUFF_ADD[15:8]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		BUFF_ADD[7:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0

**Bits 31:0 – BUFF\_ADD[31:0] Buffer Address**

This field determines the AHB bus starting address of a DMA channel transfer.

Channel start and end addresses may be aligned on any byte boundary.

The firmware may write this field only when the UDPHS\_DMASTATUS register CHANN\_ENB bit is clear.

This field is updated at the end of the address phase of the current access to the AHB bus. It is incrementing of the access byte width. The access width is 4 bytes (or less) at packet start or end, if the start or end address is not aligned on a word boundary.

The packet start address is either the channel start address or the next channel address to be accessed in the channel buffer.

The packet end address is either the channel end address or the latest channel address accessed in the channel buffer.

The channel start address is written by software or loaded from the descriptor, whereas the channel end address is either determined by the end of buffer or the UDPHS device, USB end of transfer if the UDPHS\_DMACONTROLx register END\_TR\_EN bit is set.

### 40.7.24 UDPHS DMA Channel Control Register

**Name:** UDPHS\_DMACONTROLx  
**Offset:** 0x0308 + x\*0x10 [x=0..6]  
**Reset:** 0x00000000  
**Property:** Read/Write

Channel 0 is not used.

Bits [31:2] are only writable when issuing a channel Control Command other than “Stop Now”.

For reliability it is highly recommended to wait for both UDPHS\_DMASTATUS.CHAN\_ACT and CHAN\_ENB flags at 0, thus ensuring the channel has been stopped before issuing a command other than “Stop Now”.

	Bit	31	30	29	28	27	26	25	24
		BUFF_LENGTH[15:8]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		BUFF_LENGTH[7:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
Access									
Reset									
	Bit	7	6	5	4	3	2	1	0
		BURST_LCK	DESC_LD_IT	END_BUFFIT	END_TR_IT	END_B_EN	END_TR_EN	LDNXT_DSC	CHANN_ENB
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0

**Bits 31:16 – BUFF\_LENGTH[15:0]** Buffer Byte Length (Write-only)

This field determines the number of bytes to be transferred until end of buffer. The maximum channel transfer size (64 KBytes) is reached when this field is 0 (default value). If the transfer size is unknown, this field should be set to 0, but the transfer end may occur earlier under UDPHS device control.

When this field is written, the UDPHS\_DMASTATUS.BUFF\_COUNT field is updated with the write value.

**Bit 7 – BURST\_LCK** Burst Lock Enable

Value	Description
0	The DMA never locks bus access.
1	USB packets AHB data bursts are locked for maximum optimization of the bus bandwidth usage and maximization of fly-by AHB burst duration.

**Bit 6 – DESC\_LD\_IT** Descriptor Loaded Interrupt Enable

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

Value	Description
0	UDPHS_DMASTATUS.DESC_LDST rising will not trigger any interrupt.
1	An interrupt is generated when a descriptor has been loaded from the bus.

**Bit 5 – END\_BUFFERIT** End of Buffer Interrupt Enable

Value	Description
0	UDPHS_DMASTATUS.END_BF_ST rising will not trigger any interrupt.
1	An interrupt is generated when the UDPHS_DMASTATUS.BUFF_COUNT reaches zero.

**Bit 4 – END\_TR\_IT** End of Transfer Interrupt Enable

Value	Description
0	UDPHS device initiated buffer transfer completion will not trigger any interrupt at UDPHS_STATUS.END_TR_ST rising.
1	An interrupt is sent after the buffer transfer is complete, if the UDPHS device has ended the buffer transfer.  Use when the receive size is unknown.

**Bit 3 – END\_B\_EN** End of Buffer Enable (Control)

Value	Description
0	DMA Buffer End has no impact on USB packet transfer.
1	Endpoint can validate the packet (according to the values programmed in the UDPHS_EPTCTL.AUTO_VALID and SHRT_PCKT fields) at DMA Buffer End, i.e., when the UDPHS_DMASTATUS.BUFF_COUNT reaches 0.  This is mainly for short packet IN validation initiated by the DMA reaching end of buffer, but could be used for OUT packet truncation (discarding of unwanted packet data) at the end of DMA buffer.

**Bit 2 – END\_TR\_EN** End of Transfer Enable (Control)

Used for OUT transfers only.

Value	Description
0	USB end of transfer is ignored.
1	UDPHS device can put an end to the current buffer transfer.  When set, a BULK or INTERRUPT short packet or the last packet of an ISOCHRONOUS (micro) frame (DATAx) will close the current buffer and the UDPHS_DMASTATUS.END_TR_ST flag will be raised.  This is intended for UDPHS non-prenegotiated end of transfer (BULK or INTERRUPT) or ISOCHRONOUS microframe data buffer closure.

**Bit 1 – LDNXT\_DSC** Load Next Channel Transfer Descriptor Enable (Command)

0: No channel register is loaded after the end of the channel transfer.

1: The channel controller loads the next descriptor after the end of the current transfer, i.e., when the UDPHS\_DMASTATUS/CHANN\_ENB bit is reset.

If CHANN\_ENB is cleared, the next descriptor is immediately loaded upon transfer request.

DMA Channel Control Command Summary

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

LDNXT_DSC	CHANN_ENB	Description
0	0	Stop now
0	1	Run and stop at end of buffer
1	0	Load next descriptor now
1	1	Run and link at end of buffer

### Bit 0 – CHANN\_ENB (Channel Enable Command)

Value	Description
0	<p>DMA channel is disabled at and no transfer will occur upon request. This bit is also cleared by hardware when the channel source bus is disabled at end of buffer.</p> <p>If the UDPHS_DMACONTROL register LDNXT_DSC bit has been cleared by descriptor loading, the firmware will have to set the corresponding CHANN_ENB bit to start the described transfer, if needed.</p> <p>If the UDPHS_DMACONTROL register LDNXT_DSC bit is cleared, the channel is frozen and the channel registers may then be read and/or written reliably as soon as both UDPHS_DMASTATUS register CHANN_ENB and CHANN_ACT flags read as 0.</p> <p>If a channel request is currently serviced when this bit is cleared, the DMA FIFO buffer is drained until it is empty, then the UDPHS_DMASTATUS register CHANN_ENB bit is cleared.</p> <p>If the LDNXT_DSC bit is set at or after this bit clearing, then the currently loaded descriptor is skipped (no data transfer occurs) and the next descriptor is immediately loaded.</p>
1	<p>UDPHS_DMASTATUS register CHANN_ENB bit will be set, thus enabling DMA channel data transfer. Then any pending request will start the transfer. This may be used to start or resume any requested transfer.</p>

#### 40.7.25 UDPHS DMA Channel Status Register

**Name:** UDPHS\_DMASTATUSx  
**Offset:** 0x030C + x\*0x10 [x=0..6]  
**Reset:** 0x00000000  
**Property:** Read/Write

Channel 0 is not used.

Bit	31	30	29	28	27	26	25	24
	BUFF_COUNT[15:8]							
Access								
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	BUFF_COUNT[7:0]							
Access								
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	DESC_LDST	END_BF_ST	END_TR_ST			CHANN_ACT	CHANN_ENB	
Access								
Reset	0	0	0				0	0

**Bits 31:16 – BUFF\_COUNT[15:0]** Buffer Byte Count

This field determines the current number of bytes still to be transferred for this buffer.

This field is decremented from the AHB source bus access byte width at the end of this bus address phase.

The access byte width is 4 by default, or less, at DMA start or end, if the start or end address is not aligned on a word boundary.

At the end of buffer, the DMA accesses the UDPHS device only for the number of bytes needed to complete it.

This field value is reliable (stable) only if the channel has been stopped or frozen (UDPHS\_EPTCTLx register NT\_DIS\_DMA bit is used to disable the channel request) and the channel is no longer active CHANN\_ACT flag is 0.

**Note:** For OUT endpoints, if the receive buffer byte length (BUFF\_LENGTH) has been defaulted to zero because the USB transfer length is unknown, the actual buffer byte length received is 0x10000-BUFF\_COUNT.

**Bit 6 – DESC\_LDST** Descriptor Loaded Status

Valid until the CHANN\_ENB flag is cleared at the end of the next buffer transfer.

# SAMA5D2 Series

## USB High Speed Device Port (UDPHS)

Value	Description
0	Cleared automatically when read by software.
1	Set by hardware when a descriptor has been loaded from the system bus.

### Bit 5 – END\_BF\_ST End of Channel Buffer Status

Valid until the CHANN\_ENB flag is cleared at the end of the next buffer transfer.

Value	Description
0	Cleared automatically when read by software.
1	Set by hardware when the BUFF_COUNT countdown reaches zero.

### Bit 4 – END\_TR\_ST End of Channel Transfer Status

Valid until the CHANN\_ENB flag is cleared at the end of the next buffer transfer.

Value	Description
0	Cleared automatically when read by software.
1	Set by hardware when the last packet transfer is complete, if the UDPHS device has ended the transfer.

### Bit 1 – CHANN\_ACT Channel Active Status

When a packet transfer is ended this bit is automatically reset.

When a packet transfer cannot be completed due to an END\_BF\_ST, this flag stays set during the next channel descriptor load (if any) and potentially until UDPHS packet transfer completion, if allowed by the new descriptor.

Value	Description
0	The DMA channel is no longer trying to source the packet data.
1	The DMA channel is currently trying to source packet data, i.e., selected as the highest-priority requesting channel.

### Bit 0 – CHANN\_ENB Channel Enable Status

When any transfer is ended either due to an elapsed byte count or a UDPHS device initiated transfer end, this bit is automatically reset.

This bit is normally set or cleared by writing into the UDPHS\_DMACONTROLx register CHANN\_ENB bit either by software or descriptor loading.

If a channel request is currently serviced when the UDPHS\_DMACONTROLx register CHANN\_ENB bit is cleared, the DMA FIFO buffer is drained until it is empty, then this status bit is cleared.

Value	Description
0	The DMA channel no longer transfers data, and may load the next descriptor if the UDPHS_DMACONTROLx register LDNXT_DSC bit is set.
1	The DMA channel is currently enabled and transfers data upon request.

## **41. USB Host High Speed Port (UHPHS)**

### **41.1 Description**

The USB Host High Speed Port (UHPHS) interfaces the USB with the host application. It handles Open HCI protocol (Open Host Controller Interface) as well as Enhanced HCI protocol (Enhanced Host Controller Interface).

### **41.2 Embedded Characteristics**

- Compliant with Enhanced HCI Rev 1.0 Specification
  - Compliant with USB V2.0 High-speed
  - Supports High-speed 480 Mbps
- Compliant with Open HCI Rev 1.0 Specification
  - Compliant with USB V2.0 Full-speed and Low-speed Specification
  - Supports both Low-speed 1.5 Mbps and Full-speed 12 Mbps USB devices
- Root Hub Integrated with 3 Downstream USB HS Ports
- Embedded USB Transceivers
- Supports Power Management
- 3 Hosts (A, B and C) High Speed (EHCI), Port A shared with UHPHS
  - 1 Host (C) High Speed Inter-Chip Only (HSIC)

### 41.3 Block Diagram

**Figure 41-1. Block Diagram**

Access to the USB host operational registers is achieved through the system bus slave interface. The Open HCI host controller and Enhanced HCI host controller initialize master DMA transfers through the system bus master interface as follows:

- Fetches endpoint descriptors and transfer descriptors
- Access to endpoint data from system memory
- Access to the HC communication area
- Write status and retire transfer descriptor

Memory access errors (abort, misalignment) lead to an “Unrecoverable Error” indicated by the corresponding flag in the host controller operational registers.

The USB root hub is integrated in the USB host. Several USB downstream ports are available. The number of downstream ports can be determined by the software driver reading the root hub’s operational registers. Device connection is automatically detected by the USB host port logic.

USB physical transceivers are integrated in the product and driven by the root hub’s ports.

## 41.4 Typical Connection

**Figure 41-2. Board Schematic to Interface UHP High-speed Host Controller**

## 41.5 Product Dependencies

### 41.5.1 I/O Lines

HFSDPs, HFSDMs, HHSDPs and HHSDMs are not controlled by any PIO controllers. The embedded USB High Speed physical transceivers are controlled by the USB host controller.

One transceiver is shared with the USB High Speed Device (port A). The selection between Host Port A and USB Device is controlled by the UPHS enable bit (EN\_UDPHS) located in the UPHS\_CTRL register.

In the case the port A is driven by the USB High Speed Device, the output signals are DFSDP, DFSDM, DHSDP and DHSDM. The transceiver is automatically selected for Device operation once the USB High Speed Device is enabled.

In the case the port A is driven by the USB High Speed Host, the output signals are HFSDPA, HFSDMA, HHSDPA and HHSDMA.

### 41.5.2 Power Management

The system embeds 3 transceivers.

The USB Host High Speed requires a 480 MHz clock for the embedded High-speed transceivers. This clock (UPLLCK) is provided by the UTMI PLL.

In case power consumption is saved by stopping the UTMI PLL, high-speed operations are not possible. Nevertheless, OHCI Full-speed operations remain possible by selecting PLLACK as the input clock of OHCI.

The High-speed transceiver returns a 30 MHz clock to the USB Host controller.

The USB Host controller requires 48 MHz and 12 MHz clocks for OHCI full-speed operations. These clocks must be generated by a PLL with a correct accuracy of +/-0.25% using the USBDIV field.

# SAMA5D2 Series

## USB Host High Speed Port (UHPHS)

Thus the USB Host peripheral receives three clocks from the Power Management Controller (PMC): the Peripheral Clock (MCK domain), the UHP48M and the UHP12M (built-in UHP48M divided by four) used by the OHCI to interface with the bus USB signals (recovered 12 MHz domain) in Full-speed operations.

For High-speed operations, the user has to perform the following:

- Enable UHP peripheral clock in PMC\_PCER.
- Write PLLCOUNT field in CKGR\_UCKR.
- Enable UPLL with UPLEN bit in CKGR\_UCKR.
- Wait until UTMI\_PLL is locked (LOCKU bit in PMC\_SR).
- Select UPLLCK as Input clock of OHCI part (USBS bit in PMC\_USB register).
- Program OHCI clocks (UHP48M and UHP12M) with USBDIV field in PMC\_USB register. USBDIV must be 9 (division by 10) if UPLLCK is selected.
- Enable OHCI clocks with UHP bit in PMC\_SCER.

For OHCI Full-speed operations only, the user has to perform the following:

- Enable UHP peripheral clock in PMC\_PCER.
- Select PLLACK as Input clock of OHCI part (USBS bit in PMC\_USB register).
- Program OHCI clocks (UHP48M and UHP12M) with USBDIV field in PMC\_USB register. USBDIV value is to be calculated according to the PLLACK value and USB Full-speed accuracy.
- Enable the OHCI clocks with UHP bit in PMC\_SCER.

**Figure 41-3. UHP Clock Trees**

### 41.5.3 Interrupt Sources

The USB host interface has an interrupt line connected to the interrupt controller.

Handling USB host interrupts requires programming the interrupt controller before configuring the UHPHS.

## 41.6 Functional Description

### 41.6.1 UTMI Transceivers Sharing

The High Speed USB Host Port A is shared with the High Speed USB Device port and connected to the second UTMI transceiver. The selection between Host Port A and USB device is controlled by the UDPHS enable bit (EN\_UDPHS) located in the UDPHS\_CTRL register.

**Figure 41-4. USB Selection**

### 41.6.2 EHCI

The USB Host Port controller is fully compliant with the Enhanced HCI specification. The USB Host Port User Interface (registers description) can be found in the Enhanced HCI Rev 1.0 Specification available on [www.usb.org](http://www.usb.org)

### 41.6.3 OHCI

The USB Host Port integrates a root hub and transceivers on downstream ports. It provides several Full-speed half-duplex serial communication ports at a baud rate of 12 Mbps. Up to 127 USB devices (printer, camera, mouse, keyboard, disk, etc.) and the USB hub can be connected to the USB host in the USB “tiered star” topology.

The USB Host Port controller is fully compliant with the Open HCI specification. The USB Host Port User Interface (registers description) can be found in the Open HCI Rev 1.0 Specification available on [www.usb.org](http://www.usb.org).

All standard class devices are automatically detected and available to the user's application. As an example, integrating an HID (Human Interface Device) class driver provides a plug & play feature for all USB keyboards and mice.

### 41.6.4 HSIC

The High-Speed Inter-Chip (HSIC) is a standard for USB chip-to-chip interconnect with a 2-signal (strobe, data) source synchronous serial interface using 240 MHz DDR signaling to provide only high-speed 480 Mbps data rate.

External cables, connectors and hot plug & play are not supported.

# **SAMA5D2 Series**

## **USB Host High Speed Port (UHPHS)**

---

---

The HSIC interface operates at high speed, 480 Mbps, and is fully compatible with existing USB software stacks. It meets all data transfer needs through a single unified USB software stack.

### 41.7 Register Summary

The Enhanced USB Host Controller contains two sets of software-accessible hardware registers: memory-mapped Host Controller Registers and optional PCI configuration registers. Note that the PCI configuration registers are only needed for PCI devices that implement the Host Controller.

- **Memory-mapped USB Host Controller Registers**—This block of registers is memory-mapped into non-cacheable memory. This memory space must begin on a DWord (32-bit) boundary. This register space is divided into two sections: a set of read-only capability registers and a set of read/write operational registers. The table below describes each register space.  
**Note:** Host controllers are not required to support exclusive-access mechanisms (such as PCI LOCK) for accesses to the memory-mapped register space. Therefore, if software attempts exclusive-access mechanisms to the host controller memory-mapped register space, the results are undefined.
- **PCI Configuration Registers (for PCI devices)**—In addition to the normal PCI header, power management, and device-specific registers, two registers are needed in the PCI configuration space to support USB. The normal PCI header and device-specific registers are beyond the scope of this document (the UHPHS\_CLASSC register is shown in this document). Note that HCD does not interact with the PCI configuration space. This space is used only by the PCI enumerator to identify the USB Host Controller, and assign the appropriate system resources.  
The table below summarizes the enhanced interface register sets.

Offset	Register Set	Explanation
0 to N-1	Capability Registers	The capability registers specify the limits, restrictions, and capabilities of a host controller implementation. These values are used as parameters to the host controller driver.
N to N+M-1	Operational Registers	The operational registers are used by system software to control and monitor the operational state of the host controller.

**Note:** Software must not modify reserved bits in Read/Write registers.

**41.7.1 UHPHS Host Controller Capability Register**

**Name:** UHPHS\_HCCAPBASE  
**Offset:** 0x00  
**Reset:** 0x01000010  
**Property:** Read-only

	Bit	31	30	29	28	27	26	25	24
		HCIVERSION[15:8]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	1
	Bit	23	22	21	20	19	18	17	16
		HCIVERSION[7:0]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
Access									
Reset									
	Bit	7	6	5	4	3	2	1	0
		CAPLENGTH[7:0]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	1	0	0	0	0

**Bits 31:16 – HCIVERSION[15:0]** Host Controller Interface Version Number

This is a two-byte field containing a BCD encoding of the EHCI revision number supported by this host controller. The most significant byte of this field represents the major revision and the least significant byte the minor revision.

**Bits 7:0 – CAPLENGTH[7:0]** Capability Registers Length

This field is used as an offset to add to the register base to find the beginning of the Operational Register Space.

### 41.7.2 UHPHS Host Controller Structural Parameters Register

**Name:** UHPHS\_HCSPARAMS  
**Offset:** 0x04  
**Reset:** 0x00001116  
**Property:** Read-only

These fields define structural parameters: number of downstream ports, etc.

	Bit	31	30	29	28	27	26	25	24	
Access										
Reset										
	Bit	23	22	21	20	19	18	17	16	
		N_DP[3:0]							P_INDICATOR	
Access		R	R	R	R				R	
Reset		0	0	0	0				0	
	Bit	15	14	13	12	11	10	9	8	
		N_CC[3:0]				N_PCC[3:0]				
Access		R	R	R	R	R	R	R	R	
Reset		0	0	0	1	0	0	0	1	
	Bit	7	6	5	4	3	2	1	0	
					PPC	N_PORTS[3:0]				
Access					R	R	R	R	R	
Reset					1	0	1	1	0	

**Bits 23:20 – N\_DP[3:0]** Debug Port Number

Optional. This register identifies which of the host controller ports is the debug port. The value is the port number (1-based) of the debug port. A non-zero value in this field indicates the presence of a debug port. The value in this register must not be greater than N\_PORTS (see above).

**Bit 16 – P\_INDICATOR** Port Indicators

This bit indicates whether the ports support port indicator control. When this bit is a 1, the port status and control registers include a read/writeable field for controlling the state of the port indicator. See [UHPHS Port Status and Control Register](#) for a definition of the port indicator control field.

**Bits 15:12 – N\_CC[3:0]** Number of Companion Controllers

This field indicates the number of companion controllers associated with this USB 2.0 host controller.

A zero in this field indicates there are no companion host controllers. Port-ownership hand-off is not supported. Only high-speed devices are supported on the host controller root ports.

A value larger than zero in this field indicates there are companion USB 1.1 host controller(s). Port-ownership hand-offs are supported. High, Full- and Low-speed devices are supported on the host controller root ports.

**Bits 11:8 – N\_PCC[3:0] Number of Ports per Companion Controller**

This field indicates the number of ports supported per companion host controller. It is used to indicate the port routing configuration to system software.

For example, if N\_PORTS has a value of 6 and N\_CC has a value of 2, then N\_PCC could have a value of 3. The convention is that the first N\_PCC ports are assumed to be routed to companion controller 1, the next N\_PCC ports to companion controller 2, etc. In the previous example, the N\_PCC could have been 4, where the first four are routed to companion controller 1 and the last two are routed to companion controller 2.

The number in this field must be consistent with N\_PORTS and N\_CC.

**Bit 4 – PPC Port Power Control**

This field indicates whether the host controller implementation includes port power control. A one in this bit indicates the ports have port power switches. A zero in this bit indicates the ports do not have port power switches. The value of this field affects the functionality of the Port Power field in each port status and control register (see [UHPHS Port Status and Control Register](#)).

**Bits 3:0 – N\_PORTS[3:0] Number of Ports**

This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the Operational Register Space. Valid values are in the range of 1 to 15.

A zero in this field is undefined.

### 41.7.3 UHPHS Host Controller Capability Parameters Register

**Name:** UHPHS\_HCCPARAMS  
**Offset:** 0x08  
**Reset:** 0x0000A010  
**Property:** Read-only

These fields define capability parameters: Multiple Mode control (time-base bit functionality), addressing capability, etc.

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits 31-24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Greyed out bits 23-16]							
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	EECP[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	1	0	1	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	IST[3:0]			[Greyed out bits 4-3]		ASPC	PFLF	AC
Access	R	R	R	R		R	R	R
Reset	0	0	0	1		0	0	0

**Bits 15:8 – EECP[7:0]** EHCI Extended Capabilities Pointer

Indicates the existence of a capabilities list. A value of 0 indicates no extended capabilities are implemented. A non-zero value in this register indicates the offset in the PCI configuration space of the first EHCI extended capability. The pointer value must be 64 or greater if implemented to maintain the consistency of the PCI header defined for this class of device.

**Bits 7:4 – IST[3:0]** Isochronous Scheduling Threshold

Indicates, relative to the current position of the executing host controller, where software can reliably update the isochronous schedule. When bit [7] is 0, the value of the least significant three bits indicates the number of microframes a host controller can hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is set to 1, the host software assumes the host controller may cache an isochronous data structure for an entire frame.

**Bit 2 – ASPC** Asynchronous Schedule Park Capability

The park capability can be disabled or enabled and set to a specific level by using the Asynchronous Schedule Park Mode Enable and Asynchronous Schedule Park Mode Count fields in the UHPHS\_USBCMD register.

Value	Description
0	Host controller does not supports the park feature for high-speed queue.

# SAMA5D2 Series

## USB Host High Speed Port (UHPHS)

Value	Description
1	Host controller supports the park feature for high-speed queue heads in the Asynchronous Schedule.

### Bit 1 – PFLF Programmable Frame List Flag

Value	Description
0	System software must use a frame list length of 1024 elements with this host controller. The UHPHS_USBCMD register Frame List Size field is a read-only register and must be set to 0.
1	System software can specify and use a smaller frame list and configure the host controller via the UHPHS_USBCMD register Frame List Size field. The frame list must always be aligned on a 4-Kbyte page boundary. This requirement ensures that the frame list is always physically contiguous.

### Bit 0 – AC 64-bit Addressing Capability

This field documents the addressing range capability of this implementation. The value of this field determines whether software should use 32-bit or 64-bit data structures.

This information is not tightly coupled with the UHPHS\_USBBASE address register mapping control. The 64-bit Addressing Capability bit indicates whether the host controller can generate 64-bit addresses as a master. The UHPHS\_USBBASE register indicates the host controller only needs to decode 32-bit addresses as a slave.

Value	Description
0	Data structures using 32-bit address memory pointers
1	Data structures using 64-bit address memory pointers

### 41.7.4 UHPHS USB Command Register

**Name:** UHPHS\_USBCMD  
**Offset:** 0x10  
**Reset:** 0x00080B00  
**Property:** Read/Write

The Command Register indicates the command to be executed by the serial bus host controller. Writing to the register causes a command to be executed.

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
	ITC[7:0]

Reset	0	0	0	0	1	0	0	0	
Bit	15	14	13	12	11	10	9	8	
					ASPME			ASPMC[1:0]	
Access					R-R/W			R-R/W	R-R/W
Reset					1			1	1
Bit	7	6	5	4	3	2	1	0	
	LHCR	IAAD	ASE	PSE	FLS[1:0]		HCRESET	RS	
Access	R/W	R/W	R/W	R/W	R-R/W	R-R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	0	

**Bits 23:16 – ITC[7:0]** Interrupt Threshold Control

This field is used by system software to select the maximum rate at which the host controller will issue interrupts. The only valid values are defined below. If software writes an invalid value to this register, the results are undefined.

Value	Maximum Interrupt Interval
0	Reserved
1	1 microframe
2	2 microframes
4	4 microframes
8	8 microframes (1 ms)
16	16 microframes (2 ms)
32	32 microframes (4 ms)
64	64 microframes (8 ms)

Any other value in this register yields undefined results.

Software modifications to this field while HCHLT=0 results in undefined behavior.

**Bit 11 – ASPME** Asynchronous Schedule Park Mode Enable (optional)

If the Asynchronous Park Capability bit in the UHPHS\_HCCPARAMS register is set to 1, then this bit is set to 1 and is Read/Write. Otherwise the bit must be 0 and is read-only.

Value	Description
0	Park mode is enabled.
1	Park mode is disabled.

**Bits 9:8 – ASPMC[1:0]** Asynchronous Schedule Park Mode Count (optional)

If the Asynchronous Park Capability bit in the UHPHS\_HCCPARAMS register is set to 1, then this field defaults to 3 and is read/write. Otherwise it defaults to 0 and is read-only. It contains a count of the number of successive transactions the host controller is allowed to execute from a high-speed queue head on the Asynchronous schedule before continuing traversal of the Asynchronous schedule. Valid values are 1 to 3. Software must not write a 0 to this bit when Park Mode Enable is set to 1 as this will result in undefined behavior.

**Bit 7 – LHCR** Light Host Controller Reset (optional)

This control bit is not required. If implemented, it allows the driver to reset the EHCI controller without affecting the state of the ports or the relationship to the companion host controllers. For example, the UHPHS\_PORTSC registers should not be reset to their default values and the CF bit setting should not go to 0 (retaining port ownership relationships).

A host software read of this bit as 0 indicates the Light Host Controller Reset has completed and it is safe for host software to re-initialize the host controller. A host software read of this bit as 1 indicates the Light Host Controller Reset has not yet completed.

If not implemented, a read of this field will always return a 0.

**Bit 6 – IAAD** Interrupt on Async Advance Doorbell

This bit is used as a doorbell by software to tell the host controller to issue an interrupt the next time it advances asynchronous schedule. Software must write a 1 to this bit to ring the doorbell.

When the host controller has evicted all appropriate cached schedule state, it sets the Interrupt on Async Advance status bit in the UHPHS\_USBSTS register. If the Interrupt on Async Advance Enable bit in the UHPHS\_USBINTR register is set to 1, then the host controller will assert an interrupt at the next interrupt threshold.

The host controller sets this bit to 0 after it has set the Interrupt on Async Advance status bit in the UHPHS\_USBSTS register to 1.

Software should not write a 1 to this bit when the asynchronous schedule is disabled. Doing so will yield undefined results.

**Bit 5 – ASE** Asynchronous Schedule Enable

This bit controls whether the host controller skips processing the Asynchronous Schedule.

Value	Description
0	Do not process the Asynchronous Schedule.
1	Use the UHPHS_ASYNCLISTADDR register to access the Asynchronous Schedule.

### Bit 4 – PSE Periodic Schedule Enable

This bit controls whether the host controller skips processing the Periodic Schedule.

Value	Description
0	Do not process the Periodic Schedule.
1	Use the UHPHS_PERIODICLISTBASE register to access the Periodic Schedule.

### Bits 3:2 – FLS[1:0] Frame List Size

This field is read-only with one exception: it is read/write if the Programmable Frame List flag, in the UHPHS\_HCCPARAMS register, is set to 1. This field specifies the size of the frame list. The size of the frame list controls which bits in the Frame Index Register should be used for the Frame List Current index.

Value	Description
0	1024 elements (4096 bytes).
1	512 elements (2048 bytes).
2	256 elements (1024 bytes), for resource-constrained environments.
3	Reserved.

### Bit 1 – HCRESET Host Controller Reset

This control bit is used by software to reset the host controller. The effects of this on Root Hub registers are similar to a Chip Hardware Reset.

When software writes a 1 to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports.

PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines, are set to their initial values. Port ownership reverts to the companion host controller(s) with side effects. Software must reinitialize the host controller in order to return the host controller to an operational state.

This bit is set to 0 by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a 0 to this register.

Software must not set this bit to 1 when HCHLT in the UHPHS\_USBSTS register is 0. Attempting to reset an actively running host controller results in undefined behavior.

### Bit 0 – RS Run/Stop

The Host Controller must halt within 16 microframes after software clears the bit RS. The HCHLT bit in the status register indicates when the Host Controller has finished its pending pipelined transactions and has entered the stopped state. Software must not write 1 to this field unless the host controller is in the halted state (i.e., HCHLT in the UHPHS\_USBSTS register is 1). Doing so yields undefined results.

Value	Description
0	Host Controller completes the current and any actively pipelined transactions on the USB and then halts.
1	Host Controller proceeds with execution of the schedule.

### 41.7.5 UHPHS USB Status Register

**Name:** UHPHS\_USBSTS  
**Offset:** 0x14  
**Reset:** 0x00001000  
**Property:** Read/Write

This register indicates pending interrupts and various states of the Host Controller. The status resulting from a transaction on the serial bus is not indicated in this register. Software sets a bit to 0 in this register by writing a 1 to it.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	ASS	PSS	RCM	HCHLT				
Access	R	R	R	R				
Reset	0	0	0	1				
Bit	7	6	5	4	3	2	1	0
			IAA	HSE	FLR	PCD	USBERRINT	USBINT
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

#### Bit 15 – ASS Asynchronous Schedule Status

The bit reports the current real status of the Asynchronous Schedule.

The Host Controller is not required to immediately disable or enable the Asynchronous Schedule when software transitions the Asynchronous Schedule Enable bit in the UHPHS\_USBCMD register. When this bit and the Asynchronous Schedule Enable bit are the same value, the Asynchronous Schedule is either enabled or disabled.

Value	Description
0	Asynchronous Schedule is disabled.
1	Asynchronous Schedule is enabled.

#### Bit 14 – PSS Periodic Schedule Status

The bit reports the current real status of the Periodic Schedule. If this bit is set to 0, then the status of the Periodic Schedule is disabled. If this bit is set to 1, then the status of the Periodic Schedule is enabled. The Host Controller is not required to immediately disable or enable the Periodic Schedule when software transitions the Periodic Schedule Enable bit in the UHPHS\_USBCMD register. When this bit and the Periodic Schedule Enable bit are the same value, the Periodic Schedule is either enabled or disabled.

**Bit 13 – RCM** Reclamation

This is a read-only status bit used to detect any empty asynchronous schedule.

**Bit 12 – HCHLT** HCHalted

This bit is 0 whenever the Run/Stop bit is 1. The Host Controller sets this bit to 1 after it has stopped executing as a result of the Run/Stop bit being set to 0, either by software or by the Host Controller hardware (e.g. internal error).

**Bit 5 – IAA** Interrupt on Async Advance (Cleared on write)

System software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by writing 1 to the Interrupt on the Async Advance Doorbell bit in the UHPHS\_USBCMD register. This status bit indicates the assertion of that interrupt source.

**Bit 4 – HSE** Host System Error (Cleared on write)

The Host Controller sets this bit to 1 when a serious error occurs during a host system access involving the Host Controller module. In a PCI system, conditions that set this bit to 1 include PCI Parity error, PCI Master Abort, and PCI Target Abort. When this error occurs, the Host Controller clears the Run/Stop bit in the Command register to prevent further execution of the scheduled TDs.

**Bit 3 – FLR** Frame List Rollover (Cleared on write)

The Host Controller sets this bit to 1 when the Frame List Index (see [UHPHS USB Frame Index Register](#)) rolls over from its maximum value to 0. The exact value at which the rollover occurs depends on the frame list size. For example, if the frame list size (as programmed in the Frame List Size field of the UHPHS\_USBCMD register) is 1024, the Frame Index Register rolls over every time FRINDEX[13] toggles. Similarly, if the size is 512, the Host Controller sets this bit to 1 every time FRINDEX[12] toggles.

**Bit 2 – PCD** Port Change Detect (Cleared on write)

The Host Controller sets this bit to 1 when any port for which the Port Owner bit is set to 0 (see [UHPHS Port Status and Control Register](#)) has a change bit transition from 0 to 1 or a Force Port Resume bit transition from 0 to 1 as a result of a J-K transition detected on a suspended port. This bit will also be set as a result of the Connect Status Change being set to 1 after system software has relinquished ownership of a connected port by writing 1 to a port's Port Owner bit.

This bit is allowed to be maintained in the Auxiliary power well. Alternatively, it is also acceptable that on a D3 to D0 transition of the EHCI HC device, this bit is loaded with the OR of all of the PORTSC change bits (including: Force Port Resume, Overcurrent Change, Enable/Disable Change and Connect Status Change).

**Bit 1 – USBERRINT** USB Error Interrupt (Cleared on write)

The Host Controller sets this bit to 1 when completion of a USB transaction results in an error condition (e.g., error counter underflow). If the TD on which the error interrupt occurred also had its IOC bit set, both this bit and USBINT bit are set.

**Bit 0 – USBINT** USB Interrupt (Cleared on write)

The Host Controller sets this bit to 1 on the completion of a USB transaction, which results in the retirement of a Transfer Descriptor that had its IOC bit set.

The Host Controller also sets this bit to 1 when a short packet is detected (the actual number of bytes received was less than the expected number of bytes).

#### 41.7.6 UHPHS USB Interrupt Enable Register

**Name:** UHPHS\_USBINTR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read/Write

This register enables and disables reporting of the corresponding interrupt to the software. When a bit is set and the corresponding interrupt is active, an interrupt is generated to the host. Interrupt sources that are disabled in this register still appear in the UHPHS\_USBSTS to allow the software to poll for events.

For all bits, 1=Enabled, 0=Disabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Reset			0	0	0	0	0	0

**Bit 5 – IAAE** Interrupt on Async Advance Enable

The interrupt is acknowledged by software clearing the Interrupt on Async Advance bit UHPHS\_USBSTS.

**Bit 4 – HSEE** Host System Error Enable

The interrupt is acknowledged by software clearing the Host System Error bit in UHPHS\_USBSTS.

**Bit 3 – FLRE** Frame List Rollover Enable

The interrupt is acknowledged by software clearing the Frame List Rollover in UHPHS\_USBSTS.

**Bit 2 – PCIE** Port Change Interrupt Enable

The interrupt is acknowledged by software clearing the Port Change Detect bit in UHPHS\_USBSTS.

**Bit 1 – USBEIE** USB Error Interrupt Enable

The interrupt is acknowledged by software clearing the USBERRINT in UHPHS\_USBSTS.

**Bit 0 – USBIE** USB Interrupt Enable

The interrupt is acknowledged by software clearing the USBINT in UHPHS\_USBSTS.

### 41.7.7 UHPHS USB Frame Index Register

**Name:** UHPHS\_FRINDEX  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is used by the host controller to index into the periodic frame list. The register updates every 125  $\mu$ s (once each microframe). Bits [N:3] are used to select a particular entry in the Periodic Frame List during periodic schedule execution. The number of bits used for the index depends on the size of the frame list as set by system software in the Frame List Size field in the UHPHS\_USBCMD register).

This register must be written as a DWord. Byte writes produce undefined results. This register cannot be written unless the Host Controller is in the Halted state as indicated by the HCHLT bit (UHPHS\_USBSTS register). A write to this register while the Run/Stop bit is set to 1 (UHPHS\_USBCMD register) produces undefined results. Writes to this register also affect the SOF value.

#### Bits 13:0 – FI[13:0] Frame Index

The value in this register increments at the end of each time frame (e.g., microframe). Bits [N:3] are used for the Frame List current index. This means that each location of the frame list is accessed eight times (frames or microframes) before moving to the next index. The following illustrates values of N based on the value of FLS (Frame List Size) in the UHPHS\_USBCMD register.

UHPHS_USBCMD.FLS	Number Elements	N
0	1024	12
1	512	11
2	256	10
3	Reserved	–

# SAMA5D2 Series

## USB Host High Speed Port (UHPHS)

---

The SOF frame number value for the bus SOF token is derived or alternatively managed from this register. The value of FRINDEX must be 125  $\mu$ s (1 microframe) ahead of the SOF token value. The SOF value may be implemented as an 11-bit shadow register. For this discussion, this shadow register is 11 bits and is named SOFV. SOFV updates every eight microframes (1 millisecond). An example implementation to achieve this behavior is to increment SOFV each time the FRINDEX[2:0] increments from 0 to 1.

Software must use the value of FRINDEX to derive the current microframe number, both for high-speed isochronous scheduling purposes and to provide the “get microframe number” function required for client drivers. Therefore, the value of FRINDEX and the value of SOFV must be kept consistent if chip is reset or software writes to FRINDEX. Writes to FRINDEX must also write-through FRINDEX[13:3] to SOFV[10:0]. In order to keep the update as simple as possible, software should never write a FRINDEX value where the three least significant bits are 7 or 0.

### 41.7.8 UHPHS Periodic Frame List Base Address Register

**Name:** UHPHS\_PERIODICLISTBASE  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** Read/Write

This 32-bit register contains the beginning address of the Periodic Frame List in the system memory. If the host controller is in 64-bit mode (as indicated by a 1 in the 64-bit Addressing Capability field in the UHPHS\_HCCSPARAMS register), then the most significant 32 bits of every control data structure address comes from the UHPHS\_CTRLDSSEGMENT register. System software loads this register prior to starting the schedule execution by the Host Controller. The memory structure referenced by this physical memory pointer is assumed to be 4-Kbyte aligned. The contents of this register are combined with the Frame Index Register (UHPHS\_FRINDEX) to enable the Host Controller to step through the Periodic Frame List in sequence. This register must be written as a DWord. Byte writes produce undefined results.

Bit	31	30	29	28	27	26	25	24
	BA[19:12]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	BA[11:4]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

**Bits 31:12 – BA[19:0]** Base Address (Low)

These bits correspond to memory address signals [31:12], respectively.

### 41.7.9 UHPHS Asynchronous List Address Register

**Name:** UHPHS\_ASYNCLISTADDR  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** Read/Write

This 32-bit register contains the address of the next asynchronous queue head to be executed. If the host controller is in 64-bit mode (as indicated by a 1 in the 64-bit Addressing Capability field in the UHPHS\_HCCPARAMS register), then the most significant 32 bits of every control data structure address comes from the UHPHS\_CTRLDSSEGMENT register. Bits [4:0] of this register cannot be modified by system software and will always return a zero when read. The memory structure referenced by this physical memory pointer is assumed to be 32-byte (cache line) aligned. This register must be written as a DWord. Byte writes produce undefined results.

	Bit	31	30	29	28	27	26	25	24	
		LPL[26:19]								
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	Bit	7	6	5	4	3	2	1	0	
		LPL[2:0]								
Access		R/W	R/W	R/W						
Reset		0	0	0						

**Bits 31:5 – LPL[26:0] Link Pointer Low**

These bits correspond to memory address signals [31:5], respectively. This field may only reference a Queue Head (QH).

### 41.7.10 UHPHS Configure Flag Register

**Name:** UHPHS\_CONFIGFLAG  
**Offset:** 0x50  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is in the auxiliary power well. It is only reset by hardware when the auxiliary power is initially applied or in response to a host controller reset.

#### Bit 0 – CF Configure Flag

Host software sets this bit as the last action in its process of configuring the Host Controller. This bit controls the default port-routing control logic. Bit values and side-effects are listed below.

Value	Description
0	Port routing control logic default-routes each port to an implementation-dependent classic host controller (default value).
1	Port routing control logic default-routes all ports to this host controller.

### 41.7.11 UHPHS Port Status and Control Register

**Name:** UHPHS\_PORTSCx  
**Offset:** 0x54 + x\*0x04 [x=0..2]  
**Reset:** 0x00002000  
**Property:** Read/Write

The number of port registers is documented in the UHPHS\_HCSPARAMS register. Software uses this information as an input parameter to determine how many ports need to be serviced. All ports have the structure defined below.

This register is in the auxiliary power well. It is only reset by hardware when the auxiliary power is initially applied or in response to a host controller reset. The initial conditions of a port are:

- No device connected
- Port disabled

If the port has port power control, software cannot change the state of the port until after it applies power to the port by setting port power to a 1. Software must not attempt to change the state of the port until after power is stable on the port. The host is required to have power stable to the port within 20 milliseconds of the 0 to 1 transition.

**Note:**

1. When a device is attached, the port state transitions to the connected state and system software will process this as with any status change notification.
2. If a port is being used as the Debug Port, then the port may report device connected and enabled when the Configured Flag is set to 0.

Bit	31	30	29	28	27	26	25	24

Reset	0		0	0	0	0	0	0

**Bit 22 – WKOC\_E** Wake on Overcurrent Enable  
 This field is 0 if Port Power is 0.

# SAMA5D2 Series

## USB Host High Speed Port (UHPHS)

Value	Description
0	Disables the port to be sensitive to overcurrent conditions as wake-up events.
1	Enables the port to be sensitive to overcurrent conditions as wake-up events.

### Bit 21 – WKDSCNNT\_E Wake on Disconnect Enable

This field is 0 if Port Power is 0.

Value	Description
0	Disables the port to be sensitive to device disconnects as wake-up events.
1	Enables the port to be sensitive to device disconnects as wake-up events.

### Bit 20 – WKCNT\_E Wake on Connect Enable

This field is 0 if Port Power is 0.

Value	Description
0	Disables the port to be sensitive to device connects as wake-up events.
1	Enables the port to be sensitive to device connects as wake-up events.

### Bits 19:16 – PTC[3:0] Port Test Control

When this field is set to 0, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value.

Test mode bits are encoded as follows (6 to 15 are reserved):

Value	Test Mode
0	Test mode not enabled
1	Test J_STATE
2	Test K_STATE
3	Test SE0_NAK
4	Test Packet
5	Test FORCE_ENABLE

Refer to the USB Specification Revision 2.0, Chapter 7, for details on each test mode.

### Bits 15:14 – PIC[1:0] Port Indicator Control

Writing to these bits has no effect if the P\_INDICATOR bit in the UHPHS\_HCSPARAMS register is set to 0. If the P\_INDICATOR bit is set to 1, then the bits are encoded as follows:

Value	Meaning
0	Port indicators are off
1	Amber
2	Green
3	Undefined

Refer to the USB Specification Revision 2.0 for a description of how these bits are to be used.

This field is 0 if Port Power is 0.

### Bit 13 – PO Port Owner

System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes 1 to this bit when the attached device is not a high-speed device. A 1 in this bit means that a companion host controller owns and controls the port.

Value	Description
0	This bit unconditionally goes to a 0 when the bit UHPHS_CONFIGFLAG.CF makes a 0 to 1 transition.
1	This bit unconditionally goes to 1 whenever the bit UHPHS_CONFIGFLAG.CF=0.

### Bit 12 – PP Port Power

The function of this bit depends on the value of the Port Power Control (PPC) field in the UHPHS\_HCSPARAMS register. When host controller has port power control switches (PPC=0), PP is in read-only mode:

Value	Description
1	Each port is hard-wired to power.

When host controller has port power control switches (PPC=1), PP is in read/write mode:

Value	Description
0	Host port power switch is OFF.  When power is not available on a port (i.e., PP at 0), the port is non-functional and does not report attaches, detaches, etc.
1	Host port power switch is ON.  When power is not available on a port (i.e., PP at 0), the port is non-functional and does not report attaches, detaches, etc.

When an overcurrent condition is detected on a powered port and PPC is set to 1, the PP bit in each affected port may be transitioned by the host controller from 1 to 0 (removing power from the port).

### Bits 11:10 – LS[1:0] Line Status

These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is 0 and the current connect status bit is set to 1.

This value of this field is undefined if Port Power is 0.

Value	Name	Description
0	SE0	Not a low-speed device, perform EHCI reset
1	K-STATE	Low-speed device, release ownership of port
2	J-STATE	Not a low-speed device, perform EHCI reset
3	Undefined	Not a low-speed device, perform EHCI reset

### Bit 8 – PR Port Reset

When software writes a 1 to this bit (from 0), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a 0 to this bit to terminate the bus reset sequence. Software must

keep this bit set to 1 long enough to ensure the reset sequence, as specified in the USB Specification Revision 2.0, completes.

**Note:** When software writes this bit to 1, it must also write 0 to the Port Enable bit.

When software writes a 0 to this bit, there may be a delay before the bit status changes to 0. The bit status will not read as 0 until after the reset has completed. If the port is in High-Speed mode after reset is complete, the host controller will automatically enable this port (e.g., set the Port Enable bit to 1). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from 1 to 0. For example: if the port detects that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2 ms of software writing this bit to 0.

The HCHLT bit in the UHPHS\_USBSTS register should be set to 0 before software attempts to use this bit. The host controller may hold Port Reset asserted to 1 when the HCHLT bit is 1.

This field is 0 if Port Power is 0.

Value	Description
0	Port is not in Reset.
1	Port is in Reset.

### Bit 7 – SUS Suspend

Value	Description
0	Port not in suspend state.
1	Port in suspend state.

**Note:**

Port Enabled Bit and Suspend bit of this register define the port states as follows:

Bits [Port Enabled, Suspend]	Port State
0X	Disable
10	Enable
11	Suspend

When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB.

A write of 0 to this bit is ignored by the host controller. The host controller will unconditionally set this bit to 0 when:

- Software sets the Force Port Resume bit to 0 (from 1).
- Software sets the Port Reset bit to 1 (from 0).

If host software sets this bit to 1 when the port is not enabled (i.e., Port Enabled bit set to 0), the results are undefined.

This field is 0 if Port Power is set to 0.

### Bit 6 – FPR Force Port Resume

This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are set to 1) and software transitions this bit to 1, then the effects on the bus are undefined.

Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to 1 because a J-to-K transition is detected, the Port Change Detect bit in the UHPHS\_USBSTS register is also set to 1. If software sets this bit to 1, the host controller must not set the Port Change Detect bit.

Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains set to 1. Software must appropriately time the Resume and set this bit to 0 when the appropriate amount of time has elapsed. Writing a 0 (from 1) causes the port to return to High-Speed mode (forcing the bus below the port into a high-speed idle). This bit will remain set to 1 until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to 0.

This field is 0 if Port Power is 0.

Value	Description
0	No resume (K-state) detected/driven on port.
1	Resume detected/driven on port.

### Bit 5 – OCC Overcurrent Change (Cleared on write)

Software clears this bit by writing 1.

Value	Description
0	No change to Overcurrent Active.
1	Changes to Overcurrent Active.

### Bit 4 – OCA Overcurrent Active

This bit will automatically transition from 1 to 0 when the overcurrent condition is removed.

Value	Description
0	This port does not have an overcurrent condition.
1	This port currently has an overcurrent condition.

### Bit 3 – PEDC Port Enable/Disable Change (Cleared on write)

For the root hub, this bit gets set to 1 only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a Port Error). Software clears this bit by writing a 1 to it.

This field is 0 if Port Power bit is 0.

Value	Description
0	No change in port enabled/disabled status.
1	Port enabled/disabled status has changed.

### Bit 2 – PED Port Enabled/Disabled

Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a 1 to this field. The host controller will only set this bit to 1 when the reset sequence determines that the attached device is a high-speed device.

# SAMA5D2 Series

## USB Host High Speed Port (UHPHS)

Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by host software. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events.

When the port is disabled (0b), downstream propagation of data is blocked on this port, except for reset.

This field is 0 if Port Power bit is 0.

Value	Description
0	Disable.
1	Enable.

### Bit 1 – CSC Connect Status Change (Cleared on write)

Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be "setting" an already-set bit (i.e., the bit remains set). Software sets this bit to 0 by writing a 1 to it.

This field is 0 if Port Power bit is 0.

Value	Description
0	No change.
1	Change in Current Connect Status.

### Bit 0 – CCS Current Connect Status

This value reflects the current state of the port, and may not correspond directly to the event that caused the CSC bit to be 1.

This bit is 0 if Port Power is 0.

Value	Description
0	No device is present.
1	Device is present on port.

### 41.7.12 EHCI: REG06 - AHB Error Status

**Name:** UHPHS\_INSNREG06  
**Offset:** 0xA8  
**Reset:** 0x00000000  
**Property:** Read/Write

Control and Status Register, used to read the UTMI registers from the signals below.

Bit	31	30	29	28	27	26	25	24	
	AHB_ERR								
Access	R/W								
Reset	0								
Bit	23	22	21	20	19	18	17	16	
Access									
Reset									
Bit	15	14	13	12	11	10	9	8	
					HBURST[2:0]			Nb_Burst[4:4]	
Access					R	R	R	R	
Reset					0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
	Nb_Burst[3:0]				Nb_Success_Burst[3:0]				
Access	R	R	R	R	R	R	R	R	
Reset	0	0	0	0	0	0	0	0	

#### Bit 31 – AHB\_ERR AHB Error

System bus error was encountered and erroneous burst characteristics are captured. To clear this field the application must write a 0.

EHCI:

- When no error, 0 is written to INSNREG06[8:4].
- When INCR4 and an error occurs, 4 is written to INSNREG06[8:4].
- When INCR8 and an error occurs, 8 is written to INSNREG06[8:4].
- When INCR16 and an error occurs, 16 is written to INSNREG06[8:4].
- Other values except 4, 8, and 16 are not written to INSNREG06[8:4].

OHCI:

- When no error, 0 is written to INSNREG06[8:4].
- When INCR4 and error occurs, 4 is written to INSNREG06[8:4].
- Other values except 4 are not written to INSNREG06[8:4].

#### Bits 11:9 – HBURST[2:0] Burst Value

Value of the control phase at which the AHB error occurred.

This field applies to enabled incremental bursts only.

**Bits 8:4 – Nb\_Burst[4:0]** Number of Bursts

Number of beats expected in the burst at which the AHB error occurred. Valid values are 0 to 16.

This field applies to enabled incremental bursts only.

**Bits 3:0 – Nb\_Success\_Burst[3:0]** Number of Successful Bursts

Number of successfully completed beats in the current burst before the AHB error occurred.

This field applies to enabled incremental bursts only.

**41.7.13 EHCI: REG07 - AHB Master Error Address**

**Name:** UHPHS\_INSNREG07  
**Offset:** 0xAC  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	AHB_ADDR[31:24]							
Access	R	R	R	R	R	R	R	R

	AHB_ADDR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – AHB\_ADDR[31:0] AHB Address**

System bus address of the control phase at which the system bus error occurred.

**41.7.14 EHCI: REG08 - HSIC Enable/Disable**

**Name:** UHPHS\_INSNREG08  
**Offset:** 0xB0  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 2 – HSIC\_EN** HSIC Enable/Disable

This register has R/W access to the host driver and gives control to the host driver to enable/disable the HSIC interface of Port C.

Value	Description
0	Port C is in the HSIC Disable state (see High-Speed Inter-Chip USB Electrical Specification, Version 1.0, Section 3.1.2). HSIC is in the Disabled state after a power-on reset.
1	Port C is in the HSIC Enable state (see High-Speed Inter-Chip USB Electrical Specification, Version 1.0, Section 3.1.2).

## **42. Audio Class D Amplifier (CLASSD)**

### **42.1 Description**

The Audio Class D Amplifier (CLASSD) is a digital input, Pulse Width Modulated (PWM) output stereo Class D amplifier. It features a high quality interpolation filter embedding a digitally controlled gain, an equalizer and a de-emphasis filter.

On its input side, the CLASSD is compatible with most common audio data rates. On the output side, its PWM output can drive either:

- high-impedance single-ended or differential output loads (Audio DAC application) or,
- external MOSFETs through an integrated non-overlapping circuit (Class D power amplifier application).

### **42.2 Embedded Characteristics**

- Stereo PWM Class D Amplifier
- 16-bit Audio Data
- DSP clocks: 12.288 and 11.2896 MHz
- Input Sampling Rates: 8, 16, 32, 48, 96, 22.05, 44.1, 88.2 kHz
- 3-band Equalizer
- De-emphasis Filter
- Digital Volume Control
- Differential or Single-ended Outputs
- Non-overlapping Circuit to Control External MOSFETs
- Supports DMA

### 42.3 Block Diagram

## 42.5 Product Dependencies

### 42.5.1 I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the CLASSD pins to their peripheral functions.

### 42.5.2 Power Management

The CLASSD is clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the CLASSD Peripheral Clock and provide a generic clock (GCLK).

The fields NOVRVAL, NON\_OVERLAP and PWMTYP in CLASSD\_MR, and DSPCLKFREQ and FREQ in CLASSD\_INTPMR, must be configured prior to applying the GCLK.

### 42.5.3 Interrupt

The CLASSD has an interrupt line connected to the interrupt controller. Handling the CLASSD interrupt requires programming the interrupt controller before configuring the CLASSD.

## 42.6 Functional Description

### 42.6.1 Interpolator

#### 42.6.1.1 Clock Configuration

The interpolator accepts input sampling frequencies ( $f_s$ ) and the input DSP clock (DSPCLK) that can be configured in the CLASSD Interpolator Mode Register. GCLK must be configured in the PMC according to the desired DSPCLK so that  $DSPCLK = GCLK / 8$ .

The following table provides authorized  $DSPCLK / f_s$  ratios and associated filter types.

**Table 42-2. Authorized DSPCLK /  $f_s$  Ratios & Filter Types**

$f_s$	DSPCLK	
	12.288 MHz	11.2896 MHz
8 kHz	2	–
16 kHz	2	–
32 kHz	2	–
48 kHz	1	–
96 kHz	3	–
22.05 kHz	–	1
44.1 kHz	–	1
88.2 kHz	–	3

**Note:** Each dash (–) indicates a configuration that is not authorized and that raises the CFGERR flag in the CLASSD Interpolator Status Register.

### 42.6.1.2 CLASSD Frequency Response

Interpolation is performed with a combination of Infinite Impulse Response (IIR) and Cascaded Integrator-Comb (CIC) filters. Given the input configuration, the coefficients of the filters are redefined to optimize their transfer function to optimize the audio bandwidth. The different types of filters are defined in section [Clock Configuration](#).

**Figure 42-2. Type 1 Frequency Response**

**Figure 42-3. Type 2 Frequency Response**

**Figure 42-4. Type 3 Frequency Response**

### 42.6.2 Equalizer

The CLASSD offers 12 pre-programmed equalization filters.

A zero-cross detection system is used to modify the equalizer on-the-fly with minimum disturbance on the output signal.

Programming of the equalization filter is detailed in section [CLASSD Interpolator Mode Register](#).

The following figures show the frequency response of the equalizer function implemented in the D/A channels.

**Figure 42-5. Bass Filters Response**

**Figure 42-6. Medium Filters Response**

**Figure 42-7. Treble Filters Response**

**42.6.3 De-emphasis Filter Frequency Response**

The CLASSD includes a de-emphasis filter which can be enabled for 32, 44.1 or 48 kHz sampling frequencies.

The response and the error generated by the digital approximation of the filter are illustrated in the following figures.

**Figure 42-8. De-emphasis Filter: Frequency Response & Error ( $f_s = 32$  kHz)**

**Figure 42-9. De-emphasis Filter: Frequency Response & Error ( $f_s = 44.1$  kHz)**

**Figure 42-10. De-emphasis Filter: Frequency Response & Error ( $f_s = 48 \text{ kHz}$ )**

#### 42.6.4 Attenuator and Recommended Input Levels

The CLASSD features a digital attenuator with an attenuation range of 0–77 dB and a step size of 1 dB. When attenuation greater than 77 dB is programmed, the attenuator mutes the channel.

To avoid saturations in the PWM stage, it is recommended to avoid input levels greater than 1 dB below the digital full scale (-1 dBFS). This can be done by programming a minimum attenuation of 1 dB.

#### 42.6.5 Pulse Width Modulator (PWM)

The CLASSD Pulse Width Modulator generates fixed frequency pulse width modulated output signals. For the 44.1 kS/s and 48 kS/s standard audio sample rates, the PWM output frequency is set to  $16 \times f_s$ : 705.6 kHz and 768 kHz respectively. For 8, 16, 24 and 96 kS/s, the 16× (interpolation) ratio is adapted to keep the output frequency at 768 kHz. In the same way, the output frequency is 705.6 kHz for the 22.05 and 88.2 kS/s cases.

The CLASSD functions either as a DAC loaded by a medium-to-high resistive load (e.g., 1 kΩ to 100 kΩ) or as a Class D power amplifier controller driving an external power stage. Depending on the value of CLASSD\_MR.NON\_OVERLAP, the CLASSD drives:

- Single-ended or differential resistive loads (NON\_OVERLAP = 0)
- Full or Half MOSFET H-bridges (NON\_OVERLAP = 1)

When driving an external power stage (NON\_OVERLAP = 1), the CLASSD generates the signals to control complementary MOSFET pairs (PMOS and NMOS) with a non-overlapping delay between the NMOS and PMOS controls to avoid short circuit current. The non-overlapping delay can be adjusted in the CLASSD\_MR.NOVRVAL field.

The CLASSD can have a single-ended or a differential output. A specific pulse width modulation type is associated to each case. For single-ended output (CLASSD\_MR.PWMTYP = 0), the PWM acts only on the falling edge of the PWM waveform (trailing edge PWM). For differential output (CLASSD\_MR.PWMTYP = 1), both the rising and the falling edges of the PWM waveform are modulated (symmetric PWM). Modulation principles are illustrated in the following figures for both types of PWM. In particular, when describing a null input, if PWMTYP = 0 (trailing edge PWM), the output waveform is a square wave with 50% duty cycle. With the same input and PWMTYP = 1, the differential output waveform is zero. This difference removes the classical L-C low pass filter when PWMTYP = 1.

**Figure 42-11. Output Waveform Modulation Principle for PWMTYP = 0**

**Figure 42-12. Output Waveform Modulation Principle for PWMTYP = 1 (Only Left Channel Pins Shown)**

# SAMA5D2 Series

## Audio Class D Amplifier (CLASSD)

### 42.6.6 Application Schematics For Use Case Examples

Figure 42-13. Use Case 1: Stereo Class D Amplifier With External Differential Power Stage

Use case example:

- D1..D4 = e.g., 1N4148
- Q1..Q4 = e.g., DMC2400UV
- R1..R8 = 10 ohm
- R9..R16 = 10 kohm
- C1..C4 = 10 nF
- C5..C6 = 10  $\mu$ F
- C7 = 1  $\mu$ F

**Figure 42-14. Use Case 1: Waveforms**

CLASSD\_MR.PWM\_TYP = 1, CLASSD\_MR.NON\_OVERLAP = 1

In Use Case 1, the external power stages are made of complementary low-cost MOSFETs. In addition to the  $R_{DS(ON)}$  and drain breakdown voltage characteristics, the choice of these components is driven by a low gate threshold voltage, a low input capacitance, a low total gate charge and a fast turn-on time characteristics. Series resistance ( $10\ \Omega$ ) added to the gates of the MOSFETs are optional and may be adjusted to optimize the gate drive. They help to limit the output current peaks driven by the I/Os into the MOSFET gates in some cases. The  $10k$  resistors ensure an OFF condition when not driven and the capacitor / diode network (C1..C2 / D1..D2) shifts the PMOS drive from the typical  $V_{DDIO}$  level (3.3V) to a higher supply voltage (e.g., a 5V power domain).

# SAMA5D2 Series

## Audio Class D Amplifier (CLASSD)

Figure 42-15. Use Case 2: Stereo Class D Amplifier With External Single-ended Power Stage

Use case example:

- D1..D2 = e.g., 1N4148
- Q1..Q2 = e.g., DMC2400UV
- R1..R4 = 10 ohm
- R5..R8 = 10 kohm
- C1..C2 = 10 nF
- C3 = 10  $\mu$ F
- C4 = 1  $\mu$ F

In the Use Case 2 application schematic, the drive network of the MOSFETs gates follows the principles described in Use Case 1.

**Figure 42-16. Use Case 2: Waveforms**

CLASSD\_MR.PWMTYP = 0, CLASSD\_MR.NON\_OVERLAP = 1

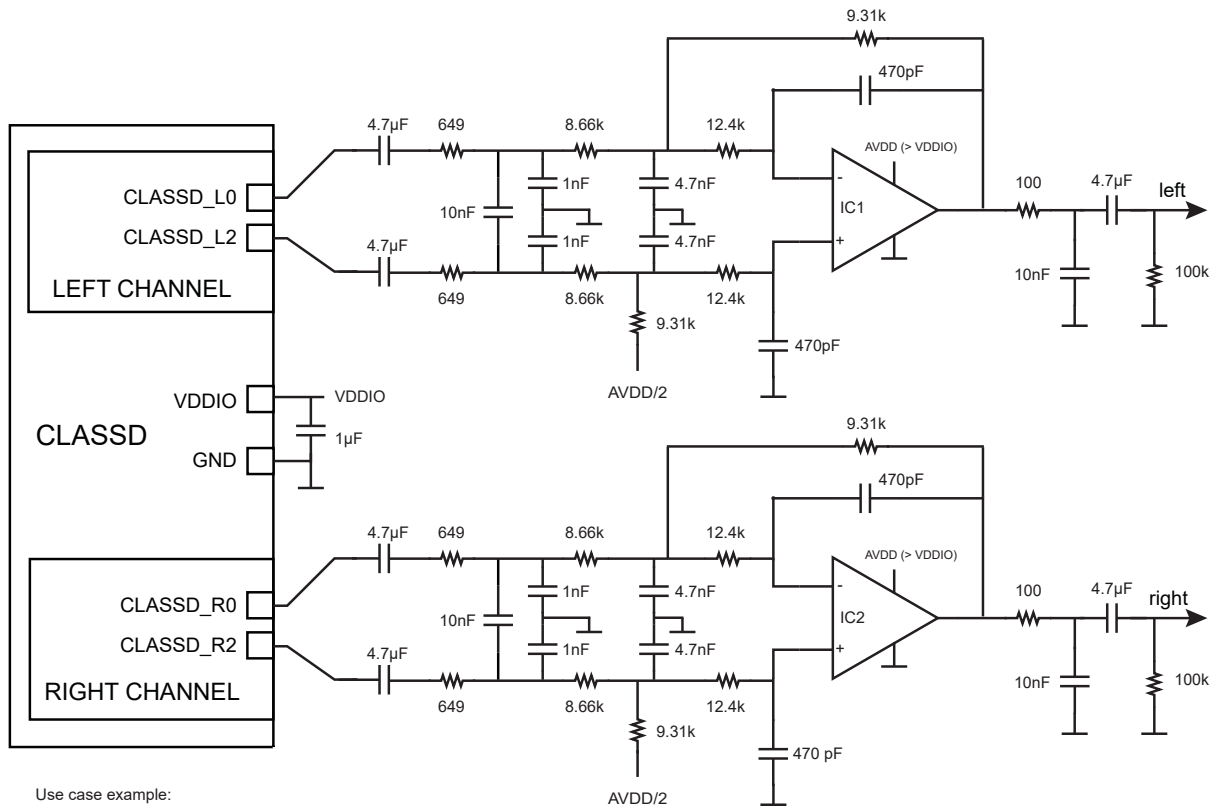

A coupling capacitor ( $C_C$ ) and an L-C low pass filter ( $L_F$ ,  $C_F$ ) are added to the output of the power stage to remove both the DC and the high frequency components of the PWM signal.  $C_C$  with the resistive part of the speaker ( $R_{SPK}$ ) forms a C-R high pass filter with a corner frequency of  $f_{HP} = 1 / (2 \times \text{PI} \times C_C \times R_{SPK})$ .

$L_F$ ,  $C_F$  and  $R_{SPK}$  form a second-order low pass filter of corner frequency  $f_C = 1 / (2 \times \text{PI} \times \text{sqrt}(L_F \times C_F))$  and of quality factor  $Q = R_{SPK} \times \text{sqrt}(C_F / L_F)$ . As a numerical example, consider the case  $f_{HP} = 200$  Hz,  $f_C = 30$  kHz,  $Q = 0.707$  (maximum flat response) with  $R_{SPK} = 8 \Omega$ . This leads to  $C_C = 100 \mu\text{F}$ ,  $L_F = 60 \mu\text{H}$ ,  $C_F = 470$  nF.

# SAMA5D2 Series

## Audio Class D Amplifier (CLASSD)

**Figure 42-17. Use Case 3A: Stereo Audio DAC With Active differential to single low pass filter**

Use case example:

IC1..IC2 = e.g., 1/2 LMV356

**Figure 42-18. Use Case 3B: Stereo Audio DAC With Simple Passive Low Pass Filter and Differential Outputs**

# SAMA5D2 Series

## Audio Class D Amplifier (CLASSD)

**Figure 42-19. Use Cases 3A and 3B: Waveforms**

CLASSD\_MR.PWMTYP = 1, CLASSD\_MR.NON\_OVERLAP = 0

In Use Case 3A, the CLASSD is used as an audio DAC. In this case, the differential outputs of the CLASSD are used. The application schematic suggested in figure "Use Case 3A: Stereo Audio DAC With Active differential to single low pass filter" above implements a third order 10 kHz low pass Butterworth filter and makes the differential to single-ended conversion. Note that in this schematic, the AVDD/2 point needs to be fed at low impedance (e.g., a buffered voltage). A simpler schematic (Use Case 3B) may also be possible, as shown in figure "Use Case 3B: Stereo Audio DAC With Simple Passive Low Pass Filter and Differential Outputs" above, at the cost of higher out-of-band noise and differential outputs which may be acceptable in some applications.

**Figure 42-20. Use Case 4A: Stereo Audio DAC With Active Low Pass Filter and Single-ended Outputs**

**Figure 42-21. Use Case 4B: Stereo Audio DAC With Passive Low Pass Filter and Single-ended Outputs**

**Figure 42-22. Use Cases 4A and 4B: Waveforms**

CLASSD\_MR.PWMTYP = 0, CLASSD\_MR.NON\_OVERLAP = 0

In Use Case 4A, the CLASSD is used as an audio DAC with active low pass filter. In this case, the single-ended outputs of the CLASSD are selected (PWMTYP = 0, trailing edge PWM) which leaves more I/Os to the application. A third order 30 kHz low pass Butterworth filter is shown in figure "Use Case 4A: Stereo Audio DAC With Active Low Pass Filter and Single-ended Outputs". The AVDD/2 point can be fed at relatively high impedance as no current is drawn from this point (a simple resistive divider properly decoupled is acceptable). A reduced complexity schematic is presented in figure "Use Case 4B: Stereo Audio DAC With Passive Low Pass Filter and Single-ended Outputs" above for less constrained applications.

### 42.6.7 Register Write Protection

To prevent any single software error from corrupting CLASSD behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the CLASSD Write Protection Mode Register (CLASSD\_WPMR).

The following registers can be write-protected:

- CLASSD Mode Register
- CLASSD Interpolator Mode Register

# SAMA5D2 Series

### 42.7.1 CLASSD Control Register

**Name:** CLASSD\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

#### Bit 0 – SWRST Software Reset

Value	Description
0	No effect.
1	Resets CLASSD, simulating a hardware reset.

### 42.7.2 CLASSD Mode Register

**Name:** CLASSD\_MR  
**Offset:** 0x04  
**Reset:** 0x00010022  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the CLASSD Write Protection Mode Register.

**Bits 21:20 – NOVRVAL[1:0]** Non-Overlapping Value  
 This field has no effect when NON\_OVERLAP = 0.

Value	Name	Description
0	5NS	Non-overlapping time is 5 ns
1	10NS	Non-overlapping time is 10 ns
2	15NS	Non-overlapping time is 15 ns
3	20NS	Non-overlapping time is 20 ns

**Bit 16 – NON\_OVERLAP** Non-Overlapping Enable

Value	Description
0	Non-overlapping circuit is disabled.
1	Non-overlapping circuit is enabled.

**Bit 8 – PWMTYP** PWM Modulation Type  
 0 (TRAILING\_EDGE): The signal is single-ended.

# SAMA5D2 Series

## Audio Class D Amplifier (CLASSD)

If NON\_OVERLAP is cleared, the signal is sent to CLASSD\_L0 and CLASSD\_R0 (see figure [Use Case 4A](#) or figure [Use Case 4B](#)).

If NON\_OVERLAP is set, the signal is sent to CLASSD\_L0/L1 and CLASSD\_R0/R1 (see figure [Use Case 2](#)).

1 (UNIFORM): The signal is differential.

If NON\_OVERLAP is cleared, the signal is sent to CLASSD\_L0/L2 and CLASSD\_R0/R2 (see figure [Use Case 3A](#) or figure [Use Case 3B](#)).

If NON\_OVERLAP is set, the signal is sent to CLASSD\_L0/L1/L2/L3 and CLASSD\_R0/R1/R2/R3 (see figure [Use Case 1](#)).

### Bit 5 – RMUTE Right Channel Mute

Value	Description
0	Right channel is unmuted.
1	Right channel is muted.

### Bit 4 – REN Right Channel Enable

Value	Description
0	Right channel is disabled.
1	Right channel is enabled.

### Bit 1 – LMUTE Left Channel Mute

Value	Description
0	Left channel is unmuted.
1	Left channel is muted.

### Bit 0 – LEN Left Channel Enable

Value	Description
0	Left channel is disabled.
1	Left channel is enabled.

### 42.7.3 CLASSD Interpolator Mode Register

**Name:** CLASSD\_INTPMR  
**Offset:** 0x08  
**Reset:** 0x00304E4E  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the CLASSD Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	MONOMODE[1:0]		MONO	EQCFG[3:0]				
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	FRAME[2:0]			SWAP	DEEMP			DSPCLKFREQ
Access		R/W	R/W	R/W	R/W	R/W		R/W
Reset		0	1	1	0	0		0
Bit	15	14	13	12	11	10	9	8
	ATTR[6:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		1	0	0	1	1	1	0
Bit	7	6	5	4	3	2	1	0
	ATTL[6:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		1	0	0	1	1	1	0

#### Bits 30:29 – MONOMODE[1:0] Mono Mode Selection

This field defines which signal is sent to both channels when the MONO bit is set.

Value	Name	Description
0	MONOMIX	(left + right) / 2 is sent to both channels
1	MONOSAT	(left + right) is sent to both channels. If the sum is too high, the result is saturated.
2	MONOLEFT	THR[15:0] is sent to both the left and the right channels
3	MONORIGHT	THR[31:16] is sent to both the left and the right channels

#### Bit 28 – MONO Mono Signal

0 (DISABLED): The signal is sent stereo to the left and right channels.

1 (ENABLED): The same signal is sent to both the left and the right channels. The sent signal is defined by the MONOMODE field value.

#### Bits 27:24 – EQCFG[3:0] Equalization Selection

EQCFG field values 13–15 = flat response

# SAMA5D2 Series

## Audio Class D Amplifier (CLASSD)

Value	Name	Description
0	FLAT	Flat response
1	BBOOST12	Bass boost +12 dB
2	BBOOST6	Bass boost +6 dB
3	BCUT12	Bass cut -12 dB
4	BCUT6	Bass cut -6 dB
5	MBOOST3	Medium boost +3 dB
6	MBOOST8	Medium boost +8 dB
7	MCUT3	Medium cut -3 dB
8	MCUT8	Medium cut -8 dB
9	TBOOST12	Treble boost +12 dB
10	TBOOST6	Treble boost +6 dB
11	TCUT12	Treble cut -12 dB
12	TCUT6	Treble cut -6 dB

### Bits 22:20 – FRAME[2:0] CLASSD Incoming Data Sampling Frequency

Value	Name	Description
0	FRAME_8K	8 kHz
1	FRAME_16K	16 kHz
2	FRAME_32K	32 kHz
3	FRAME_48K	48 kHz
4	FRAME_96K	96 kHz
5	FRAME_22K	22.05 kHz
6	FRAME_44K	44.1 kHz
7	FRAME_88K	88.2 kHz

### Bit 19 – SWAP Swap Left and Right Channels

0 (LEFT\_ON\_LSB): Left channel is on CLASSD\_THR[15:0], right channel is on CLASSD\_THR[31:16].

1 (RIGHT\_ON\_LSB): Right channel is on CLASSD\_THR[15:0], left channel is on CLASSD\_THR[31:16].

### Bit 18 – DEEMP Enable De-emphasis Filter

0 (DISABLED): De-emphasis filter is disabled.

1 (ENABLED): De-emphasis filter is enabled.

### Bit 16 – DSPCLKFREQ DSP Clock Frequency

0 (12M288): DSP Clock (DSPCLK) is 12.288 MHz.

1 (11M2896): DSP Clock (DSPCLK) is 11.2896 MHz.

### Bits 14:8 – ATTR[6:0] Right Channel Attenuation

Right channel attenuation is defined as follows:

– if  $ATTR \leq 77$  the attenuation is  $-ATTR$  dB

– else the right signal is muted

### Bits 6:0 – ATTL[6:0] Left Channel Attenuation

Left channel attenuation is defined as follows:

– if  $ATTL \leq 77$  the attenuation is  $-ATTL$  dB

– else the left signal is muted

#### 42.7.4 CLASSD Interpolator Status Register

**Name:** CLASSD\_INTSR  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read-only

**Bit 0 – CFGERR** Configuration Error

Value	Description
0	The frame and clock configurations are correct.
1	The frame and clock configurations are wrong (see <a href="#">Clock Configuration</a> for information about allowed configurations).

### 42.7.5 CLASSD Transmit Holding Register

**Name:** CLASSD\_THR  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
RDATA[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
LDATA[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:16 – RDATA[15:0]** Right Channel Data

**Bits 15:0 – LDATA[15:0]** Left Channel Data

### 42.7.6 CLASSD Interrupt Enable Register

**Name:** CLASSD\_IER  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

#### Bit 0 – DATRDY Data Ready

Value	Description
0	No effect.
1	Enables the interrupt when CLASSD is ready to receive new data to convert.

### 42.7.7 CLASSD Interrupt Disable Register

**Name:** CLASSD\_IDR  
**Offset:** 0x18  
**Reset:** –  
**Property:** Write-only

#### Bit 0 – DATRDY Data Ready

Value	Description
0	No effect.
1	Disables the interrupt when CLASSD is ready to receive new data to convert.

### 42.7.8 CLASSD Interrupt Mask Register

**Name:** CLASSD\_IMR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bit 0 – DATRDY Data Ready

Value	Description
0	The interrupt is disabled.
1	The interrupt is enabled.

### 42.7.9 CLASSD Interrupt Status Register

**Name:** CLASSD\_ISR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bit 0 – DATRDY Data Ready

Value	Description
0	CLASSD has not been ready to convert a value since the last read of CLASSD_ISR.
1	CLASSD has been ready to convert a value since the last read of CLASSD_ISR.

### 42.7.10 CLASSD Write Protection Mode Register

**Name:** CLASSD\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

	Bit	31	30	29	28	27	26	25	24
		WPKEY[23:16]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x434C44	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit.
4		Always reads as 0.

#### Bit 0 – WPEN Write Protection Enable

See [Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x434C44 (“CLD” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x434C44 (“CLD” in ASCII).

## 43. Inter-IC Sound Controller (I2SC)

### 43.1 Description

The Inter-IC Sound Controller (I2SC) provides a 5-wire, bidirectional, synchronous, digital audio link to external audio devices: I2SC\_DI, I2SC\_DO, I2SC\_WS, I2SC\_CK, and I2SC\_MCK pins.

The I2SC is compliant with the Inter-IC Sound (I<sup>2</sup>S) bus specification.

The I2SC consists of a receiver, a transmitter and a common clock generator that can be enabled separately to provide Master, Slave or Controller modes with receiver and/or transmitter active.

DMA Controller channels, separate for the receiver and for the transmitter, allow a continuous high bit rate data transfer without processor intervention to the following:

- Audio CODECs in Master, Slave, or Controller mode
- Stereo DAC or ADC through a dedicated I<sup>2</sup>S serial interface

The I2SC uses a single DMA Controller channel for both audio channels.

The 8- and 16-bit compact stereo format reduces the required DMA Controller bandwidth by transferring the left and right samples within the same data word.

In Master mode, the I2SC can produce a  $32 f_s$  to  $1024 f_s$  master clock that provides an over-sampling clock to an external audio codec or digital signal processor (DSP).

### 43.2 Embedded Characteristics

- Compliant with Inter-IC Sound (I<sup>2</sup>S) Bus Specification
- Master, Slave, and Controller Modes
  - Slave: Data Received/Transmitted
  - Master: Data Received/Transmitted And Clocks Generated
  - Controller: Clocks Generated
- Individual Enable and Disable of Receiver, Transmitter and Clocks
- Configurable Clock Generator Common to Receiver and Transmitter
  - Suitable for a Wide Range of Sample Frequencies ( $f_s$ ), Including 32 kHz, 44.1 kHz, 48 kHz, 88.2 kHz, 96 kHz, and 192 kHz
  - $32 f_s$  to  $1024 f_s$  Master Clock Generated for External Oversampling Data Converters
- Support for Multiple Data Formats
  - 32-, 24-, 20-, 18-, 16-, and 8-bit Mono or Stereo Format
  - 16- and 8-bit Compact Stereo Format, with Left and Right Samples Packed in the Same Word to Reduce Data Transfers
- DMA Controller Interfaces the Receiver and Transmitter to Reduce Processor Overhead
  - One DMA Controller Channel for Both Audio Channels
- Smart Holding Registers Management to Avoid Audio Channels Mix After Overrun or Underrun

### 43.3 Block Diagram

**Figure 43-1. I2SC Block Diagram**

(1) For the value of 'PID', refer to I2SCx in the table "Peripheral Identifiers".

### 43.4 I/O Lines Description

**Table 43-1. I/O Lines Description**

Pin Name	Pin Description	Type
I2SC_MCK	Master Clock	Output
I2SC_CK	Serial Clock	Input/Output
I2SC_WS	I <sup>2</sup> S Word Select	Input/Output
I2SC_DI	Serial Data Input	Input
I2SC_DO	Serial Data Output	Output

### 43.5 Product Dependencies

To use the I2SC, other parts of the system must be configured correctly, as described below.

#### 43.5.1 I/O Lines

The I2SC pins may be multiplexed with I/O Controller lines. The user must first program the PIO Controller to assign the required I2SC pins to their peripheral function. If the I2SC I/O lines are not used by the application, they can be used for other purposes by the PIO Controller. The user must enable the I2SC inputs and outputs that are used.

### 43.5.2 Power Management

If the CPU enters a Sleep mode that disables clocks used by the I2SC, the I2SC stops functioning and resumes operation after the system wakes up from Sleep mode.

### 43.5.3 Clocks

The clock for the I2SC bus interface is generated by the Power Management Controller (PMC). I2SC must be disabled before disabling the clock to avoid freezing the I2SC in an undefined state.

### 43.5.4 DMA Controller

The I2SC interfaces to the DMA Controller. Using the I2SC DMA functionality requires the DMA Controller to be programmed first.

### 43.5.5 Interrupt Sources

The I2SC interrupt line is connected to the Interrupt Controller. Using the I2SC interrupt requires the Interrupt Controller to be programmed first.

## 43.6 Functional Description

### 43.6.1 Initialization

The I2SC features a receiver, a transmitter and a clock generator for Master and Controller modes. Receiver and transmitter share the same serial clock and word select.

Before enabling the I2SC, the selected configuration must be written to the I2SC Mode Register (I2SC\_MR) and to the I2S Clock Source Selection register (SFR\_I2SCLKSEL) described in the section “Special Function Registers (SFR)”.

If the I2SC\_MR.IMCKMODE bit is set, the I2SC\_MR.IMCKFS field must be configured as described in section “[Serial Clock and Word Select Generation](#)”.

Once the I2SC\_MR has been written, the I2SC clock generator, receiver, and transmitter can be enabled by writing a '1' to the CKEN, RXEN, and TXEN bits in the Control Register (I2SC\_CR). The clock generator can be enabled alone in Controller mode to output clocks to the I2SC\_MCK, I2SC\_CK, and I2SC\_WS pins. The clock generator must also be enabled if the receiver or the transmitter is enabled.

The clock generator, receiver, and transmitter can be disabled independently by writing a '1' to I2SC\_CR.CXDIS, I2SC\_CR.RXDIS and/or I2SC\_CR.TXDIS, respectively. Once requested to stop, they stop only when the transmission of the pending frame transmission is completed.

### 43.6.2 Basic Operation

The receiver can be operated by reading the Receiver Holding Register (I2SC\_RHR), whenever the Receive Ready (RXRDY) bit in the Status Register (I2SC\_SR) is set. Successive values read from RHR correspond to the samples from the left and right audio channels for the successive frames.

The transmitter can be operated by writing to the Transmitter Holding Register (I2SC\_THR), whenever the Transmit Ready (TXRDY) bit in the I2SC\_SR is set. Successive values written to THR correspond to the samples from the left and right audio channels for the successive frames.

The RXRDY and TXRDY bits can be polled by reading the I2SC\_SR.

The I2SC processor load can be reduced by enabling interrupt-driven operation. The RXRDY and/or TXRDY interrupt requests can be enabled by writing a '1' to the corresponding bit in the Interrupt Enable Register (I2SC\_IER). The interrupt service routine associated to the I2SC interrupt request is executed whenever the Receive Ready or the Transmit Ready status bit is set.

### 43.6.3 Master, Controller and Slave Modes

In Master and Controller modes, the I2SC provides the master clock, the serial clock and the word select. I2SC\_MCK, I2SC\_CK, and I2SC\_WS pins are outputs.

In Controller mode, the I2SC receiver and transmitter are disabled. Only the clocks are enabled and used by an external receiver and/or transmitter.

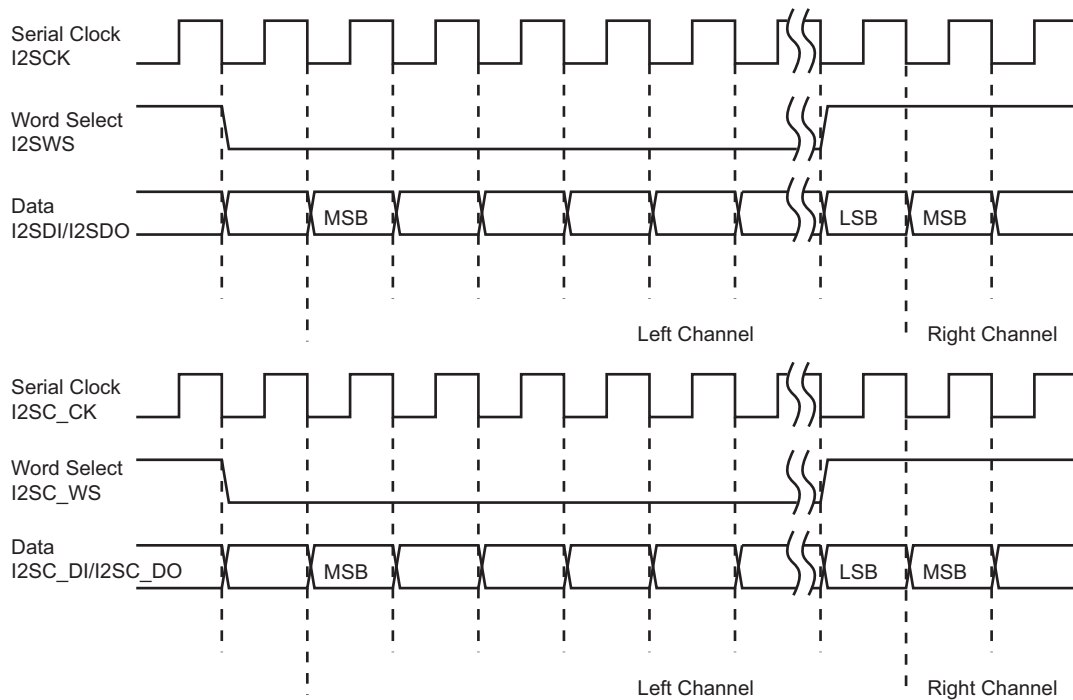

In Slave mode, the I2SC receives the serial clock and the word select from an external master. I2SC\_CK and I2SC\_WS pins are inputs.

The mode is selected by writing the MODE field in the I2SC\_MR. Since the MODE field changes the direction of the I2SC\_WS and I2SC\_SCK pins, the I2SC\_MR must be written when the I2SC is stopped.

### 43.6.4 I<sup>2</sup>S Reception and Transmission Sequence

As specified in the I<sup>2</sup>S protocol, data bits are left-justified in the word select time slot, with the MSB transmitted first, starting one clock period after the transition on the word select line.

**Figure 43-2. I<sup>2</sup>S Reception and Transmission Sequence**

Data bits are sent on the falling edge of the serial clock and sampled on the rising edge of the serial clock. The word select line indicates the channel in transmission, a low level for the left channel and a high level for the right channel.

The length of transmitted words can be chosen among 8, 16, 18, 20, 24, and 32 bits by writing the I2SC\_MR.DATALENGTH field.

If the time slot allows for more data bits than written in the I2SC\_MR.DATALENGTH field, zeroes are appended to the transmitted data word or extra received bits are discarded.

### 43.6.5 Serial Clock and Word Select Generation

The generation of clocks in the I2SC is described in figure "[I2SC Clock Generation](#)".

In Slave mode, the serial clock and word select clock are driven by an external master. I2SC\_CK and I2SC\_WS pins are inputs.

# SAMA5D2 Series

## Inter-IC Sound Controller (I2SC)

In Master mode, the user can configure the master clock, serial clock, and word select clock through the I2SC\_MR. I2SC\_MCK, I2SC\_CK, and I2SC\_WS pins are outputs and MCK is used to derive the I2SC clocks.

In Master mode, if the peripheral clock frequency is higher than 96 MHz, GCLK[PID] from the PMC must be selected as the I2SC input clock by writing a '1' in the CLKSELx bit of the SFR\_I2SCLKSEL register located in SFR.

Audio codecs connected to the I2SC pins may require a master clock (I2SC\_MCK) signal with a frequency multiple of the audio sample frequency ( $f_s$ ), such as  $256f_s$ . When the I2SC is in Master mode, writing a '1' to I2SC\_MR.IMCKMODE outputs MCK as master clock to the I2SC\_MCK pin, and divides MCK to create the internal bit clock, output on the I2SC\_CK pin. The clock division factor is defined by writing to I2SC\_MR.IMCKFSS and I2SC\_MR.DATALENGTH, as described in the I2SC\_MR.IMCKFSS field description.

The master clock (I2SC\_MCK) frequency is  $(2 \times 16 \times (\text{IMCKFSS} + 1)) / (\text{IMCKDIV} + 1)$  times the sample frequency ( $f_s$ ), i.e., I2SC\_WS frequency.

Example: If the sampling rate is 44.1 kHz with an I2S master clock (I2SC\_MCK) ratio of 256, the core frequency must be an integer multiple of 11.2896 MHz. Assuming an integer multiple of 4, the IMCKDIV field must be configured to 4; the field IMCKFSS must then be set to 31.

The serial clock (I2SC\_CK) frequency is  $2 \times \text{Slot Length}$  times the sample frequency ( $f_s$ ), where Slot Length is defined in table [Slot Length](#).

**Table 43-2. Slot Length**

I2SC_MR.DATALENGTH	Word Length	Slot Length
0	32 bits	32
1	24 bits	32 if I2SC_MR.IWS = 0 24 if I2SC_MR.IWS = 1
2	20 bits	
3	18 bits	
4	16 bits	16
5	16 bits compact stereo	
6	8 bits	8
7	8 bits compact stereo	

 I2SC\_MR.IMCKMODE must be written to '1' if the master clock frequency is strictly higher than the serial clock.

If a master clock output is not required, the MCK clock is used as I2SC\_CK by clearing I2SC\_MR.IMCKMODE. Alternatively, if the frequency of the MCK clock used is a multiple of the required I2SC\_CK frequency, the I2SC\_MCK to I2SC\_CK divider can be used with the ratio defined by writing the I2SC\_MR.IMCKFSS field.

The I2SC\_WS pin is used as word select as described in section [“I2S Reception and Transmission Sequence”](#).

**Figure 43-3. I2SC Clock Generation**

SFR.SFR\_I2SCLKSEL.CLKSELx

### 43.6.6 Mono

When the Transmit Mono bit (TXMONO) in I2SC\_MR is set, data written to the left channel is duplicated to the right output channel.

When the Receive Mono bit (RXMONO) in I2SC\_MR is set, data received from the left channel is duplicated to the right channel.

### 43.6.7 Holding Registers

The I2SC user interface includes a Receive Holding Register (I2SC\_RHR) and a Transmit Holding Register (I2SC\_THR). These registers are used to access audio samples for both audio channels.

When a new data word is available in I2SC\_RHR, the Receive Ready bit (RXRDY) in I2SC\_SR is set. Reading I2SC\_RHR clears this bit.

A receive overrun condition occurs if a new data word becomes available before the previous data word has been read from I2SC\_RHR. In this case, the Receive Overrun bit in I2SC\_SR and bit *i* of the RXORCH field in I2SC\_SR are set, where *i* is the current receive channel number.

When I2SC\_THR is empty, the Transmit Ready bit (TXRDY) in I2SC\_SR is set. Writing to I2SC\_THR clears this bit.

A transmit underrun condition occurs if a new data word needs to be transmitted before it has been written to I2SC\_THR. In this case, the Transmit Underrun (TXUR) bit and bit *i* of the TXORCH field in I2SC\_SR are set, where *i* is the current transmit channel number. If the TXSAME bit in I2SC\_MR is '0', then a zero data word is transmitted in case of underrun. If I2SC\_MR.TXSAME is '1', then the previous data word for the current transmit channel number is transmitted.

Data words are right-justified in I2SC\_RHR and I2SC\_THR. For the 16-bit compact stereo data format, the left sample uses bits 15:0 and the right sample uses bits 31:16 of the same data word. For the 8-bit compact stereo data format, the left sample uses bits 7:0 and the right sample uses bits 15:8 of the same data word.

### 43.6.8 DMA Controller Operation

All receiver audio channels are assigned to a single DMA Controller.

The DMA Controller reads from the I2SC\_RHR and writes to the I2SC\_THR for both audio channels successively.

The DMA Controller transfers may use 32-bit word, 16-bit halfword, or 8-bit byte depending on the value of the I2SC\_MR.DATALength field.

### 43.6.9 Loopback Mode

For debug purposes, the I2SC can be configured to loop back the transmitter to the Receiver. Writing a '1' to the I2SC\_MR.LOOP bit internally connects I2SC\_DO to I2SC\_DI, so that the transmitted data is also received. Writing a '0' to I2SC\_MR.LOOP restores the normal behavior with independent Receiver and Transmitter. As for other changes to the Receiver or Transmitter configuration, the I2SC Receiver and Transmitter must be disabled before writing to I2SC\_MR to update I2SC\_MR.LOOP.

### 43.6.10 Interrupts

An I2SC interrupt request can be triggered whenever one or several of the following bits are set in I2SC\_SR: Receive Ready (RXRDY), Receive Overrun (RXOR), Transmit Ready (TXRDY) or Transmit Underrun (TXUR).

The interrupt request is generated if the corresponding bit in the Interrupt Mask Register (I2SC\_IMR) is set. Bits in I2SC\_IMR are set by writing a '1' to the corresponding bit in I2SC\_IER and cleared by writing a '1' to the corresponding bit in the Interrupt Disable Register (I2SC\_IDR). The interrupt request remains active until the corresponding bit in I2SC\_SR is cleared by writing a '1' to the corresponding bit in the Status Clear Register (I2SC\_SCR).

For debug purposes, interrupt requests can be simulated by writing a '1' to the corresponding bit in the Status Set Register (I2SC\_SSR).

**Figure 43-4. Interrupt Block Diagram**

### 43.7 I2SC Application Examples

The I2SC supports several serial communication modes used in audio or high-speed serial links. Examples of standard applications are shown in the following figures. All serial link applications supported by the I2SC are not listed here.

**Figure 43-5. Slave Transmitter I2SC Application Example**

### 43.8.1 I2SC Control Register

**Name:** I2SC\_CR  
**Offset:** 0x00  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	SWRST		TXDIS	TXEN	CKDIS	CKEN	RXDIS	RXEN
Access	W		W	W	W	W	W	W
Reset	–		–	–	–	–	–	–

#### Bit 7 – SWRST Software Reset

Value	Description
0	Writing a '0' to this bit has no effect.
1	Writing a '1' to this bit resets all the registers in the I2SC. The I2SC is disabled after the reset.

#### Bit 5 – TXDIS Transmitter Disable

Value	Description
0	Writing a '0' to this bit has no effect.
1	Writing a '1' to this bit disables the I2SC transmitter. Bit I2SC_SR.TXEN is cleared when the Transmitter is stopped.

#### Bit 4 – TXEN Transmitter Enable

Value	Description
0	Writing a '0' to this bit has no effect.
1	Writing a '1' to this bit enables the I2SC transmitter, if TXDIS is not one. Bit I2SC_SR.TXEN is set when the Transmitter is started.

#### Bit 3 – CKDIS Clocks Disable

---

---

Value	Description
0	Writing a '0' to this bit has no effect.
1	Writing a zone to this bit disables the I2SC clock generation.

**Bit 2 – CKEN** Clocks Enable

Value	Description
0	Writing a '0' to this bit has no effect.
1	Writing a '1' to this bit enables the I2SC clocks generation, if CKDIS is not one.

**Bit 1 – RXDIS** Receiver Disable

Value	Description
0	Writing a '0' to this bit has no effect.
1	Writing a '1' to this bit disables the I2SC receiver. Bit I2SC_SR.RXEN is cleared when the receiver is stopped.

**Bit 0 – RXEN** Receiver Enable

Value	Description
0	Writing a '0' to this bit has no effect.
1	Writing a '1' to this bit enables the I2SC receiver, if RXDIS is not one. Bit I2SC_SR.RXEN is set when the receiver is activated.

### 43.8.2 I2SC Mode Register

**Name:** I2SC\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

The I2SC\_MR must be written when the I2SC is stopped. The proper sequence is to write to I2SC\_MR, then write to I2SC\_CR to enable the I2SC or to disable the I2SC before writing a new value to I2SC\_MR.

Bit	31	30	29	28	27	26	25	24
	IWS	IMCKMODE	IMCKFS[5:0]					
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
			IMCKDIV[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	TXSAME		TXMONO		RXLOOP		RXMONO	
Access	R/W		R/W		R/W		R/W	
Reset	0		0		0		0	
Bit	7	6	5	4	3	2	1	0
	FORMAT[1:0]		DATALENGTH[2:0]				MODE	
Access	R/W	R/W	R/W		R/W	R/W	R/W	
Reset	0	0	0		0	0	0	

**Bit 31 – IWS** I2SC\_WS Slot Width  
 Refer to table [Slot Length \(I2S format\)](#).

Value	Description
0	I2SC_WS slot is 32 bits wide for DATALENGTH = 18/20/24 bits.
1	I2SC_WS slot is 24 bits wide for DATALENGTH = 18/20/24 bits.

**Bit 30 – IMCKMODE** Master Clock Mode

**⚠ WARNING** If I2SC\_MCK frequency is the same as I2SC\_CK, IMCKMODE must be cleared. Refer to section [Serial Clock and Word Select Generation](#) and table [Slot Length](#).

Value	Description
0	No master clock generated (Selected Clock drives I2SC_CK output).
1	Master clock generated (internally generated clock is used as I2SC_MCK output).

**Bits 29:24 – IMCKFS[5:0]** Master Clock to  $f_s$  Ratio

Master clock frequency is  $[2 \times 16 \times (\text{IMCKFS} + 1)] / (\text{IMCKDIV} + 1)$  times the sample rate, i.e., I2SC\_WS frequency.

Value	Name	Description
0	M2SF32	Sample frequency ratio set to 32
1	M2SF64	Sample frequency ratio set to 64
2	M2SF96	Sample frequency ratio set to 96
3	M2SF128	Sample frequency ratio set to 128
5	M2SF192	Sample frequency ratio set to 192
7	M2SF256	Sample frequency ratio set to 256
11	M2SF384	Sample frequency ratio set to 384
15	M2SF512	Sample frequency ratio set to 512
23	M2SF768	Sample frequency ratio set to 768
31	M2SF1024	Sample frequency ratio set to 1024
47	M2SF1536	Sample frequency ratio set to 1536
63	M2SF2048	Sample frequency ratio set to 2048

**Bits 21:16 – IMCKDIV[5:0]** Selected Clock to I2SC Master Clock Ratio

I2SC\_MCK Master clock output frequency is Selected Clock divided by  $(\text{IMCKDIV} + 1)$ . Refer to the IMCKFS field description.

**Note:**

1. This field is write-only. Always read as '0'.
2. Do not write a '0' to this field.

**Bit 14 – TXSAME** Transmit Data when Underrun

Value	Description
0	Zero sample transmitted when underrun.
1	Previous sample transmitted when underrun

**Bit 12 – TXMONO** Transmit Mono

Value	Description
0	Stereo
1	Mono, with left audio samples duplicated to right audio channel by the I2SC.

**Bit 10 – RXLOOP** Loopback Test Mode

Value	Description
0	Normal mode
1	I2SC_DO output of I2SC is internally connected to I2SC_DI input.

**Bit 8 – RXMONO** Receive Mono

Value	Description
0	Stereo
1	Mono, with left audio samples duplicated to right audio channel by the I2SC.

**Bits 7:6 – FORMAT[1:0]** Data Format

# SAMA5D2 Series

## Inter-IC Sound Controller (I2SC)

Value	Name	Description
0	I2S	I <sup>2</sup> S format, stereo with I2SC_WS low for left channel, and MSB of sample starting one I2SC_CK period after I2SC_WS edge
1	LJ	Left-justified format, stereo with I2SC_WS high for left channel, and MSB of sample starting on I2SC_WS edge
2	–	Reserved
3	–	Reserved

### Bits 4:2 – DATALENGTH[2:0] Data Word Length

Value	Name	Description
0	32_BITS	Data length is set to 32 bits.
1	24_BITS	Data length is set to 24 bits.
2	20_BITS	Data length is set to 20 bits.
3	18_BITS	Data length is set to 18 bits.
4	16_BITS	Data length is set to 16 bits.
5	16_BITS_COMPACT	Data length is set to 16-bit compact stereo. Left sample in bits 15:0 and right sample in bits 31:16 of same word.
6	8_BITS	Data length is set to 8 bits.
7	8_BITS_COMPACT	Data length is set to 8-bit compact stereo. Left sample in bits 7:0 and right sample in bits 15:8 of the same word.

### Bit 0 – MODE Inter-IC Sound Controller Mode

Value	Name	Description
0	SLAVE	I2SC_CK and I2SC_WS pin inputs used as bit clock and word select/frame synchronization.
1	MASTER	Bit clock and word select/frame synchronization generated by I2SC from MCK and output to I2SC_CK and I2SC_WS pins. Peripheral clock or GCLK is output as master clock on I2SC_MCK if I2SC_MR.IMCKMODE is set.

### 43.8.3 I2SC Status Register

**Name:** I2SC\_SR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
			TXURCH[1:0]					
Access			R	R				
Reset			0	0				
Bit	15	14	13	12	11	10	9	8
							RXORCH[1:0]	
Access							R	R
Reset							0	0
Bit	7	6	5	4	3	2	1	0
		TXUR	TXRDY	TXEN		RXOR	RXRDY	RXEN
Access		R	R	R		R	R	R
Reset		0	0	0		0	0	0

#### Bits 21:20 – TXURCH[1:0] Transmit Underrun Channel

Value	Description
0	This field is cleared when I2SC_SCR.TXUR is written to '1'.
1	Bit i of this field is set when a transmit underrun error occurred in channel i (i = 0 for first channel of the frame).

#### Bits 9:8 – RXORCH[1:0] Receive Overrun Channel

This field is cleared when I2SC\_SCR.RXOR is written to '1'.

Bit i of this field is set when a receive overrun error occurred in channel i (i = 0 for first channel of the frame).

#### Bit 6 – TXUR Transmit Underrun

Value	Description
0	This bit is cleared when the corresponding bit in I2SC_SCR is written to '1'.
1	This bit is set when an underrun error occurs on I2SC_THR or when the corresponding bit in I2SC_SSR is written to '1'.

#### Bit 5 – TXRDY Transmit Ready

# SAMA5D2 Series

## Inter-IC Sound Controller (I2SC)

Value	Description
0	This bit is cleared when data is written to I2SC_THR.
1	This bit is set when I2SC_THR is empty and can be written with new data to be transmitted.

### Bit 4 – TXEN Transmitter Enabled

Value	Description
0	This bit is cleared when the transmitter is disabled, following a I2SC_CR.TXDIS or I2SC_CR.SWRST request.
1	This bit is set when the transmitter is enabled, following a I2SC_CR.TXEN request.

### Bit 2 – RXOR Receive Overrun

Value	Description
0	This bit is cleared when the corresponding bit in I2SC_SCR is written to '1'.
1	This bit is set when an overrun error occurs on I2SC_RHR or when the corresponding bit in I2SC_SSR is written to '1'.

### Bit 1 – RXRDY Receive Ready

Value	Description
0	This bit is cleared when I2SC_RHR is read.
1	This bit is set when received data is present in I2SC_RHR.

### Bit 0 – RXEN Receiver Enabled

Value	Description
0	This bit is cleared when the receiver is disabled, following a RXDIS or SWRST request in I2SC_CR.
1	This bit is set when the receiver is enabled, following a RXEN request in I2SC_CR.

#### 43.8.4 I2SC Status Clear Register

**Name:** I2SC\_SCR  
**Offset:** 0x0C  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
			TXURCH[1:0]					
Access			W	W				
Reset			–	–				
Bit	15	14	13	12	11	10	9	8
							RXORCH[1:0]	
Access							W	W
Reset							–	–
Bit	7	6	5	4	3	2	1	0
			TXUR				RXOR	
Access			W				W	
Reset			–				–	

**Bits 21:20 – TXURCH[1:0]** Transmit Underrun Per Channel Status Clear

Writing a '0' has no effect.

Writing a '1' to any bit in this field clears the corresponding bit in the I2SC\_SR and the corresponding interrupt request.

**Bits 9:8 – RXORCH[1:0]** Receive Overrun Per Channel Status Clear

Writing a '0' has no effect.

Writing a '1' to any bit in this field clears the corresponding bit in the I2SC\_SR and the corresponding interrupt request.

**Bit 6 – TXUR** Transmit Underrun Status Clear

Writing a '0' to this bit has no effect.

Writing a '1' to this bit clears the status bit.

**Bit 2 – RXOR** Receive Overrun Status Clear

Writing a '0' to this bit has no effect.

Writing a '1' to this bit clears the status bit.

### 43.8.5 I2SC Status Set Register

**Name:** I2SC\_SSR  
**Offset:** 0x10  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
			TXURCH[1:0]					
Access			W	W				
Reset			–	–				
Bit	15	14	13	12	11	10	9	8
							RXORCH[1:0]	
Access							W	W
Reset							–	–
Bit	7	6	5	4	3	2	1	0
			TXUR				RXOR	
Access			W				W	
Reset			–				–	

**Bits 21:20 – TXURCH[1:0]** Transmit Underrun Per Channel Status Set

Writing a '0' has no effect.

Writing a '1' to any bit in this field sets the corresponding bit in I2SC\_SR and the corresponding interrupt request.

**Bits 9:8 – RXORCH[1:0]** Receive Overrun Per Channel Status Set

Writing a '0' has no effect.

Writing a '1' to any bit in this field sets the corresponding bit in I2SC\_SR and the corresponding interrupt request.

**Bit 6 – TXUR** Transmit Underrun Status Set

Writing a '0' to this bit has no effect.

Writing a '1' to this bit sets the status bit.

**Bit 2 – RXOR** Receive Overrun Status Set

Writing a '0' to this bit has no effect.

Writing a '1' to this bit sets the status bit.

### 43.8.6 I2SC Interrupt Enable Register

**Name:** I2SC\_IER  
**Offset:** 0x14  
**Property:** Write-only

**Bit 6 – TXUR** Transmit Underflow Interrupt Enable

Value	Description
0	Writing a '0' to this bit has no effect.
1	Writing a '1' to this bit sets the corresponding bit in I2SC_IMR.

**Bit 5 – TXRDY** Transmit Ready Interrupt Enable

Value	Description
0	Writing a '0' to this bit as no effect.
1	Writing a '1' to this bit sets the corresponding bit in I2SC_IMR.

**Bit 2 – RXOR** Receiver Overrun Interrupt Enable

Value	Description
0	Writing a '0' to this bit has no effect.
1	Writing a '1' to this bit sets the corresponding bit in I2SC_IMR.

**Bit 1 – RXRDY** Receiver Ready Interrupt Enable

Value	Description
0	Writing a '0' to this bit has no effect.
1	Writing a '1' to this bit sets the corresponding bit in I2SC_IMR.

### 43.8.7 I2SC Interrupt Disable Register

**Name:** I2SC\_IDR  
**Offset:** 0x18  
**Property:** Write-only

**Bit 6 – TXUR** Transmit Underflow Interrupt Disable

Value	Description
0	Writing a '0' to this bit has no effect.
1	Writing a '1' to this bit clears the corresponding bit in I2SC_IMR.

**Bit 5 – TXRDY** Transmit Ready Interrupt Disable

Value	Description
0	Writing a '0' to this bit has no effect.
1	Writing a '1' to this bit clears the corresponding bit in I2SC_IMR.

**Bit 2 – RXOR** Receiver Overrun Interrupt Disable

Value	Description
0	Writing a '0' to this bit has no effect.
1	Writing a '1' to this bit clears the corresponding bit in I2SC_IMR.

**Bit 1 – RXRDY** Receiver Ready Interrupt Disable

Value	Description
0	Writing a '0' to this bit has no effect.
1	Writing a '1' to this bit clears the corresponding bit in I2SC_IMR.

### 43.8.8 I2SC Interrupt Mask Register

**Name:** I2SC\_IMR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
		TXUR	TXRDY			RXOR	RXRDY	
Access		R	R			R	R	
Reset		0	0			0	0	

**Bit 6 – TXUR** Transmit Underflow Interrupt Disable

Value	Description
0	The corresponding interrupt is disabled. This bit is cleared when the corresponding bit in I2SC_IDR is written to '1'.
1	The corresponding interrupt is enabled. This bit is set when the corresponding bit in I2SC_IER is written to '1'.

**Bit 5 – TXRDY** Transmit Ready Interrupt Disable

Value	Description
0	The corresponding interrupt is disabled. This bit is cleared when the corresponding bit in I2SC_IDR is written to '1'.
1	The corresponding interrupt is enabled. This bit is set when the corresponding bit in I2SC_IER is written to '1'.

**Bit 2 – RXOR** Receiver Overrun Interrupt Disable

Value	Description
0	The corresponding interrupt is disabled. This bit is cleared when the corresponding bit in I2SC_IDR is written to '1'.

# SAMA5D2 Series

## Inter-IC Sound Controller (I2SC)

---

---

Value	Description
1	The corresponding interrupt is enabled. This bit is set when the corresponding bit in I2SC_IER is written to '1'.

### Bit 1 – RXRDY Receiver Ready Interrupt Disable

Value	Description
0	The corresponding interrupt is disabled. This bit is cleared when the corresponding bit in I2SC_IDR is written to '1'.
1	The corresponding interrupt is enabled. This bit is set when the corresponding bit in I2SC_IER is written to '1'.

### 43.8.9 I2SC Receiver Holding Register

**Name:** I2SC\_RHR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	RHR[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	RHR[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	RHR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	RHR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – RHR[31:0] Receiver Holding Register**

This field is set by hardware to the last received data word. If I2SC\_MR.DATALLENGTH specifies fewer than 32 bits, data is right-justified in the RHR field.

### 43.8.10 I2SC Transmitter Holding Register

**Name:** I2SC\_THR  
**Offset:** 0x24  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	THR[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	THR[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	THR[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	THR[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 31:0 – THR[31:0]** Transmitter Holding Register

Next data word to be transmitted after the current word if TXRDY is not set. If I2SC\_MR.DATALength specifies fewer than 32 bits, data is right-justified in the THR field.

## **44. Synchronous Serial Controller (SSC)**

### **44.1 Description**

The Synchronous Serial Controller (SSC) provides a synchronous communication link with external devices. It supports many serial synchronous communication protocols generally used in audio and telecom applications such as I2S, Short Frame Sync, Long Frame Sync, etc.

The SSC contains an independent receiver and transmitter and a common clock divider. The receiver and the transmitter each interface with three signals: the TD/RD signal for data, the TK/RK signal for the clock and the TF/RF signal for the Frame Sync. The transfers can be programmed to start automatically or on different events detected on the Frame Sync signal.

The SSC high-level of programmability and its use of DMA enable a continuous high bit rate data transfer without processor intervention.

Featuring connection to the DMA, the SSC enables interfacing with low processor overhead to:

- Codecs in Master or Slave mode
- DAC through dedicated serial interface, particularly I2S
- Magnetic card reader

### **44.2 Embedded Characteristics**

- Provides Serial Synchronous Communication Links Used in Audio and Telecom Applications
- Contains an Independent Receiver and Transmitter and a Common Clock Divider
- Interfaced with the DMA Controller (DMAC) to Reduce Processor Overhead
- Offers a Configurable Frame Sync and Data Length
- Receiver and Transmitter Can be Programmed to Start Automatically or on Detection of Different Events on the Frame Sync Signal
- Receiver and Transmitter Include a Data Signal, a Clock Signal and a Frame Sync Signal

### 44.3 Block Diagram

Figure 44-1. Block Diagram

### 44.4 Application Block Diagram

Figure 44-2. Application Block Diagram

### 44.5 SSC Application Examples

The SSC can support several serial communication modes used in audio or high speed serial links. Some standard applications are shown in the following figures. All serial link applications supported by the SSC are not listed here.

**Figure 44-3. Audio Application Block Diagram**

**Figure 44-4. Codec Application Block Diagram**

**Figure 44-5. Time Slot Application Block Diagram**

## 44.6 Pin Name List

**Table 44-1. I/O Lines Description**

Pin Name	Pin Description	Type
RF	Receive Frame Synchronization	Input/Output
RK	Receive Clock	Input/Output
RD	Receive Data	Input
TF	Transmit Frame Synchronization	Input/Output
TK	Transmit Clock	Input/Output
TD	Transmit Data	Output

## 44.7 Product Dependencies

### 44.7.1 I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines.

Before using the SSC receiver, the PIO controller must be configured to dedicate the SSC receiver I/O lines to the SSC Peripheral mode.

Before using the SSC transmitter, the PIO controller must be configured to dedicate the SSC transmitter I/O lines to the SSC Peripheral mode.

### 44.7.2 Power Management

The SSC is not continuously clocked. The SSC interface may be clocked through the Power Management Controller (PMC), therefore the programmer must first configure the PMC to enable the SSC clock.

### 44.7.3 Interrupt

The SSC interface has an interrupt line connected to the interrupt controller. Handling interrupts requires programming the interrupt controller before configuring the SSC.

All SSC interrupts can be enabled/disabled configuring the SSC Interrupt Mask Register. Each pending and unmasked SSC interrupt asserts the SSC interrupt line. The SSC interrupt service routine can get the interrupt origin by reading the SSC Interrupt Status Register.

## 44.8 Functional Description

This section contains the functional description of the following: SSC Functional Block, Clock Management, Data Format, Start, Transmit, Receive and Frame Synchronization.

The receiver and transmitter operate separately. However, they can work synchronously by programming the receiver to use the transmit clock and/or to start a data transfer when transmission starts.

Alternatively, this can be done by programming the transmitter to use the receive clock and/or to start a data transfer when reception starts. The transmitter and the receiver can be programmed to operate with the clock signals provided on either the TK or RK pins. This allows the SSC to support many Slave mode data transfers. The maximum clock speed allowed on the TK and RK pins is the peripheral clock divided by 2.

**Figure 44-6. SSC Functional Block Diagram**

### 44.8.1 Clock Management

The transmit clock can be generated by:

- an external clock received on the TK I/O pad
- the receive clock
- the internal clock divider

The receive clock can be generated by:

- an external clock received on the RK I/O pad
- the transmit clock
- the internal clock divider

Furthermore, the transmitter block can generate an external clock on the TK I/O pad, and the receive block can generate an external clock on the RK I/O pad.

This allows the SSC to support many Master and Slave mode data transfers.

### 44.8.1.1 Clock Divider

**Figure 44-7. Divided Clock Block Diagram**

The peripheral clock divider is determined by the 12-bit field DIV counter and comparator (so its maximal value is 4095) in the Clock Mode Register (SSC\_CMCR), allowing a peripheral clock division by up to 8190. The Divided Clock is provided to both the receiver and the transmitter. When this field is programmed to 0, the Clock Divider is not used and remains inactive.

When DIV is set to a value equal to or greater than 1, the Divided Clock has a frequency of peripheral clock divided by 2 times DIV. Each level of the Divided Clock has a duration of the peripheral clock multiplied by DIV. This ensures a 50% duty cycle for the Divided Clock regardless of whether the DIV value is even or odd.

**Figure 44-8. Divided Clock Generation**

### 44.8.1.2 Transmit Clock Management

The transmit clock is generated from the receive clock or the divider clock or an external clock scanned on the TK I/O pad. The transmit clock is selected by the CKS field in the Transmit Clock Mode Register (SSC\_TCMR). Transmit Clock can be inverted independently by the CKI bits in the SSC\_TCMR.

The transmitter can also drive the TK I/O pad continuously or be limited to the current data transfer. The clock output is configured by the SSC\_TCMR. The Transmit Clock Inversion (CKI) bits have no effect on the clock outputs. Programming the SSC\_TCMR to select TK pin (CKS field) and at the same time Continuous Transmit Clock (CKO field) can lead to unpredictable results.

**Figure 44-9. Transmit Clock Management**

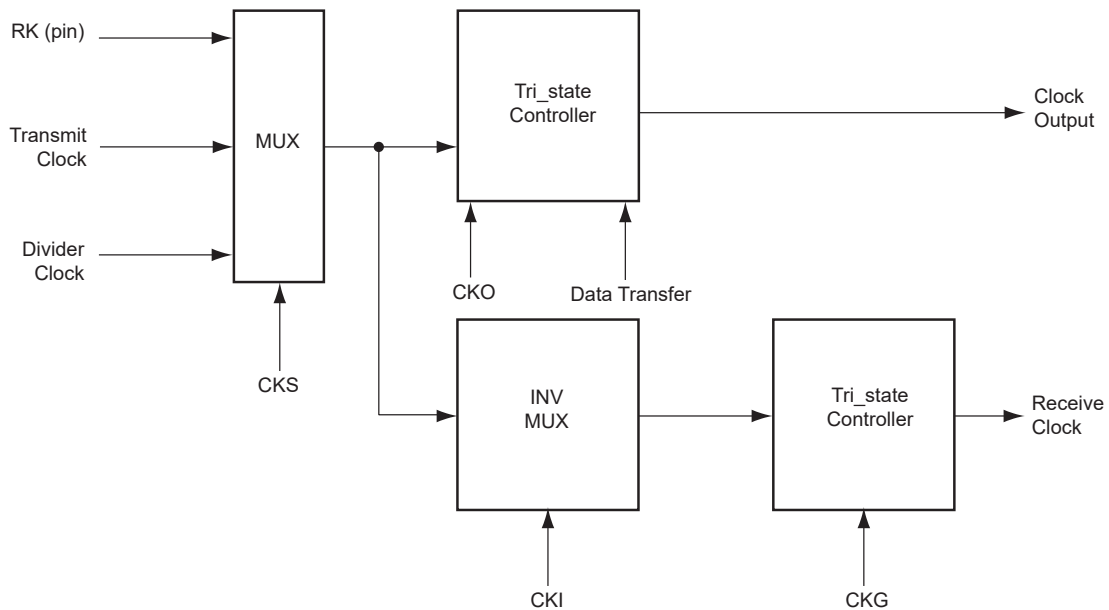

### 44.8.1.3 Receive Clock Management

The receive clock is generated from the transmit clock or the divider clock or an external clock scanned on the RK I/O pad. The Receive Clock is selected by the CKS field in SSC\_RCMR (Receive Clock Mode Register). Receive Clocks can be inverted independently by the CKI bits in SSC\_RCMR.

The receiver can also drive the RK I/O pad continuously or be limited to the current data transfer. The clock output is configured by the SSC\_RCMR. The Receive Clock Inversion (CKI) bits have no effect on the clock outputs. Programming the SSC\_RCMR to select RK pin (CKS field) and at the same time Continuous Receive Clock (CKO field) can lead to unpredictable results.

**Figure 44-10. Receive Clock Management**

### 44.8.1.4 Serial Clock Ratio Considerations

The transmitter and the receiver can be programmed to operate with the clock signals provided on either the TK or RK pins. This allows the SSC to support many Slave mode data transfers. In this case, the maximum clock speed allowed on the RK pin is:

- Peripheral clock divided by 2 if Receive Frame Synchronization is input
- Peripheral clock divided by 3 if Receive Frame Synchronization is output

In addition, the maximum clock speed allowed on the TK pin is:

- Peripheral clock divided by 6 if Transmit Frame Synchronization is input
- Peripheral clock divided by 2 if Transmit Frame Synchronization is output

These are only theoretical speed limits for first order calculations. Exact speed limits on TK and RK are provided in the "Electrical Characteristics" chapter.

### 44.8.2 Transmit Operations

A transmit frame is triggered by a start event and can be followed by synchronization data before data transmission.

The start event is configured by setting the SSC\_TCMR. See [Start](#).

The frame synchronization is configured setting the Transmit Frame Mode Register (SSC\_TFMR). See [Frame Synchronization](#).

To transmit data, the transmitter uses a shift register clocked by the transmit clock signal and the start mode selected in the SSC\_TCMR. Data is written by the application to the Transmit Holding register (SSC\_THR) then transferred to the transmit shift register according to the data format selected.

When both the SSC\_THR and the transmit shift register are empty, the status flag TXEMPTY is set in the Status register (SSC\_SR). When the Transmit Holding register is transferred in the transmit shift register, the status flag TXRDY is set in the SSC\_SR and additional data can be loaded in the Transmit Holding register.

**Figure 44-11. Transmit Block Diagram**

### 44.8.3 Receive Operations

A receive frame is triggered by a start event and can be followed by synchronization data before data transmission.

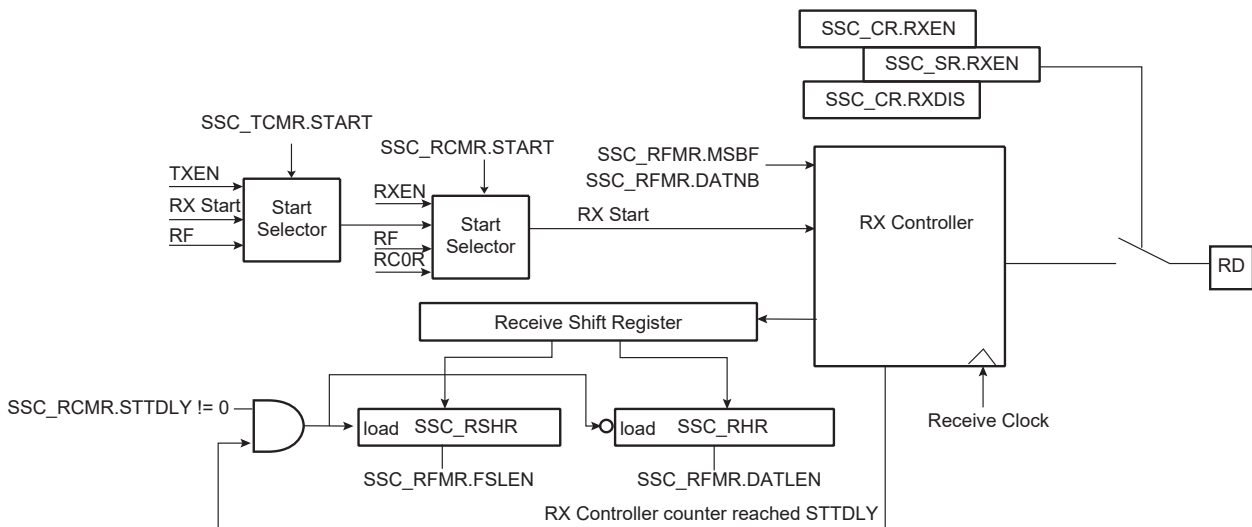

The start event is configured by setting the Receive Clock Mode Register (SSC\_RCMR). See [Start](#).

The frame synchronization is configured by setting the Receive Frame Mode Register (SSC\_RFMR). See [Frame Synchronization](#).

The receiver uses a shift register clocked by the receive clock signal and the start mode selected in the SSC\_RCMR. The data is transferred from the shift register depending on the data format selected.

When the receive shift register is full, the SSC transfers the data into the Receive Holding register (SSC\_RHR), the status flag RXRDY is set in the SSC\_SR and the data can be read in the Receive Holding register. If another transfer occurs before read of the Receive Holding register, the status flag OVRUN is set in the SSC\_SR and the receive shift register is transferred in the SSC\_RHR. The old unread data is then lost.

**Figure 44-12. Receive Block Diagram**

### 44.8.4 Start

The transmitter and receiver can both be programmed to start their operations when an event occurs, respectively in the Transmit Start Selection (START) field of SSC\_TCMR and in the Receive Start Selection (START) field of SSC\_RCMR.

Under the following conditions the start event is independently programmable:

- Continuous. In this case, the transmission starts as soon as a word is written in SSC\_THR and the reception starts as soon as the receiver is enabled.
- Synchronously with the transmitter/receiver
- On detection of a falling/rising edge on TF/RF
- On detection of a low level/high level on TF/RF
- On detection of a level change or an edge on TF/RF

A start can be programmed in the same manner on either side of the Transmit/Receive Clock Register (SSC\_RCMR/SSC\_TCMR). Thus, the start could be on TF (Transmit) or RF (Receive).

Moreover, the receiver can start when data is detected in the bit stream with the Compare Functions.

Detection on TF/RF input/output is done by the field FSOS of the Transmit/Receive Frame Mode Register (SSC\_TFMR/SSC\_RFMR).

**Figure 44-13. Transmit Start Mode**

**Figure 44-14. Receive Pulse/Edge Start Modes**

### 44.8.5 Frame Synchronization

The Transmit and Receive Frame Sync pins, TF and RF, can be programmed to generate different kinds of Frame Sync signals. The Frame Sync Output Selection (FSOS) field in the Receive Frame Mode Register (SSC\_RFMR) and in the Transmit Frame Mode Register (SSC\_TFMR) are used to select the required waveform.

- Programmable low or high levels during data transfer are supported.
- Programmable high levels before the start of data transfers or toggling are also supported.

If a pulse waveform is selected, the Frame Sync Length (FSLEN) field in SSC\_RFMR and SSC\_TFMR programs the length of the pulse, from 1 bit time up to 256 bit times.

The periodicity of the Receive and Transmit Frame Sync pulse output can be programmed through the Period Divider Selection (PERIOD) field in SSC\_RCMR and SSC\_TCMR.

### 44.8.5.1 Frame Sync Data

Frame Sync Data transmits or receives a specific tag during the Frame Sync signal.

During the Frame Sync signal, the receiver can sample the RD line and store the data in the Receive Sync Holding Register and the transmitter can transfer Transmit Sync Holding Register in the shift register. The data length to be sampled/shifted out during the Frame Sync signal is programmed by the FSLEN field in SSC\_RFMR/SSC\_TFMR and has a maximum value of 256.

Concerning the Receive Frame Sync Data operation, if the Frame Sync Length is equal to or lower than the delay between the start event and the current data reception, the data sampling operation is performed in the Receive Sync Holding Register through the receive shift register.

The Transmit Frame Sync Operation is performed by the transmitter only if the bit Frame Sync Data Enable (FSDEN) in SSC\_TFMR is set. If the Frame Sync length is equal to or lower than the delay between the start event and the current data transmission, the normal transmission has priority and the data contained in the Transmit Sync Holding Register is transferred in the Transmit Register, then shifted out.

### 44.8.5.2 Frame Sync Edge Detection

The Frame Sync Edge detection is programmed by the FSEDGE field in SSC\_RFMR/SSC\_TFMR. This sets the corresponding flags RXSYN/TXSYN in the SSC Status Register (SSC\_SR) on Frame Sync Edge detection (signals RF/TF).

### 44.8.6 Receive Compare Modes

**Figure 44-15. Receive Compare Modes**

#### 44.8.6.1 Compare Functions

The length of the comparison patterns (Compare 0, Compare 1) and thus the number of bits they are compared to is defined by FSLEN, but with a maximum value of 256 bits. Comparison is always done by comparing the last bits received with the comparison pattern. Compare 0 can be one start event of the receiver. In this case, the receiver compares at each new sample the last bits received at the Compare 0 pattern contained in the Compare 0 Register (SSC\_RC0R). When this start event is selected, the user can program the receiver to start a new data transfer either by writing a new Compare 0, or by receiving continuously until Compare 1 occurs. This selection is done with the STOP bit in the SSC\_RCMR.

### 44.8.7 Data Format

The data framing format of both the transmitter and the receiver are programmable through the Transmitter Frame Mode Register (SSC\_TFMR) and the Receive Frame Mode Register (SSC\_RFMR). In either case, the user can independently select the following parameters:

- Event that starts the data transfer (START)
- Delay in number of bit periods between the start event and the first data bit (STTDLY)

# SAMA5D2 Series

## Synchronous Serial Controller (SSC)

- Length of the data (DATLEN)
- Number of data to be transferred for each start event (DATNB)
- Length of synchronization transferred for each start event (FSLEN)
- Bit sense: most or least significant bit first (MSBF)

Additionally, the transmitter can be used to transfer synchronization and select the level driven on the TD pin while not in data transfer operation. This is done respectively by the Frame Sync Data Enable (FSDEN) and by the Data Default Value (DATDEF) bits in SSC\_TFMR.

**Table 44-2. Data Frame Registers**

Transmitter	Receiver	Field	Length	Comment
SSC_TFMR	SSC_RFMR	DATLEN	Up to 32	Size of word
SSC_TFMR	SSC_RFMR	DATNB	Up to 16	Number of words transmitted in frame
SSC_TFMR	SSC_RFMR	MSBF	–	Most significant bit first
SSC_TFMR	SSC_RFMR	FSLEN	Up to 256	Size of Synchro data register
SSC_TFMR	–	DATDEF	0 or 1	Data default value ended
SSC_TFMR	–	FSDEN	–	Enable send SSC_TSHR
SSC_TCMR	SSC_RCMR	PERIOD	Up to 512	Frame size
SSC_TCMR	SSC_RCMR	STTDLY	Up to 255	Size of transmit start delay

**Figure 44-16. Transmit and Receive Frame Format in Edge/Pulse Start Modes**

Note: 1. Example of input on falling edge of TF/RF.

In the example illustrated above, the SSC\_THR is loaded twice. The FSDEN value has no effect on the transmission. SyncData cannot be output in Continuous mode.

**Figure 44-17. Transmit Frame Format in Continuous Mode (STTDLY = 0)**

**Figure 44-18. Receive Frame Format in Continuous Mode (STTDLY = 0)**

#### 44.8.8 Loop Mode

The receiver can be programmed to receive transmissions from the transmitter. This is done by setting the Loop Mode (LOOP) bit in the SSC\_RFMR. In this case, RD is connected to TD, RF is connected to TF and RK is connected to TK.

#### 44.8.9 Interrupt

Most bits in the SSC\_SR have a corresponding bit in interrupt management registers.

The SSC can be programmed to generate an interrupt when it detects an event. The interrupt is controlled by writing the Interrupt Enable Register (SSC\_IER) and Interrupt Disable Register (SSC\_IDR). These registers enable and disable, respectively, the corresponding interrupt by setting and clearing the corresponding bit in the Interrupt Mask Register (SSC\_IMR), which controls the generation of interrupts by asserting the SSC interrupt line connected to the interrupt controller.

**Figure 44-19. Interrupt Block Diagram**

#### 44.8.10 Register Write Protection

To prevent any single software error from corrupting SSC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [SSC Write Protection Mode Register](#) (SSC\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the [SSC Write Protection Status Register](#) (SSC\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the SSC\_WPSR.

The following registers can be write-protected:

- [SSC Clock Mode Register](#)
- [SSC Receive Clock Mode Register](#)
- [SSC Receive Frame Mode Register](#)
- [SSC Transmit Clock Mode Register](#)
- [SSC Transmit Frame Mode Register](#)
- [SSC Receive Compare 0 Register](#)
- [SSC Receive Compare 1 Register](#)

# SAMA5D2 Series

### 44.9.1 SSC Control Register

**Name:** SSC\_CR  
**Offset:** 0x0  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits 31-24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Greyed out bits 23-16]							
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	SWRST	[Greyed out bits 14-10]					TXDIS	TXEN
Access	W						W	W
Reset	–						–	–
Bit	7	6	5	4	3	2	1	0
	[Greyed out bits 7-2]						RXDIS	RXEN
Access							W	W
Reset							–	–

#### Bit 15 – SWRST Software Reset

Value	Description
0	No effect.
1	Performs a software reset. Has priority on any other bit in SSC_CR.

#### Bit 9 – TXDIS Transmit Disable

Value	Description
0	No effect.
1	Disables Transmit. If a character is currently being transmitted, disables at end of current character transmission.

#### Bit 8 – TXEN Transmit Enable

Value	Description
0	No effect.
1	Enables Transmit if TXDIS is not set.

#### Bit 1 – RXDIS Receive Disable

Value	Description
0	No effect.

# SAMA5D2 Series

## Synchronous Serial Controller (SSC)

---

---

Value	Description
1	Disables Receive. If a character is currently being received, disables at end of current character reception.

### Bit 0 – RXEN Receive Enable

Value	Description
0	No effect.
1	Enables Receive if RXDIS is not set.

### 44.9.2 SSC Clock Mode Register

**Name:** SSC\_CMCR  
**Offset:** 0x4  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SSC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
					DIV[11:8]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	DIV[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 11:0 – DIV[11:0] Clock Divider

Value	Description
0	The Clock Divider is not active.
Any other value	The divided clock equals the peripheral clock divided by 2 times DIV. The maximum bit rate is $f_{\text{peripheral clock}}/2$ . The minimum bit rate is $f_{\text{peripheral clock}}/2 \times 4095 = f_{\text{peripheral clock}}/8190$ .

### 44.9.3 SSC Receive Clock Mode Register

**Name:** SSC\_RCMR  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SSC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	PERIOD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	STTDLY[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
				STOP	START[3:0]			
Access				R/W	R/W	R/W	R/W	R/W
Reset				0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CKG[1:0]		CKI	CKO[2:0]			CKS[1:0]	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:24 – PERIOD[7:0] Receive Period Divider Selection

This field selects the divider to apply to the selected Receive Clock in order to generate a new Frame Sync signal. If 0, no PERIOD signal is generated. If not 0, a PERIOD signal is generated each 2 x (PERIOD + 1) Receive Clock.

#### Bits 23:16 – STTDLY[7:0] Receive Start Delay

If STTDLY is not 0, a delay of STTDLY clock cycles is inserted between the start event and the current start of reception. When the receiver is programmed to start synchronously with the transmitter, the delay is also applied.

#### Note:

STTDLY must be configured in relation to the receive synchronization data to be stored in SSC\_RSHR.

#### Bit 12 – STOP Receive Stop Selection

Value	Description
0	After completion of a data transfer when starting with a Compare 0, the receiver stops the data transfer and waits for a new compare 0.
1	After starting a receive with a Compare 0, the receiver operates in a continuous mode until a Compare 1 is detected.

# SAMA5D2 Series

## Synchronous Serial Controller (SSC)

### Bits 11:8 – START[3:0] Receive Start Selection

Value	Name	Description
0	CONTINUOUS	Continuous, as soon as the receiver is enabled, and immediately after the end of transfer of the previous data.
1	TRANSMIT	Transmit start
2	RF_LOW	Detection of a low level on RF signal
3	RF_HIGH	Detection of a high level on RF signal
4	RF_FALLING	Detection of a falling edge on RF signal
5	RF_RISING	Detection of a rising edge on RF signal
6	RF_LEVEL	Detection of any level change on RF signal
7	RF_EDGE	Detection of any edge on RF signal
8	CMP_0	Compare 0

### Bits 7:6 – CKG[1:0] Receive Clock Gating Selection

Value	Name	Description
0	CONTINUOUS	None
1	EN_RF_LOW	Receive Clock enabled only if RF Low
2	EN_RF_HIGH	Receive Clock enabled only if RF High

### Bit 5 – CKI Receive Clock Inversion

CKI affects only the Receive Clock and not the output clock signal.

Value	Description
0	The data inputs (Data and Frame Sync signals) are sampled on Receive Clock falling edge. The Frame Sync signal output is shifted out on Receive Clock rising edge.
1	The data inputs (Data and Frame Sync signals) are sampled on Receive Clock rising edge. The Frame Sync signal output is shifted out on Receive Clock falling edge.

### Bits 4:2 – CKO[2:0] Receive Clock Output Mode Selection

Value	Name	Description
0	NONE	None, RK pin is an input
1	CONTINUOUS	Continuous Receive Clock, RK pin is an output
2	TRANSFER	Receive Clock only during data transfers, RK pin is an output

### Bits 1:0 – CKS[1:0] Receive Clock Selection

Value	Name	Description
0	MCK	Divided Clock
1	TK	TK Clock signal
2	RK	RK pin

### 44.9.4 SSC Receive Frame Mode Register

**Name:** SSC\_RFMR  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SSC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	FSLEN_EXT[3:0]							FSEDGE
Access	R/W	R/W	R/W	R/W				R/W
Reset	0	0	0	0				0
Bit	23	22	21	20	19	18	17	16
		FSOS[2:0]			FSLEN[3:0]			
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
					DATNB[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	MSBF		LOOP	DATLEN[4:0]				
Access	R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset	0		0	0	0	0	0	0

**Bits 31:28 – FSLEN\_EXT[3:0]** FSLEN Field Extension  
 Extends FSLEN field. For details, see [FSLEN: Receive Frame Sync Length](#).

**Bit 24 – FSEDGE** Frame Sync Edge Detection  
 Determines which edge on Frame Sync will generate the interrupt RXSYN in the SSC Status Register.

Value	Name	Description
0	POSITIVE	Positive Edge Detection
1	NEGATIVE	Negative Edge Detection

**Bits 22:20 – FSOS[2:0]** Receive Frame Sync Output Selection

Value	Name	Description
0	NONE	None, RF pin is an input
1	NEGATIVE	Negative Pulse, RF pin is an output
2	POSITIVE	Positive Pulse, RF pin is an output
3	LOW	Driven Low during data transfer, RF pin is an output
4	HIGH	Driven High during data transfer, RF pin is an output
5	TOGGLING	Toggling at each start of data transfer, RF pin is an output

# SAMA5D2 Series

## Synchronous Serial Controller (SSC)

### Bits 19:16 – FSLEN[3:0] Receive Frame Sync Length

This field defines the number of bits sampled and stored in the Receive Sync Data Register. When this mode is selected by the START field in the Receive Clock Mode Register, it also determines the length of the sampled data to be compared to the Compare 0 or Compare 1 register.

This field is used with FSLEN\_EXT to determine the pulse length of the Receive Frame Sync signal.

Pulse length is equal to  $FSLEN + (FSLEN\_EXT \times 16) + 1$  Receive Clock periods.

### Bits 11:8 – DATNB[3:0] Data Number per Frame

This field defines the number of data words to be received after each transfer start, which is equal to  $(DATNB + 1)$ .

### Bit 7 – MSBF Most Significant Bit First

Value	Description
0	The lowest significant bit of the data register is sampled first in the bit stream.
1	The most significant bit of the data register is sampled first in the bit stream.

### Bit 5 – LOOP Loop Mode

Value	Description
0	Normal operating mode.
1	RD is driven by TD, RF is driven by TF and TK drives RK.

### Bits 4:0 – DATLEN[4:0] Data Length

Value	Description
0	Forbidden value (1-bit data length not supported).
Any other value	The bit stream contains $DATLEN + 1$ data bits.

### 44.9.5 SSC Transmit Clock Mode Register

**Name:** SSC\_TCMR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SSC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	PERIOD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	STTDLY[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	START[3:0]							
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CKG[1:0]		CKI	CKO[2:0]			CKS[1:0]	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:24 – PERIOD[7:0] Transmit Period Divider Selection

This field selects the divider to apply to the selected Transmit Clock to generate a new Frame Sync signal. If 0, no period signal is generated. If not 0, a period signal is generated at each  $2 \times (\text{PERIOD} + 1)$  Transmit Clock.

#### Bits 23:16 – STTDLY[7:0] Transmit Start Delay

If STTDLY is not 0, a delay of STTDLY clock cycles is inserted between the start event and the current start of transmission of data. When the transmitter is programmed to start synchronously with the receiver, the delay is also applied.

#### Note:

If STTDLY is too short with respect to transmit synchronization data (SSC\_TSHR), SSC\_THR.TDAT is transmitted instead of the end of SSC\_TSHR.

#### Bits 11:8 – START[3:0] Transmit Start Selection

Value	Name	Description
0	CONTINUOUS	Continuous, as soon as a word is written in the SSC_THR (if Transmit is enabled), and immediately after the end of transfer of the previous data
1	RECEIVE	Receive start
2	TF_LOW	Detection of a low level on TF signal

# SAMA5D2 Series

## Synchronous Serial Controller (SSC)

Value	Name	Description
3	TF_HIGH	Detection of a high level on TF signal
4	TF_FALLING	Detection of a falling edge on TF signal
5	TF_RISING	Detection of a rising edge on TF signal
6	TF_LEVEL	Detection of any level change on TF signal
7	TF_EDGE	Detection of any edge on TF signal

### Bits 7:6 – CKG[1:0] Transmit Clock Gating Selection

Value	Name	Description
0	CONTINUOUS	None
1	EN_TF_LOW	Transmit Clock enabled only if TF Low
2	EN_TF_HIGH	Transmit Clock enabled only if TF High

### Bit 5 – CKI Transmit Clock Inversion

CKI affects only the Transmit Clock and not the Output Clock signal.

Value	Description
0	The data outputs (Data and Frame Sync signals) are shifted out on Transmit Clock falling edge. The Frame Sync signal input is sampled on Transmit Clock rising edge.
1	The data outputs (Data and Frame Sync signals) are shifted out on Transmit Clock rising edge. The Frame Sync signal input is sampled on Transmit Clock falling edge.

### Bits 4:2 – CKO[2:0] Transmit Clock Output Mode Selection

Value	Name	Description
0	NONE	None, TK pin is an input
1	CONTINUOUS	Continuous Transmit Clock, TK pin is an output
2	TRANSFER	Transmit Clock only during data transfers, TK pin is an output

### Bits 1:0 – CKS[1:0] Transmit Clock Selection

Value	Name	Description
0	MCK	Divided Clock
1	RK	RK Clock signal
2	TK	TK pin

### 44.9.6 SSC Transmit Frame Mode Register

**Name:** SSC\_TFMR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SSC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	FSLEN_EXT[3:0]							FSEDGE
Access	R/W	R/W	R/W	R/W				R/W
Reset	0	0	0	0				0
Bit	23	22	21	20	19	18	17	16
	FSDEN	FSOS[2:0]			FSLEN[3:0]			
Access	R/W	R/W	R/W	R/W				
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
					DATNB[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	MSBF		DATDEF	DATLEN[4:0]				
Access	R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset	0		0	0	0	0	0	0

**Bits 31:28 – FSLEN\_EXT[3:0]** FSLEN Field Extension  
 Extends FSLEN field. For details, see FSLEN bit description below.

**Bit 24 – FSEDGE** Frame Sync Edge Detection  
 Determines which edge on frame synchronization will generate the interrupt TXSYN (Status Register).

Value	Name	Description
0	POSITIVE	Positive Edge Detection
1	NEGATIVE	Negative Edge Detection

**Bit 23 – FSDEN** Frame Sync Data Enable

Value	Description
0	The TD line is driven with the default value during the Transmit Frame Sync signal.
1	SSC_TSHR value is shifted out during the transmission of the Transmit Frame Sync signal.

**Bits 22:20 – FSOS[2:0]** Transmit Frame Sync Output Selection

Value	Name	Description
0	NONE	None, TF pin is an input
1	NEGATIVE	Negative Pulse, TF pin is an output

# SAMA5D2 Series

## Synchronous Serial Controller (SSC)

Value	Name	Description
2	POSITIVE	Positive Pulse, TF pin is an output
3	LOW	Driven Low during data transfer
4	HIGH	Driven High during data transfer
5	TOGGLING	Toggling at each start of data transfer

### Bits 19:16 – FSLEN[3:0] Transmit Frame Sync Length

This field defines the length of the Transmit Frame Sync signal and the number of bits shifted out from SSC\_TSHR if FSDEN is 1.

This field is used with FSLEN\_EXT to determine the pulse length of the Transmit Frame Sync signal.

Pulse length is equal to  $FSLEN + (FSLEN\_EXT \times 16) + 1$  Transmit Clock period.

### Bits 11:8 – DATNB[3:0] Data Number per Frame

This field defines the number of data words to be transferred after each transfer start, which is equal to  $(DATNB + 1)$ .

### Bit 7 – MSBF Most Significant Bit First

Value	Description
0	The lowest significant bit of the data register is shifted out first in the bit stream.
1	The most significant bit of the data register is shifted out first in the bit stream.

### Bit 5 – DATDEF Data Default Value

This bit defines the level driven on the TD pin while out of transmission. Note that if the pin is defined as multi-drive by the PIO Controller, the pin is enabled only if the SCC TD output is 1.

### Bits 4:0 – DATLEN[4:0] Data Length

Value	Description
0	Forbidden value (1-bit data length not supported).
Any other value	The bit stream contains $DATLEN + 1$ data bits.

# SAMA5D2 Series

## Synchronous Serial Controller (SSC)

### 44.9.7 SSC Receive Holding Register

**Name:** SSC\_RHR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24

#### Bit 17 – RXEN Receive Enable

Value	Description
0	Receive is disabled.
1	Receive is enabled.

#### Bit 16 – TXEN Transmit Enable

Value	Description
0	Transmit is disabled.
1	Transmit is enabled.

#### Bit 11 – RXSYN Receive Sync

Value	Description
0	An Rx Sync has not occurred since the last read of the Status Register.
1	An Rx Sync has occurred since the last read of the Status Register.

#### Bit 10 – TXSYN Transmit Sync

Value	Description
0	A Tx Sync has not occurred since the last read of the Status Register.
1	A Tx Sync has occurred since the last read of the Status Register.

# SAMA5D2 Series

## Synchronous Serial Controller (SSC)

### Bit 9 – CP1 Compare 1

Value	Description
0	A compare 1 has not occurred since the last read of the Status Register.
1	A compare 1 has occurred since the last read of the Status Register.

### Bit 8 – CP0 Compare 0

Value	Description
0	A compare 0 has not occurred since the last read of the Status Register.
1	A compare 0 has occurred since the last read of the Status Register.

### Bit 5 – OVRUN Receive Overrun

Value	Description
0	No data has been loaded in SSC_RHR while previous data has not been read since the last read of the Status Register.
1	Data has been loaded in SSC_RHR while previous data has not yet been read since the last read of the Status Register.

### Bit 4 – RXRDY Receive Ready

Value	Description
0	SSC_RHR is empty.
1	Data has been received and loaded in SSC_RHR.

### Bit 1 – TXEMPTY Transmit Empty

Value	Description
0	Data remains in SSC_THR or is currently transmitted from TSR.
1	Last data written in SSC_THR has been loaded in TSR and last data loaded in TSR has been transmitted.

### Bit 0 – TXRDY Transmit Ready

Value	Description
0	Data has been loaded in SSC_THR and is waiting to be loaded in the transmit shift register (TSR).
1	SSC_THR is empty.

### 44.9.14 SSC Interrupt Enable Register

**Name:** SSC\_IER  
**Offset:** 0x44  
**Reset:** –  
**Property:** Write-only

#### Bit 11 – RXSYN Rx Sync Interrupt Enable

Value	Description
0	No effect.
1	Disables the Rx Sync Interrupt.

#### Bit 10 – TXSYN Tx Sync Interrupt Enable

Value	Description
0	No effect.
1	Disables the Tx Sync Interrupt.

#### Bit 9 – CP1 Compare 1 Interrupt Disable

Value	Description
0	No effect.
1	Disables the Compare 1 Interrupt.

#### Bit 8 – CP0 Compare 0 Interrupt Disable

Value	Description
0	No effect.
1	Disables the Compare 0 Interrupt.

**Bit 5 – OVRUN** Receive Overrun Interrupt Disable

Value	Description
0	No effect.
1	Disables the Receive Overrun Interrupt.

**Bit 4 – RXRDY** Receive Ready Interrupt Disable

Value	Description
0	No effect.
1	Disables the Receive Ready Interrupt.

**Bit 1 – TXEMPTY** Transmit Empty Interrupt Disable

Value	Description
0	No effect.
1	Disables the Transmit Empty Interrupt.

**Bit 0 – TXRDY** Transmit Ready Interrupt Disable

Value	Description
0	No effect.
1	Disables the Transmit Ready Interrupt.

#### 44.9.16 SSC Interrupt Mask Register

**Name:** SSC\_IMR  
**Offset:** 0x4C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24

##### Bit 11 – RXSYN Rx Sync Interrupt Mask

Value	Description
0	The Rx Sync Interrupt is disabled.
1	The Rx Sync Interrupt is enabled.

##### Bit 10 – TXSYN Tx Sync Interrupt Mask

Value	Description
0	The Tx Sync Interrupt is disabled.
1	The Tx Sync Interrupt is enabled.

##### Bit 9 – CP1 Compare 1 Interrupt Mask

Value	Description
0	The Compare 1 Interrupt is disabled.
1	The Compare 1 Interrupt is enabled.

##### Bit 8 – CP0 Compare 0 Interrupt Mask

Value	Description
0	The Compare 0 Interrupt is disabled.
1	The Compare 0 Interrupt is enabled.

**Bit 5 – OVRUN** Receive Overrun Interrupt Mask

Value	Description
0	The Receive Overrun Interrupt is disabled.
1	The Receive Overrun Interrupt is enabled.

**Bit 4 – RXRDY** Receive Ready Interrupt Mask

Value	Description
0	The Receive Ready Interrupt is disabled.
1	The Receive Ready Interrupt is enabled.

**Bit 1 – TXEMPTY** Transmit Empty Interrupt Mask

Value	Description
0	The Transmit Empty Interrupt is disabled.
1	The Transmit Empty Interrupt is enabled.

**Bit 0 – TXRDY** Transmit Ready Interrupt Mask

Value	Description
0	The Transmit Ready Interrupt is disabled.
1	The Transmit Ready Interrupt is enabled.

Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		WPEN							
Access									R/W
Reset									0

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x535343	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit.
3		Always reads as 0.

#### Bit 0 – WPEN Write Protection Enable

See [Register Write Protection](#) for the list of registers that can be protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x535343 (“SSC” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x535343 (“SSC” in ASCII).

### 44.9.18 SSC Write Protection Status Register

**Name:** SSC\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	[Greyed out bits]							WPVS
Access								R
Reset								0

**Bits 23:8 – WPVSR[15:0]** Write Protect Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of the SSC_WPSR.
1	A write protection violation has occurred since the last read of the SSC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

## 45. Two-wire Interface (TWIHS)

### 45.1 Description

The Two-wire Interface (TWIHS) interconnects components on a unique two-wire bus, made up of one clock line and one data line with speeds of up to 400 kbit/s in Fast mode and up to 3.4 Mbit/s in High-speed slave mode only, based on a byte-oriented transfer format. It can be used with any Two-wire Interface bus Serial EEPROM and I<sup>2</sup>C-compatible devices, such as a Real-Time Clock (RTC), Dot Matrix/Graphic LCD Controller and temperature sensor. The TWIHS is programmable as a master or a slave with sequential or single-byte access. Multiple master capability is supported.

A configurable baud rate generator permits the output data rate to be adapted to a wide range of core clock frequencies.

The table below lists the compatibility level of the Two-wire Interface in Master mode and a full I<sup>2</sup>C compatible device.

**Table 45-1. TWI Compatibility with I<sup>2</sup>C Standard**

I <sup>2</sup> C Standard	TWI
Standard Mode Speed (100 kHz)	Supported
Fast Mode Speed (400 kHz)	Supported
High-speed Mode (Slave only, 3.4 MHz)	Supported
7- or 10-bit <sup>(1)</sup> Slave Addressing	Supported
START Byte <sup>(2)</sup>	Not Supported
Repeated Start (Sr) Condition	Supported
ACK and NACK Management	Supported
Input Filtering	Supported
Slope Control	Not Supported
Clock Stretching	Supported
Multi Master Capability	Supported

**Note:**

1. 10-bit support in Master mode only.
2. START + 00000001 + Ack + Sr

### 45.2 Embedded Characteristics

- 2 TWIHSs
- 16-byte Transmit and Receive FIFOs
- Compatible with Two-wire Interface Serial Memory and I<sup>2</sup>C Compatible Devices<sup>(1)</sup>
- One, Two or Three Bytes for Slave Address
- Sequential Read/Write Operations

- Master and Multimaster Operation (Standard and Fast Modes Only)
- Slave Mode Operation (Standard, Fast and High-Speed Modes)
- Bit Rate: Up to 400 Kbit/s in Fast Mode and 3.4 Mbit/s in High-Speed Mode (Slave Mode Only)
- General Call Supported in Slave Mode
- SleepWalking (Asynchronous and Partial Wakeup)
- SMBus Support
- Connection to DMA Controller (DMA) Channel Capabilities Optimizes Data Transfers
- Register Write Protection

**Note:**

See [TWI Compatibility with I2C Standard](#) for details on compatibility with I<sup>2</sup>C Standard.

### 45.3 List of Abbreviations

**Table 45-2. Abbreviations**

Abbreviation	Description
TWI	Two-wire Interface
A	Acknowledge
NA	Non Acknowledge
P	Stop
S	Start
Sr	Repeated Start
SADR	Slave Address
ADR	Any address except SADR
R	Read
W	Write

### 45.4 Block Diagram

**Figure 45-1. Block Diagram**

### 45.4.1 I/O Lines Description

**Table 45-3. I/O Lines Description**

Pin Name	Pin Description	Type
TWD	Two-wire Serial Data	Input/Output
TWCK	Two-wire Serial Clock	Input/Output

## 45.5 Product Dependencies

### 45.5.1 I/O Lines

Both TWD and TWCK are bidirectional lines, connected to a positive supply voltage via a current source or pullup resistor. When the bus is free, both lines are high. The output stages of devices connected to the bus must have an open-drain or open-collector to perform the wired-AND function.

TWD and TWCK pins may be multiplexed with PIO lines. To enable the TWIHS, the user must program the PIO Controller to dedicate TWD and TWCK as peripheral lines. When High-speed Slave mode is enabled, the analog pad filter must be enabled.

The user must not program TWD and TWCK as open-drain. This is already done by the hardware.

### 45.5.2 Power Management

Enable the peripheral clock.

The TWIHS may be clocked through the Power Management Controller (PMC), thus the user must first configure the PMC to enable the TWIHS clock.

### 45.5.3 Interrupt Sources

The TWIHS has an interrupt line connected to the Interrupt Controller. In order to handle interrupts, the Interrupt Controller must be programmed before configuring the TWIHS.

## 45.6 Functional Description

### 45.6.1 Transfer Format

The data put on the TWD line must be 8 bits long. Data is transferred MSB first; each byte must be followed by an acknowledgement. The number of bytes per transfer is unlimited, shown in [Transfer Format](#).

Each transfer begins with a START condition and terminates with a STOP condition, as shown in [START and STOP Conditions](#).

- A high-to-low transition on the TWD line while TWCK is high defines the START condition.
- A low-to-high transition on the TWD line while TWCK is high defines the STOP condition.

**Figure 45-2. START and STOP Conditions**

**Figure 45-3. Transfer Format**

## 45.6.2 Modes of Operation

The TWIHS has different modes of operation:

- Master Transmitter mode (Standard and Fast modes only)
- Master Receiver mode (Standard and Fast modes only)
- Multimaster Transmitter mode (Standard and Fast modes only)
- Multimaster Receiver mode (Standard and Fast modes only)
- Slave Transmitter mode (Standard, Fast and High-speed modes)
- Slave Receiver mode (Standard, Fast and High-speed modes)

These modes are described in the following sections.

## 45.6.3 Master Mode

### 45.6.3.1 Definition

The master is the device that starts a transfer, generates a clock and stops it. This operating mode is not available if High-speed mode is selected.

### 45.6.3.2 Programming Master Mode

The following registers must be programmed before entering Master mode:

1. TWIHS\_MMR.DADR (+ IADRSZ + IADR if a 10-bit device is addressed): The device address is used to access slave devices in Read or Write mode.
2. TWIHS\_CWGR.CKDIV + CHDIV + CLDIV: Clock Waveform register
3. TWIHS\_CR.SVDIS: Disables the Slave mode
4. TWIHS\_CR.MSEN: Enables the Master mode

**Note:** If the TWIHS is already in Master mode, the device address (DADR) can be configured without disabling the Master mode.

### 45.6.3.3 Transfer Rate Clock Source

The TWIHS speed is defined in the TWIHS\_CWGR. The TWIHS baud rate can be based either on the peripheral clock if the CKSRC bit value is '0' or on a GCLK clock if the CKSRC bit value is '1'.

If CKSRC = 1, the baud rate is independent of the system/core clock (MCK) and thus the MCK frequency can be changed without affecting the TWIHS transfer rate.

The GCLK frequency must always be three times lower than the peripheral clock frequency.

### 45.6.3.4 Master Transmitter Mode

This operating mode is not available if High-speed mode is selected.

After the master initiates a START condition when writing into the Transmit Holding register (TWIHS\_THR), it sends a 7-bit slave address, configured in the Master Mode register (DADR in TWIHS\_MMR), to notify the slave device. The bit following the slave address indicates the transfer direction, 0 in this case (MREAD = 0 in TWIHS\_MMR).

The TWIHS transfers require the slave to acknowledge each received byte. During the acknowledge clock pulse (9th pulse), the master releases the data line (HIGH), enabling the slave to pull it down in order to generate the acknowledge. If the slave does not acknowledge the byte, then the Not Acknowledge flag (NACK) is set in the TWIHS Status Register (TWIHS\_SR) of the master and a STOP condition is sent. The NACK flag must be clear by reading TWIHS\_SR before the next write into TWIHS\_THR. As with the other status bits, an interrupt can be generated if enabled in the Interrupt Enable register (TWIHS\_IER). If the slave acknowledges the byte, the data written in the TWIHS\_THR is then shifted in the internal shifter and transferred. When an acknowledge is detected, the TXRDY bit is set until a new write in the TWIHS\_THR.

TXRDY is used as Transmit Ready for the DMA transmit channel.

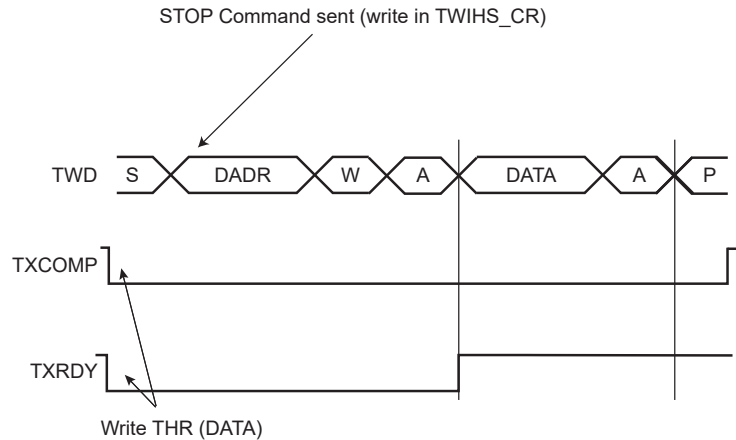

While no new data is written in the TWIHS\_THR, the serial clock line is tied low. When new data is written in the TWIHS\_THR, the SCL is released and the data is sent. Setting the STOP bit in TWIHS\_CR generates a STOP condition.

After a master write transfer, the serial clock line is stretched (tied low) as long as no new data is written in the TWIHS\_THR or until a STOP command is performed.

To clear the TXRDY flag, first set the bit TWIHS\_CR.MSDIS, then set the bit TWIHS\_CR.MSEN.

See the figures below.

**Figure 45-4. Master Write with One Data Byte**

**Figure 45-5. Master Write with Multiple Data Bytes**

**Figure 45-6. Master Write with One-Byte Internal Address and Multiple Data Bytes**

### 45.6.3.5 Master Receiver Mode

Master Receiver mode is not available if High-speed mode is selected.

The read sequence begins by setting the START bit. After the START condition has been sent, the master sends a 7-bit slave address to notify the slave device. The bit following the slave address indicates the transfer direction, 1 in this case (MREAD = 1 in TWIHS\_MMR). During the acknowledge clock pulse (9th pulse), the master releases the data line (HIGH), enabling the slave to pull it down in order to generate the acknowledge. The master polls the data line during this clock pulse and sets TWIHS\_SR.NACK if the slave does not acknowledge the byte.

If an acknowledge is received, the master is then ready to receive data from the slave. After data has been received, the master sends an acknowledge condition to notify the slave that the data has been received except for the last data (see [Master Read with One Data Byte](#)). When TWIHS\_SR.RXRDY is set, a character has been received in the Receive Holding register (TWIHS\_RHR). The RXRDY bit is reset when reading the TWIHS\_RHR.

When a single data byte read is performed, with or without internal address (IADR), the START and STOP bits must be set at the same time. See [Master Read with One Data Byte](#). When a multiple data byte read is performed, with or without internal address (IADR), the STOP bit must be set after the next-

to-last data received (same condition applies for START bit to generate a REPEATED START). See [Master Read with Multiple Data Bytes](#). For internal address usage, see [Internal Address](#).

If TWIHS\_RHR is full (RXRDY high) and the master is receiving data, the serial clock line is tied low before receiving the last bit of the data and until the TWIHS\_RHR is read. Once the TWIHS\_RHR is read, the master stops stretching the serial clock line and ends the data reception. See [Master Read Clock Stretching with Multiple Data Bytes](#).

**WARNING** When receiving multiple bytes in Master Read mode, if the next-to-last access is not read (the RXRDY flag remains high), the last access is not completed until TWIHS\_RHR is read. The last access stops on the next-to-last bit (clock stretching). When the TWIHS\_RHR is read, there is only half a bit period to send the STOP (or START) command, else another read access might occur (spurious access).

A possible workaround is to set the STOP (or START) bit before reading the TWIHS\_RHR on the next-to-last access (within IT handler).

**Figure 45-7. Master Read with One Data Byte**

**Figure 45-8. Master Read with Multiple Data Bytes**

**Figure 45-9. Master Read Clock Stretching with Multiple Data Bytes**

RXRDY is used as receive ready for the DMA receive channel.

### 45.6.3.6 Internal Address

The TWIHS can perform transfers with 7-bit slave address devices and with 10-bit slave address devices.

#### 45.6.3.6.1 7-bit Slave Addressing

When addressing 7-bit slave devices, the internal address bytes are used to perform random address (read or write) accesses to reach one or more data bytes, e.g. within a memory page location in a serial memory. When performing read operations with an internal address, the TWIHS performs a write operation to set the internal address into the slave device, and then switch to Master Receiver mode. Note that the second START condition (after sending the IADR) is sometimes called “repeated start” (Sr) in I<sup>2</sup>C fully-compatible devices. See [Master Read with One-, Two- or Three-Byte Internal Address and One Data Byte](#).

See [Master Write with One-, Two- or Three-Byte Internal Address and One Data Byte](#) and [Internal Address Usage](#) for the master write operation with internal address.

The three internal address bytes are configurable through TWIHS\_MMR.

If the slave device supports only a 7-bit address, i.e., no internal address, IADRSZ must be set to 0.

The table below shows the abbreviations used in the figures below.

**Table 45-4. Abbreviations**

Abbreviation	Definition
S	Start
Sr	Repeated Start
P	Stop
W	Write
R	Read
A	Acknowledge
NA	Not Acknowledge
DADR	Device Address

.....continued	
Abbreviation	Definition
IADR	Internal Address

**Figure 45-10. Master Write with One-, Two- or Three-Byte Internal Address and One Data Byte**

**Figure 45-11. Master Read with One-, Two- or Three-Byte Internal Address and One Data Byte**

#### 45.6.3.6.2 10-bit Slave Addressing

For a slave address higher than seven bits, configure the address size (IADRSZ) and set the other slave address bits in the Internal Address register (TWIHS\_IADR). The two remaining internal address bytes, IADR[15:8] and IADR[23:16], can be used the same way as in 7-bit slave addressing.

Example: Address a 10-bit device (10-bit device address is b1 b2 b3 b4 b5 b6 b7 b8 b9 b10)

1. Program IADRSZ = 1,
2. Program DADR with 1 1 1 1 0 b1 b2 (b1 is the MSB of the 10-bit address, b2, etc.)
3. Program TWIHS\_IADR with b3 b4 b5 b6 b7 b8 b9 b10 (b10 is the LSB of the 10-bit address)

The figure below shows a byte write to a memory device. This demonstrates the use of internal addresses to access the device.

**Figure 45-12. Internal Address Usage**

#### 45.6.3.7 Repeated Start

In addition to Internal Address mode, REPEATED START (Sr) can be generated manually by writing the START bit at the end of a transfer instead of the STOP bit. In such case, the parameters of the next transfer (direction, SADR, etc.) need to be set before writing the START bit at the end of the previous transfer.

See [Read/Write Flowcharts](#) for detailed flowcharts.

Note that generating a REPEATED START after a single data read is not supported.

#### 45.6.3.8 Bus Clear Command

The TWIHS can perform a Bus Clear command:

1. Configure the Master mode (DADR, CKDIV, etc).
2. Start the transfer by setting TWIHS\_CR.CLEAR.

**Note:** If alternative command is used (ACMEN bit set to '1'), DATAL field must be set to 0.

#### 45.6.3.9 Using the DMA Controller (DMAC) in Master Mode

The use of the DMA significantly reduces the CPU load.

To ensure correct implementation, follow the programming sequences below:

##### 45.6.3.9.1 Data Transmit with the DMA in Master Mode

If Alternative Command mode is disabled (ACMEN bit set to '0'):

The DMA transfer size must be defined with the buffer size minus 1. The remaining character must be managed without DMA to ensure that the exact number of bytes are transmitted regardless of system bus latency conditions during the end of the buffer transfer period.

1. Initialize the DMA (channels, memory pointers, size - 1, etc.);
2. Configure the Master mode (DADR, CKDIV, MREAD = 0, etc.) or Slave mode.
3. Enable the DMA.
4. Wait for the DMA status flag indicating that the buffer transfer is complete.
5. Disable the DMA.
6. Wait for the TXRDY flag in TWIHS\_SR.
7. Set TWIHS\_CR.STOP.
8. Write the last character in TWIHS\_THR.
9. (Only if peripheral clock must be disabled) Wait for the TXCOMP flag to be raised in TWIHS\_SR.

If Alternative Command mode is enabled (ACMEN bit set to '1'):

1. Initialize the transmit DMA (memory pointers, transfer size).
2. Configure the Master mode (DADR, CKDIV, etc.) and TWIHS\_ACR.
3. Start the transfer by setting the DMA TXTEN bit.
4. Wait for the DMA ENDTX flag either by using the polling method or ENDTX interrupt.
5. Disable the DMA by setting the DMA TXTDIS bit.
6. (Only if peripheral clock must be disabled) Wait for the TXCOMP flag to be raised in TWIHS\_SR.

##### 45.6.3.9.2 Data Receive with the DMA in Master Mode

If Alternative Command mode is disabled (ACMEN bit set to '0'):

The DMA transfer size must be defined with the buffer size minus 2. The two remaining characters must be managed without DMA to ensure that the exact number of bytes are received regardless of system bus latency conditions encountered during the end of buffer transfer period.

1. Initialize the DMA (channels, memory pointers, size - 2, etc.);
2. Configure the Master mode (DADR, CKDIV, MREAD = 1, etc.) or Slave mode.
3. Enable the DMA.
4. (Master Only) Write TWIHS\_CR.START to start the transfer.
5. Wait for the DMA status flag indicating that the buffer transfer is complete.
6. Disable the DMA.
7. Wait for the RXRDY flag in the TWIHS\_SR.

8. Set TWIHS\_CR.STOP.
9. Read the penultimate character in TWIHS\_RHR.
10. Wait for the RXRDY flag in the TWIHS\_SR.
11. Read the last character in TWIHS\_RHR.
12. (Only if peripheral clock must be disabled) Wait for the TXCOMP flag to be raised in TWIHS\_SR.

If Alternative Command mode is enabled (ACMEN bit set to '1'):

1. Initialize the transmit DMA (memory pointers, transfer size).
2. Configure the Master mode (DADR, CKDIV, etc.) and TWIHS\_ACR.
3. Set the DMA RXTEN bit.
4. (Master Only) Write TWIHS\_CR.START to start the transfer.
5. Wait for the DMA ENDTX Flag either by using the polling method or ENDTX interrupt.
6. Disable the DMA by setting the DMA TXTDIS bit.
7. (Only if peripheral clock must be disabled) Wait for the TXCOMP flag to be raised in TWIHS\_SR.

#### 45.6.3.10 SMBus Mode

SMBus mode is enabled when a one is written to TWIHS\_CR.SMBEN. SMBus mode operation is similar to I<sup>2</sup>C operation with the following exceptions:

- Only 7-bit addressing can be used.
- The SMBus standard describes a set of timeout values to ensure progress and throughput on the bus. These timeout values must be programmed into TWIHS\_SMBTR.
- Transmissions can optionally include a CRC byte, called Packet Error Check (PEC).
- A set of addresses has been reserved for protocol handling, such as alert response address (ARA) and host header (HH) address. Address matching on these addresses can be enabled by configuring TWIHS\_CR.

##### 45.6.3.10.1 Packet Error Checking

Each SMBus transfer can optionally end with a CRC byte, called the PEC byte. Writing a one to TWIHS\_CR.PECEN enables automatic PEC handling in the current transfer. Transfers with and without PEC can be intermixed in the same system, since some slaves may not support PEC. The PEC LFSR is always updated on every bit transmitted or received, so that PEC handling on combined transfers is correct.

In Master Transmitter mode, the master calculates a PEC value and transmits it to the slave after all data bytes have been transmitted. Upon reception of this PEC byte, the slave compares it to the PEC value it has computed itself. If the values match, the data was received correctly, and the slave returns an ACK to the master. If the PEC values differ, data was corrupted, and the slave returns a NACK value. Some slaves may not be able to check the received PEC in time to return a NACK if an error occurred. In this case, the slave should always return an ACK after the PEC byte, and another method must be used to verify that the transmission was received correctly.

In Master Receiver mode, the slave calculates a PEC value and transmits it to the master after all data bytes have been transmitted. Upon reception of this PEC byte, the master compares it to the PEC value it has computed itself. If the values match, the data was received correctly. If the PEC values differ, data was corrupted, and TWIHS\_SR.PECERR is set. In Master Receiver mode, the PEC byte is always followed by a NACK transmitted by the master, since it is the last byte in the transfer.

In combined transfers, the PECRQ bit should only be set in the last of the combined transfers.

If the Alternative Command mode is enabled, only the NPEC bit should be set.

Consider the following transfer:

S, ADR+W, COMMAND\_BYTE, ACK, SR, ADR+R, DATA\_BYTE, ACK, PEC\_BYTE, NACK, P

See [Read/Write Flowcharts](#) for detailed flowcharts.

### 45.6.3.10.2 Timeouts

The TLOWS and TLOWM fields in TWIHS\_SMBTR configure the SMBus timeout values. If a timeout occurs, the master transmits a STOP condition and leaves the bus. The TOUT bit is also set in TWIHS\_SR.

### 45.6.3.11 SMBus Quick Command (Master Mode Only)

The TWIHS can perform a quick command by following these steps:

1. Configure the Master mode (DADR, CKDIV, etc).
2. Write TWIHS\_MMR.MREAD at the value of the one-bit command to be sent.
3. Start the transfer by setting TWIHS\_CR.QUICK.

If alternative command is used (ACMEN bit set to '1'), DATAL field must be set to 0.

**Figure 45-13. SMBus Quick Command**

### 45.6.3.12 Alternative Command

Another way to configure the transfer is to enable the Alternative Command mode with the ACMEN bit of the [TWIHS Control Register](#).

In this mode, the transfer is configured through the [TWIHS Alternative Command Register](#). It is possible to define a simple read or write transfer or a combined transfer with a repeated start.

In order to set a simple transfer, the DATAL field and the DIR field of the [TWIHS Alternative Command Register](#) must be filled accordingly and the NDATAL field must be cleared. To begin the transfer, either set the START bit in the [TWIHS Control Register](#) in case of a read transfer, or write the [TWIHS Transmit Holding Register](#) in case of a write transfer.

For a combined transfer linked by a repeated start, the NDATAL field must be filled with the length of the second transfer and NDIR with the corresponding direction.

The PEC and NPEC bits are used to set a PEC field. In the case of a single transfer with PEC, the PEC bit must be set. In the case of a combined transfer, the NPEC bit must be set.

**Note:** If Alternative Command mode is used, TWIHS\_MMR.IADRSZ must be set to 0.

See [Read/Write Flowcharts](#) for detailed flowcharts.

### 45.6.3.13 Handling Errors in Alternative Command

If a NACK is generated by a slave device or SMBus timeout error, the TWIHS stops the frame immediately, although the DMA transfer may still be active. To prevent a new frame from being restarted

with the remaining DMA data (transmit), the TWIHS prevents any start of frame until the LOCK flag is cleared in the TWIHS\_SR.

TWIHS\_SR.LOCK indicates the state of the TWIHS (locked or not locked).

When the TWIHS is locked, no transfer begins until the LOCK is cleared by TWIHS\_CR.LOCKCLR and error flags are cleared by reading the TWIHS\_SR.

In case of error, the TWIHS\_THR may have been loaded with a new data. TWIHS\_CR.THRCLR can be used to flush the TWIHS\_THR. If THRCLR is set, the TXRDY and TXCOMP flags are set.

#### 45.6.3.14 Read/Write Flowcharts

The flowcharts give examples for read and write operations. A polling or interrupt method can be used to check the status bits. The interrupt method requires that TWIHS\_IER be configured first.

**Figure 45-27. TWIHS Read Operation with Multiple Data Bytes + Write with Alternative Command Mode with PEC**

### 45.6.4 Multimaster Mode

#### 45.6.4.1 Definition

In Multimaster mode, more than one master may handle the bus at the same time without data corruption by using arbitration.

Arbitration starts as soon as two or more masters place information on the bus at the same time, and stops (arbitration is lost) for the master that intends to send a logical one while the other master sends a logical zero.

As soon as arbitration is lost by a master, it stops sending data and listens to the bus in order to detect a stop. When the stop is detected, the master that has lost arbitration may put its data on the bus by respecting arbitration.

Arbitration is illustrated in [Arbitration Cases](#).

### 45.6.4.2 Different Multimaster Modes

Two Multimaster modes may be distinguished:

1. The TWIHS is considered as a master only and is never addressed.
2. The TWIHS may be either a master or a slave and may be addressed.

**Note:** Arbitration is supported in both Multimaster modes.

#### 45.6.4.2.1 TWIHS as Master Only

In this mode, the TWIHS is considered as a master only (MSEN is always at one) and must be driven like a master with the ARBLST (Arbitration Lost) flag in addition.

If arbitration is lost (ARBLST = 1), the user must reinitiate the data transfer.

If starting a transfer (ex.: DADR + START + W + Write in THR) and if the bus is busy, the TWIHS automatically waits for a STOP condition on the bus to initiate the transfer (see [User Sends Data While the Bus is Busy](#)).

**Note:** The state of the bus (busy or free) is not indicated in the user interface.

#### 45.6.4.2.2 TWIHS as Master or Slave

The automatic reversal from master to slave is not supported in case of a lost arbitration.

Then, in the case where TWIHS may be either a master or a slave, the user must manage the pseudo Multimaster mode described in the steps below:

1. Program the TWIHS in Slave mode (SADR + MSDIS + SVEN) and perform a slave access (if TWIHS is addressed).
2. If the TWIHS has to be set in Master mode, wait until TXCOMP flag is at 1.
3. Program the Master mode (DADR + SVDIS + MSEN) and start the transfer (ex: START + Write in THR).
4. As soon as the Master mode is enabled, the TWIHS scans the bus in order to detect if it is busy or free. When the bus is considered free, the TWIHS initiates the transfer.
5. As soon as the transfer is initiated and until a STOP condition is sent, the arbitration becomes relevant and the user must monitor the ARBLST flag.
6. If the arbitration is lost (ARBLST is set to 1), the user must program the TWIHS in Slave mode in case the master that won the arbitration needs to access the TWIHS.
7. If the TWIHS has to be set in Slave mode, wait until the TXCOMP flag is at 1 and then program the Slave mode.

**Note:** If the arbitration is lost and the TWIHS is addressed, the TWIHS does not acknowledge, even if it is programmed in Slave mode as soon as ARBLST is set to 1. Then the master must repeat SADR.

**Figure 45-28. User Sends Data While the Bus is Busy**

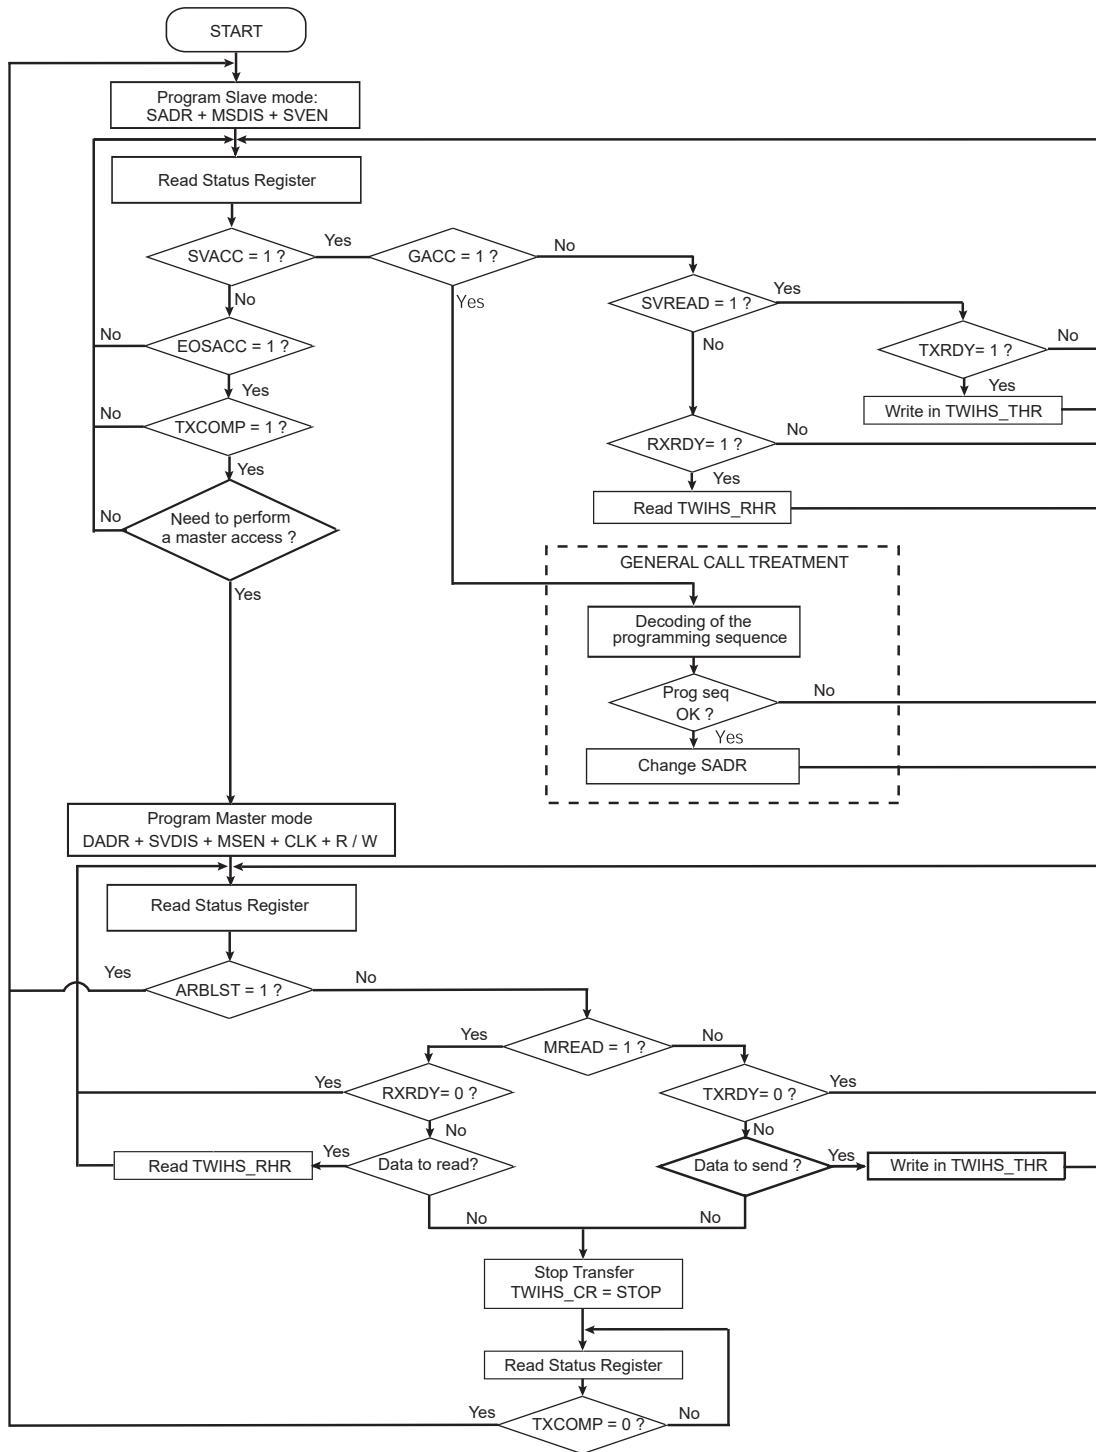

**Figure 45-29. Arbitration Cases**

The flowchart below gives an example of read and write operations in Multimaster mode.

**Figure 45-30. Multimaster Flowchart**

### 45.6.5 Slave Mode

#### 45.6.5.1 Definition

Slave mode is defined as a mode where the device receives the clock and the address from another device called the master.

In this mode, the device never initiates and never completes the transmission (START, REPEATED\_START and STOP conditions are always provided by the master).

### 45.6.5.2 Programming Slave Mode

The following fields must be programmed before entering Slave mode:

1. TWIHS\_SMR.SADR: The slave device address is used in order to be accessed by master devices in Read or Write mode.
2. (Optional) TWIHS\_SMR.MASK can be set to mask some SADR address bits and thus allow multiple address matching.
3. TWIHS\_CR.MSDIS: Disables the Master mode.
4. TWIHS\_CR.SVEN: Enables the Slave mode.

As the device receives the clock, values written in TWIHS\_CWGR are ignored.

### 45.6.5.3 Receiving Data

After a START or REPEATED START condition is detected, and if the address sent by the master matches the slave address programmed in the SADR (Slave Address) field, the SVACC (Slave Access) flag is set and SVREAD (Slave Read) indicates the direction of the transfer.

SVACC remains high until a STOP condition or a REPEATED START is detected. When such a condition is detected, the EOSACC (End Of Slave Access) flag is set.

#### 45.6.5.3.1 Read Sequence

In the case of a read sequence (SVREAD is high), the TWIHS transfers data written in the TWIHS\_THR until a STOP condition or a REPEATED\_START + an address different from SADR is detected. Note that at the end of the read sequence TXCOMP (Transmission Complete) flag is set and SVACC reset.

As soon as data is written in the TWIHS\_THR, TXRDY (Transmit Holding Register Ready) flag is reset, and it is set when the internal shifter is empty and the sent data acknowledged or not. If the data is not acknowledged, the NACK flag is set.

Note that a STOP or a REPEATED START always follows a NACK.

To clear the TXRDY flag, first set TWIHS\_CR.SVDIS, then set TWIHS\_CR.SVEN.

See [Read Access Ordered by a Master](#).

#### 45.6.5.3.2 Write Sequence

In the case of a write sequence (SVREAD is low), the RXRDY (Receive Holding Register Ready) flag is set as soon as a character has been received in TWIHS\_RHR. RXRDY is reset when reading TWIHS\_RHR.

The TWIHS continues receiving data until a STOP condition or a REPEATED\_START + an address different from SADR is detected. Note that at the end of the write sequence, the TXCOMP flag is set and SVACC is reset.

See [Write Access Ordered by a Master](#).

#### 45.6.5.3.3 Clock Stretching Sequence

If TWIHS\_THR or TWIHS\_RHR is not written/read in time, the TWIHS performs a clock stretching.

Clock stretching information is given by the SCLWS (Clock Wait State) bit.

See [Clock Stretching in Read Mode](#) and [Clock Stretching in Write Mode](#).

**Note:** Clock stretching can be disabled by configuring the SCLWSDIS bit in TWIHS\_SMR. In that case, the UNRE and OVRE flags indicate an underrun (when TWIHS\_THR is not filled on time) or an overrun (when TWIHS\_RHR is not read on time).

### 45.6.5.3.4 General Call

In the case where a GENERAL CALL is performed, the GACC (General Call Access) flag is set.

After GACC is set, the user must interpret the meaning of the GENERAL CALL and decode the new address programming sequence.

See [Master Performs a General Call](#).

### 45.6.5.4 Data Transfer

#### 45.6.5.4.1 Read Operation

The Read mode is defined as a data requirement from the master.

After a START or a REPEATED START condition is detected, the decoding of the address starts. If the slave address (SADR) is decoded, SVACC is set and SVREAD indicates the direction of the transfer.

Until a STOP or REPEATED START condition is detected, the TWIHS continues sending data loaded in TWIHS\_THR.

If a STOP condition or a REPEATED START + an address different from SADR is detected, SVACC is reset.

The figure below describes the read operation.

**Figure 45-31. Read Access Ordered by a Master**

**Note:**

1. When SVACC is low, the state of SVREAD becomes irrelevant.
2. TXRDY is reset when data has been transmitted from TWIHS\_THR to the internal shifter and set when this data has been acknowledged or non acknowledged.

#### 45.6.5.4.2 Write Operation

The Write mode is defined as a data transmission from the master.

After a START or a REPEATED START, the decoding of the address starts. If the slave address is decoded, SVACC is set and SVREAD indicates the direction of the transfer (SVREAD is low in this case).

Until a STOP or REPEATED START condition is detected, the TWIHS stores the received data in TWIHS\_RHR.

If a STOP condition or a REPEATED START + an address different from SADR is detected, SVACC is reset.

The figure below describes the write operation.

**Figure 45-32. Write Access Ordered by a Master**

**Note:**

1. When SVACC is low, the state of SVREAD becomes irrelevant.
2. RXRDY is set when data has been transmitted from the internal shifter to TWIHS\_RHR and reset when this data is read.

**45.6.5.4.3 General Call**

The general call is performed in order to change the address of the slave.

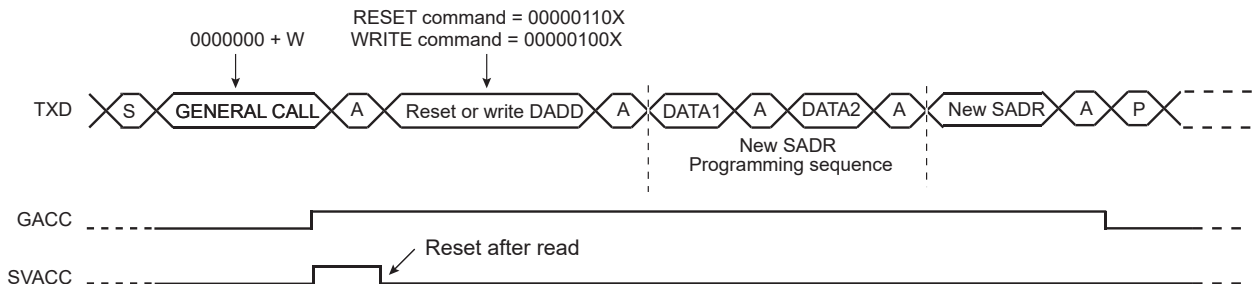

If a GENERAL CALL is detected, GACC is set.

After the detection of general call, decode the commands that follow.

In case of a WRITE command, decode the programming sequence and program a new SADR if the programming sequence matches.

The figure below describes the general call access.

**Figure 45-33. Master Performs a General Call**

**Note:** This method enables the user to create a personal programming sequence by choosing the programming bytes and their number. The programming sequence has to be provided to the master.

**45.6.5.4.4 Clock Stretching**

In both Read and Write modes, it may occur that TWIHS\_THR/TWIHS\_RHR buffer is not filled/emptied before the transmission/reception of a new character. In this case, to avoid sending/receiving undesired data, a clock stretching mechanism is implemented.

**Note:** Clock stretching can be disabled by setting TWIHS\_SMR.SCLWSDIS. In that case the UNRE and OVRE flags indicate an underrun (when TWIHS\_THR is not filled on time) or an overrun (when TWIHS\_RHR is not read on time).

**Clock Stretching in Read Mode**

The clock is tied low if the internal shifter is empty and if a STOP or REPEATED START condition was not detected. It is tied low until the internal shifter is loaded.

The figure below describes the clock stretching in Read mode.

**Figure 45-34. Clock Stretching in Read Mode**

**Note:**

1. TXRDY is reset when data has been written in TWIHS\_THR to the internal shifter and set when this data has been acknowledged or non acknowledged.
2. At the end of the read sequence, TXCOMP is set after a STOP or after a REPEATED\_START + an address different from SADR.
3. SCLWS is automatically set when the clock stretching mechanism is started.

**Clock Stretching in Write Mode**

The clock is tied low if the internal shifter and TWIHS\_RHR is full. If a STOP or REPEATED\_START condition was not detected, it is tied low until TWIHS\_RHR is read.

The figure below describes the clock stretching in Write mode.

**Figure 45-35. Clock Stretching in Write Mode**

**Note:**

1. At the end of the read sequence, TXCOMP is set after a STOP or after a REPEATED\_START + an address different from SADR.
2. SCLWS is automatically set when the clock stretching mechanism is started and automatically reset when the mechanism is finished.

### 45.6.5.4.5 Reversal after a Repeated Start

#### **Reversal of Read to Write**

The master initiates the communication by a read command and finishes it by a write command.

The figure below describes the REPEATED START and the reversal from Read mode to Write mode.

**Figure 45-36. Repeated Start and Reversal from Read Mode to Write Mode**

**Note:** TXCOMP is only set at the end of the transmission. This is because after the REPEATED START, SADR is detected again.

#### **Reversal of Write to Read**

The master initiates the communication by a write command and finishes it by a read command. The figure below describes the REPEATED START and the reversal from Write mode to Read mode.

**Figure 45-37. Repeated Start and Reversal from Write Mode to Read Mode**

**Note:**

1. In this case, if TWIHS\_THR has not been written at the end of the read command, the clock is automatically stretched before the ACK.
2. TXCOMP is only set at the end of the transmission. This is because after the REPEATED START, SADR is detected again.

### 45.6.5.5 Using the DMA Controller (DMAC) in Slave Mode

The use of the DMAC significantly reduces the CPU load.

#### 45.6.5.5.1 Data Transmit with the DMA in Slave Mode

The following procedure shows an example to transmit data with DMA.

1. Initialize the transmit DMA (memory pointers, transfer size, etc).

2. Configure the Slave mode.
3. Enable the DMA.
4. Wait for the DMA status flag indicating that the buffer transfer is complete.
5. Disable the DMA.
6. (Only if peripheral clock must be disabled) Wait for the TXCOMP flag to be raised in TWIHS\_SR.

#### 45.6.5.5.2 Data Receive with the DMA in Slave Mode

The following procedure shows an example to transmit data with DMA where the number of characters to receive is known.

1. Initialize the DMA (channels, memory pointers, size, etc.).
2. Configure the Slave mode.
3. Enable the DMA.
4. Wait for the DMA status flag indicating that the buffer transfer is complete.
5. Disable the DMA.
6. (Only if peripheral clock must be disabled) Wait for the TXCOMP flag to be raised in TWIHS\_SR.

#### 45.6.5.6 SMBus Mode

SMBus mode is enabled when a one is written to TWIHS\_CR.SMBEN. SMBus mode operation is similar to I<sup>2</sup>C operation with the following exceptions:

- Only 7-bit addressing can be used.
- The SMBus standard describes a set of timeout values to ensure progress and throughput on the bus. These timeout values must be programmed into the TWIHS\_SMBTR.
- Transmissions can optionally include a CRC byte, called Packet Error Check (PEC).
- A set of addresses have been reserved for protocol handling, such as alert response address (ARA) and host header (HH) address. Address matching on these addresses can be enabled by configuring the TWIHS\_CR.

##### 45.6.5.6.1 Packet Error Checking

Each SMBus transfer can optionally end with a CRC byte, called the PEC byte. Writing a one to TWIHS\_CR.PECEN will send/check the PEC field in the current transfer. The PEC generator is always updated on every bit transmitted or received, so that PEC handling on the following linked transfers is correct.

In Slave Receiver mode, the master calculates a PEC value and transmits it to the slave after all data bytes have been transmitted. Upon reception of this PEC byte, the slave compares it to the PEC value it has computed itself. If the values match, the data was received correctly, and the slave returns an ACK to the master. If the PEC values differ, data was corrupted, and the slave returns a NACK value.

TWIHS\_SR.PECERR is set automatically if a PEC error occurred.

In Slave Transmitter mode, the slave calculates a PEC value and transmits it to the master after all data bytes have been transmitted. Upon reception of this PEC byte, the master compares it to the PEC value it has computed itself. If the values match, the data was received correctly. If the PEC values differ, data was corrupted, and the master must take appropriate action.

See [Slave Read Write Flowcharts](#) for detailed flowcharts.

##### 45.6.5.6.2 Timeouts

The TWIHS SMBus Timing Register (TWIHS\_SMBTR) configures the SMBus timeout values. If a timeout occurs, the slave leaves the bus. The TOUT bit is also set in TWIHS\_SR.

### 45.6.5.7 High-Speed Slave Mode

High-speed mode is enabled when a one is written to TWIHS\_CR.HSEN. Furthermore, the analog pad filter must be enabled, a one must be written to TWIHS\_FILTR.PADFEN and the FILT bit must be cleared. TWIHS High-speed mode operation is similar to TWIHS operation with the following exceptions:

1. A master code is received first at normal speed before entering High-speed mode period.
2. When TWIHS High-speed mode is active, clock stretching is only allowed after acknowledge (ACK), not-acknowledge (NACK), START (S) or REPEATED START (Sr) (as consequence OVF may happen).

TWIHS High-speed mode allows transfers of up to 3.4 Mbit/s.

The TWIHS slave in High-speed mode requires that the peripheral clock runs at a minimum of 14 MHz if slave clock stretching is enabled (SCLWSDIS bit at '0'). If slave clock stretching is disabled (SCLWSDIS bit at '1'), the peripheral clock must run at a minimum of 11 MHz (assuming the system has no latency).

**Note:** When slave clock stretching is disabled, the TWIHS\_RHR must always be read before receiving the next data (MASTER write frame). It is strongly recommended to use either the polling method on the RXRDY flag in TWIHS\_SR, or the DMA. If the receive is managed by an interrupt, the TWIHS interrupt priority must be set to the right level and its latency minimized to avoid receive overrun.

**Note:** When slave clock stretching is disabled, the TWIHS\_THR must be filled with the first data to send before the beginning of the frame (MASTER read frame). It is strongly recommended to use either the polling method on the TXRDY flag in TWIHS\_SR, or the DMA. If the transmit is managed by an interrupt, the TWIHS interrupt priority must be set to the right level and its latency minimized to avoid transmit underrun.

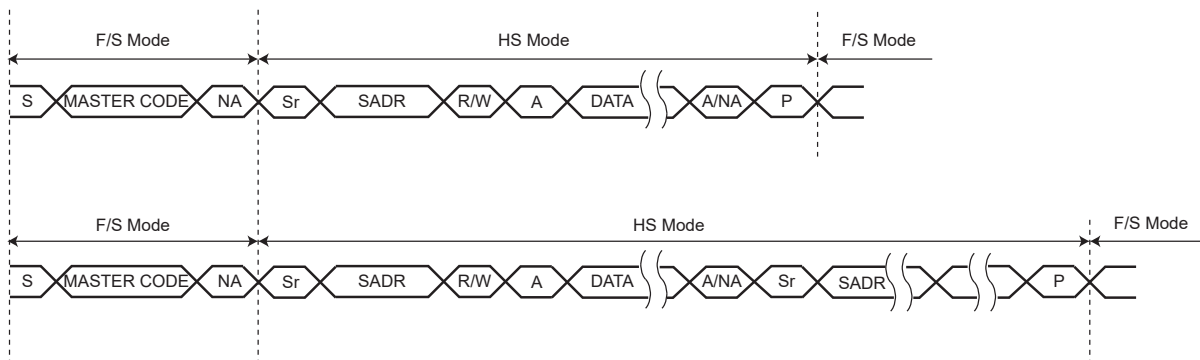

#### 45.6.5.7.1 Read/Write Operation

A TWIHS high-speed frame always begins with the following sequence:

1. START condition (S)
2. Master Code (0000 1XXX)
3. Not-acknowledge (NACK)

When the TWIHS is programmed in Slave mode and TWIHS High-speed mode is activated, master code matching is activated and internal timings are set to match the TWIHS High-speed mode requirements.

**Figure 45-38. High-Speed Mode Read/Write**

#### 45.6.5.7.2 Usage

TWIHS High-speed mode usage is the same as the standard TWIHS (See [Read/Write Flowcharts](#)).

#### 45.6.5.8 Alternative Command

In Slave mode, Alternative Command mode is useful when SMBus mode is enabled to send or check the PEC byte.

Alternative Command mode is enabled by setting the ACMEN bit of the [TWIHS Control Register](#) and the transfer is configured in TWIHS\_ACR.

For a combined transfer with PEC, only TWIHS\_ACR.NPEC must be set as the PEC byte is sent once at the end of the frame.

See [Slave Read Write Flowcharts](#) for detailed flowcharts.

#### 45.6.5.9 Asynchronous Partial Wakeup (SleepWalking)

The TWIHS includes an asynchronous start condition detector. It is capable of waking the device up from a Sleep mode upon an address match (and optionally an additional data match), including Sleep modes where the TWIHS peripheral clock is stopped.

After detecting the START condition on the bus, the TWIHS stretches TWCK until the TWIHS peripheral clock has started. The time required for starting the TWIHS depends on which Sleep mode the device is in. After the TWIHS peripheral clock has started, the TWIHS releases its TWCK stretching and receives one byte of data (slave address) on the bus. At this time, only a limited part of the device, including the TWIHS module, receives a clock, thus saving power. If the address phase causes a TWIHS address match (and, optionally, if the first data byte causes data match as well), the entire device is woken up and normal TWIHS address matching actions are performed. Normal TWIHS transfer then follows. If the TWIHS is not addressed (or if the optional data match fails), the TWIHS peripheral clock is automatically stopped and the device returns to its original Sleep mode.

The TWIHS has the capability to match on more than one address. The SADR1EN, SADR2EN and SADR3EN bits in TWIHS\_SMR enable address matching on additional addresses which can be configured through SADR1, SADR2 and SADR3 fields in the TWIHS\_SWMR. The SleepWalking matching process can be extended to the first received data byte if TWIHS\_SMR.DATAMEN is set and, in this case, a complete matching includes address matching and first received data matching. TWIHS\_SWMR.DATAM configures the data to match on the first received byte.

When the system is in Active mode and the TWIHS enters Asynchronous Partial Wakeup mode, the flag SVACC must be programmed as the unique source of the TWIHS interrupt and the data match comparison must be disabled.

When the system exits Wait mode as the result of a matching condition, the SVACC flag is used to determine if the TWIHS is the source of exit.

**Figure 45-39. Address Match Only (Data Matching Disabled)**

**Figure 45-40. No Address Match (Data Matching Disabled)**

**Figure 45-41. Address Match and Data Match (Data Matching Enabled)**

**Figure 45-42. Address Match and No Data Match (Data Matching Enabled)**

### 45.6.5.10 Slave Read Write Flowcharts

The flowchart below illustrates an example of read and write operations in Slave mode. A polling or interrupt method can be used to check the status bits. The interrupt method requires that TWIHS\_IER be configured first.

**Figure 45-43. Read Write Flowchart in Slave Mode**

**Figure 45-44. Read Write Flowchart in Slave Mode with SMBus PEC**

**Figure 45-45. Read Write Flowchart in Slave Mode with SMBus PEC and Alternative Command Mode**

### 45.6.6 FIFOs

#### 45.6.6.1 Overview

The TWI includes two FIFOs which can be enabled/disabled using TWIHS\_CR.FIFOEN/FIFODIS. Both Master and Slave modes must be disabled before enabling or disabling the FIFOs (TWIHS\_CR.MSDIS/SVDIS).

Writing TWIHS\_CR.FIFOEN to '1' enables a 16-data Transmit FIFO and a 16-data Receive FIFO.

It is possible to write or to read single or multiple data in the same access to TWIHS\_THR/RHR, depending on TWIHS\_FMR.TXRDYM/RXRDM settings.

**Figure 45-46. FIFOs Block Diagram**

**45.6.6.2 Sending Data with FIFO Enabled**

When the Transmit FIFO is enabled, write access to TWIHS\_THR loads the Transmit FIFO.

The Transmit FIFO level is provided in TWIHS\_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor TWIHS\_SR.TXRDY and the data can be successively written in TWIHS\_THR.

If the FIFO cannot accept the data due to insufficient space, wait for the TXRDY flag to be set before writing the data in TWIHS\_THR.

When the space in the FIFO allows only a portion of the data to be written, the TXRDY flag must be monitored before writing the remaining data.

See the figure below and the figure [Sending/Receiving Data with FIFO Enabled in Slave Mode](#).

**Figure 45-47. Sending Data with FIFO Enabled in Master Mode**

### 45.6.6.3 Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, TWIHS\_RHR access reads the FIFO.

When data are present in the Receive FIFO (RXRDY flag set to '1'), the exact number of data can be checked with TWIHS\_FLR.RXFL. All the data can be read successively in TWIHS\_RHR without checking the TWIHS\_SR.RXRDY flag between each access.

See the figure below and the figure [Sending/Receiving Data with FIFO Enabled in Slave Mode](#).

**Figure 45-48. Receiving Data with FIFO Enabled in Master Mode**

#### 45.6.6.4 Sending/Receiving with FIFO Enabled in Slave Mode

See sections [45.6.6.2 Sending Data with FIFO Enabled](#) and [45.6.6.3 Receiving Data with FIFO Enabled](#) for details.

**Figure 45-49. Sending/Receiving Data with FIFO Enabled in Slave Mode**

#### 45.6.6.5 Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using TWIHS\_CR.TXFCLR/RXFCLR.

#### 45.6.6.6 TXRDY and RXRDY Behavior

TWIHS\_SR.TXRDY/RXRDY flags display a specific behavior when FIFOs are enabled.

TXRDY indicates if a data can be written in the Transmit FIFO. Thus the TXRDY flag is set as long as the Transmit FIFO can accept new data. See figure [Figure 45-50](#).

RXRDY indicates if an unread data is present in the Receive FIFO. Thus the RXRDY flag is set as soon as one unread data is in the Receive FIFO. Refer to figure [Figure 45-51](#).

TXRDY and RXRDY behavior can be modified using the TXRDYM and RXRDYM fields in the TWI FIFO Mode Register (TWIHS\_FMR) to reduce the number of accesses to TWIHS\_THR/RHR.

As an example, in Master mode, the Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0.

See TWI FIFO Mode Register for the FIFO configuration.

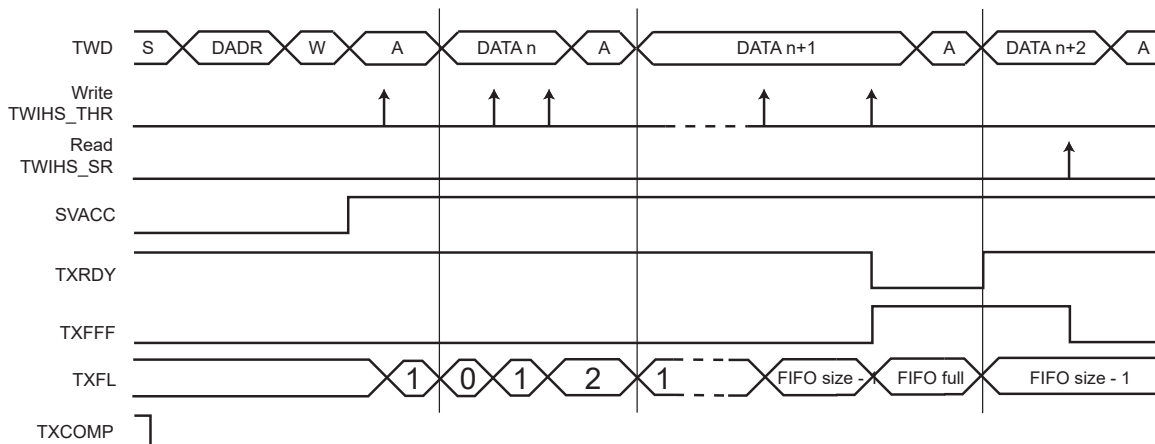

**Figure 45-50. TXRDY Behavior when TXRDYM = 0 in Master Mode**

**Figure 45-51. RXRDY Behavior when RXRDYM = 0 in Master and Slave Modes**

**Figure 45-52. TXRDY Behavior when TXRDYM = 0 in Slave Mode**

#### 45.6.6.7 Single Data Mode

In Single Data mode, only one data is written every time TWIHS\_THR is accessed, and only one data is read every time TWIHS\_RHR is accessed.

When TWIHS\_FMR.TXRDYM = 0, the Transmit FIFO operates in Single Data mode.

When TWIHS\_FMR.RXRDYM = 0, the Receive FIFO operates in Single Data mode.

See sections [45.7.18 TWIHS\\_THR](#) and [45.7.15 TWIHS\\_RHR](#).

#### 45.6.6.8 Multiple Data Mode

Multiple Data mode minimizes the number of accesses by concatenating the data to send/read in one access.

When TWIHS\_FMR.TXRDYM > 0, the Transmit FIFO operates in Multiple Data mode.

When TWIHS\_FMR.RXRDYM > 0, the Receive FIFO operates in Multiple Data mode.

In Multiple Data mode, it is possible to write/read up to four data in one TWIHS\_THR/TWIHS\_RHR register access.

The number of data to write/read is defined by the size of the register access. If the access is a byte-size register access, only one data is written/read. If the access is a halfword size register access, then up to two data are read and only one data is written. Lastly, if the access is a wordsize register access, then up to four data are read and up to two data are written.

Written/Read data are always right-aligned, as described in sections [45.7.16 TWIHS\\_RHR \(FIFO\\_ENABLED\)](#) and [45.7.19 TWIHS\\_THR \(FIFO\\_ENABLED\)](#).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six TWIHS\_THR-byte write accesses
- three TWIHS\_THR-halfword write accesses
- one TWIHS\_THR-word write access and one TWIHS\_THR halfword write access

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six TWIHS\_RHR-byte read accesses
- three TWIHS\_RHR-halfword read accesses
- one TWIHS\_RHR-word read access and one TWIHS\_RHR-halfword read access

##### 45.6.6.8.1 TXRDY and RXRDY Configuration

In Multiple Data mode, it is possible to write one or more data in the same TWIHS\_THR/TWIHS\_RHR access. The TXRDY flag indicates if one or more data can be written in the FIFO depending on the configuration of TWIHS\_FMR.TXRDYM/RXRDYM.

As an example, if two data are written each time in TWIHS\_THR, it is useful to configure the TXRDYM field to the value '1' so that the TXRDY flag is at '1' only when at least two data can be written in the Transmit FIFO.

In the same way, if four data are read each time in TWIHS\_RHR, it is useful to configure the RXRDYM field to the value '2' so that the RXRDY flag is at '1' only when at least four unread data are in the Receive FIFO.

##### 45.6.6.8.2 DMAC

When FIFOs operate in Multiple Data mode, the DMAC transfer type must be configured in byte, halfword or word depending on the TWIHS\_FMR.TXRDYM/RXRDYM settings.

#### 45.6.6.9 Transmit FIFO Lock

If a frame is terminated early due to a not-acknowledge error (NACK flag), SMBus timeout error (TOUT flag) or master code acknowledge error (MACK flag), a lock is set on the Transmit FIFO preventing any new frame from being sent until it is cleared. This allows clearing the FIFO if needed, resetting DMAC channels, etc., without any risk.

TWIHS\_SR.LOCK is used to check the state of the Transmit FIFO lock.

The Transmit FIFO lock can be cleared by setting TWIHS\_CR.TXFLCLR to '1'.

#### 45.6.6.10 FIFO Pointer Error

A FIFO overflow is reported in TWIHS\_FSR.

If the Transmit FIFO is full and a write access is performed on TWIHS\_THR, it generates a Transmit FIFO pointer error and sets TWIHS\_FSR.TXFPTEF.

In Multiple Data mode, if the number of data written in TWIHS\_THR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO pointer error is generated and TWIHS\_FSR.TXFPTEF is set.

A FIFO underflow is reported in TWIHS\_FSR.

In Multiple Data mode, if the number of data read in TWIHS\_RHR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO pointer error is generated and TWIHS\_FSR.RXFPTEF is set.

No pointer error occurs if the FIFO state/level is checked before writing/reading in TWIHS\_THR/TWIHS\_RHR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When a pointer error occurs, other FIFO flags may not behave as expected; their states should be ignored.

If a Transmit or Receive pointer error occurs, a software reset must be performed using TWIHS\_CR.SWRST. Note that issuing a software while transmitting might leave a slave in an unknown state holding the TWD line. In such case, a Bus Clear Command will allow to make the slave release the TWD line (the first frame sent after might not be received properly by the slave).

#### 45.6.6.11 FIFO Thresholds

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using the field TWIHS\_FMR.TXFTHRES. Each time the Transmit FIFO level goes from 'above threshold' to 'equal to or below threshold', the flag TWIHS\_FESR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field TWIHS\_FMR.RXFTHRES. Each time the Receive FIFO level goes from 'below threshold' to 'equal to or above threshold', the flag TWIHS\_FESR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF and RXFTHF flags can be configured to generate an interrupt using TWIHS\_FIER and TWIHS\_FIDR.

#### 45.6.6.12 FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through TWIHS\_FIER and TWIHS\_FIDR.

FIFO flags state can be read in TWIHS\_FSR. They are cleared when TWIHS\_FSR is read.

### 45.6.7 TWIHS Comparison Function on Received Character

The comparison function differs if asynchronous partial wakeup (SleepWalking) is enabled or not.

If asynchronous partial wakeup is disabled (see the section “Power Management Controller (PMC)”), the TWIHS can extend the address matching on up to three slave addresses. The SADR1EN, SADR2EN and SADR3EN bits in TWIHS\_SMR enable address matching on additional addresses which can be configured through SADR1, SADR2 and SADR3 fields in the TWIHS\_SWMR. The DATAMEN bit in the TWIHS\_SMR has no effect.

The SVACC bit is set when there is a comparison match with the received slave address.

### 45.6.8 Register Write Protection

To prevent any single software error from corrupting TWIHS behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [TWIHS Write Protection Mode Register](#) (TWIHS\_WPMR).

If a write access to a write-protected register is detected, the WPVS bit in the [TWIHS Write Protection Status Register](#) (TWIHS\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading TWIHS\_WPSR.

The following registers can be write-protected:

- [TWIHS Slave Mode Register](#)
- [TWIHS Clock Waveform Generator Register](#)
- [TWIHS SMBus Timing Register](#)
- [TWIHS SleepWalking Matching Register](#)

### 45.7 Register Summary

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	SWRST	QUICK	SVDIS	SVEN	MSDIS	MSEN	STOP	START
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

#### Bit 29 – FIFODIS FIFO Disable

Value	Description
0	No effect.
1	Disables the Transmit and Receive FIFOs.

#### Bit 28 – FIFOEN FIFO Enable

Value	Description
0	No effect.
1	Enables the Transmit and Receive FIFOs.

#### Bit 26 – LOCKCLR Lock Clear

Value	Description
0	No effect.
1	Clears the TWIHS FSM lock.

#### Bit 24 – THRCLR Transmit Holding Register Clear

Value	Description
0	No effect.
1	Clears the Transmit Holding Register and sets TXRDY, TXCOMP flags.

**Bit 17 – ACMDIS** Alternative Command Mode Disable

Value	Description
0	No effect.
1	Alternative Command mode disabled.

**Bit 16 – ACMEN** Alternative Command Mode Enable

Value	Description
0	No effect.
1	Alternative Command mode enabled.

**Bit 15 – CLEAR** Bus CLEAR Command

Value	Description
0	No effect.
1	If Master mode is enabled, sends a bus clear command.

**Bit 14 – PECRQ** PEC Request

Value	Description
0	No effect.
1	A PEC check or transmission is requested.

**Bit 13 – PECDIS** Packet Error Checking Disable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check disabled.

**Bit 12 – PECEN** Packet Error Checking Enable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check enabled.

**Bit 11 – SMBDIS** SMBus Mode Disabled

Value	Description
0	No effect.
1	SMBus mode disabled.

**Bit 10 – SMBEN** SMBus Mode Enabled

Value	Description
0	No effect.
1	If SMBDIS = 0, SMBus mode enabled.

**Bit 9 – HSDIS** TWIHS High-Speed Mode Disabled

Value	Description
0	No effect.
1	High-speed mode disabled.

**Bit 8 – HSEN** TWIHS High-Speed Mode Enabled

Value	Description
0	No effect.
1	High-speed mode enabled.

**Bit 7 – SWRST** Software Reset

Value	Description
0	No effect.
1	Equivalent to a system reset.

**Bit 6 – QUICK** SMBus Quick Command

Value	Description
0	No effect.
1	If Master mode is enabled, a SMBus Quick Command is sent.

**Bit 5 – SVDIS** TWIHS Slave Mode Disabled

Value	Description
0	No effect.
1	The Slave mode is disabled. The shifter and holding characters (if it contains data) are transmitted in case of read operation. In write operation, the character being transferred must be completely received before disabling.

**Bit 4 – SVEN** TWIHS Slave Mode Enabled

Switching from Master to Slave mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables the Slave mode (SVDIS must be written to 0).

**Bit 3 – MSDIS** TWIHS Master Mode Disabled

Value	Description
0	No effect.
1	The Master mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in case of write operation. In read operation, the character being transferred must be completely received before disabling.

**Bit 2 – MSEN** TWIHS Master Mode Enabled

Switching from Slave to Master mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables the Master mode (MSDIS must be written to 0).

**Bit 1 – STOP** Send a STOP Condition

Value	Description
0	No effect.

Value	Description
1	<p>STOP condition is sent just after completing the current byte transmission in Master Read mode.</p> <ul style="list-style-type: none"> <li>• In single data byte master read, both START and STOP must be set.</li> <li>• In multiple data bytes master read, the STOP must be set after the last data received but one.</li> <li>• In Master Read mode, if a NACK bit is received, the STOP is automatically performed.</li> <li>• In master data write operation, a STOP condition will be sent after the transmission of the current data is finished.</li> </ul>

**Bit 0 – START** Send a START Condition

This action is necessary when the TWIHS peripheral needs to read data from a slave. When configured in Master mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding Register (TWIHS\_THR).

Value	Description
0	No effect.
1	A frame beginning with a START bit is transmitted according to the features defined in the TWIHS Master Mode Register (TWIHS_MMR).

### 45.7.2 TWIHS Control Register (FIFO\_ENABLED)

**Name:** TWIHS\_CR (FIFO\_ENABLED)  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

This configuration is relevant only if TWIHS.CR.FIFOEN = '1'.

	Bit	31	30	29	28	27	26	25	24
				FIFODIS	FIFOEN		TXFLCLR	RXFCLR	TXFCLR
Access				W	W		W	W	W
Reset				–	–		–	–	–
	Bit	23	22	21	20	19	18	17	16
								ACMDIS	ACMEN
Access								W	W
Reset								–	–
	Bit	15	14	13	12	11	10	9	8
		CLEAR	PECRQ	PECDIS	PECEN	SMBDIS	SMBEN	HSDIS	HSEN
Access		W	W	W	W	W	W	W	W
Reset		–	–	–	–	–	–	–	–
	Bit	7	6	5	4	3	2	1	0
		SWRST	QUICK	SVDIS	SVEN	MSDIS	MSEN	STOP	START
Access		W	W	W	W	W	W	W	W
Reset		–	–	–	–	–	–	–	–

#### Bit 29 – FIFODIS FIFO Disable

Value	Description
0	No effect.
1	Disables the Transmit and Receive FIFOs.

#### Bit 28 – FIFOEN FIFO Enable

Value	Description
0	No effect.
1	Enables the Transmit and Receive FIFOs.

#### Bit 26 – TXFLCLR Transmit FIFO Lock CLEAR

Value	Description
0	No effect.
1	Clears the Transmit FIFO Lock.

#### Bit 25 – RXFCLR Receive FIFO Clear

Value	Description
0	No effect.

Value	Description
1	Clears the Receive FIFO, Receive FIFO will become empty.

**Bit 24 – TXFCLR** Transmit FIFO Clear

Value	Description
0	No effect.
1	Clears the Transmit FIFO, Transmit FIFO will become empty.

**Bit 17 – ACMDIS** Alternative Command Mode Disable

Value	Description
0	No effect.
1	Alternative Command mode disabled.

**Bit 16 – ACMEN** Alternative Command Mode Enable

Value	Description
0	No effect.
1	Alternative Command mode enabled.

**Bit 15 – CLEAR** Bus CLEAR Command

Value	Description
0	No effect.
1	If Master mode is enabled, sends a bus clear command.

**Bit 14 – PECRQ** PEC Request

Value	Description
0	No effect.
1	A PEC check or transmission is requested.

**Bit 13 – PECDIS** Packet Error Checking Disable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check disabled.

**Bit 12 – PECEN** Packet Error Checking Enable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check enabled.

**Bit 11 – SMBDIS** SMBus Mode Disabled

Value	Description
0	No effect.
1	SMBus mode disabled.

**Bit 10 – SMBEN** SMBus Mode Enabled

Value	Description
0	No effect.
1	If SMBDIS = 0, SMBus mode enabled.

**Bit 9 – HSDIS** TWIHS High-Speed Mode Disabled

Value	Description
0	No effect.
1	High-speed mode disabled.

**Bit 8 – HSEN** TWIHS High-Speed Mode Enabled

Value	Description
0	No effect.
1	High-speed mode enabled.

**Bit 7 – SWRST** Software Reset

Value	Description
0	No effect.
1	Equivalent to a system reset.

**Bit 6 – QUICK** SMBus Quick Command

Value	Description
0	No effect.
1	If Master mode is enabled, a SMBus Quick Command is sent.

**Bit 5 – SVDIS** TWIHS Slave Mode Disabled

Value	Description
0	No effect.
1	The Slave mode is disabled. The shifter and holding characters (if it contains data) are transmitted in case of read operation. In write operation, the character being transferred must be completely received before disabling.

**Bit 4 – SVEN** TWIHS Slave Mode Enabled

Switching from Master to Slave mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables the Slave mode (SVDIS must be written to 0).

**Bit 3 – MSDIS** TWIHS Master Mode Disabled

Value	Description
0	No effect.
1	The Master mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in case of write operation. In read operation, the character being transferred must be completely received before disabling.

**Bit 2 – MSEN** TWIHS Master Mode Enabled

Switching from Slave to Master mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables the Master mode (MSDIS must be written to 0).

**Bit 1 – STOP** Send a STOP Condition

Value	Description
0	No effect.
1	STOP condition is sent just after completing the current byte transmission in Master Read mode. <ul style="list-style-type: none"><li>• In single data byte master read, both START and STOP must be set.</li><li>• In multiple data bytes master read, the STOP must be set after the last data received but one.</li><li>• In Master Read mode, if a NACK bit is received, the STOP is automatically performed.</li><li>• In master data write operation, a STOP condition will be sent after the transmission of the current data is finished.</li></ul>

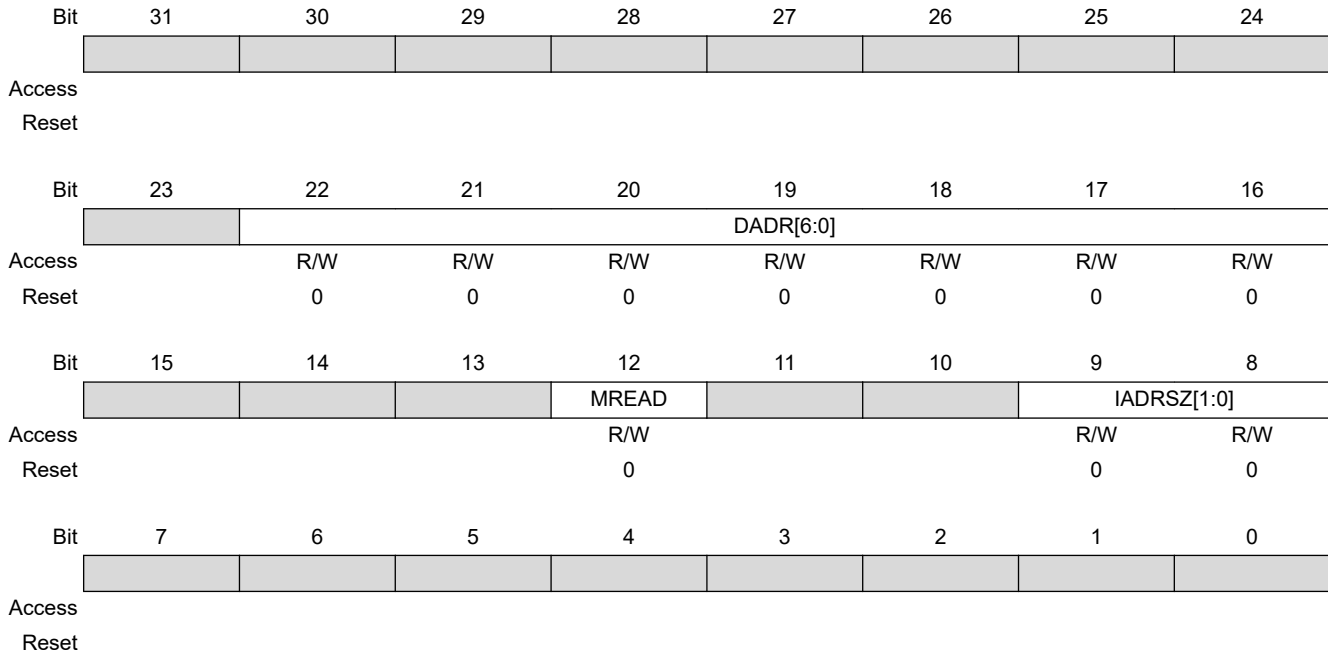

**Bit 0 – START** Send a START Condition

This action is necessary when the TWIHS peripheral needs to read data from a slave. When configured in Master mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding Register (TWIHS\_THR).

Value	Description
0	No effect.
1	A frame beginning with a START bit is transmitted according to the features defined in the TWIHS Master Mode Register (TWIHS_MMR).

### 45.7.3 TWIHS Master Mode Register

**Name:** TWIHS\_MMR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 22:16 – DADR[6:0]** Device Address

The device address is used to access slave devices in Read or Write mode. These bits are only used in Master mode.

**Bit 12 – MREAD** Master Read Direction

Value	Description
0	Master write direction.
1	Master read direction.

**Bits 9:8 – IADRSZ[1:0]** Internal Device Address Size

Value	Name	Description
0	NONE	No internal device address
1	1_BYTE	One-byte internal device address
2	2_BYTE	Two-byte internal device address
3	3_BYTE	Three-byte internal device address

### 45.7.4 TWIHS Slave Mode Register

**Name:** TWIHS\_SMR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TWIHS Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	DATAMEN	SADR3EN	SADR2EN	SADR1EN				
Access	R/W	R/W	R/W	R/W				
Reset	0	0	0	0				
Bit	23	22	21	20	19	18	17	16
	SADR[6:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	MASK[6:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
		SCLWSDIS			SMHH	SMDA		NACKEN
Access		R/W			R/W	R/W		R/W
Reset		0			0	0		0

#### Bit 31 – DATAMEN Data Matching Enable

Value	Description
0	Data matching on first received data is disabled.
1	Data matching on first received data is enabled.

#### Bit 30 – SADR3EN Slave Address 3 Enable

Value	Description
0	Slave address 3 matching is disabled.
1	Slave address 3 matching is enabled.

#### Bit 29 – SADR2EN Slave Address 2 Enable

Value	Description
0	Slave address 2 matching is disabled.
1	Slave address 2 matching is enabled.

#### Bit 28 – SADR1EN Slave Address 1 Enable

Value	Description
0	Slave address 1 matching is disabled.

Value	Description
1	Slave address 1 matching is enabled.

**Bits 22:16 – SADR[6:0]** Slave Address

The slave device address is used in Slave mode in order to be accessed by master devices in Read or Write mode.

SADR must be programmed before enabling the Slave mode or after a general call. Writes at other times have no effect.

**Bits 14:8 – MASK[6:0]** Slave Address Mask

A mask can be applied on the slave device address in Slave mode in order to allow multiple address answer. For each bit of the MASK field set to 1, the corresponding SADR bit is masked.

If the MASK field value is 0, no mask is applied to the SADR field.

**Bit 6 – SCLWSDIS** Clock Wait State Disable

Value	Description
0	No effect.
1	Clock stretching disabled in Slave mode, OVRE and UNRE indicate an overrun/underrun.

**Bit 3 – SMHH** SMBus Host Header

Value	Description
0	Acknowledge of the SMBus host header disabled.
1	Acknowledge of the SMBus host header enabled.

**Bit 2 – SMDA** SMBus Default Address

Value	Description
0	Acknowledge of the SMBus default address disabled.
1	Acknowledge of the SMBus default address enabled.

**Bit 0 – NACKEN** Slave Receiver Data Phase NACK enable

Value	Description
0	Normal value to be returned in the ACK cycle of the data phase in Slave Receiver mode.
1	NACK value to be returned in the ACK cycle of the data phase in Slave Receiver mode.

### 45.7.5 TWIHS Internal Address Register

**Name:** TWIHS\_IADR  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	IADR[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	IADR[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	IADR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 23:0 – IADR[23:0]** Internal Address  
 0, 1, 2 or 3 bytes depending on IADRSZ.

### 45.7.6 TWIHS Clock Waveform Generator Register

**Name:** TWIHS\_CWGR  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TWIHS Write Protection Mode Register](#). TWIHS\_CWGR is used in Master mode only.

	Bit	31	30	29	28	27	26	25	24
		HOLD[4:0]							
Access					R/W	R/W	R/W	R/W	R/W
Reset					0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
					CKSRC	CKDIV[2:0]			
Access					R/W		R/W	R/W	R/W
Reset					0		0	0	0
	Bit	15	14	13	12	11	10	9	8
		CHDIV[7:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		CLDIV[7:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0

**Bits 28:24 – HOLD[4:0]** TWD Hold Time Versus TWCK Falling

If High-speed mode is selected TWD is internally modified on the TWCK falling edge to meet the I2C specified maximum hold time, else if High-speed mode is not configured TWD is kept unchanged after TWCK falling edge for a period of  $(HOLD + 3) \times t_{\text{peripheral clock}}$ .

**Bit 20 – CKSRC** Transfer Rate Clock Source

Value	Name	Description
0	PERIPH_CK	Peripheral clock is used to generate the TWIHS baud rate.
1	GCLK	GCLK is used to generate the TWIHS baud rate.

**Bits 18:16 – CKDIV[2:0]** Clock Divider

The CKDIV is used to increase both SCL high and low periods.

**Bits 15:8 – CHDIV[7:0]** Clock High Divider

The SCL high period is defined as follows:

If CKSRC = 0

$$t_{\text{high}} = ((\text{CHDIV} \times 2^{\text{CKDIV}}) + 3) \times t_{\text{peripheral clock}}$$

If CKSRC = 1

$$t_{\text{high}} = (\text{CHDIV} \times 2^{\text{CKDIV}}) \times t_{\text{external clock}}$$

**Bits 7:0 – CLDIV[7:0]** Clock Low Divider

The SCL low period is defined as follows:

If CKSRC = 0

$$t_{\text{low}} = ((\text{CLDIV} \times 2^{\text{CKDIV}}) + 3) \times t_{\text{peripheral clock}}$$

If CKSRC = 1

$$t_{\text{low}} = (\text{CLDIV} \times 2^{\text{CKDIV}}) \times t_{\text{external clock}}$$

### 45.7.7 TWIHS Status Register

**Name:** TWIHS\_SR  
**Offset:** 0x20  
**Reset:** 0x03000009  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24	
							SDA	SCL	
Access							R	R	
Reset							1	1	
Bit	23	22	21	20	19	18	17	16	
	LOCK			SMBHMH	SMBDAM	PECERR	TOUT		
Access	R			R	R	R	R	R	
Reset	0			0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	
					EOSACC	SCLWS	ARBLST	NACK	
Access					R	R	R	R	
Reset					0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
	UNRE	OVRE	GACC	SVACC	SVREAD	TXRDY	RXRDY	TXCOMP	
Access	R	R	R	R	R	R	R	R	
Reset	0	0	0	0	1	0	0	1	

#### Bit 25 – SDA SDA Line Value

Value	Description
0	SDA line sampled value is '0'.
1	SDA line sampled value is '1'.

#### Bit 24 – SCL SCL Line Value

Value	Description
0	SCL line sampled value is '0'.
1	SCL line sampled value is '1'.

**Bit 23 – LOCK** TWIHS Lock due to Frame Errors (cleared by writing a one to bit LOCKCLR in TWIHS\_CR)

Value	Description
0	The TWIHS is not locked or LOCKCLR command issued in TWIHS_CR.
1	The TWIHS is locked due to frame errors (see <a href="#">Handling Errors in Alternative Command</a> ).

**Bit 21 – SMBHMH** SMBus Host Header Address Match (cleared on read)

Value	Description
0	No SMBus Host Header Address received since the last read of TWIHS_SR.

Value	Description
1	An SMBus Host Header Address was received since the last read of TWIHS_SR.

**Bit 20 – SMBDAM** SMBus Default Address Match (cleared on read)

Value	Description
0	No SMBus Default Address received since the last read of TWIHS_SR.
1	An SMBus Default Address was received since the last read of TWIHS_SR.

**Bit 19 – PECERR** PEC Error (cleared on read)

Value	Description
0	No SMBus PEC error occurred since the last read of TWIHS_SR.
1	An SMBus PEC error occurred since the last read of TWIHS_SR.

**Bit 18 – TOUT** Timeout Error (cleared on read)

Value	Description
0	No SMBus timeout occurred since the last read of TWIHS_SR.
1	An SMBus timeout occurred since the last read of TWIHS_SR.

**Bit 16 – MACK** Master Code Acknowledge (cleared on read)

MACK used in Slave mode:

Value	Description
0	No Master Code has been received since the last read of TWIHS_SR.
1	A Master Code has been received since the last read of TWIHS_SR.

**Bit 11 – EOSACC** End Of Slave Access (cleared on read)

This bit is used in Slave mode only.

EOSACC behavior can be seen in [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	A slave access is being performing.
1	The Slave Access is finished. End Of Slave Access is automatically set as soon as SVACC is reset.

**Bit 10 – SCLWS** Clock Wait State

This bit is used in Slave mode only.

SCLWS behavior can be seen in the figures, [Clock Stretching in Read Mode](#) and [Clock Stretching in Write Mode](#).

Value	Description
0	The clock is not stretched.
1	The clock is stretched. TWIHS_THR / TWIHS_RHR buffer is not filled / emptied before the transmission / reception of a new character.

**Bit 9 – ARBLST** Arbitration Lost (cleared on read)

This bit is used in Master mode only.

Value	Description
0	Arbitration won.
1	Arbitration lost. Another master of the TWIHS bus has won the multimaster arbitration. TXCOMP is set at the same time.

**Bit 8 – NACK** Not Acknowledged (cleared on read)

- NACK used in Master mode:

0: Each data byte has been correctly received by the far-end side TWIHS slave component.

1: A data or address byte has not been acknowledged by the slave component. Set at the same time as TXCOMP.

- NACK used in Slave Read mode:

0: Each data byte has been correctly received by the master.

1: In Read mode, a data byte has not been acknowledged by the master. When NACK is set, the user must not fill TWIHS\_THR even if TXRDY is set, because it means that the master stops the data transfer or re-initiate it.

**Note:** In Slave Write mode, all data are acknowledged by the TWIHS.

**Bit 7 – UNRE** Underrun Error (cleared on read)

This bit is used only if clock stretching is disabled.

Value	Description
0	TWIHS_THR has been filled on time.
1	TWIHS_THR has not been filled on time.

**Bit 6 – OVRE** Overrun Error (cleared on read)

This bit is used only if clock stretching is disabled.

Value	Description
0	TWIHS_RHR has not been loaded while RXRDY was set.
1	TWIHS_RHR has been loaded while RXRDY was set. Reset by read in TWIHS_SR when TXCOMP is set.

**Bit 5 – GACC** General Call Access (cleared on read)

This bit is used in Slave mode only.

GACC behavior can be seen in [Master Performs a General Call](#).

Value	Description
0	No general call has been detected.
1	A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes.

**Bit 4 – SVACC** Slave Access

This bit is used in Slave mode only.

SVACC behavior can be seen in [Read Access Ordered by a Master](#), [Clock Stretching in Read Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	TWIHS is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected.
1	Indicates that the address decoding sequence has matched (A master has sent SADR). SVACC remains high until a NACK or a STOP condition is detected.

### Bit 3 – SVREAD Slave Read

This bit is used in Slave mode only. When SVACC is low (no slave access has been detected) SVREAD is irrelevant.

SVREAD behavior can be seen in [Read Access Ordered by a Master](#), [Clock Stretching in Read Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	Indicates that a write access is performed by a master.
1	Indicates that a read access is performed by a master.

### Bit 2 – TXRDY Transmit Holding Register Ready (cleared by writing TWIHS\_THR)

- TXRDY used in Master mode:

0: The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into TWIHS\_THR.

1: As soon as a data byte is transferred from TWIHS\_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWIHS).

TXRDY behavior in Master mode can be seen in [Master Write with One Data Byte](#), [Master Write with Multiple Data Bytes](#) and [Master Write with One-Byte Internal Address and Multiple Data Bytes](#).

- TXRDY used in Slave mode:

0: As soon as data is written in the TWIHS\_THR, until this data has been transmitted and acknowledged (ACK or NACK).

1: Indicates that the TWIHS\_THR is empty and that data has been transmitted and acknowledged.

If TXRDY is high and if a NACK has been detected, the transmission is stopped. Thus when TRDY = NACK = 1, the user must not fill TWIHS\_THR to avoid losing it.

TXRDY behavior in Slave mode can be seen in [Read Access Ordered by a Master](#), [Clock Stretching in Read Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

### Bit 1 – RXRDY Receive Holding Register Ready (cleared by reading TWIHS\_RHR)

RXRDY behavior in Master mode can be seen in [Master Read with One Data Byte](#), [Master Read with Multiple Data Bytes](#) and [Master Read Clock Stretching with Multiple Data Bytes](#).

RXRDY behavior in Slave mode can be seen in [Write Access Ordered by a Master](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	No character has been received since the last TWIHS_RHR read operation.

Value	Description
1	A byte has been received in the TWIHS_RHR since the last read.

**Bit 0 – TXCOMP** Transmission Completed (cleared by writing TWIHS\_THR)

- TXCOMP used in Master mode:

0: During the length of the current frame.

1: When both holding register and internal shifter are empty and STOP condition has been sent.

TXCOMP behavior in Master mode can be seen in [Master Write with One-Byte Internal Address and Multiple Data Bytes](#) and in [Master Read with Multiple Data Bytes](#).

- TXCOMP used in Slave mode:

0: As soon as a START is detected.

1: After a STOP or a REPEATED START + an address different from SADR is detected.

TXCOMP behavior in Slave mode can be seen in [Clock Stretching in Read Mode](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

### 45.7.8 TWIHS Status Register (FIFO\_ENABLED)

**Name:** TWIHS\_SR (FIFO\_ENABLED)  
**Offset:** 0x20  
**Reset:** 0x03000009  
**Property:** Read-only

This configuration is relevant only if TWIHS\_CR.FIFOEN = '1'.

Bit	31	30	29	28	27	26	25	24	
							SDA	SCL	
Access							R	R	
Reset							1	1	
Bit	23	22	21	20	19	18	17	16	
	TXFLOCK			SMBHBM	SMBDAM	PECERR	TOUT		
Access	R			R	R	R	R	R	
Reset	0			0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	
					EOSACC	SCLWS	ARBLST	NACK	
Access					R	R	R	R	
Reset					0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
	UNRE	OVRE	GACC	SVACC	SVREAD	TXRDY	RXRDY	TXCOMP	
Access	R	R	R	R	R	R	R	R	
Reset	0	0	0	0	1	0	0	1	

#### Bit 25 – SDA SDA Line Value

Value	Description
0	SDA line sampled value is '0'.
1	SDA line sampled value is '1'.

#### Bit 24 – SCL SCL Line Value

Value	Description
0	SCL line sampled value is '0'.
1	SCL line sampled value is '1'.

#### Bit 23 – TXFLOCK Transmit FIFO Lock

Value	Description
0	The Transmit FIFO is not locked.
1	The Transmit FIFO is locked.

#### Bit 21 – SMBHBM SMBus Host Header Address Match (cleared on read)

Value	Description
0	No SMBus Host Header Address received since the last read of TWIHS_SR.

Value	Description
1	An SMBus Host Header Address was received since the last read of TWIHS_SR.

**Bit 20 – SMBDAM** SMBus Default Address Match (cleared on read)

Value	Description
0	No SMBus Default Address received since the last read of TWIHS_SR.
1	An SMBus Default Address was received since the last read of TWIHS_SR.

**Bit 19 – PECERR** PEC Error (cleared on read)

Value	Description
0	No SMBus PEC error occurred since the last read of TWIHS_SR.
1	An SMBus PEC error occurred since the last read of TWIHS_SR.

**Bit 18 – TOUT** Timeout Error (cleared on read)

Value	Description
0	No SMBus timeout occurred since the last read of TWIHS_SR.
1	An SMBus timeout occurred since the last read of TWIHS_SR.

**Bit 16 – MACK** Master Code Acknowledge (cleared on read)

- MACK used in Slave mode:

Value	Description
0	No Master Code has been received since the last read of TWIHS_SR.
1	A Master Code has been received since the last read of TWIHS_SR.

**Bit 11 – EOSACC** End Of Slave Access (cleared on read)

This bit is used in Slave mode only.

EOSACC behavior can be seen in [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	A slave access is being performing.
1	The Slave Access is finished. End Of Slave Access is automatically set as soon as SVACC is reset.

**Bit 10 – SCLWS** Clock Wait State

This bit is used in Slave mode only.

SCLWS behavior can be seen in [Clock Stretching in Read Mode](#) and [Clock Stretching in Write Mode](#).

Value	Description
0	The clock is not stretched.
1	The clock is stretched. TWIHS_THR / TWIHS_RHR buffer is not filled / emptied before the transmission / reception of a new character.

**Bit 9 – ARBLST** Arbitration Lost (cleared on read)

This bit is used in Master mode only.

Value	Description
0	Arbitration won.
1	Arbitration lost. Another master of the TWIHS bus has won the multimaster arbitration. TXCOMP is set at the same time.

**Bit 8 – NACK** Not Acknowledged (cleared on read)

**Note:** In Slave Write mode, all data are acknowledged by the TWIHS.

- NACK used in Master mode:

0: Each data byte has been correctly received by the far-end side TWIHS slave component.

1: A data or address byte has not been acknowledged by the slave component. Set at the same time as TXCOMP.

- NACK used in Slave Read mode:

0: Each data byte has been correctly received by the master.

1: In Read mode, a data byte has not been acknowledged by the master. When NACK is set, the user must not fill TWIHS\_THR even if TXRDY is set, because it means that the master stops the data transfer or re-initiate it.

**Bit 7 – UNRE** Underrun Error (cleared on read)

This bit is used only if clock stretching is disabled.

Value	Description
0	TWIHS_THR has been filled on time.
1	TWIHS_THR has not been filled on time.

**Bit 6 – OVRE** Overrun Error (cleared on read)

This bit is used only if clock stretching is disabled.

Value	Description
0	TWIHS_RHR has not been loaded while RXRDY was set.
1	TWIHS_RHR has been loaded while RXRDY was set. Reset by read in TWIHS_SR when TXCOMP is set.

**Bit 5 – GACC** General Call Access (cleared on read)

This bit is used in Slave mode only.

GACC behavior can be seen in [Master Performs a General Call](#).

Value	Description
0	No general call has been detected.
1	A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes.

**Bit 4 – SVACC** Slave Access

This bit is used in Slave mode only.

SVACC behavior can be seen in [Read Access Ordered by a Master](#), [Write Access Ordered by a Master](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	TWIHS is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected.
1	Indicates that the address decoding sequence has matched (A master has sent SADR). SVACC remains high until a NACK or a STOP condition is detected.

### Bit 3 – SVREAD Slave Read

This bit is used in Slave mode only. When SVACC is low (no slave access has been detected) SVREAD is irrelevant.

SVREAD behavior can be seen in [Read Access Ordered by a Master](#), [Write Access Ordered by a Master](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	Indicates that a write access is performed by a master.
1	Indicates that a read access is performed by a master.

### Bit 2 – TXRDY Transmit Holding Register Ready (cleared by writing TWIHS\_THR)

- TXRDY used in Master mode:

TXRDY behavior in Master mode can be seen in [Master Write with One Data Byte](#), [Master Write with Multiple Data Bytes](#) and [Master Write with One-Byte Internal Address and Multiple Data Bytes](#).

- TXRDY used in Slave mode:

If TXRDY is high and if a NACK has been detected, the transmission is stopped. Thus when TRDY = NACK = 1, the user must not fill TWIHS\_THR to avoid losing it.

TXRDY behavior in Slave mode can be seen in [Read Access Ordered by a Master](#), [Clock Stretching in Read Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into TWIHS_THR.
1	As soon as a data byte is transferred from TWIHS_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWIHS).
0	As soon as data is written in the TWIHS_THR, until this data has been transmitted and acknowledged (ACK or NACK).
1	Indicates that the TWIHS_THR is empty and that data has been transmitted and acknowledged.

### Bit 1 – RXRDY Receive Holding Register Ready (cleared by reading TWIHS\_RHR)

RXRDY behavior in Master mode can be seen in [Master Read with One Data Byte](#), [Master Read with Multiple Data Bytes](#) and [Master Read Clock Stretching with Multiple Data Bytes](#).

RXRDY behavior in Slave mode can be seen in [Write Access Ordered by a Master](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	No character has been received since the last TWIHS_RHR read operation.

Value	Description
1	A byte has been received in the TWIHS_RHR since the last read.

**Bit 0 – TXCOMP** Transmission Completed (cleared by writing TWIHS\_THR)

- TXCOMP used in Master mode:

0: During the length of the current frame.

1: When both holding register and internal shifter are empty and STOP condition has been sent.

TXCOMP behavior in Master mode can be seen in [Master Write with One-Byte Internal Address and Multiple Data Bytes](#) and in [Master Read with Multiple Data Bytes](#).

- TXCOMP used in Slave mode:

0: As soon as a START is detected.

1: After a STOP or a REPEATED START + an address different from SADR is detected.

TXCOMP behavior in Slave mode can be seen in [Clock Stretching in Read Mode](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

### 45.7.9 TWIHS SMBus Timing Register

**Name:** TWIHS\_SMBTR  
**Offset:** 0x38  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TWIHS Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
THMAX[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
TLOWM[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Reset					0	0	0	0

**Bits 31:24 – THMAX[7:0]** Clock High Maximum Cycles

Clock cycles in clock high maximum count. Prescaled by PRESC. Used for bus free detection. Used to time THIGH:MAX.

**Bits 23:16 – TLOWM[7:0]** Master Clock Stretch Maximum Cycles

Value	Description
0	TLOW:MEXT timeout check disabled.
1-255	Clock cycles in master maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:MEXT.

**Bits 15:8 – TLOWS[7:0]** Slave Clock Stretch Maximum Cycles

Value	Description
0	TLOW:SEXT timeout check disabled.
1-255	Clock cycles in slave maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:SEXT.

**Bits 3:0 – PRESC[3:0]** SMBus Clock Prescaler

Used to specify how to prescale the TLOWS, TLOWM and THMAX counters in SMBTR. Counters are prescaled according to the following formula:

$$f_{\text{Prescaled}} = \frac{f_{\text{peripheral clock}}}{2^{(\text{PRESC} + 1)}}$$

### 45.7.10 TWIHS Alternative Command Register

**Name:** TWIHS\_ACR  
**Offset:** 0x40  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
							NPEC	NDIR

Reset	0	0	0	0	0	0	0	0

#### Bit 25 – NPEC Next PEC Request (SMBus Mode only)

Value	Description
0	The next transfer does not use a PEC byte.
1	The next transfer uses a PEC byte.

#### Bit 24 – NDIR Next Transfer Direction

Value	Description
0	Write direction.
1	Read direction.

#### Bits 23:16 – NDATAL[7:0] Next Data Length

Value	Description
0	No data to send (see <a href="#">Alternative Command</a> ).
1–255	Number of bytes to send for the next transfer.

#### Bit 9 – PEC PEC Request (SMBus Mode only)

Value	Description
0	The transfer does not use a PEC byte.
1	The transfer uses a PEC byte.

**Bit 8 – DIR** Transfer Direction

Value	Description
0	Write direction.
1	Read direction.

**Bits 7:0 – DATAL[7:0]** Data Length

Value	Description
0	No data to send (see <a href="#">Alternative Command</a> ).
1–255	Number of bytes to send during the transfer.

### 45.7.11 TWIHS Filter Register

**Name:** TWIHS\_FILTR  
**Offset:** 0x44  
**Reset:** 0x00000000  
**Property:** Read/Write

TWIHS digital input filtering follows a majority decision based on three samples from SDA/SCL lines at peripheral clock frequency.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
						THRES[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	0
Bit	7	6	5	4	3	2	1	0
						PADFCFG	PADFEN	FILT
Access						R/W	R/W	R/W
Reset						0	0	0

#### Bits 10:8 – THRES[2:0] Digital Filter Threshold

Value	Description
0	No filtering applied on TWIHS inputs.
1–7	Maximum pulse width of spikes to be suppressed by the input filter, defined in peripheral clock cycles.

#### Bit 2 – PADFCFG PAD Filter Config

See the electrical characteristics section for filter configuration details.

#### Bit 1 – PADFEN PAD Filter Enable

Value	Description
0	PAD analog filter is disabled.
1	PAD analog filter is enabled. (The analog filter must be enabled if High-speed mode is enabled.)

#### Bit 0 – FILT RX Digital Filter

# SAMA5D2 Series

## Two-wire Interface (TWIHS)

Value	Description
0	No filtering applied on TWIHS inputs.
1	TWIHS input filtering is active (only in Standard and Fast modes)

### 45.7.12 TWIHS Interrupt Enable Register

**Name:** TWIHS\_IER  
**Offset:** 0x24  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
			SMBHHM	SMBDAM	PECERR	TOUT		MACK

Reset	–	–	–	–			–	–

**Bit 21 – SMBHHM** SMBus Host Header Address Match Interrupt Enable

**Bit 20 – SMBDAM** SMBus Default Address Match Interrupt Enable

**Bit 19 – PECERR** PEC Error Interrupt Enable

**Bit 18 – TOUT** Timeout Error Interrupt Enable

**Bit 16 – MACK** Master Code Acknowledge Interrupt Enable

**Bit 11 – EOSACC** End Of Slave Access Interrupt Enable

**Bit 10 – SCL\_WS** Clock Wait State Interrupt Enable

**Bit 9 – ARBLST** Arbitration Lost Interrupt Enable

**Bit 8 – NACK** Not Acknowledge Interrupt Enable

**Bit 7 – UNRE** Underrun Error Interrupt Enable

**Bit 6 – OVRE** Overrun Error Interrupt Enable

**Bit 5 – GACC** General Call Access Interrupt Enable

**Bit 4 – SVACC** Slave Access Interrupt Enable

**Bit 2 – TXRDY** Transmit Holding Register Ready Interrupt Enable

**Bit 1 – RXRDY** Receive Holding Register Ready Interrupt Enable

**Bit 0 – TXCOMP** Transmission Completed Interrupt Enable

### 45.7.13 TWIHS Interrupt Disable Register

**Name:** TWIHS\_IDR  
**Offset:** 0x28  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
			SMBHHM	SMBDAM	PECERR	TOUT		MACK

Reset	–	–	–	–			–	–

**Bit 21 – SMBHHM** SMBus Host Header Address Match Interrupt Disable

**Bit 20 – SMBDAM** SMBus Default Address Match Interrupt Disable

**Bit 19 – PECERR** PEC Error Interrupt Disable

**Bit 18 – TOUT** Timeout Error Interrupt Disable

**Bit 16 – MACK** Master Code Acknowledge Interrupt Disable

**Bit 11 – EOSACC** End Of Slave Access Interrupt Disable

**Bit 10 – SCL\_WS** Clock Wait State Interrupt Disable

**Bit 9 – ARBLST** Arbitration Lost Interrupt Disable

**Bit 8 – NACK** Not Acknowledge Interrupt Disable

**Bit 7 – UNRE** Underrun Error Interrupt Disable

**Bit 6 – OVRE** Overrun Error Interrupt Disable

**Bit 5 – GACC** General Call Access Interrupt Disable

**Bit 4 – SVACC** Slave Access Interrupt Disable

**Bit 2 – TXRDY** Transmit Holding Register Ready Interrupt Disable

**Bit 1 – RXRDY** Receive Holding Register Ready Interrupt Disable

**Bit 0 – TXCOMP** Transmission Completed Interrupt Disable

### 45.7.14 TWIHS Interrupt Mask Register

**Name:** TWIHS\_IMR  
**Offset:** 0x2C  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
			SMBHHM	SMBDAM	PECERR	TOUT		MACK

	UNRE	OVRE	GACC	SVACC		TXRDY	RXRDY	TXCOMP
Access	R	R	R	R			R	R
Reset	0	0	0	0			0	0

**Bit 21 – SMBHHM** SMBus Host Header Address Match Interrupt Mask

**Bit 20 – SMBDAM** SMBus Default Address Match Interrupt Mask

**Bit 19 – PECERR** PEC Error Interrupt Mask

**Bit 18 – TOUT** Timeout Error Interrupt Mask

**Bit 16 – MACK** Master Code Acknowledge Interrupt Mask

**Bit 11 – EOSACC** End Of Slave Access Interrupt Mask

**Bit 10 – SCL\_WS** Clock Wait State Interrupt Mask

**Bit 9 – ARBLST** Arbitration Lost Interrupt Mask

**Bit 8 – NACK** Not Acknowledge Interrupt Mask

**Bit 7 – UNRE** Underrun Error Interrupt Mask

**Bit 6 – OVRE** Overrun Error Interrupt Mask

**Bit 5 – GACC** General Call Access Interrupt Mask

**Bit 4 – SVACC** Slave Access Interrupt Mask

**Bit 2 – TXRDY** Transmit Holding Register Ready Interrupt Mask

**Bit 1 – RXRDY** Receive Holding Register Ready Interrupt Mask

**Bit 0 – TXCOMP** Transmission Completed Interrupt Mask

### 45.7.15 TWIHS Receive Holding Register

**Name:** TWIHS\_RHR  
**Offset:** 0x30  
**Reset:** 0x00000000  
**Property:** Read-only

**Bits 7:0 – RXDATA[7:0]** Master or Slave Receive Holding Data

#### 45.7.16 TWIHS Receive Holding Register (FIFO Enabled)

**Name:** TWIHS\_RHR (FIFO\_ENABLED)  
**Offset:** 0x30  
**Reset:** 0x00000000  
**Property:** Read-only

If FIFO is enabled (FIFOEN bit in TWIHS\_CR), refer to [45.6.6.8 Multiple Data Mode](#) for details.

Bit	31	30	29	28	27	26	25	24
	RXDATA3[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 31:24 – RXDATA3[7:0]** Master or Slave Receive Holding Data 3

**Bits 23:16 – RXDATA2[7:0]** Master or Slave Receive Holding Data 2

**Bits 15:8 – RXDATA1[7:0]** Master or Slave Receive Holding Data 1

**Bits 7:0 – RXDATA0[7:0]** Master or Slave Receive Holding Data 0

### 45.7.17 TWIHS SleepWalking Matching Register

**Name:** TWIHS\_SWMR  
**Offset:** 0x4C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TWIHS Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	DATAM[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	SADR3[6:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	SADR2[6:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	SADR1[6:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

**Bits 31:24 – DATAM[7:0] Data Match**

The TWIHS module extends the SleepWalking matching process to the first received data, comparing it with DATAM if DATAMEN bit is enabled.

**Bits 22:16 – SADR3[6:0] Slave Address 3**

Slave address 3. The TWIHS module matches on this additional address if SADR3EN bit is enabled.

**Bits 14:8 – SADR2[6:0] Slave Address 2**

Slave address 2. The TWIHS module matches on this additional address if SADR2EN bit is enabled.

**Bits 6:0 – SADR1[6:0] Slave Address 1**

Slave address 1. The TWIHS module matches on this additional address if SADR1EN bit is enabled.

**45.7.18 TWIHS Transmit Holding Register**

**Name:** TWIHS\_THR  
**Offset:** 0x34  
**Reset:** 0x00000000  
**Property:** Write-only

**Bits 7:0 – TXDATA[7:0]** Master or Slave Transmit Holding Data

### 45.7.19 TWIHS Transmit Holding Register (FIFO Enabled)

**Name:** TWIHS\_THR (FIFO\_ENABLED)  
**Offset:** 0x34  
**Reset:** 0x00000000  
**Property:** Write-only

If FIFO is enabled (FIFOEN bit in TWIHS\_CR), refer to [45.6.6.8 Multiple Data Mode](#) for details.

Bit	31	30	29	28	27	26	25	24
	TXDATA3[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	TXDATA0[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0

**Bits 31:24 – TXDATA3[7:0]** Master or Slave Transmit Holding Data 3

**Bits 23:16 – TXDATA2[7:0]** Master or Slave Transmit Holding Data 2

**Bits 15:8 – TXDATA1[7:0]** Master or Slave Transmit Holding Data 1

**Bits 7:0 – TXDATA0[7:0]** Master or Slave Transmit Holding Data 0

### 45.7.20 TWIHS FIFO Mode Register

**Name:** TWIHS\_FMR  
**Offset:** 0x50  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24	
			RXFTHRES[5:0]						
Access			R/W	R/W	R/W	R/W	R/W	R/W	
Reset			0	0	0	0	0	0	
Bit	23	22	21	20	19	18	17	16	
			TXFTHRES[5:0]						
Access			R/W	R/W	R/W	R/W	R/W	R/W	
Reset			0	0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	
Access									
Reset									
Bit	7	6	5	4	3	2	1	0	
			RXRDYM[1:0]					TXRDYM[1:0]	
Access			R/W	R/W			R/W	R/W	
Reset			0	0			0	0	

#### Bits 29:24 – RXFTHRES[5:0] Receive FIFO Threshold

Value	Description
0–16	Defines the Receive FIFO threshold value (number of data). RXFTH flag in TWIHS_FSR will be set when Receive FIFO goes from “below” threshold state to “equal or above” threshold state.

#### Bits 21:16 – TXFTHRES[5:0] Transmit FIFO Threshold

Value	Description
0–16	Defines the Transmit FIFO threshold value (number of data). TXFTH flag in TWIHS_FSR will be set when Transmit FIFO goes from “above” threshold state to “equal or below” threshold state.

#### Bits 5:4 – RXRDYM[1:0] Receiver Ready Mode

If FIFOs are enabled, the RXRDY flag (in TWIHS\_SR) behaves as follows.

Value	Name	Description
0	ONE_DATA	RXRDY will be at level ‘1’ when at least one unread data is in the Receive FIFO
1	TWO_DATA	RXRDY will be at level ‘1’ when at least two unread data are in the Receive FIFO

# SAMA5D2 Series

## Two-wire Interface (TWIHS)

Value	Name	Description
2	FOUR_DATA	RXRDY will be at level '1' when at least four unread data are in the Receive FIFO

### Bits 1:0 – TXRDYM[1:0] Transmitter Ready Mode

If FIFOs are enabled, the TXRDY flag (in TWIHS\_SR) behaves as follows.

Value	Name	Description
0	ONE_DATA	TXRDY will be at level '1' when at least one data can be written in the Transmit FIFO
1	TWO_DATA	TXRDY will be at level '1' when at least two data can be written in the Transmit FIFO
2	FOUR_DATA	TXRDY will be at level '1' when at least four data can be written in the Transmit FIFO

### 45.7.21 TWIHS FIFO Level Register

**Name:** TWIHS\_FLR  
**Offset:** 0x54  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24	
	[Greyed out bits]								
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
	[Greyed out bits]		RXFL[5:0]						[Greyed out bit]
Access			R	R	R	R	R	R	
Reset			0	0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	
	[Greyed out bits]								
Access									
Reset									
Bit	7	6	5	4	3	2	1	0	
	[Greyed out bits]		TXFL[5:0]						[Greyed out bit]
Access			R	R	R	R	R	R	
Reset			0	0	0	0	0	0	

#### Bits 21:16 – RXFL[5:0] Receive FIFO Level

Value	Description
0	There is no unread data in the Receive FIFO
1-16	Indicates the number of unread DATA in the Receive FIFO

#### Bits 5:0 – TXFL[5:0] Transmit FIFO Level

Value	Description
0	There is no data in the Transmit FIFO
1-16	Indicates the number of DATA in the Transmit FIFO

### 45.7.22 TWIHS FIFO Status Register

**Name:** TWIHS\_FSR  
**Offset:** 0x60  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bit 7 – RXFPTEF** Receive FIFO Pointer Error Flag  
 See [45.6.6.10 FIFO Pointer Error](#) for details.

Value	Description
0	No Receive FIFO pointer occurred
1	Receive FIFO pointer error occurred. Receiver must be reset

**Bit 6 – TXFPTEF** Transmit FIFO Pointer Error Flag  
 See [45.6.6.10 FIFO Pointer Error](#) for details.

Value	Description
0	No Transmit FIFO pointer occurred
1	Transmit FIFO pointer error occurred. Transceiver must be reset

**Bit 5 – RXFTHF** Receive FIFO Threshold Flag

Value	Description
0	Number of unread DATA in Receive FIFO is below RXFTHRES threshold.
1	Number of unread DATA in Receive FIFO has reached RXFTHRES threshold since the last read of TWIHS_FSR.

**Bit 4 – RXFFF** Receive FIFO Full Flag

Value	Description
0	Receive FIFO is not empty.
1	Receive FIFO has been filled since the last read of TWIHS_FSR.

**Bit 3 – RXFEF** Receive FIFO Empty Flag

Value	Description
0	Receive FIFO is not empty.
1	Receive FIFO has been emptied since the last read of TWIHS_FSR.

**Bit 2 – TXFTHF** Transmit FIFO Threshold Flag (cleared on read)

Value	Description
0	Number of DATA in Transmit FIFO is above TXFTHRES threshold.
1	Number of DATA in Transmit FIFO has reached TXFTHRES threshold since the last read of TWIHS_FSR.

**Bit 1 – TXFFF** Transmit FIFO Full Flag (cleared on read)

Value	Description
0	Transmit FIFO is not full.
1	Transmit FIFO has been filled since the last read of TWIHS_FSR.

**Bit 0 – TXFEF** Transmit FIFO Empty Flag (cleared on read)

Value	Description
0	Transmit FIFO is not empty.
1	Transmit FIFO has been emptied since the last read of TWIHS_FSR.

### 45.7.23 TWIHS FIFO Interrupt Enable Register

**Name:** TWIHS\_FIER  
**Offset:** 0x64  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset

**Bits 31:8 – WPKEY[23:0] Write Protection Key**

Value	Name	Description
0x545749	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0.

**Bit 0 – WPEN Write Protection Enable**

See [Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x545749 (“TWI” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x545749 (“TWI” in ASCII).

### 45.7.27 TWIHS Write Protection Status Register

**Name:** TWIHS\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

	Bit	31	30	29	28	27	26	25	24

	Bit	7	6	5	4	3	2	1	0
		WPVS							
Access									R
Reset									0

**Bits 31:8 – WPVSR[23:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of the TWIHS_WPSR.
1	A write protection violation has occurred since the last read of the TWIHS_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

## 46. Flexible Serial Communication Controller (FLEXCOM)

### 46.1 Description

The Flexible Serial Communication Controller (FLEXCOM) offers several serial communication protocols that are managed by the three submodules USART, SPI, and TWI.

The Universal Synchronous Asynchronous Receiver Transceiver (USART) provides one full-duplex universal synchronous asynchronous serial link. Data frame format is widely programmable (data length, parity, number of stop bits) to support a maximum of standards. The receiver implements parity error, framing error and overrun error detection. The receiver timeout enables handling variable-length frames and the transmitter timeguard facilitates communications with slow remote devices. Multidrop communications are also supported through address bit handling in reception and transmission.

The USART features three test modes: Remote Loopback, Local Loopback and Automatic Echo.

The USART supports specific operating modes providing interfaces on RS485, LIN, and SPI, with ISO7816 T = 0 or T = 1 smart card slots, and infrared transceivers. The hardware handshaking feature enables an out-of-band flow control by automatic management of the pins RTS and CTS.

The USART supports the connection to the DMA Controller, which enables data transfers to the transmitter and from the receiver. The DMAC provides chained buffer management without any intervention of the processor.

The Serial Peripheral Interface (SPI) circuit is a synchronous serial data link that provides communication with external devices in Master or Slave mode. It also enables communication between processors if an external processor is connected to the system.

The Serial Peripheral Interface is essentially a shift register that serially transmits data bits to other SPIs. During a data transfer, one SPI system acts as the “master” which controls the data flow, while the other devices act as “slaves” which have data shifted into and out by the master. Different CPUs can take turn being masters (multiple master protocol, contrary to single master protocol where one CPU is always the master while all of the others are always slaves). One master can simultaneously shift data into multiple slaves. However, only one slave can drive its output to write data back to the master at any given time.

A slave device is selected when the master asserts its NSS signal. If multiple slave devices exist, the master generates a separate slave select signal for each slave (NPCS).

The SPI system consists of two data lines and two control lines:

- Master Out Slave In (MOSI)—This data line supplies the output data from the master shifted into the input(s) of the slave(s).
- Master In Slave Out (MISO)—This data line supplies the output data from a slave to the input of the master. There may be no more than one slave transmitting data during any particular transfer.
- Serial Clock (SPCK)—This control line is driven by the master and regulates the flow of the data bits. The master can transmit data at a variety of baud rates; there is one SPCK pulse for each bit that is transmitted.
- Slave Select (NSS)—This control line allows slaves to be turned on and off by hardware.

The Two-wire Interface (TWI) interconnects components on a unique two-wire bus, made up of one clock line and one data line with speeds of up to 400 kbits per second in Fast mode and up to 3.4 Mbits per second in High-speed Slave mode only, based on a byte-oriented transfer format. It can be used with any Two-wire Interface bus Serial EEPROM and I<sup>2</sup>C-compatible devices, such as a Real-Time Clock (RTC),

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Dot Matrix/Graphic LCD Controller and temperature sensor. The TWI is programmable as a master or a slave with sequential or single-byte access. Multiple master capability is supported.

Arbitration of the bus is performed internally and puts the TWI in Slave mode automatically if the bus arbitration is lost.

A configurable baud rate generator permits the output data rate to be adapted to a wide range of core clock frequencies.

The following table lists the compatibility level of any Two-wire Interface in Master mode and a full I<sup>2</sup>C compatible device.

**Table 46-1. TWI Compatibility with I<sup>2</sup>C Standard**

I <sup>2</sup> C Standard	TWI
Standard Mode Speed (100 kHz)	Supported
Fast Mode Speed (400 kHz)	Supported
High-speed Mode (Slave only, 3.4 MHz)	Supported
7- or 10-bit <sup>(1)</sup> Slave Addressing	Supported
Repeated Start (Sr) Condition	Supported
ACK and NACK Management	Supported
Input Filtering	Supported
Slope Control	Not Supported
Clock Stretching	Supported
Multi Master Capability	Supported

Notes: 1. 10-bit support in Master mode only

## 46.2 Embedded Characteristics

### 46.2.1 USART/UART Characteristics

- 32-byte Transmit and Receive FIFOs
- Programmable Baud Rate Generator
- Baud Rate can be Independent of the Processor/Peripheral Clock
- Comparison Function on Received Character
- 5-bit to 9-bit Full-duplex Synchronous or Asynchronous Serial Communications
  - 1, 1.5 or 2 Stop Bits in Asynchronous Mode or 1 or 2 Stop Bits in Synchronous Mode
  - Parity Generation and Error Detection
  - Framing Error Detection, Overrun Error Detection
  - Digital Filter on Receive Line
  - MSB- or LSB-first
  - Optional Break Generation and Detection
  - By 8 or by 16 Oversampling Receiver Frequency
  - Optional Hardware Handshaking RTS-CTS

- Receiver Timeout and Transmitter Timeguard
  - Optional Multidrop Mode with Address Generation and Detection
- RS485 with Driver Control Signal
- ISO7816, T = 0 or T = 1 Protocols for Interfacing with Smart Cards
  - NACK Handling, Error Counter with Repetition and Iteration Limit
- IrDA Modulation and Demodulation
  - Communication at up to 115.2 kbit/s
- SPI Mode
  - MASTER or Slave
  - Serial Clock Programmable Phase and Polarity
  - SPI Serial Clock (SCK) Frequency up to  $f_{\text{peripheral clock}}/6$
- LIN Mode
  - Compliant with LIN 1.3 and LIN 2.0 specifications
  - Master or Slave
  - Processing of Frames with Up to 256 Data Bytes
  - Response Data Length can be Configurable or Defined Automatically by the Identifier
  - Self-synchronization in Slave Node Configuration
  - Automatic Processing and Verification of the “Synch Break” and the “Synch Field”
  - “Synch Break” Detection Even When Partially Superimposed with a Data Byte
  - Automatic Identifier Parity Calculation/Sending and Verification
  - Parity Sending and Verification Can be Disabled
  - Automatic Checksum Calculation/sending and Verification
  - Checksum Sending and Verification Can be Disabled
  - Support Both “Classic” and “Enhanced” Checksum Types
  - Full LIN Error Checking and Reporting
  - Frame Slot Mode: Master Allocates Slots to the Scheduled Frames Automatically
  - Generation of the Wakeup Signal
- Test Modes
  - Remote Loopback, Local Loopback, Automatic Echo
- Supports Connection of:
  - Two DMA Controller (DMAC) Channels
  - Offers Buffer Transfer without Processor Intervention
- Register Write Protection

#### **46.2.2 SPI Characteristics**

- 32-byte Transmit and Receive FIFOs
- Master or Slave Serial Peripheral Bus Interface
  - 8-bit to 16-bit programmable data length per chip select
  - Programmable phase and polarity per chip select
  - Programmable transfer delay between consecutive transfers and delay before SPI clock per chip select
  - Programmable delay between chip selects
- Selectable Mode Fault Detection

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

- Master Mode Can Drive SPCK up to Peripheral Clock
- Master Mode Bit Rate Can Be Independent of the Processor/Peripheral Clock
- Slave Mode Operates on SPCK, Asynchronously with Core and Bus Clock
- Two Chip Selects with External Decoder Support Allow Communication with up to 3 Peripherals
- Communication with Serial External Devices Supported
  - Serial memories, such as DataFlash and 3-wire EEPROMs
  - Serial peripherals, such as ADCs, DACs, LCD controllers, CAN controllers and sensors
  - External coprocessors
- Connection to DMA Channel Capabilities, Optimizing Data Transfers
  - One channel for the receiver
  - One channel for the transmitter
- Register Write Protection

### 46.2.3 TWI/SMBus Characteristics

- 16-byte Transmit and Receive FIFOs
- Bit Rate: Up to 400 kbit/s in Fast Mode and 3.4 Mbit/s in High-Speed Mode (Slave Only)
- Bit Rate can be Independent of the Processor/Peripheral Clock
- SMBus Support
- Compatible with Two-wire Interface Serial Memory and I<sup>2</sup>C Compatible Devices<sup>(1)</sup>
- Master and Multi-Master Operation (Standard and Fast Mode Only)
- Slave Mode Operation (Standard, Fast and High-Speed Mode)
- One, Two or Three Bytes for Slave Address
- Sequential Read/Write Operations
- General Call Supported in Slave Mode
- Connection to DMA Controller Channels Optimizes Data Transfers
  - One Channel for the Receiver
  - One Channel for the Transmitter
- Register Write Protection

Note: 1. See table [TWI Compatibility with I<sup>2</sup>C Standard](#) for further details.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.3 Block Diagram

Figure 46-1. FLEXCOM Block Diagram

### 46.4 I/O Lines Description

Table 46-2. I/O Lines Description

Name	Description			Type
	USART/UART	SPI	TWI	
FLEXCOM_IO0	TXD	MOSI	TWD	I/O
FLEXCOM_IO1	RXD	MISO	TWCK	I/O
FLEXCOM_IO2	SCK	SPCK	–	I/O
FLEXCOM_IO3	CTS	NPCS0/NSS	–	I/O
FLEXCOM_IO4	RTS	NPCS1	–	O

### 46.5 Product Dependencies

#### 46.5.1 I/O Lines

The pins used for interfacing the FLEXCOM are multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the desired FLEXCOM pins to their peripheral function. If I/O lines of the FLEXCOM are not used by the application, they can be used for other purposes by the PIO Controller.

### 46.5.2 Power Management

The peripheral clock is not continuously provided to the FLEXCOM. The programmer must first enable the FLEXCOM Clock in the Power Management Controller (PMC) before using the USART or SPI or TWI.

In SleepWalking mode (asynchronous partial wakeup), the PMC must be configured to enable SleepWalking for the FLEXCOM in the Sleepwalking Enable Register (PMC\_SLPWK\_ER). The peripheral clock can be automatically provided to the FLEXCOM, depending on the instructions (requests) provided by the FLEXCOM to the PMC.

### 46.5.3 Interrupt Sources

The FLEXCOM interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the FLEXCOM interrupt requires the Interrupt Controller to be programmed first.

## 46.6 Register Accesses

Register accesses support 8-bit, 16-bit and 32-bit accesses, which means that only an 8-bit part of a 32-bit register can be written in one access, for instance. For this the access must be done with the right size at the right address.

8-bit, 16-bit and 32-bit accesses are supported for register accesses. However, a field in a register cannot be partially written (e.g., if a field is bigger than 8 bits, the whole field must be written).

This feature helps avoiding a read-modify-write process if only a small part of the register is to be modified.

## 46.7 USART Functional Description

### 46.7.1 Baud Rate Generator

The baud rate generator provides the bit period clock named “baud rate clock” to both the receiver and the transmitter.

Configuring the USCLKS field in FLEX\_US\_MR selects the baud rate generator clock from one of the following sources:

- the peripheral clock
- a division of the peripheral clock, the divider being product dependent, but generally set to 8
- a fully programmable generic clock (GCLK) provided by PMC and independent of processor/peripheral clock
- the external clock, available on the SCK pin

The baud rate generator is based upon a 16-bit divider, which is programmed with the CD field of the Baud Rate Generator Register (FLEX\_US\_BRGR). If a zero is written to CD, the baud rate generator does not generate any clock. If a one is written to CD, the divider is bypassed and becomes inactive.

If the external SCK clock is selected, the duration of the low and high levels of the signal provided on the SCK pin must be longer than a peripheral clock period. The frequency of the signal provided on SCK must be at least three times lower than peripheral clock in USART mode (field USART\_MODE differs from 0xE or 0xF) or six times lower in SPI mode (field USART\_MODE equals 0xE or 0xF).

If GCLK is selected, the baud rate is independent of the processor/peripheral clock and thus processor/peripheral clock frequency can be changed without affecting the USART transfer. The GCLK frequency must be at least three times lower than peripheral clock frequency.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

If GCLK is selected (USCLKS = 2) and the SCK pin is driven (CLKO = 1), the CD field must be greater than 1.

**Figure 46-2. Baud Rate Generator**

### 46.7.1.1 Baud Rate in Asynchronous Mode

If the USART is programmed to operate in Asynchronous mode, the selected clock is first divided by CD, which is field-programmed in FLEX\_US\_BRGR. The resulting clock is provided to the receiver as a sampling clock and then divided by 16 or 8, depending on the programming of FLEX\_US\_MR.OVER.

If OVER is set, the receiver sampling is eight times higher than the baud rate clock. If OVER is cleared, the sampling is performed at 16 times the baud rate clock.

The baud rate is calculated as per the following formula:

$$\text{Baud rate} = \frac{\text{Selected Clock}}{(8(2 - \text{OVER})\text{CD})}$$

This gives a maximum baud rate of peripheral clock divided by 8, assuming that peripheral clock is the highest possible clock and that the OVER bit is set.

#### 46.7.1.1.1 Baud Rate Calculation Example

The following table shows calculations of CD to obtain a baud rate at 38,400 bit/s for different source clock frequencies. It also shows the actual resulting baud rate and the error.

**Table 46-3. Baud Rate Example (OVER = 0)**

Source Clock (MHz)	Expected Baud Rate (bit/s)	Calculation Result	CD	Actual Baud Rate (bit/s)	Error
3,686,400	38,400	6.00	6	38,400.00	0.00%
4,915,200	38,400	8.00	8	38,400.00	0.00%
5,000,000	38,400	8.14	8	39,062.50	1.70%
7,372,800	38,400	12.00	12	38,400.00	0.00%
8,000,000	38,400	13.02	13	38,461.54	0.16%
12,000,000	38,400	19.53	20	37,500.00	2.40%
12,288,000	38,400	20.00	20	38,400.00	0.00%
14,318,180	38,400	23.30	23	38,908.10	1.31%

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

.....continued

Source Clock (MHz)	Expected Baud Rate (bit/s)	Calculation Result	CD	Actual Baud Rate (bit/s)	Error
14,745,600	38,400	24.00	24	38,400.00	0.00%
18,432,000	38,400	30.00	30	38,400.00	0.00%
24,000,000	38,400	39.06	39	38,461.54	0.16%
24,576,000	38,400	40.00	40	38,400.00	0.00%
25,000,000	38,400	40.69	40	38,109.76	0.76%
32,000,000	38,400	52.08	52	38,461.54	0.16%
32,768,000	38,400	53.33	53	38,641.51	0.63%
33,000,000	38,400	53.71	54	38,194.44	0.54%
40,000,000	38,400	65.10	65	38,461.54	0.16%
50,000,000	38,400	81.38	81	38,580.25	0.47%

The baud rate is calculated with the following formula:

$$\text{Baud rate} = \text{MCK} / \text{CD} \times 16$$

The baud rate error is calculated with the following formula. It is not recommended to work with an error higher than 5%.

$$\text{Error} = 1 - \left( \frac{\text{Expected Baud Rate}}{\text{Actual Baud Rate}} \right)$$

### 46.7.1.2 Fractional Baud Rate in Asynchronous Mode

The baud rate generator previously defined is subject to the following limitation: the output frequency changes by only integer multiples of the reference frequency. An approach to this problem is to integrate a fractional N clock generator that has a high resolution. The generator architecture is modified to obtain baud rate changes by a fraction of the reference source clock. This fractional part is programmed with the FP field in FLEX\_US\_BRGR. If FP is not 0, the fractional part is activated. The resolution is one eighth of the clock divider. The fractional baud rate is calculated using the following formula:

$$\text{Baud rate} = \frac{\text{Selected Clock}}{\left( 8(2 - \text{OVER}) \left( \text{CD} + \frac{\text{FP}}{8} \right) \right)}$$

The modified architecture is presented in the following figure.

**Figure 46-3. Fractional Baud Rate Generator**

When the value of field FP is greater than 0, the SCK (oversampling clock) generates nonconstant duty cycles. The SCK high duration is increased by “selected clock” period from time to time. The duty cycle depends on the value of the CD field.

### 46.7.1.3 Baud Rate in Synchronous Mode or SPI Mode

If the USART is programmed to operate in Synchronous mode, the selected clock is simply divided by the CD field in FLEX\_US\_BRGR:

$$\text{Baud rate} = \frac{\text{Selected Clock}}{\text{CD}}$$

In Synchronous mode, if the external clock is selected (USCLKS = 3) and CLKO = 0 (Slave mode), the clock is provided directly by the signal on the USART SCK pin. No division is active. The value written in FLEX\_US\_BRGR has no effect. The external clock frequency must be at least three times lower than the system clock. In Synchronous mode master (USCLKS = 0 or 1, CLKO = 1), the receive part limits the SCK maximum frequency to  $f_{\text{peripheral clock}}/3$  in USART mode, or  $f_{\text{peripheral clock}}/6$  in SPI mode.

When either the external clock SCK or the internal clock divided (peripheral clock/DIV or GCLK) is selected, the value programmed in CD must be even if the user has to ensure a 50:50 mark/space ratio on the SCK pin. If the peripheral clock is selected, the baud rate generator ensures a 50:50 duty cycle on the SCK pin, even if the value programmed in CD is odd.

### 46.7.1.4 Baud Rate in ISO 7816 Mode

The ISO7816 specification defines the bit rate with the following formula:

$$B = \frac{D_i}{F_i} \times f$$

where:

- B is the bit rate
- $D_i$  is the bit rate adjustment factor
- $F_i$  is the clock frequency division factor

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

- $f$  is the ISO7816 clock frequency (Hz)

$D_i$  is a binary value encoded on a 4-bit field, named DI, as represented in the following table.

**Table 46-4. Binary and Decimal Values for  $D_i$**

DI field	0001	0010	0011	0100	0101	0110	1000	1001
$D_i$ (decimal)	1	2	4	8	16	32	12	20

$F_i$  is a binary value encoded on a 4-bit field, named FI, as represented in the following table.

**Table 46-5. Binary and Decimal Values for  $F_i$**

FI field	0000	0001	0010	0011	0100	0101	0110	1001	1010	1011	1100	1101
$F_i$ (decimal)	372	372	558	744	1116	1488	1860	512	768	1024	1536	2048

The following table shows the resulting  $F_i/D_i$  Ratio, which is the ratio between the ISO7816 clock and the baud rate clock.

**Table 46-6. Possible Values for the  $F_i/D_i$  Ratio**

$F_i/D_i$	372	558	744	1116	1488	1806	512	768	1024	1536	2048
1	372	558	744	1116	1488	1860	512	768	1024	1536	2048
2	186	279	372	558	744	930	256	384	512	768	1024
4	93	139.5	186	279	372	465	128	192	256	384	512
8	46.5	69.75	93	139.5	186	232.5	64	96	128	192	256
16	23.25	34.87	46.5	69.75	93	116.2	32	48	64	96	128
32	11.62	17.43	23.25	34.87	46.5	58.13	16	24	32	48	64
12	31	46.5	62	93	124	155	42.66	64	85.33	128	170.6
20	18.6	27.9	37.2	55.8	74.4	93	25.6	38.4	51.2	76.8	102.4

If the USART is configured in ISO7816 mode, the clock selected by the USCLKS field in FLEX\_US\_MR is first divided by the value programmed in field CD field in FLEX\_US\_BRGR. The resulting clock can be provided to the SCK pin to feed the smart card clock inputs. This means that FLEX\_US\_MR.CLKO can be set.

This clock is then divided by the value programmed in the FI\_DI\_RATIO field in the FI DI Ratio Register (FLEX\_US\_FIDI). This is performed by the Sampling Divider, which performs a division by up to 65535 in ISO7816 mode. The noninteger values of the  $F_i/D_i$  Ratio are not supported and the user must program the FI\_DI\_RATIO field to a value as close as possible to the expected value.

The FI\_DI\_RATIO field resets to the value 0x174 (372 in decimal) and is the most common divider between the ISO7816 clock and the bit rate ( $F_i = 372$ ,  $D_i = 1$ ).

The following figure shows the relation between the Elementary Time Unit, corresponding to a bit time, and the ISO 7816 clock.

**Figure 46-4. Elementary Time Unit (ETU)**

### 46.7.2 Receiver and Transmitter Control

After reset, the receiver is disabled. The user must enable the receiver by setting the RXEN bit in the USART Control Register (FLEX\_US\_CR). However, the receiver registers can be programmed before the receiver clock is enabled.

After reset, the transmitter is disabled. The user must enable it by setting the TXEN bit in FLEX\_US\_CR. However, the transmitter registers can be programmed before being enabled.

The receiver and the transmitter can be enabled together or independently.

At any time, the software can perform a reset on the receiver or the transmitter of the USART by setting the corresponding bit, RSTRX and RSTTX respectively, in FLEX\_US\_CR. The software resets clear the status flag and reset internal state machines but the user interface configuration registers hold the value configured prior to software reset. Regardless of what the receiver or the transmitter is performing, the communication is immediately stopped.

The user can also independently disable the receiver or the transmitter by setting RXDIS and TXDIS respectively in FLEX\_US\_CR. If the receiver is disabled during a character reception, the USART waits until the end of reception of the current character, then the reception is stopped. If the transmitter is disabled while it is operating, the USART waits the end of transmission of both the current character and character being stored in the USART Transmit Holding Register (FLEX\_US\_THR). If a timeguard is programmed, it is handled normally.

### 46.7.3 Synchronous and Asynchronous Modes

#### 46.7.3.1 Transmitter Operations

The transmitter performs the same in both Synchronous and Asynchronous operating modes (SYNC = 0 or SYNC = 1). One start bit, up to 9 data bits, 1 optional parity bit and up to 2 stop bits are successively shifted out on the TXD pin at each falling edge of the programmed serial clock.

The number of data bits is selected by the CHRL field and the MODE9 bit in FLEX\_US\_MR. Nine bits are selected by setting the MODE9 bit regardless of the CHRL field. The parity bit is set according to the PAR field in FLEX\_US\_MR. The even, odd, space, marked or none parity bit can be configured. The MSBF bit in FLEX\_US\_MR configures which data bit is sent first. If written to 1, the most significant bit is sent first. If written to 0, the less significant bit is sent first. The number of stop bits is selected by the NBSTOP field in FLEX\_US\_MR. The 1.5 stop bit is supported in Asynchronous mode only.

**Figure 46-5. Character Transmit**

Example: 8-bit, Parity Enabled One Stop

The characters are sent by writing in FLEX\_US\_THR. The transmitter reports two status bits in the USART Channel Status Register (FLEX\_US\_CSR): TXRDY (Transmitter Ready), which indicates that FLEX\_US\_THR is empty and TXEMPTY, which indicates that all the characters written in FLEX\_US\_THR have been processed. When the current character processing is completed, the last character written in FLEX\_US\_THR is transferred into the shift register of the transmitter and FLEX\_US\_THR is emptied, thus TXRDY rises.

Both TXRDY and TXEMPTY bits are low when the transmitter is disabled. Writing a character in FLEX\_US\_THR while TXRDY is low has no effect and the written character is lost.

**Figure 46-6. Transmitter Status**

### 46.7.3.2 Manchester Encoder

When the Manchester encoder is in use, characters transmitted through the USART are encoded based on biphase Manchester II format. To enable this mode, set the FLEX\_US\_MR.MAN bit to 1. Depending on polarity configuration, a logic level (zero or one), is transmitted as a coded signal one-to-zero or zero-to-one. Thus, a transition always occurs at the midpoint of each bit time. It consumes more bandwidth than the original NRZ signal (2x) but the receiver has more error control since the expected input must show a change at the center of a bit cell. An example of Manchester encoded sequence is: the byte 0xB1 or 10110001 encodes to 10 01 10 10 01 01 01 10, assuming the default polarity of the encoder. The following figure illustrates this coding scheme.

**Figure 46-7. NRZ to Manchester Encoding**

The Manchester encoded character can also be encapsulated by adding both a configurable preamble and a start frame delimiter pattern. Depending on the configuration, the preamble is a training sequence, composed of a predefined pattern with a programmable length from 1 to 15 bit times. If the preamble length is set to 0, the preamble waveform is not generated prior to any character. The preamble pattern is

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

chosen among the following sequences: ALL\_ONE, ALL\_ZERO, ONE\_ZERO or ZERO\_ONE, writing the FLEX\_US\_MAN.TX\_PP field. The TX\_PL field is used to configure the preamble length. The following figure illustrates and defines the valid patterns. To improve flexibility, the encoding scheme can be configured using the FLEX\_US\_MAN.TX\_MPOL bit. If the TX\_MPOL bit is set to zero (default), a logic zero is encoded with a zero-to-one transition and a logic one is encoded with a one-to-zero transition. If the TX\_MPOL bit is set to one, a logic one is encoded with a one-to-zero transition and a logic zero is encoded with a zero-to-one transition.

**Figure 46-8. Preamble Patterns, Default Polarity Assumed**

A start frame delimiter is to be configured using the FLEX\_US\_MR.ONEBIT bit. It consists of a user-defined pattern that indicates the beginning of a valid data. The following figure illustrates these patterns. If the start frame delimiter, also known as the start bit, is one bit, (ONEBIT = 1), a logic zero is Manchester encoded and indicates that a new character is being sent serially on the line. If the start frame delimiter is a synchronization pattern also referred to as sync (ONEBIT = 0), a sequence of three bit times is sent serially on the line to indicate the start of a new character. The sync waveform is in itself an invalid Manchester waveform as the transition occurs at the middle of the second bit time. Two distinct sync patterns are used: the command sync and the data sync. The command sync has a logic one level for one and a half bit times, then a transition to logic zero for the second one and a half bit times. If the FLEX\_US\_MR.MODSYNC bit is set to 1, the next character is a command. If it is set to 0, the next character is a data. When direct memory access is used, the MODSYNC bit can be immediately updated with a modified character located in memory. To enable this mode, the FLEX\_US\_MR.VAR\_SYNC bit must be set. In this case, the FLEX\_US\_MR.MODSYNC bit is bypassed and the sync configuration is held in the FLEX\_US\_THR.TXSYNH bit. The USART character format is modified and includes sync information.

**Figure 46-9. Start Frame Delimiter**

### 46.7.3.2.1 Drift Compensation

Drift compensation is available only in 16X Oversampling mode. An hardware recovery system allows a larger clock drift. To enable the hardware system, the bit in the FLEX\_US\_MAN register must be set. If the RXD edge is one 16X clock cycle from the expected edge, this is considered as normal jitter and no corrective actions is taken. If the RXD event is between 4 and 2 clock cycles before the expected edge, then the current period is shortened by one clock cycle. If the RXD event is between 2 and 3 clock cycles after the expected edge, then the current period is lengthened by one clock cycle. These intervals are considered to be drift and so corrective actions are automatically taken.

**Figure 46-10. Bit Resynchronization**

### 46.7.3.3 Asynchronous Receiver

If the USART is programmed in Asynchronous operating mode (SYNC = 0), the receiver oversamples the RXD input line. The oversampling is either 16 or 8 times the baud rate clock, depending on the FLEX\_US\_MR.OVER bit.

The receiver samples the RXD line. If the line is sampled during one half of a bit time to 0, a start bit is detected and data, parity and stop bits are successively sampled on the bit rate clock.

If the oversampling is 16 (OVER = 0), a start is detected at the eighth sample to 0. Data bits, parity bit and stop bit are assumed to have a duration corresponding to 16 oversampling clock cycles. If the oversampling is 8 (OVER = 1), a start is detected at the fourth sample to 0. Data bits, parity bit and stop bit are assumed to have a duration corresponding to 8 oversampling clock cycles.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

The number of data bits, first bit sent and Parity mode are selected by the same fields and bits as the transmitter, i.e., respectively CHRL, MODE9, MSBF and PAR. For the synchronization mechanism only, the number of stop bits has no effect on the receiver as it considers only one stop bit, regardless of the NBSTOP field, so that resynchronization between the receiver and the transmitter can occur. Moreover, as soon as the stop bit is sampled, the receiver starts looking for a new start bit so that resynchronization can also be accomplished when the transmitter is operating with one stop bit.

The following figures illustrate start detection and character reception when USART operates in Asynchronous mode.

**Figure 46-11. Asynchronous Start Detection**

**Figure 46-12. Asynchronous Character Reception**

Example: 8-bit, Parity Enabled

### 46.7.3.4 Manchester Decoder

When the FLEX\_US\_MR.MAN bit is set, the Manchester decoder is enabled. The decoder performs both preamble and start frame delimiter detection. One input line is dedicated to Manchester encoded input data.

An optional preamble sequence can be defined. Its length is user-defined and totally independent of the transmitter side. Use the FLEX\_US\_MAN.RX\_PL field to configure the length of the preamble sequence. If the length is set to 0, no preamble is detected and the function is disabled. In addition, the polarity of the input stream is programmable with the FLEX\_US\_MAN.RX\_MPOL bit. Depending on the desired application, the preamble pattern matching is to be defined via the FLEX\_US\_MAN.RX\_PP field. See figure [Preamble Patterns, Default Polarity Assumed](#) for available preamble patterns.

Unlike preamble, the start frame delimiter is shared between Manchester Encoder and Decoder. So, if ONEBIT bit = 1, only a zero encoded Manchester can be detected as a valid start frame delimiter. If ONEBIT = 0, only a sync pattern is detected as a valid start frame delimiter. Decoder operates by

detecting transition on incoming stream. If RXD is sampled during one quarter of a bit time to zero, a start bit is detected. See the following figure. The sample pulse rejection mechanism applies.

The FLEX\_US\_MAN.RXIDLEV bit informs the USART of the receiver line idle state value (receiver line inactive). The user must define RXIDLEV to ensure reliable synchronization. By default, RXIDLEV is set to one (receiver line is at level 1 when there is no activity).

**Figure 46-13. Asynchronous Start Bit Detection**

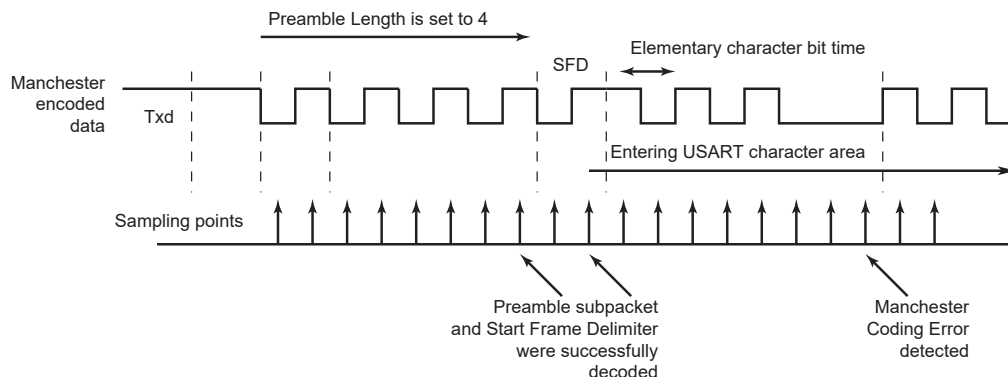

The receiver is activated and starts preamble and frame delimiter detection, sampling the data at one quarter and then three quarters. If a valid preamble pattern or start frame delimiter is detected, the receiver continues decoding with the same synchronization. If the stream does not match a valid pattern or a valid start frame delimiter, the receiver resynchronizes on the next valid edge. The minimum time threshold to estimate the bit value is three quarters of a bit time.

If a valid preamble (if used) followed with a valid start frame delimiter is detected, the incoming stream is decoded into NRZ data and passed to USART for processing. The following figure illustrates Manchester pattern mismatch. When incoming data stream is passed to the USART, the receiver is also able to detect Manchester code violation. A code violation is a lack of transition in the middle of a bit cell. In this case, the MANE flag in FLEX\_US\_CSR is raised. It is cleared by writing a one to FLEX\_US\_CR.RSTSTA. See figure "Manchester Error Flag" below for an example of Manchester error detection during the data phase.

**Figure 46-14. Preamble Pattern Mismatch**

**Figure 46-15. Manchester Error Flag**

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

When the start frame delimiter is a sync pattern (ONEBIT = 0), both command and data delimiter are supported. If a valid sync is detected, the received character is written as RXCHR field in the Receive Holding Register (FLEX\_US\_RHR) and the RXSYNH is updated. RXCHR is set to 1 when the received character is a command, and it is set to 0 if the received character is a data. This mechanism alleviates and simplifies the direct memory access as the character contains its own sync field in the same register.

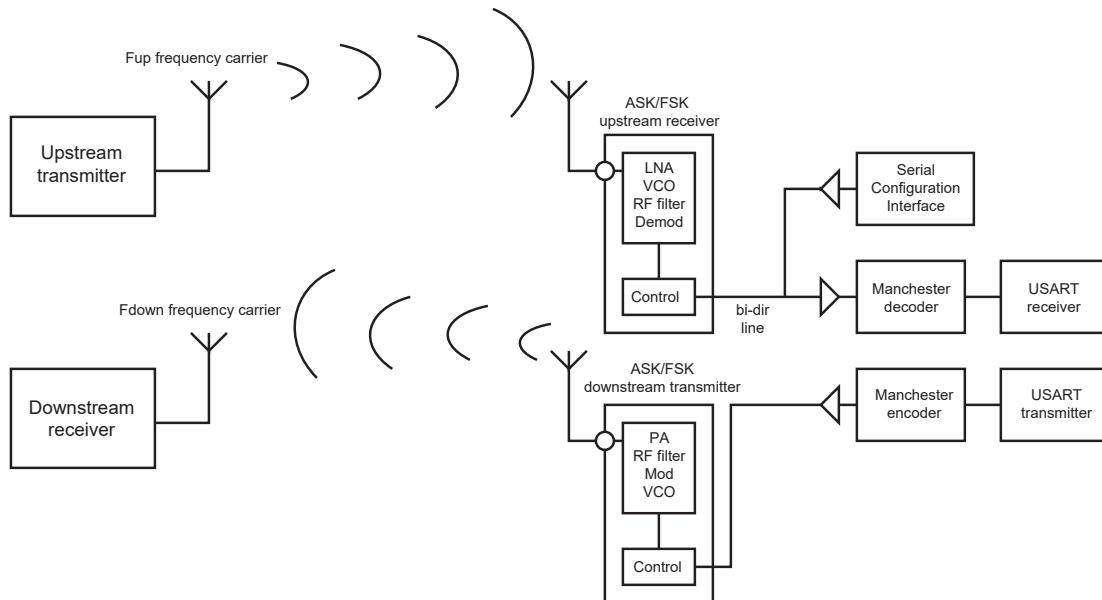

As the decoder is setup to be used in Unipolar mode, the first bit of the frame has to be a zero-to-one transition.

### 46.7.3.5 Radio Interface: Manchester Encoded USART Application

This section describes low data rate RF transmission systems and their integration with a Manchester encoded USART. These systems are based on transmitter and receiver ICs that support ASK and FSK modulation schemes.

The goal is to perform full-duplex radio transmission of characters using two different frequency carriers. See configuration in the following figure.

**Figure 46-16. Manchester Encoded Characters RF Transmission**

The USART peripheral is configured as a Manchester encoder/decoder. Looking at the downstream communication channel, Manchester encoded characters are serially sent to the RF transmitter. This may also include a user defined preamble and a start frame delimiter. Mostly, preamble is used in the RF receiver to distinguish between a valid data from a transmitter and signals due to noise. The Manchester stream is then modulated. See the following figure for an example of ASK modulation scheme. When a logic one is sent to the ASK modulator, the power amplifier, referred to as PA, is enabled and transmits an RF signal at downstream frequency. When a logic zero is transmitted, the RF signal is turned off. If the FSK modulator is activated, two different frequencies are used to transmit data. When a logic 1 is sent, the modulator outputs an RF signal at frequency F0 and switches to F1 if the data sent is a 0. See figure "FSK Modulator Output" below.

From the receiver side, another carrier frequency is used. The RF receiver performs a bit check operation examining demodulated data stream. If a valid pattern is detected, the receiver switches to Receiving mode. The demodulated stream is sent to the Manchester decoder. Because of bit checking inside RF IC, the data transferred to the microcontroller is reduced by a user-defined number of bits. The Manchester preamble length is to be defined in accordance with the RF IC configuration.

**Figure 46-17. ASK Modulator Output**

**Figure 46-18. FSK Modulator Output**

#### 46.7.3.6 Synchronous Receiver

In Synchronous mode ( $SYNC = 1$ ), the receiver samples the RXD signal on each rising edge of the baud rate clock. If a low level is detected, it is considered as a start. All data bits, the parity bit and the stop bits are sampled and the receiver waits for the next start bit. Synchronous mode operations provide a high-speed transfer capability.

Configuration fields and bits are the same as in Asynchronous mode.

The following figure illustrates a character reception in Synchronous mode.

**Figure 46-19. Synchronous Mode Character Reception**

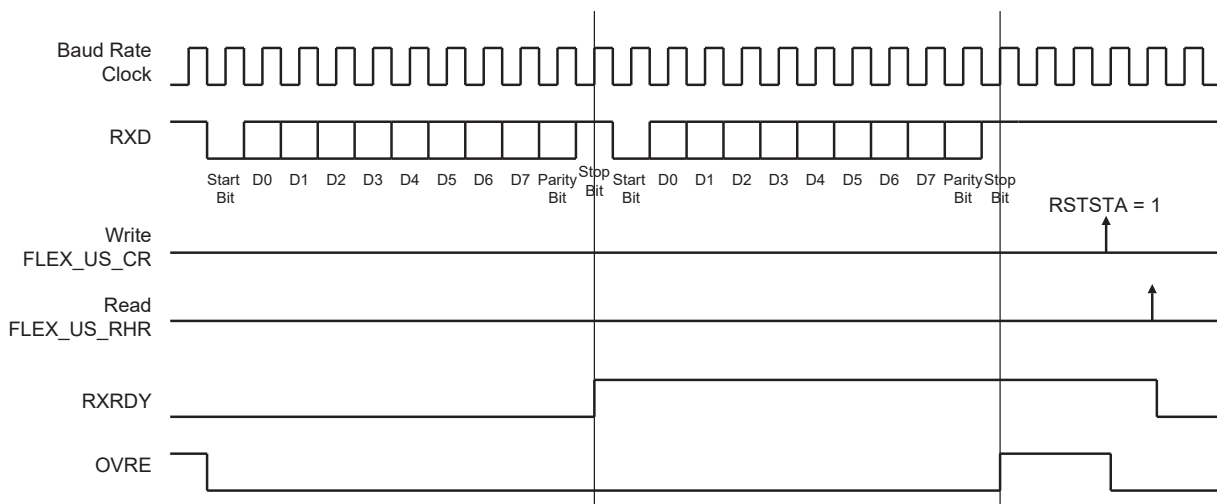

Example: 8-bit, Parity Enabled 1 Stop

#### 46.7.3.7 Receiver Operations

When a character reception is completed, it is transferred to the Receive Holding Register (FLEX\_US\_RHR) and the FLEX\_US\_CSR.RXRDY bit is raised. If a character is completed while the RXRDY is set, the Overrun Error (OVRE) bit is set. The last character is transferred into FLEX\_US\_RHR and overwrites the previous one. The OVRE bit is cleared by writing a one to Reset Status bit FLEX\_US\_CR.RSTSTA.

**Figure 46-20. Receiver Status**

### 46.7.3.8 Parity

The USART supports five parity modes that are selected by writing to the FLEX\_US\_MR.PAR field. The PAR field also enables the Multidrop mode (see section [Multidrop Mode](#)). Even and odd parity bit generation and error detection are supported.

If even parity is selected, the parity generator of the transmitter drives the parity bit to 0 if a number of 1s in the character data bit is even, and to 1 if the number of 1s is odd. Accordingly, the receiver parity checker counts the number of received 1s and reports a parity error if the sampled parity bit does not correspond. If odd parity is selected, the parity generator of the transmitter drives the parity bit to 1 if a number of 1s in the character data bit is even, and to 0 if the number of 1s is odd. Accordingly, the receiver parity checker counts the number of received 1s and reports a parity error if the sampled parity bit does not correspond. If the mark parity is used, the parity generator of the transmitter drives the parity bit to 1 for all characters. The receiver parity checker reports an error if the parity bit is sampled to 0. If the space parity is used, the parity generator of the transmitter drives the parity bit to 0 for all characters. The receiver parity checker reports an error if the parity bit is sampled to 1. If parity is disabled, the transmitter does not generate any parity bit and the receiver does not report any parity error.

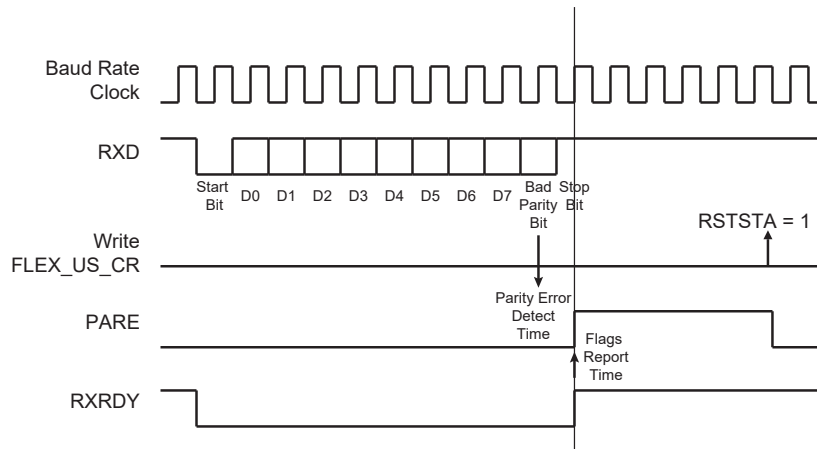

The following table shows an example of the parity bit for the character 0x41 (character ASCII “A”) depending on the configuration of the USART. Because there are two bits set to 1 in the character value, the parity bit is set to 1 when the parity is odd, or configured to 0 when the parity is even.

**Table 46-7. Parity Bit Examples**

Character	Hexadecimal	Binary	Parity Bit	Parity Mode
A	0x41	0100 0001	1	Odd
A	0x41	0100 0001	0	Even
A	0x41	0100 0001	1	Mark
A	0x41	0100 0001	0	Space
A	0x41	0100 0001	None	None

When the receiver detects a parity error, it sets the Parity Error bit FLEX\_US\_CSR.PARE. The PARE bit can be cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit. The following figure illustrates the parity bit status setting and clearing.

**Figure 46-21. Parity Error**

#### 46.7.3.9 Multidrop Mode

If the value 0x6 or 0x07 is written to the FLEX\_US\_MR.PAR field, the USART runs in Multidrop mode. This mode differentiates the data characters and the address characters. Data are transmitted with the parity bit to 0 and addresses are transmitted with the parity bit to 1.

If the USART is configured in Multidrop mode, the receiver sets the PARE parity error bit when the parity bit is high and the transmitter is able to send a character with the parity bit high when a one is written to the FLEX\_US\_CR.SENDA bit.

To handle parity error, the PARE bit is cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit.

The transmitter sends an address byte (parity bit set) when the FLEX\_US\_CR.SENDA bit is written to 1. In this case, the next byte written to FLEX\_US\_THR is transmitted as an address. Any character written in FLEX\_US\_THR when the SENDA command is not written is transmitted normally with parity to 0.

#### 46.7.3.10 Transmitter Timeguard

The timeguard feature enables the USART interface with slow remote devices.

The timeguard function enables the transmitter to insert an idle state on the TXD line between two characters. This idle state actually acts as a long stop bit.

The duration of the idle state is programmed in the TG field of the Transmitter Timeguard Register (FLEX\_US\_TTGR). When this field is written to zero, no timeguard is generated. Otherwise, the transmitter holds a high level on TXD after each transmitted byte during the number of bit periods programmed in TG in addition to the number of stop bits.

As illustrated in the following figure, the behavior of the TXRDY and TXEMPTY status bits is modified by the programming of a timeguard. TXRDY rises only when the start bit of the next character is sent, and thus remains to 0 during the timeguard transmission if a character has been written in FLEX\_US\_THR. TXEMPTY remains low until the timeguard transmission is completed as the timeguard is part of the current character being transmitted.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

**Figure 46-22. Timeguard Operations**

The following table indicates the maximum length of a timeguard period that the transmitter can handle in relation to the function of the baud rate.

**Table 46-8. Maximum Timeguard Length Depending on Baud Rate**

Baud Rate (bit/s)	Bit Time ( $\mu$ s)	Timeguard (ms)
1,200	833	212.50
9,600	104	26.56
14,400	69.4	17.71
19,200	52.1	13.28
28,800	34.7	8.85
38,400	26	6.63
56,000	17.9	4.55
57,600	17.4	4.43
115,200	8.7	2.21

### 46.7.3.11 Receiver Timeout

The Receiver Timeout provides support in handling variable-length frames. This feature detects an idle condition on the RXD line. When a timeout is detected, the FLEX\_US\_CSR.TIMEOUT bit rises and can generate an interrupt, thus indicating to the driver an end of frame.

The timeout delay period (during which the receiver waits for a new character) is programmed in the TO field of the Receiver Timeout Register (FLEX\_US\_RTOR). If the TO field is written to 0, the Receiver Timeout is disabled and no timeout is detected. The FLEX\_US\_CSR.TIMEOUT bit remains at 0. Otherwise, the receiver loads a 16-bit counter with the value programmed in TO. This counter is decremented at each bit period and reloaded each time a new character is received. If the counter reaches 0, the FLEX\_US\_CSR.TIMEOUT bit rises. Then, the user can either:

- Stop the counter clock until a new character is received. This is performed by writing a '1' to FLEX\_US\_CR.STTTO. In this case, the idle state on RXD before a new character is received does not provide a timeout. This prevents having to handle an interrupt before a character is received and enables waiting for the next idle state on RXD after a frame is received.
- Obtain an interrupt while no character is received. This is performed by writing a '1' to FLEX\_US\_CR.RETTO. In this case, the counter starts counting down immediately from the value

TO. This generates a periodic interrupt so that a user timeout can be handled, for example when no key is pressed on a keyboard.

The following figure shows the block diagram of the Receiver Timeout feature.

**Figure 46-23. Receiver Timeout Block Diagram**

The following table gives the maximum timeout period for some standard baud rates.

**Table 46-9. Maximum Timeout Period**

Baud Rate (bit/s)	Bit Time ( $\mu\text{s}$ )	Timeout (ms)
600	1,667	109,225
1,200	833	54,613
2,400	417	27,306
4,800	208	13,653
9,600	104	6,827
14,400	69	4,551
19,200	52	3,413
28,800	35	2,276
38,400	26	1,704
56,000	18	1,170
57,600	17	1,138
200,000	5	328

### 46.7.3.12 Framing Error

The receiver is capable of detecting framing errors. A framing error happens when the stop bit of a received character is detected at level 0. This can occur if the receiver and the transmitter are fully desynchronized.

A framing error is reported on the FLEX\_US\_CSR.FRAME bit. The FRAME bit is asserted in the middle of the stop bit as soon as the framing error is detected. It is cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit.

**Figure 46-24. Framing Error Status**

### 46.7.3.13 Transmit Break

The user can request the transmitter to generate a break condition on the TXD line. A break condition drives the TXD line low during at least one complete character. It appears the same as a 0x00 character sent with the parity and the stop bits to 0. However, the transmitter holds the TXD line at least during one character until the user requests the break condition to be removed.

A break is transmitted by setting the FLEX\_US\_CR.STTBK bit. This can be done at any time, either while the transmitter is empty (no character in either the shift register or in FLEX\_US\_THR) or when a character is being transmitted. If a break is requested while a character is being shifted out, the character is first completed before the TXD line is held low.

Once the Start Break command is requested, further Start Break commands are ignored until the end of the break is completed.

The break condition is removed by setting the FLEX\_US\_CR.STPBRK bit. If the Stop Break command is requested before the end of the minimum break duration (one character, including start, data, parity and stop bits), the transmitter ensures that the break condition completes.

The transmitter considers the break as though it is a character, i.e., the Start Break and Stop Break commands are processed only if the FLEX\_US\_CSR.TXRDY bit = 1 and the start of the break condition clears the TXRDY and TXEMPTY bits as if a character was processed.

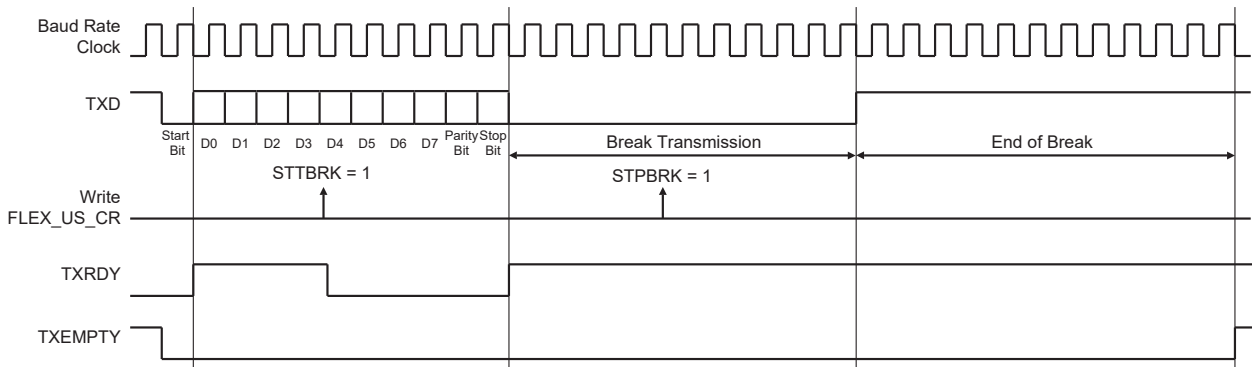

Setting both the FLEX\_US\_CR.STTBK and FLEX\_US\_CR.STPBRK bits can lead to an unpredictable result. All Stop Break commands requested without a previous Start Break command are ignored. A byte written into the Transmit Holding register while a break is pending, but not started, is ignored.

After the break condition, the transmitter returns the TXD line to 1 for a minimum of 12 bit times. Thus, the transmitter ensures that the remote receiver detects correctly the end of break and the start of the next character. If the timeguard is programmed with a value higher than 12, the TXD line is held high for the timeguard period.

After holding the TXD line for this period, the transmitter resumes normal operations.

The following figure illustrates the effect of both the Start Break (STTBK) and Stop Break (STPBRK) commands on the TXD line.

**Figure 46-25. Break Transmission**

### 46.7.3.14 Receive Break

The receiver detects a break condition when all data, parity and stop bits are low. This corresponds to detecting a framing error with data to 0x00, but FRAME remains low.

When the low stop bit is detected, the receiver asserts the FLEX\_US\_CSR.RXBRK bit. FLEX\_US\_CSR.RXBRK may be cleared by setting the FLEX\_US\_CR.RSTSTA bit.

An end of receive break is detected by a high level for at least 2/16ths of a bit period in Asynchronous operating mode or one sample at high level in Synchronous operating mode. The end of break detection also asserts the RXBRK bit.

### 46.7.3.15 Hardware Handshaking

The USART features a hardware handshaking out-of-band flow control. The RTS and CTS pins are used to connect with the remote device, as shown in the following figure.

**Figure 46-26. Connection with a Remote Device for Hardware Handshaking**

Setting the USART to operate with hardware handshaking is performed by writing the FLEX\_US\_MR.USART\_MODE field to the value 0x2.

The USART behavior when hardware handshaking is enabled is the same as the behavior in standard Synchronous or Asynchronous mode, except that the receiver drives the RTS pin as described below and the level on the CTS pin modifies the behavior of the transmitter as described below. Using this mode requires using the DMAC channel for reception. The transmitter can handle hardware handshaking in any case.

**Figure 46-27. RTS Line Software Control when FLEX\_US\_MR.USART\_MODE = 2**

The following figure shows how the transmitter operates if hardware handshaking is enabled. The CTS pin disables the transmitter. If a character is being processed, the transmitter is disabled only after the completion of the current character and transmission of the next character happens as soon as the pin CTS falls.

**Figure 46-28. Transmitter Behavior when Operating with Hardware Handshaking**

If USART FIFOs are enabled (bit FLEX\_US\_CR.FIFOEN), the RTS pin can be controlled by the USART Receive FIFO thresholds. The RTS pin control through Receive FIFO thresholds can be activated with the FLEX\_US\_FMR.FRTSC bit. Once activated, the RTS pin will be controlled by Receive FIFO thresholds, set to level 1 each time RXFTHRES is reached and set to level '0' each time RXFTHRES2 is reached (and RXFTHRES is not reached).

**Figure 46-29. Receiver Behavior When FIFO Enabled and FRTSC Set to '1'**

**Note:** In this mode, RXFTHRES must be > RXFTHRES2.

### 46.7.4 ISO7816 Mode

The USART features an ISO7816-compatible operating mode. This mode permits interfacing with smart cards and Security Access Modules (SAM) communicating through an ISO7816 link. Both T = 0 and T = 1 protocols defined by the ISO7816 specification are supported.

Setting the USART in ISO7816 mode is performed by writing the FLEX\_US\_MR.USART\_MODE field to the value 0x4 for protocol T = 0 and to the value 0x6 for protocol T = 1.

#### 46.7.4.1 ISO7816 Mode Overview

The ISO7816 is a half-duplex communication on only one bidirectional line. The baud rate is determined by a division of the clock provided to the remote device (see figure in section [Baud Rate Generator](#)).

The USART connects to a smart card as shown in the following figure. The TXD line becomes bidirectional and the baud rate generator feeds the ISO7816 clock on the SCK pin. As the TXD pin becomes bidirectional, its output remains driven by the output of the transmitter but only when the transmitter is active while its input is directed to the input of the receiver. The USART is considered as the master of the communication as it generates the clock.

**Figure 46-30. Connection of a Smart Card to the USART**

When operating in ISO7816, either in T = 0 or T = 1 modes, the character format is partially predefined. The configuration is forced to 8 data bits, and 1 or 2 stop bits, regardless of the values programmed in the CHRL, MODE9 and CHMODE fields. MSBF can be used to transmit LSB or MSB first. The bit INVDATA can be used to transmit in Normal or Inverse mode.

The USART cannot operate concurrently in both Receiver and Transmitter modes as the communication is unidirectional at a time. It has to be configured according to the required mode by enabling or disabling either the receiver or the transmitter as desired. Enabling both the receiver and the transmitter at the same time in ISO7816 mode may lead to unpredictable results.

The ISO7816 specification defines an inverse transmission format. Data bits of the character must be transmitted on the I/O line at their negative value.

**46.7.4.2 Protocol T = 0**

In T = 0 protocol, a character is made up of 1 start bit, 8 data bits, 1 parity bit and 1 guard time, which lasts two bit times. The transmitter shifts out the bits and does not drive the I/O line during the guard time.

If no parity error is detected, the I/O line remains at 1 during the guard time and the transmitter can continue with the transmission of the next character, as shown in the following figure.

If a parity error is detected by the receiver, it drives the I/O line to 0 during the guard time, as shown in figure "T = 0 Protocol with Parity Error" below. This error bit is also named NACK, for Non Acknowledge. In this case, the character lasts 1 bit time more, as the guard time length is the same and is added to the error bit time which lasts 1 bit time.

When the USART is the receiver and it detects an error, it does not load the erroneous character in the Receive Holding Register (FLEX\_US\_RHR). It appropriately sets the PARE bit in the Status Register (FLEX\_US\_CSR) so that the software can handle the error.

**Figure 46-31. T = 0 Protocol without Parity Error**

**Figure 46-32. T = 0 Protocol with Parity Error**

#### **46.7.4.2.1 Receive Error Counter**

The USART receiver also records the total number of errors. This can be read in the Number of Error (FLEX\_US\_NER) register. The NB\_ERRORS field can record up to 255 errors. Reading FLEX\_US\_NER automatically clears the NB\_ERRORS field.

#### **46.7.4.2.2 Receive NACK Inhibit**

The USART can be configured to inhibit an error. This is done by writing a '1' to FLEX\_US\_MR.INACK. In this case, no error signal is driven on the I/O line even if a parity bit is detected.

Moreover, if INACK = 1, the erroneous received character is stored in the Receive Holding register as if no error occurred, and the RXRDY bit rises.

#### **46.7.4.2.3 Transmit Character Repetition**

When the USART is transmitting a character and gets a NACK, it can automatically repeat the character before moving on to the next one. Repetition is enabled by writing the FLEX\_US\_MR.MAX\_ITERATION field at a value higher than 0. Each character can be transmitted up to eight times: the first transmission plus seven repetitions.

If MAX\_ITERATION does not equal zero, the USART repeats the character as many times as the value loaded in MAX\_ITERATION.

When the USART repetition number reaches MAX\_ITERATION, and the last repeated character is not acknowledged, the FLEX\_US\_CSR.ITER bit is set. If the repetition of the character is acknowledged by the receiver, the repetitions are stopped and the iteration counter is cleared.

The FLEX\_US\_CSR.ITER bit can be cleared by writing the FLEX\_US\_CR.RSTIT bit to 1.

#### **46.7.4.2.4 Disable Successive Receive NACK**

The receiver can limit the number of successive NACKs sent back to the remote transmitter. This is programmed by setting the FLEX\_US\_MR.DSNACK bit. The maximum number of NACKs transmitted is programmed in the MAX\_ITERATION field. As soon as MAX\_ITERATION is reached, no error signal is driven on the I/O line and the FLEX\_US\_CSR.ITER bit is set.

#### **46.7.4.3 Protocol T = 1**

When operating in ISO7816 protocol T = 1, the transmission is similar to an asynchronous format with only one stop bit. The parity is generated when transmitting and checked when receiving. Parity error detection sets the FLEX\_US\_CSR.PARE bit.

#### **46.7.5 IrDA Mode**

The USART features an IrDA mode supplying half-duplex point-to-point wireless communication. It embeds the modulator and demodulator which allows a glueless connection to the infrared transceivers, as shown in the following figure. The modulator and demodulator are compliant with the IrDA specification version 1.1 and support data transfer speeds ranging from 2.4 kbit/s to 115.2 kbit/s.

The USART IrDA mode is enabled by setting the FLEX\_US\_MR.USART\_MODE field to the value 0x8. The IrDA Filter Register (FLEX\_US\_IF) allows configuring the demodulator filter. The USART transmitter and receiver operate in a normal Asynchronous mode and all parameters are accessible. Note that the modulator and the demodulator are activated.

**Figure 46-33. Connection to IrDA Transceivers**

The receiver and the transmitter must be enabled or disabled according to the direction of the transmission to be managed.

To receive IrDA signals, the following needs to be done:

- Disable TX and Enable RX
- Configure the TXD pin as PIO and set it as an output to 0 (to avoid LED transmission). Disable the internal pullup (better for power consumption).
- Receive data

### 46.7.5.1 IrDA Modulation

For baud rates up to and including 115.2 kbit/s, the RZI modulation scheme is used. “0” is represented by a light pulse of 3/16th of a bit time. Some examples of signal pulse duration are shown in the following table.

**Table 46-10. IrDA Pulse Duration**

Baud Rate	Pulse Duration (3/16)
2.4 kbit/s	78.13 $\mu$ s
9.6 kbit/s	19.53 $\mu$ s
19.2 kbit/s	9.77 $\mu$ s
38.4 kbit/s	4.88 $\mu$ s
57.6 kbit/s	3.26 $\mu$ s
115.2 kbit/s	1.63 $\mu$ s

The following figure shows an example of character transmission.

**Figure 46-34. IrDA Modulation**

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.7.5.2 IrDA Baud Rate

The following table gives some examples of CD values, baud rate error and pulse duration. Note that the requirement on the maximum acceptable error of  $\pm 1.87\%$  must be met.

**Table 46-11. IrDA Baud Rate Error**

Peripheral Clock	Baud Rate (bit/s)	CD	Baud Rate Error	Pulse Time ( $\mu$ s)
3,686,400	115,200	2	0.00%	1.63
20,000,000	115,200	11	1.38%	1.63
32,768,000	115,200	18	1.25%	1.63
40,000,000	115,200	22	1.38%	1.63
3,686,400	57,600	4	0.00%	3.26
20,000,000	57,600	22	1.38%	3.26
32,768,000	57,600	36	1.25%	3.26
40,000,000	57,600	43	0.93%	3.26
3,686,400	38,400	6	0.00%	4.88
20,000,000	38,400	33	1.38%	4.88
32,768,000	38,400	53	0.63%	4.88
40,000,000	38,400	65	0.16%	4.88
3,686,400	19,200	12	0.00%	9.77
20,000,000	19,200	65	0.16%	9.77
32,768,000	19,200	107	0.31%	9.77
40,000,000	19,200	130	0.16%	9.77
3,686,400	9,600	24	0.00%	19.53
20,000,000	9,600	130	0.16%	19.53
32,768,000	9,600	213	0.16%	19.53
40,000,000	9,600	260	0.16%	19.53
3,686,400	2,400	96	0.00%	78.13
20,000,000	2,400	521	0.03%	78.13
32,768,000	2,400	853	0.04%	78.13

### 46.7.5.3 IrDA Demodulator

The demodulator is based on the IrDA Receive filter comprised of an 8-bit down counter which is loaded with the value programmed in FLEX\_US\_IF. When a falling edge is detected on the RXD pin, the Filter Counter starts counting down at the peripheral clock speed. If a rising edge is detected on the RXD pin, the counter stops and is reloaded with FLEX\_US\_IF. If no rising edge is detected when the counter reaches 0, the input of the receiver is driven low during one bit time.

The following figure illustrates the operations of the IrDA demodulator.

**Figure 46-35. IrDA Demodulator Operations**

The programmed value in the FLEX\_US\_IF register must always meet the following criteria:

$$t_{\text{peripheral clock}} \times (\text{IRDA\_FILTER} + 3) < 1.41 \mu\text{s}$$

As the IrDA mode uses the same logic as the ISO7816, note that the FLEX\_US\_FIDI.FI\_DI\_RATIO field must be set to a value higher than 0 to make sure IrDA communications operate correctly.

### 46.7.6 RS485 Mode

The USART features the RS485 mode to enable line driver control. While operating in RS485 mode, the USART behaves as though in Asynchronous or Synchronous mode and configuration of all the parameters is possible. The difference is that the RTS pin is driven high when the transmitter is operating. The behavior of the RTS pin is controlled by the TXEMPTY bit. A typical connection of the USART to an RS485 bus is shown in the following figure.

**Figure 46-36. Typical Connection to an RS485 Bus**

The USART is set in RS485 mode by writing the value 0x1 to the FLEX\_US\_MR.USART\_MODE field.

The RTS pin is at a level inverse to the TXEMPTY bit. Significantly, the RTS pin remains high when a timeguard is programmed, so that the line can remain driven after the last character completion. The following figure gives an example of the RTS waveform during a character transmission when the timeguard is enabled.

**Figure 46-37. Example of RTS Drive with Timeguard**

#### 46.7.7 USART Comparison Function on Received Character

The CMP flag in FLEX\_US\_CSR is set when the received character matches the conditions programmed in FLEX\_US\_CMPR. The CMP flag is set as soon as FLEX\_US\_RHR is loaded with the new received character. The CMP flag is cleared by writing a one to FLEX\_US\_CR.RSTSTA.

FLEX\_US\_CMPR can be programmed to provide different comparison methods:

- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if any received character equals VAL1 or VAL2.

When the FLEX\_US\_CMPR.CMPMODE bit is set to FLAG\_ONLY (value 0), all received data are loaded in FLEX\_US\_RHR and the CMP flag provides the status of the comparison result.

By programming the START\_CONDITION.CMPMODE bit (value 1), the comparison function result triggers the start of the loading of FLEX\_US\_RHR (see the following figure). The trigger condition exists as soon as the received character value matches the condition defined by the programming of VAL1, VAL2 and CMPPAR in FLEX\_US\_CMPR. The comparison trigger event is restarted by writing a 1 to the FLEX\_US\_CR.REQCLR bit.

The value programmed in the VAL1 and VAL2 fields must not exceed the maximum value of the received character (see CHRL field in register [46.10.6 FLEX\\_US\\_MR](#)).

**Figure 46-38. Receive Holding Register Management**

CMPMODE = 1, VAL1 = VAL2 = 0x06

### 46.7.8 SPI Mode

The Serial Peripheral Interface (SPI) mode is a synchronous serial data link that provides communication with external devices in Master or Slave mode. It also enables communication between processors if an external processor is connected to the system.

The Serial Peripheral Interface is essentially a shift register that serially transmits data bits to other SPIs. During a data transfer, one SPI system acts as the “master” which controls the data flow, while the other devices act as “slaves” which have data shifted into and out by the master. Different CPUs can take turns being masters and one master may simultaneously shift data into multiple slaves. (Multiple master protocol is the opposite of single master protocol, where one CPU is always the master while all of the others are always slaves.) However, only one slave may drive its output to write data back to the master at any given time.

A slave device is selected when its NSS signal is asserted by the master. The USART in SPI Master mode can address only one SPI slave because it can generate only one NSS signal.

The SPI system consists of two data lines and two control lines:

- Master Out Slave In (MOSI): This data line supplies the output data from the master shifted into the input of the slave.
- Master In Slave Out (MISO): This data line supplies the output data from a slave to the input of the master.
- Serial Clock (SCK): This control line is driven by the master and regulates the flow of the data bits. The master may transmit data at a variety of bit rates. The SCK line cycles once for each bit that is transmitted.
- Slave Select (NSS): This control line allows the master to select or deselect the slave.

#### 46.7.8.1 Modes of Operation

The USART can operate in SPI Master mode or in SPI Slave mode.

Operation in SPI Master mode is programmed by writing 0xE to the FLEX\_US\_MR.USART\_MODE field. In this case, the SPI lines must be connected as described below:

- The MOSI line is driven by the output pin TXD

- The MISO line drives the input pin RXD
- The SCK line is driven by the output pin SCK
- The NSS line is driven by the output pin RTS

Operation in SPI Slave mode is programmed by writing to 0xF the FLEX\_US\_MR.USART\_MODE field. In this case, the SPI lines must be connected as described below:

- The MOSI line drives the input pin RXD
- The MISO line is driven by the output pin TXD
- The SCK line drives the input pin SCK
- The NSS line drives the input pin CTS

In order to avoid an unpredictable behavior, any change of the SPI mode must be followed by a software reset of the transmitter and of the receiver (except the initial configuration after a hardware reset). (See section [Receiver and Transmitter Control](#).)

### 46.7.8.2 Bit Rate

In SPI mode, the bit rate generator operates in the same way as in USART Synchronous mode. See section [46.7.1.3 Baud Rate in Synchronous Mode or SPI Mode](#). However, some restrictions apply:

In SPI Master mode:

- The external clock SCK must not be selected (USCLKS  $\neq$  0x3), and the FLEX\_US\_MR.CLKO bit must be set in order to generate correctly the serial clock on the SCK pin.
- To ensure a correct behavior of the receiver and the transmitter, the value programmed in CD must be  $\geq 6$ .
- If the divided peripheral clock is selected, the value programmed in CD must be even to ensure a 50:50 mark/space ratio on the SCK pin; this value can be odd if the peripheral clock is selected.

In SPI Slave mode:

- The external clock (SCK) selection is forced regardless of the value of the FLEX\_US\_MR.USCLKS field. Likewise, the value written in FLEX\_US\_BRGR has no effect, because the clock is provided directly by the signal on the USART SCK pin.
- To ensure a correct behavior of the receiver and the transmitter, the external clock (SCK) frequency must be at least six times lower than the system clock.

### 46.7.8.3 Data Transfer

Up to nine data bits are successively shifted out on the TXD pin at each rising or falling edge (depending of CPOL and CPHA) of the programmed serial clock. There is no Start bit, no Parity bit and no Stop bit.

The number of data bits is selected by the CHRL field and the MODE9 bit in FLEX\_US\_MR. The nine bits are selected by setting the MODE9 bit regardless of the CHRL field. The MSB data bit is always sent first in SPI mode (Master or Slave).

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the FLEX\_US\_MR.CPOL bit. The clock phase is programmed with the CPHA bit. These two parameters determine the edges of the clock signal upon which data are driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Thus, a master/slave pair must use the same parameter pair values to communicate. If multiple slaves are used and fixed in different configurations, the master must reconfigure itself each time it needs to communicate with a different slave.

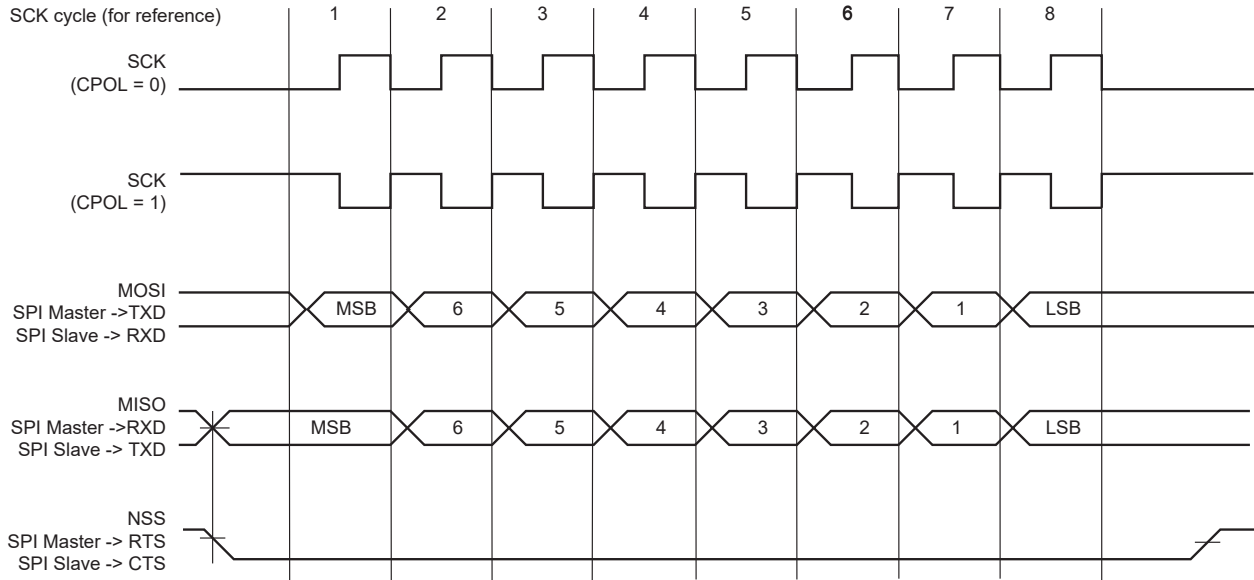

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

**Table 46-12. SPI Bus Protocol Mode**

SPI Bus Protocol Mode	CPOL	CPHA
0	0	1
1	0	0
2	1	1
3	1	0

**Figure 46-40. SPI Transfer Format (CPHA = 0, 8 bits per transfer)**

### 46.7.8.4 Receiver and Transmitter Control

See section [Receiver and Transmitter Control](#).

#### 46.7.8.5 Character Transmission

The characters are sent by writing in the Transmit Holding Register (FLEX\_US\_THR). An additional condition for transmitting a character can be added when the USART is configured in SPI Master mode. In the “USART Mode Register (SPI\_MODE)” (FLEX\_US\_MR), the value configured on the WRDBT bit can prevent any character transmission (even if FLEX\_US\_THR has been written) while the receiver side is not ready (character not read). When WRDBT = 0, the character is transmitted whatever the receiver status. If WRDBT = 1, the transmitter waits for the Receive Holding Register (FLEX\_US\_RHR) to be read before transmitting the character (RXRDY flag cleared), thus preventing any overflow (character loss) on the receiver side.

The chip select line is deasserted for a period equivalent to 3 bits between the transmission of two data.

The transmitter reports two status bits in FLEX\_US\_CSR: TXRDY (Transmitter Ready), which indicates that FLEX\_US\_THR is empty and TXEMPTY, which indicates that all the characters written in FLEX\_US\_THR have been processed. When the current character processing is completed, the last character written in FLEX\_US\_THR is transferred into the shift register of the transmitter and FLEX\_US\_THR is emptied, and thus TXRDY rises.

Both the TXRDY and the TXEMPTY bits are low when the transmitter is disabled. Writing a character in FLEX\_US\_THR while TXRDY is low has no effect and the written character is lost.

If the USART is in SPI Slave mode and if a character must be sent while FLEX\_US\_THR is empty, the UNRE (Underrun Error) bit is set. The TXD transmission line stays at high level during all this time. The UNRE bit is cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit.

In SPI Master mode, the slave select line (NSS) is asserted at low level one  $t_{bit}$  ( $t_{bit}$  being the nominal time required to transmit a bit) before the transmission of the MSB bit and released at high level one  $t_{bit}$  after the transmission of the LSB bit. So, the slave select line (NSS) is always released between each character transmission and a minimum delay of three  $t_{bit}$  always inserted. However, in order to address slave devices supporting the CSAAT mode (Chip Select Active After Transfer), the slave select line (NSS) can be forced at low level by writing a one to the FLEX\_US\_CR.RTSEN bit. The slave select line (NSS) can be released at high level only by writing a one to the FLEX\_US\_CR.RTSDIS bit (for example, when all data have been transferred to the slave device).

In SPI Slave mode, the transmitter does not require a falling edge of the slave select line (NSS) to initiate a character transmission but only a low level. However, this low level must be present on the slave select line (NSS) at least one  $t_{bit}$  before the first serial clock cycle corresponding to the MSB bit.

#### 46.7.8.6 Character Reception

When a character reception is completed, it is transferred to the Receive Holding Register (FLEX\_US\_RHR) and the RXRDY bit in the Status Register (FLEX\_US\_CSR) rises. If a character is completed while RXRDY is set, the OVRE (Overrun Error) bit is set. The last character is transferred into FLEX\_US\_RHR and overwrites the previous one. The OVRE bit is cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit.

To ensure correct behavior of the receiver in SPI Slave mode, the master device sending the frame must ensure a minimum delay of one  $t_{bit}$  between each character transmission. The receiver does not require a falling edge of the slave select line (NSS) to initiate a character reception but only a low level. However, this low level must be present on the slave select line (NSS) at least one  $t_{bit}$  before the first serial clock cycle corresponding to the MSB bit.

#### 46.7.8.7 Receiver Timeout

Because the receiver bit rate clock is active only during data transfers in SPI mode, a receiver timeout is impossible in this mode, whatever the timeout value is in field FLEX\_US\_RTOR.TO.

### 46.7.9 LIN Mode

The LIN mode provides master node and slave node connectivity on a LIN bus.

The LIN (Local Interconnect Network) is a serial communication protocol which efficiently supports the control of mechatronic nodes in distributed automotive applications.

The main properties of the LIN bus are:

- Single master/multiple slaves concept
- Low-cost silicon implementation based on common UART/SCI interface hardware, an equivalent in software, or as a pure state machine.
- Self synchronization without quartz or ceramic resonator in the slave nodes
- Deterministic signal transmission
- Low cost single-wire implementation
- Speed up to 20 kbit/s

LIN provides cost efficient bus communication where the bandwidth and versatility of CAN are not required.

The LIN mode enables processing LIN frames with a minimum of action from the microprocessor.

#### 46.7.9.1 Modes of Operation

The USART can act either as a LIN master node or as a LIN slave node.

The node configuration is chosen by setting the USART\_MODE field in the USART Mode Register (FLEX\_US\_MR):

- LIN master node (USART\_MODE = 0xA)
- LIN slave node (USART\_MODE = 0xB)

In order to avoid unpredictable behavior, any change of the LIN node configuration must be followed by a software reset of the transmitter and of the receiver (except the initial node configuration after a hardware reset). (See section [46.7.2 Receiver and Transmitter Control](#).)

#### 46.7.9.2 Baud Rate Configuration

See section [Baud Rate in Asynchronous Mode](#).

- LIN master node: The baud rate is configured in FLEX\_US\_BRGR.
- LIN slave node: The initial baud rate is configured in FLEX\_US\_BRGR. This configuration is automatically copied in the LIN Baud Rate Register (FLEX\_US\_LINBRR) when writing FLEX\_US\_BRGR. After the synchronization procedure, the baud rate is updated in FLEX\_US\_LINBRR.

#### 46.7.9.3 Receiver and Transmitter Control

See section [46.7.2 Receiver and Transmitter Control](#).

#### 46.7.9.4 Character Transmission

See section [Transmitter Operations](#).

#### 46.7.9.5 Character Reception

See section [Receiver Operations](#).

#### 46.7.9.6 Header Transmission (Master Node Configuration)

All the LIN Frames start with a header which is sent by the master node and consists of a Synch Break Field, Synch Field and Identifier Field.

So in master node configuration, the frame handling starts with the sending of the header.

The header is transmitted as soon as the identifier is written in the LIN Identifier Register (FLEX\_US\_LINIR). At this moment the flag TXRDY falls.

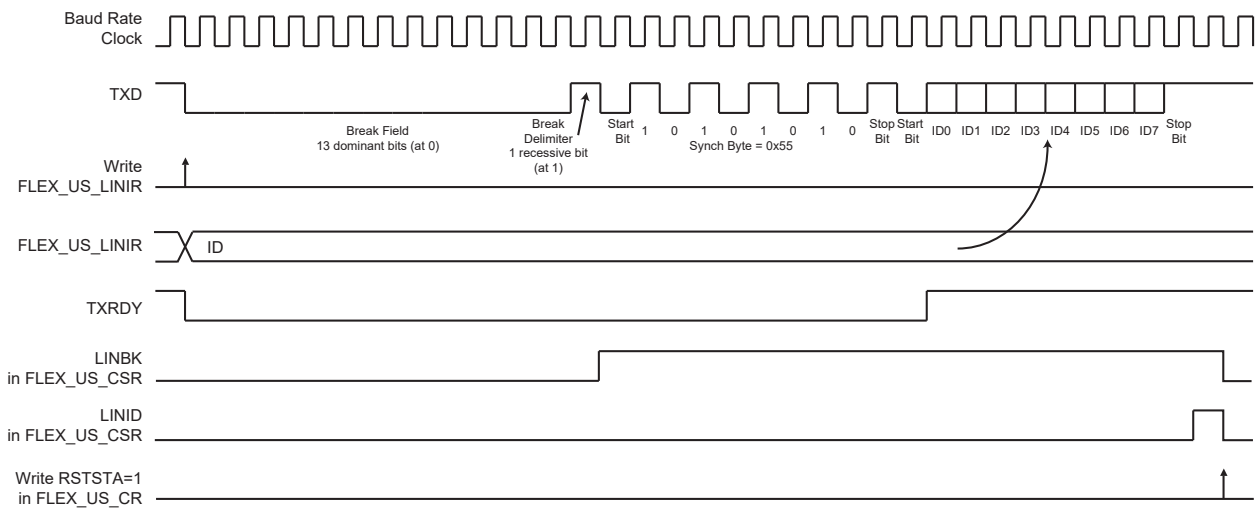

The Break Field, the Synch Field and the Identifier Field are sent automatically one after the other.

The Break Field consists of 13 dominant bits and 1 recessive bit, the Synch Field is the character 0x55 and the Identifier corresponds to the character written in the LIN Identifier Register (FLEX\_US\_LINIR). The Identifier parity bits can be automatically computed and sent (see section [Identifier Parity](#)).

The flag TXRDY rises when the identifier character is transferred into the shift register of the transmitter.

As soon as the Synch Break Field is transmitted, the FLEX\_US\_CSR.LINBK flag bit is set. Likewise, as soon as the Identifier Field is sent, the FLEX\_US\_CSR.LINID flag bit is set. These flags are reset by writing a one to the FLEX\_US\_CR.RSTSTA bit.

**Figure 46-41. Header Transmission**

### 46.7.9.7 Header Reception (Slave Node Configuration)

All the LIN frames start with a header which is sent by the master node and consists of a Synch Break Field, Synch Field and Identifier Field.

In slave node configuration, the frame handling starts with the reception of the header.

The USART uses a break detection threshold of 11 nominal bit times at the actual baud rate. At any time, if 11 consecutive recessive bits are detected on the bus, the USART detects a Break Field. As long as a Break Field has not been detected, the USART stays idle and the received data are not taken in account.

When a Break Field has been detected, the FLEX\_US\_CSR.LINBK flag is set and the USART expects the Synch Field character to be 0x55. This field is used to update the actual baud rate in order to remain synchronized (see section [Slave Node Synchronization](#)). If the received Synch character is not 0x55, an Inconsistent Synch Field error is generated (see section [LIN Errors](#)).

After receiving the Synch Field, the USART expects to receive the Identifier Field.

When the Identifier Field has been received, the FLEX\_US\_CSR.LINID flag bit is set. At this moment, the IDCHR field in the LIN Identifier Register (FLEX\_US\_LINIR) is updated with the received character. The Identifier parity bits can be automatically computed and checked (see section [Identifier Parity](#)).

If the header is not entirely received within the time given by the maximum length of the header  $t_{Header\_Maximum}$ , the FLEX\_US\_CSR.LINHTE error flag bit is set.

The flag bits LINID, LINBK and LINHTE are reset by writing a one to the FLEX\_US\_CR.RSTSTA bit.

**Figure 46-42. Header Reception**

### 46.7.9.8 Slave Node Synchronization

The synchronization is done only in slave node configuration. The procedure is based on time measurement between the falling edges of the Synch Field. The falling edges are available in distances of 2, 4, 6 and 8 bit times.

**Figure 46-43. Synch Field**

The time measurement is made by a 19-bit counter driven by the sampling clock (see section [Baud Rate Generator](#)).

When the start bit of the Synch Field is detected, the counter is reset. Then during the next eight  $t_{bit}$  of the Synch Field, the counter is incremented. At the end of these eight  $t_{bit}$ , the counter is stopped. At this moment, the 16 most significant bits of the counter (value divided by 8) give the new clock divider (LINCD) and the 3 least significant bits of this value (the remainder) give the new fractional part (LINFp).

Once the Synch Field has been entirely received, the clock divider (LINCD) and the fractional part (LINFp) are updated in the LIN Baud Rate Register (FLEX\_US\_LINBRR) with the computed values, if the Synchronization is not disabled by the SYNCDIS bit in the LIN Mode Register (FLEX\_US\_LINMR).

After reception of the Synch Field:

- If it appears that the computed baud rate deviation compared to the initial baud rate is superior to the maximum tolerance  $FTol_{Unsynch}$  ( $\pm 15\%$ ), then the clock divider (LINCD) and the fractional part (LINFp) are not updated, and the FLEX\_US\_CSR.LINSTE error flag bit is set.
- If it appears that the sampled Synch character is not equal to 0x55, then the clock divider (LINCD) and the fractional part (LINFp) are not updated, and the FLEX\_US\_CSR.LINISFE error flag bit is set.

Flags LINSTE and LINISFE are reset by writing a one to the FLEX\_US\_CR.RSTSTA bit.

**Figure 46-44. Slave Node Synchronization**

The synchronization accuracy depends on several parameters:

- The nominal clock frequency ( $f_{Nom}$ ) (the theoretical slave node clock frequency)
- The baud rate
- The oversampling ( $OVER = 0 \Rightarrow 16X$  or  $OVER = 1 \Rightarrow 8X$ )

The following formula is used to compute the deviation of the slave bit rate relative to the master bit rate after synchronization ( $f_{SLAVE}$  is the real slave node clock frequency).

$$\text{Baud rate deviation} = \left( 100 \times \frac{[\alpha \times 8 \times (2 - Over) + \beta] \times \text{Baud rate}}{8 \times f_{SLAVE}} \right) \%$$

$$\text{Baud rate deviation} = \left( 100 \times \frac{[\alpha \times 8 \times (2 - Over) + \beta] \times \text{Baud rate}}{8 \times \left( \frac{f_{TOL\_UNSYNCH}}{100} \right) \times f_{Nom}} \right) \%$$

$$-0.5 \leq \alpha \leq +0.5 \quad -1 < \beta < +1$$

$f_{TOL\_UNSYNCH}$  is the deviation of the real slave node clock from the nominal clock frequency. The LIN Standard imposes that it must not exceed  $\pm 15\%$ . The LIN Standard imposes also that for communication between two nodes, their bit rate must not differ by more than  $\pm 2\%$ . This means that the baud rate deviation must not exceed  $\pm 1\%$ .

Therefore, a minimum value for the nominal clock frequency can be computed as follows:

$$f_{Nom}(\min) = \left( 100 \times \frac{[0.5 \times 8 \times (2 - Over) + 1] \times \text{Baud rate}}{8 \times \left( \frac{-15}{100} + 1 \right) \times 1\%} \right) \text{Hz}$$

Examples:

- Baud rate = 20 kbit/s,  $OVER = 0$  (Oversampling 16X)  $\Rightarrow f_{Nom}(\min) = 2.64$  MHz
- Baud rate = 20 kbit/s,  $OVER = 1$  (Oversampling 8X)  $\Rightarrow f_{Nom}(\min) = 1.47$  MHz
- Baud rate = 1 kbit/s,  $OVER = 0$  (Oversampling 16X)  $\Rightarrow f_{Nom}(\min) = 132$  kHz
- Baud rate = 1 kbit/s,  $OVER = 1$  (Oversampling 8X)  $\Rightarrow f_{Nom}(\min) = 74$  kHz

### 46.7.9.9 Identifier Parity

A protected identifier consists of two subfields: the identifier and the identifier parity. Bits 0 to 5 are assigned to the identifier, and bits 6 and 7 are assigned to the parity.

The USART interface can generate/check these parity bits, but this feature can also be disabled. The user can choose between two modes via the FLEX\_US\_LINMR.PARDIS bit:

- PARDIS = 0:
  - During header transmission, the parity bits are computed and sent with the six least significant bits of the IDCHR field of the LIN Identifier Register (FLEX\_US\_LINIR). Bits 6 and 7 of this register are discarded.
  - During header reception, the parity bits of the identifier are checked. If the parity bits are wrong, an Identifier Parity error occurs (see section [Parity](#)). Only the six least significant bits of the IDCHR field are updated with the received Identifier. Bits 6 and 7 are stuck to 0.
- PARDIS = 1:
  - During header transmission, all the bits of the IDCHR field of the LIN Identifier Register (FLEX\_US\_LINIR) are sent on the bus.
  - During header reception, all the bits of the IDCHR field are updated with the received Identifier.

### 46.7.9.10 Node Action

Depending on the identifier, the node is affected—or not—by the LIN response. Consequently, after sending or receiving the identifier, the USART must be configured. There are three possible configurations:

- PUBLISH: the node sends the response.
- SUBSCRIBE: the node receives the response.
- IGNORE: the node is not concerned by the response, it does not send and does not receive the response.

This configuration is made by the LIN Node Action (NACT) field in USART LIN Mode Register (FLEX\_US\_LINMR).

Example: a LIN cluster that contains a master and two slaves:

- Data transfer from the master to slave 1 and to slave 2:

NACT(master) = PUBLISH

NACT(slave 1) = SUBSCRIBE

NACT(slave 2) = SUBSCRIBE

- Data transfer from the master to slave 1 only:

NACT(master) = PUBLISH

NACT(slave 1) = SUBSCRIBE

NACT(slave 2) = IGNORE

- Data transfer from slave 1 to the master:

NACT(master) = SUBSCRIBE

NACT(slave 1) = PUBLISH

NACT(slave 2) = IGNORE

- Data transfer from slave 1 to slave 2:

NACT(master) = IGNORE

NACT(slave 1) = PUBLISH

NACT(slave 2) = SUBSCRIBE

- Data transfer from slave 2 to the master and to slave 1:

NACT(master) = SUBSCRIBE

NACT(slave 1) = SUBSCRIBE

NACT(slave 2) = PUBLISH

### 46.7.9.11 Response Data Length

The LIN response data length is the number of data fields (bytes) of the response excluding the checksum.

The response data length can either be configured by the user or be defined automatically by bits 4 and 5 of the Identifier (compatibility to LIN Specification 1.1). The user can choose between these two modes by the FLEX\_US\_LINMR.DLM bit:

- DLM = 0: The response data length is configured by the user via the FLEX\_US\_LINMR.DLC field. The response data length is equal to (DLC + 1) bytes. DLC can be programmed from 0 to 255, so the response can contain from 1 data byte up to 256 data bytes.
- DLM = 1: The response data length is defined by the Identifier (IDCHR in FLEX\_US\_LINIR) according to the table below. The FLEX\_US\_LINMR.DLC field is discarded. The response can contain 2 or 4 or 8 data bytes.

**Table 46-13. Response Data Length if DLM = 1**

IDCHR[5]	IDCHR[4]	Response Data Length (bytes)
0	0	2
0	1	2
1	0	4
1	1	8

**Figure 46-45. Response Data Length**

### 46.7.9.12 Checksum

The last field of a frame is the checksum. The checksum contains the inverted 8-bit sum with carry, over all data bytes or all data bytes and the protected identifier. Checksum calculation over the data bytes only is called classic checksum and it is used for communication with LIN 1.3 slaves. Checksum calculation over the data bytes and the protected identifier byte is called enhanced checksum and it is used for communication with LIN 2.0 slaves.

The USART can be configured to:

- Send/Check an Enhanced checksum automatically (CHKDIS = 0 & CHKTYP = 0)
- Send/Check a Classic checksum automatically (CHKDIS = 0 & CHKTYP = 1)
- Not send/check a checksum (CHKDIS = 1)

This configuration is made by the Checksum Type (CHKTYP) and Checksum Disable (CHKDIS) bits of FLEX\_US\_LINMR.

If the checksum feature is disabled, the user can send it manually all the same, by considering the checksum as a normal data byte and by adding 1 to the response data length (see section [Response Data Length](#)).

### 46.7.9.13 Frame Slot Mode

This mode is useful only for master nodes. It respects the following rule: each frame slot shall be longer than or equal to  $t_{\text{Frame\_Maximum}}$ .

If the Frame Slot mode is enabled (FSDIS = 0) and a frame transfer has been completed, the TXRDY flag is set again only after  $t_{\text{Frame\_Maximum}}$  delay, from the start of frame. So the master node cannot send a new header if the frame slot duration of the previous frame is inferior to  $t_{\text{Frame\_Maximum}}$ .

If the Frame Slot mode is disabled (FSDIS = 1) and a frame transfer has been completed, the TXRDY flag is set again immediately.

The  $t_{\text{Frame\_Maximum}}$  is calculated as follows:

If the Checksum is sent (CHKDIS = 0):

- $t_{\text{Header\_Nominal}} = 34 \times t_{\text{bit}}$
- $t_{\text{Response\_Nominal}} = 10 \times (\text{NData} + 1) \times t_{\text{bit}}$
- $t_{\text{Frame\_Maximum}} = 1.4 \times (t_{\text{Header\_Nominal}} + t_{\text{Response\_Nominal}} + 1)^{(1)}$
- $t_{\text{Frame\_Maximum}} = 1.4 \times (34 + 10 \times (\text{DLC} + 1 + 1) + 1) \times t_{\text{bit}}$
- $t_{\text{Frame\_Maximum}} = (77 + 14 \times \text{DLC}) \times t_{\text{bit}}$

If the Checksum is not sent (CHKDIS = 1):

- $t_{\text{Header\_Nominal}} = 34 \times t_{\text{bit}}$
- $t_{\text{Response\_Nominal}} = 10 \times \text{NData} \times t_{\text{bit}}$
- $t_{\text{Frame\_Maximum}} = 1.4 \times (t_{\text{Header\_Nominal}} + t_{\text{Response\_Nominal}} + 1)^{(1)}$
- $t_{\text{Frame\_Maximum}} = 1.4 \times (34 + 10 \times (\text{DLC} + 1) + 1) \times t_{\text{bit}}$
- $t_{\text{Frame\_Maximum}} = (63 + 14 \times \text{DLC}) \times t_{\text{bit}}$

Note: 1. The term “+1” leads to an integer result for  $t_{\text{Frame\_Maximum}}$  (LIN Specification 1.3).

**Figure 46-46. Frame Slot Mode**

### 46.7.9.14 LIN Errors

#### 46.7.9.14.1 Bit Error

This error is generated in master of slave node configuration, when the USART is transmitting and if the transmitted value on the Tx line is different from the value sampled on the Rx line. If a bit error is detected, the transmission is aborted at the next byte border.

This error is reported by the FLEX\_US\_CSR.LINBE flag.

#### 46.7.9.14.2 Inconsistent Synch Field Error

This error is generated in slave node configuration, if the Synch Field character received is other than 0x55.

This error is reported by the FLEX\_US\_CSR.LINISFE flag.

#### 46.7.9.14.3 Identifier Parity Error

This error is generated in slave node configuration, if the parity of the identifier is wrong. This error can be generated only if the parity feature is enabled (PARDIS = 0).

This error is reported by the FLEX\_US\_CSR.LINIPE flag.

#### 46.7.9.14.4 Checksum Error

This error is generated in master of slave node configuration, if the received checksum is wrong. This flag can be set to 1 only if the checksum feature is enabled (CHKDIS = 0).

This error is reported by the FLEX\_US\_CSR.LINCE flag.

#### 46.7.9.14.5 Slave Not Responding Error

This error is generated in master of slave node configuration, when the USART expects a response from another node (NACT = SUBSCRIBE) but no valid message appears on the bus within the time given by the maximum length of the message frame,  $t_{Frame\_Maximum}$  (see section [Frame Slot Mode](#)). This error is disabled if the USART does not expect any message (NACT = PUBLISH or NACT = IGNORE).

This error is reported by the FLEX\_US\_CSR.LINSNRE.

#### 46.7.9.14.6 Synch Tolerance Error

This error is generated in slave node configuration if, after the clock synchronization procedure, it appears that the computed baud rate deviation compared to the initial baud rate is superior to the maximum tolerance FTol\_Unsynch ( $\pm 15\%$ ).

This error is reported by the FLEX\_US\_CSR.LINSTE flag.

### 46.7.9.14.7 Header Timeout Error

This error is generated in slave node configuration, if the Header is not entirely received within the time given by the maximum length of the Header,  $t_{Header\_Maximum}$ .

This error is reported by the FLEX\_US\_CSR.LINHTE flag.

### 46.7.9.15 LIN Frame Handling

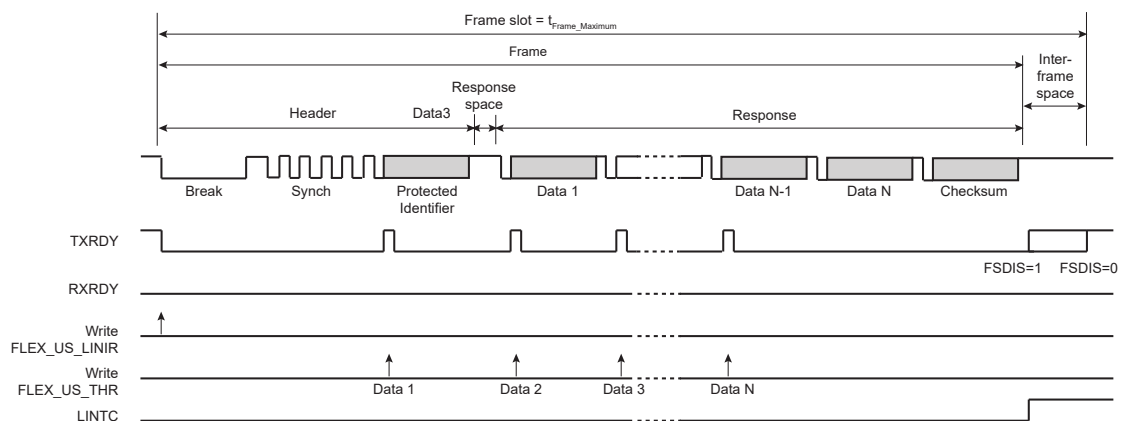

#### 46.7.9.15.1 Master Node Configuration

- Write FLEX\_US\_CR.TXEN and FLEX\_US\_CR.RXEN to enable both the transmitter and the receiver.
- Write FLEX\_US\_MR.USART\_MODE to select the LIN mode and the master node configuration.
- Write FLEX\_US\_BRGR.CD and FLEX\_US\_BRGR.FP to configure the baud rate.
- Write NACT, PARDIS, CHKDIS, CHKTYPE, DLCM, FSDIS and DLC in FLEX\_US\_LINMR to configure the frame transfer.
- Check that FLEX\_US\_CSR.TXRDY is set to 1.
- Write FLEX\_US\_LINIR.IDCHR to send the header.

What comes next depends on the NACT configuration:

- Case 1: NACT = PUBLISH, the USART sends the response.
  - Wait until FLEX\_US\_CSR.TXRDY rises.
  - Write FLEX\_US\_THR.TCHR to send a byte.
  - If all the data have not been written, repeat the two previous steps.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.
- Case 2: NACT = SUBSCRIBE, the USART receives the response.
  - Wait until FLEX\_US\_CSR.RXRDY rises.
  - Read FLEX\_US\_RHR.RCHR.
  - If all the data have not been read, repeat the two previous steps.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.
- Case 3: NACT = IGNORE, the USART is not concerned by the response.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.

**Figure 46-47. Master Node Configuration, NACT = PUBLISH**

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

**Figure 46-48. Master Node Configuration, NACT = SUBSCRIBE**

**Figure 46-49. Master Node Configuration, NACT = IGNORE**

### 46.7.9.15.2 Slave Node Configuration

- Write FLEX\_US\_CR.TXEN and FLEX\_US\_CR.RXEN to enable both the transmitter and the receiver.
- Write FLEX\_US\_MR.USART\_MODE to select the LIN mode and the slave node configuration.
- Write FLEX\_US\_BRGR.CD and FLEX\_US\_BRGR.FP to configure the baud rate.
- Wait until FLEX\_US\_CSR.LINID rises.
- Check LINISFE and LINPE errors.
- Read FLEX\_US\_RHR.IDCHR.
- Write NACT, PARDIS, CHKDIS, CHKTYPE, DLCM and DLC in FLEX\_US\_LINMR to configure the frame transfer.

**IMPORTANT:** If the NACT configuration for this frame is PUBLISH, FLEX\_US\_LINMR must be written with NACT = PUBLISH even if this field is already correctly configured, in order to set the TXREADY flag and the corresponding write transfer request.

What comes next depends on the NACT configuration:

- Case 1: NACT = PUBLISH, the LIN controller sends the response.
  - Wait until FLEX\_US\_CSR.TXRDY rises.
  - Write FLEX\_US\_THR.TCHR to send a byte.
  - If all the data have not been written, repeat the two previous steps.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

- Case 2: NACT = SUBSCRIBE, the USART receives the response.
  - Wait until FLEX\_US\_CSR.RXRDY rises.
  - Read FLEX\_US\_RHR.RCHR.
  - If all the data have not been read, repeat the two previous steps.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.
- Case 3: NACT = IGNORE, the USART is not concerned by the response.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.

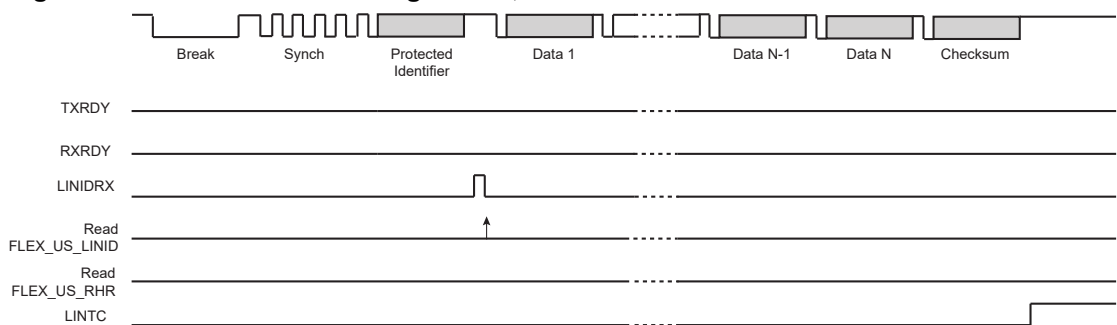

**Figure 46-50. Slave Node Configuration, NACT = PUBLISH**

**Figure 46-51. Slave Node Configuration, NACT = SUBSCRIBE**

**Figure 46-52. Slave Node Configuration, NACT = IGNORE**

### 46.7.9.16 LIN Frame Handling with the DMAC

The USART can be used in association with the DMAC in order to transfer data directly into/from the on- and off-chip memories without any processor intervention.

The DMAC uses the trigger flags, TXRDY and RXRDY, to write or read into the USART. The DMAC always writes in the Transmit Holding Register (FLEX\_US\_THR) and it always reads in the Receive

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Holding Register (FLEX\_US\_RHR). The size of the data written or read by the DMAC in the USART is always a byte.

### 46.7.9.16.1 Master Node Configuration

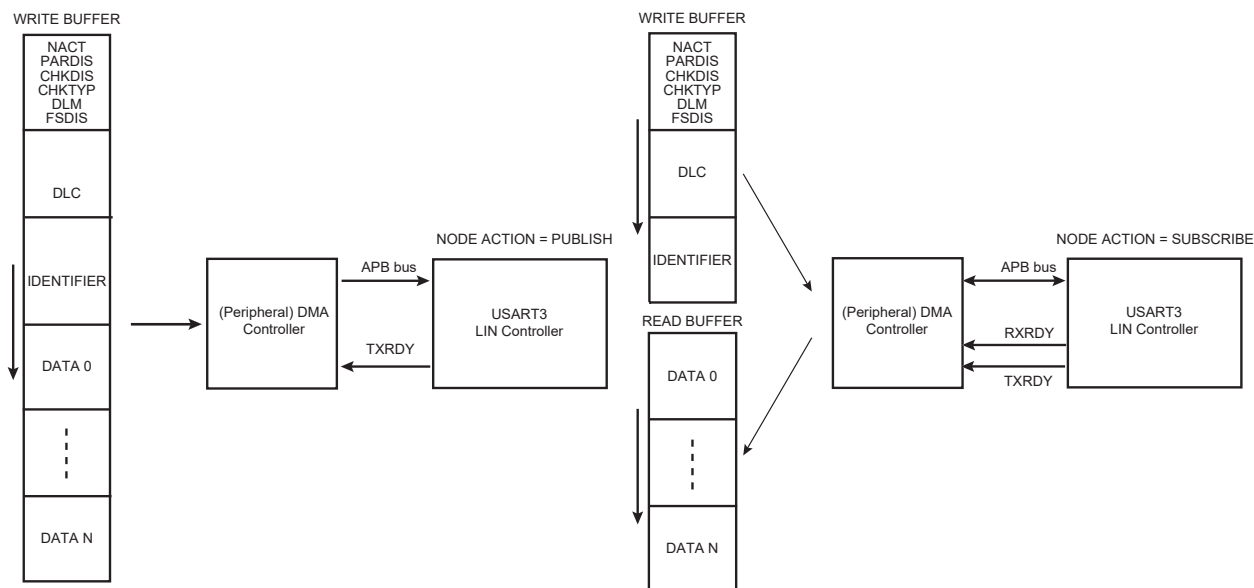

The user can choose between two DMAC modes by configuring the FLEX\_US\_LINMR.PDCM bit:

- PDCM = 1: The LIN configuration is stored in the WRITE buffer and it is written by the DMAC in the Transmit Holding register FLEX\_US\_THR (instead of the LIN Mode register FLEX\_US\_LINMR). Because the DMAC transfer size is limited to a byte, the transfer is split into two accesses. During the first access, the NACT, PARDIS, CHKDIS, CHKTYP, DLM and FSDIS bits are written. During the second access, the 8-bit DLC field is written.
- PDCM = 0: The LIN configuration is not stored in the WRITE buffer and it must be written by the user in FLEX\_US\_LINMR.

The WRITE buffer also contains the Identifier and the data, if the USART sends the response (NACT = PUBLISH).

The READ buffer contains the data if the USART receives the response (NACT = SUBSCRIBE).

**Figure 46-53. Master Node with DMAC (PDCM = 1)**

**Figure 46-54. Master Node with DMAC (PDCM = 0)**

### 46.7.9.16.2 Slave Node Configuration

In this configuration, the DMAC transfers only the data. The identifier must be read by the user in the LIN Identifier Register (FLEX\_US\_LINIR). The LIN mode must be written by the user in FLEX\_US\_LINMR.

The WRITE buffer contains the data if the USART sends the response (NACT = PUBLISH).

The READ buffer contains the data if the USART receives the response (NACT = SUBSCRIBE).

**Figure 46-55. Slave Node with DMAC**

### 46.7.9.17 Wakeup Request

Any node in a sleeping LIN cluster may request a wakeup.

In the LIN 2.0 specification, the wakeup request is issued by forcing the bus to the dominant state from 250  $\mu$ s to 5 ms. For this, it is necessary to send the character 0xF0 in order to impose five successive dominant bits. Whatever the baud rate is, this character respects the specified timings.

- Baud rate min = 1 kbit/s  $\rightarrow t_{bit} = 1$  ms  $\rightarrow 5 t_{bit} = 5$  ms
- Baud rate max = 20 kbit/s  $\rightarrow t_{bit} = 50$   $\mu$ s  $\rightarrow 5 t_{bit} = 250$   $\mu$ s

In the LIN 1.3 specification, the wakeup request should be generated with the character 0x80 in order to impose eight successive dominant bits.

Using the FLEX\_US\_LINMR.WKUPTYP bit, the user can choose to send either a LIN 2.0 wakeup request (WKUPTYP = 0) or a LIN 1.3 wakeup request (WKUPTYP = 1).

A wakeup request is transmitted by writing the FLEX\_US\_CR.LINWKUP bit to 1. Once the transfer is completed, the LINTC flag is asserted in the Status Register (FLEX\_US\_CSR). It is cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit.

### 46.7.9.18 Bus Idle Timeout

If the LIN bus is inactive for a certain duration, the slave nodes shall automatically enter in Sleep mode. In the LIN 2.0 specification, this timeout is defined as 4 seconds. In the LIN 1.3 specification, it is defined as 25,000  $t_{bit}$ .

In slave Node configuration, the receiver timeout detects an idle condition on the RXD line. When a timeout is detected, the FLEX\_US\_CSR.TIMEOUT bit rises and can generate an interrupt, thus indicating to the driver to go into Sleep mode.

The timeout delay period (during which the receiver waits for a new character) is programmed in the FLEX\_US\_RTOR.TO field. If a zero is written to the TO field, the Receiver Timeout is disabled and no timeout is detected. The FLEX\_US\_CSR.TIMEOUT bit remains at 0. Otherwise, the receiver loads a 17-bit counter with the value programmed in TO. This counter is decremented at each bit period and reloaded each time a new character is received. If the counter reaches 0, the FLEX\_US\_CSR.TIMEOUT bit rises.

If STTTO is performed, the counter clock is stopped until a first character is received.

If RETTO is performed, the counter starts counting down immediately from the value TO.

**Table 46-14. Receiver Timeout Programming**

LIN Specification	Baud Rate	Timeout period	TO
2.0	1,000 bit/s	4s	4,000
	2,400 bit/s		9,600
	9,600 bit/s		38,400
	19,200 bit/s		76,800
	20,000 bit/s		80,000
1.3	–	25,000 $t_{bit}$	25,000

**46.7.10 Test Modes**

The USART can be programmed to operate in three different test modes. The internal loopback capability allows on-board diagnostics. In Loopback mode, the USART interface pins are disconnected or not and reconfigured for loopback internally or externally.

**46.7.10.1 Normal Mode**

Normal mode connects the RXD pin on the receiver input and the transmitter output on the TXD pin.

**Figure 46-56. Normal Mode Configuration**

**46.7.10.2 Automatic Echo Mode**

Automatic Echo mode allows bit-by-bit retransmission. When a bit is received on the RXD pin, it is sent to the TXD pin, as shown in the following figure. Programming the transmitter has no effect on the TXD pin. The RXD pin is still connected to the receiver input, thus the receiver remains active.

**Figure 46-57. Automatic Echo Mode Configuration**

**46.7.10.3 Local Loopback Mode**

Local Loopback mode connects the output of the transmitter directly to the input of the receiver, as shown in the following figure. The TXD and RXD pins are not used. The RXD pin has no effect on the receiver and the TXD pin is continuously driven high, as in idle state.

**Figure 46-58. Local Loopback Mode Configuration**

**46.7.10.4 Remote Loopback Mode**

Remote Loopback mode directly connects the RXD pin to the TXD pin, as shown in the following figure. The transmitter and the receiver are disabled and have no effect. This mode allows bit-by-bit retransmission.

**Figure 46-59. Remote Loopback Mode Configuration**

**46.7.11 USART FIFOs**

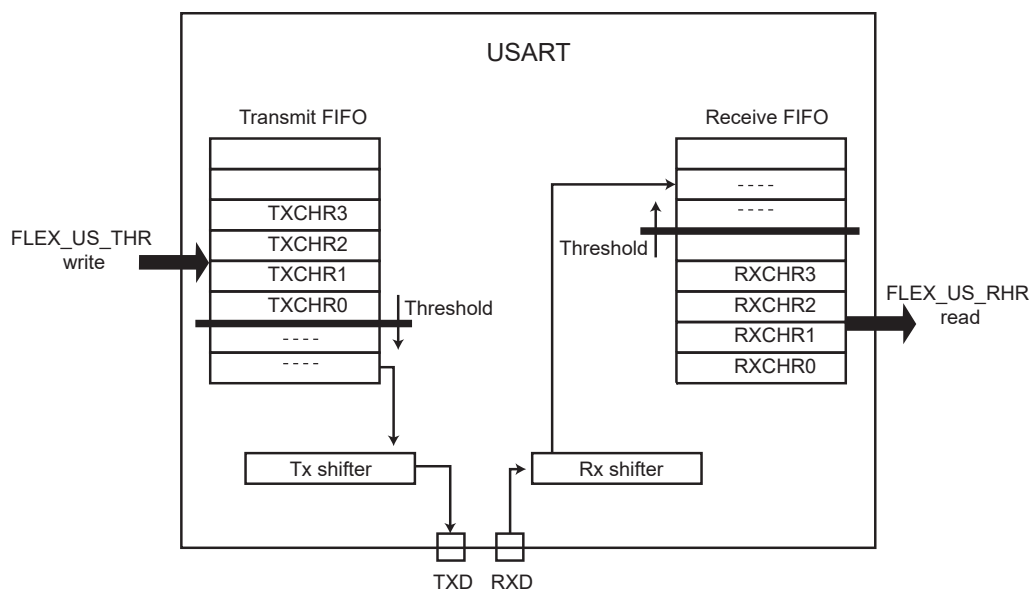

**46.7.11.1 Overview**

The USART includes two FIFOs which can be enabled/disabled using FLEX\_US\_CR.FIFOEN/FIFODIS. Both the transmitter and the receiver must be disabled before enabling or disabling the FIFOs, using the FLEX\_US\_CR.TXDIS/RXDIS bits.

Writing FLEX\_US\_CR.FIFOEN to '1' enables a 32-data Transmit FIFO and a 32-data Receive FIFO.

It is possible to write or to read single or multiple data in the same access to FLEX\_US\_THR/RHR. See sections [USART Single Data Mode](#) and [USART Multiple Data Mode](#).

**Figure 46-60. FIFOs Block Diagram**

### 46.7.11.2 Sending Data with FIFO Enabled

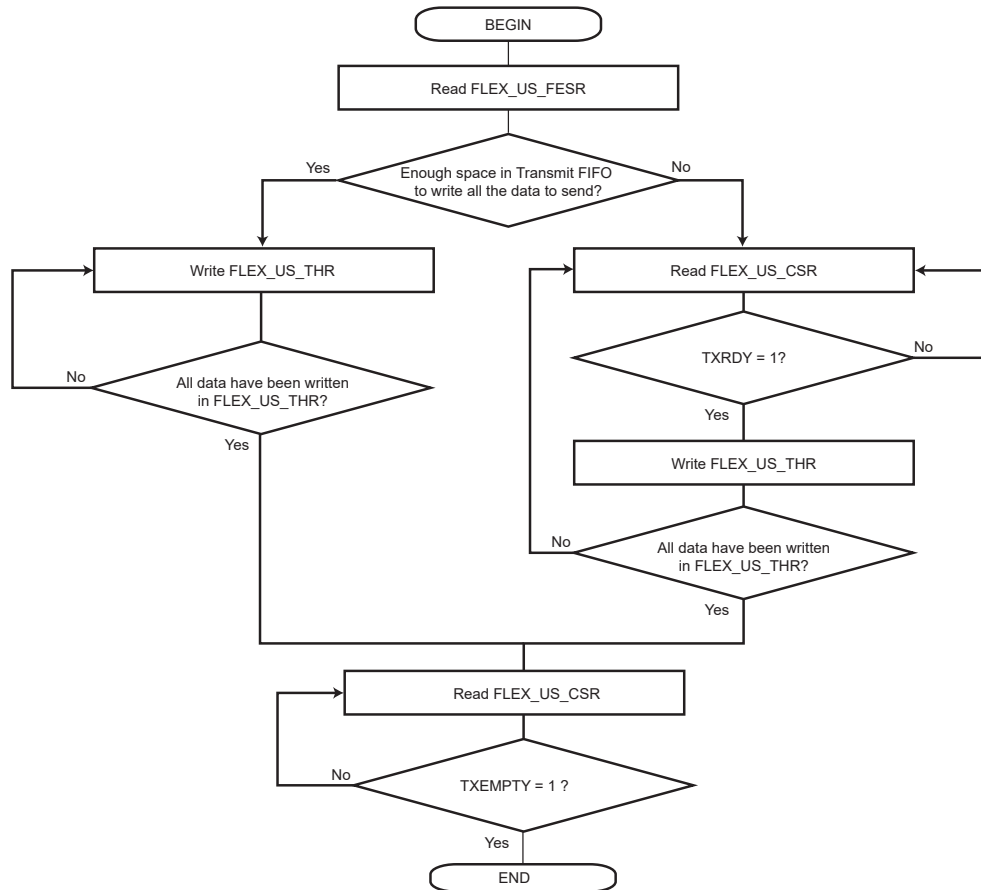

When the Transmit FIFO is enabled, write access to FLEX\_US\_THR loads the Transmit FIFO.

The FIFO level is provided in FLEX\_US\_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor FLEX\_US\_CSR.TXRDY and the data can be successively written in FLEX\_US\_THR.

If the FIFO cannot accept the data due to insufficient space, wait for the TXRDY flag to be set before writing the data in FLEX\_US\_THR.

When the space in the FIFO allows only a portion of the data to be written, the TXRDY flag must be monitored before writing the remaining data.

**Figure 46-61. Sending Data with FIFO Enabled**

### 46.7.11.3 Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, FLEX\_US\_RHR access reads the FIFO.

When data are present in the Receive FIFO (RXRDY flag set to '1'), the exact number of data can be checked with FLEX\_US\_FLR.RXFL. All the data can be read successively in FLEX\_US\_RHR without checking the RXRDY flag between each access.

**Figure 46-62. Receiving Data with FIFO Enabled**

#### 46.7.11.4 Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using FLEX\_US\_CR.TXFCLR/RXFCLR.

#### 46.7.11.5 TXEMPTY, TXRDY and RXRDY Behavior

FLEX\_US\_CSR.TXEMPTY, FLEX\_US\_CSR.TXRDY and FLEX\_US\_CSR.RXRDY flags display a specific behavior when FIFOs are enabled.

The TXEMPTY flag is cleared as long as there are characters in the Transmit FIFO or in the internal shift register. TXEMPTY is set when there are no characters in the Transmit FIFO and in the internal shift register.

TXRDY indicates if a data can be written in the Transmit FIFO. Thus the TXRDY flag is set as long as the Transmit FIFO can accept new data. See figure [TXRDY in Single Data Mode and TXRDYM = 0](#).

RXRDY indicates if an unread data is present in the Receive FIFO. Thus the RXRDY flag is set as soon as one unread data is in the Receive FIFO. See figure [RXRDY in Single Data Mode and RXRDYM = 0](#) below.

TXRDY and RXRDY behavior can be modified using the TXRDYM and RXRDYM fields in the USART FIFO Mode Register (FLEX\_US\_FMR) to reduce the number of accesses to FLEX\_US\_RHR/THR.

However, for some configurations, the following constraints apply:

- If FLEX\_US\_MR.MODE9 is set, FLEX\_US\_FMR.TXRDYM/RXRDYM must be cleared.
- If FLEX\_US\_MR.USART\_MODE is set to either LIN\_MASTER or LIN\_SLAVE, FLEX\_US\_FMR.TXRDYM/RXRDYM must be cleared.

See USART FIFO Mode Register for the FIFO configuration.

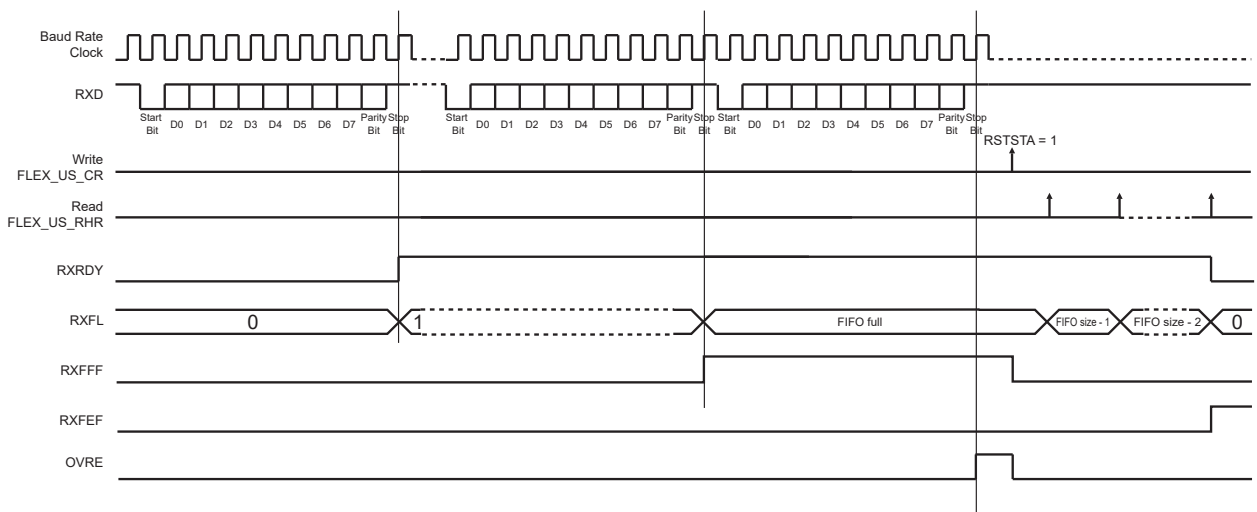

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

**Figure 46-63. TXRDY in Single Data Mode and TXRDYM = 0**

**Figure 46-64. RXRDY in Single Data Mode and RXRDYM = 0**

### 46.7.11.6 USART Single Data Mode

In Single Data mode, only one data is written every time FLEX\_US\_THR is accessed, and only one data is read every time FLEX\_US\_RHR is accessed.

When FLEX\_US\_FMR.TXRDYM = 0, the Transmit FIFO operates in Single Data mode.

When FLEX\_US\_FMR.RXRDYM = 0, the Receive FIFO operates in Single Data mode.

If FLEX\_US\_MR.MODE9 is set, or if FLEX\_US\_MR.USART\_MODE is set to either LIN\_MASTER or LIN\_SLAVE, the FIFOs must operate in Single Data mode.

See [USART Receive Holding Register \(FLEX\\_US\\_RHR\)](#) and [USART Transmit Holding Register \(FLEX\\_US\\_THR\)](#).

#### 46.7.11.6.1 DMAC

The DMAC transfer type must be configured in bytes or halfwords when FIFOs operate in Single Data mode (the same applies when FIFOs are disabled).

#### 46.7.11.7 USART Multiple Data Mode

Multiple Data mode minimizes the number of accesses by concatenating the data to send/read in one access.

When FLEX\_US\_FMR.TXRDYM > 0, the Transmit FIFO operates in Multiple Data mode.

When FLEX\_US\_FMR.RXRDYM > 0, the Receive FIFO operates in Multiple Data mode.

However, Multiple Data mode cannot be used for the following configurations:

- If FLEX\_US\_MR.MODE9 is set
- If FLEX\_US\_MR.USART\_MODE is set to either LIN\_MASTER or LIN\_SLAVE

In Multiple Data mode, it is possible to write/read up to four data in one FLEX\_US\_THR/FLEX\_US\_RHR access.

The number of data to write/read is defined by the size of the register access. If the access is a byte-size register access, only one data is written/read, if the access is a halfword size register access, then two data are written/read and, finally, if the access is a word-size register access, four data are written/read.

Written/read data are always right-aligned, as described in sections [USART Receive Holding Register \(FIFO Multi Data\)](#) and [USART Transmit Holding Register \(FIFO Multi Data\)](#).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six FLEX\_US\_THR-byte write accesses
- three FLEX\_US\_THR-halfword write accesses
- one FLEX\_US\_THR word write access and one FLEX\_US\_THR halfword write access

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six FLEX\_US\_RHR-byte read accesses
- three FLEX\_US\_RHR-halfword read accesses
- one FLEX\_US\_RHR-word read access and one FLEX\_US\_RHR-halfword read access

##### 46.7.11.7.1 TXRDY and RXRDY Configuration

In Multiple Data mode, it is possible to write one or more data in the same FLEX\_US\_THR/FLEX\_US\_RHR access. The TXRDY flag indicates if one or more data can be written in the FIFO depending on the configuration of FLEX\_US\_FMR.TXRDYM/RXRDYM.

As an example, if four data are written each time in FLEX\_US\_THR, it is useful to configure the TXRDYM field to the value '2' so that the TXRDY flag is at '1' only when at least four data can be written in the Transmit FIFO.

In the same way, if four data are read each time in FLEX\_US\_RHR, it is useful to configure the RXRDYM field to the value '2' so that the RXRDY flag is at '1' only when at least four unread data are in the Receive FIFO.

##### 46.7.11.7.2 DMAC

When FIFOs operate in Multiple Data mode, the DMAC transfer type must be configured in byte, halfword or word depending on the FLEX\_US\_FMR.TXRDYM/RXRDYM settings.

##### 46.7.11.8 Transmit FIFO Lock

- LIN Mode:

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

If a frame is aborted using the Abort LIN Transmission bit (FLEX\_US\_CR.LINABT), a lock is set on the Transmit FIFO, preventing any new frame from being sent until it is cleared. This allows clearing the FIFO if needed, resetting DMAC channels, etc., without any risk.

The TXFLOCK bit in the USART FIFO Event Status Register (FLEX\_US\_FESR) is used to check the state of the Transmit FIFO lock.

The Transmit FIFO lock can be cleared by setting FLEX\_US\_CR.TXFLCLR to '1'.

### 46.7.11.9 FIFO Pointer Error

A FIFO overflow is reported in FLEX\_US\_FESR.

If the Transmit FIFO is full and a write access is performed on FLEX\_US\_THR, it generates a Transmit FIFO pointer error and sets FLEX\_US\_FESR.TXFPTEF.

In Multiple Data mode, if the number of data written in FLEX\_US\_THR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO pointer error is generated and FLEX\_US\_FESR.TXFPTEF is set.

A FIFO underflow is reported in FLEX\_US\_FESR.

In Multiple Data mode, if the number of data read in FLEX\_US\_RHR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO pointer error is generated and FLEX\_US\_FESR.RXFPTEF is set.

No pointer error occurs if the FIFO state/level is checked before writing/reading in FLEX\_US\_THR/ FLEX\_US\_RHR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When a pointer error occurs, other FIFO flags may not behave as expected; their states should be ignored.

If a Transmit pointer error occurs, a transmitter reset must be performed using FLEX\_US\_CR.RSTTX. If a Receive pointer error occurs, a receiver reset must be performed using FLEX\_US\_CR.RSTRX.

### 46.7.11.10 FIFO Thresholds

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using the field FLEX\_US\_FMR.TXFTHRES. Each time the Transmit FIFO level goes from 'above threshold' to 'equal to or below threshold', the flag FLEX\_US\_FESR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field FLEX\_US\_FMR.RXFTHRES. Each time the Receive FIFO level goes from 'below threshold' to 'equal to or above threshold', the flag FLEX\_US\_FESR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The Receive FIFO threshold 2 can be set using the field FLEX\_US\_FMR.RXFTHRES2. Each time the Receive FIFO level goes from 'above threshold 2' to 'equal to or below threshold 2', the flag FLEX\_US\_FESR.RXFTHF2 is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF, RXFTHF and RXTHF2 flags can be configured to generate an interrupt using FLEX\_US\_FIER and FLEX\_US\_FIDR.

### 46.7.11.11 FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through FLEX\_US\_FIER and FLEX\_US\_FIDR.

FIFO flags state can be read in FLEX\_US\_FESR. They are cleared by writing FLEX\_US\_CR.RSTSTA to '1'.

#### 46.7.12 USART Register Write Protection

The FLEXCOM operating mode (FLEX\_MR.OPMODE) must be set to FLEX\_MR\_OPMODE\_USART to enable access to the write protection registers.

To prevent any single software error from corrupting USART behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable) bit in the [USART Write Protection Mode Register \(FLEX\\_US\\_WPMR\)](#).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the [USART Write Protection Status Register \(FLEX\\_US\\_WPSR\)](#) is set and the Write Protection Violation Source (WPVSR) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading FLEX\_US\_WPSR.

The following registers can be write-protected when WPEN is set:

- USART Mode Register
- USART Baud Rate Generator Register
- USART Receiver Timeout Register
- USART Transmitter Timeguard Register
- USART FI DI RATIO Register
- USART IrDA FILTER Register
- USART Manchester Configuration Register
- USART Comparison Register

## 46.8 SPI Functional Description

### 46.8.1 Modes of Operation

The SPI operates in Master mode or in Slave mode.

- The SPI operates in Master mode by writing a 1 to the MSTR bit in the SPI Mode Register (FLEX\_SPI\_MR):
  - The pins NPC0 to NPC1 are all configured as outputs.
  - The SPCK pin is driven.
  - The MISO line is wired on the receiver input.
  - The MOSI line is driven as an output by the transmitter.
- The SPI operates in Slave mode if the MSTR bit in FLEX\_SPI\_MR is written to 0:
  - The MISO line is driven by the transmitter output.
  - The MOSI line is wired on the receiver input.
  - The SPCK pin is driven by the transmitter to synchronize the receiver.
  - The NPC0 pin becomes an input, and is used as a slave select signal (NSS).
  - Pin NPC1 is not driven and can be used for other purposes.

The data transfers are identically programmable for both modes of operation. The bit rate generator is activated only in Master mode.

### 46.8.2 Data Transfer

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the CPOL bit in the SPI Chip Select Register (FLEX\_SPI\_CSR). The clock phase is programmed with the NCPHA bit. These two parameters determine the edges of the clock signal on which data are driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Consequently, a master/slave pair must use the same parameter pair values to communicate. If multiple slaves are connected and require different configurations, the master must reconfigure itself each time it needs to communicate with a different slave.

The following table shows the four modes and corresponding parameter settings.

**Table 46-15. SPI Bus Protocol Mode**

SPI Mode	CPOL	NCPHA	Shift SPCK Edge	Capture SPCK Edge	SPCK Inactive Level
0	0	1	Falling	Rising	Low
1	0	0	Rising	Falling	Low
2	1	1	Rising	Falling	High
3	1	0	Falling	Rising	High

The following figures show examples of data transfers.

**Figure 46-65. SPI Transfer Format (NCPHA = 1, 8 bits per transfer)**

\* Not defined.

**Figure 46-66. SPI Transfer Format (NCPHA = 0, 8 bits per transfer)**

### 46.8.3 Master Mode Operations

When configured in Master mode, the SPI operates on the clock generated by the internal programmable bit rate generator. It fully controls the data transfers to and from the slave(s) connected to the SPI bus. The SPI drives the chip select line to the slave and the serial clock signal (SPCK).

The SPI features two holding registers, the Transmit Data Register (FLEX\_SPI\_TDR) and the Receive Data Register (FLEX\_SPI\_RDR), and a single shift register. The holding registers maintain the data flow at a constant rate.

After enabling the SPI, a data transfer starts when the processor writes to FLEX\_SPI\_TDR. The written data are immediately transferred in the shift register and the transfer on the SPI bus starts. While the data in the shift register is shifted on the MOSI line, the MISO line is sampled and shifted in the shift register. Data cannot be loaded in FLEX\_SPI\_RDR without transmitting data. If there is no data to transmit, a dummy data can be used (FLEX\_SPI\_TDR filled with ones). When the WDRBT bit is set, a new data cannot be transmitted if FLEX\_SPI\_RDR has not been read. If Receiving mode is not required, for example when communicating with a slave receiver only (such as an LCD), the receive status flags in the SPI Status Register (FLEX\_SPI\_SR) can be discarded.

Before writing the TDR, the FLEX\_SPI\_MR.PCS field must be set in order to select a slave.

If new data are written in FLEX\_SPI\_TDR during the transfer, it is kept in FLEX\_SPI\_TDR until the current transfer is completed. Then, the received data are transferred from the shift register to FLEX\_SPI\_RDR, the data in FLEX\_SPI\_TDR is loaded in the shift register and a new transfer starts.

As soon as the FLEX\_SPI\_TDR is written, the Transmit Data Register Empty (TDRE) flag in FLEX\_SPI\_SR is cleared. When the data written in FLEX\_SPI\_TDR is loaded into the shift register, the FLEX\_SPI\_SR.TDRE flag is set. The TDRE bit is used to trigger the Transmit DMA channel (see figure below).

The end of transfer is indicated by FLEX\_SPI\_SR.TXEMPTY. If a transfer delay (DLYBCT) is greater than 0 for the last transfer, TXEMPTY is set after the completion of this delay. The peripheral clock can be switched off at this time.

**Note:**

1. When the SPI is enabled, the TDRE and TXEMPTY flags are set.
2. The TXEMPTY flag alone cannot be used to detect the end of the buffer DMA transfer.

**Figure 46-67. TDRE and TXEMPTY Flag Behavior**

The transfer of received data from the shift register to FLEX\_SPI\_RDR is indicated by the Receive Data Register Full (RDRF) bit in FLEX\_SPI\_SR. When the received data are read, the RDRF bit is cleared.

If FLEX\_SPI\_RDR has not been read before new data are received, the Overrun Error bit (OVRES) in FLEX\_SPI\_SR is set. As long as this flag is set, data are loaded in FLEX\_SPI\_RDR. The user has to read the status register to clear the OVRES bit.

The following figures show, respectively, a block diagram of the SPI when operating in Master mode and a flow chart describing how transfers are handled.

### 46.8.3.1 Master Mode Block Diagram

Figure 46-68. Master Mode Block Diagram

### 46.8.3.2 Master Mode Flowchart

Figure 46-69. Master Mode

The following figure shows the behavior of Transmit Data Register Empty (TDRE), Receive Data Register (RDRF) and Transmission Register Empty (TXEMPTY) status flags within FLEX\_SPI\_SR during an 8-bit data transfer in Fixed mode without the DMAC involved.

**Figure 46-70. Status Register Flags Behavior**

### 46.8.3.3 Clock Generation

The SPI bit rate clock is generated by dividing a source clock which can be the peripheral clock or a programmable clock from the GCLK. The divider can be a value between 1 and 255.

If the SCBR field is programmed to 1 and the clock source is GCLK, the operating bit rate is peripheral clock (refer to the section “Electrical Characteristics” for the SPCK maximum frequency). Triggering a transfer while SCBR is at 0 can lead to unpredictable results.

At reset, SCBR is 0 and the user has to program it to a valid value before performing the first transfer.

The divisor can be defined independently for each chip select, as it has to be programmed in the FLEX\_SPI\_CSR.SCBR field. This allows the SPI to automatically adapt the bit rate for each interfaced peripheral without reprogramming.

If GCLK is selected as source clock (FLEX\_SPI\_MR.BRSRCCLK = 1), the bit rate is independent of the processor/bus clock. Thus, the processor clock can be changed while SPI is enabled. The processor clock frequency changes must be performed only by programming the PMC\_MCKR.PRES field (refer to the section “Power Management Controller” (PMC)). Any other method to modify the processor/bus clock frequency (PLL multiplier, etc.) is forbidden when SPI is enabled.

The peripheral clock frequency must be at least three times higher than GCLK.

### 46.8.3.4 Transfer Delays

The figure below shows a chip select transfer change and consecutive transfers on the same chip select. Three delays can be programmed to modify the transfer waveforms:

- The delay between the chip selects. It is programmable only once for all chip selects by writing the FLEX\_SPI\_MR.DLYBCS field. The SPI slave device deactivation delay is managed through DLYBCS. If there is only one SPI slave device connected to the master, the DLYBCS field does not need to be configured. If several slave devices are connected to a master, DLYBCS must be configured depending on the highest deactivation delay. Refer to the SPI slave device electrical characteristics.

- The delay before SPCK, independently programmable for each chip select by writing the DLYBS field. The SPI slave device activation delay is managed through DLYBS. Refer to the SPI slave device electrical characteristics to define DLYBS.
- The delay between consecutive transfers, independently programmable for each chip select by writing the DLYBCT field. The time required by the SPI slave device to process received data is managed through DLYBCT. This time depends on the SPI slave system activity.

These delays allow the SPI to be adapted to the interfaced peripherals and their speed and bus release time.

**Figure 46-71. Programmable Delays**

### 46.8.3.5 Peripheral Selection

The serial peripherals are selected through the assertion of the NPCS0 to NPCS1 signals. By default, all NPCS signals are high before and after each transfer.

- **Fixed Peripheral Select Mode:** SPI exchanges data with only one peripheral. Fixed Peripheral Select mode is enabled by writing the FLEX\_SPI\_MR.PS bit to zero. In this case, the current peripheral is defined by the FLEX\_SPI\_MR.PCS field, and the FLEX\_SPI\_TDR.PCS field has no effect.
- **Variable Peripheral Select Mode:** Data can be exchanged with more than one peripheral without having to reprogram FLEX\_SPI\_MR.PCS. Variable Peripheral Select Mode is enabled by setting the FLEX\_SPI\_MR.PS bit to one. The FLEX\_SPI\_TDR.PCS field is used to select the current peripheral. This means that the peripheral selection can be defined for each new data. The value must be written in a single access to FLEX\_SPI\_TDR in the following format:

[xxxxxxx(7-bit) + LASTXFER(1-bit)<sup>(1)</sup> + xxxx(4-bit) + PCS (4-bit) + TD (8 to 16-bit data)]  
 with LASTXFER at 0 or 1 depending on the CSAAT bit, and PCS equal to the chip select to assert, as defined in section [SPI Transmit Data Register \(FLEX\\_SPI\\_TDR\)](#).

Note: 1. Optional

The CSAAT, LASTXFER and CSNAAT bits are discussed in section [Peripheral Deselection with DMA](#).

If LASTXFER is used, the command must be issued after writing the last character. Instead of LASTXFER, the user can use the SPIDIS command. After the end of the DMA transfer, it is necessary to wait for the TXEMPTY flag and then write SPIDIS into the SPI Control Register (FLEX\_SPI\_CR). This does not change the configuration register values). The NPCS is disabled after the last character transfer. Then, another DMA transfer can be started if the FLEX\_SPI\_CR.SPIEN bit has previously been written.

#### **46.8.3.6 SPI Direct Access Memory Controller (DMAC)**

In both Fixed and Variable modes, the Direct Memory Access Controller (DMAC) can be used to reduce processor overhead.

The fixed peripheral selection allows buffer transfers with a single peripheral. Using the DMAC is an optimal means, as the size of the data transfer between the memory and the SPI is either 8 bits or 16 bits. However, if the peripheral selection is modified, FLEX\_SPI\_MR must be reprogrammed.

The variable peripheral selection allows buffer transfers with multiple peripherals without reprogramming FLEX\_SPI\_MR. Data written in FLEX\_SPI\_TDR is 32 bits wide and defines the real data to be transmitted and the destination peripheral. Using the DMAC in this mode requires 32-bit wide buffers, with the data in the LSBs and the PCS and LASTXFER fields in the MSBs. However, the SPI still controls the number of bits (8 to 16) to be transferred through MISO and MOSI lines with the chip select configuration registers. This is not the optimal means in terms of memory size for the buffers, but it provides a very effective means to exchange data with several peripherals without any intervention of the processor.

#### **46.8.3.7 Peripheral Chip Select Decoding**

The user can program the SPI to operate with up to 3 slave peripherals by decoding the two chip select lines, NPCS0 to NPCS1 with an external decoder/demultiplexer (see the following figure). This can be enabled by setting the FLEX\_SPI\_MR.PCSDEC bit.

When operating without decoding, the SPI makes sure that in any case only one chip select line is activated, i.e., one NPCS line driven low at a time. If two bits are defined low in a PCS field, only the lowest numbered chip select is driven low.

When operating with decoding, the SPI directly outputs the value defined by the PCS field on the NPCS lines of either FLEX\_SPI\_MR or FLEX\_SPI\_TDR (depending on PS).

As the SPI sets a default value of 0x3 on the chip select lines (i.e., all chip select lines at 1) when not processing any transfer, only 3 peripherals can be decoded.

The SPI has only two Chip Select registers. As a result, when external decoding is activated, each NPCS chip select defines the characteristics of up to two peripherals. As an example, FLEX\_SPI\_CR0 defines the characteristics of the externally decoded peripherals 0 to 1, corresponding to the PCS values 0x0 to 0x1. Consequently, the user has to make sure to connect compatible peripherals on the decoded chip select lines 0 to 1 and 2. The following figure shows this type of implementation.

If the CSAAT bit is used, with or without the DMAC, the mode fault detection for NPCS0 line must be disabled. This is not needed for all other chip select lines since mode fault detection is only on NPCS0.

**Figure 46-72. Chip Select Decoding Application Block Diagram: Single Master/Multiple Slave Implementation**

#### 46.8.3.8 Peripheral Deselection without DMA

During a transfer of more than one data on a Chip Select without the DMA, FLEX\_SPI\_TDR is loaded by the processor, the TDRE flag rises as soon as the content of FLEX\_SPI\_TDR is transferred into the internal shift register. When this flag is detected high, FLEX\_SPI\_TDR can be reloaded. If this reload by the processor occurs before the end of the current transfer, and if the next transfer is performed on the same chip select as the current transfer, the Chip Select is not deasserted between the two transfers. But depending on the application software handling the SPI status register flags (by interrupt or polling method) or servicing other interrupts or other tasks, the processor may not reload FLEX\_SPI\_TDR in time to keep the chip select active (low). A null DLYBCT value (delay between consecutive transfers) in FLEX\_SPI\_CSR, gives even less time for the processor to reload FLEX\_SPI\_TDR. With some SPI slave peripherals, if the chip select line must remain active (low) during a full set of transfers, communication errors can occur.

To facilitate interfacing with such devices, the Chip Select registers [CSR0...CSR1] can be programmed with the Chip Select Active After Transfer (CSAAT) bit to 1. This allows the chip select lines to remain in their current state (low = active) until a transfer to another chip select is required. Even if FLEX\_SPI\_TDR is not reloaded, the chip select remains active. To de-assert the chip select line at the end of the transfer, the Last Transfer (LASTXFER) bit in FLEX\_SPI\_CR must be set after writing the last data to transmit into FLEX\_SPI\_TDR.

#### 46.8.3.9 Peripheral Deselection with DMA

DMA provides faster reloads of FLEX\_SPI\_TDR compared to software. However, depending on the system activity, it is not guaranteed that FLEX\_SPI\_TDR is written with the next data before the end of the current transfer. Consequently, a data can be lost by the deassertion of the NPCS line for SPI slave peripherals requiring the chip select line to remain active between two transfers. The only way to guarantee a safe transfer in this case is the use of the CSAAT and LASTXFER bits.

When the CSAAT bit is cleared, the NPCS does not rise in all cases between two transfers on the same peripheral. During a transfer on a Chip Select, the TDRE flag rises as soon as the content of FLEX\_SPI\_TDR is transferred into the internal shift register. When this flag is detected, FLEX\_SPI\_TDR can be reloaded. If this reload occurs before the end of the current transfer and if the next transfer is performed on the same chip select as the current transfer, the Chip Select is not deasserted between the two transfers. This can lead to difficulties to interface with some serial peripherals requiring the chip select

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

to be deasserted after each transfer. To facilitate interfacing with such devices, FLEX\_SPI\_CSR can be programmed with the Chip Select Not Active After Transfer (CSNAAT) bit to 1. This allows the chip select lines to be deasserted systematically during a time “DLYBCS” (the value of the CSNAAT bit is processed only if the CSAAT bit is cleared for the same chip select).

The following figure shows different peripheral deselection cases and the effect of the CSAAT and CSNAAT bits.

**Figure 46-73. Peripheral Deselection**

### 46.8.3.10 Mode Fault Detection

The SPI has the capability to operate in multi-master environment. Consequently, the NPCS0/NSS line must be monitored. If one of the masters on the SPI bus is currently transmitting, the NPCS0/NSS line is low and the SPI must not transmit a data. A mode fault is detected when the SPI is programmed in Master mode and a low level is driven by an external master on the NPCS0/NSS signal. In multi-master environment, NPCS0, MOSI, MISO and SPCK pins must be configured in open drain (through the PIO controller). When a mode fault is detected, the FLEX\_SPI\_SR.MODF bit is set until FLEX\_SPI\_SR is

read and the SPI is automatically disabled until it is re-enabled by writing the FLEX\_SPI\_CR.SPIEN bit to 1.

By default, the mode fault detection is enabled. The user can disable it by setting the FLEX\_SPI\_MR.MODFDIS bit.

#### 46.8.4 SPI Slave Mode

When operating in Slave mode, the SPI processes data bits on the clock provided on the SPI clock pin (SPCK).

The SPI waits until NSS goes active before receiving the serial clock from an external master. When NSS falls, the clock is validated and the data are loaded in FLEX\_SPI\_RDR according to the configuration value of the FLEX\_SPI\_CSR0.BITS field. These bits are processed following a phase and a polarity defined respectively by the FLEX\_SPI\_CSR0.NCPHA and FLEX\_SPI\_CSR0.CPOL bits. Note that the BITS field, CPOL bit and NCPHA bit of the other Chip Select registers have no effect when the SPI is programmed in Slave mode.

The bits are shifted out on the MISO line and sampled on the MOSI line.

**Note:** For more information on the BITS field, see also the note below the FLEX\_SPI\_CSRx register bitmap in section [SPI Chip Select Register](#)

When all bits are processed, the received data are transferred in FLEX\_SPI\_RDR and the RDRF bit rises. If FLEX\_SPI\_RDR has not been read before new data are received, the Overrun Error bit (OVRES) in FLEX\_SPI\_SR is set. As long as this flag is set, data are loaded in FLEX\_SPI\_RDR. The user must read FLEX\_SPI\_SR to clear the OVRES bit.

When a transfer starts, the data shifted out is the data present in the shift register. If no data has been written in FLEX\_SPI\_TDR, the last data received is transferred. If no data has been received since the last reset, all bits are transmitted low, as the shift register resets to 0.

When a first data is written in FLEX\_SPI\_TDR, it is transferred immediately in the shift register and the TDRE flag rises. If new data is written, it remains in FLEX\_SPI\_TDR until a transfer occurs, i.e., NSS falls and there is a valid clock on the SPCK pin. When the transfer occurs, the last data written in FLEX\_SPI\_TDR is transferred in the shift register and the TDRE flag rises. This enables frequent updates of critical variables with single transfers.

Then, a new data is loaded in the shift register from FLEX\_SPI\_TDR. If no character is ready to be transmitted, i.e., no character has been written in FLEX\_SPI\_TDR since the last load from FLEX\_SPI\_TDR to the shift register, FLEX\_SPI\_TDR is retransmitted. In this case the Underrun Error Status Flag (UNDES) is set in FLEX\_SPI\_SR.

If NSS rises between two characters, it must be kept high for two MCK clock periods or more and the next SPCK capture edge must not occur less than four MCK periods after NSS rise.

The following figure shows a block diagram of the SPI when operating in Slave mode.

**Figure 46-74. Slave Mode Functional Block Diagram**

### 46.8.5 SPI Comparison Function on Received Character

The comparison is only relevant for SPI Slave mode (MSTR = 0 in FLEX\_US\_MR).

The effect of a comparison match changes if the system is in Wait or Active mode.

In Wait mode, if asynchronous partial wakeup is enabled, a system wakeup is performed (see section [46.8.6 SPI Asynchronous and Partial Wake-up \(SleepWalking\)](#)).

In Active mode, the CMP flag in FLEX\_SPI\_SR is raised. It is set when the received character matches the conditions programmed in the SPI Comparison Register (FLEX\_SPI\_CMPR). The CMP flag is set as soon as FLEX\_SPI\_RDR is loaded with the new received character. The CMP flag is cleared by reading FLEX\_SPI\_SR.

The SPI Comparison Register can be programmed to provide different comparison methods. These are listed below:

- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if any received character equals VAL1 or VAL2.

When FLEX\_SPI\_MR.CMPMODE is cleared, all received data is loaded in FLEX\_SPI\_RDR and the CMP flag provides the status of the comparison result.

By setting the CMPMODE bit, the comparison result triggers the start of FLEX\_SPI\_RDR loading (see the figure below). The trigger condition exists as soon as the received character value matches the conditions defined by VAL1 and VAL2 in FLEX\_SPI\_CMPR. The comparison trigger event is restarted by writing a 1 to the FLEX\_SPI\_CR.REQCLR bit.

The value programmed in VAL1 and VAL2 fields must not exceed the maximum value of the received character (see BITS field in SPI Chip Select Register (FLEX\_SPI\_CSR)).

**Figure 46-75. Receive Data Register Management**

CMPMODE = 1, VAL1 = VAL2 = 0x06

### 46.8.6 SPI Asynchronous and Partial Wake-up (SleepWalking)

This operating mode is a means of data pre-processing that qualifies an incoming event, thus allowing the SPI to decide whether or not to wake up the system. Asynchronous and partial wake-up is mainly used when the system is in Wait mode (refer to the section “Power Management Controller” (PMC) for further details). It can also be enabled when the system is fully running.

Asynchronous and partial wake-up can be used only when SPI is configured in Slave mode (FLEX\_SPI\_MR.MSTR is cleared).

The maximum SPI clock (SPCK) frequency that can be provided by the SPI master is bounded by the peripheral clock frequency. The SPCK frequency must be lower than or equal to the peripheral clock. The NSS line must be deasserted by the SPI master between two characters. The NSS deassertion duration time must be greater than or equal to six peripheral clock periods. The time between the assertion of NSS line (falling edge) and the first edge of the SPI clock must be higher than 15  $\mu$ s.

The FLEX\_SPI\_RDR register must be read before enabling the asynchronous and partial wake-up.

When asynchronous and partial wake-up is enabled for the SPI (refer to the section “Power Management Controller” (PMC)), the PMC decodes a clock request from the SPI. The request is generated as soon as there is a falling edge on the NSS line as this may indicate the beginning of a frame. If the system is in Wait mode (processor and peripheral clocks switched off), the PMC restarts the fast RC oscillator and provides the clock only to the SPI.

The SPI processes the received frame and compares the received character with VAL1 and VAL2 in FLEX\_SPI\_CMPR (section [FLEX\\_SPI\\_CMPR](#)).

The SPI instructs the PMC to disable the peripheral clock if the received character value does not meet the conditions defined by VAL1 and VAL2 fields in FLEX\_SPI\_CMPR (see [Figure 46-76](#)).

If the received character value meets the conditions, the SPI instructs the PMC to exit the system from Wait mode (see [Figure 46-77](#)).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

The VAL1 and VAL2 fields can be programmed to provide different comparison methods and thus matching conditions.

- If VAL1 equals VAL2, then the comparison is performed on a single value and the wake-up is triggered if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 wakes up the system.
- If VAL1 is strictly higher than VAL2, the wake-up is triggered if any received character equals VAL1 or VAL2.
- If VAL1 = 0 and VAL2 = 65535, the wake-up is triggered as soon as a character is received.

If the processor and peripherals are running, the SPI can be configured in Asynchronous and Partial Wake-up mode by enabling the PMC\_SLPWK\_ER (refer to the section “Power Management Controller” (PMC)). When activity is detected on the receive line, the SPI requests the clock from the PMC and the comparison is performed. If there is a comparison match, the SPI continues to request the clock. If there is no match, the clock is switched off for the SPI only, until a new activity is detected.

The CMPMODE configuration has no effect when Asynchronous and Partial Wake-up mode is enabled for the SPI (refer to PMC\_SLPWK\_ER in the section “Power Management Controller” (PMC)).

When the system is in Active mode and the SPI enters Asynchronous and Partial Wake-up mode, the flag RDRF must be programmed as the unique source of the SPI interrupt.

When the system exits Wait mode as the result of a matching condition, the RDRF flag is used to determine if the SPI is the source for the exit from Wait mode.

### Figure 46-76. Asynchronous Wake-up Use Case Example

Case with VAL1 = VAL2 = 0x55

**Figure 46-77. Asynchronous Event Generating Only Partial Wake-up**

Case with VAL1 = VAL2 = 0x55

### 46.8.7 SPI FIFOs

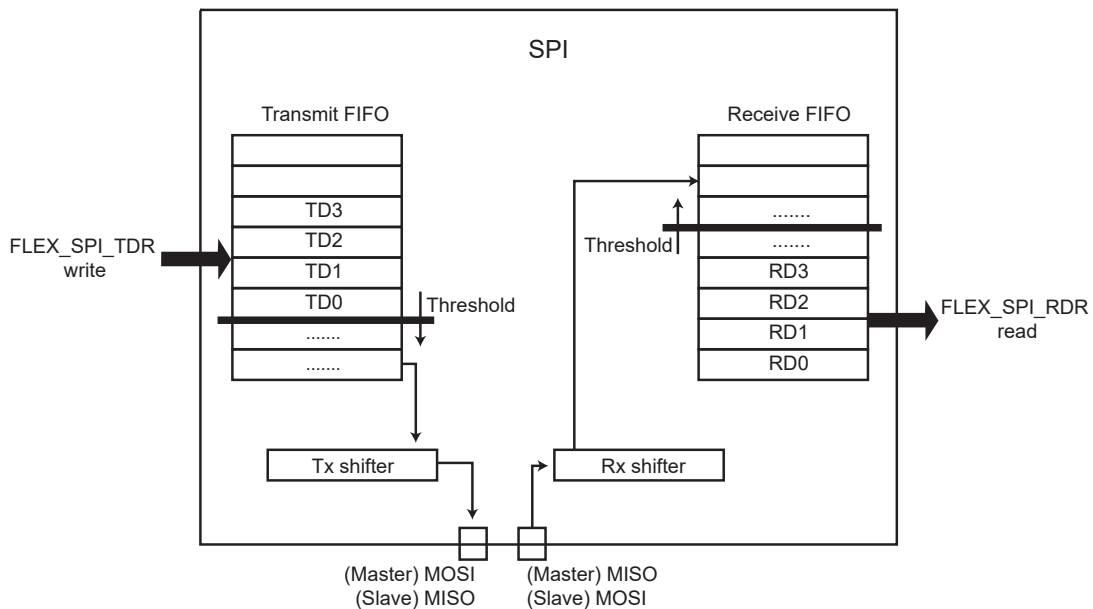

#### 46.8.7.1 Overview

The SPI includes two FIFOs which can be enabled/disabled using the FLEX\_SPI\_CR.FIFOEN/FIFODIS. The SPI module must be disabled before enabling or disabling the SPI FIFOs (FLEX\_SPI\_CR.SPIDIS).

Writing FLEX\_SPI\_CR.FIFOEN to '1' enables a FIFO\_DEPTH-data Transmit FIFO and a FIFO\_DEPTH-data Receive FIFO.

It is possible to write or to read single or multiple data in the same access to FLEX\_SPI\_TDR/RDR. See sections [SPI Single Data Mode](#) and [SPI Multiple Data Mode](#).

**Figure 46-78. FIFOs Block Diagram**

#### 46.8.7.2 Sending Data with FIFO Enabled

When the Transmit FIFO is enabled, write access to FLEX\_SPI\_TDR loads the Transmit FIFO.

The FIFO level is provided in FLEX\_SPI\_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor FLEX\_SPI\_SR.TDRE and the data can be successively written in FLEX\_SPI\_TDR.

If the FIFO cannot accept the data due to insufficient space, wait for the TDRE flag to be set before writing the data in FLEX\_SPI\_TDR.

When the space in the FIFO allows only a portion of the data to be written, the TDRE flag must be monitored before writing the remaining data.

**Figure 46-79. Sending Data with FIFO Enabled**

### 46.8.7.3 Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, FLEX\_SPI\_RDR access reads the FIFO.

When data are present in the Receive FIFO (RDRF flag set to '1'), the exact number of data can be checked with FLEX\_SPI\_FLR.RXFL. All the data can be read successively in FLEX\_SPI\_RDR without checking the RDRF flag between each access.

**Figure 46-80. Receiving Data with FIFO Enabled**

#### 46.8.7.4 Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using FLEX\_SPI\_CR.TXFCLR/RXFCLR.

#### 46.8.7.5 TXEMPTY, TDRE and RDRF Behavior

FLEX\_SPI\_SR.TXEMPTY, FLEX\_SPI\_SR.TDRE and FLEX\_SPI\_SR.RDRF flags display a specific behavior when FIFOs are enabled.

The TXEMPTY flag is cleared as long as there are characters in the Transmit FIFO or in the internal shift register. TXEMPTY is set when there are no characters in the Transmit FIFO and in the internal shift register.

TDRE indicates if a data can be written in the Transmit FIFO. Thus the TDRE flag is set as long as the Transmit FIFO can accept new data. See figure [TDRE in Single Data Mode and TXRDYM = 0](#).

RDRF indicates if an unread data is present in the Receive FIFO. Thus the RDRF flag is set as soon as one unread data is in the Receive FIFO. See figure [RDRF in Single Data Mode and RXRDYM = 0](#).

TDRE and RDRF behavior can be modified using the TXRDYM and RXRDYM fields in the SPI FIFO Mode Register (FLEX\_SPI\_FMR) to reduce the number of accesses to FLEX\_SPI\_TDR/RDR. However, for some configurations, the following constraints apply:

- When the Variable Peripheral Select mode is used (FLEX\_SPI\_MR.PS=1), TXRDYM/RXRDYM must be cleared.
- In Master mode (FLEX\_SPI\_MR.MSTR=1), RXRDYM must be cleared.

As an example, in Master mode, the Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0.

See SPI FIFO Mode Register ([FLEX\\_SPI\\_FMR](#)) for the FIFO configuration.

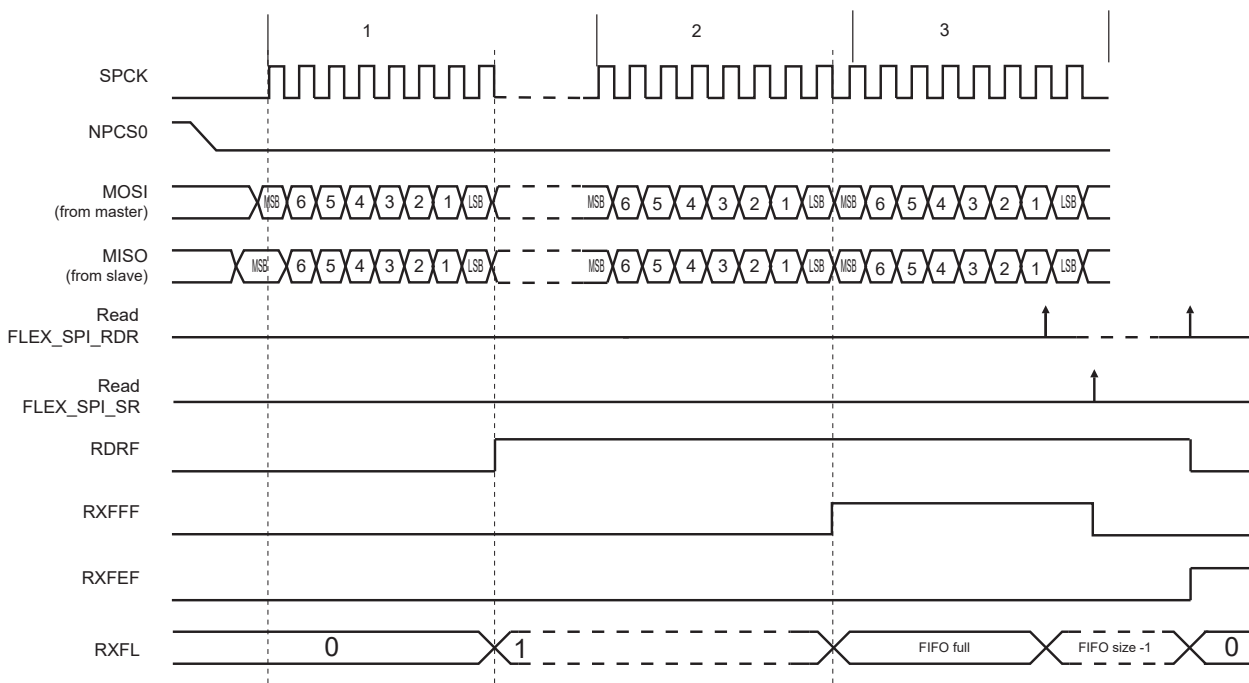

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

**Figure 46-81. TDRE in Single Data Mode and TXRDYM = 0**

**Figure 46-82. RDRF in Single Data Mode and RXRDYM = 0**

### 46.8.7.6 SPI Single Data Mode

In Single Data mode, only one data is written every time FLEX\_SPI\_TDR is accessed, and only one data is read every time FLEX\_SPI\_RDR is accessed.

When FLEX\_SPI\_FMR.TXRDYM = 0, the Transmit FIFO operates in Single Data mode.

When FLEX\_SPI\_FMR.RXRDYM = 0, the Receive FIFO operates in Single Data mode.

If Master mode is used (FLEX\_SPI\_MR.MSTR=1), the Receive FIFO must operate in Single Data mode.

If Variable Peripheral Select mode is used (FLEX\_SPI\_MR.PS=1), the Transmit FIFO must operate in Single Data mode.

See sections [SPI Transmit Data Register](#) and [SPI Receive Data Register](#).

### 46.8.7.6.1 DMAC

When FIFOs operate in Single Data mode, the DMAC transfer type must be configured either in bytes, halfwords or words depending on FLEX\_SPI\_MR.PS bit value and FLEX\_SPI\_CSRx.BITS field value.

The same applies when FIFOs are disabled.

### 46.8.7.7 SPI Multiple Data Mode

Multiple Data mode minimizes the number of accesses by concatenating the data to send/read in one access.

When FLEX\_SPI\_FMR.TXRDYM > 0, the Transmit FIFO operates in Multiple Data mode.

When FLEX\_SPI\_FMR.RXRDYM > 0, the Receive FIFO operates in Multiple Data mode.

Multiple data can be read from the Receive FIFO only in Slave mode (FLEX\_SPI\_MR.MSTR=0).

The Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0 and when FLEX\_SPI\_MR.PS=0.

In Multiple Data mode, up to two data can be written in one FLEX\_SPI\_TDR write access. It is also possible to read up to four data in one FLEX\_SPI\_RDR access if FLEX\_SPI\_CSRx.BITS is configured to '0' (8-bit data size) and up to two data if FLEX\_SPI\_CSRx.BITS is configured to a value other than '0' (more than 8-bit data size).

The number of data to write/read is defined by the size of the register access. If the access is a byte-size register access, only one data is written/read. If the access is a halfword size register access, then up to two data are read and only one data is written. Lastly, if the access is a word-size register access, then up to four data are read and up to two data are written.

Written/read data are always right-aligned, as described in sections [SPI Receive Data Register \(FIFO Multiple Data, 8-bit\)](#), [SPI Receive Data Register \(FIFO Multiple Data, 16-bit\)](#) and [SPI Transmit Data Register \(FIFO Multiple Data, 8- to 16-bit\)](#).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six FLEX\_SPI\_TDR-byte write accesses
- three FLEX\_SPI\_TDR-halfword write accesses

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six FLEX\_SPI\_RDR-byte read accesses
- three FLEX\_SPI\_RDR-halfword read accesses
- one FLEX\_SPI\_RDR-word read access and one FLEX\_SPI\_RDR-halfword read access

### 46.8.7.7.1 TDRE and RDRF Configuration

In Multiple Data mode, it is possible to write one or more data in the same FLEX\_SPI\_TDR/RDR access. The TDRE flag indicates if one or more data can be written in the FIFO depending on the configuration of FLEX\_SPI\_FMR.TXRDYM/RXRDYM.

As an example, if two data are written each time in FLEX\_SPI\_TDR, it is useful to configure the TXRDYM field to the value '1' so that the TDRE flag is at '1' only when at least two data can be written in the Transmit FIFO.

Similarly, if four data are read each time in FLEX\_SPI\_RDR, it is useful to configure the RXRDYM field to the value '2' so that the RDRF flag is at '1' only when at least four unread data are in the Receive FIFO.

### 46.8.7.7.2 DMAC

It is mandatory to configure DMAC channel size (byte, halfword or word) according to FLEX\_SPI\_FMR.TXRDYM/RXRDYM configuration. See section [SPI Multiple Data Mode](#) for constraints.

### 46.8.7.8 FIFO Pointer Error

A FIFO overflow is reported in FLEX\_SPI\_SR.

If the Transmit FIFO is full and a write access is performed on FLEX\_SPI\_TDR, it generates a Transmit FIFO pointer error and sets FLEX\_SPI\_SR.TXFPTEF.

In Multiple Data mode, if the number of data written in FLEX\_SPI\_TDR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO pointer error is generated and FLEX\_SPI\_SR.TXFPTEF is set.

A FIFO underflow is reported in FLEX\_SPI\_SR.

In Multiple Data mode, if the number of data read in FLEX\_SPI\_RDR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO pointer error is generated and FLEX\_SPI\_SR.RXFPTEF is set.

No pointer error occurs if the FIFO state/level is checked before writing/reading in FLEX\_SPI\_TDR/SPI\_RDR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When a pointer error occurs, other FIFO flags may not behave as expected; their states should be ignored.

If a pointer error occurs, a software reset must be performed using FLEX\_SPI\_CR.SWRST (configuration will be lost).

### 46.8.7.9 FIFO Thresholds

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using the field FLEX\_SPI\_FMR.TXFTHRES. Each time the Transmit FIFO level goes from 'above threshold' to 'equal to or below threshold', the flag FLEX\_SPI\_SR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field FLEX\_SPI\_FMR.RXFTHRES. Each time the Receive FIFO level goes from 'below threshold' to 'equal to or above threshold', the flag FLEX\_SPI\_SR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF and RXFTHF flags can be configured to generate an interrupt using FLEX\_SPI\_IER and FLEX\_SPI\_IDR.

### 46.8.7.10 FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through FLEX\_SPI\_IER and FLEX\_SPI\_IDR.

FIFO flags state can be read in FLEX\_SPI\_SR. They are cleared when FLEX\_SPI\_SR is read.

### 46.8.8 SPI Register Write Protection

The FLEXCOM operating mode (FLEX\_MR.OPMODE) must be set to FLEX\_MR\_OPMODE\_SPI to enable access to the write protection registers.

To prevent any single software error from corrupting SPI behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the SPI Write Protection Mode Register (FLEX\_SPI\_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the SPI Write Protection Status Register (FLEX\_SPI\_WPSR) is set and the Write Protection Violation Source (WPVSR) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading FLEX\_SPI\_WPSR.

The following registers can be write-protected when WPEN is set:

- SPI Mode Register
- SPI Chip Select Register
- SPI Comparison Register

The following registers can be write-protected when WPITEN is set:

- SPI Interrupt Enable Register
- SPI Interrupt Disable Register

The following register can be write-protected when WPCREN is set:

- SPI Control Register

## 46.9 TWI Functional Description

### 46.9.1 Transfer Format

The data put on the TWD line must be 8 bits long. Data are transferred MSB first; each byte must be followed by an acknowledgement. The number of bytes per transfer is unlimited (see figure below).

**Figure 46-83. Transfer Format**

Each transfer begins with a START condition and terminates with a STOP condition (see figure below).

- A high-to-low transition on the TWD line while TWCK is high defines the START condition.
- A low-to-high transition on the TWD line while TWCK is high defines a STOP condition.

**Figure 46-84. START and STOP Conditions**

## 46.9.2 Modes of Operation

The TWI has different modes of operation:

- Master Transmitter mode (Standard and Fast modes only)
- Master Receiver mode (Standard and Fast modes only)
- Multi-master Transmitter mode (Standard and Fast modes only)
- Multi-master Receiver mode (Standard and Fast modes only)
- Slave Transmitter mode (Standard, Fast and High-speed modes)
- Slave Receiver mode (Standard, Fast and High-speed modes)

These modes are described in the following sections.

## 46.9.3 Master Mode

### 46.9.3.1 Definition

The master is the device that starts a transfer, generates a clock and stops it. This operating mode is not available if High-speed mode is selected.

### 46.9.3.2 Programming Master Mode

The following fields must be programmed before entering Master mode:

1. DADR (+ IADRSZ + IADR if a 10-bit device is addressed): The device address is used to access slave devices in Read or Write mode.
2. CWGR + CKDIV + CHDIV + CLDIV: Clock waveform.
3. SVDIS: Disables Slave mode.
4. MSEN: Enables Master mode.

**Note:** If the TWI is already in Master mode, the device address (DADR) can be configured without disabling the Master mode.

### 46.9.3.3 Transfer Speed/Bit Rate

The TWI speed is defined in FLEX\_TWI\_CWGR. The TWI bit rate can be based either on the peripheral clock if the BRSRCCLK bit value is 0 or on a programmable clock source provided by the GCLK if the BRSRCCLK bit value is 1.

If BRSRCCLK = 1, the bit rate is independent of the processor/peripheral clock and thus processor/peripheral clock frequency can be changed without affecting the TWI transfer rate.

The GCLK frequency must be at least three times lower than the peripheral clock frequency.

### 46.9.3.4 Master Transmitter Mode

This operating mode is not available if High-speed mode is selected.

After the master initiates a START condition when writing into the Transmit Holding register FLEX\_TWI\_THR, it sends a 7-bit slave address, configured in the Master Mode Register (DADR in FLEX\_TWI\_MMR), to notify the slave device. The bit following the slave address indicates the transfer direction, 0 in this case (FLEX\_TWI\_MMR.MREAD = 0).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

The TWI transfers require the slave to acknowledge each received byte. During the acknowledge clock pulse (ninth pulse), the master releases the data line (HIGH), enabling the slave to pull it down in order to generate the acknowledge. If the slave does not acknowledge the byte, then the Not Acknowledge flag (NACK) is set in the TWI Status Register (FLEX\_TWI\_SR) of the master and a STOP condition is sent. Alternatively, if the FLEX\_TWI\_MMR.NOAP bit is set, no stop condition will be sent and a START or STOP condition must be triggered manually through the FLEX\_TWI\_CR.START or FLEX\_TWI\_CR.STOP bit once the software is ready for the transmission of the condition. The NACK flag must be cleared by reading the TWI Status Register (FLEX\_TWI\_SR) before the next write into the TWI Transmit Holding Register (FLEX\_TWI\_THR). As with the other status bits, an interrupt can be generated if enabled in the interrupt enable Register (FLEX\_TWI\_IER). If the slave acknowledges the byte, the data written in FLEX\_TWI\_THR is then shifted in the internal shifter and transferred. When an acknowledge is detected, the TXRDY bit is set until a new write in FLEX\_TWI\_THR.

TXRDY is used as transmit ready for the DMA transmit channel.

**Note:** To clear the TXRDY flag in Master mode, write the FLEX\_TWI\_CR.MSDIS bit to 1, then write the FLEX\_TWI\_CR.MSEN bit to 1.

While no new data is written in FLEX\_TWI\_THR, the serial clock line is tied low. When new data is written in FLEX\_TWI\_THR, the SCL is released and the data is sent. To generate a STOP event, the STOP command must be performed by writing in the STOP field of the TWI Control Register (FLEX\_TWI\_CR).

After a master write transfer, the Serial Clock line is stretched (tied low) while no new data is written in FLEX\_TWI\_THR or until a STOP command is performed.

See the following figures.

**Figure 46-85. Master Write with One Data Byte**

**Figure 46-86. Master Write with Multiple Data Bytes**

**Figure 46-87. Master Write with One Byte Internal Address and Multiple Data Bytes**

### 46.9.3.5 Master Receiver Mode

Master Receiver mode is not available if High-speed mode is selected.

The read sequence begins by setting the START bit. After the start condition has been sent, the master sends a 7-bit slave address to notify the slave device. The bit following the slave address indicates the transfer direction, 1 in this case (`FLEX_TWI_MMR.MREAD = 1`). During the acknowledge clock pulse (9th pulse), the master releases the data line (HIGH), enabling the slave to pull it down in order to generate the acknowledge. The master polls the data line during this clock pulse and sets the `FLEX_TWI_SR.NACK` bit if the slave does not acknowledge the byte.

If an acknowledge is received, the master is then ready to receive data from the slave. After data has been received, the master sends an acknowledge condition to notify the slave that the data has been received except for the last data (see figure "Master Read with One Data Byte" below). When the `FLEX_TWI_SR.RXRDY` bit is set, a character has been received in the Receive Holding Register (`FLEX_TWI_RHR`). The `RXRDY` bit is reset when reading `FLEX_TWI_RHR`.

When a single data byte read is performed, with or without internal address (IADR), the START and STOP bits must be set at the same time. See figure "Master Read with One Data Byte" below. When a multiple data byte read is performed, with or without internal address (IADR), the STOP bit must be set after the next-to-last data received (same condition applies for START bit to generate a repeated start).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

See figure "Master Read with Multiple Data Bytes" below. For internal address usage, see section [Internal Address](#).

If FLEX\_TWI\_RHR is full (RXRDY high) and the master is receiving data, the serial clock line will be tied low before receiving the last bit of the data and until FLEX\_TWI\_RHR is read. Once FLEX\_TWI\_RHR is read, the master will stop stretching the serial clock line and end the data reception. See figure "Master Read Clock Stretching with Multiple Data Bytes" below.

**WARNING** When receiving multiple bytes in Master Read mode, if the next-to-last access is not read (the RXRDY flag remains high), the last access will not be completed until FLEX\_TWI\_RHR is read. The last access stops on the next-to-last bit (clock stretching). When FLEX\_TWI\_RHR is read there is only half a bit period to send the STOP bit (or START bit) command, else another read access might occur (spurious access).

A possible workaround is to set the STOP bit (or START bit) before reading FLEX\_TWI\_RHR on the next-to-last access (within IT handler).

**Figure 46-88. Master Read with One Data Byte**

**Figure 46-89. Master Read with Multiple Data Bytes**

**Figure 46-90. Master Read Clock Stretching with Multiple Data Bytes**

RXRDY is used as receive ready trigger event for the DMA receive channel.

### 46.9.3.6 Internal Address

The TWI interface can perform transfers with 7-bit slave address devices and with 10-bit slave address devices.

#### 46.9.3.6.1 7-bit Slave Addressing

When addressing 7-bit slave devices, the internal address bytes are used to perform random address (read or write) accesses to reach one or more data bytes, e.g., within a memory page location in a serial memory. When performing read operations with an internal address, the TWI performs a write operation to set the internal address into the slave device, and then switch to Master Receiver mode. Note that the second start condition (after sending the IADR) is sometimes called “repeated start” (Sr) in I<sup>2</sup>C fully-compatible devices. See figure [Master Read with One, Two or Three Bytes Internal Address and One Data Byte](#).

See figures [Master Write with One, Two or Three Bytes Internal Address and One Data Byte](#) and [Internal Address Usage](#) for the master write operation with internal address.

The three internal address bytes are configurable through the Master Mode Register (FLEX\_TWI\_MMR).

If the slave device supports only a 7-bit address, i.e., no internal address, IADRSZ must be configured to 0.

The abbreviations listed below are used in the following figures:

S	Start
Sr	Repeated Start
P	Stop
W	Write
R	Read
A	Acknowledge
N	Not Acknowledge
DADR	Device Address

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

IADR	Internal Address
------	------------------

**Figure 46-91. Master Write with One, Two or Three Bytes Internal Address and One Data Byte**

**Figure 46-92. Master Read with One, Two or Three Bytes Internal Address and One Data Byte**

### 46.9.3.6.2 10-bit Slave Addressing

For a slave address higher than seven bits, the user must configure the address size (IADRSZ) and set the other slave address bits in the Internal Address Register (FLEX\_TWI\_IADR). The two remaining internal address bytes, IADR[15:8] and IADR[23:16], can be used the same way as in 7-bit slave addressing.

Example: Address a 10-bit device (10-bit device address is b1 b2 b3 b4 b5 b6 b7 b8 b9 b10)

1. Program IADRSZ = 1
2. Program DADR with 1 1 1 1 0 b1 b2 (b1 is the MSB of the 10-bit address, b2, etc.)
3. Program FLEX\_TWI\_IADR with b3 b4 b5 b6 b7 b8 b9 b10 (b10 is the LSB of the 10-bit address)

The following figure shows a byte write to a TWI EEPROM. This demonstrates the use of internal addresses to access the device.

**Figure 46-93. Internal Address Usage**

### 46.9.3.7 Repeated Start

In addition to Internal Address mode, repeated start (Sr) can be generated manually by writing the START bit at the end of a transfer instead of the STOP bit. In such case the parameters of the next transfer (direction, SADR, etc.) will need to be set before writing the START bit at the end of the previous transfer.

See section [Read/Write Flowcharts](#).

### 46.9.3.8 Bus Clear Command

The TWI interface can perform a Bus Clear Command:

1. Configure the Master mode (DADR, CKDIV, etc).
2. Start the transfer by setting the FLEX\_TWI\_CR.CLEAR bit.

**Note:** If an alternative command is used (ACMEN bit = 1), the DATAL field must be cleared.

#### 46.9.3.9 SMBus Mode

SMBus mode is enabled when the FLEX\_TWI\_CR.SMBEN bit is written to one. SMBus mode operation is similar to I<sup>2</sup>C operation with the following exceptions:

1. Only 7-bit addressing can be used.
2. The SMBus standard describes a set of timeout values to ensure progress and throughput on the bus. These timeout values must be programmed into FLEX\_TWI\_SMBTR.
3. Transmissions can optionally include a CRC byte, called Packet Error Check (PEC).
4. A set of addresses has been reserved for protocol handling, such as alert response address (ARA) and host header (HH) address. Address matching on these addresses can be enabled by configuring FLEX\_TWI\_CR appropriately.

##### 46.9.3.9.1 Packet Error Checking

Each SMBus transfer can optionally end with a CRC byte, called the PEC byte. Writing the FLEX\_TWI\_CR.PECEN bit to one enables automatic PEC handling in the current transfer. Transfers with and without PEC can freely be intermixed in the same system, since some slaves may not support PEC. The PEC LFSR is always updated on every bit transmitted or received, so that PEC handling on combined transfers will be correct.

In Master Transmitter mode, the master calculates a PEC value and transmits it to the slave after all data bytes have been transmitted. Upon reception of this PEC byte, the slave will compare it to the PEC value it has computed itself. If the values match, the data was received correctly, and the slave will return an ACK to the master. If the PEC values differ, data was corrupted, and the slave will return a NACK value. Some slaves may not be able to check the received PEC in time to return a NACK if an error occurred. In this case, the slave should always return an ACK after the PEC byte, and some other mechanism must be implemented to verify that the transmission was received correctly.

In Master Receiver mode, the slave calculates a PEC value and transmits it to the master after all data bytes have been transmitted. Upon reception of this PEC byte, the master will compare it to the PEC value it has computed itself. If the values match, the data was received correctly. If the PEC values differ, data was corrupted, and the FLEX\_TWI\_SR.PECERR bit is set. In Master Receiver mode, the PEC byte is always followed by a NACK transmitted by the master, since it is the last byte in the transfer.

In combined transfers, the PECRQ bit should only be set in the last of the combined transfers. If Alternative Command mode is enabled, only the NPEC bit should be set.

Consider the following transfer:

S, ADR+W, COMMAND\_BYTE, ACK, SR, ADR+R, DATA\_BYTE, ACK, PEC\_BYTE, NACK, P

See section [Read/Write Flowcharts](#) for detailed flowcharts.

##### 46.9.3.9.2 Timeouts

The FLEX\_TWI\_SMBTR.TLOWS/TLOWM fields configure the SMBus timeout values. If a timeout occurs, the master transmits a STOP condition and leaves the bus. Furthermore, the FLEX\_TWI\_SR.TOUT bit is set.

##### 46.9.3.10 SMBus Quick Command (Master Mode Only)

The TWI interface can perform a quick command:

1. Configure the Master mode (DADR, CKDIV, etc).

2. Write the FLEX\_TWI\_MMR.MREAD bit at the value of the one-bit command to be sent.
3. Start the transfer by setting the FLEX\_TWI\_CR.QUICK bit.

**Note:** If an alternative command is used (ACMEN bit = 1), the DATAL field must be cleared.

**Figure 46-94. SMBus Quick Command**

### 46.9.3.11 Alternative Command

Another way to configure the transfer is to enable the Alternative Command mode with the ACMEN bit of the TWI Control Register.

In this mode, the transfer is configured through the TWI Alternative Command Register. It is possible to define a simple read or write transfer or a combined transfer with a repeated start.

In order to set a simple transfer, the DATAL field and the DIR field of the TWI Alternative Command Register must be filled accordingly and the NDATAL field must be cleared. To begin the transfer, either set the START bit in the TWI Control Register in case of a read transfer, or write the TWI Transmit Holding Register in case of a write transfer.

For a combined transfer linked by a repeated start, the NDATAL field must be filled with the length of the second transfer and NDIR with the corresponding direction.

The PEC and NPEC bits are used to set a PEC field. In the case of a single transfer with PEC, the PEC bit must be set. In the case of a combined transfer, the NPEC bit must be set.

**Note:** If the Alternative Command mode is used, the TWIHS\_MMR.IADRSZ field must be set to 0.

See [Read/Write Flowcharts](#) for detailed flowcharts.

### 46.9.3.12 Handling Errors in Alternative Command

In case of NACK generated by a slave device or SMBus timeout error, the TWI stops immediately the frame, but the DMA transfer may still be active. To prevent a new frame to be restarted with the remaining DMA data (transmit), the TWI prevents any start of frame until the FLEX\_TWI\_SR.LOCK flag is cleared.

The FLEX\_TWI\_SR.LOCK bit indicates the state of the TWI (locked or not locked).

When the TWI is locked, no transfer can begin until the LOCK is cleared using the FLEX\_TWI\_CR.LOCKCLR bit and until the error flags are cleared reading FLEX\_TWI\_SR.

In case of error, FLEX\_TWI\_THR may have been loaded with a new data. The FLEX\_TWI\_CR.THRCLR bit can be used to flush FLEX\_TWI\_THR. If the THRCLR bit is set, the TXRDY and TXCOMP flags are set.

### 46.9.3.13 Read/Write Flowcharts

The flowcharts shown in this section provide examples for read and write operations. A polling or interrupt method can be used to check the status bits. The interrupt method requires that the Interrupt Enable Register (FLEX\_TWI\_IER) be configured first.

### 46.9.4 Multi-Master Mode

#### 46.9.4.1 Definition

In Multi-Master mode, more than one master may handle the bus at the same time without data corruption by using arbitration.

Arbitration starts as soon as two or more masters place information on the bus at the same time, and stops (arbitration is lost) for the master that intends to send a logical one while the other master sends a logical zero.

As soon as arbitration is lost by a master, it stops sending data and listens to the bus in order to detect a STOP. When the STOP is detected, the master that has lost arbitration may put its data on the bus by respecting arbitration.

Arbitration is illustrated in figure "Arbitration Cases" below.

### 46.9.4.2 Different Multi-Master Modes

Two Multi-Master modes may be distinguished:

- TWI as Master Only—TWI is considered as a master only and will never be addressed.
- TWI as Master or Slave—TWI may be either a master or a slave and may be addressed.

**Note:** Arbitration is supported in both Multi-Master modes.

#### 46.9.4.2.1 TWI as Master Only

In this mode, the TWI is considered as a master only (MSEN is always at one) and must be driven like a master with the ARBLST (ARBitration Lost) flag in addition.

If arbitration is lost (ARBLST = 1), the user must reinitiate the data transfer.

If the user starts a transfer (ex.: DADR + START + W + Write in THR) and if the bus is busy, the TWI automatically waits for a STOP condition on the bus to initiate the transfer (see figure "User Sends Data While the Bus is Busy" below).

**Note:** The state of the bus (busy or free) is not indicated in the user interface.

#### 46.9.4.2.2 TWI as Master or Slave

The automatic reversal from master to slave is not supported in case of a lost arbitration.

Then, in the case where TWI may be either a master or a slave, the user must manage the pseudo Multi-Master mode described in the steps below:

1. Program the TWI in Slave mode (SADR + MSDIS + SVEN) and perform a slave access (if TWI is addressed).
2. If the TWI has to be set in Master mode, wait until TXCOMP flag is at 1.
3. Program the Master mode (DADR + SVDIS + MSEN) and start the transfer (ex: START + Write in THR).
4. As soon as the Master mode is enabled, the TWI scans the bus in order to detect if it is busy or free. When the bus is considered as free, the TWI initiates the transfer.
5. As soon as the transfer is initiated and until a STOP condition is sent, the arbitration becomes relevant and the user must monitor the ARBLST flag.
6. If the arbitration is lost (ARBLST is = 1), the user must program the TWI in Slave mode in case the master that won the arbitration needs to access the TWI.
7. If the TWI has to be set in Slave mode, wait until TXCOMP flag is at 1 and then program the Slave mode.

**Note:** In case the arbitration is lost and the TWI is addressed, the TWI will not acknowledge even if it is programmed in Slave mode as soon as ARBLST = 1. Then the master must repeat SADR.

**Figure 46-109. User Sends Data While the Bus is Busy**

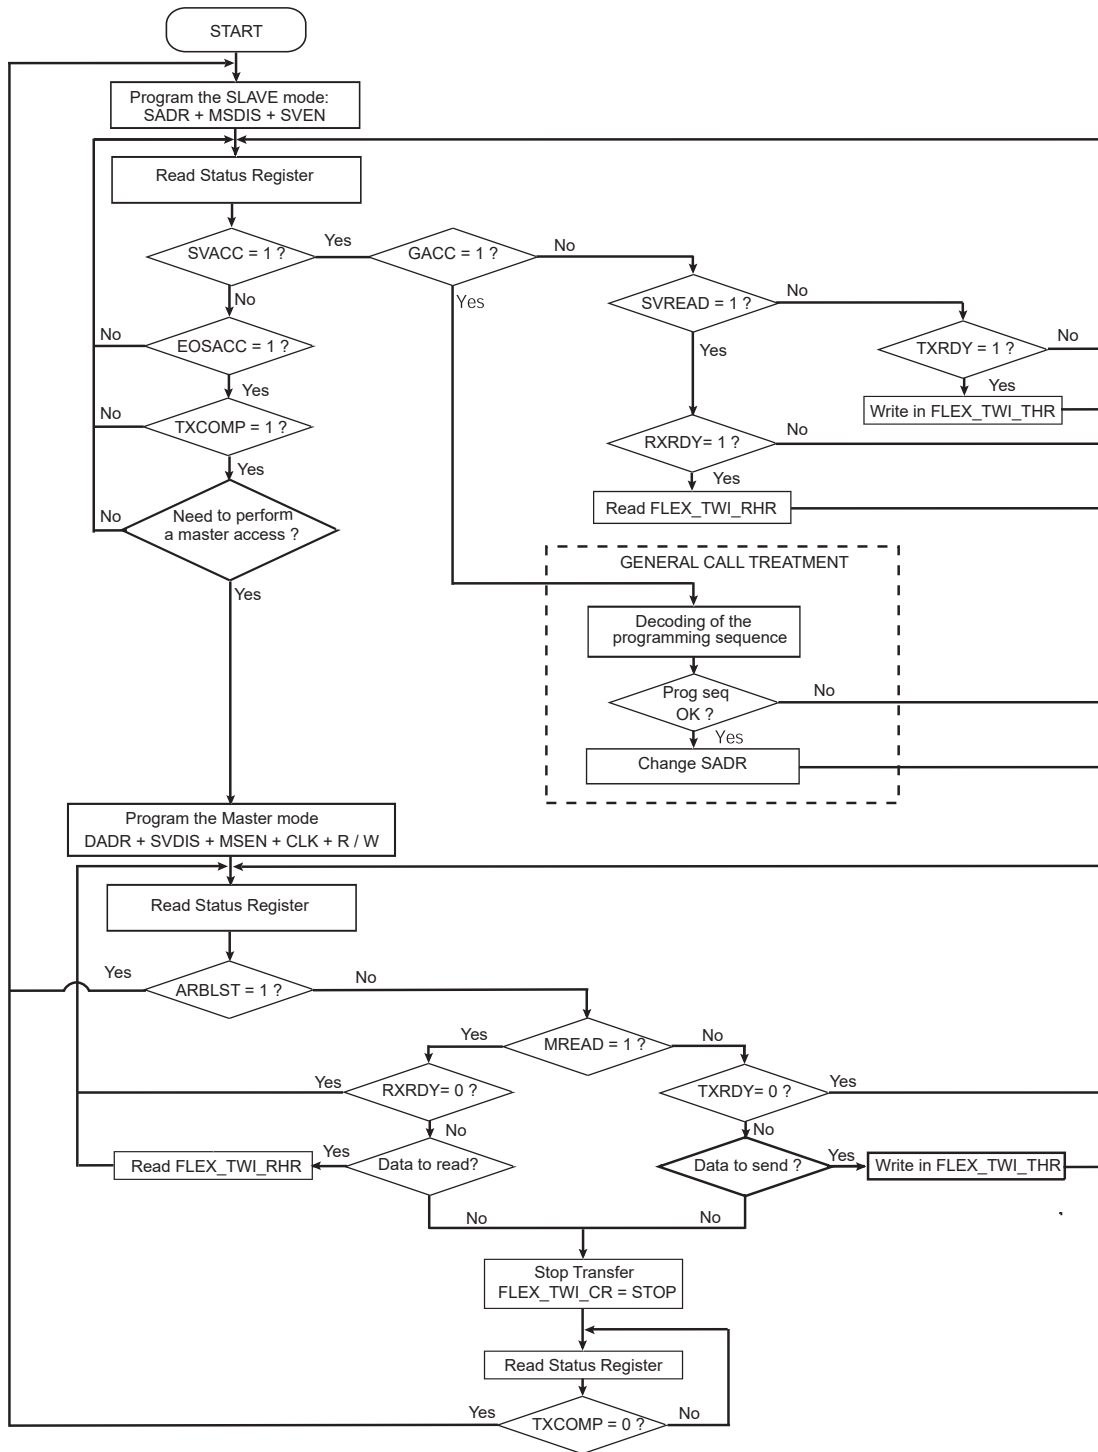

**Figure 46-110. Arbitration Cases**

The flowchart shown in the following figure gives an example of read and write operations in Multi-Master mode.

**Figure 46-111. Multi-Master Mode**

### 46.9.5 Slave Mode

#### 46.9.5.1 Definition

Slave mode is defined as a mode where the device receives the clock and the address from another device called the master.

In this mode, the device never initiates and never completes the transmission (START, REPEATED\_START and STOP conditions are always provided by the master).

#### 46.9.5.2 Programming Slave Mode

The following fields must be programmed before entering Slave mode:

1. FLEX\_TWI\_SMR.SADR: The slave device address is used in order to be accessed by master devices in Read or Write mode.
2. (Optional) FLEX\_TWI\_SMR.MASK can be set to mask some SADR address bits and thus allow multiple address matching.
3. FLEX\_TWI\_CR.MSDIS: Disables the Master mode.
4. FLEX\_TWI\_CR.SVEN: Enables the Slave mode.

As the device receives the clock, values written in FLEX\_TWI\_CWGR are not processed.

#### 46.9.5.3 Receiving Data

After a START or repeated START condition is detected, and if the address sent by the master matches the slave address programmed in the SADR (Slave Address) field, the SVACC (Slave Access) flag is set and SVREAD (Slave Read) indicates the direction of the transfer.

SVACC remains high until a STOP condition or a repeated START is detected. When such a condition is detected, EOSACC (End Of Slave Access) flag is set.

##### 46.9.5.3.1 Read Sequence

In the case of a read sequence (SVREAD is high), the TWI transfers data written in FLEX\_TWI\_THR (TWI Transmit Holding Register) until a STOP condition or a REPEATED\_START + an address different from SADR is detected. Note that at the end of the read sequence TXCOMP (Transmission Complete) flag is set and SVACC is reset.

As soon as data is written in FLEX\_TWI\_THR, the TXRDY (Transmit Holding Register Ready) flag is reset, and it is set when the internal shifter is empty and the sent data acknowledged or not. If the data is not acknowledged, the NACK flag is set.

Note that a STOP or a repeated START always follows a NACK.

See figure "Read Access Ordered by a Master" below.

**Note:** To clear the TXRDY flag in Slave mode, write the FLEX\_TWI\_CR.SVDIS bit to 1, then write the FLEX\_TWI\_CR.SVEN bit to 1.

##### 46.9.5.3.2 Write Sequence

In the case of a write sequence (SVREAD is low), the RXRDY (Receive Holding Register Ready) flag is set as soon as a character has been received in FLEX\_TWI\_RHR (TWI Receive Holding Register). RXRDY is reset when reading FLEX\_TWI\_RHR.

TWI continues receiving data until a STOP condition or a REPEATED\_START + an address different from SADR is detected. Note that at the end of the write sequence TXCOMP flag is set and SVACC reset.

See figure "Write Access Ordered by a Master" below.

##### 46.9.5.3.3 Clock Stretching Sequence

If FLEX\_TWI\_THR or FLEX\_TWI\_RHR is not written/read in time, the TWI performs a clock stretching.

Clock stretching information is given by the SCLWS (Clock Wait State) bit.

See figures "Clock Stretching in Read Mode" and "Clock Stretching in Write Mode" below.

**Note:** Clock stretching can be disabled by configuring the FLEX\_TWI\_SMR.SCLWSDIS bit. In that case, UNRE and OVRE flags will indicate underrun (when FLEX\_TWI\_THR is not filled on time) or overrun (when FLEX\_TWI\_RHR is not read on time).

### 46.9.5.3.4 General Call

In the case where a GENERAL CALL is performed, the GACC (General Call Access) flag is set.

After GACC is set, it is up to the user to interpret the meaning of the GENERAL CALL and to decode the new address programming sequence.

See figure "Master Performs a General Call" below.

### 46.9.5.4 Data Transfer

#### 46.9.5.4.1 Read Operation

The Read mode is defined as a data requirement from the master.

After a START or a REPEATED START condition is detected, the decoding of the address starts. If the slave address (SADR) is decoded, SVACC is set and SVREAD indicates the direction of the transfer.

Until a STOP or REPEATED START condition is detected, TWI continues sending data loaded in FLEX\_TWI\_THR.

If a STOP condition or a REPEATED START + an address different from SADR is detected, SVACC is reset.

The following figure describes the read operation.

**Figure 46-112. Read Access Ordered by a Master**

**Note:**

1. When SVACC is low, the state of SVREAD becomes irrelevant.
2. TXRDY is reset when data has been transmitted from FLEX\_TWI\_THR to the internal shifter and set when this data has been acknowledged or non acknowledged.

#### 46.9.5.4.2 Write Operation

The Write mode is defined as a data transmission from the master.

After a START or a REPEATED START, the decoding of the address starts. If the slave address is decoded, SVACC is set and SVREAD indicates the direction of the transfer (SVREAD is low in this case).

Until a STOP or REPEATED START condition is detected, TWI stores the received data in FLEX\_TWI\_RHR.

If a STOP condition or a REPEATED START + an address different from SADR is detected, SVACC is reset.

The following figure describes the write operation.

**Figure 46-113. Write Access Ordered by a Master**

**Note:**

1. When SVACC is low, the state of SVREAD becomes irrelevant.
2. RXRDY is set when data has been transmitted from the internal shifter to FLEX\_TWI\_RHR, and reset when this data is read.

#### 46.9.5.4.3 General Call

The general call is performed in order to change the address of the slave.

If a GENERAL CALL is detected, GACC is set.

After the detection of general call, it is up to the user to decode the commands which follow.

In case of a WRITE command, the user has to decode the programming sequence and program a new SADR if the programming sequence matches.

The following figure describes the general call access.

**Figure 46-114. Master Performs a General Call**

**Note:** This method enables to create a user-specific programming sequence by choosing the number of programming bytes. The programming sequence has to be provided to the master.

#### 46.9.5.4.4 Clock Stretching

In both Read and Write modes, it may happen that the FLEX\_TWI\_THR/FLEX\_TWI\_RHR buffer is not filled/emptied before the transmission/reception of a new character. In this case, to avoid sending/receiving undesired data, a clock stretching mechanism is implemented.

**Note:** Clock stretching can be disabled by setting the FLEX\_TWI\_SMR.SCLWSDIS bit. In that case, the UNRE and OVRE flags indicate an underrun (when FLEX\_TWI\_THR is not filled on time) or an overrun (when FLEX\_TWI\_RHR is not read on time).

##### — Clock Stretching in Read Mode

The clock is tied low if the internal shifter is empty and if a STOP or REPEATED START condition was not detected. It is tied low until the internal shifter is loaded.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

The following figure describes clock stretching in Read mode.

**Figure 46-115. Clock Stretching in Read Mode**

**Note:**

1. TXRDY is reset when data has been written in FLEX\_TWI\_THR to the internal shifter, and set when this data has been acknowledged or non acknowledged.
2. At the end of the read sequence, TXCOMP is set after a STOP or after a REPEATED\_START + an address different from SADR.
3. SCLWS is automatically set when the clock stretching mechanism is started.

**— Clock Stretching in Write Mode**

The clock is tied low if the internal shifter and FLEX\_TWI\_RHR are full. If a STOP or REPEATED\_START condition was not detected, it is tied low until FLEX\_TWI\_RHR is read.

The following figure describes the clock stretching in Write mode.

**Figure 46-116. Clock Stretching in Write Mode**

**Note:**

1. At the end of the read sequence, TXCOMP is set after a STOP or after a REPEATED\_START + an address different from SADR.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

2. SCLWS is automatically set when the clock stretching mechanism is started and automatically reset when the mechanism is finished.

### 46.9.5.4.5 Reversal after a Repeated Start

#### — Reversal of Read to Write

The master initiates the communication by a read command and finishes it by a write command.

The following figure describes the repeated start and the reversal from Read mode to Write mode.

**Figure 46-117. Repeated Start and Reversal from Read Mode to Write Mode**

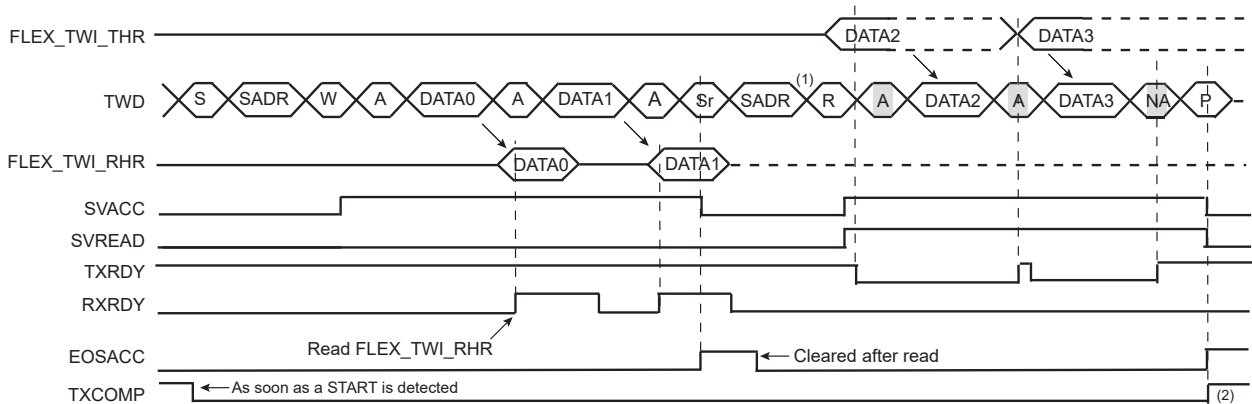

Note:  
1. TXCOMP is only set at the end of the transmission because after the repeated start, SADR is detected again.

#### — Reversal of Write to Read

The master initiates the communication by a write command and finishes it by a read command.

The following figure describes the repeated start and the reversal from Write mode to Read mode.

**Figure 46-118. Repeated Start and Reversal from Write Mode to Read Mode**

Notes:  
1. In this case, if FLEX\_TWI\_THR has not been written at the end of the read command, the clock is automatically stretched before the ACK.  
2. TXCOMP is only set at the end of the transmission because after the repeated start, SADR is detected again.

### 46.9.5.4.6 SMBus Mode

SMBus mode is enabled when the FLEX\_TWI\_CR.SMEN bit is written to one. SMBus mode operation is similar to I<sup>2</sup>C operation with the following exceptions:

1. Only 7-bit addressing can be used.
2. The SMBus standard describes a set of timeout values to ensure progress and throughput on the bus. These timeout values must be programmed into FLEX\_TWI\_SMBTR.
3. Transmissions can optionally include a CRC byte, called Packet Error Check (PEC).

4. A set of addresses have been reserved for protocol handling, such as alert response address (ARA) and host header (HH) address. Address matching on these addresses can be enabled by configuring FLEX\_TWI\_CR appropriately.

— **Packet Error Checking**

Each SMBus transfer can optionally end with a CRC byte, called the PEC byte. Writing the FLEX\_TWI\_CR.PECEN bit to one will send/check the FLEX\_TWI\_ACR.PEC field in the current transfer. The PEC generator is always updated on every bit transmitted or received, so that PEC handling on following linked transfers will be correct.

In Slave Receiver mode, the master calculates a PEC value and transmits it to the slave after all data bytes have been transmitted. Upon reception of this PEC byte, the slave will compare it to the PEC value it has computed itself. If the values match, the data was received correctly, and the slave will return an ACK to the master. If the PEC values differ, data was corrupted, and the slave will return a NACK value. The FLEX\_TWI\_SR.PECERR bit is set automatically if a PEC error occurred.

In Slave Transmitter mode, the slave calculates a PEC value and transmits it to the master after all data bytes have been transmitted. Upon reception of this PEC byte, the master will compare it to the PEC value it has computed itself. If the values match, the data was received correctly. If the PEC values differ, data was corrupted, and the master must take appropriate action.

See section [Slave Read/Write Flowcharts](#) for detailed flowcharts.

— **Timeouts**

The TWI SMBus Timing Register (FLEX\_TWI\_SMBTR) configures the SMBus timeout values. If a timeout occurs, the slave will leave the bus. Furthermore, the FLEX\_TWI\_SR.TOUT bit is set.

#### 46.9.5.5 High-Speed Slave Mode

High-speed mode is enabled when the FLEX\_TWI\_CR.HSEN bit is written to one. Furthermore, the analog pad filter must be enabled, the FLEX\_TWI\_FILTR.PADFEN bit must be written to one and the FLEX\_TWI\_FILTR.FILT bit must be cleared. TWI High-speed mode operation is similar to TWI operation with the following exceptions:

1. A master code is received first at normal speed before entering High-speed mode period.
2. When TWI High-speed mode is active, clock stretching is only allowed after acknowledge (ACK), not-acknowledge (NACK), START (S) or repeated START (Sr) (asa consequence, OVF may happen).

TWI High-speed mode allows transfers of up to 3.4 Mbit/s.

The TWI slave in High-speed mode requires that the peripheral clock runs at a minimum of 14 MHz if slave clock stretching is enabled (SCLWSDIS bit at '0'). If slave clock stretching is disabled (SCLWSDIS bit at '1'), the peripheral clock must run at a minimum of 11 MHz (assuming the system has no latency).

**Note:**

1. When slave clock stretching is disabled, FLEX\_TWI\_RHR must always be read before receiving the next data (MASTER write frame). It is strongly recommended to use either the polling method on the FLEX\_TWI\_SR.RXRDY flag, or the DMA. If the receive is managed by an interrupt, the TWI interrupt priority must be set to the right level and its latency minimized to avoid receive overrun.
2. When slave clock stretching is disabled, FLEX\_TWI\_THR must be filled with the first data to send before the beginning of the frame (MASTER read frame). It is strongly recommended to use either the polling method on the FLEX\_TWI\_SR.TXRDY flag, or the DMA. If the transmit is managed by an interrupt, the TWI interrupt priority must be set to the right level and its latency minimized to avoid transmit underrun.

### 46.9.5.5.1 Read/Write Operation

A TWI high-speed frame always begins with the following sequence:

1. START condition (S)
2. Master Code (0000 1XXX)
3. Not-acknowledge (NACK)

When the TWI is programmed in Slave mode and TWI High-speed mode is activated, master code matching is activated and internal timings are set to match the TWI High-speed mode requirements.

**Figure 46-119. High-Speed Mode Read/Write**

### 46.9.5.5.2 Usage

TWI High-speed mode usage is the same as the standard TWI (see section [Read/Write Flowcharts](#)).

### 46.9.5.6 Alternative Command

In Slave mode, the Alternative Command mode is used when the SMBus mode is enabled to send or check the PEC byte.

The Alternative Command mode is enabled by setting the ACMEN bit of the TWIHS Control Register, and the transfer is configured in TWIHS\_ACR.

For a combined transfer with PEC, only the NPEC bit in TWIHS\_ACR must be set as the PEC byte is sent once at the end of the frame.

See section [Slave Read/Write Flowcharts](#) for detailed flowcharts.

### 46.9.5.7 TWI Asynchronous and Partial Wakeup (SleepWalking)

The TWI module includes an asynchronous start condition detector, it is capable of waking the device up from a Sleep mode upon an address match (and optionally an additional data match), including Sleep modes where the TWI peripheral clock is stopped.

The FLEX\_TWI\_RHR register must be read prior to enable the asynchronous and partial wakeup.

After detecting the START condition on the bus, the TWI will stretch TWCK until the TWI peripheral clock has started. The time required for starting the TWI peripheral depends on which Sleep mode the device is in. After the TWI peripheral clock has started, the TWI releases its TWCK stretching and receives one byte of data (slave address) on the bus. At this time, only a limited part of the device, including the TWI module, receives a clock, thus saving power. If the address phase causes a TWIS address match (and optionally if the first data byte causes data match as well), the entire device is wakened and normal TWI address matching actions are performed. Normal TWI transfer then follows. If the TWI module is not addressed (or if the optional data match fails), the TWI peripheral clock is automatically stopped and the device returns to its original Sleep mode.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

The TWI module has the capability to match on more than one address. The FLEX\_TWI\_SMR.SADR1EN/SADR2EN/SADR3EN bits enable address matching on additional addresses which can be configured through the FLEX\_TWI\_SWMR.SADR1/SADR2/SADR3 fields. The SleepWalking matching process can be extended to the first received data byte if the FLEX\_TWI\_SMR.DATAMEN bit is set. In that case, a complete matching includes address matching and first received data matching. The FLEX\_TWI\_SWMR.DATAM field can be used to configure the data to match on the first received byte.

When the system is in Active mode and the TWI enters asynchronous partial Wakeup mode, the flag SVACC must be programmed as the unique source of the TWI interrupt and the data match comparison must be disabled.

When the system exits Wait mode as the result of a matching condition, the SVACC flag is used to determine if the TWI is the source of the exit from Wait mode.

**Figure 46-120. Address Match and Data Matching Disabled**

**Figure 46-121. Address Does Not Match and Data Matching Disabled**

**Figure 46-122. Address and Data Match (Data Matching Enabled)**

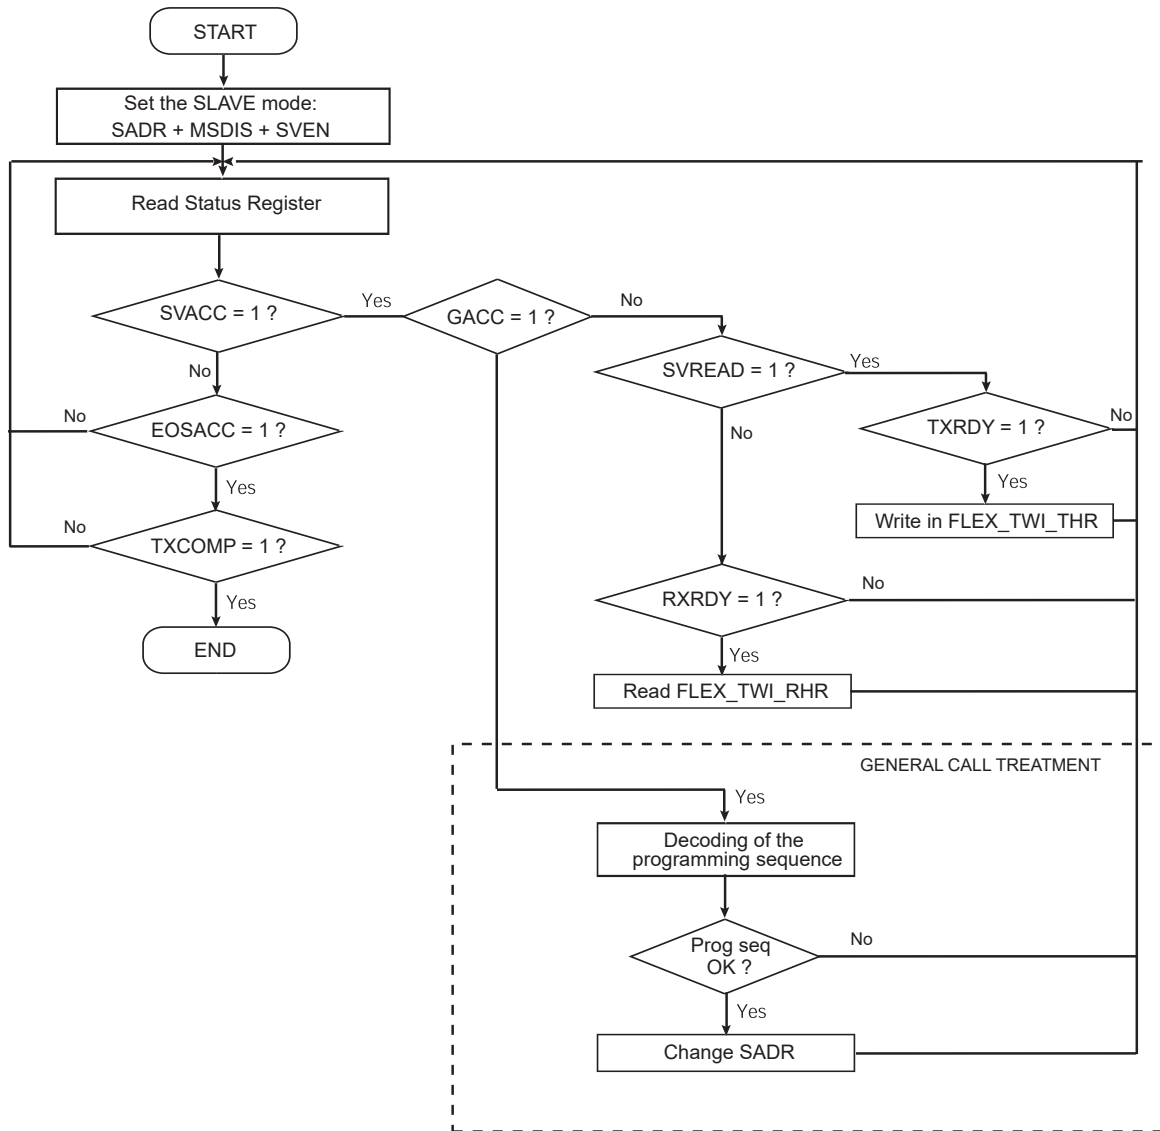

**Figure 46-123. Address Matches and Data Do Not Match (Data Matching Enabled)**

### 46.9.5.8 Slave Read/Write Flowcharts

The flowchart shown in the following figure gives an example of read and write operations in Slave mode. A polling or interrupt method can be used to check the status bits. The interrupt method requires that the Interrupt Enable Register (FLEX\_TWI\_IER) be configured first.

**Figure 46-124. Read/Write in Slave Mode**

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

**Figure 46-125. Read/Write in Slave Mode with SMBus PEC**

**Figure 46-126. Read/Write in Slave Mode with SMBus PEC and Alternative Command Mode**

### 46.9.6 TWI FIFOs

#### 46.9.6.1 Overview

The TWI includes two FIFOs which can be enabled/disabled using FLEX\_TWI\_CR.FIFOEN/FIFODIS. Both Master and Slave modes must be disabled before enabling or disabling the FIFOs (FLEX\_TWI\_CR.MSDIS/SVDIS).

Writing FLEX\_TWI\_CR.FIFOEN to '1' enables a 16-data Transmit FIFO and a 16-data Receive FIFO.

It is possible to write or to read single or multiple data in the same access to FLEX\_TWI\_THR/RHR, depending on FLEX\_TWI\_FMR.TXRDYM/RXRDYM settings.

**Figure 46-127. FIFOs Block Diagram**

#### 46.9.6.2 Sending Data with FIFO Enabled

When the Transmit FIFO is enabled, write access to FLEX\_TWI\_THR loads the Transmit FIFO.

The Transmit FIFO level is provided in FLEX\_TWI\_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor FLEX\_TWI\_SR.TXRDY and the data can be successively written in FLEX\_TWI\_THR.

If the FIFO cannot accept the data due to insufficient space, wait for the TXRDY flag to be set before writing the data in FLEX\_TWI\_THR.

When the space in the FIFO allows only a portion of the data to be written, the TXRDY flag must be monitored before writing the remaining data.

See figures [Sending Data with FIFO Enabled in Master Mode](#) and [Sending/Receiving Data with FIFO Enabled in Slave Mode](#).

**Figure 46-128. Sending Data with FIFO Enabled in Master Mode**

### 46.9.6.3 Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, FLEX\_TWI\_RHR access reads the FIFO.

When data are present in the Receive FIFO (RXRDY flag set to '1'), the exact number of data can be checked with FLEX\_TWI\_FLR.RXFL. All the data can be read successively in FLEX\_TWI\_RHR without checking the FLEX\_TWI\_SR.RXRDY flag between each access.

See figures [Receiving Data with FIFO Enabled in Master Mode](#) and [Sending/Receiving Data with FIFO Enabled in Slave Mode](#).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

**Figure 46-129. Receiving Data with FIFO Enabled in Master Mode**

#### 46.9.6.4 Sending/Receiving with FIFO Enabled in Slave Mode

See sections [Sending Data with FIFO Enabled](#) and [Receiving Data with FIFO Enabled](#) for details.

**Figure 46-130. Sending/Receiving Data with FIFO Enabled in Slave Mode**

#### 46.9.6.5 Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using FLEX\_TWI\_CR.TXFCLR/RXFCLR.

#### 46.9.6.6 TXRDY and RXRDY Behavior

FLEX\_TWI\_SR.TXRDY/RXRDY flags display a specific behavior when FIFOs are enabled.

TXRDY indicates if a data can be written in the Transmit FIFO. Thus the TXRDY flag is set as long as the Transmit FIFO can accept new data. See figure [TXRDY Behavior when TXRDYM = 0 in Master mode](#).

RXRDY indicates if an unread data is present in the Receive FIFO. Thus the RXRDY flag is set as soon as one unread data is in the Receive FIFO. Refer to figure [RXRDY Behavior when RXRDYM = 0 in Master and Slave modes](#).

TXRDY and RXRDY behavior can be modified using the TXRDYM and RXRDYM fields in the TWI FIFO Mode Register (FLEX\_TWI\_FMR) to reduce the number of accesses to FLEX\_TWI\_THR/RHR.

As an example, in Master mode, the Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0.

See TWI FIFO Mode Register for the FIFO configuration.

**Figure 46-131. TXRDY Behavior when TXRDYM = 0 in Master Mode**

**Figure 46-132. RXRDY Behavior when RXRDYM = 0 in Master and Slave Modes**

**Figure 46-133. TXRDY Behavior when TXRDYM = 0 in Slave Mode**

### 46.9.6.7 TWI Single Data Mode

In Single Data mode, only one data is written every time FLEX\_TWI\_THR is accessed, and only one data is read every time FLEX\_TWI\_RHR is accessed.

When FLEX\_TWI\_FMR.TXRDYM = 0, the Transmit FIFO operates in Single Data mode.

When FLEX\_TWI\_FMR.RXRDM = 0, the Receive FIFO operates in Single Data mode.

See sections [TWI Transmit Holding Register](#) and [TWI Receive Holding Register](#).

### 46.9.6.8 TWI Multiple Data Mode

Multiple Data mode minimizes the number of accesses by concatenating the data to send/read in one access.

When FLEX\_TWI\_FMR.TXRDYM > 0, the Transmit FIFO operates in Multiple Data mode.

When FLEX\_TWI\_FMR.RXRDM > 0, the Receive FIFO operates in Multiple Data mode.

In Multiple Data mode, it is possible to write/read up to four data in one FLEX\_TWI\_THR/ FLEX\_TWI\_RHR register access.

The number of data to write/read is defined by the size of the register access. If the access is a byte-size register access, only one data is written/read. If the access is a halfword size register access, then up to two data are read and only one data is written. Lastly, if the access is a wordsize register access, then up to four data are read and up to two data are written.

Written/Read data are always right-aligned, as described in sections [TWI Receive Holding Register \(FIFO Enabled\)](#) and [TWI Transmit Holding Register \(FIFO Enabled\)](#).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six FLEX\_TWI\_THR-byte write accesses
- three FLEX\_TWI\_THR-halfword write accesses
- one FLEX\_TWI\_THR-word write access and one FLEX\_TWI\_THR halfword write access

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six FLEX\_TWI\_RHR-byte read accesses
- three FLEX\_TWI\_RHR-halfword read accesses
- one FLEX\_TWI\_RHR-word read access and one FLEX\_TWI\_RHR-halfword read access

#### **46.9.6.8.1 TXRDY and RXRDY Configuration**

In Multiple Data mode, it is possible to write one or more data in the same FLEX\_TWI\_THR/FLEX\_TWI\_RHR access. The TXRDY flag indicates if one or more data can be written in the FIFO depending on the configuration of FLEX\_TWI\_FMR.TXRDYM/RXRDYM.

As an example, if two data are written each time in FLEX\_TWI\_THR, it is useful to configure the TXRDYM field to the value '1' so that the TXRDY flag is at '1' only when at least two data can be written in the Transmit FIFO.

In the same way, if four data are read each time in FLEX\_TWI\_RHR, it is useful to configure the RXRDYM field to the value '2' so that the RXRDY flag is at '1' only when at least four unread data are in the Receive FIFO.

#### **46.9.6.8.2 DMAC**

When FIFOs operate in Multiple Data mode, the DMAC transfer type must be configured in byte, halfword or word depending on the FLEX\_TWI\_FMR.TXRDYM/RXRDYM settings.

#### **46.9.6.9 Transmit FIFO Lock**

If a frame is terminated early due to a not-acknowledge error (NACK flag), SMBus timeout error (TOUT flag) or master code acknowledge error (MACK flag), a lock is set on the Transmit FIFO preventing any new frame from being sent until it is cleared. This allows clearing the FIFO if needed, resetting DMAC channels, etc., without any risk.

FLEX\_TWI\_SR.LOCK is used to check the state of the Transmit FIFO lock.

The Transmit FIFO lock can be cleared by setting FLEX\_TWI\_CR.TXFLCLR to '1'.

#### **46.9.6.10 FIFO Pointer Error**

A FIFO overflow is reported in FLEX\_TWI\_FSR.

If the Transmit FIFO is full and a write access is performed on FLEX\_TWI\_THR, it generates a Transmit FIFO pointer error and sets FLEX\_TWI\_FSR.TXFPTEF.

In Multiple Data mode, if the number of data written in FLEX\_TWI\_THR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO pointer error is generated and FLEX\_TWI\_FSR.TXFPTEF is set.

A FIFO underflow is reported in FLEX\_TWI\_FSR.

In Multiple Data mode, if the number of data read in FLEX\_TWI\_RHR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO pointer error is generated and FLEX\_TWI\_FSR.RXFPTEF is set.

No pointer error occurs if the FIFO state/level is checked before writing/reading in FLEX\_TWI\_THR/FLEX\_TWI\_RHR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When a pointer error occurs, other FIFO flags may not behave as expected; their states should be ignored.

If a Transmit or Receive pointer error occurs, a software reset must be performed using FLEX\_TWI\_CR.SWRST. Note that issuing a software while transmitting might leave a slave in an unknown state holding the TWD line. In such case, a Bus Clear Command will allow to make the slave release the TWD line (the first frame sent afterwards might not be received properly by the slave).

#### **46.9.6.11 FIFO Thresholds**

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using the field FLEX\_TWI\_FMR.TXFTHRES. Each time the Transmit FIFO level goes from 'above threshold' to 'equal to or below threshold', the flag FLEX\_TWI\_FESR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field FLEX\_TWI\_FMR.RXFTHRES. Each time the Receive FIFO level goes from 'below threshold' to 'equal to or above threshold', the flag FLEX\_TWI\_FESR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF and RXFTHF flags can be configured to generate an interrupt using FLEX\_TWI\_FIER and FLEX\_TWI\_FIDR.

#### 46.9.6.12 FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through FLEX\_TWI\_FIER and FLEX\_TWI\_FIDR.

FIFO flags state can be read in FLEX\_TWI\_FSR. They are cleared when FLEX\_TWI\_FSR is read.

#### 46.9.7 TWI Comparison Function on Received Character

The comparison function differs if the asynchronous partial wakeup (Sleepwalking) is enabled or not.

If asynchronous partial wakeup is disabled (refer to the section "Power Management Controller" (PMC)), the TWI has the capability to extend the address matching on up to three slave addresses. The FLEX\_TWI\_SMR.SADR1EN/SADR2EN/SADR3EN bits enable address matching on additional addresses which can be configured through the FLEX\_TWI\_SWMR.SADR1/SADR2/SADR3 fields. The DATAMEN bit has no effect.

The SVACC bit is set when there is a comparison match with the received slave address.

#### 46.9.8 TWI Register Write Protection

The FLEXCOM operating mode (FLEX\_MR.OPMODE) must be set to FLEX\_MR\_OPMODE\_TWI to enable access to the write protection registers.

To prevent any single software error from corrupting TWI behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the TWI Write Protection Mode Register (FLEX\_TWI\_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the TWI Write Protection Status Register (FLEX\_TWI\_WPSR) is set and the Write Protection Violation Source (WPVSR) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading FLEX\_TWI\_WPSR.

The following register(s) can be write-protected when WPEN is set:

- TWI Slave Mode Register
- TWI Clock Waveform Generator Register
- TWI SMBus Timing Register
- TWI SleepWalking Matching Register
- TWI FIFO Mode Register

The following register(s) can be write-protected when WPITEN is set:

- TWI Interrupt Enable Register

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.1 FLEXCOM Mode Register

**Name:** FLEX\_MR  
**Offset:** 0x000  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 1:0 – OPMODE[1:0] FLEXCOM Operating Mode

Value	Name	Description
0	NO_COM	No communication
1	USART	All UART-related protocols are selected (RS232, RS485, IrDA, ISO7816, LIN,) SPI/TWI-related registers are not accessible and have no impact on IOs.
2	SPI	SPI operating mode is selected. USART/TWI related registers are not accessible and have no impact on IOs.
3	TWI	All TWI-related protocols are selected (TWI, SMBus). USART/SPI-related registers are not accessible and have no impact on IOs.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.2 FLEXCOM Receive Holding Register

**Name:** FLEX\_RHR  
**Offset:** 0x010  
**Reset:** 0x00000000  
**Property:** Read-only

**Bits 15:0 – TXDATA[15:0]** Transmit Data

This register is a mirror of:

- USART Transmit Holding Register (FLEX\_US\_THR) if FLEX\_MR.OPMODE field equals 1
- SPI Transmit Data Register (FLEX\_SPI\_TDR) if FLEX\_MR.OPMODE field equals 2
- TWI Transmit Holding Register (FLEX\_TWI\_THR) if FLEX\_MR.OPMODE field equals 3

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.4 USART Control Register

**Name:** FLEX\_US\_CR  
**Offset:** 0x200  
**Reset:** –  
**Property:** Write-only

For SPI control, see [USART Control Register \(SPI\\_MODE\)](#).

	Bit	31	30	29	28	27	26	25	24
		FIFODIS	FIFOEN		REQCLR		TXFLCLR	RXFCLR	TXFCLR
Access		W	W		W		W	W	W
Reset		–	–		–		–	–	–
	Bit	23	22	21	20	19	18	17	16
				LINWKUP	LINABT	RTSDIS	RTSEN		
Access				W	W	W	W		
Reset				–	–	–	–		
	Bit	15	14	13	12	11	10	9	8
		RETTO	RSTNACK	RSTIT	SENDA	STTTO	STPBRK	STTBRK	RSTSTA
Access		W	W	W	W	W	W	W	W
Reset		–	–	–	–	–	–	–	–
	Bit	7	6	5	4	3	2	1	0
		TXDIS	TXEN	RXDIS	RXEN	RSTTX	RSTRX		
Access		W	W	W	W	W	W		
Reset		–	–	–	–	–	–		

#### Bit 31 – FIFODIS FIFO Disable

Value	Description
0	No effect.
1	Disables the Transmit and Receive FIFOs.

#### Bit 30 – FIFOEN FIFO Enable

Value	Description
0	No effect.
1	Enables the Transmit and Receive FIFOs.

#### Bit 28 – REQCLR Request to Clear the Comparison Trigger

#### Bit 26 – TXFLCLR Transmit FIFO Lock CLEAR

Value	Description
0	No effect.
1	Clears the Transmit FIFO Lock.

#### Bit 25 – RXFCLR Receive FIFO Clear

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
0	No effect.
1	Empties the Receive FIFO.

### Bit 24 – TXFCLR Transmit FIFO Clear

Value	Description
0	No effect.
1	Empties the Transmit FIFO.

### Bit 21 – LINWKUP Send LIN Wakeup Signal

Value	Description
0	No effect:
1	Sends a wakeup signal on the LIN bus.

### Bit 20 – LINABT Abort LIN Transmission

Value	Description
0	No effect.
1	Aborts the current LIN transmission.

### Bit 19 – RTSDIS Request to Send Disable

Value	Description
0	No effect.
1	Drives the RTS pin to 0 if FLEX_US_MR.USART_MODE field = 2, else drives the RTS pin to 1 if FLEX_US_MR.USART_MODE field = 0.

### Bit 18 – RTSEN Request to Send Enable

Value	Description
0	No effect.
1	Drives the RTS pin to 1 if FLEX_US_MR.USART_MODE field = 2, else drives the RTS pin to 0 if FLEX_US_MR.USART_MODE field = 0.

### Bit 15 – RETTO Start Timeout Immediately

Value	Description
0	No effect
1	Immediately restarts timeout period.

### Bit 14 – RSTNACK Reset Non Acknowledge

Value	Description
0	No effect
1	Resets FLEX_US_CSR.NACK.

### Bit 13 – RSTIT Reset Iterations

Value	Description
0	No effect.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
1	Resets FLEX_US_CSR.ITER. No effect if the ISO7816 is not enabled.

### Bit 12 – SENDA Send Address

Value	Description
0	No effect.
1	In Multidrop mode only, the next character written to FLEX_US_THR is sent with the address bit set.

### Bit 11 – STTTO Clear TIMEOUT Flag and Start Timeout After Next Character Received

Value	Description
0	No effect.
1	Starts waiting for a character before clocking the timeout counter. Immediately disables a timeout period in progress. Resets the FLEX_US_CSR.TIMEOUT status bit.

### Bit 10 – STPBRK Stop Break

Value	Description
0	No effect.
1	Stops transmission of the break after a minimum of one character length and transmits a high level during 12-bit periods. No effect if no break is being transmitted.

### Bit 9 – STTBRK Start Break

Value	Description
0	No effect.
1	Starts transmission of a break after the characters present in FLEX_US_THR and the Transmit Shift Register have been transmitted. No effect if a break is already being transmitted.

### Bit 8 – RSTSTA Reset Status Bits

Value	Description
0	No effect.
1	Resets the PARE, FRAME, OVRE, MANE, LINBE, LINISFE, LINIPE, LINC, LINSNRE, LINSTE, LINHTE, LINID, LINTC, LINBK, CMP and RXBRK in FLEX_US_CSR status bits, as well as the TXFEF, TXFFF, TXFTHF, RXFEF, RXFFF, RXFTHF, TXFPTEF, RXFPTEF in FLEX_US_FESR status bits.

### Bit 7 – TXDIS Transmitter Disable

Value	Description
0	No effect.
1	Disables the transmitter.

### Bit 6 – TXEN Transmitter Enable

Value	Description
0	No effect.
1	Enables the transmitter if TXDIS is 0.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

---

### Bit 5 – RXDIS Receiver Disable

Value	Description
0	No effect.
1	Disables the receiver.

### Bit 4 – RXEN Receiver Enable

Value	Description
0	No effect.
1	Enables the receiver, if RXDIS is 0.

### Bit 3 – RSTTX Reset Transmitter

Value	Description
0	No effect.
1	Resets the transmitter.

### Bit 2 – RSTRX Reset Receiver

Value	Description
0	No effect.
1	Resets the receiver.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.5 USART Control Register (SPI\_MODE)

**Name:** FLEX\_US\_CR (SPI\_MODE)  
**Offset:** 0x200  
**Reset:** –  
**Property:** Write-only

This configuration is relevant only if USART\_MODE = 0xE or 0xF in the [USART Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
					RCS	FCS		
Access					W	W		
Reset					–	–		
Bit	15	14	13	12	11	10	9	8
								RSTSTA
Access								W
Reset								–
Bit	7	6	5	4	3	2	1	0
	TXDIS	TXEN	RXDIS	RXEN	RSTTX	RSTRX		
Access	W	W	W	W	W	W		
Reset	–	–	–	–	–	–		

#### Bit 19 – RCS Release SPI Chip Select

Applicable if USART operates in SPI Master mode (USART\_MODE = 0xE):

Value	Description
0	No effect.
1	Releases the Slave Select Line NSS (RTS pin).

#### Bit 18 – FCS Force SPI Chip Select

Applicable if USART operates in SPI Master mode (USART\_MODE = 0xE):

Value	Description
0	No effect.
1	Forces the Slave Select Line NSS (RTS pin) to 0, even if USART is not transmitting, in order to address SPI slave devices supporting the CSAAT mode (Chip Select Active After Transfer).

#### Bit 8 – RSTSTA Reset Status Bits

Value	Description
0	No effect.
1	Resets the FLEX_US_CSR.OVRE/UNRE status bits.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 7 – TXDIS Transmitter Disable

Value	Description
0	No effect.
1	Disables the transmitter.

### Bit 6 – TXEN Transmitter Enable

Value	Description
0	No effect.
1	Enables the transmitter if TXDIS is 0.

### Bit 5 – RXDIS Receiver Disable

Value	Description
0	No effect.
1	Disables the receiver.

### Bit 4 – RXEN Receiver Enable

Value	Description
0	No effect.
1	Enables the receiver, if RXDIS is 0.

### Bit 3 – RSTTX Reset Transmitter

Value	Description
0	No effect.
1	Resets the transmitter.

### Bit 2 – RSTRX Reset Receiver

Value	Description
0	No effect.
1	Resets the receiver.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.6 USART Mode Register

**Name:** FLEX\_US\_MR  
**Offset:** 0x204  
**Reset:** –  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).  
 For SPI configuration, see section [USART Mode Register \(SPI\\_MODE\)](#).

	Bit	31	30	29	28	27	26	25	24
		ONEBIT	MODSYNC	MAN	FILTER		MAX_ITERATION[2:0]		
Access		R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset		–	–	–	–		–	–	–
	Bit	23	22	21	20	19	18	17	16
		INVDATA	VAR_SYNC	DSNACK	INACK	OVER	CLKO	MODE9	MSBF
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		–	–	–	–	–	–	–	–
	Bit	15	14	13	12	11	10	9	8
		CHMODE[1:0]		NBSTOP[1:0]			PAR[2:0]		SYNC
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		–	–	–	–	–	–	–	–
	Bit	7	6	5	4	3	2	1	0
		CHRL[1:0]		USCLKS[1:0]			USART_MODE[3:0]		
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		–	–	–	–	–	–	–	–

#### Bit 31 – ONEBIT Start Frame Delimiter Selector

Value	Description
0	Start frame delimiter is COMMAND or DATA SYNC.
1	Start frame delimiter is one bit.

#### Bit 30 – MODSYNC Manchester Synchronization Mode

Value	Description
0	The Manchester start bit is a 0 to 1 transition
1	The Manchester start bit is a 1 to 0 transition.

#### Bit 29 – MAN Manchester Encoder/Decoder Enable

Value	Description
0	Manchester encoder/decoder are disabled.
1	Manchester encoder/decoder are enabled.

#### Bit 28 – FILTER Receive Line Filter

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
0	The USART does not filter the receive line.
1	The USART filters the receive line using a three-sample filter (1/16-bit clock) (2 over 3 majority).

**Bits 26:24 – MAX\_ITERATION[2:0]** Maximum Number of Automatic Iterations

Value	Description
0–7	Defines the maximum number of iterations in mode ISO7816, protocol T = 0.

**Bit 23 – INVDATA** Inverted Data

Value	Description
0	The data field transmitted on TXD line is the same as the one written in FLEX_US_THR or the content read in FLEX_US_RHR is the same as RXD line. Normal mode of operation.
1	The data field transmitted on TXD line is inverted (voltage polarity only) compared to the value written in FLEX_US_THR or the content read in FLEX_US_RHR is inverted compared to what is received on RXD line (or ISO7816 IO line). Inverted mode of operation, useful for contactless card application. To be used with configuration bit MSBF.

**Bit 22 – VAR\_SYNC** Variable Synchronization of Command/Data Sync Start Frame Delimiter

Value	Description
0	User defined configuration of command or data sync field depending on MODSYNC value.
1	The sync field is updated when a character is written into FLEX_US_THR.

**Bit 21 – DSNACK** Disable Successive NACK

The MAX\_ITERATION field must be cleared if DSNACK is cleared.

Value	Description
0	NACK is sent on the ISO line as soon as a parity error occurs in the received character (unless INACK is set).
1	Successive parity errors are counted up to the value specified in the MAX_ITERATION field. These parity errors generate a NACK on the ISO line. As soon as this value is reached, no additional NACK is sent on the ISO line. The flag ITER is asserted.

**Bit 20 – INACK** Inhibit Non Acknowledge

Value	Description
0	The NACK is generated.
1	The NACK is not generated.

**Bit 19 – OVER** Oversampling Mode

Value	Description
0	16x Oversampling.
1	8x Oversampling.

**Bit 18 – CLKO** Clock Output Select

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
0	The USART does not drive the SCK pin (Synchronous Slave mode or Asynchronous mode with external baud rate clock source).
1	The USART drives the SCK pin if USCLKS does not select the external clock SCK (USART Synchronous Master mode).

### Bit 17 – MODE9 9-bit Character Length

Value	Description
0	CHRL defines character length.
1	9-bit character length.

### Bit 16 – MSBF Bit Order

Value	Description
0	Least significant bit is sent/received first.
1	Most significant bit is sent/received first.

### Bits 15:14 – CHMODE[1:0] Channel Mode

Value	Name	Description
0	NORMAL	Normal mode
1	AUTOMATIC	Automatic Echo. Receiver input is connected to the TXD pin.
2	LOCAL_LOOPBACK	Local Loopback. Transmitter output is connected to the Receiver Input.
3	REMOTE_LOOPBACK	Remote Loopback. RXD pin is internally connected to the TXD pin.

### Bits 13:12 – NBSTOP[1:0] Number of Stop Bits

Value	Name	Description
0	1_BIT	1 stop bit
1	1_5_BIT	1.5 stop bit (SYNC = 0) or reserved (SYNC = 1)
2	2_BIT	2 stop bits

### Bits 11:9 – PAR[2:0] Parity Type

Value	Name	Description
0	EVEN	Even parity
1	ODD	Odd parity
2	SPACE	Parity forced to 0 (Space)
3	MARK	Parity forced to 1 (Mark)
4	NO	No parity
6	MULTIDROP	Multidrop mode

### Bit 8 – SYNC Synchronous Mode Select

Value	Description
0	USART operates in Asynchronous mode (UART).
1	USART operates in Synchronous mode.

### Bits 7:6 – CHRL[1:0] Character Length

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Name	Description
0	5_BIT	Character length is 5 bits
1	6_BIT	Character length is 6 bits
2	7_BIT	Character length is 7 bits
3	8_BIT	Character length is 8 bits

### Bits 5:4 – USCLKS[1:0] Clock Selection

Value	Name	Description
0	MCK	Peripheral clock is selected
1	DIV	Peripheral clock divided (DIV = 8) is selected
2	GCLK	PMC generic clock is selected. If the SCK pin is driven (CLKO = 1), the CD field must be greater than 1.
3	SCK	External pin SCK is selected

### Bits 3:0 – USART\_MODE[3:0] USART Mode of Operation

Value	Name	Description
0x0	NORMAL	Normal mode
0x1	RS485	RS485
0x2	HW_HANDSHAKING	Hardware handshaking
0x3	MODEM	Modem
0x4	IS07816_T_0	IS07816 Protocol: T = 0
0x6	IS07816_T_1	IS07816 Protocol: T = 1
0x8	IRDA	IrDA
0x9	LON	LON
0xA	LIN_MASTER	LIN Master mode
0xB	LIN_SLAVE	LIN Slave mode
0xC	DATA16BIT_MASTER	16-bit data master
0xD	DATA16BIT_SLAVE	16-bit data slave
0xE	SPI_MASTER	SPI Master mode (CLKO must be written to 1 and USCLKS = 0, 1 or 2)
0xF	SPI_SLAVE	SPI Slave mode

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.7 USART Mode Register (SPI\_MODE)

**Name:** FLEX\_US\_MR (SPI\_MODE)  
**Offset:** 0x204  
**Reset:** –  
**Property:** Read/Write

This configuration is relevant only if USART\_MODE = 0xE or 0xF in the [USART Mode Register](#).

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
				WRDBT					
Access				R/W				R/W	
Reset				–				–	
Bit	15	14	13	12	11	10	9	8	
	CHMODE[1:0]							CPHA	
Access	R/W	R/W						R/W	
Reset	0	–						–	
Bit	7	6	5	4	3	2	1	0	
	CHRL[1:0]		USCLKS[1:0]		USART_MODE[3:0]				
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	–	0	–	0	0	0	–	

#### Bit 20 – WRDBT Wait Read Data Before Transfer

Value	Description
0	The character transmission starts as soon as a character is written into FLEX_US_THR (assuming TXRDY was set).
1	The character transmission starts when a character is written and only if RXRDY flag is cleared (Receive Holding Register has been read).

#### Bit 16 – CPOL SPI Clock Polarity

CPOL is used to determine the inactive state value of the serial clock (SPCK). It is used with CPHA to produce the required clock/data relationship between master and slave devices.

Applicable if USART operates in SPI mode (slave or master, USART\_MODE = 0xE or 0xF):

Value	Description
0	The inactive state value of SPCK is logic level zero.
1	The inactive state value of SPCK is logic level one.

#### Bits 15:14 – CHMODE[1:0] Channel Mode

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Name	Description
0	NORMAL	Normal mode

### Bit 8 – CPHA SPI Clock Phase

CPHA determines which edge of SPCK causes data to change and which edge causes data to be captured. CPHA is used with CPOL to produce the required clock/data relationship between master and slave devices.

Applicable if USART operates in SPI mode (USART\_MODE = 0xE or 0xF):

Value	Description
0	Data are changed on the leading edge of SPCK and captured on the following edge of SPCK.
1	Data are captured on the leading edge of SPCK and changed on the following edge of SPCK.

### Bits 7:6 – CHRL[1:0] Character Length

Value	Name	Description
3	8_BIT	Character length is 8 bits

### Bits 5:4 – USCLKS[1:0] Clock Selection

Value	Name	Description
0	MCK	Peripheral clock is selected
1	DIV	Peripheral clock Divided (DIV= 8) is selected
2	GCLK	A PMC generic clock is selected
3	SCK	External pin SCK is selected

### Bits 3:0 – USART\_MODE[3:0] USART Mode of Operation

Value	Name	Description
0xE	SPI_MASTER	SPI master
0xF	SPI_SLAVE	SPI slave

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.8 USART Interrupt Enable Register

**Name:** FLEX\_US\_IER  
**Offset:** 0x208  
**Reset:** –  
**Property:** Write-only

For SPI-specific configurations, see [USART Interrupt Enable Register \(SPI\\_MODE\)](#).

For LIN-specific configurations, see [USART Interrupt Enable Register \(LIN\\_MODE\)](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
								MANE
Access								W
Reset								–
Bit	23	22	21	20	19	18	17	16
			CMP			CTSIC		
Access			W			W		
Reset			–			–		
Bit	15	14	13	12	11	10	9	8
			NACK			ITER	TXEMPTY	TIMEOUT
Access			W			W	W	W
Reset			–			–	–	–
Bit	7	6	5	4	3	2	1	0
	PARE	FRAME	OVRE			RXBRK	TXRDY	RXRDY
Access	W	W	W			W	W	W
Reset	–	–	–			–	–	–

**Bit 24 – MANE** Manchester Error Interrupt Enable

**Bit 22 – CMP** Comparison Interrupt Enable

**Bit 19 – CTSIC** Clear to Send Input Change Interrupt Enable

**Bit 13 – NACK** Non Acknowledge Interrupt Enable

**Bit 10 – ITER** Max number of Repetitions Reached Interrupt Enable

**Bit 9 – TXEMPTY** TXEMPTY Interrupt Enable

**Bit 8 – TIMEOUT** Timeout Interrupt Enable

**Bit 7 – PARE** Parity Error Interrupt Enable

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

---

**Bit 6 – FRAME** Framing Error Interrupt Enable

**Bit 5 – OVRE** Overrun Error Interrupt Enable

**Bit 2 – RXBRK** Receiver Break Interrupt Enable

**Bit 1 – TXRDY** TXRDY Interrupt Enable

**Bit 0 – RXRDY** RXRDY Interrupt Enable

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.9 USART Interrupt Enable Register (SPI\_MODE)

**Name:** FLEX\_US\_IER (SPI\_MODE)  
**Offset:** 0x208  
**Reset:** –  
**Property:** Write-only

This configuration is relevant only if USART\_MODE = 0xE or 0xF in the [USART Mode Register](#).

This register can only be written if the WPITEN bit is cleared in the [USART Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
	CMP				NSSE				
Access	W				W				
Reset	–				–				
Bit	15	14	13	12	11	10	9	8	
							UNRE	TXEMPTY	
Access							W	W	
Reset							–	–	
Bit	7	6	5	4	3	2	1	0	
			OVRE					TXRDY	RXRDY
Access			W					W	W
Reset			–					–	–

**Bit 22 – CMP** Comparison Interrupt Enable

**Bit 19 – NSSE** NSS Line (Driving CTS Pin) Rising or Falling Edge Event

**Bit 10 – UNRE** SPI Underrun Error Interrupt Enable

**Bit 9 – TXEMPTY** TXEMPTY Interrupt Enable

**Bit 5 – OVRE** Overrun Error Interrupt Enable

**Bit 1 – TXRDY** TXRDY Interrupt Enable

**Bit 0 – RXRDY** RXRDY Interrupt Enable

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.10 USART Interrupt Enable Register (LIN\_MODE)

**Name:** FLEX\_US\_IER (LIN\_MODE)  
**Offset:** 0x208  
**Reset:** –  
**Property:** Write-only

This configuration is relevant only if USART\_MODE = 0xA or 0xB in the [USART Mode Register](#).

This register can only be written if the WPITEN bit is cleared in the [USART Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt.

	Bit	31	30	29	28	27	26	25	24
		LINHTE	LINSTE	LINSNRE	LINCE	LINIPE	LINISFE	LINBE	
Access		W	W	W	W	W	W	W	
Reset		–	–	–	–	–	–	–

---

**Bit 6 – FRAME** Framing Error Interrupt Disable

**Bit 5 – OVRE** Overrun Error Interrupt Enable

**Bit 2 – RXBRK** Receiver Break Interrupt Disable

**Bit 1 – TXRDY** TXRDY Interrupt Disable

**Bit 0 – RXRDY** RXRDY Interrupt Disable

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.12 USART Interrupt Disable Register (SPI\_MODE)

**Name:** FLEX\_US\_IDR (SPI\_MODE)  
**Offset:** 0x20C  
**Reset:** –  
**Property:** Write-only

This configuration is relevant only if USART\_MODE = 0xE or 0xF in the [USART Mode Register](#).

This register can only be written if the WPITEN bit is cleared in the [USART Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
	CMP				NSSE				
Access	W				W				
Reset	–				–				
Bit	15	14	13	12	11	10	9	8	
							UNRE	TXEMPTY	
Access							W	W	
Reset							–	–	
Bit	7	6	5	4	3	2	1	0	
			OVRE					TXRDY	RXRDY
Access			W					W	W
Reset			–					–	–

**Bit 22 – CMP** Comparison Interrupt Disable

**Bit 19 – NSSE** NSS Line (Driving CTS Pin) Rising or Falling Edge Event

**Bit 10 – UNRE** SPI Underrun Error Interrupt Disable

**Bit 9 – TXEMPTY** TXEMPTY Interrupt Disable

**Bit 5 – OVRE** Overrun Error Interrupt Disable

**Bit 1 – TXRDY** TXRDY Interrupt Disable

**Bit 0 – RXRDY** RXRDY Interrupt Disable

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.13 USART Interrupt Disable Register (LIN\_MODE)

**Name:** FLEX\_US\_IDR (LIN\_MODE)  
**Offset:** 0x20C  
**Reset:** –  
**Property:** Write-only

This configuration is relevant only if USART\_MODE = 0xA or 0xB in the [USART Mode Register](#).

This register can only be written if the WPITEN bit is cleared in the [USART Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Disables the corresponding interrupt.

	Bit	31	30	29	28	27	26	25	24
		LINHTE	LINSTE	LINSNRE	LINCE	LINIPE	LINISFE	LINBE	
Access		W	W	W	W	W	W	W

### 46.10.17 USART Channel Status Register

**Name:** FLEX\_US\_CSR  
**Offset:** 0x214  
**Reset:** 0x00000000  
**Property:** Read-only

For SPI-specific configurations, see [USART Channel Status Register \(SPI\\_MODE\)](#).

For LIN-specific configurations, see [USART Channel Status Register \(LIN\\_MODE\)](#).

Bit	31	30	29	28	27	26	25	24
								MANE
Access								R
Reset								–
Bit	23	22	21	20	19	18	17	16
	CTS	CMP			CTSIC			
Access	R	R			R			
Reset	–	–			–			
Bit	15	14	13	12	11	10	9	8
			NACK			ITER	TXEMPTY	TIMEOUT
Access			R			R	R	R
Reset			–			–	–	–
Bit	7	6	5	4	3	2	1	0
	PARE	FRAME	OVRE			RXBRK	TXRDY	RXRDY
Access	R	R	R			R	R	R
Reset	–	–	–			–	–	–

#### Bit 24 – MANE Manchester Error

Value	Description
0	No Manchester error has been detected since the last RSTSTA command was issued.
1	At least one Manchester error has been detected since the last RSTSTA command was issued.

#### Bit 23 – CTS Image of CTS Input

Value	Description
0	CTS input is driven low.
1	CTS input is driven high.

#### Bit 22 – CMP Comparison Status

Value	Description
0	No received character matched the comparison criteria programmed in VAL1, VAL2 fields and CMPPAR bit in since the last RSTSTA command was issued.
1	A received character matched the comparison criteria since the last RSTSTA command was issued.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 19 – CTSIC Clear to Send Input Change Flag

Value	Description
0	No input change has been detected on the CTS pin since the last read of FLEX_US_CSR.
1	At least one input change has been detected on the CTS pin since the last read of FLEX_US_CSR.

### Bit 13 – NACK Non Acknowledge Interrupt

Value	Description
0	Non acknowledge has not been detected since the last RSTNACK.
1	At least one non acknowledge has been detected since the last RSTNACK.

### Bit 10 – ITER Max Number of Repetitions Reached

Value	Description
0	Maximum number of repetitions has not been reached since the last RSTIT command was issued.
1	Maximum number of repetitions has been reached since the last RSTIT command was issued.

### Bit 9 – TXEMPTY Transmitter Empty (cleared by writing FLEX\_US\_THR)

Value	Description
0	There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled.
1	There are no characters in FLEX_US_THR, nor in the Transmit Shift Register.

### Bit 8 – TIMEOUT Receiver Timeout

Value	Description
0	There has not been a timeout since the last Start Timeout command (FLEX_US_CR.STTTO) or the Timeout Register is 0.
1	There has been a timeout since the last Start Timeout command (FLEX_US_CR.STTTO).

### Bit 7 – PARE Parity Error

Value	Description
0	No parity error has been detected since the last RSTSTA command was issued.
1	At least one parity error has been detected since the last RSTSTA command was issued.

### Bit 6 – FRAME Framing Error

Value	Description
0	No stop bit has been detected low since the last RSTSTA command was issued.
1	At least one stop bit has been detected low since the last RSTSTA command was issued.

### Bit 5 – OVRE Overrun Error

Value	Description
0	No overrun error has occurred since the last RSTSTA command was issued.
1	At least one overrun error has occurred since the last RSTSTA command was issued.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

---

### Bit 2 – RXBRK Break Received/End of Break

Value	Description
0	No break received or end of break detected since the last RSTSTA command was issued.
1	Break received or end of break detected since the last RSTSTA command was issued.

### Bit 1 – TXRDY Transmitter Ready (cleared by writing FLEX\_US\_THR)

When FIFOs are disabled:

0: A character in FLEX\_US\_THR is waiting to be transferred to the Transmit Shift Register, or an STTBRK command has been requested, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1.

1: There is no character in FLEX\_US\_THR.

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

TXRDY behavior with FIFO enabled is illustrated in [46.7.11.5 TXEMPTY, TXRDY and RXRDY Behavior](#).

### Bit 0 – RXRDY Receiver Ready (cleared by reading FLEX\_US\_RHR)

When FIFOs are disabled:

0: No complete character has been received since the last read of FLEX\_US\_RHR or the receiver is disabled. If characters were received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled.

1: At least one complete character has been received and FLEX\_US\_RHR has not yet been read.

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read

1: At least one unread data is in the Receive FIFO

RXRDY behavior with FIFO enabled is illustrated in [46.7.11.5 TXEMPTY, TXRDY and RXRDY Behavior](#).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.18 USART Channel Status Register (SPI\_MODE)

**Name:** FLEX\_US\_CSR (SPI\_MODE)  
**Offset:** 0x214  
**Reset:** –  
**Property:** Read-only

This configuration is relevant only if USART\_MODE = 0xE or 0xF in the [USART Mode Register](#).

Bit	31	30	29	28	27	26	25	24	
	[Greyed out bits 31-24]								
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
	NSS	CMP			NSSE				
Access	R	R			R

Access						R	R		
Reset						–	–		
Bit	7	6	5	4	3	2	1	0	
			OVRE					TXRDY	RXRDY
Access			R					R	R
Reset			–					–	–

#### Bit 23 – NSS Image of NSS Line

Value	Description
0	NSS line is driven low (if NSSE = 1, falling edge occurred on NSS line).
1	NSS line is driven high (if NSSE = 1, rising edge occurred on NSS line).

#### Bit 22 – CMP Comparison Match

Value	Description
0	No received character matched the comparison criteria programmed in VAL1, VAL2 fields and CMPPAR bit in FLEX_US_CMPPR since the last RSTSTA command was issued.
1	A received character matched the comparison criteria since the last RSTSTA command was issued.

#### Bit 19 – NSSE NSS Line (Driving CTS Pin) Rising or Falling Edge Event (cleared on read)

Value	Description
0	No NSS line event has been detected since the last read of FLEX_US_CSR.
1	A rising or falling edge has been detected on the NSS line since the last read of FLEX_US_CSR.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 10 – UNRE Underrun Error

Value	Description
0	No SPI underrun error has occurred since the last RSTSTA command was issued.
1	At least one SPI underrun error has occurred since the last RSTSTA command was issued.

### Bit 9 – TXEMPTY Transmitter Empty (cleared by writing FLEX\_US\_THR)

Value	Description
0	There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled.
1	There are no characters in FLEX_US_THR, nor in the Transmit Shift Register.

### Bit 5 – OVRE Overrun Error

Value	Description
0	No overrun error has occurred since the last RSTSTA command was issued.
1	At least one overrun error has occurred since the last RSTSTA command was issued.

### Bit 1 – TXRDY Transmitter Ready (cleared by writing FLEX\_US\_THR)

Value	Description
0	A character in FLEX_US_THR is waiting to be transferred to the Transmit Shift Register, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1.
1	There is no character in FLEX_US_THR.

### Bit 0 – RXRDY Receiver Ready (cleared by reading FLEX\_US\_RHR)

Value	Description
0	No complete character has been received since the last read of FLEX_US_RHR or the receiver is disabled. If characters were being received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled.
1	At least one complete character has been received and FLEX_US_RHR has not yet been read.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.19 USART Channel Status Register (LIN\_MODE)

**Name:** FLEX\_US\_CSR (LIN\_MODE)  
**Offset:** 0x214  
**Reset:** –  
**Property:** Read-only

This configuration is relevant only if USART\_MODE = 0xA or 0xB in the [USART Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	LINHTE	LINSTE	LINSNRE	LINCE	LINIPE	LINISFE	LINBE	
Access	R	R	R	R	R	R	R	
Reset	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	PARE	FRAME	OVRE				TXRDY	RXRDY
Access	R	R	R				R	R
Reset	–	–	–				–	–

#### Bit 31 – LINHTE LIN Header Timeout Error

Value	Description
0	No LIN header timeout error has been detected since the last RSTSTA command was issued.
1	A LIN header timeout error has been detected since the last RSTSTA command was issued.

#### Bit 30 – LINSTE LIN Synch Tolerance Error

Value	Description
0	No LIN synch tolerance error has been detected since the last RSTSTA command was issued.
1	A LIN synch tolerance error has been detected since the last RSTSTA command was issued.

#### Bit 29 – LINSNRE LIN Slave Not Responding Error

Value	Description
0	No LIN slave not responding error has been detected since the last RSTSTA command was issued.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
1	A LIN slave not responding error has been detected since the last RSTSTA command was issued.

### Bit 28 – LINC E LIN Checksum Error

Value	Description
0	No LIN checksum error has been detected since the last RSTSTA command was issued.
1	A LIN checksum error has been detected since the last RSTSTA command was issued.

### Bit 27 – LINIPE LIN Identifier Parity Error

Value	Description
0	No LIN identifier parity error has been detected since the last RSTSTA command was issued.
1	A LIN identifier parity error has been detected since the last RSTSTA command was issued.

### Bit 26 – LINISFE LIN Inconsistent Synch Field Error

Value	Description
0	No LIN inconsistent synch field error has been detected since the last RSTSTA
1	The USART is configured as a slave node and a LIN Inconsistent synch field error has been detected since the last RSTSTA command was issued.

### Bit 25 – LINBE LIN Bit Error

Value	Description
0	No bit error has been detected since the last RSTSTA command was issued.
1	A bit error has been detected since the last RSTSTA command was issued.

### Bit 23 – LINBLS LIN Bus Line Status

Value	Description
0	LIN bus line is set to 0.
1	LIN bus line is set to 1.

### Bit 15 – LINTC LIN Transfer Completed

Value	Description
0	The USART is idle or a LIN transfer is ongoing.
1	A LIN transfer has been completed since the last RSTSTA command was issued.

### Bit 14 – LINID LIN Identifier Sent or LIN Identifier Received

If USART operates in LIN Master mode (USART\_MODE = 0xA):

0: No LIN identifier has been sent since the last RSTSTA command was issued.

1: At least one LIN identifier has been sent since the last RSTSTA command was issued.

If USART operates in LIN Slave mode (USART\_MODE = 0xB):

0: No LIN identifier has been received since the last RSTSTA command was issued.

1: At least one LIN identifier has been received since the last RSTSTA.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 13 – LINBK LIN Break Sent or LIN Break Received

Applicable if USART operates in LIN Master mode (USART\_MODE = 0xA):

0: No LIN break has been sent since the last RSTSTA command was issued.

1: At least one LIN break has been sent since the last RSTSTA.

If USART operates in LIN Slave mode (USART\_MODE = 0xB):

0: No LIN break has received sent since the last RSTSTA command was issued.

1: At least one LIN break has been received since the last RSTSTA command was issued.

### Bit 9 – TXEMPTY Transmitter Empty (cleared by writing FLEX\_US\_THR)

Value	Description
0	There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled.
1	There are no characters in FLEX_US_THR, nor in the Transmit Shift Register.

### Bit 8 – TIMEOUT Receiver Timeout

Value	Description
0	There has not been a timeout since the last start timeout command (FLEX_US_CR.STTTO) or the Timeout Register is 0.
1	There has been a timeout since the last start timeout command (FLEX_US_CR.STTTO).

### Bit 7 – PARE Parity Error

Value	Description
0	No parity error has been detected since the last RSTSTA command was issued.
1	At least one parity error has been detected since the last RSTSTA command was issued.

### Bit 6 – FRAME Framing Error

Value	Description
0	No stop bit has been detected low since the last RSTSTA command was issued.
1	At least one stop bit has been detected low since the last RSTSTA command was issued.

### Bit 5 – OVRE Overrun Error

Value	Description
0	No overrun error has occurred since the last RSTSTA command was issued.
1	At least one overrun error has occurred since the last RSTSTA command was issued.

### Bit 1 – TXRDY Transmitter Ready (cleared by writing FLEX\_US\_THR)

Value	Description
0	A character in FLEX_US_THR is waiting to be transferred to the Transmit Shift Register, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1.
1	There is no character in FLEX_US_THR.

### Bit 0 – RXRDY Receiver Ready (cleared by reading FLEX\_US\_RHR)

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
0	No complete character has been received since the last read of FLEX_US_RHR or the receiver is disabled. If characters were being received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled.
1	At least one complete character has been received and FLEX_US_RHR has not yet been read.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.20 USART Receive Holding Register

**Name:** FLEX\_US\_RHR  
**Offset:** 0x218  
**Reset:** 0x00000000  
**Property:** Read-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit) and FLEX\_US\_FMR.RXRDYM = 0, see [46.7.11.6 USART Single Data Mode](#) for details.

#### Bit 15 – RXSYNH Received Sync

Value	Description
0	Last character received is a data.
1	Last character received is a command.

**Bits 8:0 – RXCHR[8:0]** Received Character  
 Last character received if RXRDY is set.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.21 USART Receive Holding Register (FIFO Multi Data)

**Name:** FLEX\_US\_RHR (FIFO\_MULTI\_DATA)  
**Offset:** 0x218  
**Reset:** 0x00000000  
**Property:** Read-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit) and FLEX\_US\_FMR.RXRDYM > 0, see [46.7.11.7 USART Multiple Data Mode](#) for details.

Bit	31	30	29	28	27	26	25	24
	RXCHR3[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

	RXCHR0[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 0:7, 8:15, 16:23, 24:31 – RXCHR<sub>x</sub>** Received Character  
 First unread character in the Receive FIFO if RXRDY is set.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.22 USART Transmit Holding Register

**Name:** FLEX\_US\_THR  
**Offset:** 0x21C  
**Reset:** –  
**Property:** Write-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit) and FLEX\_US\_FMR.TXRDY = 0, see [46.7.11.6 USART Single Data Mode](#) for details.

**Bit 15 – TXSYNH** Sync Field to be Transmitted

Value	Description
0	The next character sent is encoded as a data. Start frame delimiter is DATA SYNC.
1	The next character sent is encoded as a command. Start frame delimiter is COMMAND SYNC.

**Bits 8:0 – TXCHR[8:0]** Character to be Transmitted

The next character to be transmitted after the current character if TXRDY is not set.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.23 USART Transmit Holding Register (FIFO Multi Data)

**Name:** FLEX\_US\_THR (FIFO\_MULTI\_DATA)  
**Offset:** 0x21C  
**Reset:** –  
**Property:** Write-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit) and FLEX\_US\_FMR.TXRDY > 0, see [46.7.11.7 USART Multiple Data Mode](#) for details.

Bit	31	30	29	28	27	26	25	24
	TXCHR3[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	TXCHR2[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	TXCHR1[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	TXCHR0[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0:7, 8:15, 16:23, 24:31 – TXCHR<sub>x</sub>** Character to be Transmitted  
 Next character to be transmitted.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.24 USART Baud Rate Generator Register

**Name:** FLEX\_US\_BRGR  
**Offset:** 0x220  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
						FP[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	0
Bit	15	14	13	12	11	10	9	8
	CD[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 18:16 – FP[2:0] Fractional Part

When the value of field FP is greater than 0, the SCK (oversampling clock) generates nonconstant duty cycles. The SCK high duration is increased by “selected clock” period from time to time. The duty cycle depends on the value of the CD field.

Value	Description
0	Fractional divider is disabled.
1–7	Baud rate resolution, defined by $FP \times 1/8$ .

#### Bits 15:0 – CD[15:0] Clock Divider

CD	USART_MODE ≠ ISO7816		USART_MODE = ISO7816	
	SYNC = 0			SYNC = 1
	OVER = 0	OVER = 1		or USART_MODE = SPI (master or Slave)

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

0	Baud Rate Clock Disabled			
1 to 65535	CD = Selected Clock / (16 × Baud Rate)	CD = Selected Clock / (8 × Baud Rate)	CD = Selected Clock / Baud Rate	CD = Selected Clock / (FI_DI_RATIO × Baud Rate)

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.25 USART Receiver Timeout Register

**Name:** FLEX\_US\_RTOR  
**Offset:** 0x224  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
								TO[16:16]
Access								R/W
Reset								0
Bit	15	14	13	12	11	10	9	8
	TO[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	TO[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 16:0 – TO[16:0] Timeout Value

Value	Description
0	The receiver timeout is disabled.
1– 131071	The receiver timeout is enabled and the timeout delay is TO × bit period.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.26 USART Transmitter Timeguard Register

**Name:** FLEX\_US\_TTGR  
**Offset:** 0x228  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

#### Bits 7:0 – TG[7:0] Timeguard Value

Value	Description
0	The transmitter timeguard is disabled.
1–255	The transmitter timeguard is enabled and TG is timeguard delay / bit period.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.27 USART FI DI RATIO Register

**Name:** FLEX\_US\_FIDI  
**Offset:** 0x240  
**Reset:** 0x174  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	FI_DI_RATIO[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	1
Bit	7	6	5	4	3	2	1	0
	FI_DI_RATIO[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	1	1	1	0	1	0	0

#### Bits 15:0 – FI\_DI\_RATIO[15:0] FI Over DI Ratio Value

Value	Description
0	If ISO7816 mode is selected, the baud rate generator generates no signal.
1-2	Do not use.
3-65535	If ISO7816 mode is selected, the baud rate is the clock provided on SCK divided by FI_DI_RATIO.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.28 USART Number of Errors Register

**Name:** FLEX\_US\_NER  
**Offset:** 0x244  
**Reset:** –  
**Property:** Read-only

This register is relevant only if USART\_MODE = 0x4 or 0x6 in the [USART Mode Register](#).

**Bits 7:0 – NB\_ERRORS[7:0]** Number of Errors

Total number of errors that occurred during an ISO7816 transfer. This register automatically clears when read.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.29 USART IrDA FILTER Register

**Name:** FLEX\_US\_IF  
**Offset:** 0x24C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x8 in the [USART Mode Register](#).

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

**Bits 7:0 – IRDA\_FILTER[7:0]** IrDA Filter

The IRDA\_FILTER value must be defined to meet the following criteria:

$$t_{\text{peripheral clock}} \times (\text{IRDA\_FILTER} + 3) < 1.41 \mu\text{s}$$

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.30 USART Manchester Configuration Register

**Name:** FLEX\_US\_MAN  
**Offset:** 0x250  
**Reset:** 0xB0011004  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	RXIDLEV	DRIFT	ONE	RX_MPOL			RX_PP[1:0]	
Access	R/W	R/W	R/W	R/W			R/W	R/W
Reset	1	0	1	1			0	0
Bit	23	22	21	20	19	18	17	16
					RX_PL[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	1
Bit	15	14	13	12	11	10	9	8
				TX_MPOL			TX_PP[1:0]	
Access				R/W			R/W	R/W
Reset				1			0	0
Bit	7	6	5	4	3	2	1	0
					TX_PL[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	1	0	0

#### Bit 31 – RXIDLEV Receiver Idle Value

Value	Description
0	Receiver line idle value is 0.
1	Receiver line idle value is 1.

#### Bit 30 – DRIFT Drift Compensation

Value	Description
0	The USART cannot recover from an important clock drift.
1	The USART can recover from clock drift. The 16X Clock mode must be enabled.

#### Bit 29 – ONE Must Be Set to 1

Bit 29 must always be set to 1 when programming the FLEX\_US\_MAN register.

#### Bit 28 – RX\_MPOL Receiver Manchester Polarity

Value	Description
0	Logic zero is coded as a zero-to-one transition, Logic one is coded as a one-to-zero transition.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
1	Logic zero is coded as a one-to-zero transition, Logic one is coded as a zero-to-one transition.

**Bits 25:24 – RX\_PP[1:0]** Receiver Preamble Pattern detected  
The following values assume that RX\_MPOL field is not set:

Value	Name	Description
0	ALL_ONE	The preamble is composed of '1's.
1	ALL_ZERO	The preamble is composed of '0's.
2	ZERO_ONE	The preamble is composed of '01's.
3	ONE_ZERO	The preamble is composed of '10's.

**Bits 19:16 – RX\_PL[3:0]** Receiver Preamble Length

Value	Description
0	The receiver preamble pattern detection is disabled.
1-15	The detected preamble length is RX_PL × Bit Period.

**Bit 12 – TX\_MPOL** Transmitter Manchester Polarity

Value	Description
0	Logic zero is coded as a zero-to-one transition, Logic one is coded as a one-to-zero transition.
1	Logic zero is coded as a one-to-zero transition, Logic one is coded as a zero-to-one transition.

**Bits 9:8 – TX\_PP[1:0]** Transmitter Preamble Pattern  
The following values assume that TX\_MPOL field is not set:

Value	Name	Description
0	ALL_ONE	The preamble is composed of '1's.
1	ALL_ZERO	The preamble is composed of '0's.
2	ZERO_ONE	The preamble is composed of '01's.
3	ONE_ZERO	The preamble is composed of '10's.

**Bits 3:0 – TX\_PL[3:0]** Transmitter Preamble Length

Value	Description
0	The transmitter preamble pattern generation is disabled.
1-15	The preamble length is TX_PL × Bit Period.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.31 USART LIN Mode Register

**Name:** FLEX\_US\_LINMR  
**Offset:** 0x254  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0xA or 0xB in the [USART Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
							SYNCDIS	PDCM
Access							R/W	R/W
Reset							0	0
Bit	15	14	13	12	11	10	9	8
	DLC[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	WКУPTYP	FSDIS	DLM	CHKTYP	CHKDIS	PARDIS	NACT[1:0]	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bit 17 – SYNCDIS Synchronization Disable

Value	Description
0	The synchronization procedure is performed in LIN slave node configuration.
1	The synchronization procedure is not performed in LIN slave node configuration.

#### Bit 16 – PDCM DMAC Mode

Value	Description
0	The LIN mode register FLEX_US_LINMR is not written by the DMAC.
1	The LIN mode register FLEX_US_LINMR (excepting that flag) is written by the DMAC.

#### Bits 15:8 – DLC[7:0] Data Length Control

Value	Description
0–255	Defines the response data length if DLM = 0, in that case the response data length is equal to DLC+1 bytes.

#### Bit 7 – WKUPTYP Wake-up Signal Type

Value	Description
0	Setting the LINWKUP bit in the control register sends a LIN 2.0 wake-up signal.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
1	Setting the LINWKUP bit in the control register sends a LIN 1.3 wake-up signal.

### Bit 6 – FSDIS Frame Slot Mode Disable

Value	Description
0	The Frame Slot mode is enabled.
1	The Frame Slot mode is disabled.

### Bit 5 – DLM Data Length Mode

Value	Description
0	The response data length is defined by the DLC field of this register.
1	The response data length is defined by the bits 5 and 6 of the identifier (FLEX_US_LINIR.IDCHR).

### Bit 4 – CHKTYP Checksum Type

Value	Description
0	LIN 2.0 “enhanced” checksum
1	LIN 1.3 “classic” checksum

### Bit 3 – CHKDIS Checksum Disable

Value	Description
0	In master node configuration, the checksum is computed and sent automatically. In slave node configuration, the checksum is checked automatically.
1	Whatever the node configuration is, the checksum is not computed/sent and it is not checked.

### Bit 2 – PARDIS Parity Disable

Value	Description
0	In master node configuration, the identifier parity is computed and sent automatically. In master node and slave node configuration, the parity is checked automatically.
1	Whatever the node configuration is, the Identifier parity is not computed/sent and it is not checked.

### Bits 1:0 – NACT[1:0] LIN Node Action

Values which are not listed in the table must be considered as “reserved”.

Value	Name	Description
0	PUBLISH	The USART transmits the response.
1	SUBSCRIBE	The USART receives the response.
2	IGNORE	The USART does not transmit and does not receive the response.

### 46.10.32 USART LIN Identifier Register

**Name:** FLEX\_US\_LINIR  
**Offset:** 0x258  
**Reset:** 0x00000000  
**Property:** Read/Write

Write is possible only in LIN master node configuration.

This register is relevant only if USART\_MODE = 0xA or 0xB in [USART Mode Register](#).

**Bits 7:0 – IDCHR[7:0] Identifier Character**

If USART\_MODE = 0xA (master node configuration):

- IDCHR is Read/Write and its value is the identifier character to be transmitted.

If USART\_MODE = 0xB (slave node configuration):

- IDCHR is Read-only and its value is the last identifier character that has been received.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.33 USART LIN Baud Rate Register

**Name:** FLEX\_US\_LINBRR  
**Offset:** 0x25C  
**Reset:** 0x00000000  
**Property:** Read-only

This register is relevant only if USART\_MODE = 0xA or 0xB in [USART Mode Register](#).

Returns the baud rate value after the synchronization process completion.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
						LINFP[2:0]		
Access						R	R	R
Reset						0	0	0
Bit	15	14	13	12	11	10	9	8
	LINCD[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	LINCD[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 18:16 – LINFP[2:0]** Fractional Part after Synchronization

**Bits 15:0 – LINCD[15:0]** Clock Divider after Synchronization

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.34 USART Comparison Register

**Name:** FLEX\_US\_CMPR  
**Offset:** 0x290  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
								VAL2[8:8]
Access								R/W
Reset								0
Bit	23	22	21	20	19	18	17	16
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
		CMPPAR		CMPMODE				VAL1[8:8]
Access		R/W		R/W				R/W
Reset		0		0				0
Bit	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 24:16 – VAL2[8:0] Second Comparison Value for Received Character

Value	Description
0–511	The received character must be lower than or equal to the value of VAL2 and higher than or equal to VAL1 to set the FLEX_US_CSR.CMP flag.

#### Bit 14 – CMPPAR Compare Parity

Value	Description
0	The parity is not checked and a bad parity cannot prevent from waking up the system.
1	The parity is checked and a matching condition on data can be cancelled by an error on parity bit, so no wakeup is performed.

#### Bit 12 – CMPMODE Comparison Mode

Value	Name	Description
0	FLAG_ONLY	Any character is received and comparison function drives CMP flag.
1	START_CONDITION	Comparison condition must be met to start reception.
2	FILTER	Comparison must be met to receive the current data only

#### Bits 8:0 – VAL1[8:0] First Comparison Value for Received Character

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

---

Value	Description
0-511	The received character must be higher than or equal to the value of VAL1 and lower than or equal to VAL2 to set the FLEX_US_CSR.CMP flag.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.35 USART FIFO Mode Register

**Name:** FLEX\_US\_FMR  
**Offset:** 0x2A0  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
			RXFTHRES2[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
			RXFTHRES[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
			TXFTHRES[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	FRTSC		RXRDYM[1:0]				TXRDYM[1:0]	
Access	R/W		R/W	R/W			R/W	R/W
Reset	0		0	0			0	0

#### Bits 29:24 – RXFTHRES2[5:0] Receive FIFO Threshold 2

Value	Description
0–32	Defines the Receive FIFO threshold 2 value (number of data). The FLEX_US_FESR.RXFTHF2 flag will be set when Receive FIFO goes from “above” threshold state to “equal to or below” threshold state.

#### Bits 21:16 – RXFTHRES[5:0] Receive FIFO Threshold

Value	Description
0–32	Defines the Receive FIFO threshold value (number of data). The FLEX_US_FESR.RXFTHF flag will be set when Receive FIFO goes from “below” threshold state to “equal to or above” threshold state.

#### Bits 13:8 – TXFTHRES[5:0] Transmit FIFO Threshold

Value	Description
0–32	Defines the Transmit FIFO threshold value (number of data). The FLEX_US_FESR.TXFTHF flag will be set when Transmit FIFO goes from “above” threshold state to “equal to or below” threshold state.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

**Bit 7 – FRTSC** FIFO RTS Pin Control enable (Hardware Handshaking mode only)

See [Hardware Handshaking](#) for details.

Value	Description
0	RTS pin is not controlled by Receive FIFO thresholds.
1	RTS pin is controlled by Receive FIFO thresholds.

**Bits 5:4 – RXRDYM[1:0]** Receiver Ready Mode

If FIFOs are enabled, the FLEX\_US\_CSR.RXRDY flag behaves as follows.

Value	Name	Description
0	ONE_DATA	RXRDY will be at level '1' when at least one unread data is in the Receive FIFO.
1	TWO_DATA	RXRDY will be at level '1' when at least two unread data are in the Receive FIFO.
2	FOUR_DATA	RXRDY will be at level '1' when at least four unread data are in the Receive FIFO.

**Bits 1:0 – TXRDYM[1:0]** Transmitter Ready Mode

If FIFOs are enabled, the FLEX\_US\_CSR.TXRDY flag behaves as follows.

Value	Name	Description
0	ONE_DATA	TXRDY will be at level '1' when at least one data can be written in the Transmit FIFO
1	TWO_DATA	TXRDY will be at level '1' when at least two data can be written in the Transmit FIFO
2	FOUR_DATA	TXRDY will be at level '1' when at least four data can be written in the Transmit FIFO

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.36 USART FIFO Level Register

**Name:** FLEX\_US\_FLR  
**Offset:** 0x2A4  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24	
	[Greyed out bits 31:24]								
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
	[Greyed out bits 23:22]		RXFL[5:0]						[Greyed out bit 16]
Access			R	R	R	R	R	R	
Reset			0	0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	
	[Greyed out bits 15:8]								
Access									
Reset									
Bit	7	6	5	4	3	2	1	0	
	[Greyed out bits 7:6]		TXFL[5:0]						[Greyed out bit 0]
Access			R	R	R	R	R	R	
Reset			0	0	0	0	0	0	

#### Bits 21:16 – RXFL[5:0] Receive FIFO Level

Value	Description
0	There is no unread data in the Receive FIFO.
1–32	Indicates the number of unread data in the Receive FIFO.

#### Bits 5:0 – TXFL[5:0] Transmit FIFO Level

Value	Description
0	There is no data in the Transmit FIFO.
1–32	Indicates the number of data in the Transmit FIFO.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.37 USART FIFO Interrupt Enable Register

**Name:** FLEX\_US\_FIER  
**Offset:** 0x2A8

Access							R	R
Reset							0	0
Bit	7	6	5	4	3	2	1	0
	RXFPTEF	TXFPTEF	RXFTHF	RXFFF	RXFEF	TXFTHF	TXFFF	TXFEF
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bit 9 – RXFTHF2** Receive FIFO Threshold Flag 2 (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

Value	Description
0	Number of unread data in Receive FIFO is above RXFTHRES threshold.
1	Number of unread data in Receive FIFO has reached RXFTHRES2 threshold since the last RSTSTA command was issued.

**Bit 8 – TXFLOCK** Transmit FIFO Lock

Value	Description
0	The Transmit FIFO is not locked.
1	The Transmit FIFO is locked.

**Bit 7 – RXFPTEF** Receive FIFO Pointer Error Flag

See [46.7.11.9 FIFO Pointer Error](#) for details.

Value	Description
0	No Receive FIFO pointer occurred.
1	Receive FIFO pointer error occurred. Receiver must be reset.

**Bit 6 – TXFPTEF** Transmit FIFO Pointer Error Flag

See [46.7.11.9 FIFO Pointer Error](#) for details.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
0	No Transmit FIFO pointer occurred.
1	Transmit FIFO pointer error occurred. Transceiver must be reset.

**Bit 5 – RXFTHF** Receive FIFO Threshold Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

Value	Description
0	Number of unread data in Receive FIFO is below RXFTHRES threshold.
1	Number of unread data in Receive FIFO has reached RXFTHRES threshold since the last RSTSTA command was issued.

**Bit 4 – RXFFF** Receive FIFO Full Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

Value	Description
0	Receive FIFO is not empty.
1	Receive FIFO has been filled since the last RSTSTA command was issued.

**Bit 3 – RXFEF** Receive FIFO Empty Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

Value	Description
0	Receive FIFO is not empty.
1	Receive FIFO has been emptied since the last RSTSTA command was issued.

**Bit 2 – TXFTHF** Transmit FIFO Threshold Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

Value	Description
0	Number of data in Transmit FIFO is above TXFTHRES threshold.
1	Number of data in Transmit FIFO has reached TXFTHRES threshold since the last RSTSTA command was issued.

**Bit 1 – TXFFF** Transmit FIFO Full Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

Value	Description
0	Transmit FIFO is not full.
1	Transmit FIFO has been filled since the last RSTSTA command was issued.

**Bit 0 – TXFEF** Transmit FIFO Empty Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

Value	Description
0	Transmit FIFO is not empty.
1	Transmit FIFO has been emptied since the last RSTSTA command was issued.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.41 USART Write Protection Mode Register

**Name:** FLEX\_US\_WPMR  
**Offset:** 0x2E4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPEN
Access								R/W
Reset								0

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x55534	PASSWD	Writing any other value in this field aborts the write operation of bit WPEN.
1		Always reads as 0.

#### Bit 0 – WPEN Write Protection Enable

See [USART Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection on configuration registers if WPKEY corresponds to 0x555341 (“USA” in ASCII).
1	Enables the write protection on configuration registers if WPKEY corresponds to 0x555341 (“USA” in ASCII).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.42 USART Write Protection Status Register

**Name:** FLEX\_US\_WPSR  
**Offset:** 0x2E8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	[Greyed out bits]							WPVS
Access								R
Reset								0

**Bits 23:8 – WPVSR[15:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of FLEX_US_WPSR.
1	A write protection violation has occurred since the last read of FLEX_US_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.43 SPI Control Register

**Name:** FLEX\_SPI\_CR  
**Offset:** 0x400  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the [SPI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	FIFODIS	FIFOEN						LASTXFER
Access	W	W						W
Reset	–	–						–
Bit	23	22	21	20	19	18	17	16
							RXFCLR	TXFCLR
Access							W	W
Reset							–	–
Bit	15	14	13	12	11	10	9	8
				REQCLR				
Access				W				
Reset				–				
Bit	7	6	5	4	3	2	1	0
	SWRST						SPIDIS	SPIEN
Access	W						W	W
Reset	–						–	–

#### Bit 31 – FIFODIS FIFO Disable

Value	Description
0	No effect.
1	Disables the Transmit and Receive FIFOs

#### Bit 30 – FIFOEN FIFO Enable

Value	Description
0	No effect.
1	Enables the Transmit and Receive FIFOs

#### Bit 24 – LASTXFER Last Transfer

See [Peripheral Selection](#) for more details.

Value	Description
0	No effect.
1	The current NPCS will be de-asserted after the character written in TD has been transferred. When CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 17 – RXFCLR Receive FIFO Clear

Value	Description
0	No effect.
1	Empties the Receive FIFO.

### Bit 16 – TXFCLR Transmit FIFO Clear

Value	Description
0	No effect.
1	Empties the Transmit FIFO.

### Bit 12 – REQCLR Request to Clear the Comparison Trigger

SleepWalking enabled:

0: No effect.

1: Clears the potential clock request currently issued by SPI, thus the potential system wakeup is cancelled.

SleepWalking disabled:

0: No effect.

1: Restarts the comparison trigger to enable FLEX\_SPI\_RDR loading.

### Bit 7 – SWRST SPI Software Reset

The SPI is in Slave mode after software reset.

Value	Description
0	No effect.
1	Resets the SPI. A software-triggered hardware reset of the SPI interface is performed.

### Bit 1 – SPIDIS SPI Disable

If a transfer is in progress when SPIDIS is set, the SPI completes the transmission of the shifter register and does not start any new transfer, even if the FLEX\_US\_THR is loaded.

All pins are set in Input mode after completion of the transmission in progress, if any.

Value	Description
0	No effect.
1	Disables the SPI.

### Bit 0 – SPIEN SPI Enable

Value	Description
0	No effect.
1	Enables the SPI to transfer and receive data.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.44 SPI Mode Register

**Name:** FLEX\_SPI\_MR  
**Offset:** 0x404  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	DLYBCS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
							PCS[1:0]	
Access							R/W	R/W
Reset							0	0
Bit	15	14	13	12	11	10	9	8
				CMPMODE				
Access				R/W				
Reset				0				
Bit	7	6	5	4	3	2	1	0
	LLB		WDRBT	MODFDIS	BRSRCCLK	PCSDEC	PS	MSTR
Access	R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset	0		0	0	0	0	0	0

#### Bits 31:24 – DLYBCS[7:0] Delay Between Chip Selects

This field defines the delay between the inactivation and the activation of NPCS. The DLYBCS time guarantees nonoverlapping chip selects and solves bus contentions in case of peripherals having long data float times.

If DLYBCS is  $\leq 6$ , six peripheral clock periods are inserted by default.

Otherwise, the following equations determine the delay:

If FLEX\_SPI\_MR.BRSRCCLK = 0:  $DLYBCS = \text{Delay Between Chip Selects} \times f_{\text{peripheral clock}}$

If FLEX\_SPI\_MR.BRSRCCLK = 1:  $DLYBCS = \text{Delay Between Chip Selects} \times f_{GCLK}$

#### Bits 17:16 – PCS[1:0] Peripheral Chip Select

This field is only used if fixed peripheral select is active (PS = 0).

If PCSDEC = 0:

PCS = x0 NPCS[1:0] = 10

PCS = 01 NPCS[1:0] = 01

PCS = 11 forbidden (no peripheral is selected)

(x = don't care)

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

If PCSDEC = 1:

NPCS[1:0] output signals = PCS

### Bit 12 – CMPMODE Comparison Mode

Value	Name	Description
0	FLAG_ONLY	Any character is received and comparison function drives CMP flag.
1	START_CONDITION	Comparison condition must be met to start reception of all incoming characters until REQCLR is set.

### Bit 7 – LLB Local Loopback Enable

LLB controls the local loopback on the data shift register for testing in Master mode only (MISO is internally connected on MOSI).

Value	Description
0	Local loopback path disabled.
1	Local loopback path enabled.

### Bit 5 – WDRBT Wait Data Read Before Transfer

Value	Description
0	No Effect. In Master mode, a transfer can be initiated regardless of the FLEX_SPI_RDR state.
1	In Master mode, a transfer can start only if FLEX_SPI_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception.

### Bit 4 – MODFDIS Mode Fault Detection

Value	Description
0	Mode fault detection is enabled.
1	Mode fault detection is disabled.

### Bit 3 – BR SRCCLK Bit Rate Source Clock

If the bit BR SRCCLK = 1, the FLEX\_US\_CSRx.SCBR field must be programmed with a value greater than 1.

Value	Name	Description
0	PERIPH_CLK	The peripheral clock is the source clock for the bit rate generation.
1	GCLK	GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock.

### Bit 2 – PCSDEC Chip Select Decode

When PCSDEC equals one, up to 3 Chip Select signals can be generated with the two NPCS lines using an external 2- to 4-bit decoder. The Chip Select registers define the characteristics of the 3 chip selects, with the following rules:

FLEX\_SPI\_CSR0 defines peripheral chip select signals 0 to 1.

FLEX\_SPI\_CSR1 defines peripheral chip select signal 2.

Value	Description
0	The chip selects are directly connected to a peripheral device.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

---

Value	Description
1	The two NPCS chip select lines are connected to a 2- to 4-bit decoder.

### Bit 1 – PS Peripheral Select

Value	Description
0	Fixed Peripheral Select
1	Variable Peripheral Select

### Bit 0 – MSTR Master/Slave Mode

Value	Description
0	SPI is in Slave mode.
1	SPI is in Master mode.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.45 SPI Receive Data Register

**Name:** FLEX\_SPI\_RDR  
**Offset:** 0x408  
**Reset:** 0x00000000  
**Property:** Read-only

If FIFO is enabled (FLEX\_SPI\_CR.FIFOEN) and FLEX\_SPI\_FMR.RXRDYM = 0, see [SPI Single Data Mode](#) for details.

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
							PCS[3:0]		
Access					R	R	R	R	
Reset					0	0	0	0	
Bit	15	14	13	12	11	10	9	8	
	RD[15:8]								
Access	R	R	R	R	R	R	R	R	
Reset	0	0	0	0	0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
	RD[7:0]								
Access	R	R	R	R	R	R	R	R	
Reset	0	0	0	0	0	0	0	0	

**Bits 19:16 – PCS[3:0]** Peripheral Chip Select

In Master mode only, these bits indicate the value on the NPCS pins at the end of a transfer. Otherwise, these bits are read as zero.

**Note:** When using Variable Peripheral Select mode (FLEX\_SPI\_MR.PS = 1), it is mandatory to set the FLEX\_SPI\_MR.WDRBT bit to 1 if the PCS field must be processed in FLEX\_SPI\_RDR.

**Bits 15:0 – RD[15:0]** Receive Data

Data received by the SPI Interface is stored in this register in a right-justified format. Unused bits are read as zero.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.46 SPI Receive Data Register (FIFO Multiple Data, 8-bit)

**Name:** FLEX\_SPI\_RDR (FIFO\_MULTI\_DATA\_8)  
**Offset:** 0x408  
**Reset:** 0x00000000  
**Property:** Read-only

If FIFO is enabled (FLEX\_SPI\_CR.FIFOEN) and FLEX\_SPI\_FMR.RXRDYM > 0, see [SPI Multiple Data Mode](#) for details.

Bit	31	30	29	28	27	26	25	24
	RD3[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Reset	–	–	–	–	–	–	–	–

#### Bit 24 – LASTXFER Last Transfer

This field is only used if variable peripheral select is active (FLEX\_SPI\_MR.PS = 1).

Value	Description
0	No effect.
1	The current NPCS is de-asserted after the transfer of the character written in TD. When FLEX_SPI_CSRx.CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed.

#### Bits 19:16 – PCS[3:0] Peripheral Chip Select

This field is only used if variable peripheral select is active (FLEX\_SPI\_MR.PS = 1).

If FLEX\_SPI\_MR.PCSDEC = 0:

PCS = x0 NPCS[1:0] = 10

PCS = 01 NPCS[1:0] = 01

PCS = 11 forbidden (no peripheral is selected)

(x = don't care)

If FLEX\_SPI\_MR.PCSDEC = 1:

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

---

NPCS[1:0] output signals = PCS

**Bits 15:0 – TD[15:0]** Transmit Data

Data to be transmitted by the SPI Interface is stored in this register. Information to be transmitted must be written to the transmit data register in a right-justified format.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.49 SPI Transmit Data Register (FIFO Multiple Data, 8- to 16-bit)

**Name:** FLEX\_SPI\_TDR (FIFO\_MULTI\_DATA)  
**Offset:** 0x40C  
**Reset:** –  
**Property:** Write-only

If FIFO is enabled (FLEX\_SPI\_CR.FIFOEN) and FLEX\_SPI\_FMR.TXRDYM > 0, see Section 1.8.7.7 “SPI Multiple Data Mode” for details.

	Bit	31	30	29	28	27	26	25	24

**Bit 31 – RXFPTEF** Receive FIFO Pointer Error Flag  
 See [46.8.7.8 FIFO Pointer Error](#) for details.

Value	Description
0	No Receive FIFO pointer occurred
1	Receive FIFO pointer error occurred. Receiver must be reset

**Bit 30 – TXFPTEF** Transmit FIFO Pointer Error Flag  
 See [46.8.7.8 FIFO Pointer Error](#) for details.

Value	Description
0	No Transmit FIFO pointer occurred
1	Transmit FIFO pointer error occurred. Transceiver must be reset

**Bit 29 – RXFTHF** Receive FIFO Threshold Flag

Value	Description
0	Number of unread data in Receive FIFO is below RXFTHRES threshold or RXFTH flag has been cleared.
1	Number of unread data in Receive FIFO has reached RXFTHRES threshold (changing states from “below threshold” to “equal to or above threshold”).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 28 – RXFFF Receive FIFO Full Flag

Value	Description
0	Receive FIFO is not empty or RXFE flag has been cleared.
1	Receive FIFO has been filled (changing states from “not full” to “full”).

### Bit 27 – RXFEF Receive FIFO Empty Flag

Value	Description
0	Receive FIFO is not empty or RXFE flag has been cleared.
1	Receive FIFO has been emptied (changing states from “not empty” to “empty”).

### Bit 26 – TXFTHF Transmit FIFO Threshold Flag (cleared on read)

Value	Description
0	Number of data in Transmit FIFO is above TXFTHRES threshold.
1	Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of FLEX_SPI_SR.

### Bit 25 – TXFFF Transmit FIFO Full Flag (cleared on read)

Value	Description
0	Transmit FIFO is not full or TXFF flag has been cleared.
1	Transmit FIFO has been filled since the last read of FLEX_SPI_SR.

### Bit 24 – TXFEF Transmit FIFO Empty Flag (cleared on read)

Value	Description
0	Transmit FIFO is not empty.
1	Transmit FIFO has been emptied since the last read of FLEX_SPI_SR.

### Bit 16 – SPIENS SPI Enable Status

Value	Description
0	SPI is disabled.
1	SPI is enabled.

### Bit 11 – CMP Comparison Status (cleared on read)

Value	Description
0	No received character matched the comparison criteria programmed in VAL1 and VAL2 fields in FLEX_SPI_CMPR since the last read of FLEX_SPI_SR.
1	A received character matched the comparison criteria since the last read of FLEX_SPI_SR.

### Bit 10 – UNDES Underrun Error Status (Slave mode only) (cleared on read)

Value	Description
0	No underrun has been detected since the last read of FLEX_SPI_SR.
1	A transfer starts whereas no data has been loaded in FLEX_SPI_TDR, cleared when FLEX_SPI_SR is read.

### Bit 9 – TXEMPTY Transmission Registers Empty (cleared by writing FLEX\_SPI\_TDR)

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
0	As soon as data is written in FLEX_SPI_TDR.
1	FLEX_SPI_TDR and internal shift register are empty. If a transfer delay has been defined, TXEMPTY is set after the end of this delay.

**Bit 8 – NSSR** NSS Rising (cleared on read)

Value	Description
0	No rising edge detected on NSS pin since the last read of FLEX_SPI_SR.
1	A rising edge occurred on NSS pin since the last read of FLEX_SPI_SR.

**Bit 3 – OVRES** Overrun Error Status (cleared on read)

An overrun occurs when FLEX\_SPI\_RDR is loaded at least twice from the shift register since the last read of FLEX\_SPI\_RDR.

Value	Description
0	No overrun has been detected since the last read of FLEX_SPI_SR.
1	An overrun has occurred since the last read of FLEX_SPI_SR.

**Bit 2 – MODF** Mode Fault Error (cleared on read)

Value	Description
0	No mode fault has been detected since the last read of FLEX_SPI_SR.
1	A mode fault occurred since the last read of FLEX_SPI_SR.

**Bit 1 – TDRE** Transmit Data Register Empty (cleared by writing FLEX\_SPI\_TDR)

When FIFOs are disabled:

0: Data has been written to FLEX\_SPI\_TDR and not yet transferred to the internal shift register.

1: The last data written to FLEX\_SPI\_TDR has been transferred to the internal shift register.

TDRE is cleared when the SPI is disabled or at reset. Enabling the SPI sets the TDRE flag.

When FIFOs are enabled:

0: Transmit FIFO cannot accept more data.

1: Transmit FIFO can accept data; one or more data can be written according to TXRDYM field configuration.

TDRE behavior with FIFOs enabled is illustrated in [46.8.7.5 TXEMPTY, TDRE and RDRF Behavior](#).

**Bit 0 – RDRF** Receive Data Register Full (cleared by reading FLEX\_SPI\_RDR)

When FIFOs are disabled:

0: No data has been received since the last read of FLEX\_SPI\_RDR.

1: Data has been received and the received data has been transferred from the internal shift register to FLEX\_SPI\_RDR since the last read of FLEX\_SPI\_RDR.

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RDRF behavior with FIFOs enabled is illustrated in [46.8.7.5 TXEMPTY, TDRE and RDRF Behavior](#).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.54 SPI Chip Select Register

**Name:** FLEX\_SPI\_CSRx  
**Offset:** 0x0430 + x\*0x04 [x=0..1]  
**Reset:** 0x00000000  
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

FLEX\_SPI\_CSRx must be written even if the user wants to use the default reset values. The BITS field is not updated with the translated value unless the register is written.

Bit	31	30	29	28	27	26	25	24

Bit	7	6	5	4	3	2	1	0
	BITS[3:0]			CSAAT	CSNAAT	NCPHA	CPOL	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:24 – DLYBCT[7:0] Delay Between Consecutive Transfers

This field defines the delay between two consecutive transfers with the same peripheral without removing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.

When DLYBCT = 0, no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers.

Otherwise, the following equations determine the delay:

If FLEX\_SPI\_MR.BRSRCCLK = 0:  $DLYBCT = \text{Delay Between Consecutive Transfers} \times f_{\text{peripheral clock}} / 32$

If FLEX\_SPI\_MR.BRSRCCLK = 1:  $DLYBCT = \text{Delay Between Consecutive Transfers} \times f_{\text{GLK}} / 32$

#### Bits 23:16 – DLYBS[7:0] Delay Before SPCK

This field defines the delay from NPCS falling edge (activation) to the first valid SPCK transition.

When DLYBS = 0, the delay is half the SPCK clock period.

Otherwise, the following equations determine the delay:

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

If FLEX\_SPI\_MR.BRSRCCLK = 0:  $DLYBS = \text{Delay Before SPCK} \times f_{\text{peripheral clock}}$

If FLEX\_SPI\_MR.BRSRCCLK = 1:  $DLYBS = \text{Delay Before SPCK} \times f_{GCLK}$

### Bits 15:8 – SCBR[7:0] Serial Clock Bit Rate

In Master mode, the SPI Interface uses a modulus counter to derive the SPCK bit rate from the clock defined by the bit BRSRCCLK. The bit rate is selected by writing a value from 1 to 255 in the SCBR field. The following equations determine the SPCK bit rate:

If FLEX\_SPI\_MR.BRSRCCLK = 0:  $SCBR = f_{\text{peripheral clock}} / \text{SPCK Bit Rate}$

If FLEX\_SPI\_MR.BRSRCCLK = 1:  $SCBR = f_{GCLK} / \text{SPCK Bit Rate}$

Programming the SCBR field to 0 is forbidden. Triggering a transfer while SCBR is at 0 can lead to unpredictable results.

If BRSRCCLK = 1 in FLEX\_SPI\_MR, SCBR must be programmed with a value greater than 1.

At reset, SCBR is 0 and the user has to program it at a valid value before performing the first transfer.

**Note:** If one of the FLEX\_SPI\_CSRx.SCBR fields is set to 1, the other FLEX\_SPI\_CSRx.SCBR fields must be set to 1 as well, if they are used to process transfers. If they are not used to transfer data, they can be set at any value.

### Bits 7:4 – BITS[3:0] Bits Per Transfer

See [Note](#).

The BITS field determines the number of data bits transferred. Reserved values should not be used.

Value	Name	Description
0	8_BIT	8 bits for transfer
1	9_BIT	9 bits for transfer
2	10_BIT	10 bits for transfer
3	11_BIT	11 bits for transfer
4	12_BIT	12 bits for transfer
5	13_BIT	13 bits for transfer
6	14_BIT	14 bits for transfer
7	15_BIT	15 bits for transfer
8	16_BIT	16 bits for transfer
9–15	Reserved	

### Bit 3 – CSAAT Chip Select Active After Transfer

Value	Description
0	The Peripheral Chip Select Line rises as soon as the last transfer is achieved.
1	The Peripheral Chip Select does not rise after the last transfer is achieved. It remains active until a new transfer is requested on a different chip select.

### Bit 2 – CSNAAT Chip Select Not Active After Transfer (Ignored if CSAAT = 1)

If FLEX\_SPI\_MR.BRSRCCLK = 0:  $\frac{DLYBCS}{f_{\text{peripheral clock}}}$  (if DLYBCS ≠ 0)

If FLEX\_SPI\_MR.BRSRCCLK = 1:  $\frac{DLYBCS}{f_{GCLK}}$

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

If DLYBCS < 6, a minimum of six periods is introduced.

Value	Description
0	The Peripheral Chip Select does not rise between two transfers if the FLEX_SPI_TDR is reloaded before the end of the first transfer and if the two transfers occur on the same Chip Select.
1	The Peripheral Chip Select rises systematically after each transfer performed on the same slave. It remains inactive after the end of transfer for a minimal duration of:

### Bit 1 – NCPHA Clock Phase

NCPHA determines which edge of SPCK causes data to change and which edge causes data to be captured. NCPHA is used with CPOL to produce the required clock/data relationship between master and slave devices.

Value	Description
0	Data are changed on the leading edge of SPCK and captured on the following edge of SPCK.
1	Data are captured on the leading edge of SPCK and changed on the following edge of SPCK.

### Bit 0 – CPOL Clock Polarity

CPOL is used to determine the inactive state value of the serial clock (SPCK). It is used with NCPHA to produce the required clock/data relationship between master and slave devices.

Value	Description
0	The inactive state value of SPCK is logic level zero.
1	The inactive state value of SPCK is logic level one.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.55 SPI FIFO Mode Register

**Name:** FLEX\_SPI\_FMR  
**Offset:** 0x440  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24	
			RXFTHRES[5:0]						
Access			R/W	R/W	R/W	R/W	R/W	R/W	
Reset			0	0	0	0	0	0	
Bit	23	22	21	20	19	18	17	16	
			TXFTHRES[5:0]						
Access			R/W	R/W	R/W	R/W	R/W	R/W	
Reset			0	0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	
Access									
Reset									
Bit	7	6	5	4	3	2	1	0	
			RXRDYM[1:0]					TXRDYM[1:0]	
Access			R/W	R/W			R/W	R/W	
Reset			0	0			0	0	

#### Bits 29:24 – RXFTHRES[5:0] Receive FIFO Threshold

Value	Description
0–32	Defines the Receive FIFO threshold value (number of data). The FLEX_SPI_SR.RXFTH flag will be set when Receive FIFO goes from “below” threshold state to “equal to or above” threshold state.

#### Bits 21:16 – TXFTHRES[5:0] Transmit FIFO Threshold

Value	Description
0–32	Defines the Transmit FIFO threshold value (number of data). The FLEX_SPI_SR.TXFTH flag will be set when Transmit FIFO goes from “above” threshold state to “equal to or below” threshold state.

#### Bits 5:4 – RXRDYM[1:0] Receive Data Register Full Mode

If FIFOs are enabled, the FLEX\_SPI\_SR.RDRF flag behaves as follows.

Value	Name	Description
0	ONE_DATA	RDRF will be at level ‘1’ when at least one unread data is in the Receive FIFO.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Name	Description
1	TWO_DATA	RDRF will be at level '1' when at least two unread data are in the Receive FIFO.  Cannot be used when FLEX_SPI_MR.MSTR =1, or if FLEX_SPI_MR.PS =1.
2	FOUR_DATA	RDRF will be at level '1' when at least four unread data are in the Receive FIFO.  Cannot be used when FLEX_SPI_CSRx.BITS is greater than 0, or if FLEX_SPI_MR.MSTR =1, or if FLEX_SPI_MR.PS =1.

**Bits 1:0 – TXRDYM[1:0]** Transmit Data Register Empty Mode  
If FIFOs are enabled, the FLEX\_SPI\_SR.TDRE flag behaves as follows.

Value	Name	Description
0	ONE_DATA	TDRE will be at level '1' when at least one data can be written in the Transmit FIFO.
1	TWO_DATA	TDRE will be at level '1' when at least two data can be written in the Transmit FIFO.  Cannot be used if FLEX_SPI_MR.PS =1.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.56 SPI FIFO Level Register

**Name:** FLEX\_SPI\_FLR  
**Offset:** 0x444  
**Reset:** 0x00000000  
**Property:** Read-only

	[Greyed out bits 15:8]								
Access									
Reset									
Bit	7	6	5	4	3	2	1	0	
	[Greyed out bits 7:6]		TXFL[5:0]						[Greyed out bit 0]
Access			R	R	R	R	R	R	
Reset			0	0	0	0	0	0	

#### Bits 21:16 – RXFL[5:0] Receive FIFO Level

Value	Description
0	There is no unread data in the Receive FIFO.
1–32	Indicates the number of unread data in the Receive FIFO.

#### Bits 5:0 – TXFL[5:0] Transmit FIFO Level

Value	Description
0	There is no data in the Transmit FIFO.
1–32	Indicates the number of data in the Transmit FIFO.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.57 SPI Comparison Register

**Name:** FLEX\_SPI\_CMPR  
**Offset:** 0x448  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	VAL2[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	VAL2[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	VAL1[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:16 – VAL2[15:0] Second Comparison Value for Received Character

Value	Description
0–65535	The received character must be lower than or equal to the value of VAL2 and higher than or equal to VAL1 to set the FLEX_SPI_CSR.CMP flag. If asynchronous partial wakeup (SleepWalking) is enabled in PMC_SLPWK_ER, the SPI requests a system wakeup if condition is met.

#### Bits 15:0 – VAL1[15:0] First Comparison Value for Received Character

Value	Description
0–65535	The received character must be higher than or equal to the value of VAL1 and lower than or equal to VAL2 to set the FLEX_SPI_SR.CMP flag. If asynchronous partial wakeup (SleepWalking) is enabled in PMC_SLPWK_ER, the SPI requests a system wakeup if the condition is met.

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x535049	PASSWD	Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN.  Always reads as 0.

#### Bit 2 – WPCREN Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x535049 (“SPI” in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x535049 (“SPI” in ASCII).

#### Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x535049 (“SPI” in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x535049 (“SPI” in ASCII).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

---

**Bit 0 – WPEN** Write Protection Enable

See [46.8.8 SPI Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.59 SPI Write Protection Status Register

**Name:** FLEX\_SPI\_WPSR  
**Offset:** 0x4E8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits 31-24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Greyed out bits 23-16]							
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]

Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	[Greyed out bits 7-1]							WPVS
Access								R
Reset								0

**Bits 15:8 – WPVSR[7:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

Value	Description
0	No write protect violation has occurred since the last read of FLEX_SPI_WPSR.
1	A write protect violation has occurred since the last read of FLEX_SPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.60 TWI Control Register

**Name:** FLEX\_TWI\_CR  
**Offset:** 0x600  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the [TWI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
			FIFODIS	FIFOEN		LOCKCLR		THRCLR
Access			W	W		W		W

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

#### Bit 29 – FIFODIS FIFO Disable

Value	Description
0	No effect.
1	Disable the Transmit and Receive FIFOs

#### Bit 28 – FIFOEN FIFO Enable

Value	Description
0	No effect.
1	Enable the Transmit and Receive FIFOs

#### Bit 26 – LOCKCLR Lock Clear

Value	Description
0	No effect.
1	Clear the TWI FSM lock.

#### Bit 24 – THRCLR Transmit Holding Register Clear

Value	Description
0	No effect.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
1	Clear the Transmit Holding Register and set TXRDY, TXCOMP flags.

**Bit 17 – ACMDIS** Alternative Command Mode Disable

Value	Description
0	No effect.
1	Alternative Command mode disabled.

**Bit 16 – ACMEN** Alternative Command Mode Enable

Value	Description
0	No effect.
1	Alternative Command mode enabled.

**Bit 15 – CLEAR** Bus CLEAR Command

Value	Description
0	No effect.
1	If Master mode is enabled, send a bus clear command.

**Bit 14 – PECRQ** PEC Request

Value	Description
0	No effect.
1	A PEC check or transmission is requested.

**Bit 13 – PECDIS** Packet Error Checking Disable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check disabled.

**Bit 12 – PECEN** Packet Error Checking Enable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check enabled.

**Bit 11 – SMBDIS** SMBus Mode Disabled

Value	Description
0	No effect.
1	SMBus mode disabled.

**Bit 10 – SMBEN** SMBus Mode Enabled

Value	Description
0	No effect.
1	If SMBDIS = 0, SMBus mode enabled.

**Bit 9 – HSDIS** TWI High-Speed Mode Disabled

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
0	No effect.
1	High-speed mode disabled.

**Bit 8 – HSEN** TWI High-Speed Mode Enabled

Value	Description
0	No effect.
1	High-speed mode enabled.

**Bit 7 – SWRST** Software Reset

Value	Description
0	No effect.
1	Equivalent to a system reset.

**Bit 6 – QUICK** SMBus Quick Command

Value	Description
0	No effect.
1	If Master mode is enabled, an SMBus Quick Command is sent.

**Bit 5 – SVDIS** TWI Slave Mode Disabled

Value	Description
0	No effect.
1	Slave mode is disabled. The shifter and holding characters (if it contains data) are transmitted in the case of a read operation. In a write operation, the character being transferred must be completely received before disabling.

**Bit 4 – SVEN** TWI Slave Mode Enabled

Switching from Master to Slave mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables the Slave mode (SVDIS must be written to 0).

**Bit 3 – MSDIS** TWI Master Mode Disabled

Value	Description
0	No effect.
1	The Master mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in case of write operation. In read operation, the character being transferred must be completely received before disabling.

**Bit 2 – MSEN** TWI Master Mode Enabled

Switching from Slave to Master mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables the Master mode (MSDIS must be written to 0).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 1 – STOP Send a STOP Condition

Value	Description
0	No effect.
1	STOP condition is sent just after completing the current byte transmission in Master Read mode. <ul style="list-style-type: none"><li>– In single data byte master read, both START and STOP must be set.</li><li>– In multiple data bytes master read, the STOP must be set after the last data received but one.</li><li>– In Master Read mode, if a NACK bit is received, the STOP is automatically performed.</li><li>– In master data write operation, a STOP condition will be sent after the transmission of the current data is finished.</li></ul>

### Bit 0 – START Send a START Condition

This action is necessary when the TWI peripheral needs to read data from a slave. When configured in Master mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding Register (FLEX\_TWI\_THR).

Value	Description
0	No effect.
1	A frame beginning with a START bit is transmitted according to the features defined in the TWI Master Mode Register (FLEX_TWI_MMR).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.61 TWI Control Register (FIFO\_ENABLED)

**Name:** FLEX\_TWI\_CR (FIFO\_ENABLED)  
**Offset:** 0x600  
**Reset:** –  
**Property:** Write-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit), see [46.9.6.8 TWI Multiple Data Mode](#) for details.

This register can only be written if the WPCREN bit is cleared in the [TWI Write Protection Mode Register](#).

	Bit	31	30	29	28	27	26	25	24
				FIFODIS	FIFOEN		TXFLCLR	RXFCLR	TXFCLR
Access				W	W		W	W	W

Access		W	W	W	W	W	W	W	W
Reset		–	–	–	–	–	–	–	–

#### Bit 29 – FIFODIS FIFO Disable

Value	Description
0	No effect.
1	Disable the Transmit and Receive FIFOs.

#### Bit 28 – FIFOEN FIFO Enable

Value	Description
0	No effect.
1	Enable the Transmit and Receive FIFOs.

#### Bit 26 – TXFLCLR Transmit FIFO Lock CLEAR

Value	Description
0	No effect.
1	Clears the Transmit FIFO Lock.

#### Bit 25 – RXFCLR Receive FIFO Clear

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
0	No effect.
1	Empties the Receive FIFO.

**Bit 24 – TXFCLR** Transmit FIFO Clear

Value	Description
0	No effect.
1	Empties the Transmit FIFO.

**Bit 17 – ACMDIS** Alternative Command Mode Disable

Value	Description
0	No effect.
1	Alternative Command mode disabled.

**Bit 16 – ACMEN** Alternative Command Mode Enable

Value	Description
0	No effect.
1	Alternative Command mode enabled.

**Bit 15 – CLEAR** Bus CLEAR Command

Value	Description
0	No effect.
1	If Master mode is enabled, send a bus clear command.

**Bit 14 – PECRQ** PEC Request

Value	Description
0	No effect.
1	A PEC check or transmission is requested.

**Bit 13 – PECDIS** Packet Error Checking Disable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check disabled.

**Bit 12 – PECEN** Packet Error Checking Enable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check enabled.

**Bit 11 – SMBDIS** SMBus Mode Disabled

Value	Description
0	No effect.
1	SMBus mode disabled.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 10 – SMBEN SMBus Mode Enabled

Value	Description
0	No effect.
1	If SMBDIS = 0, SMBus mode enabled.

### Bit 9 – HSDIS TWI High-Speed Mode Disabled

Value	Description
0	No effect.
1	High-speed mode disabled.

### Bit 8 – HSEN TWI High-Speed Mode Enabled

Value	Description
0	No effect.
1	High-speed mode enabled.

### Bit 7 – SWRST Software Reset

Value	Description
0	No effect.
1	Equivalent to a system reset.

### Bit 6 – QUICK SMBus Quick Command

Value	Description
0	No effect.
1	If Master mode is enabled, a SMBus Quick Command is sent.

### Bit 5 – SVDIS TWI Slave Mode Disabled

Value	Description
0	No effect.
1	Slave mode is disabled. The shifter and holding characters (if it contains data) are transmitted in the case of a read operation. In a write operation, the character being transferred must be completely received before disabling.

### Bit 4 – SVEN TWI Slave Mode Enabled

Switching from Master to Slave mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables the Slave mode (SVDIS must be written to 0).

### Bit 3 – MSDIS TWI Master Mode Disabled

Value	Description
0	No effect.
1	The Master mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in the case of a write operation. In a read operation, the character being transferred must be completely received before disabling.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 2 – MSEN TWI Master Mode Enabled

Switching from Slave to Master mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables the Master mode (MSDIS must be written to 0).

### Bit 1 – STOP Send a STOP Condition

Value	Description
0	No effect.
1	STOP condition is sent just after completing the current byte transmission in Master Read mode. <ul style="list-style-type: none"><li>– In single data byte master read, both START and STOP must be set.</li><li>– In multiple data bytes master read, the STOP must be set after the last data received but one.</li><li>– In Master Read mode, if a NACK bit is received, the STOP is automatically performed.</li><li>– In master data write operation, a STOP condition will be sent after the transmission of the current data is finished.</li></ul>

### Bit 0 – START Send a START Condition

This action is necessary when the TWI peripheral needs to read data from a slave. When configured in Master mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding Register (FLEX\_TWI\_THR).

Value	Description
0	No effect.
1	A frame beginning with a START bit is transmitted according to the features defined in the TWI Master Mode Register (FLEX_TWI_MMR).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.62 TWI Master Mode Register

**Name:** FLEX\_TWI\_MMR  
**Offset:** 0x604  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

#### Bit 24 – NOAP No Auto-Stop On NACK Error

Value	Description
0	A stop condition is sent automatically upon Not-Acknowledge error detection.
1	No automatic action is performed upon Not-Acknowledge error detection.

#### Bits 22:16 – DADR[6:0] Device Address

The device address is used to access slave devices in Read or Write mode. Those bits are only used in Master mode.

#### Bit 12 – MREAD Master Read Direction

Value	Description
0	Master write direction.
1	Master read direction.

#### Bits 9:8 – IADRSZ[1:0] Internal Device Address Size

Value	Name	Description
0	NONE	No internal device address
1	1_BYTE	One-byte internal device address
2	2_BYTE	Two-byte internal device address

# SAMA5D2 Series

### 46.10.63 TWI Slave Mode Register

**Name:** FLEX\_TWI\_SMR  
**Offset:** 0x608  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TWI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24	
	DATAMEN	SADR3EN	SADR2EN	SADR1EN					
Access	R/W	R/W	R/W	R/W					
Reset	0	0	0	0					
Bit	23	22	21	20	19	18	17	16	
		SADR[6:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset		0	0	0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	
		MASK[6:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset		0	0	0	0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
		SCLWSDIS		SADAT	SMHH	SMDA		NACKEN	
Access		R/W		R/W	R/W	R/W		R/W	
Reset		0		0	0	0		0	

#### Bit 31 – DATAMEN Data Matching Enable

Value	Description
0	Data matching on first received data is disabled.
1	Data matching on first received data is enabled.

#### Bit 30 – SADR3EN Slave Address 3 Enable

Value	Description
0	Slave address 3 matching is disabled.
1	Slave address 3 matching is enabled.

#### Bit 29 – SADR2EN Slave Address 2 Enable

Value	Description
0	Slave address 2 matching is disabled.
1	Slave address 2 matching is enabled.

#### Bit 28 – SADR1EN Slave Address 1 Enable

Value	Description
0	Slave address 1 matching is disabled.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
1	Slave address 1 matching is enabled.

### Bits 22:16 – SADR[6:0] Slave Address

The slave device address is used in Slave mode in order to be accessed by master devices in Read or Write mode.

SADR must be programmed before enabling the Slave mode or after a general call. Writes at other times have no effect.

### Bits 14:8 – MASK[6:0] Slave Address Mask

A mask can be applied on the slave device address in Slave mode in order to allow multiple address answer. For each bit of the MASK field set to one, the corresponding SADR bit will be masked.

If the MASK field is set to 0, no mask is applied to the SADR field.

### Bit 6 – SCLWSDIS Clock Wait State Disable

Value	Description
0	No effect.
1	Clock stretching disabled in Slave mode, OVRE and UNRE will indicate overrun and underrun.

### Bit 4 – SADAT Slave Address Treated as Data

Value	Description
0	Slave address is handled normally (will not trig RXRDY flag and will not fill FLEX_TWI_RHR upon reception).
1	Slave address is handled as data field, RXRDY will be set and FLEX_TWI_RHR filled upon slave address reception.

### Bit 3 – SMHH SMBus Host Header

Value	Description
0	Acknowledge of the SMBus Host Header disabled.
1	Acknowledge of the SMBus Host Header enabled.

### Bit 2 – SMDA SMBus Default Address

Value	Description
0	Acknowledge of the SMBus Default Address disabled.
1	Acknowledge of the SMBus Default Address enabled.

### Bit 0 – NACKEN Slave Receiver Data Phase NACK Enable

Value	Description
0	Normal value to be returned in the ACK cycle of the data phase in Slave Receiver mode.
1	NACK value to be returned in the ACK cycle of the data phase in Slave Receiver mode.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0

#### Bits 29:24 – HOLD[5:0] TWD Hold Time Versus TWCK Falling

If High-speed mode is selected TWD is internally modified on the TWCK falling edge to meet the I<sup>2</sup>C specified maximum hold time, else if High-speed mode is not configured TWD is kept unchanged after TWCK falling edge for a period of  $(HOLD + 3) \times t_{\text{peripheral clock}}$ .

#### Bit 20 – BRSRCCLK Bit Rate Source Clock

Value	Name	Description
0	PERIPH_CLK	The peripheral clock is the source clock for the bit rate generation.
1	GCLK	GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock.

#### Bits 18:16 – CKDIV[2:0] Clock Divider

The CKDIV is used to increase both SCL high and low periods.

#### Bits 15:8 – CHDIV[7:0] Clock High Divider

The SCL high period is defined as follows:

If BRSRCCLK = 0:  $CHDIV = ((t_{\text{high}} / t_{\text{peripheral clock}}) - 3) / 2^{\text{CKDIV}}$

If BRSRCCLK = 1:  $CHDIV = (t_{\text{high}} / t_{\text{ext\_ck}}) / 2^{\text{CKDIV}}$

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

---

**Bits 7:0 – CLDIV[7:0]** Clock Low Divider

The SCL low period is defined as follows:

If BRSRCCLK = 0:  $CLDIV = ((t_{low} / t_{\text{peripheral clock}}) - 3) / 2^{CKDIV}$

If BRSRCCLK = 1:  $CLDIV = (t_{low} / t_{\text{ext\_ck}}) / 2^{CKDIV}$

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.66 TWI Status Register

**Name:** FLEX\_TWI\_SR  
**Offset:** 0x620  
**Reset:** 0x0300F009  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	1	0	0	1

#### Bit 26 – SR Start Repeated

Value	Description
0	No repeated start has been detected since last FLEX_TWI_SR read.
1	At least one repeated start has been detected since last FLEX_TWI_SR read.

#### Bit 25 – SDA SDA Line Value

Value	Description
0	SDA line sampled value is '0'.
1	SDA line sampled value is '1'.

#### Bit 24 – SCL SCL Line Value

Value	Description
0	SCL line sampled value is '0'.
1	SCL line sampled value is '1'.

#### Bit 23 – LOCK TWI Lock Due to Frame Errors

Value	Description
0	The TWI is not locked.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
1	The TWI is locked due to frame errors (see <a href="#">46.9.3.12 Handling Errors in Alternative Command</a> and <a href="#">46.9.6 TWI FIFOs</a> ).

**Bit 21 – SMBHHM** SMBus Host Header Address Match (cleared on read)

Value	Description
0	No SMBus Host Header Address received.
1	A SMBus Host Header Address was received.

**Bit 20 – SMBDAM** SMBus Default Address Match (cleared on read)

Value	Description
0	No SMBus Default Address received.
1	A SMBus Default Address was received.

**Bit 19 – PECERR** PEC Error (cleared on read)

Value	Description
0	No SMBus PEC error occurred.
1	A SMBus PEC error occurred.

**Bit 18 – TOUT** Timeout Error (cleared on read)

Value	Description
0	No SMBus timeout occurred.
1	SMBus timeout occurred.

**Bit 16 – MACK** Master Code Acknowledge (cleared on read)

MACK used in Slave mode:

Value	Description
0	No master code has been received.
1	A master code has been received.

**Bit 11 – EOSACC** End Of Slave Access (cleared on read)

This bit is only used in Slave mode.

EOSACC behavior can be seen in figures [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	A slave access is being performing.
1	The Slave Access is finished. End Of Slave Access is automatically set as soon as SVACC is reset.

**Bit 10 – SCLWS** Clock Wait State

This bit is only used in Slave mode.

SCLWS behavior can be seen in figures [Clock Stretching in Read Mode](#) and [Clock Stretching in Write Mode](#).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
0	The clock is not stretched.
1	The clock is stretched. FLEX_TWI_THR / FLEX_TWI_RHR buffer is not filled / emptied before the transmission / reception of a new character.

**Bit 9 – ARBLST** Arbitration Lost (cleared on read)

This bit is only used in Master mode.

Value	Description
0	Arbitration won.
1	Arbitration lost. Another master of the TWI bus has won the multi-master arbitration. TXCOMP is set at the same time.

**Bit 8 – NACK** Not Acknowledged (cleared on read)

NACK used in Master mode:

0: Each data byte has been correctly received by the far-end side TWI slave component.

1: A data or address byte has not been acknowledged by the slave component. Set at the same time as TXCOMP.

NACK used in Slave Read mode:

0: Each data byte has been correctly received by the master.

1: In Read mode, a data byte has not been acknowledged by the master. When NACK is set, the user must not fill FLEX\_TWI\_THR even if TXRDY is set, because it means that the master will stop the data transfer or reinitiate it..

Note that in Slave Write mode, all data are acknowledged by the TWI.

**Bit 7 – UNRE** Underrun Error (cleared on read)

This bit is only used in Slave mode if clock stretching is disabled.

Value	Description
0	FLEX_TWI_THR has been filled on time.
1	FLEX_TWI_THR has not been filled on time.

**Bit 6 – OVRE** Overrun Error (cleared on read)

This bit is only used in Slave mode if clock stretching is disabled.

Value	Description
0	FLEX_TWI_RHR has not been loaded while RXRDY was set.
1	FLEX_TWI_RHR has been loaded while RXRDY was set. Reset by read in FLEX_TWI_SR when TXCOMP is set.

**Bit 5 – GACC** General Call Access (cleared on read)

This bit is only used in Slave mode.

GACC behavior can be seen in figure [Master Performs a General Call](#).

Value	Description
0	No general call has been detected.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
1	A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes.

### Bit 4 – SVACC Slave Access

This bit is only used in Slave mode.

SVACC behavior can be seen in figures [Read Access Ordered by a Master](#), [Write Access Ordered by a Master](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	TWI is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected.
1	Indicates that the address decoding sequence has matched (a master has sent SADR). SVACC remains high until a NACK or a STOP condition is detected.

### Bit 3 – SVREAD Slave Read

This bit is only used in Slave mode. When SVACC is low (no slave access has been detected) SVREAD is irrelevant.

SVREAD behavior can be seen in figures [Read Access Ordered by a Master](#), [Write Access Ordered by a Master](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	Indicates that a write access is performed by a master.
1	Indicates that a read access is performed by a master.

### Bit 2 – TXRDY Transmit Holding Register Ready (cleared by writing FLEX\_TWI\_THR)

TXRDY used in Master mode:

0: The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into FLEX\_TWI\_THR.

1: As soon as a data byte is transferred from FLEX\_TWI\_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWI).

TXRDY behavior in Master mode can be seen in figures [Master Write with One Data Byte](#), [Master Write with Multiple Data Bytes](#) and [Master Write with One Byte Internal Address and Multiple Data Bytes](#).

TXRDY used in Slave mode:

0: As soon as data is written in FLEX\_TWI\_THR, until this data has been transmitted and acknowledged (ACK or NACK).

1: Indicates that FLEX\_TWI\_THR is empty and that data has been transmitted and acknowledged.

If TXRDY is high and if a NACK has been detected, the transmission will be stopped. Thus when TRDY = NACK = 1, the user must not fill FLEX\_TWI\_THR to avoid losing it.

TXRDY behavior in Slave mode can be seen in figures [Read Access Ordered by a Master](#), [Clock Stretching in Read Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

TXRDY behavior with FIFOs enabled is illustrated in [TXRDY and RXRDY Behavior](#).

**Bit 1 – RXRDY** Receive Holding Register Ready (cleared when reading FLEX\_TWI\_RHR)

When FIFOs are disabled:

0: No character has been received since the last FLEX\_TWI\_RHR read operation.

1: A byte has been received in FLEX\_TWI\_RHR since the last read.

RXRDY behavior in Master mode can be seen in figure [Master Read with Multiple Data Bytes](#).

RXRDY behavior in Slave mode can be seen in figures [Write Access Ordered by a Master](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RXRDY behavior with FIFO enabled is illustrated in [TXRDY and RXRDY Behavior](#).

**Bit 0 – TXCOMP** Transmission Completed (cleared by writing FLEX\_TWI\_THR)

TXCOMP used in Master mode:

0: During the length of the current frame.

1: When both the holding register and the internal shifter are empty and STOP condition has been sent.

TXCOMP behavior in Master mode can be seen in figures [Master Write with One Byte Internal Address and Multiple Data Bytes](#) and [Master Read with Multiple Data Bytes](#).

TXCOMP used in Slave mode:

0: As soon as a Start is detected.

1: After a Stop or a Repeated Start + an address different from SADR is detected.

TXCOMP behavior in Slave mode can be seen in figures [Clock Stretching in Read Mode](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.67 TWI Status Register (FIFO ENABLED)

**Name:** FLEX\_TWI\_SR (FIFO\_ENABLED)  
**Offset:** 0x620  
**Reset:** 0x0300F009  
**Property:** Read-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit), see [TWI Multiple Data Mode](#) for details.

Bit	31	30	29	28	27	26	25	24
						SR	SDA	SCL
Access						R	R	R
Reset						0	1	1
Bit	23	22	21	20	19	18	17	16
	TXFLOCK		SMBHHM	SMBDAM	PECERR	TOUT		MCACK
Access	R		R	R	R	R		R
Reset	0		0	0	0	0		0
Bit	15	14	13	12	11	10	9	8
					EOSACC	SCLWS	ARBLST	NACK
Access					R	R	R	R
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	UNRE	OVRE	GACC	SVACC	SVREAD	TXRDY	RXRDY	TXCOMP
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	1	0	0	1

#### Bit 26 – SR Start Repeated

Value	Description
0	No repeated start has been detected since last FLEX_TWI_SR read.
1	At least one repeated start has been detected since last FLEX_TWI_SR read.

#### Bit 25 – SDA SDA Line Value

Value	Description
0	SDA line sampled value is '0'.
1	SDA line sampled value is '1'.

#### Bit 24 – SCL SCL Line Value

Value	Description
0	SCL line sampled value is '0'.
1	SCL line sampled value is '1'.

#### Bit 23 – TXFLOCK Transmit FIFO Lock

Value	Description
0	The Transmit FIFO is not locked.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
1	The Transmit FIFO is locked.

**Bit 21 – SMBHMM** SMBus Host Header Address Match (cleared on read)

Value	Description
0	No SMBus Host Header Address received.
1	A SMBus Host Header Address was received.

**Bit 20 – SMBDAM** SMBus Default Address Match (cleared on read)

Value	Description
0	No SMBus Default Address received.
1	A SMBus Default Address was received.

**Bit 19 – PECERR** PEC Error (cleared on read)

Value	Description
0	No SMBus PEC error occurred.
1	A SMBus PEC error occurred.

**Bit 18 – TOUT** Timeout Error (cleared on read)

Value	Description
0	No SMBus timeout occurred.
1	SMBus timeout occurred.

**Bit 16 – MACK** Master Code Acknowledge (cleared on read)

MACK used in Slave mode:

Value	Description
0	No master code has been received.
1	A master code has been received.

**Bit 11 – EOSACC** End Of Slave Access (cleared on read)

This bit is only used in Slave mode.

EOSACC behavior can be seen in figures [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	A Slave Access is being performed.
1	The Slave Access is finished. End Of Slave Access is automatically set as soon as SVACC is reset.

**Bit 10 – SCLWS** Clock Wait State

This bit is only used in Slave mode.

SCLWS behavior can be seen in figures [Clock Stretching in Read Mode](#) and [Clock Stretching in Write Mode](#).

Value	Description
0	The clock is not stretched.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
1	The clock is stretched. FLEX_TWI_THR / FLEX_TWI_RHR buffer is not filled / emptied before the transmission / reception of a new character.

**Bit 9 – ARBLST** Arbitration Lost (cleared on read)

This bit is only used in Master mode.

Value	Description
0	Arbitration won.
1	Arbitration lost. Another master of the TWI bus has won the multi-master arbitration. TXCOMP is set at the same time.

**Bit 8 – NACK** Not Acknowledged (cleared on read)

NACK used in Master mode:

0: Each data byte has been correctly received by the far-end side TWI slave component.

1: A data or address byte has not been acknowledged by the slave component. Set at the same time as TXCOMP.

NACK used in Slave Read mode:

0: Each data byte has been correctly received by the master.

1: In Read mode, a data byte has not been acknowledged by the master. When NACK is set the user must not fill FLEX\_TWI\_THR even if TXRDY is set, because it means that the master will stop the data transfer or re initiate it.

Note that in Slave Write mode all data are acknowledged by the TWI.

**Bit 7 – UNRE** Underrun Error (cleared on read)

This bit is only used in Slave mode if clock stretching is disabled.

Value	Description
0	FLEX_TWI_THR has been filled on time.
1	FLEX_TWI_THR has not been filled on time.

**Bit 6 – OVRE** Overrun Error (cleared on read)

This bit is only used in Slave mode if clock stretching is disabled.

Value	Description
0	FLEX_TWI_RHR has not been loaded while RXRDY was set.
1	FLEX_TWI_RHR has been loaded while RXRDY was set. Reset by read in FLEX_TWI_SR when TXCOMP is set.

**Bit 5 – GACC** General Call Access (cleared on read)

This bit is only used in Slave mode.

GACC behavior can be seen in figure [Master Performs a General Call](#).

Value	Description
0	No general call has been detected.
1	A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 4 – SVACC Slave Access

This bit is only used in Slave mode.

SVACC behavior can be seen in figures [Read Access Ordered by a Master](#), [Write Access Ordered by a Master](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	TWI is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected.
1	Indicates that the address decoding sequence has matched (a master has sent SADR). SVACC remains high until a NACK or a STOP condition is detected.

### Bit 3 – SVREAD Slave Read

This bit is only used in Slave mode. When SVACC is low (no slave access has been detected) SVREAD is irrelevant.

SVREAD behavior can be seen in figures [Read Access Ordered by a Master](#), [Write Access Ordered by a Master](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	Indicates that a write access is performed by a master.
1	Indicates that a read access is performed by a master.

### Bit 2 – TXRDY Transmit Holding Register Ready (cleared by writing FLEX\_TWI\_THR)

TXRDY used in Master mode:

0: The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into FLEX\_TWI\_THR.

1: As soon as a data byte is transferred from FLEX\_TWI\_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWI).

TXRDY behavior in Master mode can be seen in figures [Master Write with One Data Byte](#), [Master Write with Multiple Data Bytes](#) and [Master Write with One Byte Internal Address and Multiple Data Bytes](#).

TXRDY used in Slave mode:

0: As soon as data is written in FLEX\_TWI\_THR, until this data has been transmitted and acknowledged (ACK or NACK).

1: Indicates that FLEX\_TWI\_THR is empty and that data has been transmitted and acknowledged.

If TXRDY is high and if a NACK has been detected, the transmission will be stopped. Thus when TRDY = NACK = 1, the user must not fill FLEX\_TWI\_THR to avoid losing it.

TXRDY behavior in Slave mode can be seen in figures [Read Access Ordered by a Master](#), [Clock Stretching in Read Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

TXRDY behavior with FIFOs enabled is illustrated in [TXRDY and RXRDY Behavior](#).

**Bit 1 – RXRDY** Receive Holding Register Ready (cleared when reading FLEX\_TWI\_RHR)

When FIFOs are disabled:

0: No character has been received since the last FLEX\_TWI\_RHR read operation.

1: A byte has been received in FLEX\_TWI\_RHR since the last read.

RXRDY behavior in Master mode can be seen in figure [Master Read with Multiple Data Bytes](#).

RXRDY behavior in Slave mode can be seen in figures [Write Access Ordered by a Master](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RXRDY behavior with FIFO enabled is illustrated in [TXRDY and RXRDY Behavior](#).

**Bit 0 – TXCOMP** Transmission Completed (cleared by writing FLEX\_TWI\_THR)

TXCOMP used in Master mode:

0: During the length of the current frame.

1: When both holding register and internal shifter are empty and STOP condition has been sent.

TXCOMP behavior in Master mode can be seen in figures [Master Write with One Byte Internal Address and Multiple Data Bytes](#) and [Master Read with Multiple Data Bytes](#).

TXCOMP used in Slave mode:

0: As soon as a Start is detected.

1: After a Stop or a Repeated Start + an address different from SADR is detected.

TXCOMP behavior in Slave mode can be seen in figures [Clock Stretching in Read Mode](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Access					R/W	R/W	R/W	R/W		
Reset					0	0	0	0		

**Bits 31:24 – THMAX[7:0]** Clock High Maximum Cycles  
 Clock cycles in clock high maximum count. Prescaled by PRESC. Used for bus free detection. Used to time THIGH:MAX.

**Bits 23:16 – TLOWM[7:0]** Master Clock Stretch Maximum Cycles

Value	Description
0	TLOW:MEXT timeout check disabled.
1-255	Clock cycles in master maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:MEXT.

**Bits 15:8 – TLOWS[7:0]** Slave Clock Stretch Maximum Cycles

Value	Description
0	TLOW:SEXT timeout check disabled.
1-255	Clock cycles in slave maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:SEXT.

**Bits 3:0 – PRESC[3:0]** SMBus Clock Prescaler  
 Used to specify how to prescale the TLOWS, TLOWM and THMAX counters in SMBTR. Counters are prescaled according to the following formula:  $PRESC = \text{Log}(f_{MCK} / f_{Prescaled}) / \text{Log}(2) - 1$

Reset	0	0	0	0	0	0	0	0

#### Bit 25 – NPEC Next PEC Request (SMBus Mode only)

Value	Description
0	The next transfer does not use a PEC byte.
1	The next transfer uses a PEC byte.

#### Bit 24 – NDIR Next Transfer Direction

Value	Description
0	Write direction.
1	Read direction.

#### Bits 23:16 – NDATAL[7:0] Next Data Length

Value	Description
0	No data to send (see <a href="#">46.9.3.11 Alternative Command</a> ).
1–255	Number of bytes to send for the next transfer.

#### Bit 9 – PEC PEC Request (SMBus Mode only)

Value	Description
0	The transfer does not use a PEC byte.
1	The transfer uses a PEC byte.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

	[Greyed out bits 7-3]					PADFCFG	PADFEN	FILT	
Access						R/W	R/W	R/W	
Reset						0	0	0	

#### Bits 10:8 – THRES[2:0] Digital Filter Threshold

Value	Description
0	No filtering applied on TWI inputs.
1–7	Maximum pulse width of spikes which will be suppressed by the input filter, defined in peripheral clock cycles.

#### Bit 2 – PADFCFG PAD Filter Config

Refer to the section “Electrical Characteristics” for filter configuration details.

#### Bit 1 – PADFEN PAD Filter Enable

Value	Description
0	PAD analog filter is disabled.
1	PAD analog filter is enabled. (The analog filter must be enabled if High-speed mode is enabled.)

#### Bit 0 – FILT RX Digital Filter

TWI digital input filtering follows a majority decision based on three samples from SDA/SCL lines at peripheral clock frequency.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
0	No filtering applied on TWI inputs.
1	TWI input filtering is active. (Only in Standard and Fast modes)

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.78 TWI SleepWalking Matching Register

**Name:** FLEX\_TWI\_SWMR  
**Offset:** 0x64C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	DATAM[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	SADR3[6:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	SADR2[6:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	SADR1[6:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

**Bits 31:24 – DATAM[7:0] Data Match**

The TWI module will extend the SleepWalking matching process to the first received data comparing it with DATAM if DATAMEN bit is enabled.

**Bits 22:16 – SADR3[6:0] Slave Address 3**

Slave address 3. The TWI module will match on this additional address if SADR3EN bit is enabled.

**Bits 14:8 – SADR2[6:0] Slave Address 2**

Slave address 2. The TWI module will match on this additional address if SADR2EN bit is enabled.

**Bits 6:0 – SADR1[6:0] Slave Address 1**

Slave address 1. The TWI module will match on this additional address if SADR1EN bit is enabled.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.79 TWI FIFO Mode Register

**Name:** FLEX\_TWI\_FMR  
**Offset:** 0x650  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TWI Write Protection Mode Register](#).

	Bit	31	30	29	28	27	26	25	24	
		RXFTHRES[5:0]								
Access				R/W	R/W	R/W	R/W	R/W	R/W	
Reset				0	0	0	0	0	0	
	Bit	23	22	21	20	19	18	17	16	
		TXFTHRES[5:0]								
Access				R/W	R/W	R/W	R/W	R/W	R/W	
Reset				0	0	0	0	0	0	
	Bit	15	14	13	12	11	10	9	8	
Access										
Reset										
	Bit	7	6	5	4	3	2	1	0	
				RXRDYM[1:0]					TXRDYM[1:0]	
Access				R/W	R/W			R/W	R/W	
Reset				0	0			0	0	

#### Bits 29:24 – RXFTHRES[5:0] Receive FIFO Threshold

Value	Description
0–16	Defines the Receive FIFO threshold value (number of data). The FLEX_TWI_FSR.RXFTH flag will be set when Receive FIFO goes from “below” threshold state to “equal to or above” threshold state.

#### Bits 21:16 – TXFTHRES[5:0] Transmit FIFO Threshold

Value	Description
0–16	Defines the Transmit FIFO threshold value (number of data). The FLEX_TWI_FSR.TXFTH flag will be set when Transmit FIFO goes from “above” threshold state to “equal to or below” threshold state.

#### Bits 5:4 – RXRDYM[1:0] Receiver Ready Mode

If FIFOs are enabled, the FLEX\_TWI\_SR.RXRDY flag behaves as follows.

Value	Name	Description
0	ONE_DATA	RXRDY will be at level ‘1’ when at least one unread data is in the Receive FIFO

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Name	Description
1	TWO_DATA	RXRDY will be at level '1' when at least two unread data are in the Receive FIFO
2	FOUR_DATA	RXRDY will be at level '1' when at least four unread data are in the Receive FIFO

### Bits 1:0 – TXRDYM[1:0] Transmitter Ready Mode

If FIFOs are enabled, the FLEX\_TWI\_SR.TXRDY flag behaves as follows.

Value	Name	Description
0	ONE_DATA	TXRDY will be at level '1' when at least one data can be written in the Transmit FIFO
1	TWO_DATA	TXRDY will be at level '1' when at least two data can be written in the Transmit FIFO
2	FOUR_DATA	TXRDY will be at level '1' when at least four data can be written in the Transmit FIFO

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.80 TWI FIFO Level Register

**Name:** FLEX\_TWI\_FLR  
**Offset:** 0x654  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits 31-24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Greyed out bits 23-22]		RXFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	[Greyed out bits 15-8]							
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	[Greyed out bits 7-6]		TXFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

#### Bits 21:16 – RXFL[5:0] Receive FIFO Level

Value	Description
0	There is no unread data in the Receive FIFO.
1-16	Indicates the number of unread data in the Receive FIFO.

#### Bits 5:0 – TXFL[5:0] Transmit FIFO Level

Value	Description
0	There is no data in the Transmit FIFO.
1-16	Indicates the number of data in the Transmit FIFO.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.81 TWI FIFO Status Register

**Name:** FLEX\_TWI\_FSR  
**Offset:** 0x660  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bit 7 – RXFPTEF** Receive FIFO Pointer Error Flag  
 See [46.9.6.10 FIFO Pointer Error](#) for details.

Value	Description
0	No Receive FIFO pointer occurred.
1	Receive FIFO pointer error occurred. Receiver must be reset.

**Bit 6 – TXFPTEF** Transmit FIFO Pointer Error Flag  
 See [46.9.6.10 FIFO Pointer Error](#) for details.

Value	Description
0	No Transmit FIFO pointer occurred.
1	Transmit FIFO pointer error occurred. Transceiver must be reset.

**Bit 5 – RXFTHF** Receive FIFO Threshold Flag

Value	Description
0	Number of unread data in Receive FIFO is below RXFTHRES threshold.
1	Number of unread data in Receive FIFO has reached RXFTHRES threshold since the last read of FLEX_TWI_FSR.

**Bit 4 – RXFFF** Receive FIFO Full Flag

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Value	Description
0	Receive FIFO is not empty.
1	Receive FIFO has been filled since the last read of FLEX_TWI_FSR.

**Bit 3 – RXFEF** Receive FIFO Empty Flag

Value	Description
0	Receive FIFO is not empty.
1	Receive FIFO has been emptied since the last read of FLEX_TWI_FSR.

**Bit 2 – TXFTHF** Transmit FIFO Threshold Flag (cleared on read)

Value	Description
0	Number of data in Transmit FIFO is above TXFTHRES threshold.
1	Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of FLEX_TWI_FSR.

**Bit 1 – TXFFF** Transmit FIFO Full Flag (cleared on read)

Value	Description
0	Transmit FIFO is not full.
1	Transmit FIFO has been filled since the last read of FLEX_TWI_FSR.

**Bit 0 – TXFEF** Transmit FIFO Empty Flag (cleared on read)

Value	Description
0	Transmit FIFO is not empty.
1	Transmit FIFO has been emptied since the last read of FLEX_TWI_FSR.

### 46.10.82 TWI FIFO Interrupt Enable Register

**Name:** FLEX\_TWI\_FIER  
**Offset:** 0x664  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [TWI Write Protection Mode Register](#).

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x545749	PASSWD	Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN.  Always reads as 0.

#### Bit 2 – WPCREN Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x545749 (“TWI” in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x545749 (“TWI” in ASCII).

#### Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x545749 (“TWI” in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x545749 (“TWI” in ASCII).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

---

### Bit 0 – WPEN Write Protection Enable

See [TWI Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x545749 (“TWI” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x545749 (“TWI” in ASCII).

# SAMA5D2 Series

Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		WPVS							
Access									R
Reset									0

**Bits 31:8 – WPVSR[23:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protect Violation Status

Value	Description
0	No Write Protection Violation has occurred since the last read of FLEX_TWI_WPSR.
1	A Write Protection Violation has occurred since the last read of FLEX_TWI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

## 47. Universal Asynchronous Receiver Transmitter (UART)

### 47.1 Description

The Universal Asynchronous Receiver Transmitter (UART) features a two-pin UART that can be used for communication and trace purposes and offers an ideal medium for in-situ programming solutions.

Moreover, the association with a DMA controller permits packet handling for these tasks with processor time reduced to a minimum.

### 47.2 Embedded Characteristics

- Two-pin UART
  - Independent Receiver and Transmitter with a Common Programmable Baud Rate Generator
  - Baud Rate can be Driven by Processor-Independent Generic Source Clock
  - Even, Odd, Mark or Space Parity Generation
  - Parity, Framing and Overrun Error Detection
  - Automatic Echo, Local Loopback and Remote Loopback Channel Modes
  - Digital Filter on Receive Line
  - Interrupt Generation
  - Support for Two DMA Channels with Connection to Receiver and Transmitter
  - Supports Asynchronous Partial Wake-up on Receive Line Activity (SleepWalking)
  - Comparison Function on Received Character
  - Receiver Time-out
  - Register Write Protection

### 47.3 Block Diagram

**Figure 47-1. UART Block Diagram**

**Table 47-1. UART Pin Description**

Pin Name	Description	Type
URXD	UART Receive Data	Input
UTXD	UART Transmit Data	Output

## **47.4 Product Dependencies**

### **47.4.1 I/O Lines**

The UART pins are multiplexed with PIO lines. The user must first configure the corresponding PIO Controller to enable I/O line operations of the UART.

### **47.4.2 Power Management**

The UART clock can be controlled through the Power Management Controller (PMC). In this case, the user must first configure the PMC to enable the UART clock. Usually, the peripheral identifier used for this purpose is 1.

In SleepWalking mode (asynchronous partial wake-up), the PMC must be configured to enable SleepWalking for the UART in the Sleepwalking Enable Register (PMC\_SLPWK\_ER). Depending on the instructions (requests) provided by the UART to the PMC, the system clock may or may not be automatically provided to the UART.

### **47.4.3 Interrupt Sources**

The UART interrupt line is connected to one of the interrupt sources of the Interrupt Controller. Interrupt handling requires programming of the Interrupt Controller before configuring the UART.

## **47.5 Functional Description**

The UART operates in Asynchronous mode only and supports only 8-bit character handling (with parity). It has no clock pin.

The UART is made up of a receiver and a transmitter that operate independently, and a common baud rate generator. Receiver timeout and transmitter time guard are not implemented. However, all the implemented features are compatible with those of a standard USART.

### **47.5.1 Baud Rate Generator**

The baud rate generator provides the bit period clock named baud rate clock to both the receiver and the transmitter.

The baud rate clock is the peripheral clock divided by 16 times the clock divisor (CD) value written in the Baud Rate Generator register (UART\_BRGR). If UART\_BRGR is set to 0, the baud rate clock is disabled and the UART remains inactive. The maximum allowable baud rate is peripheral clock or GCLK divided by 16. The minimum allowable baud rate is peripheral clock divided by (16 x 65536). The clock source driving the baud rate generator (peripheral clock or GCLK) can be selected by writing the bit BRSRCK in UART\_MR.

If GCLK is selected, the baud rate is independent of the processor/bus clock. Thus the processor clock can be changed while UART is enabled. The processor clock frequency changes must be performed only by programming the field PRES in PMC\_MCKR (refer to "Power Management Controller (PMC)"). Other methods to modify the processor/bus clock frequency (PLL multiplier, etc.) are forbidden when UART is enabled.

The peripheral clock frequency must be at least three times higher than GCLK.

**Figure 47-2. Baud Rate Generator**

### 47.5.2 Receiver

#### 47.5.2.1 Receiver Reset, Enable and Disable

After device reset, the UART receiver is disabled and must be enabled before being used. The receiver can be enabled by writing the Control Register (UART\_CR) with the bit RXEN at 1. At this command, the receiver starts looking for a start bit.

The programmer can disable the receiver by writing UART\_CR with the bit RXDIS at 1. If the receiver is waiting for a start bit, it is immediately stopped. However, if the receiver has already detected a start bit and is receiving the data, it waits for the stop bit before actually stopping its operation.

The receiver can be put in reset state by writing UART\_CR with the bit RSTRX at 1. In this case, the receiver immediately stops its current operations and is disabled, whatever its current state. If RSTRX is applied when data is being processed, this data is lost.

#### 47.5.2.2 Start Detection and Data Sampling

The UART only supports asynchronous operations, and this affects only its receiver. The UART receiver detects the start of a received character by sampling the URXD signal until it detects a valid start bit. A low level (space) on URXD is interpreted as a valid start bit if it is detected for more than seven cycles of the sampling clock, which is 16 times the baud rate. Hence, a space that is longer than 7/16 of the bit period is detected as a valid start bit. A space which is 7/16 of a bit period or shorter is ignored and the receiver continues to wait for a valid start bit.

When a valid start bit has been detected, the receiver samples the URXD at the theoretical midpoint of each bit. It is assumed that each bit lasts 16 cycles of the sampling clock (1-bit period) so the bit sampling point is eight cycles (0.5-bit period) after the start of the bit. The first sampling point is therefore 24 cycles (1.5-bit periods) after detecting the falling edge of the start bit.

Each subsequent bit is sampled 16 cycles (1-bit period) after the previous one.

**Figure 47-3. Start Bit Detection**

**Figure 47-4. Character Reception**

Example: 8-bit, parity enabled 1 stop

### 47.5.2.3 Receiver Ready

When a complete character is received, it is transferred to the Receive Holding Register (UART\_RHR) and the RXRDY status bit in the Status Register (UART\_SR) is set. The bit RXRDY is automatically cleared when UART\_RHR is read.

**Figure 47-5. Receiver Ready**

### 47.5.2.4 Receiver Overrun

The OVRE status bit in UART\_SR is set if UART\_RHR has not been read by the software (or the DMA Controller) since the last transfer, the RXRDY bit is still set and a new character is received. OVRE is cleared when the software writes a 1 to the bit RSTSTA (Reset Status) in UART\_CR.

**Figure 47-6. Receiver Overrun**

### 47.5.2.5 Parity Error

Each time a character is received, the receiver calculates the parity of the received data bits, in accordance with the field PAR in the Mode Register (UART\_MR). It then compares the result with the received parity bit. If different, the parity error bit PARE in UART\_SR is set at the same time RXRDY is set. The parity bit is cleared when UART\_CR is written with the bit RSTSTA (Reset Status) at 1. If a new character is received before the reset status command is written, the PARE bit remains at 1.

**Figure 47-7. Parity Error**

### 47.5.2.6 Receiver Framing Error

When a start bit is detected, it generates a character reception when all the data bits have been sampled. The stop bit is also sampled and when it is detected at 0, the FRAME (Framing Error) bit in UART\_SR is set at the same time the RXRDY bit is set. The FRAME bit remains high until the Control Register (UART\_CR) is written with the bit RSTSTA at 1.

**Figure 47-8. Receiver Framing Error**

### 47.5.2.7 Receiver Digital Filter

The UART embeds a digital filter on the receive line. It is disabled by default and can be enabled by writing a logical 1 in the FILTER bit of UART\_MR. When enabled, the receive line is sampled using the 16x bit clock and a three-sample filter (majority 2 over 3) determines the value of the line.

### 47.5.2.8 Receiver Time-out

The Receiver Time-out provides support in handling variable-length frames. This feature detects an idle condition on the URXD line. When a time-out is detected, the bit TIMEOUT in the UART\_SR rises and can generate an interrupt, thus indicating to the driver an end of frame.

The time-out delay period (during which the receiver waits for a new character) is programmed in the TO field of the Receiver Time-out register (UART\_RTOR). If the TO field is written to 0, the Receiver Time-out is disabled and no time-out is detected. The TIMEOUT bit in the UART\_SR remains at 0. Otherwise, the receiver loads an 8-bit counter with the value programmed in TO. This counter is decremented at each bit period and reloaded each time a new character is received. If the counter reaches 0, the TIMEOUT bit in the UART\_SR rises. Then, the user can either:

- stop the counter clock until a new character is received. This is performed by writing a one to the STTTO (start Time-out) bit in the UART\_CR. In this case, the idle state on URXD before a new character is received does not provide a time-out. This prevents having to handle an interrupt before a character is received and allows waiting for the next idle state on URXD after a frame is received, or
- obtain an interrupt while no character is received. This is performed by writing a one to the RETTO (Reload and Start Time-out) bit in the UART\_CR. If RETTO is performed, the counter starts counting down immediately from the TO value. This enables generation of a periodic interrupt so that a user time-out can be handled, for example when no key is pressed on a keyboard.

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

If STTTO is performed, the counter clock is stopped until a first character is received. The idle state on URXD before the start of the frame does not provide a time-out. This prevents having to obtain a periodic interrupt and enables a wait of the end of frame when the idle state on URXD is detected.

If RETTO is performed, the counter starts counting down immediately from the TO value. This enables generation of a periodic interrupt so that a user time-out can be handled, for example when no key is pressed on a keyboard.

The figure below shows the block diagram of the Receiver Time-out feature.

**Figure 47-9. Receiver Time-out Block Diagram**

The table below gives the maximum time-out period for some standard baud rates.

**Table 47-2. Maximum Time-out Period**

Baud Rate (bit/s)	Bit Time ( $\mu\text{s}$ )	Time-out ( $\mu\text{s}$ )
600	1,667	425,085
1,200	833	212,415
2,400	417	106,335
4,800	208	53,040
9,600	104	26,520
14,400	69	17,595
19,200	52	13,260
28,800	35	8,925
38,400	26	6,630
56,000	18	4,590
57,600	17	4,335
200,000	5	1,275

### 47.5.3 Transmitter

#### 47.5.3.1 Transmitter Reset, Enable and Disable

After device reset, the UART transmitter is disabled and must be enabled before being used. The transmitter is enabled by writing UART\_CR with the bit TXEN at 1. From this command, the transmitter waits for a character to be written in the Transmit Holding Register (UART\_THR) before actually starting the transmission.

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

The programmer can disable the transmitter by writing UART\_CR with the bit TXDIS at 1. If the transmitter is not operating, it is immediately stopped. However, if a character is being processed into the internal shift register and/or a character has been written in the UART\_THR, the characters are completed before the transmitter is actually stopped.

The programmer can also put the transmitter in its reset state by writing the UART\_CR with the bit RSTTX at 1. This immediately stops the transmitter, whether or not it is processing characters.

### 47.5.3.2 Transmit Format

The UART transmitter drives the pin UTXD at the baud rate clock speed. The line is driven depending on the format defined in UART\_MR and the data stored in the internal shift register. One start bit at level 0, then the 8 data bits, from the lowest to the highest bit, one optional parity bit and one stop bit at 1 are consecutively shifted out as shown in the following figure. The field PARE in UART\_MR defines whether or not a parity bit is shifted out. When a parity bit is enabled, it can be selected between an odd parity, an even parity, or a fixed space or mark bit.

**Figure 47-10. Character Transmission**

### 47.5.3.3 Transmitter Control

When the transmitter is enabled, the bit TXRDY (Transmitter Ready) is set in UART\_SR. The transmission starts when the programmer writes in the UART\_THR, and after the written character is transferred from UART\_THR to the internal shift register. The TXRDY bit remains high until a second character is written in UART\_THR. As soon as the first character is completed, the last character written in UART\_THR is transferred into the internal shift register and TXRDY rises again, showing that the holding register is empty.

When both the internal shift register and UART\_THR are empty, i.e., all the characters written in UART\_THR have been processed, the TXEMPTY bit rises after the last stop bit has been completed.

**Figure 47-11. Transmitter Control**

### 47.5.4 DMA Support

Both the receiver and the transmitter of the UART are connected to a DMA Controller (DMAC) channel.

The DMA Controller channels are programmed via registers that are mapped within the DMAC user interface.

### 47.5.5 Comparison Function on Received Character

When a comparison is performed on a received character, the result of the comparison is reported on the CMP flag in UART\_SR when UART\_RHR is loaded with the new received character. The CMP flag is cleared by writing a one to the RSTSTA bit in UART\_CR.

UART\_CMPR (see [UART Comparison Register](#)) can be programmed to provide different comparison methods. These are listed below:

- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if either received character equals VAL1 or VAL2.

By programming the CMPMODE bit to 1, the comparison function result triggers the start of the loading of UART\_RHR (see the figure below). The trigger condition occurs as soon as the received character value matches the condition defined by the programming of VAL1, VAL2 and CMPPAR in UART\_CMPR. The comparison trigger event can be restarted by writing a one to the REQCLR bit in UART\_CR.

**Figure 47-12. Receive Holding Register Management**

CMPMODE = 1, VAL1 = VAL2 = 0x06

### 47.5.6 Asynchronous and Partial Wake-up (SleepWalking)

Asynchronous and partial wake-up (SleepWalking) is a means of data pre-processing that qualifies an incoming event, thus allowing the UART to decide whether or not to wake up the system. SleepWalking is used primarily when the system is in Wait mode (refer to section “Power Management Controller (PMC)”) but can also be enabled when the system is fully running.

No access must be performed in the UART between the enable of asynchronous partial wake-up and the wake-up performed by the UART.

If the system is in Wait mode and asynchronous and partial wake-up is enabled, the maximum baud rate that can be achieved equals 19200.

If the system is running or in Sleep mode, the maximum baud rate that can be achieved equals 115200 or higher. This limit is bounded by the peripheral clock frequency divided by 16.

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

---

The UART\_RHR must be read before enabling asynchronous and partial wake-up.

When SleepWalking is enabled for the UART (refer to section "Power Management Controller (PMC)"), the PMC decodes a clock request from the UART. The request is generated as soon as there is a falling edge on the URXD line as this may indicate the beginning of a start bit. If the system is in Wait mode (processor and peripheral clocks switched off), the PMC restarts the fast RC oscillator and provides the clock only to the UART.

As soon as the clock is provided by the PMC, the UART processes the received frame and compares the received character with VAL1 and VAL2 in UART\_CMPR ([UART Comparison Register](#)).

The UART instructs the PMC to disable the clock if the received character value does not meet the conditions defined by VAL1 and VAL2 fields in UART\_CMPR (see [Asynchronous Event Generating Only Partial Wake-up](#)).

If the received character value meets the conditions, the UART instructs the PMC to exit the full system from Wait mode (see [Asynchronous Wake-up Use Case Examples](#)).

The VAL1 and VAL2 fields can be programmed to provide different comparison methods and thus matching conditions.

- If VAL1 equals VAL2, then the comparison is performed on a single value and the wake-up is triggered if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 wakes up the system.
- If VAL1 is strictly higher than VAL2, then the wake-up is triggered if the received character equals VAL1 or VAL2.
- If VAL1 = 0 and VAL2 = 255, the wake-up is triggered as soon as a character is received.

The matching condition can be configured to include the parity bit (CMPPAR in UART\_CMPR). Thus, if the received data matches the comparison condition defined by VAL1 and VAL2 but a parity error is encountered, the matching condition is cancelled and the UART instructs the PMC to disable the clock (see [Asynchronous Event Generating Only Partial Wake-up](#)).

If the processor and peripherals are running, the UART can be configured in Asynchronous and partial wake-up mode by enabling the PMC\_SLPWK\_ER (refer to "Power Management Controller (PMC)"). When activity is detected on the receive line, the UART requests the clock from the PMC and the comparison is performed. If there is a comparison match, the UART continues to request the clock. If there is no match, the clock is switched off for the UART only, until a new activity is detected.

The CMPMODE configuration has no effect when Asynchronous and Partial Wake-up mode is enabled for the UART (refer to PMC\_SLPWK\_ER in "Power Management Controller (PMC)").

When the system is kept in active/running mode and the UART enters Asynchronous and Partial Wake-up mode, the flag CMP must be programmed as the unique source of the UART interrupt.

When the system exits Wait mode as the result of a matching condition, the RXRDY flag is used to determine if the UART is the source of exit.

**Note:** If the SleepWalking function is enabled on the UART, a divide by 8 of the peripheral clock versus the bus clock is not possible. Other dividers can be used with no constraints.

**Figure 47-13. Asynchronous Wake-up Use Case Examples**

Case with VAL1 = VAL2 = 0x55, CMPPAR = 1

Case with VAL1 = 0x54, VAL2 = 0x56, CMPPAR = 1

Case with VAL1 = 0x75, VAL2 = 0x76, CMPPAR = 0

**Figure 47-14. Asynchronous Event Generating Only Partial Wake-up**

Case with VAL1 = VAL2 = 0x00, CMPPAR = Don't care

Case with VAL1 = 0xF5, VAL2 = 0xF5, CMPPAR = 1

### 47.5.7 Register Write Protection

To prevent any single software error from corrupting UART behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [UART Write Protection Mode Register \(UART\\_WPMR\)](#).

The following registers can be write-protected:

- [UART Mode Register](#)
- [UART Baud Rate Generator Register](#)
- [UART Comparison Register](#)
- [UART Receiver Time-out Register](#)

### 47.5.8 Test Modes

The UART supports three test modes. These modes of operation are programmed by using the CHMODE field in [UART\\_MR](#).

The Automatic Echo mode allows a bit-by-bit retransmission. When a bit is received on the URXD line, it is sent to the UTXD line. The transmitter operates normally, but has no effect on the UTXD line.

The Local Loopback mode allows the transmitted characters to be received. UTXD and URXD pins are not used and the output of the transmitter is internally connected to the input of the receiver. The URXD pin level has no effect and the UTXD line is held high, as in idle state.

The Remote Loopback mode directly connects the URXD pin to the UTXD line. The transmitter and the receiver are disabled and have no effect. This mode allows a bit-by-bit retransmission.

### 47.6.1 UART Control Register

**Name:** UART\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
Access									
Reset									
Bit	15	14	13	12	11	10	9	8	
				REQCLR	STTTO	RETTO			RSTSTA
Access				W	W	W			W
Reset				–	–	–			–
Bit	7	6	5	4	3	2	1	0	
	TXDIS	TXEN	RXDIS	RXEN	RSTTX	RSTRX			
Access	W	W	W	W	W	W			
Reset	–	–	–	–	–	–			

#### Bit 12 – REQCLR Request Clear

- SleepWalking enabled:

0: No effect.

1: Bit REQCLR clears the potential clock request currently issued by UART, thus the potential system wake-up is cancelled.

- SleepWalking disabled:

0: No effect.

1: Bit REQCLR restarts the comparison trigger to enable receive holding register loading.

#### Bit 11 – STTTO Start Time-out

Value	Description
0	No effect.
1	Starts waiting for a character before clocking the time-out counter. Resets status bit TIMEOUT in UART_SR.

#### Bit 10 – RETTO Rearm Time-out

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

Value	Description
0	No effect.
1	Restarts time-out.

### Bit 8 – RSTSTA Reset Status

Value	Description
0	No effect.
1	Resets the status bits PARE, FRAME, CMP and OVRE in the UART_SR.

### Bit 7 – TXDIS Transmitter Disable

Value	Description
0	No effect.
1	The transmitter is disabled. If a character is being processed and a character has been written in the UART_THR and RSTTX is not set, both characters are completed before the transmitter is stopped.

### Bit 6 – TXEN Transmitter Enable

Value	Description
0	No effect.
1	The transmitter is enabled if TXDIS is 0.

### Bit 5 – RXDIS Receiver Disable

Value	Description
0	No effect.
1	The receiver is disabled. If a character is being processed and RSTRX is not set, the character is completed before the receiver is stopped.

### Bit 4 – RXEN Receiver Enable

Value	Description
0	No effect.
1	The receiver is enabled if RXDIS is 0.

### Bit 3 – RSTTX Reset Transmitter

Value	Description
0	No effect.
1	The transmitter logic is reset and disabled. If a character is being transmitted, the transmission is aborted.

### Bit 2 – RSTRX Reset Receiver

Value	Description
0	No effect.
1	The receiver logic is reset and disabled. If a character is being received, the reception is aborted.

Access	R/W	R/W		R/W	R/W	R/W	R/W								
Reset	0	0		0	0	0	0								
Bit	7	6	5	4	3	2	1	0							
				FILTER											
Access				R/W											
Reset				0											

#### Bits 15:14 – CHMODE[1:0] Channel Mode

Value	Name	Description
0	NORMAL	Normal mode
1	AUTOMATIC	Automatic echo
2	LOCAL_LOOPBACK	Local loopback
3	REMOTE_LOOPBACK	Remote loopback

#### Bit 12 – BRSRCCK Baud Rate Source Clock

0 (PERIPH\_CLK): The baud rate is driven by the peripheral clock

1 (GCLK): The baud rate is driven by a PMC-programmable clock GCLK (refer to section "Power Management Controller (PMC)").

#### Bits 11:9 – PAR[2:0] Parity Type

Value	Name	Description
0	EVEN	Even Parity
1	ODD	Odd Parity
2	SPACE	Space: parity forced to 0
3	MARK	Mark: parity forced to 1
4	NO	No parity

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

---

---

**Bit 4 – FILTER** Receiver Digital Filter

0 (DISABLED): UART does not filter the receive line.

1 (ENABLED): UART filters the receive line using a three-sample filter (16x-bit clock) (2 over 3 majority).

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

### 47.6.3 UART Interrupt Enable Register

**Name:** UART\_IER  
**Offset:** 0x08  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
Access									
Reset									
Bit	15	14	13	12	11	10	9	8	
	CMP							TXEMPTY	TIMEOUT
Access	W							W	W
Reset	–							–	–
Bit	7	6	5	4	3	2	1	0	
	PARE	FRAME	OVRE				TXRDY	RXRDY	
Access	W	W	W				W	W	
Reset	–	–	–				–	–	

**Bit 15 – CMP** Enable Comparison Interrupt

**Bit 9 – TXEMPTY** Enable TXEMPTY Interrupt

**Bit 8 – TIMEOUT** Enable Time-out Interrupt

**Bit 7 – PARE** Enable Parity Error Interrupt

**Bit 6 – FRAME** Enable Framing Error Interrupt

**Bit 5 – OVRE** Enable Overrun Error Interrupt

**Bit 1 – TXRDY** Enable TXRDY Interrupt

**Bit 0 – RXRDY** Enable RXRDY Interrupt

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

### 47.6.4 UART Interrupt Disable Register

**Name:** UART\_IDR  
**Offset:** 0x0C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
Access									
Reset									
Bit	15	14	13	12	11	10	9	8	
	CMP							TXEMPTY	TIMEOUT
Access	W							W	W
Reset	–							–	–
Bit	7	6	5	4	3	2	1	0	
	PARE	FRAME	OVRE				TXRDY	RXRDY	
Access	W	W	W				W	W	
Reset	–	–	–				–	–	

**Bit 15 – CMP** Disable Comparison Interrupt

**Bit 9 – TXEMPTY** Disable TXEMPTY Interrupt

**Bit 8 – TIMEOUT** Disable Time-out Interrupt

**Bit 7 – PARE** Disable Parity Error Interrupt

**Bit 6 – FRAME** Disable Framing Error Interrupt

**Bit 5 – OVRE** Disable Overrun Error Interrupt

**Bit 1 – TXRDY** Disable TXRDY Interrupt

**Bit 0 – RXRDY** Disable RXRDY Interrupt

#### Bit 15 – CMP Comparison Match

Value	Description
0	No received character matches the comparison criteria programmed in VAL1, VAL2 fields and in CMPPAR bit since the last RSTSTA.
1	The received character matches the comparison criteria.

#### Bit 9 – TXEMPTY Transmitter Empty

Value	Description
0	There are characters in UART_THR, or characters being processed by the transmitter, or the transmitter is disabled.
1	There are no characters in UART_THR and there are no characters being processed by the transmitter.

#### Bit 8 – TIMEOUT Receiver Time-out

Value	Description
0	There has not been a time-out since the last Start Time-out command (STTTO in UART_CR) or the Time-out Register is 0.
1	There has been a time-out since the last Start Time-out command (STTTO in UART_CR).

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

### Bit 7 – PARE Parity Error

Value	Description
0	No parity error has occurred since the last RSTSTA.
1	At least one parity error has occurred since the last RSTSTA.

### Bit 6 – FRAME Framing Error

Value	Description
0	No framing error has occurred since the last RSTSTA.
1	At least one framing error has occurred since the last RSTSTA.

### Bit 5 – OVRE Overrun Error

Value	Description
0	No overrun error has occurred since the last RSTSTA.
1	At least one overrun error has occurred since the last RSTSTA.

### Bit 1 – TXRDY Transmitter Ready

Value	Description
0	A character has been written to UART_THR and not yet transferred to the internal shift register, or the transmitter is disabled.
1	There is no character written to UART_THR not yet transferred to the internal shift register.

### Bit 0 – RXRDY Receiver Ready

Value	Description
0	No character has been received since the last read of the UART_RHR, or the receiver is disabled.
1	At least one complete character has been received, transferred to UART_RHR and not yet read.

Access										R/W
Reset										0

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x554152	PASSWD	Writing any other value in this field aborts the write operation. Always reads as 0.

#### Bit 0 – WPEN Write Protection Enable

See [Register Write Protection](#) for the list of registers that can be protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x554152 (UART in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x554152 (UART in ASCII).

## 48. Serial Peripheral Interface (SPI)

### 48.1 Description

The Serial Peripheral Interface (SPI) circuit is a synchronous serial data link that provides communication with external devices in Master or Slave mode. It also enables communication between processors if an external processor is connected to the system.

The Serial Peripheral Interface is essentially a shift register that serially transmits data bits to other SPIs. During a data transfer, one SPI system acts as the “master” which controls the data flow, while the other devices act as “slaves” which have data shifted into and out by the master. Different CPUs can take turn being masters (multiple master protocol, contrary to single master protocol where one CPU is always the master while all of the others are always slaves). One master can simultaneously shift data into multiple slaves. However, only one slave can drive its output to write data back to the master at any given time.

A slave device is selected when the master asserts its NSS signal. If multiple slave devices exist, the master generates a separate slave select signal for each slave (NPCS).

The SPI system consists of two data lines and two control lines:

- Master Out Slave In (MOSI)—This data line supplies the output data from the master shifted into the input(s) of the slave(s).
- Master In Slave Out (MISO)—This data line supplies the output data from a slave to the input of the master. There may be no more than one slave transmitting data during any particular transfer.
- Serial Clock (SPCK)—This control line is driven by the master and regulates the flow of the data bits. The master can transmit data at a variety of baud rates; there is one SPCK pulse for each bit that is transmitted.
- Slave Select (NSS)—This control line allows slaves to be turned on and off by hardware.

### 48.2 Embedded Characteristics

- Master or Slave Serial Peripheral Bus Interface
  - 8-bit to 16-bit programmable data length per chip select
  - Programmable phase and polarity per chip select
  - Programmable transfer delay between consecutive transfers and delay before SPI clock per chip select
  - Programmable delay between chip selects
  - Selectable mode fault detection
- Master Mode can Drive SPCK up to Peripheral Clock
- 16-data Transmit and Receive FIFOs
- Master Mode Bit Rate can be Independent of the Processor/Peripheral Clock
- Slave Mode Operates on SPCK, Asynchronously with Core and Bus Clock
- Four Chip Selects with External Decoder Support Allow Communication with up to 15 Peripherals
- Communication with Serial External Devices Supported
  - Serial memories, such as DataFlash and 3-wire EEPROMs
  - Serial peripherals, such as ADCs, DACs, LCD controllers, CAN controllers and sensors
  - External coprocessors

- Connection to DMA Channel Capabilities, Optimizing Data Transfers
  - One channel for the receiver
  - One channel for the transmitter
- Register Write Protection

### 48.3 Block Diagram

Figure 48-1. Block Diagram

### 48.4 Application Block Diagram

Figure 48-2. Application Block Diagram: Single Master/Multiple Slave Implementation

## 48.5 Signal Description

**Table 48-1. Signal Description**

Pin Name	Pin Description	Type	
		Master	Slave
MISO	Master In Slave Out	Input	Output
MOSI	Master Out Slave In	Output	Input
SPCK	Serial Clock	Output	Input
NPCS1–NPCS3	Peripheral Chip Selects	Output	Unused
NPCS0/NSS	Peripheral Chip Select/Slave Select	Output	Input

## 48.6 Product Dependencies

### 48.6.1 I/O Lines

The pins used for interfacing the compliant external devices can be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the SPI pins to their peripheral functions.

### 48.6.2 Power Management

The SPI can be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the SPI clock.

### 48.6.3 Interrupt

The SPI interface has an interrupt line connected to the interrupt controller. Handling the SPI interrupt requires programming the interrupt controller before configuring the SPI.

### 48.6.4 Direct Memory Access Controller (DMAC)

The SPI interface can be used in conjunction with the DMAC in order to reduce processor overhead. For a full description of the DMAC, refer to the relevant section.

## 48.7 Functional Description

### 48.7.1 Modes of Operation

The SPI operates in Master mode or in Slave mode.

- The SPI operates in Master mode by setting the MSTR bit in the SPI Mode Register (SPI\_MR):
  - Pins NPCS0 to NPCS3 are all configured as outputs
  - The SPCK pin is driven
  - The MISO line is wired on the receiver input
  - The MOSI line is driven as an output by the transmitter.
- The SPI operates in Slave mode if the MSTR bit in SPI\_MR is written to '0':
  - The MISO line is driven by the transmitter output
  - The MOSI line is wired on the receiver input

- The SPCK pin is driven by the transmitter to synchronize the receiver.
- The NPCS0 pin becomes an input, and is used as a slave select signal (NSS)
- The NPCS1 to NPCS3 pins are not driven and can be used for other purposes.

The data transfers are identically programmable for both modes of operation. The baud rate generator is activated only in Master mode.

### 48.7.2 Data Transfer

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the CPOL bit in the SPI Chip Select registers (SPI\_CSRx). The clock phase is programmed with the NCPHA bit. These two parameters determine the edges of the clock signal on which data is driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Consequently, a master/slave pair must use the same parameter pair values to communicate. If multiple slaves are connected and require different configurations, the master must reconfigure itself each time it needs to communicate with a different slave.

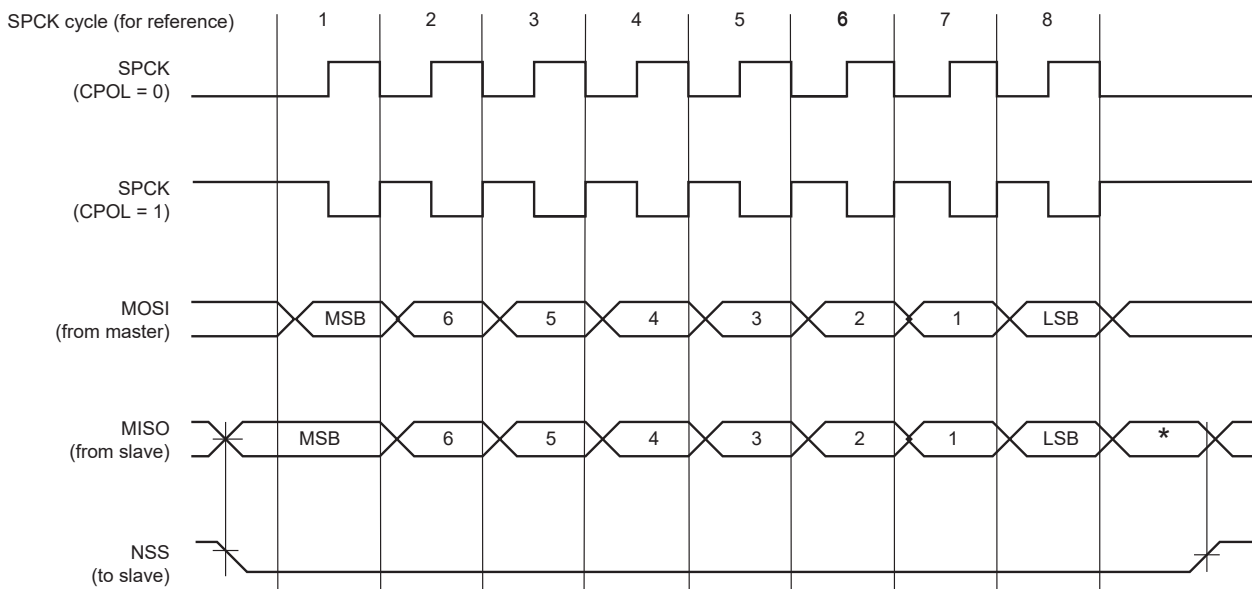

The table below shows the four modes and corresponding parameter settings.

**Table 48-2. SPI Bus Protocol Modes**

SPI Mode	CPOL	NCPHA	Shift SPCK Edge	Capture SPCK Edge	SPCK Inactive Level
0	0	1	Falling	Rising	Low
1	0	0	Rising	Falling	Low
2	1	1	Rising	Falling	High
3	1	0	Falling	Rising	High

The following figures show examples of data transfers.

**Figure 48-3. SPI Transfer Format (NCPHA = 1, 8 bits per transfer)**

\* Not defined.

**Figure 48-4. SPI Transfer Format (NCPHA = 0, 8 bits per transfer)**

### 48.7.3 Master Mode Operations

When configured in Master mode, the SPI operates on the clock generated by the internal programmable baud rate generator. It fully controls the data transfers to and from the slave(s) connected to the SPI bus. The SPI drives the chip select line to the slave and the serial clock signal (SPCK).

The SPI features two holding registers, the Transmit Data Register (SPI\_TDR) and the Receive Data Register (SPI\_RDR), and a single shift register. The holding registers maintain the data flow at a constant rate.

After enabling the SPI, a data transfer starts when the processor writes to SPI\_TDR. The written data is immediately transferred into the internal shift register and the transfer on the SPI bus starts. While the data in the shift register is shifted on the MOSI line, the MISO line is sampled and shifted into the shift register. Data cannot be loaded in SPI\_RDR without transmitting data. If there is no data to transmit, dummy data can be used (SPI\_TDR filled with ones). If SPI\_MR.WDRBT is set, transmission can occur only if SPI\_RDR has been read. If Receiving mode is not required, for example when communicating with a slave receiver only (such as an LCD), the receive status flags in the SPI Status register (SPI\_SR) can be discarded.

Before writing SPI\_TDR, SPI\_MR.PCS must be set in order to select a slave.

If new data is written in SPI\_TDR during the transfer, it is kept in SPI\_TDR until the current transfer is completed. Then, the received data is transferred from the shift register to SPI\_RDR, the data in SPI\_TDR is loaded in the shift register and a new transfer starts.

As soon as SPI\_TDR is written, the Transmit Data Register Empty (TDRE) flag in SPI\_SR is cleared. When the data written in SPI\_TDR is loaded into the shift register, TDRE in SPI\_SR is set. The TDRE flag is used to trigger the Transmit DMA channel.

See the figure below.

The end of transfer is indicated by the TXEMPTY flag in SPI\_SR. If a transfer delay (DLYBCT) is greater than 0 for the last transfer, TXEMPTY is set after the completion of this delay. The peripheral clock can be switched off at this time.

**Note:** When the SPI is enabled, the TDRE and TXEMPTY flags are set.

**Figure 48-5. TDRE and TXEMPTY Flag Behavior**

The transfer of received data from the internal shift register to SPI\_RDR is indicated by the Receive Data Register Full (RDRF) bit in SPI\_SR. When the received data is read, SPI\_SR.RDRF is cleared.

If SPI\_RDR has not been read before new data is received, the Overrun Error (OVRES) flag in SPI\_SR is set. As long as this flag is set, data is loaded in SPI\_RDR. The user has to read SPI\_SR to clear OVRES.

The following figures show, respectively, a block diagram of the SPI when operating in Master mode and a flow chart describing how transfers are handled.

### 48.7.3.1 Master Mode Block Diagram

**Figure 48-6. Master Mode Block Diagram**

### 48.7.3.2 Master Mode Flow Diagram

**Figure 48-7. Master Mode Flow Diagram**

The figure below shows the behavior of Transmit Data Register Empty (TDRE), Receive Data Register (RDRF) and Transmission Register Empty (TXEMPTY) status flags within SPI\_SR during an 8-bit data transfer in Fixed mode without the DMA involved.

**Figure 48-8. Status Register Flags Behavior**

### 48.7.3.3 Clock Generation

The SPI Baud rate clock is generated by dividing the peripheral clock by a value between 1 and 255.

If SPI\_CSRx.SCBR is programmed to 1, the operating baud rate is peripheral clock (refer to the section “Electrical Characteristics” for the SPCK maximum frequency). Triggering a transfer while SPI\_CSRx.SCBR is at 0 can lead to unpredictable results.

At reset, SPI\_CSRx.SCBR=0 and the user has to program it to a valid value before performing the first transfer.

The divisor can be defined independently for each chip select, as it has to be programmed in SPI\_CSRx.SCBR. This allows the SPI to automatically adapt the baud rate for each interfaced peripheral without reprogramming.

### 48.7.3.4 Transfer Delays

The following figure shows a chip select transfer change and consecutive transfers on the same chip select. Three delays can be programmed to modify the transfer waveforms:

- Delay between the chip selects—programmable only once for all chip selects by writing field SPI\_MR.DLYBCS. The SPI slave device deactivation delay is managed through DLYBCS. If there is only one SPI slave device connected to the master, DLYBCS does not need to be configured. If several slave devices are connected to a master, DLYBCS must be configured depending on the highest deactivation delay. Refer to details on the SPI slave device in the section “Electrical Characteristics”.
- Delay before SPCK— Independently programmable for each chip select by writing SPI\_CSRx.DLYBS. The SPI slave device activation delay is managed through DLYBS. Refer to details on the SPI slave device in the section “Electrical Characteristics” to define DLYBS.

- Delay between consecutive transfers—independently programmable for each chip select by writing SPI\_CSRx.DLYBCT. The time required by the SPI slave device to process received data is managed through DLYBCT. This time depends on the SPI slave system activity.

These delays allow the SPI to be adapted to the interfaced peripherals and their speed and bus release time.

**Figure 48-9. Programmable Delays**

### 48.7.3.5 Peripheral Selection

The serial peripherals are selected through the assertion of the NPCS0 to NPCS3 signals. By default, all NPCS signals are high before and after each transfer.

- **Fixed Peripheral Select Mode:** SPI exchanges data with only one peripheral. Fixed Peripheral Select mode is enabled by clearing SPI\_MR.PS. In this case, the current peripheral is defined by SPI\_MR.PCS. SPI\_TDR.PCS has no effect.
- **Variable Peripheral Select Mode:** Data can be exchanged with more than one peripheral without having to reprogram SPI\_MR.PCS.

Variable Peripheral Select mode is enabled by setting SPI\_MR.PS. SPI\_TDR.PCS is used to select the current peripheral. This means that the peripheral selection can be defined for each new data. The value must be written in a single access to SPI\_TDR in the following format:

[xxxxxxx(7-bit) + LASTXFER(1-bit)<sup>(1)</sup> + xxxx(4-bit) + PCS (4-bit) + TD (8- to 16-bit data)]

with LASTXFER at 0 or 1 depending on the CSAAT bit, and PCS equal to the chip select to assert, as defined in section [SPI Transmit Data Register](#).

**Note:**

1. Optional

For details on CSAAT, LASTXFER and CSNAAT, see section [Peripheral Deselection with another DMA](#).

If LASTXFER is used, the command must be issued after writing the last character. Instead of LASTXFER, the user can use the SPIDIS command. After the end of the DMA transfer, it is necessary to wait for the TXEMPTY flag and then write SPIDIS into the SPI Control Register (SPI\_CR). This does not change the configuration register values). The NPCS is disabled after the last character transfer. Then, another DMA transfer can be started if SPI\_CR.SPIEN has previously been written.

### 48.7.3.6 SPI Direct Access Memory Controller (DMAC)

In both Fixed and Variable modes, the Direct Memory Access Controller (DMAC) can be used to reduce processor overhead.

The fixed peripheral selection allows buffer transfers with a single peripheral. Using the DMAC is an optimal means, as the size of the data transfer between the memory and the SPI is either 8 bits or 16 bits. However, if the peripheral selection is modified, SPI\_MR must be reprogrammed.

The variable peripheral selection allows buffer transfers with multiple peripherals without reprogramming SPI\_MR. Data written in SPI\_TDR is 32 bits wide and defines the real data to be transmitted and the destination peripheral. Using the DMAC in this mode requires 32-bit wide buffers, with the data in the LSBs and the PCS and LASTXFER fields in the MSBs. However, the SPI still controls the number of bits (8 to 16) to be transferred through MISO and MOSI lines with the chip select configuration registers. This is not the optimal means in terms of memory size for the buffers, but it provides a very effective means to exchange data with several peripherals without any intervention of the processor.

### 48.7.3.7 Peripheral Chip Select Decoding

The user can program the SPI to operate with up to 15 slave peripherals by decoding the four chip select lines, NPCS0 to NPCS3 with an external decoder/demultiplexer (see figure below). This can be enabled by setting SPI\_MR.PCSDEC.

When operating without decoding, the SPI makes sure that in any case only one chip select line is activated, i.e., one NPCS line driven low at a time. If two bits are defined low in a PCS field, only the lowest numbered chip select is driven low.

When operating with decoding, the SPI directly outputs the value defined by the PCS field on the NPCS lines of either SPI\_MR or SPI\_TDR (depending on PS).

As the SPI sets a default value of 0xF on the chip select lines (i.e., all chip select lines at 1) when not processing any transfer, only 15 peripherals can be decoded.

The SPI has four chip select registers (SPI\_CSR0...SPI\_CSR3). As a result, when external decoding is activated, each NPCS chip select defines the characteristics of up to four peripherals. As an example, SPI\_CSR0 defines the characteristics of the externally decoded peripherals 0 to 3, corresponding to the PCS values 0x0 to 0x3. Consequently, the user has to make sure to connect compatible peripherals on the decoded chip select lines 0 to 3, 4 to 7, 8 to 11 and 12 to 14. The following figure shows this type of implementation.

If SPI\_CSRx.CSAAT bit is used, with or without the DMAC, the Mode Fault detection for NPCS0 line must be disabled. This is not needed for all other chip select lines since Mode Fault detection is only on NPCS0.

**Figure 48-10. Chip Select Decoding Application Block Diagram: Single Master/Multiple Slave Implementation**

#### 48.7.3.8 Peripheral Deselection without DMA

During a transfer of more than one unit of data on a chip select without the DMA, SPI\_TDR is loaded by the processor, the TDRE flag rises as soon as the content of SPI\_TDR is transferred into the internal shift register. When this flag is detected high, SPI\_TDR can be reloaded. If this reload by the processor occurs before the end of the current transfer and if the next transfer is performed on the same chip select as the current transfer, the chip select is not deasserted between the two transfers. But depending on the application software handling the SPI status register flags (by interrupt or polling method) or servicing other interrupts or other tasks, the processor may not reload SPI\_TDR in time to keep the chip select active (low). A null DLYBCT value (delay between consecutive transfers) in SPI\_CSR, gives even less time for the processor to reload SPI\_TDR. With some SPI slave peripherals, if the chip select line must remain active (low) during a full set of transfers, communication errors can occur.

To facilitate interfacing with such devices, the chip select registers [SPI\_CSR0...SPI\_CSR3] can be programmed with the Chip Select Active After Transfer (CSAAT) bit at 1. This allows the chip select lines to remain in their current state (low = active) until a transfer to another chip select is required. Even if SPI\_TDR is not reloaded, the chip select remains active. To deassert the chip select line at the end of the transfer, the Last Transfer (LASTXFER) bit in SPI\_CR must be set after writing the last data to transmit into SPI\_TDR.

#### 48.7.3.9 Peripheral Deselection with DMA

DMA provides faster reloads of SPI\_TDR compared to software. However, depending on the system activity, it is not guaranteed that SPI\_TDR is written with the next data before the end of the current transfer. Consequently, data can be lost by the deassertion of the NPCS line for SPI slave peripherals requiring the chip select line to remain active between two transfers. The only way to guarantee a safe transfer in this case is the use of the CSAAT and LASTXFER bits.

When the CSAAT bit is configured to 0, the NPCS does not rise in all cases between two transfers on the same peripheral. During a transfer on a chip select, the TDRE flag rises as soon as the content of SPI\_TDR is transferred into the internal shift register. When this flag is detected, SPI\_TDR can be reloaded. If this reload occurs before the end of the current transfer and if the next transfer is performed on the same chip select as the current transfer, the chip select is not deasserted between the two

transfers. This can lead to difficulties to interface with some serial peripherals requiring the chip select to be deasserted after each transfer. To facilitate interfacing with such devices, SPI\_CSR can be programmed with the Chip Select Not Active After Transfer (CSNAAT) bit at 1. This allows the chip select lines to be deasserted systematically during a time “DLYBCS” (the value of the CSNAAT bit is processed only if the CSAAT bit is configured to 0 for the same chip select).

The following figure shows different peripheral deselection cases and the effect of the CSAAT and CSNAAT bits.

**Figure 48-11. Peripheral Deselection**

### 48.7.3.10 Mode Fault Detection

The SPI has the capability to operate in multimaster environment. Consequently, the NPCS0/NSS line must be monitored. If one of the masters on the SPI bus is currently transmitting, the NPCS0/NSS line is low and the SPI must not transmit any data. A mode fault is detected when the SPI is programmed in Master mode and a low level is driven by an external master on the NPCS0/NSS signal. In multimaster

environment, NPCS0, MOSI, MISO and SPCK pins must be configured in open drain (through the PIO controller). When a mode fault is detected, SPI\_SR.MODF bit is set until SPI\_SR is read and the SPI is automatically disabled until it is reenabled by setting SPI\_CR.SPIEN bit.

By default, the mode fault detection is enabled. The user can disable it by setting SPI\_MR.MODFDIS bit.

#### 48.7.4 SPI Slave Mode

When operating in Slave mode, the SPI processes data bits on the clock provided on the SPI clock pin (SPCK).

The SPI waits until NSS goes active before receiving the serial clock from an external master. When NSS falls, the clock is validated and the data is loaded in SPI\_RDR depending on the configuration of SPI\_CSR0.BITS. These bits are processed following a phase and a polarity defined respectively by the NCPHA and CPOL bits in SPI\_CSR0. Note that the fields BITS, CPOL and NCPHA of the other chip select registers (SPI\_CSR1...SPI\_CSR3) have no effect when the SPI is programmed in Slave mode.

The bits are shifted out on the MISO line and sampled on the MOSI line.

**Note:** For more information on SPI\_CSRx.BITS, see the note in section [SPI Chip Select Register](#).

When all bits are processed, the received data is transferred in SPI\_RDR and the RDRF bit rises. If SPI\_RDR has not been read before new data is received, the Overrun Error Status (OVRES) bit in SPI\_SR is set. As long as this flag is set, data is loaded in SPI\_RDR. The user must read SPI\_SR to clear the OVRES bit.

When a transfer starts, the data shifted out is the data present in the internal shift register. If no data has been written in SPI\_TDR, the last data received is transferred. If no data has been received since the last reset, all bits are transmitted low, as the internal shift register resets to 0.

When a first data is written in SPI\_TDR, it is transferred immediately in the internal shift register and the TDRE flag rises. If new data is written, it remains in SPI\_TDR until a transfer occurs, i.e., NSS falls and there is a valid clock on the SPCK pin. When the transfer occurs, the last data written in SPI\_TDR is transferred in the internal shift register and the TDRE flag rises. This enables frequent updates of critical variables with single transfers.

Then, new data is loaded in the internal shift register from SPI\_TDR. If no character is ready to be transmitted, i.e., no character has been written in SPI\_TDR since the last load from SPI\_TDR to the internal shift register, SPI\_TDR is retransmitted. In this case the Underrun Error Status Flag (UNDES) is set in SPI\_SR.

If NSS rises between two characters, it must be kept high for two MCK clock periods or more and the next SPCK capture edge must not occur less than four MCK periods after NSS rise.

The following figure shows a block diagram of the SPI when operating in Slave mode.

**Figure 48-12. Slave Mode Functional Block Diagram**

### 48.7.5 SPI Comparison Function on Received Character

The comparison is only relevant for SPI Slave mode (SPI\_MR.MSTR=0).

The effect of a comparison match changes if the system is in Wait or Active mode.

In Wait mode, if asynchronous partial wakeup is enabled, a system wakeup is performed (see section [SPI Asynchronous and Partial Wakeup \(SleepWalking\)](#)).

In Active mode, the CMP flag in SPI\_SR is raised. It is set when the received character matches the conditions programmed in the SPI Comparison Register (SPI\_CMPR). The CMP flag is set as soon as SPI\_RDR is loaded with the new received character. The CMP flag is cleared by reading SPI\_SR.

SPI\_CMPR (see section [SPI Comparison Register](#)) can be programmed to provide different comparison methods. These are listed below:

- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if any received character equals VAL1 or VAL2.

When SPI\_MR.CMPMODE is cleared, all received data is loaded in SPI\_RDR and the CMP flag provides the status of the comparison result.

By setting SPI\_MR.CMPMODE, the comparison result triggers the start of SPI\_RDR loading (see the following figure). The trigger condition exists as soon as the received character value matches the conditions defined by VAL1 and VAL2 in SPI\_CMPR. The comparison trigger event is restarted by setting SPI\_CR.REQCLR if SleepWalking is disabled.

The value programmed in VAL1 and VAL2 fields must not exceed the maximum value of the received character (see SPI\_CSR0.BITS).

**Figure 48-13. Receive Data Register Management**

CMPMODE = 1, VAL1 = VAL2 = 0x06

### 48.7.6 SPI Asynchronous and Partial Wakeup (SleepWalking)

This operating mode is a means of data preprocessing that qualifies an incoming event, thus allowing the SPI to decide whether or not to wake up the system. Asynchronous and partial wakeup is mainly used when the system is in Wait mode (refer to the section “Power Management Controller (PMC)” for further details). It can also be enabled when the system is fully running.

Asynchronous and partial wakeup can be used only when SPI is configured in Slave mode (SPI\_MR.MSTR is cleared).

The maximum SPI clock (SPCK) frequency that can be provided by the SPI master is bounded by the peripheral clock frequency. The SPCK frequency must be lower than or equal to the peripheral clock. The NSS line must be deasserted by the SPI master between two characters. The NSS deassertion duration time must be greater than or equal to six peripheral clock periods. The time between the assertion of NSS line (falling edge) and the first edge of the SPI clock must be higher than 5  $\mu$ s.

SPI\_RDR must be read before enabling the asynchronous and partial wakeup.

When asynchronous and partial wakeup is enabled for the SPI (refer to the section “Power Management Controller (PMC)” ), the PMC decodes a clock request from the SPI. The request is generated as soon as there is a falling edge on the NSS line as this may indicate the beginning of a frame. If the system is in Wait mode (processor and peripheral clocks switched off), the PMC restarts the fast RC oscillator and provides the clock only to the SPI.

The SPI processes the received frame and compares the received character with SPI\_CMPR.VAL1 and SPI\_CMPR.VAL2 (see section [SPI Comparison Register](#)).

The SPI instructs the PMC to disable the peripheral clock if the received character value does not meet the conditions defined by SPI\_CMPR.VAL1 and SPI\_CMPR.VAL2 (see figure [Asynchronous Event Generating Only Partial Wakeup](#)).

If the received character value meets the conditions, the SPI instructs the PMC to exit the system from Wait mode (see figure [Asynchronous Wakeup Use Case Example](#)).

The VAL1 and VAL2 fields can be programmed to provide different comparison methods and thus matching conditions.

- If VAL1 = VAL2, then the comparison is performed on a single value and the wakeup is triggered if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 wakes up the system.
- If VAL1 is strictly higher than VAL2, the wakeup is triggered if any received character equals VAL1 or VAL2.
- If VAL1 = 0 and VAL2 = 65535, the wakeup is triggered as soon as a character is received.

If the processor and peripherals are running, the SPI can be configured in Asynchronous and Partial Wakeup mode by enabling the PMC\_SLPWK\_ER (refer to the section “Power Management Controller (PMC)”). When activity is detected on the receive line, the SPI requests the clock from the PMC and the comparison is performed. If there is a comparison match, the SPI continues to request the clock. If there is no match, the clock is switched off for the SPI only, until a new activity is detected.

The CMPMODE configuration has no effect when Asynchronous and Partial Wakeup mode is enabled for the SPI (refer to PMC\_SLPWK\_ER in the section “Power Management Controller (PMC)”).

When the system is in Active mode and the SPI enters Asynchronous and Partial Wakeup mode, the flag RDRF must be programmed as the unique source of the SPI interrupt.

When the system exits Wait mode as the result of a matching condition, the RDRF flag is used to determine if the SPI is the source for the exit from Wait mode.

### Figure 48-14. Asynchronous Wakeup Use Case Example

Case with VAL1 = VAL2 = 0x55

**Figure 48-15. Asynchronous Event Generating Only Partial Wakeup**

Case with VAL1 = VAL2 = 0x55

### 48.7.7 FIFOs

#### 48.7.7.1 Overview

The SPI includes two FIFOs which can be enabled/disabled using SPI\_CR.FIFOEN/FIFODIS. The SPI must be disabled (SPI\_CR.SPIDIS) before enabling or disabling the SPI FIFOs.

Writing SPI\_CR.FIFOEN to '1' enables a 16-data Transmit FIFO and a 16-data Receive FIFO.

It is possible to write or to read single or multiple data in the same access to SPI\_TDR/RDR. Refer to sections [Single Data Mode](#) and [Multiple Data Mode](#).

**Figure 48-16. FIFOs Block Diagram**

#### 48.7.7.2 Sending Data with FIFO Enabled

When the Transmit FIFO is enabled, write access to SPI\_TDR loads the Transmit FIFO.

The FIFO level is provided in SPI\_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor SPI\_SR.TDRE and the data can be successively written in SPI\_TDR.

If the FIFO cannot accept the data due to insufficient space, wait for the TDRE flag to be set before writing the data in SPI\_TDR.

When the space in the FIFO allows only a portion of the data to be written, the TDRE flag must be monitored before writing the remaining data.

**Figure 48-17. Sending Data with FIFO**

### 48.7.7.3 Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, SPI\_RDR access reads the FIFO.

When data are present in the Receive FIFO (RDRF flag set to '1'), the exact number of data can be checked with SPI\_FLR.RXFL. All the data can be read successively in SPI\_RDR without checking the RDRF flag between each access.

**Figure 48-18. Receiving Data with FIFO**

#### 48.7.7.4 Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using SPI\_CR.TXFCLR/RXFCLR.

#### 48.7.7.5 TXEMPTY, TDRE and RDRF Behavior

SPI\_SR.TXEMPTY, SPI\_SR.TDRE and SPI\_SR.RDRF flags display a specific behavior when FIFOs are enabled.

The TXEMPTY flag is cleared as long as there are characters in the Transmit FIFO or in the internal shift register. TXEMPTY is set when there are no characters in the Transmit FIFO and in the internal shift register.

TDRE indicates if a data can be written in the Transmit FIFO. Thus the TDRE flag is set as long as the Transmit FIFO can accept new data. Refer to figure [TDRE in Single Data Mode and TXRDYM=0](#).

RDRF indicates if an unread data is present in the Receive FIFO. Thus the RDRF flag is set as soon as one unread data is in the Receive FIFO. Refer to figure [RDRF in Single Data Mode and RXRDYM=0](#).

TDRE and RDRF behavior can be modified using the TXRDYM and RXRDYM fields in the SPI FIFO Mode Register (SPI\_FMR) to reduce the number of accesses to SPI\_TDR/RDR. However, for some configurations, the following constraints apply:

- When the Variable Peripheral Select mode is used (SPI\_MR.PS=1), SPI\_FMR.TXRDYM/RXRDYM must be cleared.
- In Master mode (SPI\_MR.MSTR=1), SPI\_FMR.RXRDYM must be cleared.

As an example, in Master mode, the Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0.

See section [SPI FIFO Mode Register](#) for the FIFO configuration.

**Figure 48-19. TDRE in Single Data Mode and TXRDYM=0**

**Figure 48-20. RDRF in Single Data Mode and RXRDYM=0**

### 48.7.7.6 Single Data Mode

In Single Data mode, only one data is written every time SPI\_TDR is accessed, and only one data is read every time SPI\_RDR is accessed.

When SPI\_FMR.TXRDYM = 0, the Transmit FIFO operates in Single Data mode.

When SPI\_FMR.RXRDYM = 0, the Receive FIFO operates in Single Data mode.

If Master mode is used (SPI\_MR.MSTR=1), the Receive FIFO must operate in Single Data mode.

If Variable Peripheral Select mode is used (SPI\_MR.PS=1), the Transmit FIFO must operate in Single Data mode.

See sections [SPI Transmit Data Register](#) and [SPI Receive Data Register](#).

### 48.7.7.6.1 DMAC

When FIFOs operate in Single Data mode, the DMAC transfer type must be configured either in bytes, halfwords or words depending on SPI\_MR.PS bit value and SPI\_CSRx.BITS field value.

The same conditions for transfer type apply when FIFOs are disabled.

### 48.7.7.7 Multiple Data Mode

Multiple Data mode minimizes the number of accesses by concatenating the data to send/read in one access.

When SPI\_FMR.TXRDYM > 0, the Transmit FIFO operates in Multiple Data mode.

When SPI\_FMR.RXRDYM > 0, the Receive FIFO operates in Multiple Data mode.

Multiple data can be read from the Receive FIFO only in Slave mode (SPI\_MR.MSTR=0).

The Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0 and when SPI\_MR.PS=0.

In Multiple Data mode, up to two data can be written in one SPI\_TDR write access. It is also possible to read up to four data in one SPI\_RDR access if SPI\_CSRx.BITS is configured to '0' (8-bit data size) and up to two data if SPI\_CSRx.BITS is configured to a value other than '0' (more than 8-bit data size).

The number of data to write/read is defined by the size of the register access. If the access is a byte-size register access, only one data is written/read. If the access is a halfword size register access, then up to two data are read and only one data is written. Lastly, if the access is a word-size register access, then up to four data are read and up to two data are written.

Written/read data are always right-aligned, as described in sections [SPI Receive Data Register \(FIFO Multiple Data, 8-bit\)](#), [SPI Receive Data Register \(FIFO Multiple Data, 16-bit\)](#) and [SPI Transmit Data Register \(FIFO Multiple Data, 8 to 16-bit\)](#).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six SPI\_TDR-byte write accesses
- three SPI\_TDR-halfword write accesses

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six SPI\_RDR-byte read accesses
- three SPI\_RDR-halfword read accesses
- one SPI\_RDR-word read access and one SPI\_RDR-halfword read access

### 48.7.7.7.1 TDRE and RDRF Configuration

In Multiple Data mode, it is possible to write one or more data in the same SPI\_TDR/SPI\_RDR access.

The TDRE flag indicates if one or more data can be written in the FIFO depending on the configuration of SPI\_FMR.TXRDYM/RXRDYM.

As an example, if two data are written each time in SPI\_TDR, it is useful to configure the TXRDYM field to the value '1' so that the TDRE flag is at '1' only when at least two data can be written in the Transmit FIFO.

Similarly, if four data are read each time in SPI\_RDR, it is useful to configure the RXRDYM field to the value '2' so that the RDRF flag is at '1' only when at least four unread data are in the Receive FIFO.

### 48.7.7.7.2 DMAC

It is mandatory to configure DMAC channel size (byte, halfword or word) according to FLEX\_SPI\_FMR.TXRDYM/RXRDYM configuration. See section [Multiple Data Mode](#) for constraints.

### 48.7.7.8 FIFO Pointer Error

A FIFO overflow is reported in SPI\_SR.

If the Transmit FIFO is full and a write access is performed on SPI\_TDR, it generates a Transmit FIFO pointer error and sets SPI\_SR.TXFPTEF.

In Multiple Data mode, if the number of data written in SPI\_TDR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO pointer error is generated and SPI\_SR.TXFPTEF is set.

A FIFO underflow is reported in SPI\_SR.

In Multiple Data mode, if the number of data read in SPI\_RDR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO pointer error is generated and SPI\_SR.RXFPTEF is set.

No pointer error occurs if the FIFO state/level is checked before writing/reading in SPI\_TDR/SPI\_RDR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When a pointer error occurs, other FIFO flags may not behave as expected; their states should be ignored.

If a pointer error occurs, a software reset must be performed using SPI\_CR.SWRST (configuration will be lost).

### 48.7.7.9 FIFO Thresholds

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using SPI\_FMR.TXFTHRES. Each time the Transmit FIFO goes from the 'above threshold' to the 'equal or below threshold' state, SPI\_SR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using SPI\_FMR.RXFTHRES. Each time the Receive FIFO goes from the 'below threshold' to the 'equal or above threshold' state, SPI\_SR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF and RXFTHF flags can be configured to generate an interrupt using SPI\_IER and SPI\_IDR.

### 48.7.7.10 FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through SPI\_IER and SPI\_IDR.

FIFO flags state can be read in SPI\_SR. They are cleared when SPI\_SR is read.

### 48.7.8 Register Write Protection

To prevent any single software error from corrupting SPI behavior, certain registers in the address space can be write-protected in the [SPI Write Protection Mode Register](#) (SPI\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the [SPI Write Protection Status Register](#) (SPI\_WPSR) is set and the WPVSRC field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading SPI\_WPSR.

The following registers are write-protected when WPEN is set in SPI\_WPMR:

- [SPI Mode Register](#)
- [SPI Chip Select Register](#)

# SAMA5D2 Series

### 48.8.1 SPI Control Register

**Name:** SPI\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	FIFODIS	FIFOEN						LASTXFER
Access	W	W						W
Reset	–	–						–
Bit	23	22	21	20	19	18	17	16
							RXFCLR	TXFCLR
Access							W	W
Reset							–	–
Bit	15	14	13	12	11	10	9	8
				REQCLR				
Access				W				
Reset				–				
Bit	7	6	5	4	3	2	1	0
	SWRST						SPIDIS	SPIEN
Access	W						W	W
Reset	–						–	–

#### Bit 31 – FIFODIS FIFO Disable

Value	Description
0	No effect.
1	Disables the Transmit and Receive FIFOs.

#### Bit 30 – FIFOEN FIFO Enable

Value	Description
0	No effect.
1	Enables the Transmit and Receive FIFOs.

#### Bit 24 – LASTXFER Last Transfer

Refer to section [Peripheral Selection](#) for more details.

Value	Description
0	No effect.
1	The current NPCS is deasserted after the character written in TD has been transferred. When SPI_CSRx.CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed.

#### Bit 17 – RXFCLR Receive FIFO Clear

Value	Description
0	No effect.
1	Empties the Receive FIFO.

**Bit 16 – TXFCLR** Transmit FIFO Clear

Value	Description
0	No effect.
1	Empties the Transmit FIFO.

**Bit 12 – REQCLR** Request to Clear the Comparison Trigger

SleepWalking enabled:

0: No effect.

1: Clears the potential clock request currently issued by SPI, thus the potential system wakeup is cancelled.

SleepWalking disabled:

0: No effect.

1: Restarts the comparison trigger to enable SPI\_RDR loading.

**Bit 7 – SWRST** SPI Software Reset

The SPI is in Slave mode after software reset.

Value	Description
0	No effect.
1	Reset the SPI. A software-triggered hardware reset of the SPI interface is performed.

**Bit 1 – SPIDIS** SPI Disable

All pins are set in Input mode after completion of the transmission in progress, if any.

If a transfer is in progress when SPIDIS is set, the SPI completes the transmission of the shifter register and does not start any new transfer, even if SPI\_THR is loaded.

If both SPIEN and SPIDIS are equal to one when SPI\_CR is written, the SPI is disabled.

Value	Description
0	No effect.
1	Disables the SPI.

**Bit 0 – SPIEN** SPI Enable

Value	Description
0	No effect.
1	Enables the SPI to transfer and receive data.

### 48.8.2 SPI Mode Register

**Name:** SPI\_MR  
**Offset:** 0x04  
**Reset:** 0x0  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	DLYBCS[7:0]

#### Bits 31:24 – DLYBCS[7:0] Delay Between Chip Selects

This field defines the delay between the inactivation and the activation of NPCS. The DLYBCS time guarantees nonoverlapping chip selects and solves bus contentions in case of peripherals having long data float times.

If DLYBCS is lower than 6, six peripheral clock periods are inserted by default.

Otherwise, the following equations determine the delay:

If BRSRCCLK = 0:

$$\text{Delay Between Chip Selects} = \frac{\text{DLYBCS}}{f_{\text{peripheral clock}}}$$

If BRSRCCLK = 1:

$$\text{Delay Between Chip Selects} = \frac{\text{DLYBCS}}{f_{\text{GCLK}}}$$

#### Bits 19:16 – PCS[3:0] Peripheral Chip Select

This field is only used if fixed peripheral select is active (PS = 0).

If SPI\_MR.PCSDEC = 0:

PCS = xxx0 NPCS[3:0] = 1110  
 PCS = xx01 NPCS[3:0] = 1101  
 PCS = x011 NPCS[3:0] = 1011  
 PCS = 0111 NPCS[3:0] = 0111  
 PCS = 1111 forbidden (no peripheral is selected)  
 (x = don't care)  
 If SPI\_MR.PCSDEC = 1:  
 NPCS[3:0] output signals = PCS.

**Bit 12 – CMPMODE** Comparison Mode

Value	Name	Description
0	FLAG_ONLY	Any character is received and comparison function drives CMP flag.
1	START_CONDITION	Comparison condition must be met to start reception of all incoming characters until REQCLR is set.

**Bit 8 – LSBHALF** LSB Timing Selection

Value	Description
0	To be used only if SPI slave LSB timing is 100% compliant with SPI standard (LSB duration is a full bit time). This value gives the better margin for SPI slave response delay (less than 1 SPCK clock cycle).
1	To be selected if the SPI slave LSB timing does not behave as the SPI standard (not triggered by NPCS deassertion in mode), the slave response delay is limited to less than 1/2 SPCK cycle.

**Bit 7 – LLB** Local Loopback Enable

LLB controls the local loopback on the data shift register for testing in Master mode only (MISO is internally connected on MOSI).

Value	Description
0	Local loopback path disabled.
1	Local loopback path enabled.

**Bit 5 – WDRBT** Wait Data Read Before Transfer

Value	Description
0	No Effect. In Master mode, a transfer can be initiated regardless of SPI_RDR state.
1	In Master mode, a transfer can start only if SPI_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception.

**Bit 4 – MODFDIS** Mode Fault Detection

Value	Description
0	Mode fault detection enabled
1	Mode fault detection disabled

**Bit 3 – BRSRCCLK** Bit Rate Source Clock

If bit BRSRCCLK = 1, the SCBR field in SPI\_CSRx must be programmed with a value greater than 1.

0 (PERIPH\_CLK): The peripheral clock is the source clock for the bit rate generation.

1 (GCLK): PMC GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock.

**Bit 2 – PCSDEC** Chip Select Decode

When PCSDEC = 1, up to 15 chip select signals can be generated with the four NPCS lines using an external 4-bit to 16-bit decoder. The chip select registers define the characteristics of the 15 chip selects, with the following rules:

SPI\_CSR0 defines peripheral chip select signals 0 to 3.

SPI\_CSR1 defines peripheral chip select signals 4 to 7.

SPI\_CSR2 defines peripheral chip select signals 8 to 11.

SPI\_CSR3 defines peripheral chip select signals 12 to 14.

Value	Description
0	The chip select lines are directly connected to a peripheral device.
1	The four NPCS chip select lines are connected to a 4-bit to 16-bit decoder.

**Bit 1 – PS** Peripheral Select

Value	Description
0	Fixed Peripheral Select
1	Variable Peripheral Select

**Bit 0 – MSTR** Master/Slave Mode

Value	Description
0	SPI is in Slave mode
1	SPI is in Master mode

### 48.8.3 SPI Receive Data Register

**Name:** SPI\_RDR  
**Offset:** 0x08  
**Reset:** 0x0  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 19:16 – PCS[3:0]** Peripheral Chip Select

In Master mode only, these bits indicate the value on the NPCS pins at the end of a transfer. Otherwise, these bits are read as zero.

When using Variable Peripheral Select mode (PS = 1 in SPI\_MR), it is mandatory to set SPI\_MR.WDRBT bit if the PCS field must be processed in SPI\_RDR.

**Bits 15:0 – RD[15:0]** Receive Data

Data received by the SPI Interface is stored in this register in a right-justified format. Unused bits are read as zero.

### 48.8.4 SPI Receive Data Register (FIFO Multiple Data, 8-bit)

**Name:** SPI\_RDR (FIFO\_MULTI\_DATA\_8)  
**Offset:** 0x08  
**Reset:** 0x0  
**Property:** Read-only

If FIFO is enabled (FIFOEN bit in SPI\_CR), refer to section [Multiple Data Mode](#).

	31	30	29	28	27	26	25	24
	RD3[7:0]

Bit	7	6	5	4	3	2	1	0
	TD[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

#### Bit 24 – LASTXFER Last Transfer

This field is only used if variable peripheral select is active (SPI\_MR.PS = 1).

Value	Description
0	No effect
1	The current NPCS is deasserted after the transfer of the character written in TD. When SPI_CSRx.CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed.

#### Bits 19:16 – PCS[3:0] Peripheral Chip Select

This field is only used if variable peripheral select is active (SPI\_MR.PS = 1).

If SPI\_MR.PCSDEC = 0:

PCS = xxx0 NPCS[3:0] = 1110

PCS = xx01 NPCS[3:0] = 1101

PCS = x011 NPCS[3:0] = 1011

PCS = 0111 NPCS[3:0] = 0111

PCS = 1111 forbidden (no peripheral is selected)

(x = don't care)

If SPI\_MR.PCSDEC = 1:

NPCS[3:0] output signals = PCS.

**Bits 15:0 – TD[15:0]** Transmit Data

Data to be transmitted by the SPI interface is stored in this register. Information to be transmitted must be written to this register in a right-justified format.

### 48.8.7 SPI Transmit Data Register (FIFO Multiple Data, 8- to 16-bit)

**Name:** SPI\_TDR (FIFO\_MULTI\_DATA)  
**Offset:** 0x0C  
**Reset:** –  
**Property:** Write-only

If FIFO is enabled (FIFOEN bit in SPI\_CR), refer to section [Multiple Data Mode](#).

	Bit	31	30	29	28	27	26	25	24

Reset		–	–	–	–	–	–	–	–

**Bits 0:15, 16:31 – TDx Transmit Data**

Next data to write in the Transmit FIFO. Information to be transmitted must be written to this register in a right-justified format.

### 48.8.8 SPI Status Register

**Name:** SPI\_SR  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	RXFPTEF	TXFPTEF	RXFTHF	RXFFF	RXFEF	TXFTHF	TXFFF	TXFEF
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16

Access								R
Reset								0
Bit	15	14	13	12	11	10	9	8
					CMP	UNDES	TXEMPTY	NSSR
Access					R	R	R	R
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
					OVRES	MODF	TDRE	RDRF
Access					R	R	R	R
Reset					0	0	0	0

**Bit 31 – RXFPTEF** Receive FIFO Pointer Error Flag  
 See [FIFO Pointer Error](#) for details.

Value	Description
0	No Receive FIFO pointer occurred.
1	Receive FIFO pointer error occurred. Receiver must be reset.

**Bit 30 – TXFPTEF** Transmit FIFO Pointer Error Flag  
 See [FIFO Pointer Error](#) for details.

Value	Description
0	No Transmit FIFO pointer occurred.
1	Transmit FIFO pointer error occurred. Transceiver must be reset.

**Bit 29 – RXFTHF** Receive FIFO Threshold Flag

Value	Description
0	Number of unread data in Receive FIFO is below RXFTHRES threshold or RXFTH flag has been cleared.
1	Number of unread data in Receive FIFO has reached RXFTHRES threshold (coming from “below threshold” state to “equal or above threshold” state).

**Bit 28 – RXFFF** Receive FIFO Full Flag

Value	Description
0	Receive FIFO is not empty or RXFE flag has been cleared.
1	Receive FIFO has become full (coming from “not full” state to “full” state).

**Bit 27 – RXFEF** Receive FIFO Empty Flag

Value	Description
0	Receive FIFO is not empty or RXFE flag has been cleared.
1	Receive FIFO has become empty (coming from “not empty” state to “empty” state).

**Bit 26 – TXFTHF** Transmit FIFO Threshold Flag (cleared on read)

Value	Description
0	Number of data in Transmit FIFO is above TXFTHRES threshold.
1	Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of SPI_SR.

**Bit 25 – TXFFF** Transmit FIFO Full Flag (cleared on read)

Value	Description
0	Transmit FIFO is not full or TXFF flag has been cleared.
1	Transmit FIFO has been filled since the last read of SPI_SR.

**Bit 24 – TXFEF** Transmit FIFO Empty Flag (cleared on read)

Value	Description
0	Transmit FIFO is not empty.
1	Transmit FIFO has been emptied since the last read of SPI_SR.

**Bit 16 – SPIENS** SPI Enable Status

Value	Description
0	SPI is disabled.
1	SPI is enabled.

**Bit 11 – CMP** Comparison Status (cleared on read)

Value	Description
0	No received character matched the comparison criteria programmed in VAL1 and VAL2 fields in SPI_CMPR since the last read of SPI_SR.
1	A received character matched the comparison criteria since the last read of SPI_SR.

**Bit 10 – UNDES** Underrun Error Status (Slave mode only) (cleared on read)

Value	Description
0	No underrun has been detected since the last read of SPI_SR.
1	A transfer starts whereas no data has been loaded in SPI_TDR.

**Bit 9 – TXEMPTY** Transmission Registers Empty (cleared by writing SPI\_TDR)

Value	Description
0	As soon as data is written in SPI_TDR.
1	SPI_TDR and internal shift register are empty. If a transfer delay has been defined, TXEMPTY is set after the end of this delay.

**Bit 8 – NSSR** NSS Rising (cleared on read)

Value	Description
0	No rising edge detected on NSS pin since the last read of SPI_SR.
1	A rising edge occurred on NSS pin since the last read of SPI_SR.

**Bit 3 – OVRES** Overrun Error Status (cleared on read)

An overrun occurs when SPI\_RDR is loaded at least twice from the internal shift register since the last read of SPI\_RDR.

Value	Description
0	No overrun has been detected since the last read of SPI_SR.
1	An overrun has occurred since the last read of SPI_SR.

**Bit 2 – MODF** Mode Fault Error (cleared on read)

Value	Description
0	No mode fault has been detected since the last read of SPI_SR.
1	A mode fault occurred since the last read of SPI_SR.

**Bit 1 – TDRE** Transmit Data Register Empty (cleared by writing SPI\_TDR)

When FIFOs are disabled:

0: Data has been written to SPI\_TDR and not yet transferred to the internal shift register.

1: The last data written in SPI\_TDR has been transferred to the internal shift register.

TDRE is cleared when the SPI is disabled or at reset. Enabling the SPI sets the TDRE flag.

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

TDRE behavior with FIFOs enabled is illustrated in section [TXEMPTY, TDRE and RDRF Behavior](#).

**Bit 0 – RDRF** Receive Data Register Full (cleared by reading SPI\_RDR)

When FIFOs are disabled:

0: No data has been received since the last read of SPI\_RDR.

1: Data has been received and the received data has been transferred from the internal shift register to SPI\_RDR since the last read of SPI\_RDR.

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RDRF behavior with FIFOs enabled is illustrated in section [TXEMPTY, TDRE and RDRF Behavior](#).

### 48.8.9 SPI Interrupt Enable Register

**Name:** SPI\_IER  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
	RXFPTEF	TXFPTEF	RXFTHF	RXFFF	RXFEF	TXFTHF	TXFFF	TXFEF

**Bit 31 – RXFPTEF** RXFPTEF Interrupt Enable

**Bit 30 – TXFPTEF** TXFPTEF Interrupt Enable

**Bit 29 – RXFTHF** RXFTHF Interrupt Enable

**Bit 28 – RXFFF** RXFFF Interrupt Enable

**Bit 27 – RXFEF** RXFEF Interrupt Enable

**Bit 26 – TXFTHF** TXFTHF Interrupt Enable

**Bit 25 – TXFFF** TXFFF Interrupt Enable

**Bit 24 – TXFEF** TXFEF Interrupt Enable

**Bit 11 – CMP** Comparison Interrupt Enable

**Bit 10 – UNDES** Underrun Error Interrupt Enable

**Bit 9 – TXEMPTY** Transmission Registers Empty Enable

**Bit 8 – NSSR** NSS Rising Interrupt Enable

**Bit 3 – OVRES** Overrun Error Interrupt Enable

**Bit 2 – MODF** Mode Fault Error Interrupt Enable

**Bit 1 – TDRE** SPI Transmit Data Register Empty Interrupt Enable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Enable

### 48.8.10 SPI Interrupt Disable Register

**Name:** SPI\_IDR  
**Offset:** 0x18  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
	RXFPTEF	TXFPTEF	RXFTHF	RXFFF	RXFEF	TXFTHF	TXFFF	TXFEF

**Bit 29 – RXFTHF** RXFTHF Interrupt Disable

**Bit 28 – RXFFF** RXFFF Interrupt Disable

**Bit 27 – RXFEF** RXFEF Interrupt Disable

**Bit 26 – TXFTHF** TXFTHF Interrupt Disable

**Bit 25 – TXFFF** TXFFF Interrupt Disable

**Bit 24 – TXFEF** TXFEF Interrupt Disable

**Bit 11 – CMP** Comparison Interrupt Disable

**Bit 10 – UNDES** Underrun Error Interrupt Disable

**Bit 9 – TXEMPTY** Transmission Registers Empty Disable

**Bit 8 – NSSR** NSS Rising Interrupt Disable

**Bit 3 – OVRES** Overrun Error Interrupt Disable

**Bit 2 – MODF** Mode Fault Error Interrupt Disable

**Bit 1 – TDRE** SPI Transmit Data Register Empty Interrupt Disable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Disable

### 48.8.11 SPI Interrupt Mask Register

**Name:** SPI\_IMR  
**Offset:** 0x1C  
**Reset:** 0x0  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
	RXFPTEF	TXFPTEF	RXFTHF	RXFFF	RXFEF	TXFTHF	TXFFF	TXFEF

**Bit 31 – RXFPTEF** RXFPTEF Interrupt Mask

**Bit 30 – TXFPTEF** TXFPTEF Interrupt Mask

**Bit 29 – RXFTHF** RXFTHF Interrupt Mask

**Bit 28 – RXFFF** RXFFF Interrupt Mask

**Bit 27 – RXFEF** RXFEF Interrupt Mask

**Bit 26 – TXFTHF** TXFTHF Interrupt Mask

**Bit 25 – TXFFF** TXFFF Interrupt Mask

**Bit 24 – TXFEF** TXFEF Interrupt Mask

**Bit 11 – CMP** Comparison Interrupt Mask

**Bit 10 – UNDES** Underrun Error Interrupt Mask

**Bit 9 – TXEMPTY** Transmission Registers Empty Mask

**Bit 8 – NSSR** NSS Rising Interrupt Mask

**Bit 3 – OVRES** Overrun Error Interrupt Mask

**Bit 2 – MODF** Mode Fault Error Interrupt Mask

**Bit 1 – TDRE** SPI Transmit Data Register Empty Interrupt Mask

**Bit 0 – RDRF** Receive Data Register Full Interrupt Mask

### 48.8.12 SPI Chip Select Register

**Name:** SPI\_CSRx  
**Offset:** 0x30 + x\*0x04 [x=0..3]  
**Reset:** 0  
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

SPI\_CSRx must be written even if the user wants to use the default reset values. The BITS field is not updated with the translated value unless the register is written.

Bit	31	30	29	28	27	26	25	24

Reset	0	0	0	0	0	0	0	0

#### Bits 31:24 – DLYBCT[7:0] Delay Between Consecutive Transfers

This field defines the delay between two consecutive transfers with the same peripheral without removing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.

When DLYBCT = 0, no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers.

Otherwise, the following equations determine the delay:

If SPI\_MR.BRSRCLK = 0:  $DLYBCT = \text{Delay Between Consecutive Transfers} \times f_{\text{peripheral clock}} / 32$

If SPI\_MR.BRSRCLK = 1:  $DLYBCT = \text{Delay Between Consecutive Transfers} \times f_{\text{CLK}} / 32$

#### Bits 23:16 – DLYBS[7:0] Delay Before SPCK

This field defines the delay from NPCS falling edge (activation) to the first valid SPCK transition.

When DLYBS = 0, the delay is half the SPCK clock period.

Otherwise, the following equations determine the delay:

If SPI\_MR.BRSRCCLK = 0: DLYBS = Delay Before SPCK ×  $f_{\text{peripheral clock}}$

If SPI\_MR.BRSRCCLK = 1: DLYBS = Delay Before SPCK ×  $f_{\text{GCLK}}$

### Bits 15:8 – SCBR[7:0] Serial Clock Bit Rate

In Master mode, the SPI Interface uses a modulus counter to derive the SPCK bit rate from the clock defined by SPI\_MR.BRSRCCLK bit. The bit rate is selected by writing a value from 1 to 255 in the SCBR field. The following equations determine the SPCK bit rate:

If SPI\_MR.BRSRCCLK = 0:  $\text{SCBR} = f_{\text{peripheral clock}} / \text{SPCK Bit Rate}$

If SPI\_MR.BRSRCCLK = 1:  $\text{SCBR} = f_{\text{GCLK}} / \text{SPCK Bit Rate}$

Programming the SCBR field to 0 is forbidden. Triggering a transfer while SCBR is at 0 can lead to unpredictable results.

If SPI\_MR.BRSRCCLK = 1, SCBR must be programmed with a value greater than 1.

At reset, SCBR is 0 and the user has to program it at a valid value before performing the first transfer.

**Note:** If one of the SCBR fields in SPI\_CSRx is set to 1, the other SCBR fields in SPI\_CSRx must be set to 1 as well, if they are used to process transfers. If they are not used to transfer data, they can be set at any value.

### Bits 7:4 – BITS[3:0] Bits Per Transfer

(See Note under the register table in [SPI Chip Select Register](#).)

The BITS field determines the number of data bits transferred. Reserved values should not be used.

Value	Name	Description
0	8_BIT	8 bits for transfer
1	9_BIT	9 bits for transfer
2	10_BIT	10 bits for transfer
3	11_BIT	11 bits for transfer
4	12_BIT	12 bits for transfer
5	13_BIT	13 bits for transfer
6	14_BIT	14 bits for transfer
7	15_BIT	15 bits for transfer
8	16_BIT	16 bits for transfer
9	–	Reserved
10	–	Reserved
11	–	Reserved
12	–	Reserved
13	–	Reserved
14	–	Reserved
15	–	Reserved

### Bit 3 – CSAAT Chip Select Active After Transfer

Value	Description
0	The Peripheral Chip Select Line rises as soon as the last transfer is achieved.
1	The Peripheral Chip Select Line does not rise after the last transfer is achieved. It remains active until a new transfer is requested on a different chip select.

---

**Bit 2 – CSNAAT** Chip Select Not Active After Transfer (ignored if CSAAT = 1)

Value	Description
0	The Peripheral Chip Select Line does not rise between two transfers if SPI_TDR is reloaded before the end of the first transfer and if the two transfers occur on the same chip select.
1	<p>The Peripheral Chip Select Line rises systematically after each transfer performed on the same slave. It remains inactive after the end of transfer for a minimal duration of:</p> <p>If SPI_MR.BRSRCCLK = 0:</p> $\frac{\text{DLYBCS}}{f_{\text{peripheral clock}}}$ <p>If SPI_MR.BRSRCCLK = 1:</p> $\frac{\text{DLYBCS}}{f_{\text{GCLK}}}$ <p>If field DLYBCS is lower than 6, a minimum of six periods is introduced.</p>

**Bit 1 – NCPHA** Clock Phase

NCPHA determines which edge of SPCK causes data to change and which edge causes data to be captured. NCPHA is used with CPOL to produce the required clock/data relationship between master and slave devices.

Value	Description
0	Data is changed on the leading edge of SPCK and captured on the following edge of SPCK.
1	Data is captured on the leading edge of SPCK and changed on the following edge of SPCK.

**Bit 0 – CPOL** Clock Polarity

CPOL is used to determine the inactive state value of the serial clock (SPCK). It is used with NCPHA to produce the required clock/data relationship between master and slave devices.

Value	Description
0	The inactive state value of SPCK is logic level zero.
1	The inactive state value of SPCK is logic level one.

### 48.8.13 SPI FIFO Mode Register

**Name:** SPI\_FMR  
**Offset:** 0x40  
**Reset:** 0x0  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24	
			RXFTHRES[5:0]						
Access			R/W	R/W	R/W	R/W	R/W	R/W	
Reset			0	0	0	0	0	0	
Bit	23	22	21	20	19	18	17	16	
			TXFTHRES[5:0]						
Access			R/W	R/W	R/W	R/W	R/W	R/W	
Reset			0	0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	
Access									
Reset									
Bit	7	6	5	4	3	2	1	0	
			RXRDYM[1:0]					TXRDYM[1:0]	
Access			R/W	R/W			R/W	R/W	
Reset			0	0			0	0	

**Bits 29:24 – RXFTHRES[5:0]** Receive FIFO Threshold

Value	Description
0-16	Defines the Receive FIFO threshold value (number of data). SPI_SR.RXFTH will be set when the Receive FIFO goes from “below” threshold state to “equal or above” threshold state.

**Bits 21:16 – TXFTHRES[5:0]** Transmit FIFO Threshold

Value	Description
0-16	Defines the Transmit FIFO threshold value (number of data). SPI_SR.TXFTH will be set when the Transmit FIFO goes from “above” threshold state to “equal or below” threshold state.

**Bits 5:4 – RXRDYM[1:0]** Receive Data Register Full Mode

If FIFOs are enabled, the SPI\_SR.RDRF flag behaves as follows:

Value	Name	Description
0	ONE_DATA	RDRF will be at level ‘1’ when at least one unread data is in the Receive FIFO.

# SAMA5D2 Series

## Serial Peripheral Interface (SPI)

Value	Name	Description
1	TWO_DATA	RDRF will be at level '1' when at least two unread data are in the Receive FIFO.  Cannot be used when SPI_MR.MSTR =1, or if SPI_MR.PS =1.
2	FOUR_DATA	RDRF will be at level '1' when at least four unread data are in the Receive FIFO.  Cannot be used when SPI_CSRx.BITS is greater than 0, or if SPI_MR.MSTR =1, or if SPI_MR.PS =1.

**Bits 1:0 – TXRDYM[1:0]** Transmit Data Register Empty Mode  
If FIFOs are enabled, the SPI\_SR.TDRE flag behaves as follows:

Value	Name	Description
0	ONE_DATA	TDRE will be at level '1' when at least one data can be written in the Transmit FIFO.
1	TWO_DATA	TDRE will be at level '1' when at least two data can be written in the Transmit FIFO.  Cannot be used if SPI_MR.PS =1.

### 48.8.14 SPI FIFO Level Register

**Name:** SPI\_FLR  
**Offset:** 0x44  
**Reset:** 0x0  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Greyed out bits]		RXFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	[Greyed out bits]							
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	[Greyed out bits]		TXFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

#### Bits 21:16 – RXFL[5:0] Receive FIFO Level

Value	Description
0	There is no unread data in the Receive FIFO.
1-16	Indicates the number of unread data in the Receive FIFO.

#### Bits 5:0 – TXFL[5:0] Transmit FIFO Level

Value	Description
0	There is no data in the Transmit FIFO.
1-16	Indicates the number of data in the Transmit FIFO.

### 48.8.15 SPI Comparison Register

**Name:** SPI\_CMPR  
**Offset:** 0x48  
**Reset:** 0x0  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
VAL2[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
VAL2[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
VAL1[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
VAL1[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:16 – VAL2[15:0] Second Comparison Value for Received Character

Value	Description
0–65535	The received character must be lower or equal to the value of VAL2 and higher or equal to VAL1 to set CMP flag in SPI_CSR. If asynchronous partial wakeup (SleepWalking) is enabled in PMC_SLPWK_ER, the SPI requests a system wakeup if condition is met.

#### Bits 15:0 – VAL1[15:0] First Comparison Value for Received Character

Value	Description
0–65535	The received character must be higher or equal to the value of VAL1 and lower or equal to VAL2 to set CMP flag in SPI_SR. If asynchronous partial wakeup (SleepWalking) is enabled in PMC_SLPWK_ER, the SPI requests a system wakeup if the condition is met.

### 48.8.16 SPI Write Protection Mode Register

**Name:** SPI\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x0  
**Property:** Read/Write

See section [Register Write Protection](#) for the list of registers that can be write-protected.

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPEN
Access								R/W
Reset								0

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x535049	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit.
9		Always reads as 0.

#### Bit 0 – WPEN Write Protection Enable

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII)
1	Enables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII)

### 48.8.17 SPI Write Protection Status Register

**Name:** SPI\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x0  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Greyed out bits]							
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	[Greyed out bits]							WPVS
Access								R
Reset								0

**Bits 15:8 – WPVSR[7:0]** Write Protection Violation Source  
 When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of SPI_WPSR.
1	A write protection violation has occurred since the last read of SPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

## 49. Quad Serial Peripheral Interface (QSPI)

### 49.1 Description

The Quad Serial Peripheral Interface (QSPI) is a synchronous serial data link that provides communication with external devices in Master mode.

The QSPI can be used in SPI mode to interface to serial peripherals such as ADCs, DACs, LCD controllers, CAN controllers and sensors, or in Serial Memory mode to interface to serial Flash memories.

The QSPI allows the system to execute code directly from a serial Flash memory (XIP) without code shadowing to RAM. The serial Flash memory mapping is seen in the system as other memories such as ROM, SRAM, DRAM, embedded Flash memory, etc.

With the support of the Quad SPI protocol, the QSPI allows the system to use high-performance serial Flash memories which are small and inexpensive, in place of larger and more expensive parallel Flash memories.

**Note:** Stacked devices with a rollover in the memory address space at each die boundary are not supported.

### 49.2 Embedded Characteristics

- Master SPI Interface
  - Programmable clock phase and clock polarity
  - Programmable transfer delays between consecutive transfers, between clock and data, between deactivation and activation of chip select
- SPI Mode
  - Interface to serial peripherals such as ADCs, DACs, LCD controllers, CAN controllers and sensors
  - 8-bit/16-bit/32-bit programmable data length
- Serial Memory Mode
  - Interface to serial Flash memories operating in Single-bit SPI, Dual SPI and Quad SPI
  - Interface to serial Flash Memories operating in Single Data Rate Mode
  - Supports “Execute In Place” (XIP)— code execution by the system directly from a serial Flash memory
  - Flexible instruction register for compatibility with all serial Flash memories
  - 32-bit address mode (default is 24-bit address) to support serial Flash memories larger than 128 Mbits
  - Continuous read mode
  - Scrambling/unscrambling “On-The-Fly”
- Connection to DMA Channel Capabilities Optimizes Data Transfers
  - One channel for the receiver, one channel for the transmitter
- Register Write Protection

### 49.3 Block Diagram

Figure 49-1. Block Diagram

### 49.4 Signal Description

Table 49-1. Signal Description

Pin Name	Pin Description	Type
QSCK	Serial Clock	Output
MOSI (QIO0) <sup>(1)(2)</sup>	Data Output (Data Input Output 0)	Output (Input/Output)
MISO (QIO1) <sup>(1)(2)</sup>	Data Input (Data Input Output 1)	Input (Input/Output)
QIO2 <sup>(3)</sup>	Data Input Output 2	Input/Output
QIO3 <sup>(3)</sup>	Data Input Output 3	Input/Output
QCS	Peripheral Chip Select	Output

**Note:**

1. MOSI and MISO are used for single-bit SPI operation.
2. QIO0–QIO1 are used for Dual SPI operation.
3. QIO0–QIO3 are used for Quad SPI operation.

### 49.5 Product Dependencies

#### 49.5.1 I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the QSPI pins to their peripheral functions.

### 49.5.2 Power Management

The QSPI may be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the QSPI clock.

### 49.5.3 Interrupt Sources

The QSPI has an interrupt line connected to the Interrupt Controller. Handling the QSPI interrupt requires programming the interrupt controller before configuring the QSPI.

### 49.5.4 Direct Memory Access Controller (DMA)

The QSPI can be used in conjunction with the Direct Memory Access Controller (DMA) in order to reduce processor overhead. For a full description of the DMA, refer to the section “DMA Controller (XDMAC)”.

## 49.6 Functional Description

### 49.6.1 Serial Clock Baud Rate

The QSPI baud rate clock is generated by dividing the peripheral clock by a value between 1 and 256.

### 49.6.2 Serial Clock Phase and Polarity

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the CPOL bit in the QSPI Serial Clock register (QSPI\_SCR). The CPHA bit in the QSPI\_SCR programs the clock phase. These two parameters determine the edges of the clock signal on which data is driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Thus, the interfaced slave must use the same parameter values to communicate.

The table below shows the four modes and corresponding parameter settings.

**Table 49-2. QSPI Bus Clock Modes**

QSPI Clock Mode	QSPI_SCR.CPOL	QSPI_SCR.CPHA	Shift QSCK Edge	Capture QSCK Edge	QSCK Inactive Level
0	0	0	Falling	Falling	Low
1	0	1	Rising	Rising	Low
2	1	0	Rising	Rising	High
3	1	1	Falling	Falling	High

The following figures show examples of data transfers.

**Figure 49-2. QSPI Transfer Format (QSPI\_SCR.CPHA = 0, 8 bits per transfer)**

\* Not defined, but normally MSB of previous character received.

**Figure 49-3. QSPI Transfer Format (QSPI\_SCR.CPHA = 1, 8 bits per transfer)**

\* Not defined but normally LSB of previous character transmitted.

### 49.6.3 Transfer Delays

The figure below shows several consecutive transfers while the chip select is active. Three delays can be programmed to modify the transfer waveforms:

- The delay between the deactivation and the activation of QCS, programmed by writing QSPI\_MR.DLYCS. Allows to adjust the minimum time of QCS at high level.
- The delay before QSCK, programmed by writing QSPI\_SR.DLYBS. Allows the start of QSCK to be delayed after the chip select has been asserted.

- The delay between consecutive transfers, programmed by writing QSPI\_MR.DLYBCT. Allows insertion of a delay between two consecutive transfers. In Serial Memory mode, this delay is not programmable and DLYBCT is ignored. In this mode, DLYBCT must be written to '0'.

These delays allow the QSPI to be adapted to the interfaced peripherals and their speed and bus release time.

**Figure 49-4. Programmable Delays**

### 49.6.4 QSPI SPI Mode

In SPI mode, the QSPI acts as a standard SPI Master.

To activate this mode, QSPI\_MR.SMM must be written to '0' in QSPI\_MR.

#### 49.6.4.1 SPI Mode Operations

The QSPI in standard SPI mode operates on the clock generated by the internal programmable baud rate generator. It fully controls the data transfers to and from the slave connected to the SPI bus. The QSPI drives the chip select line to the slave (QCS) and the serial clock signal (QSCK).

The QSPI features two holding registers, the Transmit Data register (QSPI\_TDR) and the Receive Data register (QSPI\_RDR), and a single internal shift register. The holding registers maintain the data flow at a constant rate.

After enabling the QSPI, a data transfer begins when the processor writes to the QSPI\_TDR. The written data is immediately transferred to the internal shift register and transfer on the SPI bus starts. While the data in the internal shift register is shifted on the MOSI line, the MISO line is sampled and shifted to the internal shift register. Receiving data cannot occur without transmitting data. If receiving mode is not needed, for example when communicating with a slave receiver only (such as an LCD), the receive status flags in the Status register (QSPI\_SR) can be discarded.

If new data is written in QSPI\_TDR during the transfer, it is retained there until the current transfer is completed. Then, the received data is transferred from the internal shift register to the QSPI\_RDR, the data in QSPI\_TDR is loaded in the internal shift register and a new transfer starts.

The transfer of a data written in QSPI\_TDR in the internal shift register is indicated by the Transmit Data Register Empty (TDRE) bit in the QSPI\_SR. When new data is written in QSPI\_TDR, this bit is cleared. QSPI\_SR.TDRE is used to trigger the Transmit DMA channel.

The end of transfer is indicated by the TXEMPTY flag in the QSPI\_SR. If a transfer delay (DLYBCT) is greater than 0 for the last transfer, QSPI\_SR.TXEMPTY is set after the completion of this delay. The peripheral clock can be switched off at this time.

The transfer of received data from the internal shift register in QSPI\_RDR is indicated by the Receive Data Register Full (RDRF) bit in the QSPI\_SR. When the received data is read, QSPI\_SR.RDRF bit is cleared.

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

If the QSPI\_RDR has not been read before new data is received, the Overrun Error Status (OVRES) bit in QSPI\_SR is set. As long as this flag is set, data is loaded in QSPI\_RDR. The user must read the QSPI\_SR to clear the OVRES bit.

The following figures show, respectively, a block diagram of the SPI when operating in Master mode, and a flow chart describing how transfers are handled.

### 49.6.4.2 SPI Mode Block Diagram

**Figure 49-5. SPI Mode Block Diagram**

**49.6.4.3 SPI Mode Flow Diagram**

**Figure 49-6. SPI Mode Flow Diagram**

The figure below shows Transmit Data Register Empty (TDRE), Receive Data Register Full (RDRF) and Transmission Register Empty (TXEMPTY) status flags behavior within the QSPI\_SR during an 8-bit data transfer in Fixed mode, without DMA.

**Figure 49-7. Status Register Flags Behavior**

#### 49.6.4.4 Peripheral Deselection without DMA

During a transfer of more than one data on a Chip Select without the DMA, the QSPI\_TDR is loaded by the processor and the flag TDRE rises as soon as the content of the QSPI\_TDR is transferred into the internal shift register. When this flag is detected high, the QSPI\_TDR can be reloaded. If this reload by the processor occurs before the end of the current transfer, the Chip Select is not deasserted between the two transfers. Depending on the application software handling the QSPI\_SR flags (by interrupt or polling method) or servicing other interrupts or other tasks, the processor may not reload the QSPI\_TDR in time to keep the chip select active (low). A null Delay Between Consecutive Transfer (DLYBCT) value in the QSPI\_MR gives even less time for the processor to reload the QSPI\_TDR. With some SPI slave peripherals, requiring the chip select line to remain active (low) during a full set of transfers may lead to communication errors.

To facilitate interfacing with such devices, QSPI\_MR.CSMODE may be configured to '1'. This allows the chip select lines to remain in their current state (low = active) until the end of transfer is indicated by the Last Transfer (LASTXFER) bit in the Control register (QSPI\_CR). Even if the QSPI\_TDR is not reloaded, the chip select remains active. To have the chip select line rise at the end of the last data transfer, QSPI\_CR.LASTXFER must be written to '1' at the same time or after writing the last data to transmit into the QSPI\_TDR.

#### 49.6.4.5 Peripheral Deselection with DMA

When the DMA Controller is used, the Chip Select line remains low during the transfer since the TDRE flag is managed by the DMA itself. Reloading the QSPI\_TDR by the DMA is done as soon as the TDRE flag is set. In this case, writing QSPI\_MR.CSMODE to '1' may not be needed. However, when other DMA channels connected to other peripherals are also in use, the QSPI DMA could be delayed by another DMA with a higher priority on the bus. Having DMA buffers in slower memories like Flash memory or SDRAM compared to fast internal SRAM, may lengthen the reload time of the QSPI\_TDR by the DMA as well. This means that the QSPI\_TDR might not be reloaded in time to keep the chip select line low. In this case, the chip select line may toggle between data transfer and according to some SPI Slave devices, the communication might get lost. It may be necessary to configure QSPI\_MR.CSMODE to '1'.

When QSPI\_MR.CSMODE is configured to '0', the QCS does not rise in all cases between two transfers on the same peripheral. During a transfer on a Chip Select, the flag TDRE rises as soon as the content of the QSPI\_TDR is transferred into the internal shifter. When this flag is detected, the QSPI\_TDR can be reloaded. If this reload occurs before the end of the current transfer, the Chip Select is not deasserted between the two transfers. This might lead to difficulties for interfacing with some serial peripherals requiring the chip select to be deasserted after each transfer. To facilitate interfacing with such devices, the QSPI\_MR may be configured with QSPI\_MR.CSMODE at '2'.

### 49.6.5 QSPI Serial Memory Mode

In Serial Memory mode, the QSPI acts as a serial Flash memory controller. The QSPI can be used to read data from the serial Flash memory allowing the CPU to execute code from it (XIP execute in place). The QSPI can also be used to control the serial Flash memory (Program, Erase, Lock, etc.) by sending specific commands. In this mode, the QSPI is compatible with single-bit SPI, Dual SPI and Quad SPI protocols.

To activate this mode, QSPI\_MR.SMM must be written to '1'.

In Serial Memory mode, data is transferred either by QSPI\_TDR and QSPI\_RDR or by writing or read in the QSPI memory space (0x90000000/0x98000000/0xD0000000/0xD8000000) depending on TFRTYP and SMRM configuration.

#### 49.6.5.1 Instruction Frame

In order to control serial Flash memories, the QSPI is able to send instructions via the SPI bus (ex: READ, PROGRAM, ERASE, LOCK, etc.). Because the instruction set implemented in serial Flash memories is memory vendor-dependent, the QSPI includes a complete Instruction Frame register (QSPI\_IFR), which makes it very flexible and compatible with all serial Flash memories.

An instruction frame includes:

- An instruction code (size: 8 bits). The instruction is optional in some cases (see section [Continuous Read mode](#)).
- An address (size: 24 bits or 32 bits). The address is optional but is required by instructions such as READ, PROGRAM, ERASE, LOCK. By default the address is 24 bits long, but it can be 32 bits long to support serial Flash memories larger than 128 Mbits (16 Mbytes).
- An option code (size: 1/2/4/8 bits). The option code is not required, but it is useful to activate the XIP mode or the Continuous Read mode (see section [Continuous Read mode](#)) for READ instructions, in some serial Flash memory devices. These modes improve the data read latency.
- Dummy cycles. Dummy cycles are optional but required by some READ instructions.
- Data bytes are optional. Data bytes are present for data transfer instructions such as READ or PROGRAM.

The instruction code, the address/option and the data can be sent with Single-bit SPI, Dual SPI or Quad SPI protocols.

**Figure 49-8. Instruction Frame**

### 49.6.5.2 Instruction Frame Transmission

To send an instruction frame, the user must first configure the address to send by writing the field ADDR in the Instruction Address register (QSPI\_IAR). This step is required if the instruction frame includes an address and no data. When data is present, the address of the instruction is defined by the address of the data accesses in the QSPI memory space, not by QSPI\_IAR.

If the instruction frame includes the instruction code and/or the option code, the user must configure the instruction code and/or the option code to send by writing the fields INST and OPT in the Instruction Code register (QSPI\_ICR).

Then, the user must write QSPI\_IFR to configure the instruction frame depending on which instruction must be sent. If the instruction frame does not include data, writing in this register triggers the send of the instruction frame in the QSPI. If the instruction frame includes data, the send of the instruction frame is triggered by the first data access in the QSPI memory space.

The instruction frame is configured by the following bits and fields of QSPI\_IFR:

- WIDTH field—used to configure which data lanes are used to send the instruction code, the address, the option code and to transfer the data. It is possible to use two unidirectional data lanes (MISO-MOSI Single-bit SPI), two bidirectional data lanes (QIO0-QIO1 Dual SPI) or four bidirectional data lanes (QIO0-QIO3 Quad SPI).
- INSTEN bit—used to enable the send of an instruction code.
- ADDREN bit—used to enable the send of an address after the instruction code.
- OPTEN bit—used to enable the send of an option code after the address.
- DATAEN bit—used to enable the transfer of data (READ or PROGRAM instruction).
- OPTL field—used to configure the option code length. The value written in OPTL must be consistent with the value written in the field WIDTH. For example: OPTL = 0 (1-bit option code) is not consistent with WIDTH = 6 (option code sent with QuadSPI protocol, thus the minimum length of the option code is 4 bits).
- ADDRRL bit—used to configure the address length.
- TFRYP field—used to define which type of data transfer must be performed.
- NBDUM field—used to configure the number of dummy cycles when reading data from the serial Flash memory. Between the address/option and the data, with some instructions, dummy cycles are inserted by the serial Flash memory.

Refer to [49.6.5.2 Instruction Frame Transmission](#).

If data transfer is enabled, the user can access the serial memory by reading or writing the QSPI memory space:

- To read in the serial memory, but not a memory data, for example a JEDEC-ID or the QSPI\_SR, QSPI\_IFR.TFRTYP must be written to '0'.
- To read in the serial memory, and particularly a memory data, TFRTYP must be written to '1'.
- To write in the serial memory, but not a memory data, for example writing the configuration or the QSPI\_SR, TFRTYP must be written to '2'.
- If the user wants to write in the serial memory in particular to program a memory data, TFRTYP must be written to '3'.

If QSPI\_IFR.TFRTYP has a value other than '1' and QSPI\_MR.SMRM = 0, the address sent in the instruction frame is the address of the first system bus accesses. The addresses of the next accesses are not used by the QSPI. At each system bus access, an SPI transfer is performed with the same size. For example, a halfword system bus access leads to a 16-bit SPI transfer, and a byte system bus access leads to an 8-bit SPI transfer.

If SMRM = 1 and TFRTYP= (0 or 2), accesses are made via the QSPI registers and the address sent in the instruction frame is the address defined in QSPI\_IAR.

Each time QSPI\_IFR is written (in case of read access), or each time QSPI\_TDR is written (in case of write transfer), an SPI transfer is performed with a byte size. Another byte is read each time QSPI\_RDR is read (flag RDRF shows when a data can be read in QSPI\_RDR) or written each time QSPI\_TDR is written (flag TDRE shows when a new data can be written). The SPI transfer ends by writing QSPI\_CR.LASTXFER.

If TFRTYP = 1, the address of the first instruction frame is the one of the first read access in the QSPI memory space. Each time the read accesses become nonsequential (addresses are not consecutive), a new instruction frame is sent with the last system bus access address. In this way, the system can read data at a random location in the serial memory. The size of the SPI transfers may differ from the size of the system bus read accesses.

When data transfer is not enabled, the end of the instruction frame is indicated when QSPI\_SR.INSTRE rises. (The QSPI\_SR.CSR flag indicates when chip select rises. A delay between these flags may exist in case of high clock division or a high DLYBCT value).

When data transfer is enabled, the user must indicate when the data transfer is completed in the QSPI memory space by setting QSPI\_CR.LASTXFER. The end of the instruction frame is indicated when QSPI\_SR.INSTRE rises.

The following figure illustrates instruction transmission management.

### 49.6.5.3 Read Memory Transfer

The user can access the data of the serial memory by sending an instruction with QSPI\_IFR.DATAEN = 1 and QSPI\_IFR.TFRTYP = 1.

In this mode, the QSPI is able to read data at random address into the serial Flash memory, allowing the CPU to execute code directly from it (XIP execute-in-place).

In order to fetch data, the user must first configure the instruction frame by writing the QSPI\_IFR. Then data can be read at any address in the QSPI address space mapping. The address of the system bus read accesses match the address of the data inside the serial Flash memory.

When Fetch mode is enabled, several instruction frames can be sent before writing QSPI\_CR.LASTXFR. Each time the system bus read accesses become nonsequential (addresses are not consecutive), a new instruction frame is sent with the corresponding address.

### 49.6.5.4 Continuous Read Mode

The QSPI is compatible with the Continuous Read mode which is implemented in some serial Flash memories.

In Continuous Read mode, the instruction overhead is reduced by excluding the instruction code from the instruction frame. When the Continuous Read mode is activated in a serial Flash memory by a specific option code, the instruction code is stored in the memory. For the next instruction frames, the instruction code is not required as the memory uses the stored one.

In the QSPI, Continuous Read mode is used when reading data from the memory (QSPI\_IFR.TFR\_TYP = 1). The addresses of the system bus read accesses are often nonsequential and this leads to many instruction frames that have the same instruction code. By disabling the send of the instruction code, the Continuous Read mode reduces the access time of the data.

To be functional, this mode must be enabled in both the QSPI and the serial Flash memory. The Continuous Read mode is enabled in the QSPI by writing CRM to '1' in the QSPI\_IFR (TFR\_TYP must equal 1). The Continuous Read mode is enabled in the serial Flash memory by sending a specific option code.

If the Continuous Read mode is not supported by the serial Flash memory or disabled, CRM bit must not be written to '1', otherwise data read out of the serial Flash memory is unpredictable.

**Figure 49-9. Continuous Read Mode**

### 49.6.5.5 Instruction Frame Transmission Examples

All waveforms in the following examples describe SPI transfers in SPI Clock mode 0 (QSPI\_SCR.CPOL = 0 and QSPI\_SCR.CPHA = 0; see section [Serial Clock Phase and Polarity](#)).

All system bus accesses described below refer to the system bus address phase. System bus wait cycles and system bus data phases are not shown.

Example 1:

Instruction in Single-bit SPI, without address, without option, without data.

Command: CHIP ERASE (C7h).

- Write 0x0000\_00C7 in QSPI\_ICR.
- Write 0x0000\_0010 in QSPI\_IFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-10. Instruction Transmission Waveform 1**

Example 2:

Instruction in Quad SPI, without address, without option, without data.

Command: POWER DOWN (B9h)

- Write 0x0000\_00B9 in QSPI\_ICR.
- Write 0x0000\_0016 in QSPI\_IFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-11. Instruction Transmission Waveform 2**

Example 3:

Instruction in Single-bit SPI, with address in Single-bit SPI, without option, without data.

Command: BLOCK ERASE (20h)

- Write the address (of the block to erase) in QSPI\_AR.
- Write 0x0000\_0020 in QSPI\_ICR.
- Write 0x0000\_0030 in QSPI\_IFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-12. Instruction Transmission Waveform 3**

**Example 4:**

Instruction in Single-bit SPI, without address, without option, with data write in Single-bit SPI.

Command: SET BURST (77h)

- Write 0x0000\_0077 in QSPI\_ICR.
- Write 0x0000\_2090 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Write data in the system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000). The address of system bus write accesses is not used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-13. Instruction Transmission Waveform 4**

**Example 5:**

Instruction in Single-bit SPI, with address in Dual SPI, without option, with data write in Dual SPI.

Command: BYTE/PAGE PROGRAM (02h)

- Write 0x0000\_0002 in QSPI\_ICR.
- Write 0x0000\_30B3 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Write data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000). The address of the first system bus write access is sent in the instruction frame. The address of the next system bus write accesses is not used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-14. Instruction Transmission Waveform 5**

**Example 6:**

Instruction in Single-bit SPI, with address in Single-bit SPI, without option, with data read in Quad SPI, with eight dummy cycles.

Command: QUAD\_OUTPUT READ ARRAY (6Bh)

- Write 0x0000\_006B in QSPI\_ICR.
- Write 0x0008\_10B2 in QSPI\_IFR.
- Read QSPI\_IR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000).  
The address of the first system bus read access is sent in the instruction frame.  
The address of the next system bus read accesses is not used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-15. Instruction Transmission Waveform 6**

**Example 7:**

Instruction in Single-bit SPI, with address and option in Quad SPI, with data read in Quad SPI, with four dummy cycles, with fetch and continuous read.

Command: FAST READ QUAD I/O (EBh) - 8-BIT OPTION (0x30h)

- Write 0x0030\_00EB in QSPI\_ICR.
- Write 0x0004\_33F4 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000).  
Fetch is enabled, the address of the system bus read accesses is always used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-16. Instruction Transmission Waveform 7**

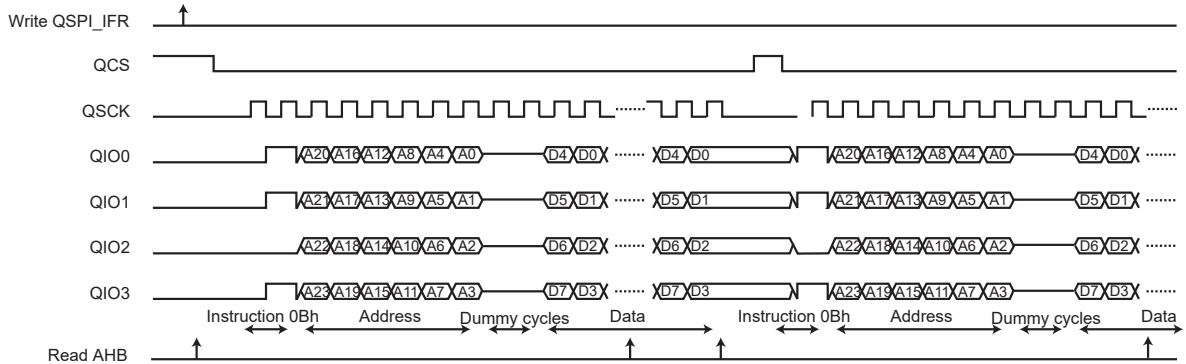

**Example 8:**

Instruction in Quad SPI, with address in Quad SPI, without option, with data read in Quad SPI, with two dummy cycles, with fetch.

Command: HIGH-SPEED READ (0Bh)

- Write 0x0000\_000B in QSPI\_ICR.
- Write 0x0002\_20B6 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000).  
Fetch is enabled, the address of the system bus read accesses is always used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-17. Instruction Transmission Waveform 8**

**Example 9:**

Instruction in Quad SPI, without address, without option, with data read in Quad SPI, without dummy cycles, without fetch.

Command: HIGH-SPEED READ (05h)

- Write 0x0000\_0005 in QSPI\_ICR.
- Write 0x0000\_0096 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000).  
Fetch is disabled.
- Write a '1' to QSPI\_CR.LASTXFR.

- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-18. Instruction Transmission Waveform 9**

Example 10:

Instruction in Quad SPI, without address, without option, with data read in Quad SPI, without dummy cycles, without fetch, read launched through APB interface.

Command: HIGH-SPEED READ (05h)

- Set SMRM to '1' in QSPI\_MR
- Write 0x0000\_0005 in QSPI\_ICR.
- Write 0x0100\_0096 in QSPI\_IFR (will start the transfer).
- Wait flag RDRF and Read data in the QSPI\_RDR register  
Fetch is disabled.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-19. Instruction Transmission Waveform 10**

### 49.6.6 Scrambling/Unscrambling Function

The scrambling/unscrambling function cannot be performed on devices other than memories. Data is scrambled when written to memory and unscrambled when data is read.

The external data lines can be scrambled in order to prevent intellectual property data located in off-chip memories from being easily recovered by analyzing data at the package pin level of either the microcontroller or the QSPI slave device (e.g., memory).

The scrambling/unscrambling function can be enabled by writing a '1' to the SCREN bit in the QSPI Scrambling Mode Register (QSPI\_SMR).

The scrambling and unscrambling are performed on-the-fly without impacting the throughput.

The scrambling method depends on the user-configurable user scrambling key (field USRK) in the QSPI Scrambling Key Register (QSPI\_SKR). QSPI\_SKR is only accessible in Write mode.

If QSPI\_SMR.RVDIS is written to '0', the scrambling/unscrambling algorithm includes the user scrambling key plus a random value depending on device processing characteristics. Data scrambled by a given microcontroller cannot be unscrambled by another.

If QSPI\_SMR.RVDIS is written to '1', the scrambling/unscrambling algorithm includes only the user scrambling key. No random value is part of the key.

The user scrambling key or the seed for key generation must be securely stored in a reliable nonvolatile memory in order to recover data from the off-chip memory. Any data scrambled with a given key cannot be recovered if the key is lost.

### 49.6.7 Register Write Protection

To prevent any single software error from corrupting QSPI behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the QSPI Write Protection Mode Register (QSPI\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the QSPI Write Protection Status Register (QSPI\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the QSPI\_WPSR.

The following registers can be write-protected when WPEN is set in QSPI\_WPMR:

- [QSPI Mode Register](#)
- [QSPI Serial Clock Register](#)
- [QSPI Scrambling Mode Register](#)
- [QSPI Scrambling Key Register](#)

# SAMA5D2 Series

Bit	7	6	5	4	3	2	1	0	
	SWRST							QSPIDIS	QSPIEN
Access	W							W	W
Reset	–							–	–

**Bit 24 – LASTXFER** Last Transfer

Value	Description
0	No effect.
1	The chip select is deasserted after the character written in QSPI_TDR.TD has been transferred.

**Bit 7 – SWRST** QSPI Software Reset  
 DMA channels are not affected by software reset.

Value	Description
0	No effect.
1	Reset the QSPI. A software-triggered hardware reset of the QSPI interface is performed.

**Bit 1 – QSPIDIS** QSPI Disable  
 As soon as QSPIDIS is set, the QSPI finishes its transfer.  
 All pins are set in Input mode and no data is received or transmitted.  
 If a transfer is in progress, the transfer is finished before the QSPI is disabled.  
 If both QSPIEN and QSPIDIS are equal to one when QSPI\_CR is written, the QSPI is disabled.

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

---

---

Value	Description
0	No effect.
1	Disables the QSPI.

### Bit 0 – QSPIEN QSPI Enable

Value	Description
0	No effect.
1	Enables the QSPI to transfer and receive data.

### 49.7.2 QSPI Mode Register

**Name:** QSPI\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bit WPEN is cleared in the [QSPI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	DLYCS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16

	CSMODE[1:0]		SMRM		WDRBT		LLB	
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

#### Bits 31:24 – DLYCS[7:0] Minimum Inactive QCS Delay

This field defines the minimum delay between the deactivation and the activation of QCS. The DLYCS time guarantees the slave minimum deselect time.

If DLYCS written to '0', one peripheral clock period is inserted by default.

Otherwise, the following equation determines the delay:

$$DLYCS = \text{Minimum inactive} \times f_{\text{peripheral clock}}$$

#### Bits 23:16 – DLYBCT[7:0] Delay Between Consecutive Transfers

This field defines the delay between two consecutive transfers with the same peripheral without removing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.

When DLYBCT is written to '0', no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers. In Serial Memory mode (SMM = 1), DLYBCT must be written to '0' and no delay is inserted.

Otherwise, the following equation determines the delay:

$$DLYBCT = (\text{Delay Between Consecutive Transfers} \times f_{\text{peripheral clock}}) / 32$$

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

**Bits 11:8 – NBBITS[3:0]** Number Of Bits Per Transfer

Value	Name	Description
0	8_BIT	8 bits for transfer
8	16_BIT	16 bits for transfer

**Bits 5:4 – CSMODE[1:0]** Chip Select Mode

The CSMODE field determines how the chip select is deasserted

**Note:** This field is forced to LASTXFER when SMM is written to ‘1’.

Value	Name	Description
0	NOT_RELOADED	The chip select is deasserted if QSPI_TDR.TD has not been reloaded before the end of the current transfer.
1	LASTXFER	The chip select is deasserted when the bit LASTXFER is written to ‘1’ and the character written in QSPI_TDR.TD has been transferred.
2	SYSTEMATICALLY	The chip select is deasserted systematically after each transfer.

**Bit 3 – SMRM** Serial Memory Register Mode

Value	Description
0	Serial Memory registers are written via AHB access. See section <a href="#">Instruction Frame Transmission</a> for details.
1	Serial Memory registers are written via APB access. See section <a href="#">Instruction Frame Transmission</a> for details.

**Bit 2 – WDRBT** Wait Data Read Before Transfer

0 (DISABLED): No effect. In SPI mode, a transfer can be initiated whatever the state of the QSPI\_RDR is.

1 (ENABLED): In SPI mode, a transfer can start only if the QSPI\_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception.

**Bit 1 – LLB** Local Loopback Enable

0 (DISABLED): Local loopback path disabled.

1 (ENABLED): Local loopback path enabled.

LLB controls the local loopback on the data serializer for testing in SPI mode only. (MISO is internally connected on MOSI).

**Bit 0 – SMM** Serial Memory Mode

0 (SPI): The QSPI is in SPI mode.

1 (MEMORY): The QSPI is in Serial Memory mode.

### 49.7.3 QSPI Receive Data Register

**Name:** QSPI\_RDR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 15:0 – RD[15:0] Receive Data**

Data received by the QSPI is stored in this register right-justified. Unused bits read zero.

### 49.7.4 QSPI Transmit Data Register

**Name:** QSPI\_TDR  
**Offset:** 0x0C  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Bit	7	6	5	4	3	2	1	0
	TD[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	–

**Bits 15:0 – TD[15:0] Transmit Data**

Data to be transmitted by the QSPI is stored in this register. Information to be transmitted must be written to the Transmit Data register in a right-justified format.

### 49.7.5 QSPI Status Register

**Name:** QSPI\_SR  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
								QSPIENS
Access								R
Reset								0
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
						INSTRE	CSS	CSR
Access						R	R	R
Reset						0	0	0
Bit	7	6	5	4	3	2	1	0
					OVRES	TXEMPTY	TDRE	RDRF
Access					R	R	R	R
Reset					0	0	0	0

#### Bit 24 – QSPIENS QSPI Enable Status

Value	Description
0	QSPI is disabled.
1	QSPI is enabled.

#### Bit 10 – INSTRE Instruction End Status (cleared on read)

Value	Description
0	No instruction end has been detected since the last read of QSPI_SR.
1	At least one instruction end has been detected since the last read of QSPI_SR.

#### Bit 9 – CSS Chip Select Status

Value	Description
0	The chip select is asserted.
1	The chip select is not asserted.

#### Bit 8 – CSR Chip Select Rise (cleared on read)

Value	Description
0	No chip select rise has been detected since the last read of QSPI_SR.
1	At least one chip select rise has been detected since the last read of QSPI_SR.

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

### Bit 3 – OVRES Overrun Error Status (cleared on read)

An overrun occurs when QSPI\_RDR is loaded at least twice from the serializer since the last read of the QSPI\_RDR.

Value	Description
0	No overrun has been detected since the last read of QSPI_SR.
1	At least one overrun error has occurred since the last read of QSPI_SR.

### Bit 2 – TXEMPTY Transmission Registers Empty (cleared by writing QSPI\_TDR)

Value	Description
0	As soon as data is written in QSPI_TDR.
1	QSPI_TDR and the internal shifter are empty. If a transfer delay has been defined, TXEMPTY is set after the completion of such delay.

### Bit 1 – TDRE Transmit Data Register Empty (cleared by writing QSPI\_TDR)

TDRE equals zero when the QSPI is disabled or at reset. The QSPI enable command sets this bit to one.

Value	Description
0	Data has been written to QSPI_TDR and not yet transferred to the serializer.
1	The last data written in the QSPI_TDR has been transferred to the serializer.

### Bit 0 – RDRF Receive Data Register Full (cleared by reading QSPI\_RDR)

Value	Description
0	No data has been received since the last read of QSPI_RDR.
1	Data has been received and the received data has been transferred from the serializer to QSPI_RDR since the last read of QSPI_RDR.

### 49.7.6 QSPI Interrupt Enable Register

**Name:** QSPI\_IER  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
						INSTRE	CSS	CSR
Access						W	W	W
Reset						–	–	–
Bit	7	6	5	4	3	2	1	0
					OVRES	TXEMPTY	TDRE	RDRF
Access					W	W	W	W
Reset					–	–	–	–

**Bit 10 – INSTRE** Instruction End Interrupt Enable

**Bit 9 – CSS** Chip Select Status Interrupt Enable

**Bit 8 – CSR** Chip Select Rise Interrupt Enable

**Bit 3 – OVRES** Overrun Error Interrupt Enable

**Bit 2 – TXEMPTY** Transmission Registers Empty Enable

**Bit 1 – TDRE** Transmit Data Register Empty Interrupt Enable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Enable

### 49.7.7 QSPI Interrupt Disable Register

**Name:** QSPI\_IDR  
**Offset:** 0x18  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
						INSTRE	CSS	CSR
Access						W	W	W
Reset						–	–	–
Bit	7	6	5	4	3	2	1	0
					OVRES	TXEMPTY	TDRE	RDRF
Access					W	W	W	W
Reset					–	–	–	–

**Bit 10 – INSTRE** Instruction End Interrupt Disable

**Bit 9 – CSS** Chip Select Status Interrupt Disable

**Bit 8 – CSR** Chip Select Rise Interrupt Disable

**Bit 3 – OVRES** Overrun Error Interrupt Disable

**Bit 2 – TXEMPTY** Transmission Registers Empty Disable

**Bit 1 – TDRE** Transmit Data Register Empty Interrupt Disable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Disable

### 49.7.8 QSPI Interrupt Mask Register

**Name:** QSPI\_IMR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24

Access  
Reset

Bit	23	22	21	20	19	18	17	16

Access  
Reset

Bit	15	14	13	12	11	10	9	8
						INSTRE	CSS	CSR

Access						R	R	R
Reset						0	0	0

Bit	7	6	5	4	3	2	1	0
					OVRES	TXEMPTY	TDRE	RDRF

Access					R	R	R	R
Reset					0	0	0	0

**Bit 10 – INSTRE** Instruction End Interrupt Mask

**Bit 9 – CSS** Chip Select Status Interrupt Mask

**Bit 8 – CSR** Chip Select Rise Interrupt Mask

**Bit 3 – OVRES** Overrun Error Interrupt Mask

**Bit 2 – TXEMPTY** Transmission Registers Empty Mask

**Bit 1 – TDRE** Transmit Data Register Empty Interrupt Mask

**Bit 0 – RDRF** Receive Data Register Full Interrupt Mask

### 49.7.9 QSPI Serial Clock Register

**Name:** QSPI\_SCR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bit WPEN is cleared in the [QSPI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	DLYBS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	SCBR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
							CPHA	CPOL
Access							R/W	R/W
Reset							0	0

**Bits 23:16 – DLYBS[7:0]** Delay Before QSCK

This field defines the delay from QCS valid to the first valid QSCK transition.

When DLYBS equals zero, the QCS valid to QSCK transition is 1/2 the QSCK clock period.

Otherwise, the following equation determines the delay:

$$DLYBS = \text{Delay Before QSCK} \times f_{\text{peripheral clock}}$$

**Bits 15:8 – SCBR[7:0]** Serial Clock Baud Rate

The QSPI uses a modulus counter to derive the QSCK baud rate from the peripheral clock. The baud rate is selected by writing a value from 0 to 255 in the SCBR field. The following equation determines the QSCK baud rate:

$$SCBR = (f_{\text{peripheral clock}} / \text{QSCK Baudrate}) - 1$$

**Bit 1 – CPHA** Clock Phase

CPHA determines which edge of QSCK causes data to change and which edge causes data to be captured. CPHA is used with CPOL to produce the required clock/data relationship between master and slave devices.

Value	Description
0	Data is captured on the leading edge of QSCK and changed on the following edge of QSCK.

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

---

---

Value	Description
1	Data is changed on the leading edge of QSCK and captured on the following edge of QSCK.

### Bit 0 – CPOL Clock Polarity

CPOL is used to determine the inactive state value of the serial clock (QSCK). It is used with CPHA to produce the required clock/data relationship between master and slave devices.

Value	Description
0	The inactive state value of QSCK is logic level zero.
1	The inactive state value of QSCK is logic level one.

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

### 49.7.10 QSPI Instruction Address Register

**Name:** QSPI\_IAR  
**Offset:** 0x30  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
ADDR[31:24]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
ADDR[23:16]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
ADDR[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
ADDR[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – ADDR[31:0] Address**

Address to send to the serial Flash memory in the instruction frame.

### 49.7.11 QSPI Instruction Code Register

**Name:** QSPI\_ICR  
**Offset:** 0x34  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	OPT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	INST[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 23:16 – OPT[7:0]** Option Code  
 Option code to send to the serial Flash memory.

**Bits 7:0 – INST[7:0]** Instruction Code  
 Instruction code to send to the serial Flash memory.

### 49.7.12 QSPI Instruction Frame Register

**Name:** QSPI\_IFR  
**Offset:** 0x38  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits 31-24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Greyed out bits 23-21]			NBDUM[4:0]				
Access								
Reset				0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	CRM		TFRTYP[1:0]		ADDRL		OPTL[1:0]	
Access	R/W		R/W		R/W		R/W	
Reset	0		0		0		0	
Bit	7	6	5	4	3	2	1	0
	DATAEN	OPTEN	ADDREN	INSTEN	WIDTH[2:0]			
Access	R/W	R/W	R/W	R/W	R/W			
Reset	0	0	0	0	0			

**Bits 20:16 – NBDUM[4:0]** Number Of Dummy Cycles

The NBDUM field defines the number of dummy cycles required by the serial Flash memory before data transfer.

**Bit 14 – CRM** Continuous Read Mode

0 (DISABLED): Continuous Read mode is disabled.

1 (ENABLED): Continuous Read mode is enabled.

**Bits 13:12 – TFRTYP[1:0]** Data Transfer Type

Value	Name	Description
0	TRSFR_READ	Read transfer from the serial memory.  Scrambling is not performed.  Read at random location (fetch) in the serial Flash memory is not possible.
1	TRSFR_READ_MEMORY	Read data transfer from the serial memory.  If enabled, scrambling is performed.  Read at random location (fetch) in the serial Flash memory is possible.

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

Value	Name	Description
2	TRSFR_WRITE	Write transfer into the serial memory. Scrambling is not performed.
3	TRSFR_WRITE_MEMORY	Write data transfer into the serial memory. If enabled, scrambling is performed.

### Bit 10 – ADDRL Address Length

The ADDRL bit determines the length of the address.

0 (24\_BIT): The address is 24 bits long.

1 (32\_BIT): The address is 32 bits long.

### Bits 9:8 – OPTL[1:0] Option Code Length

The OPTL field determines the length of the option code. The value written in OPTL must be consistent with the value written in the field WIDTH. For example, OPTL = 0 (1-bit option code) is not consistent with WIDTH = 6 (option code sent with QuadSPI protocol, thus the minimum length of the option code is 4 bits).

Value	Name	Description
0	OPTION_1BIT	The option code is 1 bit long.
1	OPTION_2BIT	The option code is 2 bits long.
2	OPTION_4BIT	The option code is 4 bits long.
3	OPTION_8BIT	The option code is 8 bits long.

### Bit 7 – DATAEN Data Enable

Value	Description
0	No data is sent/received to/from the serial Flash memory.
1	Data is sent/received to/from the serial Flash memory.

### Bit 6 – OPTEN Option Enable

Value	Description
0	The option is not sent to the serial Flash memory.
1	The option is sent to the serial Flash memory.

### Bit 5 – ADDREN Address Enable

Value	Description
0	The transfer address is not sent to the serial Flash memory.
1	The transfer address is sent to the serial Flash memory.

### Bit 4 – INSTEN Instruction Enable

Value	Description
0	The instruction is not sent to the serial Flash memory.
1	The instruction is sent to the serial Flash memory.

### Bits 2:0 – WIDTH[2:0] Width of Instruction Code, Address, Option Code and Data

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

Value	Name	Description
0	SINGLE_BIT_SPI	Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Single-bit SPI
1	DUAL_OUTPUT	Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Dual SPI
2	QUAD_OUTPUT	Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Quad SPI
3	DUAL_IO	Instruction: Single-bit SPI / Address-Option: Dual SPI / Data: Dual SPI
4	QUAD_IO	Instruction: Single-bit SPI / Address-Option: Quad SPI / Data: Quad SPI
5	DUAL_CMD	Instruction: Dual SPI / Address-Option: Dual SPI / Data: Dual SPI
6	QUAD_CMD	Instruction: Quad SPI / Address-Option: Quad SPI / Data: Quad SPI

### 49.7.13 QSPI Scrambling Mode Register

**Name:** QSPI\_SMR  
**Offset:** 0x40  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bit WPEN is cleared in the [QSPI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	[Bit Field Diagram: 8 boxes from bit 31 to 24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Bit Field Diagram: 8 boxes from bit 23 to 16]							
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	[Bit Field Diagram: 8 boxes from bit 15 to 8]							
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	[Bit Field Diagram: 6 boxes from bit 7 to 2]						RVDIS	SCREN
Access							R/W	R/W
Reset							0	0

**Bit 1 – RVDIS** Scrambling/Unscrambling Random Value Disable

Value	Description
0	The scrambling/unscrambling algorithm includes the user scrambling key plus a random value that may differ between devices.
1	The scrambling/unscrambling algorithm includes only the user scrambling key.

**Bit 0 – SCREN** Scrambling/Unscrambling Enable

0 (DISABLED): The scrambling/unscrambling is disabled.

1 (ENABLED): The scrambling/unscrambling is enabled.

### 49.7.14 QSPI Scrambling Key Register

**Name:** QSPI\_SKR  
**Offset:** 0x44  
**Reset:** –  
**Property:** Write-only

This register can only be written if bit WPEN is cleared in the [QSPI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	USRK[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	USRK[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	USRK[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0

	USRK[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	–

**Bits 31:0 – USRK[31:0]** User Scrambling Key

### 49.7.15 QSPI Write Protection Mode Register

**Name:** QSPI\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPEN
Access								
Reset								0

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x51535	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit.
0		Always reads as 0.

#### Bit 0 – WPEN Write Protection Enable

See section [Register Write Protection](#) for the list of registers that can be protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x515350 (QSP in ASCII)
1	Enables the write protection if WPKEY corresponds to 0x515350 (QSP in ASCII)

### 49.7.16 QSPI Write Protection Status Register

**Name:** QSPI\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Greyed out bits]							
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	[Greyed out bits]							WPVS
Access								R
Reset								0

**Bits 15:8 – WPVSR[7:0] Write Protection Violation Source**

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS Write Protection Violation Status**

Value	Description
0	No write protection violation has occurred since the last read of the QSPI_WPSR.
1	A write protection violation has occurred since the last read of the QSPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

## 50. Secure Digital MultiMedia Card Controller (SDMMC)

### 50.1 Description

The Secure Digital MultiMedia Card Controller (SDMMC) supports the embedded MultiMedia Card (e.MMC) Specification V4.51, the SD Memory Card Specification V3.0, and the SDIO V3.0 specification. It is compliant with the SD Host Controller Standard V3.0 specification.

The SDMMC includes the register set defined in the “SD Host Controller Simplified Specification V3.00” and additional registers to manage e.MMC devices, sampling tuning procedure, PAD calibration and enhanced features.

The SDMMC is clocked by three asynchronous clocks and requires the PMC to be configured first.

### 50.2 Embedded Characteristics

- Compatible with SD Host Controller Standard Specification Version 3.00
- Compatible with MultiMedia Card Specification Version V4.51
- Compatible with SD Memory Card Specification Version 3.00
- Compatible with SDIO Specification Version 3.00
- Support for 1-bit/ 4-bit SD/SDIO Devices
- Support for 1-bit/4-bit/8-bit e.MMC Devices
- Support for SD/SDIO Default Speed (Maximum SDCLK Frequency = 25 MHz)
- Support for SD/SDIO High Speed (Maximum SDCLK Frequency = 50 MHz)
- Support for SD/SDIO UHS-I SDR12 (Maximum SDCLK Frequency = 25 MHz)
- Support for SD/SDIO UHS-I SDR25 (Maximum SDCLK Frequency = 50 MHz)
- Support for SD/SDIO UHS-I SDR50 (Maximum SDCLK Frequency = 100 MHz)
- Support for SD/SDIO UHS-I SDR104 (Maximum SDCLK Frequency = 120 MHz)
- Support for SD/SDIO UHS-I DDR50 (Maximum SDCLK Frequency = 50 MHz)
- Support for SDSC, SDHC and SDXC
- Support for MMC/e.MMC Default Speed (Maximum SDCLK Frequency = 26 MHz)
- Support for MMC/e.MMC High Speed (Maximum SDCLK Frequency = 52 MHz)
- Support for e.MMC High Speed DDR (Maximum SDCLK Frequency = 52 MHz)
- Support for e.MMC HS200 (Maximum SDCLK Frequency = 120 MHz)
- e.MMC Boot Operation Mode Support
- Support for Block Size from 1 to 512 Bytes
- Support for Stream, Block and Multiblock Data Read and Write
  - Advanced DMA and SDMA Capability
- Internal 1024-byte Dual Port RAM
- Support for both Synchronous and Asynchronous Abort
- Supports for SDIO Card Interrupt

### 50.3 Reference Documents

**Table 50-1. Reference Documents**

Name	Link
SD Host Controller Simplified Specification V3.00	<a href="https://www.sdcard.org">https://www.sdcard.org</a>
SDIO Simplified Specification V3.00	
Physical Layer Simplified Specification V3.01	
Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51	<a href="http://www.jedec.org">http://www.jedec.org</a>

### 50.4 Block Diagram

Figure 50-1. Block Diagram

- Notes:
1. SDMMC\_1V8SEL not available on SDMMC1.
  2. Limited to SDMMC\_DAT[3..0] on SDMMC1.

## 50.5 Application Block Diagram

Figure 50-2. Application Block Diagram

## 50.6 Pin Name List

Table 50-2. I/O Lines Description for 8-bit Configuration

Pin Name <sup>(1)</sup>	Pin Description	Type
SDMMC_CD	SDCard / SDIO / e.MMC Card Detect	Input
SDMMC_CMD	SDCard / SDIO / e.MMC Command/Response Line	I/O
SDMMC_WP	SDCard Connector Write Protect Signal	Input
SDMMC_RSTN	e.MMC Reset Signal	Output
SDMMC_1V8SEL	SDCard Signal Voltage Selection	Output
SDMMC_CK	SDCard / SDIO / e.MMC Clock Signal	Output
SDMMC_DAT[7..0]	SDCard / SDIO / e.MMC Data Lines	I/O

Notes: 1. When several SDMMCs are embedded in a product, SDMMC\_CK refers to SDMMCx\_CK, SDMMC\_CMD to SDMMCx\_CMD, SDMMC\_DATy to SDMMCx\_DATy, SDMMC\_WP to SDMMCx\_WP, SDMMC\_1V8SEL to SDMMCx\_1V8SEL, SDMMC\_CD to SDMMCx\_CD and SDMMC\_RSTN to SDMMCx\_RSTN.

## **50.7 Product Dependencies**

### **50.7.1 I/O Lines**

The pins used for interfacing the Secure Digital MultiMedia Card (SDMMC) Controller are multiplexed with PIO lines. The programmer must first program the PIO controller to assign the peripheral functions to SDMMC pins.

### **50.7.2 Power Management**

The SDMMC is clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the SDMMC clocks.

### **50.7.3 Interrupt Sources**

The SDMMC has an interrupt line connected to the interrupt controller.

Handling the SDMMC interrupt requires programming the interrupt controller before configuring the SDMMC.

## **50.8 SD/SDIO Operating Mode**

The SDMMC is fully compliant with the “SD Host Controller Simplified Specification V3.00” for SD/SDIO devices. See this specification for the SDMMC configuration.

See “Physical Layer Simplified Specification V3.01” and “SDIO Simplified Specification V3.00” for SD/SDIO management.

## **50.9 e.MMC Operating Mode**

The SDMMC supports management of e.MMC devices. As the “SD Host Controller Simplified Specification V3.00” does not apply to e.MMC devices, some registers have been added to those described in this specification in order to manage e.MMC devices. Most of the registers described in the “SD Host Controller Simplified Specification V3.00” must be used for e.MMC management, but e.MMC-specific features are managed using SDMMC\_MC1R and SDMMC\_MC2R.

### **50.9.1 Boot Operation Mode**

In Boot Operation mode, the processor can read boot data from the e.MMC device by keeping the CMD line low after poweron before issuing the CMD1. The data can be read from either one of the boot partitions or the user area according to BOOT\_PARTITION\_ENABLE in the Extended CSD register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” ).

#### **50.9.1.1 Boot Procedure, Processor Mode**

1. Configure the SDMMC:
  - a. Set the data bus width using SDMMC\_HC1R.DW and SDMMC\_HC1R.EXTDW according to the BOOT\_BUS\_WIDTH in the Extended CSD Register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” ).
  - b. Select the speed mode (using SDMMC\_HC1R.HSEN or SDMMC\_MC1R.DDR) according to BOOT\_MODE in the Extended CSD Register.
  - c. Set the SDCLK frequency according to the selected speed mode.
  - d. If the Boot Acknowledge is sent by the e.MMC device (BOOT\_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to ‘1’ (SDMMC\_MC1R.BOOTA = 1).

- e. Enable the interrupt on Boot Acknowledge Received (SDMMC\_NISTER.BOOTAR = 1 and SDMMC\_NISIER.BOOTAR = 1).
  - f. Set the e.MMC Command Type to BOOT (SDMMC\_MC1R.COMDTYP = 3)
  - g. Set SDMMC\_TMR to read multiple blocks for the e.MMC device (SDMMC\_TMR.MSBSEL = 1 and SDMMC\_TMR.DTDSEL = 1).
  - h. Select the NonDMA transfer (SDMMC\_TMR.DMAEN = 0).
  - i. Optional: select the Auto CMD method (using SDMMC\_TMR.ACMDEN).
  - j. Set the block size to 512 bytes (SDMMC\_BSR.BLKSIZE = 512).
  - k. Set the required number of read blocks (using SDMMC\_BCR.BLKCNT). SDMMC\_TMR.BCEN must be set to '1'.
2. Write SDMMC\_CR = 20(hexa) to set the e.MMC in Boot Operation mode.
  3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).
  4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.
  5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC\_MC2R.ABOOT to '1'.

#### 50.9.1.2 Boot Procedure, SDMA Mode

1. Configure SDMMC:
  - a. Set the data bus width using SDMMC\_HC1R.DW and SDMMC\_HC1R.EXTDW according to BOOT\_BUS\_WIDTH in the Extended CSD Register (see "Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51" ).
  - b. Select the speed mode (SDMMC\_HC1R.HSEN or SDMMC\_MC1R.DDR) according to BOOT\_MODE in the Extended CSD Register.
  - c. Set the SDCLK frequency according to the selected speed mode.
  - d. If the Boot Acknowledge is sent by the e.MMC device (BOOT\_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to 1 (SDMMC\_MC1R.BOOTA = 1).
  - e. Enable interrupt on Boot Acknowledge Received (SDMMC\_NISTER.BOOTAR = 1 and SDMMC\_NISIER.BOOTAR = 1).
  - f. Set the e.MMC Command Type to BOOT (SDMMC\_MC1R.COMDTYP = 3).
  - g. Set SDMMC\_TMR to read multiple blocks for the e.MMC device (SDMMC\_TMR.MSBSEL = 1 and SDMMC\_TMR.TDSEL = 1).
  - h. Select the SDMA transfer (SDMMC\_TMR.DMAEN = 1 and SDMMC\_HC1R.DMASEL = 0).
  - i. Write the SDMA system address where the boot data will be copied (SDMMC\_SSAR.ADDR).
  - j. Optional: select the Auto CMD method (SDMMC\_TMR.ACMDEN).  
Note: Auto CMD23 cannot be used with SDMA.
  - k. Set the block size to 512 bytes (SDMMC\_BSR.BLKSIZE = 512).
  - l. Set the required number of read blocks (SDMMC\_BCR.BLKCNT). SDMMC\_TMR.BCEN must be set to 1.
2. Write SDMMC\_CR = 20(hexa) to set the e.MMC in Boot Operation mode.
3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).
4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.

5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC\_MC2R.ABOOT to '1'.

#### 50.9.1.3 Boot Procedure, ADMA Mode

1. Configure the SDMMC:
  - a. Set the data bus width using SDMMC\_HC1R.DW and SDMMC\_HC1R.EXTDW according to BOOT\_BUS\_WIDTH in the Extended CSD Register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” ).
  - b. Select the speed mode (SDMMC\_HC1R.HSEN or SDMMC\_MC1R.DDR) according to BOOT\_MODE in the Extended CSD register.
  - c. Set the SDCLK frequency according to the selected speed mode.
  - d. If the Boot Acknowledge is sent by the e.MMC device (BOOT\_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to '1' (SDMMC\_MC1R.BOOTA = 1).
  - e. Enable interrupt on Boot Acknowledge Received (SDMMC\_NISTER.BOOTAR = 1 and SDMMC\_NISIER.BOOTAR = 1).
  - f. Set the e.MMC Command Type to BOOT (SDMMC\_MC1R.COMDTYP = 3).
  - g. Set SDMMC\_TMR to read multiple blocks for the e.MMC device (SDMMC\_TMR.MSBSEL = 1 and SDMMC\_TMR.DTDSEL = 1).
  - h. Select the ADMA transfer (SDMMC\_TMR.DMAEN = 1 and SDMMC\_HC1R.DMASEL = 2 or 3).
  - i. Write the address of the descriptor table in the ADMA system address (SDMMC\_ASARx [0..1].ADMASA).
  - j. Optional: select the Auto CMD method (SDMMC\_TMR.ACMDEN).
  - k. Set the block size to 512 bytes (SDMMC\_BSR.BLKSIZE = 512).
  - l. Set the required number of read blocks (SDMMC\_BCR.BLKCNT). SDMMC\_TMR.BCEN must be set to '1'.
2. Write SDMMC\_CR = 20(hexa) to set the e.MMC in Boot Operation Mode.
3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).
4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.
5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC\_MC2R.ABOOT to '1'.

## 50.10 SDR104 / HS200 Tuning

### 50.10.1 DLL and Sampling Point

In SD/SDIO SDR104 mode (SDMMC\_HC2R.VS18EN = 1 and SDMMC\_HC2R.UHSMS = 3) or e.MMC HS200 mode (HS200EN = B<sub>(hexa)</sub>), a tuning procedure must be performed first in order to adjust the sampling point for read transactions. For more details regarding the basic tuning procedure, see section “Sampling Clock Tuning Procedure” in the “SD Host Controller Simplified Specification V3.00” .

As the position of data and command coming from the device varies, a DLL is used to generate an accurate sampling point (DLL\_CLKOUT) (see the figure below).

**Figure 50-3. DLL Sampling Point**

Note: 1.  $t_{OUTPUT}$  varies from 0 to  $2 \times t_{SDCLK}$

The minimum SDCLK frequency is 100 MHz when SD/SDIO SDR104 or e.MMC HS200 is selected.

The sampling point can be selected to be located at 50% or 75% of the data window to anticipate the effect of the temperature rise. If SDMMC\_TUNCR.SMPLPT is cleared, the sampling point is centered (50% of the data window). If SDMMC\_TUNCR.SMPLPT is set to '1', the sampling point is set at 75% of the data window (see the figure below).

**Figure 50-4. SDR104/HS200 Sampling Point Selection**

### 50.10.2 Retuning Method

Once the data window sampling point has been tuned following the tuning procedure, the data window can be shifted by temperature drift. Thus, the tuning procedure must be applied periodically to adjust the sampling point position. The SDMMC implements a retuning timer which periodically instructs the software to restart the tuning procedure.

**Figure 50-5. Temperature Effect on Data Window**

Note: 1.  $t_{OUTPUT}$  varies from 0 to  $2 \times t_{SDCLK}$

### 50.10.2.1 SDMMC Tuning Sequence

The SDMMC tuning sequence must only be done when SD/SDIO SDR104 or e.MMC HS200 is selected and for a 100-MHz SDCLK frequency or higher.

1. Enable the retuning timer (`SDMMC_RTC1R.TMREN = 1`).
2. Configure the retuning period by setting `SDMMC_RTCVR.TCVAL`.
3. Set `SDMMC_RTISTR.TEVT` to '1' so that the TEVT status flag in `SDMMC_RTISTR` rises each time the retuning timer counter period elapses.
4. Set `SDMMC_RTISIER.TEVT` to '1' to generate an interrupt on the TEVT status flag assertion (optional).
5. Execute the tuning procedure as defined in "Sampling Clock Tuning Procedure" in the "SD Host Controller Simplified Specification V3.00".
6. Start the retuning timer count (write `SDMMC_RTC2R.RLD` to 1). At this step, data can be read by the SDMMC.
7. Each time `SDMMC_RTISTR.TEVT` is set to '1':
  - a. Execute the tuning procedure as defined in "Sampling Clock Tuning Procedure" in the "SD Host Controller Simplified Specification V3.00" before issuing the next command.
  - b. Restart the retuning timer count (write `SDMMC_RTC2R.RLD` to '1').
  - c. Resume data reading from the device.

When several instances of SDMMC are implemented in a product, the TEVT status flag of each SDMMC instance can be checked by reading `SDMMC_RTSSR`.

## 50.11 I/O Calibration

The need for output impedance calibration arises with higher data rates. As the data rate increases, some transmission line effects can occur and lead to the generation of undershoots and overshoots, hence degrading the signal quality.

To avoid these transmission problems, an I/O calibration cell is used to adjust the output impedance to the driven I/Os.

The I/O calibration sequence is mandatory when one of the SD/SDIO UHS-I modes (SDMMC\_HC2R.VS18EN = 1) or e.MMC HS200 (HS200EN = B<sub>(hexa)</sub>) is selected. It must be performed periodically to prevent the output impedance drift. Once the calibration is finished, the I/O calibration cell provides two four-bit control words (CALP[3:0] and CALN[3:0]) in the Calibration Control register (SDMMC\_CALCR) to tune the output impedance, and thus reach the best transmission performances.

The I/O calibration sequence can be started manually by writing a '1' to SDMMC\_CALCR.EN. This bit is cleared automatically at the end of the calibration.

The I/O calibration sequence can also be performed automatically if SDMMC\_CALCR.TUNDIS is cleared. In this case, the calibration starts automatically at the beginning of the tuning procedure when writing a '1' to SDMMC\_HC2R.EXTUN.

The I/O calibration cell requires a startup time defined by SDMMC\_CALCR.CNTVAL. Thus, CNTVAL must be configured prior to start the calibration sequence. If SDMMC\_CALCR.ALWYSON is set to '1', the startup time is only required for the first calibration sequence as the analog circuitry is not shut down at the end of the calibration. In order to reduce the power consumption, the analog circuitry can be shut down at the end of the calibration sequence by clearing ALWYSON. In this case, the startup time is performed each time a calibration sequence is started.

### 50.12.1 SDMMC SDMA System Address / Argument 2 Register

**Name:** SDMMC\_SSAR  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

This register contains the physical system memory address used for SDMA transfers or the second argument for Auto CMD23.

Bit	31	30	29	28	27	26	25	24
	ADDR/ARG2[31:24]							
Access								
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	ADDR/ARG2[23:16]							
Access								
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	ADDR/ARG2[15:8]							
Access								
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	ADDR/ARG2[7:0]							
Access								
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – ADDR/ARG2[31:0] SDMA System Address/Argument 2**

**ADDR:** This field is the system memory address for a SDMA transfer. When the SDMMC stops an SDMA transfer, this field points to the system address of the next contiguous data position. This field can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value. An interrupt can be generated to instruct the software to update this field. Writing the next system address of the next data position restarts the SDMA transfer.

**ARG2:** This field is used with Auto CMD23 to set a 32-bit block count value to the CMD23 argument while executing Auto CMD23. If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without ADMA, the available block count value is limited by SDMMC\_BCR. In this case, 65535 blocks is the maximum value.

### 50.12.2 SDMMC Block Size Register

**Name:** SDMMC\_BSR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	15	14	13	12	11	10	9	8
	BOUNDARY[2:0]						BLKSIZE[9:8]	
Access		R/W	R/W	R/W			R/W	R/W
Reset		0	0	0			0	0
Bit	7	6	5	4	3	2	1	0
	BLKSIZE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 14:12 – BOUNDARY[2:0] SDMA Buffer Boundary

This field specifies the size of the contiguous buffer in the system memory. The SDMA transfer waits at every boundary specified by this field and the SDMMC generates the DMA Interrupt to instruct the software to update SDMMC\_SSAR. If this field is set to 0 (buffer size = 4 Kbytes), the lowest 12 bits of SDMMC\_SSAR.ADDRESS point to data in the contiguous buffer, and the upper 20 bits point to the location of the buffer in the system memory. This function is active when SDMMC\_TMR.DMAEN is set.

Value	Name	Description
0	4K	4-Kbyte boundary
1	8K	8-Kbyte boundary
2	16K	16-Kbyte boundary
3	32K	32-Kbyte boundary
4	64K	64-Kbyte boundary
5	128K	128-Kbyte boundary
6	256k	256-Kbyte boundary
7	512K	512-Kbyte boundary

#### Bits 9:0 – BLKSIZE[9:0] Transfer Block Size

This field specifies the block size of data transfers for CMD14, CMD17, CMD18, CMD19, CMD24, CMD25, CMD53 and other data transfer commands such as CMD6, CMD8, ACMD13 and ACMD51. Values ranging from 1 to 512 can be set. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations are ignored.

### 50.12.3 SDMMC Block Count Register

**Name:** SDMMC\_BCR  
**Offset:** 0x06  
**Reset:** 0x0000  
**Property:** Read/Write

Bit	15	14	13	12	11	10	9	8
BLKCNT[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
BLKCNT[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 15:0 – BLKCNT[15:0]** Block Count for Current Transfer

This field is used only if SDMMC\_TMR.BCEN (Block Count Enable) is set to 1 and is valid only for multiple block transfers. BLKCNT is the number of blocks to be transferred and it must be set to a value between 1 and the maximum block count. The SDMMC decrements the block count after each block transfer and stops when the count reaches 0. When this field is set to 0, no data block is transferred.

This register should be accessed only when no transaction is executing (i.e., after transactions are stopped). During data transfer, read operations on this register may return an invalid value and write operations are ignored.

When a suspend command is completed, the number of blocks yet to be transferred can be determined by reading this register. Before issuing a resume command, the previously saved block count is restored.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.4 SDMMC Argument 1 Register

**Name:** SDMMC\_ARG1R  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	ARG1[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	ARG1[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	ARG1[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	ARG1[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – ARG1[31:0] Argument 1**

This register contains the SD command argument which is specified as the bit 39-8 of Command-Format in the “Physical Layer Simplified Specification V3.01” or “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” .

### 50.12.5 SDMMC Transfer Mode Register

**Name:** SDMMC\_TMR  
**Offset:** 0x0C  
**Reset:** 0x0000  
**Property:** Read/Write

This register is used to control data transfers. The user shall set this register before issuing a command which transfers data (see SDMMC\_CR.DPSEL), or before issuing a Resume command. The user must save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, this register cannot be written while data transactions are in progress. Writes to this register are ignored when SDMMC\_PSR.CMDINHD is 1.

**Table 50-3. Determining the Transfer Type**

MSBSEL	BCEN	BLKCNT (SDMMC_BCR)	Function
0	Don't care	Don't care	Single Transfer
1	0	Don't care	Infinite Transfer
1	1	Not Zero	Multiple Transfer
1	1	Zero	Stop Multiple Transfer

Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

**Bit 5 – MSBSEL** Multi/Single Block Selection

This bit is set to 1 when issuing multiple-block transfer commands using DAT line(s). For any other commands, set this bit to 0. If this bit is 0, it is not necessary to set SDMMC\_BCR (see the table above, “Determining the Transfer Type”).

**Bit 4 – DTDSEL** Data Transfer Direction Selection

This bit defines the direction of the DAT lines data transfers. Set this bit to 1 to transfer data from the device (SD Card/SDIO/e.MMC) to the SDMMC, and to 0 for all other commands.

0 (WRITE): Writes data from the SDMMC to the device.

1 (READ): Reads data from the device to the SDMMC.

**Bits 3:2 – ACMDEN[1:0]** Auto Command Enable

Two methods can be used to stop Multiple-block read and write operation:

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

- Auto CMD12: when the ACMDEN field is set to 1, the SDMMC issues CMD12 automatically when the last block transfer is completed. An Auto CMD12 error is indicated to SDMMC\_ACESR. Auto CMD12 is not enabled if the command does not require CMD12.
- Auto CMD23: when the ACMDEN field is set to 2, the SDMMC issues a CMD23 automatically before issuing a command specified in SDMMC\_CR.

The following conditions are required to use Auto CMD23:

- A memory card that supports CMD23 (SCR[33] = 1)
- If DMA is used, it must be ADMA (SDMA not supported).
- Only CMD18 or CMD25 is issued.

**Note:** The SDMMC does not check the command index.

Auto CMD23 can be used with or without ADMA. By writing SDMMC\_CR, the SDMMC issues a CMD23 first and then issues a command specified by the SDMMC\_CR.CMDIDX field. If CMD23 response errors are detected, the second command is not issued. A CMD23 error is indicated in SDMMC\_ACESR. The CMD23 argument (32-bit block count value) is set in SDMMC\_SSAR.

This field determines the use of auto command functions.

Value	Name	Description
0	DISABLED	Auto Command Disabled
1	CMD12	Auto CMD12 Enabled
2	CMD23	Auto CMD23 Enabled
3	–	Reserved

### Bit 1 – BCEN Block Count Enable

This bit is used to enable SDMMC\_BCR, which is only relevant for multiple block transfers. When this bit is 0, SDMMC\_BCR is disabled, which is useful when executing an infinite transfer (see the table above). If an ADMA2 transfer is more than 65535 blocks, this bit is set to 0 and the data transfer length is designated by the Descriptor Table.

0 (DISABLED): Block count is disabled.

1 (ENABLED): Block count is enabled.

### Bit 0 – DMAEN DMA Enable

This bit enables the DMA functionality described in section “Supporting DMA” in “SD Host Controller Simplified Specification V3.00”. DMA can be enabled only if it is supported as indicated by the bit SDMMC\_CA0R.ADMA2SUP. One of the DMA modes can be selected using the field SDMMC\_HC1R.DMASEL. If DMA is not supported, this bit is meaningless and then always reads 0. When this bit is set to 1, a DMA operation begins when the user writes to the upper byte of SDMMC\_CR.

0 (DISABLED): DMA functionality is disabled.

1 (ENABLED): DMA functionality is enabled.

### 50.12.6 SDMMC Command Register

**Name:** SDMMC\_CR  
**Offset:** 0x0E  
**Reset:** 0x0000  
**Property:** Read/Write

	Bit	15	14	13	12	11	10	9	8
		CMDIDX[5:0]							
Access				R/W	R/W	R/W	R/W	R/W	R/W
Reset				0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		CMDTYP[1:0]		DPSEL	CMDICEN	CMDCCEN		RESPTYP[1:0]	
Access		R/W	R/W	R/W	R/W	R/W		R/W	R/W
Reset		0	0	0	0	0		0	0

#### Bits 13:8 – CMDIDX[5:0] Command Index

This bit shall be set to the command number (CMD0–63, ACMD0–63) that is specified in bits 45–40 of the Command-Format in the “Physical Layer Simplified Specification V3.01”, “SDIO Simplified Specification V3.00”, and “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51”.

#### Bits 7:6 – CMDTYP[1:0] Command Type

Value	Name	Description
0	NORMAL	Other commands
1	SUSPEND	CMD52 to write “Bus Suspend” in the Card Common Control Registers (CCCR) (for SDIO only)
2	RESUME	CMD52 to write “Function Select” in the Card Common Control Registers (CCCR) (for SDIO only)
3	ABORT	CMD12, CMD52 to write “I/O Abort” in the Card Common Control Registers (CCCR) (for SDIO only)

#### Bit 5 – DPSEL Data Present Select

This bit is set to 1 to indicate that data is present and shall be transferred using the DAT lines. It is set to 0 for the following:

- Commands using only CMD line (Ex. CMD52)
- Commands with no data transfer but using Busy signal on DAT[0] line (Ex. CMD38)
- Resume command

Value	Description
0	No data present
1	Data present

#### Bit 4 – CMDICEN Command Index Check Enable

If this bit is set to 1, the SDMMC checks the Index field in the response to see if it has the same value as the command index. If it has not, it is reported as a Command Index Error (CMDIDX) in SDMMC\_EISTR. If this bit is set to 0, the Index field of the response is not checked.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

0 (DISABLED): The Command Index Check is disabled.

1 (ENABLED): The Command Index Check is enabled.

### Bit 3 – CMDCCEN Command CRC Check Enable

If this bit is set to 1, the SDMMC checks the CRC field in the response. If an error is detected, it is reported as a Command CRC Error (CMDCRC) in SDMMC\_EISTR. If this bit is set to 0, the CRC field is not checked. The position of the CRC field is determined according to the length of the response.

0 (DISABLED): The Command CRC Check is disabled.

1 (ENABLED): The Command CRC Check is enabled.

### Bits 1:0 – RESPTYP[1:0] Response Type

This field is set according to the response type expected for the command index (CMDIDX).

Value	Name	Description
0	NORESP	No Response
1	RL136	Response Length 136
2	RL48	Response Length 48
3	RL48BUSY	Response Length 48 with Busy

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.7 SDMMC Response Register x

**Name:** SDMMC\_RRx  
**Offset:** 0x10 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

	Bit	31	30	29	28	27	26	25	24
		CMDRESP[31:24]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		CMDRESP[23:16]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		CMDRESP[15:8]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		CMDRESP[7:0]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0

#### Bits 31:0 – CMDRESP[31:0] Command Response

The table below describes the mapping of command responses from the SD\_SDIO/e.MMC bus to these registers for each responses type. In this table, R[] refers to a bit range of the response data as transmitted on the SD\_SDIO/e.MMC bus.

Type of response	Meaning of response	Response field	Response register
R1, R1b (normal response)	Card Status	R[39:8]	SDMMC_RR0[31:0]
R1b (Auto CMD12 response)	Card Status for Auto CMD12	R[39:8]	SDMMC_RR3[31:0]
R1 (Auto CMD23 response)	Card Status for Auto CMD23	R[39:8]	SDMMC_RR3[31:0]
R2 (CID, CSD register)	CID or CSD register	R[127:8]	SDMMC_RR0[31:0] SDMMC_RR1[31:0] SDMMC_RR2[31:0] SDMMC_RR3[23:0]
R3 (OCR register)	OCR register for memory	R[39:8]	SDMMC_RR0[31:0]
R4 (OCR register)	OCR register for I/O	R[39:8]	SDMMC_RR0[31:0]
R5, R5b	SDIO response	R[39:8]	SDMMC_RR0[31:0]

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

.....continued

Type of response	Meaning of response	Response field	Response register
R6 (Published RCA response)	New published RCA[31:16] and Card status bits	R[39:8]	SDMMC_RR0[31:0]

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.8 SDMMC Buffer Data Port Register

**Name:** SDMMC\_BDPR  
**Offset:** 0x20  
**Reset:** –  
**Property:** Read/Write

**Note:** The reset value is an unpredictable value read from the dual port RAM.

Bit	31	30	29	28	27	26	25	24
	BUFDATA[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	BUFDATA[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	BUFDATA[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	BUFDATA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	–	–	–	–	–	–	–	–

**Bits 31:0 – BUFDATA[31:0] Buffer Data**

The SDMMC data buffer can be accessed through this 32-bit Data Port register.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.9 SDMMC Present State Register

**Name:** SDMMC\_PSR  
**Offset:** 0x24  
**Reset:** 0x00F80000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
								CMDLL
Access								R
Reset								0
Bit	23	22	21	20	19	18	17	16
	DATLL[3:0]				WRPPL	CARDDPL	CARDSS	CARDINS
Access	R	R	R	R	R	R	R	R
Reset	1	1	1	1	1	0	0	0
Bit	15	14	13	12	11	10	9	8
					BUFRDEN	BUFWREN	RTACT	WTACT
Access					R	R	R	R
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
						DLACT	CMDINHDL	CMDINHCL
Access						R	R	R
Reset						0	0	0

**Bit 24 – CMDLL** CMD Line Level

This status is used to check the CMD line level to recover from errors, and for debugging.

**Bits 23:20 – DATLL[3:0]** DAT[3:0] Line Level

This status is used to check the DAT line level to recover from errors, and for debugging. This is especially useful in detecting the Busy signal level from DAT[0].

**Bit 19 – WRPPL** Write Protect Pin Level

The Write Protect Switch is supported for memory and combo cards. This bit reflects the SDMMC\_WP pin.

Value	Description
0	Write protected (SDMMC_WP = 0)
1	Write enabled (SDMMC_WP = 1)

**Bit 18 – CARDDPL** Card Detect Pin Level

This bit reflects the inverse value of the SDMMC\_CD pin. Debouncing is not performed on this bit. This bit may be valid when CARDSS is set to 1, but it is not guaranteed because of the propagation delay. Use of this bit is limited to testing since it must be debounced by software.

Value	Description
0	No card present (SDMMC_CD = 1).

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

Value	Description
1	Card present (SDMMC_CD = 0).

### Bit 17 – CARDSS Card State Stable

This bit is used for testing. If it is 0, the CARDDPL is not stable. If this bit is set to 1, it means that the CARDDPL is stable. No Card state can be detected if this bit is set to 1 and CARDINS is set to 0.

The Software Reset For All (SWRSTALL) in SDMMC\_SRR does not affect this bit.

Value	Description
0	Reset or debouncing.
1	No card or card inserted.

### Bit 16 – CARDINS Card Inserted

This bit indicates whether a card has been inserted. The SDMMC debounces this signal so that the user does not need to wait for it to stabilize.

A change from 0 to 1 raises the Card Insertion (CINS) status flag in SDMMC\_NISTR if SDMMC\_NISTER.CINS is set to 1. An interrupt is generated if SDMMC\_NISIER.CINS is set to 1.

A change from 1 to 0 raises the Card Removal (CREM) status flag in SDMMC\_NISTR if SDMMC\_NISTER.CREM is set to 1. An interrupt is generated if SDMMC\_NISIER.CREM is set to 1.

The Software Reset For All (SWRSTALL) in SDMMC\_SRR does not affect this bit.

### Bit 11 – BUFRDEN Buffer Read Enable

This bit is used for nonDMA read transfers. This flag indicates that valid data exists in the SDMMC data buffer. If this bit is 1, readable data exists in the buffer.

A change from 1 to 0 occurs when all the block data is read from the buffer.

A change from 0 to 1 occurs when block data is ready in the buffer. This raises the Buffer Read Ready (BRDRDY) status flag in SDMMC\_NISTR if SDMMC\_NISTER.BRDRDY is set to 1. An interrupt is generated if SDMMC\_NISIER.BRDRDY is set to 1.

### Bit 10 – BUFWREN Buffer Write Enable

This bit is used for nonDMA write transfers. This flag indicates if space is available for write data. If this bit is 1, data can be written to the buffer.

A change from 1 to 0 occurs when all the block data are written to the buffer.

A change from 0 to 1 occurs when top of block data can be written to the buffer. This raises the Buffer Write Ready (BWRRDY) status flag in SDMMC\_NISTR if SDMMC\_NISTER.BWRRDY is set to 1. An interrupt is generated if SDMMC\_NISIER.BWRRDY is set to 1.

### Bit 9 – RTACT Read Transfer Active

This bit is used to detect completion of a read transfer. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit is set to 1 in either of the following conditions:

- After the end bit of the read command.
- When a read operation is restarted by writing a 1 to SDMMC\_BGCR.CONTR (Continue Request).

This bit is cleared to 0 in either of the following conditions:

- When the last data block as specified by Transfer Block Size (BLKSIZE) is transferred to the system.
- In case of ADMA2, end of read is designated by the descriptor table.
- When all valid data blocks in the SDMMC have been transferred to the system and no current block transfers are being sent as a result of the Stop At Block Gap Request (STPBGR) of SDMMC\_BGCR being set to 1.

A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC\_NISTR if SDMMC\_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC\_NISIER.TRFC is set to 1.

### **Bit 8 – WTACT** Write Transfer Active

This bit indicates a write transfer is active. If this bit is 0, it means no valid write data exists in the SDMMC. See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit is set to 1 in either of the following conditions:

- After the end bit of the write command.
- When a write operation is restarted by writing a 1 to SDMMC\_BGCR.CONTR (Continue Request).

This bit is cleared to 0 in either of the following conditions:

- After getting the CRC status of the last data block as specified by the transfer count (single and multiple). In case of ADMA2, transfer count is designated by the descriptor table.
- After getting the CRC status of any block where a data transmission is about to be stopped by a Stop At Block Gap Request (STPBGR) of SDMMC\_BGCR.

During a write transaction and as the result of the Stop At Block Gap Request (STPBGR) being set, a change from 1 to 0 raises the Block Gap Event (BLKGE) status flag in SDMMC\_NISTR if SDMMC\_NISTER.BLKGE is set to 1. An interrupt is generated if BLKGE is set to 1 in SDMMC\_NISIER. This status is useful to determine whether nonDAT line commands can be issued during Write Busy.

### **Bit 2 – DLACT** DAT Line Active

This bit indicates whether one of the DAT lines on the bus is in use.

In the case of read transactions:

- This status indicates whether a read transfer is executing on the bus. A change from 1 to 0 resulting from setting the Stop At Block Gap Request (STPBGR) raises the Block Gap Event (BLKGE) status flag in SDMMC\_NISTR if SDMMC\_NISTER.BLKGE is set to 1. An interrupt is generated if SDMMC\_NISIER.BLKGE is set to 1. See the section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for details on timing.
- This bit is set in either of the following cases:
  - After the end bit of the read command.
  - When writing 1 to SDMMC\_BGCR.CONTR (Continue Request) to restart a read transfer.
- This bit is SDMMC cleared in either of the following cases:
  - When the end bit of the last data block is sent from the bus to the SDMMC. In case of ADMA2, the last block is designated by the last transfer of the Descriptor Table.
  - When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request (STPBGR).
- The SDMMC stops a read operation at the start of the interrupt cycle by driving the Read Wait (DAT[2] line) or by stopping the SD Clock. If the Read Wait signal is already driven (due to the fact

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

that the data buffer cannot receive data), the SDMMC can continue to stop the read operation by driving the Read Wait signal. It is necessary to support the Read Wait in order to use the Suspend/Resume operation.

In the case of write transactions:

- This status indicates that a write transfer is executing on the bus. A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC\_NISTR if SDMMC\_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC\_NISIER.TRFC is set to 1. See the section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for details on timing.
- This bit is set in either of the following cases:
  - After the end bit of the write command.
  - When writing 1 to SDMMC\_BGCR.CONTR (Continue Request) to continue a write transfer.
- This bit is cleared in either of the following cases:
  - When the card releases Write Busy of the last data block. If the card does not drive a Busy signal for 8 SDCLK, the SDMMC considers the card drive “Not Busy”. In the case of ADMA2, the last block is designated by the last transfer of the Descriptor Table.
  - When the card releases Write Busy prior to wait for write transfer as a result of a Stop At Block Gap Request (STPBGR).

Command with Busy:

This status indicates whether a command that indicates Busy (ex. erase command for memory) is executing on the bus. This bit is set to 1 after the end bit of the command with Busy and cleared when Busy is deasserted. A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC\_NISTR if SDMMC\_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC\_NISIER.TRFC is set to 1. See Figures 2.11 to 2.13 in the “SD Host Controller Simplified Specification V3.00” .

Value	Description
0	DAT line inactive.
1	DAT line active.

### Bit 1 – CMDINH D Command Inhibit (DAT)

This status bit is 1 if either the DAT Line Active (DLACT) or the Read Transfer Active (RTACT) is set to 1. If this bit is 0, it indicates that the SDMMC can issue the next command. Commands with a Busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC\_NISTR if SDMMC\_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC\_NISIER.TRFC is set to 1.

Note: The software can save registers in the 000–00Dh range for a suspend transaction after this bit has changed from 1 to 0.

Value	Description
0	Can issue a command which uses the DAT line(s).
1	Cannot issue a command which uses the DAT line(s).

### Bit 0 – CMDINH C Command Inhibit (CMD)

If this bit is 0, it indicates the CMD line is not in use and the SDMMC can issue a command using the CMD line. This bit is set to 1 immediately after SDMMC\_CR is written. This bit is cleared when the

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the CMD12 or CMD23 response, but by the Read/Write command response.

Status issuing Auto CMD12 is not read from this bit. So, if a command is issued during Auto CMD12 operation, the SDMMC manages to issue both commands: CMD12 and a command set by SDMMC\_CR.

Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0.

A change from 1 to 0 raises the Command Complete (CMDC) status flag in SDMMC\_NISTR if SDMMC\_NISTER.CMDC is set to 1. An interrupt is generated if SDMMC\_NISIER.CMDC is set to 1.

If the SDMMC cannot issue the command because of a command conflict error (see SDMMC\_EISTR.CMDCRC) or because of a 'Command Not Issued By Auto CMD12' error (see section "SDMMC Auto CMD Error Status Register"), this bit remains 1 and Command Complete is not set.

Value	Description
0	Can issue a command using only CMD line.
1	Cannot issue a command.

### 50.12.10 SDMMC Host Control 1 Register (SD\_SDIO)

**Name:** SDMMC\_HC1R (SD\_SDIO)  
**Offset:** 0x28  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

Bit	7	6	5	4	3	2	1	0
	CARDDSEL	CARDDTL		DMASEL[1:0]		HSEN	DW	LEDCTRL
Access	R/W	R/W		R/W	R/W	R/W	R/W	R/W
Reset	0	0		0	0	0	0	0

**Bit 7 – CARDDSEL** Card Detect Signal Selection  
 This bit selects the source for the card detection.

Value	Description
0	The SDMMC_CD pin is selected.
1	The Card Detect Test Level (CARDDTL) is selected (for test purposes).

**Bit 6 – CARDDTL** Card Detect Test Level  
 This bit is enabled while the Card Detect Signal Selection (CARDDSEL) is set to 1 and it indicates whether the card is inserted or not.

Value	Description
0	No card.
1	Card inserted.

**Bits 4:3 – DMASEL[1:0]** DMA Select  
 One of the supported DMA modes can be selected. The DMA modes supported are given in SDMMC\_CA0R. Use of a selected DMA is determined by DMA Enable (DMAEN) in SDMMC\_TMR.

Value	Name	Description
0	SDMA	SDMA is selected
1	–	Reserved
2	ADMA32	32-bit Address ADMA2 is selected
3	–	Reserved

**Bit 2 – HSEN** High Speed Enable  
 Before setting this bit, the user must check High Speed Support (HSSUP) in SDMMC\_CA0R.

If this bit is set to 0 (default), the SDMMC outputs CMD line and DAT lines at the falling edge of the SD clock (up to 25 MHz). If this bit is set to 1, the SDMMC outputs the CMD line and the DAT lines at the rising edge of the SD clock (up to 50 MHz).

If Preset Value Enable (PVALEN) in SDMMC\_HC2R is set to 1, the user needs to reset SD Clock Enable (SDCLKEN) before changing this bit to avoid generating clock glitches. After setting this bit to 1, the user sets SDCLLEN to 1 again.

**Note:** This bit is effective only if SDMMC\_MC1R.DDR is set to 0.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

**Note:** The clock divider (DIV) in SDMMC\_CCR must be set to a value different from 0 when HSEN is 1.

Value	Description
0	Normal Speed mode.
1	High Speed mode.

### Bit 1 – DW Data Width

This bit selects the data width of the SDMMC. It must be set to match the data width of the card.

0 (1\_BIT): 1-bit mode.

1 (4\_BIT): 4-bit mode.

**Note:** If the Extended Data Transfer Width is 1, this bit has no effect and the data width is 8-bit mode.

### Bit 0 – LEDCTRL LED Control

This bit is used to caution the user not to remove the card while it is being accessed. If the software is going to issue multiple commands, this bit is set to 1 during all transactions.

0 (OFF): LED off.

1 (ON): LED on.

### 50.12.11 SDMMC Host Control 1 Register (e.MMC)

**Name:** SDMMC\_HC1R (e.MMC)  
**Offset:** 0x28  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

Bit	7	6	5	4	3	2	1	0
			EXTDW	DMASEL[1:0]		HSEN	DW	
Access			R/W	R/W	R/W	R/W	R/W	
Reset			0	0	0	0	0	

**Bit 5 – EXTDW** Extended Data Width

This bit controls the 8-bit Bus Width mode for embedded devices. Support of this function is indicated in 8-bit Support for Embedded Device in SDMMC\_CA0R. If a device supports the 8-bit mode, this may be set to 1. If this bit is 0, the bus width is controlled by Data Width (DW).

**Bits 4:3 – DMASEL[1:0]** DMA Select

One of the supported DAM modes can be selected. The DMA modes supported are given in SDMMC\_CA0R. Use of selected DMA is determined by DMA Enable (DMAEN) in SDMMC\_TMR.

Value	Name	Description
0	SDMA	SDMA is selected
1	–	Reserved
2	ADMA32	32-bit Address ADMA2 is selected
3	–	Reserved

**Bit 2 – HSEN** High Speed Enable

Before setting this bit, the user must check High Speed Support (HSSUP) in SDMMC\_CA0R.

If this bit is set to 0 (default), the SDMMC outputs CMD line and DAT lines at the falling edge of the SD clock (up to 25 MHz). If this bit is set to 1, the SDMMC outputs the CMD line and the DAT lines at the rising edge of the SD clock (up to 50 MHz).

If Preset Value Enable (PVALEN) in SDMMC\_HC2R is set to 1, the user needs to reset the SD Clock Enable (SDCLKEN) before changing this bit to avoid generating clock glitches. After setting this bit to 1, the user sets SDCLEN to 1 again.

**Note:** This bit is effective only if SDMMC\_MC1R.DDR is set to 0.

**Note:** The clock divider (DIV) in SDMMC\_CCR must be set to a value different from 0 when HSEN is 1.

Value	Description
0	Normal Speed mode.
1	High Speed mode.

**Bit 1 – DW** Data Width

This bit selects the data width of the SDMMC. It must be set to match the data width of the card.

0 (1\_BIT): 1-bit mode.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

---

1 (4\_BIT): 4-bit mode.

**Note:** If the Extended Data Transfer Width is 1, this bit has no effect and the data width is 8-bit mode.

**50.12.12 SDMMC Power Control Register**

**Name:** SDMMC\_PCR  
**Offset:** 0x29  
**Reset:** 0x0E  
**Property:** Read/Write

Bit	7	6	5	4	3	2	1	0
								SDBPWR
Access								R/W
Reset								0

**Bit 0 – SDBPWR** SD Bus Power

This bit is automatically cleared by the SDMMC if the card is removed. If this bit is cleared, the SDMMC stops driving SDMMC\_CMD and SDMMC\_DAT[7:0] (tri-state) and drives SDMMC\_CK to low level.

### 50.12.13 SDMMC Block Gap Control Register (SD\_SDIO)

**Name:** SDMMC\_BGCR (SD\_SDIO)  
**Offset:** 0x2A  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

Bit	7	6	5	4	3	2	1	0
					INTBG	RWCTRL	CONTR	STPBGR
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

**Bit 3 – INTBG** Interrupt at Block Gap

This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. If the SDIO card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the software detects an SDIO card insertion, it sets this bit according to the CCCR of the SDIO card.

Value	Name	Description
0	DISABLED	Interrupt detection disabled.
1	ENABLED	Interrupt detection enabled.

**Bit 2 – RWCTRL** Read Wait Control

The Read Wait control is optional for SDIO cards. If the card supports Read Wait, set this bit to enable use of the Read Wait protocol to stop read data using the SDMMC\_DAT[2] line. Otherwise, the SDMMC stops the SDCLK to hold read data, which restricts command generation. When the software detects an SD card insertion, this bit must be set according to the CCCR of the SDIO card. If the card does not support Read Wait, this bit shall never be set to 1, otherwise an SDMMC\_DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported.

Value	Description
0	Disables Read Wait control.
1	Enables Read Wait control.

**Bit 1 – CONTR** Continue Request

This bit is used to restart a transaction which was stopped using a Stop At Block Gap Request (STPBGR). To cancel stop at the block gap, set STPBGR to 0 and set this bit to 1 to restart the transfer.

The SDMMC automatically clears this bit in either of the following cases:

- In the case of a read transaction, the DAT Line Active (DLACT) changes from 0 to 1 as a read transaction restarts.
- In the case of a write transaction, the Write Transfer Active (WTACT) changes from 0 to 1 as the write transaction restarts.

Therefore, it is not necessary to set this bit to 0. If STPBGR is set to 1, any write to this bit is ignored.

See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

Value	Description
0	No effect.
1	Restart.

### Bit 0 – STPBGR Stop At Block Gap Request

This bit is used to stop executing read and write transactions at the next block gap for nonDMA, SDMA, and ADMA transfers. The user must leave this bit set to 1 until Transfer Complete (TRFC) in SDMMC\_NISTR. Clearing both Stop At Block Gap Request and Continue Request does not cause the transaction to restart. This bit can be set whether the card supports the Read Wait signal or not.

During read transfers, the SDMMC stops the transaction by using the Read Wait signal (SDMMC\_DAT[2]) if supported, or by stopping the SD clock otherwise.

In case of write transfers in which the user writes data to SDMMC\_BDPR, this bit must be set to 1 after all the block of data is written. If this bit is set to 1, the user does not write data to SDMMC\_BDPR.

This bit affects Read Transfer Active (RTACT), Write Transfer Active (WTACT), DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINH) in SDMMC\_PSR.

See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

Value	Description
0	Transfer
1	Stop

### 50.12.14 SDMMC Block Gap Control Register (e.MMC)

**Name:** SDMMC\_BGCR (e.MMC)  
**Offset:** 0x2A  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

	7	6	5	4	3	2	1	0
							CONTR	STPBGR
Access							R/W	R/W
Reset							0	0

**Bit 1 – CONTR** Continue Request

This bit is used to restart a transaction which was stopped using a Stop At Block Gap Request (STPBGR). To cancel stop at the block gap, set STPBGR to 0 and set this bit to 1 to restart the transfer.

The SDMMC automatically clears this bit in either of the following cases:

- In the case of a read transaction, the DAT Line Active (DLACT) changes from 0 to 1 as a read transaction restarts.
- In the case of a write transaction, the Write Transfer Active (WTACT) changes from 0 to 1 as the write transaction restarts.

Therefore, it is not necessary to set this bit to 0. If STPBGR is set to 1, any write to this bit is ignored.

See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

Value	Description
0	No effect.
1	Restart.

**Bit 0 – STPBGR** Stop At Block Gap Request

This bit is used to stop executing read and write transactions at the next block gap for nonDMA, SDMA, and ADMA transfers. The user must leave this bit set to 1 until Transfer Complete (TRFC) in SDMMC\_NISTR. Clearing both Stop At Block Gap Request and Continue Request does not cause the transaction to restart. This bit can be set whether the card supports the Read Wait signal or not.

During read transfers, the SDMMC stops the transaction by using the Read Wait signal (SDMMC\_DAT[2]) if supported, or by stopping the SD clock otherwise.

In case of write transfers in which the user writes data to SDMMC\_BDPR, this bit must be set to 1 after all the block of data is written. If this bit is set to 1, the user does not write data to SDMMC\_BDPR.

This bit affects Read Transfer Active (RTACT), Write Transfer Active (WTACT), DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINH) in SDMMC\_PSR.

See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

Value	Description
0	Transfer

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

---

Value	Description
1	Stop

**50.12.15 SDMMC Wakeup Control Register (SD\_SDIO)**

**Name:** SDMMC\_WCR (SD\_SDIO)  
**Offset:** 0x2B  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

	7	6	5	4	3	2	1	0
						WKENCREM	WKENCINS	WKENCINT
Access						R/W	R/W	R/W
Reset						0	0	0

**Bit 2 – WKENCREM** Wakeup Event Enable on Card Removal

This bit enables a wakeup event via Card Removal (CREM) in SDMMC\_NISTR. FN\_WUS (Wakeup Support) in the CIS (Card Information Structure) does not affect this bit.

0 (DISABLED): Wakeup Event disabled.

1 (ENABLED): Wakeup Event enabled.

**Bit 1 – WKENCINS** Wakeup Event Enable on Card Insertion

This bit enables a wakeup event via Card Insertion (CINS) in SDMMC\_NISTR. FN\_WUS (Wakeup Support) in the CIS (Card Information Structure) does not affect this bit.

0 (DISABLED): Wakeup Event disabled.

1 (ENABLED): Wakeup Event enabled.

**Bit 0 – WKENCINT** Wakeup Event Enable on Card Interrupt

This bit enables a wakeup event via Card Interrupt (CINT) in SDMMC\_NISTR. This bit can be set to 1 if FN\_WUS (Wakeup Support) in the CIS (Card Information Structure) is set to 1 in the SDIO card.

0 (DISABLED): Wakeup Event disabled.

1 (ENABLED): Wakeup Event enabled.

### 50.12.16 SDMMC Clock Control Register

**Name:** SDMMC\_CCR  
**Offset:** 0x2C  
**Reset:** 0x0000  
**Property:** Read/Write

Bit	15	14	13	12	11	10	9	8
	SDCLKFSEL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	USDCLKFSEL[1:0]		CLKGSEL			SDCLKEN	INTCLKS	INTCLKEN
Access	R/W	R/W	R/W			R/W	R/W	R/W
Reset	0	0	0			0	0	0

**Bits 15:8 – SDCLKFSEL[7:0]** SDCLK Frequency Select

This register is used to select the frequency of the SDCLK pin. There are two SDCLK Frequency modes according to Clock Generator Select (CLKGSEL).

The length of the clock divider (DIV) is extended to 10 bits (DIV[9:8] = USDCLKFSEL, DIV[7:0] = SDCLKFSEL)

– 10-bit Divided Clock Mode (CLKGSEL = 0):  $f_{SDCLK} = f_{BASECLK} / (2 \times DIV)$ . If DIV = 0 then  $f_{SDCLK} = f_{BASECLK}$

– Programmable Clock Mode (CLKGSEL = 1):  $f_{SDCLK} = f_{MULTCLK} / (DIV + 1)$

When HSEN is set in SDMMC\_HC1R, or DDR is set in SDMMC\_MC1R, the clock divider (DIV) must be non-zero. This field depends on the setting of Preset Value Enable (PVALEN) in SDMMC\_HC2R.

If PVALEN = 0, this field is set by the user.

If PVALEN = 1, this field is automatically set to a value specified in one of the SDMMC\_PVR.

**Bits 7:6 – USDCLKFSEL[1:0]** Upper Bits of SDCLK Frequency Select

These bits expand the SDCLK Frequency Select (SDCLKFSEL) to 10 bits. These two bits are assigned to bit 09-08 of the clock divider as described in SDCLKFSEL.

**Bit 5 – CLKGSEL** Clock Generator Select

This bit is used to select the clock generator mode in the SDCLK Frequency Select field. If the Programmable mode is not supported (SDMMC\_CA1R.CLKMULT (Clock Multiplier) set to 0), then this bit cannot be written and is always read at 0.

This bit depends on the setting of Preset Value Enable (PVALEN) in SDMMC\_HC2R.

If PVALEN = 0, this bit is set by the user.

If PVALEN = 1, this bit is automatically set to a value specified in one of the SDMMC\_PVRx.

Value	Description
0	Divided Clock mode (BASECLK is used to generate SDCLK).

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

Value	Description
1	Programmable Clock mode (MULTCLK is used to generate SDCLK).

### Bit 2 – SDCLKEN SD Clock Enable

The SDMMC stops the SD Clock when writing this bit to 0. SDCLK Frequency Select (SDCLKFSEL) can be changed when this bit is 0. Then, the SDMMC maintains the same clock frequency until SDCLK is stopped (Stop at SDCLK = 0). If Card Inserted (CARDINS) in SDMMC\_PSR is cleared, this bit is also cleared.

Value	Description
0	SD Clock disabled
1	SD Clock enabled

### Bit 1 – INTCLKS Internal Clock Stable

This bit is set to 1 when the SD clock is stable after setting SDMMC\_CCR.INTCLKEN (Internal Clock Enable) to 1. The user must wait to set SD Clock Enable (SDCLKEN) until this bit is set to 1.

Value	Description
0	Internal clock not ready.
1	Internal clock ready.

### Bit 0 – INTCLKEN Internal Clock Enable

This bit is set to 0 when the SDMMC is not used or is awaiting a wakeup interrupt. In this case, its internal clock is stopped to reach a very low power state. Registers are still able to be read and written. The clock starts to oscillate when this bit is set to 1. Once the clock oscillation is stable, the SDMMC sets Internal Clock Stable (INTCLKS) in this register to 1.

This bit does not affect card detection.

Value	Description
0	The internal clock stops.
1	The internal clock oscillates.

### 50.12.17 SDMMC Timeout Control Register

**Name:** SDMMC\_TCR  
**Offset:** 0x2E  
**Reset:** 0x00  
**Property:** Read/Write

	7	6	5	4	3	2	1	0
					DTCVAL[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

**Bits 3:0 – DTCVAL[3:0]** Data Timeout Counter Value

This value determines the interval at which DAT line timeouts are detected. For more information about timeout generation, see Data Timeout Error (DATTEO) in SDMMC\_EISTR. When setting this register, the user can prevent inadvertent timeout events by clearing the Data Timeout Error Status Enable (in SDMMC\_EISTER).

$$\text{TIMEOUT}_{(\mu\text{s})} = \frac{2^{13 + \text{DTCVAL}}}{f_{\text{FTEOCLK}}(\text{MHz})}$$

**Note:** DTCVAL = f<sub>(Hexa)</sub> is reserved.

### 50.12.18 SDMMC Software Reset Register

**Name:** SDMMC\_SRR  
**Offset:** 0x2F  
**Reset:** 0x00  
**Property:** Read/Write

Bit	7	6	5	4	3	2	1	0
						SWRSTDAT	SWRSTCMD	SWRSTALL
Access						R/W	R/W	R/W
Reset						0	0	0

**Bit 2 – SWRSTDAT** Software Reset for DAT Line  
 Only part of a data circuit is reset. The DMA circuit is also reset.

The following registers and bits are cleared by this bit:

[“SDMMC Buffer Data Port Register”](#)

- Buffer is cleared and initialized.

[“SDMMC Present State Register”](#)

- Buffer Read Enable (BUFRDEN)
- Buffer Write Enable (BUFWREN)
- Read Transfer Active (RTACT)
- Write Transfer Active (WTACT)
- DAT Line Active (DATLL)
- Command Inhibit (DAT) (CMDINH)

[“SDMMC Block Gap Control Register \(SD\\_SDIO\)”](#)

- Continue Request (CONTR)
- Stop At Block Gap Request (STPBGR)

[“SDMMC Normal Interrupt Status Register \(SD\\_SDIO\)”](#)

- Buffer Read Ready (BRDRDY)
- Buffer Write Ready (BWRRDY)
- DMA Interrupt (DMAINT)
- Block Gap Event (BLKGE)
- Transfer Complete (TRFC)

Value	Description
0	Work
1	Reset

**Bit 1 – SWRSTCMD** Software Reset for CMD Line  
 Only part of a command circuit is reset.

The following registers and bits are cleared by this bit:

“SDMMC Present State Register”

– Command Inhibit (CMD) (CMDINHC)

“SDMMC Normal Interrupt Status Register (SD\_SDIO)” and “SDMMC Normal Interrupt Status Register (e.MMC)”

– Command Complete (CMDC)

Value	Description
0	Work
1	Reset

**Bit 0 – SWRSTALL** Software Reset for All

This reset affects the entire SDMMC except the card detection circuit. During initialization, the SDMMC must be reset by setting this bit to '1'. This bit is automatically cleared to '0' when SDMMC\_CA0R and SDMMC\_CA1R are valid and the user can read them. If this bit is set to '1', the user should issue a reset command and reinitialize the card.

List of registers cleared to '0':

- “SDMMC SDMA System Address / Argument 2 Register”
- “SDMMC Block Size Register”
- “SDMMC Block Count Register”
- “SDMMC Argument 1 Register”
- “SDMMC Command Register”
- “SDMMC Transfer Mode Register”
- “SDMMC Response Register”
- “SDMMC Buffer Data Port Register”
- “SDMMC Present State Register” (except CMDLL, DATLL, WRPPL, CARDDDPL, CARDSS, CARDINS)
- “SDMMC Host Control 1 Register (SD\_SDIO)”
- “SDMMC Host Control 1 Register (e.MMC)”
- “SDMMC Power Control Register”
- “SDMMC Block Gap Control Register (SD\_SDIO)”
- “SDMMC Block Gap Control Register (e.MMC)”
- “SDMMC Wakeup Control Register (SD\_SDIO)”

Value	Description
0	Work
1	Reset

### 50.12.19 SDMMC Normal Interrupt Status Register (SD\_SDIO)

**Name:** SDMMC\_NISTR (SD\_SDIO)  
**Offset:** 0x30  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

	Bit	15	14	13	12	11	10	9	8
		ERRINT							CINT
Access		R							R/W
Reset		0							0
	Bit	7	6	5	4	3	2	1	0
		CREM	CINS	BRDRDY	BWRRDY	DMAINT	BLKGE	TRFC	CMDC
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0

#### Bit 15 – ERRINT Error Interrupt

If any of the bits in SDMMC\_EISTR are set, then this bit is set. Therefore, the user can efficiently test for an error by checking this bit first. This bit is read-only.

Value	Description
0	No error.
1	Error.

#### Bit 8 – CINT Card Interrupt

Writing this bit to '1' does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the SDMMC detects the Card Interrupt without SDCLK to support wakeup. In 4-bit mode, the Card Interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the system.

When this bit has been set to '1' and the user needs to start this interrupt service, Card Interrupt Status Enable (CINT) in SDMMC\_NISTER may be set to '0' in order to clear the card interrupt statuses latched in the SDMMC and to stop driving the interrupt signal to the system. After completion of the card interrupt service (it should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set SDMMC\_NISTER.CINT to '1' and start sampling the interrupt signal again.

Interrupt detected by DAT[1] is supported when there is one card per slot.

This bit can only be set to '1' if SDMMC\_NISTER.CREM is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.CREM is set to '1'.

Value	Description
0	No card interrupt.
1	Card interrupt.

#### Bit 7 – CREM Card Removal

This status is set to '1' if Card Inserted (CARDINS) in SDMMC\_PSR changes from '1' to '0'. When the user writes this bit to '1' to clear this status, the status of SDMMC\_PSR.CARDINS must be confirmed

because the card detect state may possibly be changed when the user clears this bit and no interrupt event can be generated.

This bit can only be set to '1' if SDMMC\_NISTER.CREM is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.CREM is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	Card state unstable or card inserted.
1	Card removed.

### Bit 6 – CINS Card Insertion

This status is set if Card Inserted (CARDINS) in SDMMC\_PSR changes from '0' to '1'. When the user writes this bit to '1' to clear this status, the status of SDMMC\_PSR.CARDINS must be confirmed because the card detect state may possibly be changed when the user clears this bit and no interrupt event can be generated.

This bit can only be set to '1' if SDMMC\_NISTER.CINS is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.CINS is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	Card state unstable or card removed.
1	Card inserted.

### Bit 5 – BRDRDY Buffer Read Ready

This status is set to '1' if the Buffer Read Enable (BUFRDEN) changes from '0' to '1'. See BUFRDEN in SDMMC\_PSR. While processing the tuning procedure (Execute Tuning (EXTUN) in SDMMC\_HC2R is set to '1'), BRDRDY is set to '1' for every CMD19 execution.

This bit can only be set to '1' if SDMMC\_NISTER.BRDRDY is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BRDRDY is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	Not ready to read buffer.
1	Ready to read buffer.

### Bit 4 – BWRRDY Buffer Write Ready

This status is set to '1' if the Buffer Write Enable (BUFWREN) changes from '0' to '1'. See BUFWREN in SDMMC\_PSR.

This bit can only be set to '1' if SDMMC\_NISTER.BWRRDY is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BWRRDY is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	Not ready to write buffer.
1	Ready to write buffer.

### Bit 3 – DMAINT DMA Interrupt

This status is set if the SDMMC detects the Host SDMA Buffer boundary during transfer. See SDMA Buffer Boundary (BOUNDARY) in SDMMC\_BSR.

In case of ADMA, by setting the “int” field in the descriptor table, the SDMMC raises this status flag when the descriptor line is completed. This status flag does not rise after Transfer Complete (TRFC).

This bit can only be set to '1' if SDMMC\_NISTER.DMAINT is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.DMAINT is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No DMA Interrupt.
1	DMA Interrupt.

### Bit 2 – BLKGE Block Gap Event

If the Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR is set to 1, this bit is set when either a read or a write transaction is stopped at a block gap. If STPBGR is not set to 1, this bit is not set to 1.

#### In the case of a Read transaction:

This bit is set at the falling edge of the DAT Line Active (DLACT) status (when the transaction is stopped at SD bus timing). The Read Wait must be supported in order to use this function. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” about the detailed timing.

#### In the case of a Write transaction:

This bit is set at the falling edge of the Write Transfer Active (WTACT) status (after getting the CRC status at SD bus timing). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit can only be set to '1' if SDMMC\_NISTER.BLKGE is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BLKGE is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No block gap event.
1	Transaction stopped at block gap.

### Bit 1 – TRFC Transfer Complete

This bit is set when a read/write transfer and a command with Busy is completed.

#### In the case of a Read Transaction:

This bit is set at the falling edge of the Read Transfer Active Status. The interrupt is generated in two cases. The first is when a data transfer is completed as specified by the data length (after the last data has been read to the system). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR (after valid data has been read to the system). See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

#### In the case of a Write Transaction:

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

This bit is set at the falling edge of the DAT Line Active (DLACT) status. This interrupt is generated in two cases. The first is when the last data is written to the card as specified by the data length and the Busy signal is released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR and data transfers are completed. (After valid data is written to the card and the Busy signal is released). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

### In the case of command with Busy:

This bit is set when Busy is deasserted. See DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINH) in SDMMC\_PSR.

This bit can only be set to '1' if SDMMC\_NISTER.TRFC is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.TRFC is set to '1'.

Writing this bit to '1' clears this bit.

The table below shows that Transfer Complete (TRFC) has a higher priority than Data Timeout Error (DATTEO). If both bits are set to '1', execution of a command can be considered to be completed.

TRFC	DATTEO	Meaning of the status
0	0	Interrupted by another factor
0	1	Timeout occurred during transfer
1	Don't Care	Command execution complete

Value	Description
0	Command execution is not complete.
1	Command execution is complete.

### Bit 0 – CMDC Command Complete

This bit is set when getting the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23, but it is generated by the response of a read/write command. See Command Inhibit (CMD) in SDMMC\_PSR for details on how to control this bit.

This bit can only be set to 1 if SDMMC\_NISTER.CMDC is set to 1. An interrupt can only be generated if SDMMC\_NISIER.CMDC is set to 1.

Writing this bit to 1 clears this bit.

The table below shows that Command Timeout Error (CMDTEO) has a higher priority than Command Complete (CMDC). If both bits are set to 1, it can be considered that the response was not received correctly.

CMDC	CMDTEO	Meaning of the status
0	0	Interrupted by another factor
Don't care	1	Response not received within 64 SDCLK cycles
1	0	Response received

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

Value	Description
0	No command complete.
1	Command complete.

### 50.12.20 SDMMC Normal Interrupt Status Register (e.MMC)

**Name:** SDMMC\_NISTR (e.MMC)  
**Offset:** 0x30  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

Bit	15	14	13	12	11	10	9	8
	ERRINT	BOOTAR						
Access	R	R/W						
Reset	0	0						
Bit	7	6	5	4	3	2	1	0
			BRDRDY	BWRRDY	DMAINT	BLKGE	TRFC	CMDC
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

**Bit 15 – ERRINT** Error Interrupt

If any of the bits in SDMMC\_EISTR are set, then this bit is set. Therefore, the user can efficiently test for an error by checking this bit first. This bit is read-only.

Value	Description
0	No error.
1	Error.

**Bit 14 – BOOTAR** Boot Acknowledge Received

This bit is set to '1' when the SDMMC received a Boot Acknowledge pattern from the e.MMC.

This bit can only be set to '1' if SDMMC\_NISTER.BOOTAR is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BOOTAR is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	Boot Acknowledge pattern not received.
1	Boot Acknowledge pattern received.

**Bit 5 – BRDRDY** Buffer Read Ready

This status is set to '1' if Buffer Read Enable (BUFRDEN) changes from '0' to '1'. See Buffer Read Enable (BUFRDEN) in SDMMC\_PSR. While processing the tuning procedure (Execute Tuning (EXTUN) in SDMMC\_HC2R is set to '1'), BRDRDY is set to '1' for every CMD19 execution.

This bit can only be set to '1' if SDMMC\_NISTER.BRDRDY is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BRDRDY is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	Not ready to read buffer.
1	Ready to read buffer.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bit 4 – BWRRDY Buffer Write Ready

This status is set to 1 if Buffer Write Enable (BUFWREN) changes from '0' to '1'. See Buffer Write Enable (BUFWREN) in SDMMC\_PSR.

This bit can only be set to '1' if SDMMC\_NISTER.BWRRDY is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BWRRDY is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	Not ready to write buffer.
1	Ready to write buffer.

### Bit 3 – DMAINT DMA Interrupt

This status is set if the SDMMC detects the Host SDMA Buffer boundary during transfer. See SDMA Buffer Boundary (BOUNDARY) in SDMMC\_BSR.

In case of ADMA, by setting “int” field in the descriptor table, the SDMMC raises this status flag when the descriptor line is completed. This status flag does not rise after the Transfer Complete (TRFC).

This bit can only be set to '1' if SDMMC\_NISTER.DMAINT is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.DMAINT is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No DMA interrupt.
1	DMA interrupt.

### Bit 2 – BLKGE Block Gap Event

If the Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR is set to '1', this bit is set when either a read or a write transaction is stopped at a block gap. If STPBGR is not set to '1', this bit is not set to '1'.

#### In the case of a Read transaction:

This bit is set at the falling edge of the DAT Line Active (DLACT) status (when the transaction is stopped at SD bus timing). The Read Wait must be supported in order to use this function. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” about the detailed timing.

#### In the case of a Write transaction:

This bit is set at the falling edge of the Write Transfer Active (WTACT) status (after getting the CRC status at SD bus timing). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit can only be set to '1' if SDMMC\_NISTER.BLKGE is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BLKGE is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No block gap event.
1	Transaction stopped at block gap.

### Bit 1 – TRFC Transfer Complete

This bit is set when a read/write transfer and a command with Busy is completed.

#### In the case of a Read Transaction:

This bit is set at the falling edge of the Read Transfer Active Status. The interrupt is generated in two cases. The first is when a data transfer is completed as specified by the data length (after the last data has been read to the system). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR (after valid data has been read to the system). See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

#### In the case of a Write Transaction:

This bit is set at the falling edge of the DAT Line Active (DLACT) status. This interrupt is generated in two cases. The first is when the last data is written to the card as specified by the data length and the Busy signal is released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR and data transfers are completed. (After valid data is written to the card and the Busy signal is released). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

#### In the case of command with Busy:

This bit is set when Busy is deasserted. See DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINH) in SDMMC\_PSR.

This bit can only be set to '1' if SDMMC\_NISTER.TRFC is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.TRFC is set to '1'.

Writing this bit to '1' clears this bit.

The table below shows that Transfer Complete (TRFC) has a higher priority than Data Timeout Error (DATTEO). If both bits are set to '1', execution of a command can be considered to be completed.

TRFC	DATTEO	Meaning of the status
0	0	Interrupted by another factor
0	1	Timeout occurred during transfer
1	Don't Care	Command execution complete

Value	Description
0	Command execution is not complete.
1	Command execution is complete.

### Bit 0 – CMDC Command Complete

This bit is set when getting the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23, but it is generated by the response of a read/write command. See CMRINHC in SDMMC\_PSR for details on how to control this bit.

This bit can only be set to '1' if SDMMC\_NISTER.CMDC is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.CMDC is set to '1'.

Writing this bit to '1' clears this bit.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

The table below shows that Command Timeout Error (CMDTEO) has a higher priority than Command Complete (CMDC). If both bits are set to '1', it can be considered that the response was not received correctly.

CMDC	CMDTEO	Meaning of the status
0	0	Interrupted by another factor
Don't care	1	Response not received within 64 SDCLK cycles
1	0	Response received

Value	Description
0	No command complete.
1	Command complete.

### 50.12.21 SDMMC Error Interrupt Status Register (SD\_SDIO)

**Name:** SDMMC\_EISTR (SD\_SDIO)  
**Offset:** 0x32  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

	Bit	15	14	13	12	11	10	9	8
								ADMA	ACMD
Access								R/W	R/W
Reset								0	0
	Bit	7	6	5	4	3	2	1	0
		CURLIM	DATEND	DATCRC	DATTEO	CMDIDX	CMDEND	CMDCRC	CMDTEO
Access		R/W	R/W	R/W		R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0

#### Bit 9 – ADMA ADMA Error

This bit is set to '1' when the SDMMC detects errors during an ADMA-based data transfer. The state of the ADMA at an error occurrence is saved in SDMMC\_AESR.

In addition, the SDMMC raises this status flag when it detects some invalid description data (Valid = 0) at the ST\_FDS state (see section “Advanced DMA” in the “SD Host Controller Simplified Specification V3.00”). ADMA Error Status (ERRST) in SDMMC\_AESR indicates that an error occurred in ST\_FDS state. The user may find that the Valid bit is not set at the error descriptor.

This bit can only be set to '1' if SDMMC\_EISTER.ADMA is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.ADMA is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No error.
1	Error.

#### Bit 8 – ACMD Auto CMD Error

Auto CMD12 and Auto CMD23 use this error status. This bit is set to '1' when detecting that one of the 0 to 4 bits in SDMMC\_ACESR[4:0] has changed from '0' to '1'. In the case of Auto CMD12, this bit is set to '1', not only when errors occur in Auto CMD12 but also when auto CMD12 is not executed due to the previous command error.

This bit can only be set to '1' if SDMMC\_EISTER.ACMD is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.ACMD is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No error.
1	Error.

### Bit 7 – CURLIM Current Limit Error

By setting SD Bus Power (SDBPWR) in SDMMC\_PCR, the SDMMC is requested to supply power for the SD Bus. The SDMMC is protected from an illegal card by stopping power supply to the card, in which case this bit indicates a failure status. Reading 1 means the SDMMC is not supplying power to the card due to some failure. Reading 0 means that the SDMMC is supplying power and no error has occurred. The SDMMC may require some sampling time to detect the current limit.

This bit can only be set to '1' if SDMMC\_EISTER.CURLIM is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CURLIM is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No error.
1	Error.

### Bit 6 – DATEND Data End Bit Error

This bit is set to '1' either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status.

This bit can only be set to '1' if SDMMC\_EISTER.DATEND is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATEND is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No error.
1	Error.

### Bit 5 – DATCRC Data CRC error

This bit is set to '1' when detecting a CRC error when transferring read data which uses the DAT line or when detecting that the Write CRC Status has a value other than '010'.

This bit can only be set to '1' if SDMMC\_EISTER.DATCRC is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATCRC is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No error.
1	Error.

### Bit 4 – DATTEO Data Timeout Error

This bit is set to '1' when detecting one of following timeout conditions.

- Busy timeout for R1b, R5b response type (see “Physical Layer Simplified Specification V3.01” and “SD Host Controller Simplified Specification V3.00”).
- Busy timeout after Write CRC status.
- Write CRC Status timeout.
- Read data timeout

This bit can only be set to '1' if SDMMC\_EISTER.DATTEO is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATTEO is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No error.
1	Error.

**Bit 3 – CMDIDX** Command Index Error

This bit is set to '1' if a Command Index error occurs in the command response.

This bit can only be set to '1' if SDMMC\_EISTER.CMDIDX is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDIDX is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No error.
1	Error.

**Bit 2 – CMDEND** Command End Bit Error

This bit is set to '1' when detecting that the end bit of a command response is 0.

This bit can only be set to '1' if SDMMC\_EISTER.CMDEND is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDEND is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No error.
1	Error.

**Bit 1 – CMDCRC** Command CRC Error

The Command CRC Error is generated in two cases.

If a response is returned and the Command Timeout Error (CMDTEO) is set to 0 (indicating no command timeout), this bit is set to '1' when detecting a CRC error in the command response.

The SDMMC detects a CMD line conflict by monitoring the CMD line when a command is issued. If the SDMMC drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SDCLK edge, then the SDMMC aborts the command (stops driving the CMD line) and sets this bit to '1'. CMDTEO is also set to '1' to indicate a CMD line conflict (see the table above).

This bit can only be set to '1' if SDMMC\_EISTER.CMDCRC is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDCRC is set to '1'.

Writing this bit to '1' clears this bit.

**Bit 0 – CMDTEO** Command Timeout Error

This bit is set to '1' only if no response is returned within 64 SDCLK cycles from the end bit of the command. If the SDMMC detects a CMD line conflict, in which case Command CRC Error (CMDCRC) is also set to '1' as shown in the table below, this bit is set without waiting for 64 SDCLK cycles because the command is aborted by the SDMMC.

This bit can only be set to '1' if SDMMC\_EISTER.CMDTEO is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDTEO is set to '1'.

Writing this bit to '1' clears this bit.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

CMDCRC	CMDTEO	Types of error
0	0	No error
0	1	Response timeout error
1	0	Response CRC error
1	1	CMD line conflict

### 50.12.22 SDMMC Error Interrupt Status Register (e.MMC)

**Name:** SDMMC\_EISTR (e.MMC)  
**Offset:** 0x32  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

Bit	15	14	13	12	11	10	9	8
				BOOTAE			ADMA	ACMD
Access				R/W			R/W	R/W
Reset				0			0	0
Bit	7	6	5	4	3	2	1	0
	CURLIM	DATEND	DATCRC	DATTEO	CMDIDX	CMDEND	CMDCRC	CMDTEO
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bit 12 – BOOTAE** Boot Acknowledge Error

This bit is set to '1' when detecting that the e.MMC Boot Acknowledge Status has a value other than '010'.

This bit can only be set to '1' if SDMMC\_EISTER.BOOTAE is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.BOOTAE is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No error.
1	Error.

**Bit 9 – ADMA** ADMA Error

This bit is set to 1 when the SDMMC detects errors during an ADMA-based data transfer. The state of the ADMA at an error occurrence is saved in SDMMC\_AESR.

In addition, the SDMMC raises this status flag when it detects some invalid description data (Valid = 0) at the ST\_FDS state (see section “Advanced DMA” in the “SD Host Controller Simplified Specification V3.00”). ADMA Error Status (ERRST) in SDMMC\_AESR indicates that an error occurred in ST\_FDS state. The user may find that the Valid bit is not set at the error descriptor.

This bit can only be set to '1' if SDMMC\_EISTER.ADMA is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.ADMA is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No error.
1	Error.

**Bit 8 – ACMD** Auto CMD Error

Auto CMD12 and Auto CMD23 use this error status. This bit is set to '1' when detecting that one of the 0 to 4 bits in SDMMC\_ACESR[4:0] has changed from 0 to 1. In the case of Auto CMD12, this bit is set to

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

'1', not only when errors occur in Auto CMD12, but also when Auto CMD12 is not executed due to the previous command error.

This bit can only be set to '1' if SDMMC\_EISTER.ACMD is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.ACMD is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No error.
1	Error.

### Bit 7 – CURLIM Current Limit Error

By setting SD Bus Power (SDBPWR) in SDMMC\_PSR, the SDMMC is requested to supply power for the SD Bus. The SDMMC is protected from an illegal card by stopping power supply to the card, in which case this bit indicates a failure status. Reading 1 means the SDMMC is not supplying power to the card due to some failure. Reading 0 means that the SDMMC is supplying power and no error has occurred. The SDMMC may require some sampling time to detect the current limit.

This bit can only be set to '1' if SDMMC\_EISTER.CURLIM is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CURLIM is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No error.
1	Error.

### Bit 6 – DATEND Data End Bit Error

This bit is set to '1' either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status.

This bit can only be set to '1' if SDMMC\_EISTER.DATEND is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATEND is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No error.
1	Error.

### Bit 5 – DATCRC Data CRC Error

This bit is set to '1' when detecting a CRC error during a transfer of read data which uses the DAT line or when detecting that the Write CRC Status has a value other than '010'.

This bit can only be set to '1' if SDMMC\_EISTER.DATCRC is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATCRC is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No error.
1	Error.

**Bit 4 – DATTEO** Data Timeout error

This bit is set to '1' when detecting one of following timeout conditions.

- Busy timeout for R1b, R5b response type (see “Physical Layer Simplified Specification V3.01” and “SDIO Simplified Specification V3.00” ).
- Busy timeout after Write CRC Status.
- Write CRC Status timeout.
- Read data timeout

This bit can only be set to '1' if SDMMC\_EISTER.DATTEO is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATTEO is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No error.
1	Error.

**Bit 3 – CMDIDX** Command Index Error

This bit is set to '1' if a Command Index error occurs in the command response.

This bit can only be set to '1' if SDMMC\_EISTER.CMDIDX is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDIDX is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No error.
1	Error.

**Bit 2 – CMDEND** Command End Bit Error

This bit is set to '1' when detecting that the end bit of a command response is 0.

This bit can only be set to '1' if SDMMC\_EISTER.CMDEND is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDEND is set to '1'.

Writing this bit to '1' clears this bit.

Value	Description
0	No error.
1	Error.

**Bit 1 – CMDCRC** Command CRC Error

The Command CRC Error is generated in two cases.

If a response is returned and Command Timeout Error (CMDTEO) is set to 0 (indicating no command timeout), this bit is set to '1' when detecting a CRC error in the command response.

The SDMMC detects a CMD line conflict by monitoring the CMD line when a command is issued. If the SDMMC drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SDCLK edge, then the SDMMC aborts the command (stops driving the CMD line) and sets this bit to '1'. CMDTEO is also set to '1' to indicate a CMD line conflict (see the table “Relations between CMDCRC and CMDTEO”).

This bit can only be set to '1' if SDMMC\_EISTER.CMDCRC is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDCRC is set to '1'.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

Writing this bit to 1 clears this bit.

### Bit 0 – CMDTEO Command Timeout Error

This bit is set to '1' only if no response is returned within 64 SDCLK cycles from the end bit of the command. If the SDMMC detects a CMD line conflict, in which case Command CRC Error (CMDCRC) is also set to '1' as shown in the table “Relations between CMDCRC and CMDTEO”, this bit is set without waiting for 64 SDCLK cycles because the command is aborted by the SDMMC.

This bit can only be set to '1' if SDMMC\_EISTER.CMDTEO is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDTEO is set to '1'.

Writing this bit to '1' clears this bit.

CMDCRC	CMDTEO	Types of error
0	0	No error
0	1	Response timeout error
1	0	Response CRC error
1	1	CMD line conflict

### 50.12.23 SDMMC Normal Interrupt Status Enable Register (SD\_SDIO)

**Name:** SDMMC\_NISTR (SD\_SDIO)  
**Offset:** 0x34  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

								CINT
Access								R/W
Reset								0
Bit	7	6	5	4	3	2	1	0
	CREM	CINS	BRDRDY	BWRRDY	DMAINT	BLKGE	TRFC	CMDC
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bit 8 – CINT** Card Interrupt Status Enable

If this bit is set to 0, the SDMMC clears interrupt requests to the system. The Card Interrupt detection is stopped when this bit is cleared and restarted when this bit is set to 1. The user may clear this bit before servicing the Card Interrupt and may set this bit again after all interrupt requests from the card are cleared to prevent inadvertent interrupts.

- 0 (MASKED): The CINT status flag in SDMMC\_NISTR is masked.
- 1 (ENABLED): The CINT status flag in SDMMC\_NISTR is enabled.

**Bit 7 – CREM** Card Removal Status Enable

- 0 (MASKED): The CREM status flag in SDMMC\_NISTR is masked.
- 1 (ENABLED): The CREM status flag in SDMMC\_NISTR is enabled.

**Bit 6 – CINS** Card Insertion Status Enable

- 0 (MASKED): The CINS status flag in SDMMC\_NISTR is masked.
- 1 (ENABLED): The CINS status flag in SDMMC\_NISTR is enabled.

**Bit 5 – BRDRDY** Buffer Read Ready Status Enable

- 0 (MASKED): The BRDRDY status flag in SDMMC\_NISTR is masked.
- 1 (ENABLED): The BRDRDY status flag in SDMMC\_NISTR is enabled.

**Bit 4 – BWRRDY** Buffer Write Ready Status Enable

- 0 (MASKED): The BWRRDY status flag in SDMMC\_NISTR is masked.
- 1 (ENABLED): The BWRRDY status flag in SDMMC\_NISTR is enabled.

**Bit 3 – DMAINT** DMA Interrupt Status Enable

- 0 (MASKED): The DMAINT status flag in SDMMC\_NISTR is masked.
- 1 (ENABLED): The DMAINT status flag in SDMMC\_NISTR is enabled.

**Bit 3 – CMDIDX** Command Index Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDIDX status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CMDIDX status rises in SDMMC\_EISTR.

**Bit 2 – CMDEND** Command End Bit Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDEND status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CMDEND status rises in SDMMC\_EISTR.

**Bit 1 – CMDCRC** Command CRC Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDCRC status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CMDCRC status rises in SDMMC\_EISTR.

**Bit 0 – CMDTEO** Command Timeout Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDTEO status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CMDTEO status rises in SDMMC\_EISTR.

### 50.12.31 SDMMC Auto CMD Error Status Register

**Name:** SDMMC\_ACESR  
**Offset:** 0x3C  
**Reset:** 0x0000  
**Property:** Read-only

Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	CMDNI			ACMDIDX	ACMDEND	ACMDCRC	ACMDTEO	ACMD12NE
Access	R			R	R	R	R	R
Reset	0			0	0	0	0	0

**Bit 7 – CMDNI** Command Not Issued by Auto CMD12 Error  
 This bit is set to 1 when CMD\_wo\_DAT is not executed due to an Auto CMD12 error (SDMMC\_ACESR[4:1]). This bit is set to 0 when Auto CMD Error is generated by Auto CMD23.

Value	Description
0	No error.
1	Error.

**Bit 4 – ACMDIDX** Auto CMD Index Error  
 This bit is set to 1 when the Command Index error occurs in response to a command.

Value	Description
0	No error.
1	Error.

**Bit 3 – ACMDEND** Auto CMD End Bit Error  
 This bit is set to 1 when detecting that the end bit of the command response is 0.

Value	Description
0	No error.
1	Error.

**Bit 2 – ACMDCRC** Auto CMD CRC Error  
 This bit is set to 1 when detecting a CRC error in the command response (see [the table above](#) for more details).

**Bit 1 – ACMDTEO** Auto CMD Timeout Error  
 This bit is set to 1 if no response is returned within 64 SDCLK cycles from the end bit of the command. If this bit is set to 1, the other error status bits (SDMMC\_ACESR[4:2]) are meaningless.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

**Table 50-4. Relation between ACMDCRC and ACMDTEO**

ACMDCRC	ACMDTEO	Types of error
0	0	No error
0	1	Response Timeout error
1	0	Response CRC error
1	1	CMD line conflict

**Bit 0 – ACMD12NE** Auto CMD12 Not Executed

If a memory multiple block data transfer is not started due to a command error, this bit is not set to 1 because it is not necessary to issue Auto CMD12. Setting this bit to 1 means the SDMMC cannot issue Auto CMD12 to stop a memory multiple block data transfer due to some error. If this bit is set to 1, other error status bits (SDMMC\_ACESR[4:1]) are meaningless.

This bit is set to 0 when an Auto CMD error is generated by Auto CMD23.

Value	Description
0	No error.
1	Error.

### 50.12.32 SDMMC Host Control 2 Register (SD\_SDIO)

**Name:** SDMMC\_HC2R (SD\_SDIO)  
**Offset:** 0x3E  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

	Bit	15	14	13	12	11	10	9	8
		PVALEN	ASINTEN						
Access		R/W	R/W						
Reset		0	0						
	Bit	7	6	5	4	3	2	1	0
		SCLKSEL	EXTUN	DRVSEL[1:0]		VS18EN	UHSMS[2:0]		
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0

#### Bit 15 – PVALEN Preset Value Enable

As the operating SDCLK frequency and I/O driver strength depend on the system implementation, it is difficult to determine these parameters in the standard host driver. When PVALEN is set to 1, automatic SDCLK frequency generation and driver strength selection are performed without considering system-specific conditions. This bit enables the functions defined in SDMMC\_PVR.

If this bit is set to 0, SDCLKFSEL, CLKGSEL in SDMMC\_CCR and DRVSEL in SDMMC\_HC2R are set by the user.

If this bit is set to 1, SDCLKFSEL, CLKGSEL in SDMMC\_CCR and DRVSEL in SDMMC\_HC2R are set by the SDMMC as specified in SDMMC\_PVR.

Value	Description
0	SDCLK and Driver strength are controlled by the user.
1	Automatic selection by Preset Value is enabled.

#### Bit 14 – ASINTEN Asynchronous Interrupt Enable

This bit can be set to 1 if a card supports asynchronous interrupts and Asynchronous Interrupt Support (ASINTSUP) is set to 1 in SDMMC\_CA0R. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode. If this bit is set to 1, the user can stop the SDCLK during the asynchronous interrupt period to save power. During this period, the SDMMC continues to deliver the Card Interrupt to the host when it is asserted by the card.

Value	Description
0	Disabled
1	Enabled

#### Bit 7 – SCLKSEL Sampling Clock Select

The SDMMC uses this bit to select the sampling clock to receive CMD and DAT.

This bit is set by the tuning procedure and is valid after completion of tuning (when EXTUN is cleared). Setting 1 means that tuning is completed successfully and setting 0 means that tuning has failed.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

Writing 1 to this bit is meaningless and ignored. A tuning circuit is reset by writing to 0. This bit can be cleared by setting EXTUN to 1. Once the tuning circuit is reset, it takes time to complete the tuning sequence. Therefore, the user should keep this bit to 1 to perform a retuning sequence to complete a retuning sequence in a short time. Changing this bit is not allowed while the SDMMC is receiving a response or a read data block. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

Value	Description
0	The fixed clock is used to sample data.
1	The tuned clock is used to sample data.

### Bit 6 – EXTUN Execute Tuning

This bit is set to 1 to start the tuning procedure and is automatically cleared when the tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select (SCLKSEL). The tuning procedure is aborted by writing 0. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

Value	Description
0	Not tuned or tuning completed.
1	Execute tuning.

### Bits 5:4 – DRVSEL[1:0] Driver Strength Select

The SDMMC output driver in 1.8V signaling is selected by this bit. In 3.3V signaling, this field is not effective. This field can be set according to the Driver Type A, C and D support bits in SDMMC\_CA1R.

This field depends on the setting of Preset Value Enable (PVALEN):

- PVALEN = 0: This field is set by the user.
- PVALEN = 1: This field is automatically set by a value specified in one of the SDMMC\_PVRx.

Value	Name	Description
0	TYPEB	Driver Type B is selected (Default)
1	TYPEA	Driver Type A is selected
2	TYPEC	Driver Type C is selected
3	TYPE D	Driver Type D is selected

### Bit 3 – VS18EN 1.8V Signaling Enable

This bit controls the SDMMC\_1V8SEL output, which in turn may control an external voltage regulator for the I/O cell and card I/Os. 3.3V or some other fixed voltage is supplied to the card/device regardless of the signaling voltage.

Setting this bit from 0 to 1 starts changing the signal voltage from 3.3V to 1.8V. The 1.8V regulator output must be stable within 5 ms.

Clearing this bit from 1 to 0 starts changing the signal voltage from 1.8V to 3.3V. The 3.3V regulator output must be stable within 5 ms.

The user can set this bit to 1 when the SDMMC supports 1.8V signaling (one of the support bits is set to 1: SDR50SUP, SDR104SUP or DDR50SUP in SDMMC\_CA1R) and the card or device supports UHS-I (S18A = 1. See “Bus Switch Voltage Switch Sequence in the “Physical Layer Simplified Specification V3.01” ).

Value	Description
0	3.3V signaling.
1	1.8V signaling.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bits 2:0 – UHSMS[2:0] UHS Mode Select

This field is used to select one of the UHS-I modes and is effective when 1.8V Signal Enable (VS18EN) is set to 1.

This field is effective only if SDMMC\_MC1R.DDR is set to 0.

If Preset Value Enable is set to 1, the SDMMC sets SDCLK Frequency Select (SDCLKFSEL), Clock Generator Select (CLKGSEL) in SDMMC\_CCR and Driver Strength Select (DRVSEL) according to SDMMC\_PVR. In this case, one of the preset value registers is selected by this field. The user needs to reset SD Clock Enable (SDCLKEN) before changing this field to avoid generating a clock glitch. After setting this field, the user sets SDCLKEN to 1 again.

Value	Name	Description
0	SDR12	UHS SDR12 Mode
1	SDR25	UHS SDR25 Mode
2	SDR50	UHS SDR50 Mode
3	SDR104	UHS SDR104 Mode
4	DDR50	UHS DDR50 Mode

### 50.12.33 SDMMC Host Control 2 Register (e.MMC)

**Name:** SDMMC\_HC2R (e.MMC)  
**Offset:** 0x3E  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

Bit	15	14	13	12	11	10	9	8
	PVALEN							
Access	R/W							
Reset	0							
Bit	7	6	5	4	3	2	1	0
	SCLKSEL	EXTUN	DRVSEL[1:0]		HS200EN[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bit 15 – PVALEN** Preset Value Enable

As the operating SDCLK frequency and I/O driver strength depend on the system implementation, it is difficult to determine these parameters in the standard host driver. When Preset Value Enable (PVALEN) is set to 1, automatic SDCLK frequency generation and driver strength selection are performed without considering system-specific conditions. This bit enables the functions defined in SDMMC\_PVR.

If this bit is set to 0, SDCLKFSEL, CLKGSEL in SDMMC\_CCR and DRVSEL in SDMMC\_HC2R are set by the user.

If this bit is set to 1, SDCLKFSEL, CLKGSEL in SDMMC\_CCR and DRVSEL in SDMMC\_HC2R are set by the SDMMC as specified in SDMMC\_PVR.

Value	Description
0	SDCLK and Driver strength are controlled by the user.
1	Automatic selection by Preset Value is enabled.

**Bit 7 – SCLKSEL** Sampling Clock Select

The SDMMC uses this bit to select the sampling clock to receive CMD and DAT.

This bit is set by the tuning procedure and is valid after completion of tuning (when EXTUN is cleared). Setting 1 means that tuning is completed successfully and setting 0 means that tuning has failed.

Writing 1 to this bit is meaningless and ignored. A tuning circuit is reset by writing to 0. This bit can be cleared by setting EXTUN to 1. Once the tuning circuit is reset, it takes time to complete a tuning sequence. Therefore, the user should keep this bit to 1 to perform a retuning sequence to complete a retuning sequence in a short time. Changing this bit is not allowed while the SDMMC is receiving a response or a read data block. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

Value	Description
0	The fixed clock is used to sample data.
1	The tuned clock is used to sample data.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bit 6 – EXTUN Execute Tuning

This bit is set to 1 to start the tuning procedure and is automatically cleared when the tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select (SCLKSEL). The tuning procedure is aborted by writing 0. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

Value	Description
0	Not tuned or tuning completed
1	Execute tuning

### Bits 5:4 – DRVSEL[1:0] Driver Strength Select

The SDMMC output driver in 1.8V signaling is selected by this bit. In 3.3V signaling, this field is not effective. This field can be set according to the Driver Type A, C and D support bits in SDMMC\_CA1R.

This field depends on setting of Preset Value Enable (PVALEN):

- PVALEN = 0: This field is set by the user.
- PVALEN = 1: This field is automatically set by a value specified in one of the SDMMC\_PVRx.

Value	Name	Description
0	TYPEB	Driver Type B is selected (Default)
1	TYPEA	Driver Type A is selected
2	TYPEC	Driver Type C is selected
3	TYPED	Driver Type D is selected

### Bits 3:0 – HS200EN[3:0] HS200 Mode Enable

This field is used to select the e.MMC HS200 mode. When HS200EN is set to B<sub>(hexa)</sub>, the HS200 mode is enabled. Any other value except 0 is forbidden when interfacing an e.MMC device.

If Preset Value Enable is set to 1, SDMMC sets SDCLK Frequency Select (SDCLKFSEL), Clock Generator Select (CLKGSEL) in SDMMC\_CCR and Driver Strength Select (DRVSEL) according to SDMMC\_PVR. In this case, one of the preset value registers is selected by this field. The user needs to reset SD Clock Enable (SDCLKEN) before changing this field to avoid generating a clock glitch. After setting this field, the user sets SDCLKEN to 1 again.

Note: This field is effective only if DDR in SDMMC\_MC1R is set to 0.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.34 SDMMC Capabilities 0 Register

**Name:** SDMMC\_CA0R  
**Offset:** 0x40  
**Property:** Read/Write

**Reset:** Register reset values depend on the instance of the SDMMC:

Instance	Reset Value
SDMMC0	0x27EC0C8C
SDMMC1	0x27E80C8C

**Note:** The Capabilities 0 Register is not supposed to be written by the user. However, the user can modify preset values only if Capabilities Write Enable (CAPWREN) is set to 1 in SDMMC\_CACR.

Bit	31	30	29	28	27	26	25	24
	SLTYPE[1:0]		ASINTSUP	SB64SUP		V18VSUP	V30VSUP	V33VSUP
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset								
Bit	23	22	21	20	19	18	17	16
	SRSUP	SDMASUP	HSSUP		ADMA2SUP	ED8SUP	MAXBLKL[1:0]	
Access	R/W	R/W	R/W		R/W	R/W	R/W	R/W
Reset								
Bit	15	14	13	12	11	10	9	8
	BASECLKF[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset								
Bit	7	6	5	4	3	2	1	0
	TEOCLKU		TEOCLKF[5:0]					
Access	R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset								

**Bits 31:30 – SLTYPE[1:0] Slot Type**

This field indicates usage of a slot by a specific system. An SDMMC control register set is defined per slot.

Embedded Slot for One Device means that only one nonremovable device is connected to a bus slot.

The Standard Host Driver controls a removable card (SLTYPE = 0) or one embedded device (SLTYPE = 1) connected to an SD bus slot.

Value	Name
0	Removable Card Slot
1	Embedded Slot for One Device
2	Reserved
3	Reserved

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bit 29 – ASINTSUP Asynchronous Interrupt Support

See section “Asynchronous Interrupt” in the “SDIO Simplified Specification V3.00” .

Value	Description
0	Asynchronous interrupt not supported.
1	Asynchronous interrupt supported.

### Bit 28 – SB64SUP 64-Bit System Bus Support

Reading this bit to 1 means that the SDMMC supports the 64-bit Address Descriptor mode and is connected to the 64-bit address system bus.

Value	Description
0	64-bit address bus not supported.
1	64-bit address bus supported.

### Bit 26 – V18VSUP Voltage Support 1.8V

Value	Description
0	1.8V Voltage supply not supported.
1	1.8V Voltage supply supported.

### Bit 25 – V30VSUP Voltage Support 3.0V

Value	Description
0	3.0V Voltage supply not supported.
1	3.0V Voltage supply supported.

### Bit 24 – V33VSUP Voltage Support 3.3V

Value	Description
0	3.3V Voltage supply not supported.
1	3.3V Voltage supply supported.

### Bit 23 – SRSUP Suspend/Resume Support

This bit indicates whether the SDMMC supports the Suspend/Resume functionality. If this bit is set to 0, the user does not issue either Suspend or Resume commands because the Suspend and Resume mechanism (see “Suspend and Resume Mechanism” in the “SD Host Controller Simplified Specification V3.00” ) is not supported.

Value	Description
0	Suspend/Resume not supported.
1	Suspend/Resume supported.

### Bit 22 – SDMASUP SDMA Support

This bit indicates whether the SDMMC is capable of using SDMA to transfer data between system memory and the SDMMC directly.

Value	Description
0	SDMA not supported.
1	SDMA supported.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bit 21 – HSSUP High Speed Support

This bit indicates whether the SDMMC and the system support High Speed mode and they can supply SDCLK frequency from 25 MHz to 50 MHz.

Value	Description
0	High Speed not supported.
1	High Speed supported.

### Bit 19 – ADMA2SUP ADMA2 Support

This bit indicates whether the SDMMC is capable of using ADMA2.

Value	Description
0	ADMA2 not supported.
1	ADMA2 supported.

### Bit 18 – ED8SUP 8-Bit Support for Embedded Device

This bit indicates whether the SDMMC is capable of using the 8-bit Bus Width mode.

Value	Description
0	8-bit bus width not supported.
1	8-bit bus width supported.

### Bits 17:16 – MAXBLKL[1:0] Max Block Length

This field indicates the maximum block size that the user can read and write to the buffer in the SDMMC. Three sizes can be defined, as shown below. It is noted that the transfer block length is always 512 bytes for SD Memory Cards regardless of this field.

Value	Name	Description
0	512	512 bytes
1	1024	1024 bytes
2	2048	2048 bytes
3	NONE	Reserved

### Bits 15:8 – BASECLKF[7:0] Base Clock Frequency

This value indicates the frequency of the base clock (BASECLK). The user uses this value to calculate the clock divider value (see SDCLK Frequency Select (SDCLKFSEL) in SDMMC\_CCR).

If this field is set to 0, the user must get the information via another method.

$$f_{\text{BASECLK}} = \text{BASECLKF}_{\text{MHz}}$$

### Bit 7 – TEOCLKU Timeout Clock Unit

This bit shows the unit of the base clock frequency used to detect Data Timeout Error.

Value	Description
0	KHz
1	MHz

### Bits 5:0 – TEOCLKF[5:0] Timeout Clock Frequency

This bit shows the timeout clock frequency (TEOCLK) used to detect Data Timeout Error.

If this field is set to 0, the user must get the information via another method.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

---

The Timeout Clock Unit (TEOCLKU) defines the unit of this field's value.

– TEOCLKU = 0:  $f_{\text{TEOCLK}} = \text{TEOCLKF}_{\text{KHz}}$

– TEOCLKU = 1:  $f_{\text{TEOCLK}} = \text{TEOCLKF}_{\text{MHz}}$

### 50.12.35 SDMMC Capabilities 1 Register

**Name:** SDMMC\_CA1R  
**Offset:** 0x44  
**Property:** Read/Write

**Note:** The Capabilities 1 Register is not supposed to be written by the user. However, the user can modify preset values only if Capabilities Write Enable (CAPWREN) is set to 1 in SDMMC\_CACR.

**Note:** Register reset values depend on the instance of the SDMMC:

Instance	Reset Value
SDMMC0	0x00200F77
SDMMC1	0x00200070

**Bits 23:16 – CLKMULT[7:0] Clock Multiplier**

This field indicates the multiplier factor between the Base Clock (BASECLK) used for the Divided Clock Mode and the Multiplied Clock (MULTCLK) used for the Programmable Clock mode (see SDMMC\_CCR).

Reading this field to 0 means that the Programmable Clock mode is not supported.

$$f_{MULTCLK} = f_{BASECLK} \times (CLKMULT + 1)$$

**Bits 15:14 – RTMOD[1:0] Retuning Modes**

This field selects the retuning method and limits the maximum data length.

There are two retuning timings: Retuning Request (RTREQ) controlled by the SDMMC, and expiration of a Retuning timer controlled by the user. By receiving either timing, the user executes the retuning procedure just before a next command issue.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

The maximum data length per read/write command is restricted so that retuning procedures can be inserted during data transfers.

### Retuning Mode 1:

The SDMMC does not have any internal logic to detect when retuning needs to be performed. In this case, the user should maintain all retuning timings by using the Retuning Timer. To enable inserting the retuning procedure during data transfers, the data length per Read/Write command must be limited to 4 Mbytes.

### Retuning Mode 2:

The SDMMC has the capability to indicate the retuning timing by Retuning Request (RTREQ) during data transfers. Then the data length per Read/Write command must be limited to 4 Mbytes.

During nondata transfer, retuning timing is determined by either Retuning Request or Retuning Timer. If Retuning Request is used, Retuning Timer should be disabled.

### Retuning Mode 3:

The SDMMC has the capability to take care of the retuning during data transfer (Auto Retuning). Retuning Request is not generated during data transfers and there is no limitation to data length per Read/Write command.

During nondata transfer, retuning timing is determined either by Retuning Request or Retuning Timer. If Retuning Request is used, Retuning Timer should be disabled.

Value	Name	Description	Data Length
0	MODE1	Timer	4 Mbytes (Max)
1	MODE2	Timer and Retuning Request	4 Mbytes (Max)
2	MODE3	Auto Retuning (for transfer) Timer and Retuning Request	Any
3	–	Reserved	–

### Bit 13 – TSDR50 Use Tuning for SDR50

If this bit is set to 1, the SDMMC requires tuning to operate SDR50 (tuning is always required to operate SDR104).

Value	Description
0	SDR50 does not require tuning.
1	SDR50 requires tuning.

### Bits 11:8 – TCNTRT[3:0] Timer Count For Retuning

This field indicates an initial value of the Retuning Timer for Retuning Mode (RTMOD) 1 to 3. Reading this field at 0 means that the Retuning Timer is disabled. The Retuning Timer initial value ranges from 0 to 1024 seconds.

$$t_{\text{TIMER}} = 2^{(\text{TCNTRT} - 1)} \text{Seconds}$$

### Bit 6 – DRVDSUP Driver Type D Support

Value	Description
0	Driver type D is not supported.
1	Driver type D is supported.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bit 5 – DRVCSUP Driver Type C Support

Value	Description
0	Driver type C is not supported.
1	Driver type C is supported.

### Bit 4 – DRVASUP Driver Type A Support

Value	Description
0	Driver type A is not supported.
1	Driver type A is supported.

### Bit 2 – DDR50SUP DDR50 Support

Value	Description
0	DDR50 mode is not supported.
1	DDR50 mode is supported.

### Bit 1 – SDR104SUP SDR104 Support

Value	Description
0	SDR104 mode is not supported.
1	SDR104 mode is supported.

### Bit 0 – SDR50SUP SDR50 Support

Value	Description
0	SDR50 mode is not supported.
1	SDR50 mode is supported.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.36 SDMMC Maximum Current Capabilities Register

**Name:** SDMMC\_MCCAR  
**Offset:** 0x48  
**Reset:** 0x00000000  
**Property:** Read/Write

**Note:** The Maximum Current Capabilities Register is not supposed to be written by the user. However, the user can modify preset values only if Capabilities Write Enable (CAPWREN) is set to 1 in SDMMC\_CACR.

Bit	31	30	29	28	27	26	25	24
Access	[Greyed out]							
Reset	[Greyed out]							
Bit	23	22	21	20	19	18	17	16
Access	MAXCUR18V[7:0]							
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access	MAXCUR30V[7:0]							
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Access	MAXCUR33V[7:0]							
Reset	0	0	0	0	0	0	0	0

**Bits 23:16 – MAXCUR18V[7:0]** Maximum Current for 1.8V  
 This field indicates the maximum current capability for 1.8V voltage. This value is meaningful only if V18VSUP is set to 1 in SDMMC\_CA0R. Reading MAXCUR18V at 0 means that the user must get information via another method.

$$I_{max_{mA}} = 4 \times MAXCURR18V$$

**Bits 15:8 – MAXCUR30V[7:0]** Maximum Current for 3.0V  
 This field indicates the maximum current capability for 3.0V voltage. This value is meaningful only if V30VSUP is set to 1 in SDMMC\_CA0R. Reading MAXCUR30V at 0 means that the user must get information via another method.

$$I_{max_{mA}} = 4 \times MAXCURR30V$$

**Bits 7:0 – MAXCUR33V[7:0]** Maximum Current for 3.3V  
 This field indicates the maximum current capability for 3.3V voltage. This value is meaningful only if V33VSUP is set to 1 in SDMMC\_CA0R. Reading MAXCUR33V at 0 means that the user must get information via another method.

$$I_{max_{mA}} = 4 \times MAXCURR33V$$

**50.12.37 SDMMC Force Event Register for Auto CMD Error Status**

**Name:** SDMMC\_FERACES  
**Offset:** 0x50  
**Reset:** –  
**Property:** Write-only

	Bit	15	14	13	12	11	10	9	8
		[ 8-bit register field ]							
Access									
Reset									
	Bit	7	6	5	4	3	2	1	0
		CMDNI			ACMDIDX	ACMDEND	ACMDCRC	ACMDTEO	ACMD12NE
Access		W			W	W	W	W	W
Reset		–			–	–	–	–	–

**Bit 7 – CMDNI** Force Event for Command Not Issued by Auto CMD12 Error  
 For test purposes, the user can write this bit to 1 to raise the CMDNI status flag in SDMMC\_ACESR.

Writing this bit to 0 has no effect.

**Bit 4 – ACMDIDX** Force Event for Auto CMD Index Error  
 For test purposes, the user can write this bit to 1 to raise the ACMDIDX status flag in SDMMC\_ACESR.

Writing this bit to 0 has no effect.

**Bit 3 – ACMDEND** Force Event for Auto CMD End Bit Error  
 For test purposes, the user can write this bit to 1 to raise the ACMDEND status flag in SDMMC\_ACESR.

Writing this bit to 0 has no effect.

**Bit 2 – ACMDCRC** Force Event for Auto CMD CRC Error  
 For test purposes, the user can write this bit to 1 to raise the ACMDCRC status flag in SDMMC\_ACESR.

Writing this bit to 0 has no effect.

**Bit 1 – ACMDTEO** Force Event for Auto CMD Timeout Error  
 For test purposes, the user can write this bit to 1 to raise the ACMDTEO status flag in SDMMC\_ACESR.

Writing this bit to 0 has no effect.

**Bit 0 – ACMD12NE** Force Event for Auto CMD12 Not Executed  
 For test purposes, the user can write this bit to 1 to raise the ACMD12NE status flag in SDMMC\_ACESR.

Writing this bit to 0 has no effect.

**50.12.38 SDMMC Force Event Register for Error Interrupt Status**

**Name:** SDMMC\_FEREIS  
**Offset:** 0x52  
**Reset:** –  
**Property:** Write-only

	Bit	15	14	13	12	11	10	9	8
					BOOTAE			ADMA	ACMD
Access					W			W	W
Reset					–			–	–
	Bit	7	6	5	4	3	2	1	0
		CURLIM	DATEND	DATCRC	DATTEO	CMDIDX	CMDEND	CMDCRC	CMDTEO
Access		W	W	W	W	W	W	W	W
Reset		–	–	–	–	–	–	–	–

**Bit 12 – BOOTAE** Force Event for Boot Acknowledge Error  
 For test purposes, the user can write this bit to 1 to raise the BOOTAE status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

**Bit 9 – ADMA** Force Event for ADMA Error  
 For test purposes, the user can write this bit to 1 to raise the ADMA status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

**Bit 8 – ACMD** Force Event for Auto CMD Error  
 For test purposes, the user can write this bit to 1 to raise the ACMD status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

**Bit 7 – CURLIM** Force Event for Current Limit Error  
 For test purposes, the user can write this bit to 1 to raise the CURLIM status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

**Bit 6 – DATEND** Force Event for Data End Bit Error  
 For test purposes, the user can write this bit to 1 to raise the DATEND status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

**Bit 5 – DATCRC** Force Event for Data CRC error  
 For test purposes, the user can write this bit to 1 to raise the DATCRC status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

**Bit 4 – DATTEO** Force Event for Data Timeout error  
 For test purposes, the user can write this bit to 1 to raise the DATTEO status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

**Bit 3 – CMDIDX** Force Event for Command Index Error

For test purposes, the user can write this bit to 1 to raise the CMDIDX status flag in SDMMC\_EISTR.

Writing this bit to 0 has no effect.

**Bit 2 – CMDEND** Force Event for Command End Bit Error

For test purposes, the user can write this bit to 1 to raise the CMDEND status flag in SDMMC\_EISTR.

Writing this bit to 0 has no effect.

**Bit 1 – CMDCRC** Force Event for Command CRC Error

For test purposes, the user can write this bit to 1 to raise the CMDCRC status flag in SDMMC\_EISTR.

Writing this bit to 0 has no effect.

**Bit 0 – CMDTEO** Force Event for Command Timeout Error

For test purposes, the user can write this bit to 1 to raise the CMDTEO status flag in SDMMC\_EISTR.

Writing this bit to 0 has no effect.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.39 SDMMC ADMA Error Status Register

**Name:** SDMMC\_AESR  
**Offset:** 0x54  
**Reset:** 0x00  
**Property:** Read-only

	Bit	7	6	5	4	3	2	1	0
							LMIS	ERRST[1:0]	
Access							R	R	R
Reset							0	0	0

**Bit 2 – LMIS** ADMA Length Mismatch Error

This error occurs in the following two cases:

- While Block Count Enable (BCEN) is being set, the total data length specified by the Descriptor table is different from that specified by the Block Count (BLKCNT) and Transfer Block Size (BLKSIZE).
- The total data length cannot be divided by the Transfer Block Size (BLKSIZE).

Value	Description
0	No error.
1	Error.

**Bits 1:0 – ERRST[1:0]** ADMA Error State

This field indicates the state of ADMA when an error has occurred during an ADMA data transfer. This field never reads 2 because ADMA never stops in this state.

Value	Name	Description
0	ST_STOP (Stop DMA)	Points to the descriptor following the error descriptor
1	ST_FDS (Fetch Descriptor)	Points to the error descriptor
2	–	(Not used)
3	ST_TRF (Transfer Data)	Points to the descriptor following the error descriptor

**50.12.40 SDMMC ADMA System Address Register 0**

**Name:** SDMMC\_ASAR0  
**Offset:** 0x58  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	ADMASA[31:24]

**Bits 31:0 – ADMASA[31:0] ADMA System Address**

This field holds the byte address of the executing command of the descriptor table. The 32-bit address descriptor uses SDMMC\_ASAR. At the start of ADMA, the user must set the start address of the descriptor table. The ADMA increments this register address, which points to the next Descriptor line to be fetched.

When the ADMA Error (ADMA) status flag rises, this field holds a valid descriptor address depending on the ADMA Error State (ERRST). The user must program Descriptor Table on 32-bit boundary and set 32-bit boundary address to this register. ADMA2 ignores the lower 2 bits of this register and assumes it to be 0.

### 50.12.41 SDMMC Preset Value Register

**Name:** SDMMC\_PVRx  
**Offset:** 0x60 + x\*0x02 [x=0..7]  
**Reset:** 0x00000000  
**Property:** Read/Write

One of the Preset Value Registers is effective based on the selected bus speed mode. The table below defines the conditions to select one of the SDMMC\_PVRs.

**Table 50-5. Preset Value Register Select Condition**

Selected Bus Speed Mode	VS18EN (SDMMC_HC2R)	HSEN (SDMMC_HC1R)	UHSMS (SDMMC_HC2R)
Default Speed	0	0	don't care
High Speed	0	1	don't care
SDR12	1	don't care	0
SDR25	1	don't care	1
SDR50	1	don't care	2
SDR104/HS200	1	don't care	3
DDR50	1	don't care	4
Reserved	1	don't care	Other values

The table below shows the effective Preset Value Register according to the Selected Bus Speed mode.

**Table 50-6. Preset Value Registers**

SDMMC_PVRx	Selected Bus Speed Mode	Signal Voltage
SDMMC_PVR0	Initialization	3.3V or 1.8V
SDMMC_PVR1	Default Speed	3.3V
SDMMC_PVR2	High Speed	3.3V
SDMMC_PVR3	SDR12	1.8V
SDMMC_PVR4	SDR25	1.8V
SDMMC_PVR5	SDR50	1.8V
SDMMC_PVR6	SDR104/HS200	1.8V
SDMMC_PVR7	DDR50	1.8V

When Preset Value Enable (PVALEN) in SDMMC\_HC2R is set to 1, SDCLK Frequency Select (SDCLKFSEL) and Clock Generator Select (CLKGSEL) in SDMMC\_CCR, and Driver Strength Select (DRVSEL) in SDMMC\_HC2R are automatically set based on the Selected Bus Speed mode. This means that the user does not need to set these fields when preset is enabled. A Preset Value Register for Initialization (SDMMC\_PVR0) is not selected by Bus Speed mode. Before starting the initialization

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

sequence, the user needs to set a clock preset value to SDCLKFSEL in SDMMC\_CCR. PVALEN can be set to 1 after the initialization is completed.

Bit	15	14	13	12	11	10	9	8
	DRVSEL[1:0]					CLKGSEL	SDCLKFSEL[9:8]	
Access	R/W	R/W				R/W	R/W	R/W
Reset	0	0				0	0	0
Bit	7	6	5	4	3	2	1	0
	SDCLKFSEL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 15:14 – DRVSEL[1:0]** Driver Strength Select  
See DRVSEL in SDMMC\_HC2R.

**Bit 10 – CLKGSEL** Clock Generator Select  
See CLKGSEL in SDMMC\_CCR.

**Bits 9:0 – SDCLKFSEL[9:0]** SDCLK Frequency Select  
See SDCLKFSEL in SDMMC\_CCR.

### 50.12.42 SDMMC Slot Interrupt Status Register

**Name:** SDMMC\_SISR  
**Offset:** 0xFC  
**Reset:** 0x0000  
**Property:** Read-only

**Bits 1:0 – INTSSL[1:0]** Interrupt Signal for Each Slot

These status bits indicate the logical OR of Interrupt Signals and Wakeup Signal for each SDMMC instance in the product (INTSSL[x] corresponds to SDMMCx instance in the product).

### 50.12.43 SDMMC Host Controller Version Register

**Name:** SDMMC\_HCVR  
**Offset:** 0xFE  
**Reset:** 0x1502  
**Property:** Read-only

Bit	15	14	13	12	11	10	9	8
	VVER[7:0]							
Access	R	R	R	R	R	R	R	R
Reset								
Bit	7	6	5	4	3	2	1	0
	SVER[7:0]							
Access	R	R	R	R	R	R	R	R
Reset								

**Bits 15:8 – VVER[7:0]** Vendor Version Number

Reserved. Value subject to change. No functionality associated. This is the internal version of the module.

**Bits 7:0 – SVER[7:0]** Specification Version Number

This status indicates the SD Host Controller Specification Version.

Value	Name
0	SD Host Specification Version 1.00
1	SD Host Specification Version 2.00, including the feature of the ADMA and Test Register
2	SD Host Specification Version 3.00

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.44 SDMMC Additional Present State Register

**Name:** SDMMC\_APSR  
**Offset:** 0x200  
**Reset:** –  
**Property:** Read-only

**Reset:**

Reset value depends on the instance of the SDMMC:

Instance	Reset Value
SDMMC0	0x0000000F
SDMMC1	0x00000000

**Bits 3:0 – HDATLL[3:0] DAT[7:4] High Line Level**

This status is used to check the DAT[7:4] line level to recover from errors, and for debugging.

### 50.12.45 SDMMC e.MMC Control 1 Register

**Name:** SDMMC\_MC1R  
**Offset:** 0x204  
**Reset:** 0x00  
**Property:** Read/Write

Bit	7	6	5	4	3	2	1	0
	FCD	RSTN	BOOTA	OPD	DDR		CMDTYP[1:0]	
Access	R/W	R/W	R/W	R/W	R/W		R/W	R/W
Reset	0	0	0	0	0		0	0

**Bit 7 – FCD** e.MMC Force Card Detect

When using e.MMC, the user can set this bit to 1 to bypass the card detection procedure using the SDMMC\_CD signal.

0 (DISABLED): e.MMC Forced Card Detect is disabled. The SDMMC\_CD signal is used and debounce timing is applied.

1 (ENABLED): e.MMC Forced Card Detect is enabled.

**Bit 6 – RSTN** e.MMC Reset Signal

This bit controls the e.MMC reset signal.

Value	Description
0	Reset signal is inactive.
1	Reset signal is active.

**Bit 5 – BOOTA** e.MMC Boot Acknowledge Enable

This bit must be set according to the value of BOOT\_ACK in the Extended CSD Register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51”).

When this bit is set to 1, the SDMMC waits for boot acknowledge pattern from the e.MMC before receiving boot data.

If the boot acknowledge pattern is wrong, the BOOTAE status flag rises in SDMMC\_EISTR if BOOTAE is set in SDMMC\_EISTER. An interrupt is generated if BOOTAE is set in SDMMC\_EISIER.

If the no boot acknowledge pattern is received, the DATTEO status flag rises in SDMMC\_EISTR if DATTEO is set in SDMMC\_EISTER. An interrupt is generated if DATTEO is set in SDMMC\_EISIER.

**Bit 4 – OPD** e.MMC Open Drain Mode

This bit sets the command line in open drain.

Value	Description
0	The command line is in push-pull.
1	The command line is in open drain.

**Bit 3 – DDR** e.MMC HSDDR Mode

This bit selects the High Speed DDR mode.

The clock divider (DIV) in SDMMC\_CCR must be set to a value different from 0 when DDR is 1.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

Value	Description
0	High Speed DDR is not selected.
1	High Speed DDR is selected.

### Bits 1:0 – CMDTYP[1:0] e.MMC Command Type

Value	Name	Description
0	NORMAL	The command is not an e.MMC specific command.
1	WAITIRQ	This bit must be set to 1 when the e.MMC is in Interrupt mode (CMD40). See “Interrupt Mode” in the “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” .
2	STREAM	This bit must be set to 1 in the case of Stream Read(CMD11) or Stream Write (CMD20). Only effective for e.MMC up to revision 4.41.
3	BOOT	Starts a Boot Operation mode at the next write to SDMMC_CR. Boot data are read directly from e.MMC device.

**50.12.46 SDMMC e.MMC Control 2 Register**

**Name:** SDMMC\_MC2R  
**Offset:** 0x205  
**Reset:** –  
**Property:** Write-only

	7	6	5	4	3	2	1	0
							ABOOT	SRESP
Access							W	W
Reset							–	–

**Bit 1 – ABOOT** e.MMC Abort Boot

This bit is used to exit from Boot mode. Writing this bit to 1 exits the Boot Operation mode. Writing 0 is ignored.

**Bit 0 – SRESP** e.MMC Abort Wait IRQ

This bit is used to exit from the Interrupt mode. When this bit is written to 1, the SDMMC sends the CMD40 response automatically. This brings the e.MMC from Interrupt mode to the standard Data Transfer mode. Writing this bit to 0 is ignored.

This bit is only effective when CMD\_TYP in SDMMC\_MC1R is set to WAITIRQ.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.47 SDMMC AHB Control Register

**Name:** SDMMC\_ACR  
**Offset:** 0x208  
**Reset:** 0x00  
**Property:** Read/Write

**Bits 1:0 – BMAX[1:0] AHB Maximum Burst**

This field selects the maximum burst size in case of DMA transfer.

Value	Name	Description
0	INCR16	The maximum burst size is INCR16.
1	INCR8	The maximum burst size is INCR8.
2	INCR4	The maximum burst size is INCR4.
3	SINGLE	Only SINGLE transfers are performed.

### 50.12.48 SDMMC Clock Control 2 Register

**Name:** SDMMC\_CC2R  
**Offset:** 0x20C  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – FSDCLKD** Force SDCLK Disabled

The user can choose to maintain the SDCLK during 8 SDCLK cycles after the end bit of the last data block in case of a read transaction, or after the end bit of the CRC status in case of a write transaction.

Value	Description
0	The SDCLK is forced and it cannot be stopped immediately after the transaction.
1	The SDCLK is not forced and it can be stopped immediately after the transaction.

#### 50.12.49 SDMMC Retuning Control 1 Register

**Name:** SDMMC\_RTC1R  
**Offset:** 0x210  
**Reset:** 0x00  
**Property:** Read/Write

Bit	7	6	5	4	3	2	1	0
								TMREN
Access								R/W
Reset								0

**Bit 0 – TMREN** Retuning Timer Enable

Enable the retuning timer.

0 (DISABLED): The retuning timer is disabled.

1 (ENABLED): The retuning timer is enabled.

### 50.12.50 SDMMC Retuning Control 2 Register

**Name:** SDMMC\_RTC2R  
**Offset:** 0x211  
**Reset:** –  
**Property:** Write-only

Bit	7	6	5	4	3	2	1	0
								RLD
Access								W
Reset								–

**Bit 0 – RLD** Retuning Timer Reload

This bit is only efficient if the Retuning timer is enabled (SDMMC\_RTC1R.TMREN set to 1). Once the Timer Counter Value (TCVAL) is set to a nonzero value in SDMMC\_RTCVR, setting this bit to 1 starts the timer count. The retuning timer count restarts each time this bit is written to 1.

Writing this bit to 0 has no effect.

**50.12.51 SDMMC Retuning Counter Value Register**

**Name:** SDMMC\_RTCVR  
**Offset:** 0x214  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 3:0 – TCVAL[3:0] Retuning Timer Counter Value**

The TCVAL value is used to define the time before expiration of the retuning timer where:

$$\text{Time} = 2^{\text{TCVAL} - 1} \text{seconds}$$

This value must range between 1 and 11. Any other value results in the retuning timer being disabled.

**50.12.52 SDMMC Retuning Interrupt Status Enable Register**

**Name:** SDMMC\_RTISTR  
**Offset:** 0x218  
**Reset:** 0x00  
**Property:** Read/Write

Bit	7	6	5	4	3	2	1	0
								TEVT
Access								R/W
Reset								0

**Bit 0 – TEVT** Retuning Timer Event

0 (MASKED): The TEVT status flag in SDMMC\_RTISTR is masked.

1 (ENABLED): The TEVT status flag in SDMMC\_RTISTR is enabled.

**50.12.53 SDMMC Retuning Interrupt Signal Enable Register**

**Name:** SDMMC\_RTISIER  
**Offset:** 0x219  
**Reset:** 0x00  
**Property:** Read/Write

	7	6	5	4	3	2	1	0
								TEVT
Access								R/W
Reset								0

**Bit 0 – TEVT** Retuning Timer Event

0 (MASKED): No interrupt is generated when the TEVT status rises in SDMMC\_RTISTR.

1 (ENABLED): An interrupt is generated when the TEVT status rises in SDMMC\_RTISTR.

### 50.12.54 SDMMC Retuning Interrupt Status Register

**Name:** SDMMC\_RTISTR  
**Offset:** 0x21C  
**Reset:** 0x00  
**Property:** Read/Write

	7		6		5		4		3		2		1		0
	[Register Bit Fields]														
Access															TEVT
Reset															R/W
															0

**Bit 0 – TEVT** Retuning Timer Event

This bit is set to 1 when the retuning timer count is elapsed if SDMMC\_RTISTR.TEVT is set to 1. An interrupt is generated if SDMMC\_RTISTR.TEVT is set to 1.

Writing this bit to 1 clears this bit.

Value	Description
0	No retuning timer event.
1	Retuning timer event.

**50.12.55 SDMMC Retuning Status Slots Register**

**Name:** SDMMC\_RTSSR  
**Offset:** 0x21D  
**Reset:** 0x00  
**Property:** Read-only

Bit	7	6	5	4	3	2	1	0
							TEVTSLOT[1:0]	
Access							R	R
Reset							0	0

**Bits 1:0 – TEVTSLOT[1:0]** Retuning Timer Event Slots

Indicates the TEVT status for each SDMMC instance in the product (TEVTSLOT[x] corresponds to SDMMCx instance in the product).

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.56 SDMMC Tuning Control Register

**Name:** SDMMC\_TUNCR  
**Offset:** 0x220  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – SMPLPT** Sampling Point

This bit selects the position of the sampling point into the data window for SDR104 and HS200 modes.

Value	Description
0	Sampling point is set at 50% of the data window.
1	Sampling point is set at 75% of the data window.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.57 SDMMC Capabilities Control Register

**Name:** SDMMC\_CACR  
**Offset:** 0x230  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits 31-24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Greyed out bits 23-16]							
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	KEY[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	[Greyed out bits 7-1]							CAPWREN
Access								R/W
Reset								0

#### Bits 15:8 – KEY[7:0] Key

Value	Name	Description
46h	KEY	Writing any other value in this field aborts the write operation of the CAPWREN bit. Always reads as 0.

#### Bit 0 – CAPWREN Capabilities Write Enable

This bit can only be written if the value of KEY is 46h.

Value	Description
0	Capabilities registers (SDMMC_CA0R, SDMMC_CA1R and SDMMC_CA1R) cannot be written.
1	Capabilities registers (SDMMC_CA0R, SDMMC_CA1R and SDMMC_CA1R) can be written.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.58 SDMMC Calibration Control Register

**Name:** SDMMC\_CALCR  
**Offset:** 0x240  
**Reset:** 0x0000500E  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	CALPBP[3:0]				CALP[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	CALNBP[3:0]				CALN[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	CNTVAL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	1	0	1	0	0	0	0
Bit	7	6	5	4	3	2	1	0
		BPEN	TUNDIS	ALWYSON	CLKDIV[2:0]			EN
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	1	1	1	0

**Bits 31:28 – CALPBP[3:0]** Calibration P Bypass Value

Calibration code applied for the p-channel transistors when BPEN is set to 1. This field is ignored if BPEN is 0.

**Bits 27:24 – CALP[3:0]** Calibration P Status

Calibration code for the p-channel transistors to match the required output impedance.

**Bits 23:20 – CALNBP[3:0]** Calibration N Bypass Value

Calibration code applied for the n-channel transistors when BPEN is set to 1. This field is ignored if BPEN is 0.

**Bits 19:16 – CALN[3:0]** Calibration N Status

Calibration code for the n-channel transistors to match the required output impedance.

**Bits 15:8 – CNTVAL[7:0]** Calibration Counter Value

Defines the number of XXXX cycles (divided by 4) required to cover the I/O calibration cell startup time.

$$CNTVAL_{\text{Minimum}} = \frac{t_{\text{STARTUP}}}{4 \times t_{\text{HCLOCK}}}$$

$$t_{\text{STARTUP}} = 2 \mu\text{s}$$

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bit 6 – BPEN Calibration Bypass Enabled

Value	Description
0	Calibration bypass is not enabled.
1	Calibration bypass is enabled. CALPBP and CALNBP codes are applied to the calibration cell.

### Bit 5 – TUNDIS Calibration During Tuning Disabled

Value	Description
0	Calibration is launched before each tuning.
1	Calibration is not launched at tuning.

### Bit 4 – ALWYSON Calibration Analog Always ON

Value	Description
0	Calibration analog is shut down after each calibration.
1	Calibration analog remains powered after calibration.

### Bits 3:1 – CLKDIV[2:0] Calibration Clock Division

The clock applied to the calibration cell is divided by  $\text{CLKDIV} + 1$

### Bit 0 – EN PADS Calibration Enable

Value	Description
0	SDMMC I/O calibration disabled.
1	SDMMC I/O calibration enabled.

## 51. Image Sensor Controller (ISC)

### 51.1 Description

The Image Sensor Controller (ISC) system manages incoming data from a parallel sensor. It supports a single active interface. The parallel interface protocol can use a free-running clock or a gated clock strategy. It supports the ITU-R BT 656/1120 422 protocol with a data width of 8 bits or 10 bits and raw Bayer format. The internal image processor includes adjustable white balance, color filter array interpolation, color correction, gamma correction, 12 bits to 10 bits compression, programmable color space conversion, horizontal and vertical chrominance subsampling module. The module also integrates a triple channel direct memory access controller master interface.

### 51.2 Embedded Characteristics

- Parallel 12-bit Interface for Raw Bayer, YCbCr, Monochrome and JPEG Compressed Sensor Interface
- BT.601/656/1120 Video Interface Supported
- Progressive Systems and Segmented Frame Systems
- Raw Bayer, YCbCr, Luminance (Black and White) Pixel Format Supported
- Resolution up to 2592 x 1944
- Input Pixel Clock up to 96 MHz
- Output Master Clock Generation
- Cropping
- Adjustable White Balance
- Raw Bayer Color Filter Array Interpolation
- Color Correction
- Gamma Correction
- Color Space Conversion
- Contrast and Brightness Control
- 4:4:4 to 4:2:2 Subsamplere
- 4:2:2 to 4:2:0 Subsamplere
- Rounding, Limiting and Packing unit
- Histogram Generation
- System Interface: Direct Memory Access Interface with Packed, Semi Planar and Planar output format
- Output Memory Format: 16 bpp RGB, 32 bpp RGB, 16 bpp, YCbCr 444, YCbCr 422, YCbCr 420, up to 12 bit raw Bayer

## 51.3 Block Diagram and Use Cases

### 51.3.1 Image Sensor Controller Functional Diagrams

**Figure 51-1. ISC Block Diagram**

**Figure 51-2. ISC Raw Bayer Signal Processor**

The ISC video pipeline integrates the following submodules:

- PFE: Parallel Front End to sample the camera sensor input stream
- WB: Programmable white balance in the Bayer domain
- CFA: Color filter array interpolation module
- CC: Programmable color correction
- GAM: Gamma correction
- CSC: Programmable color space conversion
- CBC: Contrast and Brightness control
- SUB: This module performs YCbCr444 to YCbCr420 chrominance subsampling.
- RLP: This module performs rounding, range limiting and packing of the incoming data.

### 51.3.2 Image Sensor Controller Clock Domain Diagram

**Figure 51-3. Clock Domain Hierarchy**

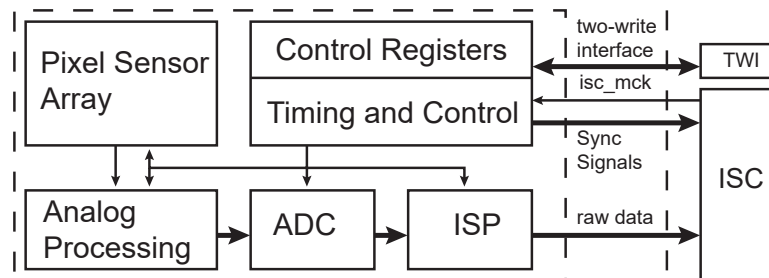

### 51.3.3 Image Sensor Controller Typical Use Cases

**Figure 51-4. Raw Bayer Sensor**

**Figure 51-5. Raw Bayer Sensor with Embedded Image Processor**

**Figure 51-6. BT656 Video Interface Sensor**

**Figure 51-7. Sensor with JPEG Output**

**Figure 51-8. Serial CMOS Sensor with External Parallel Bridge**

## 51.4 Product Dependencies

### 51.4.1 I/O Lines

The pins used for interfacing the ISC are multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the ISC pins to their peripheral function. If I/O lines of the ISC are not used by the application, they can be used for other purposes by the PIO controller.

### 51.4.2 Power Management

The peripheral clock is not continuously provided to the ISC. The programmer must first enable the ISC clock in the Power Management Controller (PMC) before using the ISC.

### 51.4.3 Interrupt Sources

The ISC interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the ISC interrupt requires the Interrupt Controller to be programmed first.

## 51.5 Functional Description

### 51.5.1 ISC Clock Management

The ISC module provides the `isc_mck` output clock to the image sensor. The `isc_mck` clock has three selectable clock sources (`ISC_CLKCFG.MCSEL`) and one programmable clock divider (`ISC_CLKCFG.MCDIV`). The clock is enabled using the `ISC_CLKEN.MCEN`. The `isc_mck` is driven by the ISC and is the external reference clock of the CMOS sensor.

**Figure 51-9. Clock Divider Block Diagram**

The ISC digital pipeline requires internally a functional clock named `isc_ispck`. This clock is also fully programmable. This `isc_ispck` is enabled using the `ISC_CLKEN.ICEN`. This clock is mandatory for ISC operation. The ISC module is designed to accept input signals that are asynchronous to the `isc_ispck`. Synchronization is done internally as long as the following relationship holds:

`isc_pck` frequency is less than or equal to `isc_ispck`, and `isc_ispck` is greater than or equal to `HCLOCK`.

**51.5.1.1 Software Requirement**

A software write operation to the `ISC_CLKEN` or `ISC_CLKDIS` register requires double clock domain synchronization and is not permitted when the `ISC_CLKSR.SIP` is asserted.

**51.5.2 Parallel Interface Timing Description**

The parallel interface protocol supports two operating modes.

**Figure 51-10. Free-Running Pixel Clock**

**Figure 51-11. Gated Pixel Clock**

**51.5.3 BT.601/656/1120 Embedded Timing Synchronization Operation**

The ISC module supports embedded synchronization decoding. When the ISC\_PFE\_CFG0.CCIR656 is set, the decoder is activated and signals **isc\_vsync** **isc\_hsync** are not used to decode the valid pixels. If the **CCIR10\_8N** is set, the bitstream is 10 bits wide, otherwise it is only 8 bits wide. When the **ISC\_PFE\_CFG0.CCIR\_CRC** is set, the decoder automatically corrects the error.

**Figure 51-12. Field/Segment Timing Relationship for Interlaced and Segmented Frame Systems**

**Figure 51-13. Frame Timing Relationship for Progressive Systems**

### 51.5.4 Parallel Interface External Sensor Connections

#### 51.5.4.1 YCbCr, 10-bit CCIR656 with Embedded Synchronization

This mode is activated when ISC\_PFE\_CFG0.CCIR656 and ISC\_PFE\_CFG0.CCIR10\_8N are both set.

Interface Bit	First Word	Second Word	Third Word	Fourth Word
isc_data[11](MSB)	1	0	0	1
isc_data[10]	1	0	0	F
isc_data[9]	1	0	0	V

### 51.5.5 Parallel Front End (PFE) Module

**Figure 51-14. PFE Block Diagram**

The Parallel Front End module performs data resampling across clock domain boundary. It includes a CCIR656 decoder used to convert a standard ITU-R BT.656 stream to 24-bit digital video. It also generates pixels, syncs flags and valid signals to the main video pipeline. It outputs field, video and synchronization signals. The PFE can optionally crop and limit the incoming pixel stream to a predefined horizontal and vertical value. By default, the PFE only relies on the cmos sensor horizontal and vertical reference to sample the incoming pixel stream. A pixel is sampled if, and only if, the vertical and horizontal synchronizations are valid and a pixel clock edge is detected. ISC\_PFE\_CFG0.BPS shows the number of bits per sample. The PFE module outputs a 12-bit data on the vp\_data[11:0] bus, and asserts the vp\_valid signal when the data can be sampled.

PFE VP_DATA Mapping	Raw Bayer 12-bit	Raw Bayer 10-bit	YUV422 8-bit	YUV422 10-bit	Mono 12-bit
VP_DATA[11]	RGGB[11]	RGGB[9]	YC422[7]	YC422[9]	Y[11]
VP_DATA[10]	RGGB[10]	RGGB[8]	YC422[6]	YC422[8]	Y[10]
VP_DATA[9]	RGGB[9]	RGGB[7]	YC422[5]	YC422[7]	Y[9]
VP_DATA[8]	RGGB[8]	RGGB[6]	YC422[4]	YC422[6]	Y[8]
VP_DATA[7]	RGGB[7]	RGGB[5]	YC422[3]	YC422[5]	Y[7]
VP_DATA[6]	RGGB[6]	RGGB[4]	YC422[2]	YC422[4]	Y[6]
VP_DATA[5]	RGGB[5]	RGGB[3]	YC422[1]	YC422[3]	Y[5]

.....continued

PFE VP_DATA Mapping	Raw Bayer 12-bit	Raw Bayer 10-bit	YUV422 8-bit	YUV422 10-bit	Mono 12-bit
VP_DATA[4]	RGGB[4]	RGGB[2]	YC422[0]	YC422[2]	Y[4]
VP_DATA[3]	RGGB[3]	RGGB[1]	YC422[7] or 0	YC422[1]	Y[3]
VP_DATA[2]	RGGB[2]	RGGB[0]	YC422[6] or 0	YC422[0]	Y[2]
VP_DATA[1]	RGGB[1]	RGGB[9] or 0	YC422[5] or 0	YC422[9] or 0	Y[1]
VP_DATA[0]	RGGB[0]	RGGB[8] or 0	YC422[4] or 0	YC422[8] or 0	Y[0]

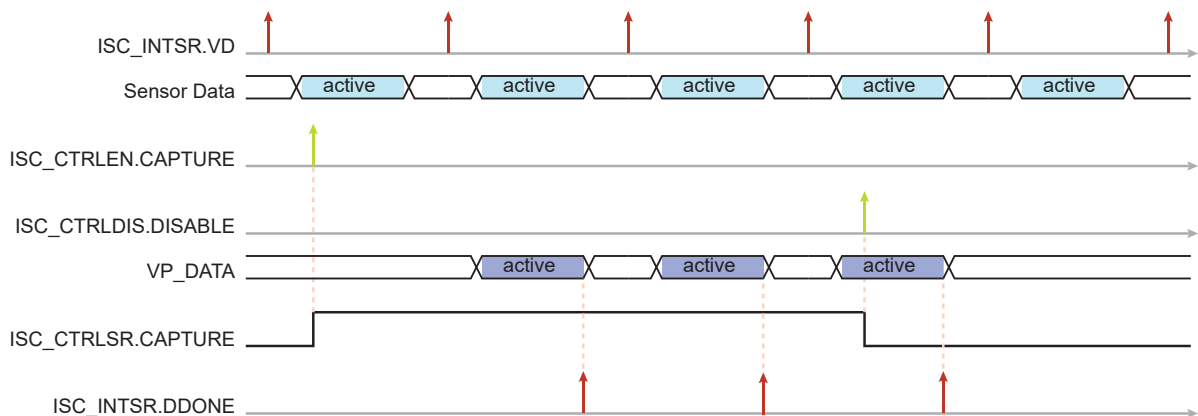

**Note:** When ISC\_PFE\_CFG0.REP is set, missing VP\_DATA LSBs are replaced with replicated LSBs of the incoming stream, otherwise they are forced to zero.

The PFE module also includes logic to synchronize capture request with the incoming pixel stream. Two operating modes are available: Single Shot and Continuous Acquisition. When the ISC\_PFE\_CFG0.CONT is cleared, the ISC transfers a single image to memory,

**Figure 51-15. Single Shot Mode**

**Figure 51-16. Continuous Acquisition Mode**

When Continuous Acquisition mode is activated (ISC\_PFE\_CFG0.CONT is set), the data transfer terminates when either a DMA end of list is reached, a software disable is performed or a software reset is activated. The ISC\_INTSR.DDONE is set at the end of the DMA data transfer.

**Figure 51-17. Continuous Acquisition, DMA Terminated**

The linked list DMA transfer is terminated when an item of the list is programmed with `ISC_DCTRL.DE` cleared or when `ISC_DNDA.NDA` is equal to zero. This configuration also clears `ISC_CTRLISR.CAPTURE` and sets the `ISC_INTSR.LDONE` interrupt flag.

The linked list DMA transfer starts if `ISC_DCTRL.DE` is set and if `ISC_DNDA.NDA` is different from zero.

### 51.5.5.1 Update the ISC Profile

Each ISC register is double-buffered to simplify the software configuration and the synchronization with the associated frame buffer. When the configuration of the ISC is modified, `ISC_CTRLLEN.UPPRO` must be set to transfer the configuration from the input buffer to the ISC video pipeline.

**Figure 51-18. Update Profile Timing Diagram**

### 51.5.5.2 Software Requirements

Writing to the `ISC_CTRLLEN` or `ISC_CTRLDIS` register requires a double domain synchronization, so it is forbidden to write these registers when `ISC_CTRLISR.SIP` is asserted.

### 51.5.6 White Balance (WB) Module

The White Balance (WB) module captures the `vp_data[11:0]` bus from the PFE module when the `vp_valid` signal is asserted, and it generates a `wb_data[11:0]` data along with its validity signal `wb_valid`. When `ISC_WB_CTRL.ENABLE` is set, each Bayer color component (R, Gr, B, Gb) can be manually adjusted using an offset and a gain. The Bayer pattern is adjustable using `ISC_WB_CFG.BAYCFG`.

**Figure 51-19. WB Block Diagram**

There are four {gain, offset} sets for each Bayer component. The output value is clipped.

ISC_WB_CTRL.ENABLE	WB_DATA Slice	Value
0	<code>wb_data[11:0]</code>	<code>vp_data[11:0]</code>
1	<code>wb_data[11:0]</code>	<code>clipped((vp_data[11:0]+offset)*gain)</code>

### 51.5.7 Color Filter Array (CFA) Interpolation Module

In a single-sensor system, each cell on the sensor has a specific color filter and microlens positioned above it. The raw data obtained from the sensor do not have the full R/G/B information at each cell position. Color interpolation is required to retrieve the missing components. The CFA module samples the `wb_data[11:0]` 12-bit bus when `wb_valid` is asserted and generates a 36-bit width data bus `cfa_data[35:0]` with the validity bit `cfa_valid`.

**Figure 51-20. CFA Block Diagram**

ISC_CFA_CTRL.ENABLE	CFA_DATA Slice	Value
0	<code>cfa_data[35:24]</code>	<code>wb_data[11:0]</code>
	<code>cfa_data[23:12]</code>	<code>wb_data[11:0]</code>
	<code>cfa_data[11:0]</code>	<code>wb_data[11:0]</code>
1	<code>cfa_data[35:24]</code>	R = <code>spatial_filter_R(wb_data[11:0])</code>
	<code>cfa_data[23:12]</code>	G = <code>spatial_filter_G(wb_data[11:0])</code>
	<code>cfa_data[11:0]</code>	B = <code>spatial_filter_B(wb_data[11:0])</code>

The filter kernel size is 5, and requires two additional lines to initialize the filter. When `ISC_CFA_CFG.EITPOL` is set, the missing information is interpolated from the nearest neighbor. If `ISC_CFA_CFG.EITPOL` is cleared, only valid pixels are used to initialize the filter kernel, but the output number of lines is less than the input number of lines. In that case, four lines are consumed to fill the kernel.

#### 51.5.7.1 Frame Size Requirement when Edge Interpolation is Off, `ISC_CFA_CFG.EITPOL` Cleared

- Minimum number of rows (in): 5
- Minimum number of columns (in): 5
- Number of rows after CFA: Number of rows (in) - 4

- Number of columns after CFA: Number of columns (in) - 4

### 51.5.7.2 Frame Size Requirement when Edge Interpolation is On, ISC\_CFA\_CFG.EITPOL Set

- Minimum number of rows (in): 3
- Minimum number of columns (in): 3
- Number of rows after CFA: Number of rows (in)
- Number of columns after CFA: Number of columns (in)

### 51.5.7.3 Bayer Mode and Edge Interpolation Description

When Edge Interpolation mode (ISC\_CFA\_CFG.EITPOL) is activated, dummy lines are generated using rows and columns replication.

The CFA module supports four sensor alignments using ISC\_CFA\_CFG.BAYCFG. See the figure below.

**Figure 51-21. Supported Color Filter Array Patterns**

### 51.5.8 Color Correction (CC) Module

RGB color correction is used to compensate for cross color bleeding in the filter used with the image sensor. The module samples the `cfa_data[35:0]` 36-bit bus when `cfa_valid` is asserted and generate a `cc_data[35:0]` 36-bit wide bus and a `cc_valid` signal.

**Figure 51-22. CC Block Diagram**

There are three {gain, offset} sets for color component R, G, B.

ISC_CC_CTRL.ENABLE	CC_DATA Slice	Value
0	cc_data[35:24]	cfa_data[11:0]
	cc_data[23:12]	cfa_data[11:0]
	cc_data[11:0]	cfa_data[11:0]
1	cc_data[35:24]	R=clipped(sum(cfa_data_x * gain_Rx) + offset_R)
	cc_data[23:12]	G=clipped(sum(cfa_data_x * gain_gx) + offset_g)
	cc_data[11:0]	B=clipped(sum(cfa_data_x * gain_Bx) + offset_B)

$$\begin{bmatrix} R \\ G \\ B \end{bmatrix} = \begin{bmatrix} RRGAIN & RGGAIN & RBGAIN \\ GRGAIN & GGGAIN & GBGAIN \\ BRGAIN & BGGAIN & BBGAIN \end{bmatrix} \times \begin{bmatrix} cfa\_data[35:24] \\ cfa\_data[23:12] \\ cfa\_data[11:0] \end{bmatrix} + \begin{bmatrix} ROFST \\ GOFST \\ BOFST \end{bmatrix}$$

### 51.5.9 Gamma Curve (GAM) Module

The GAM module samples the cc\_data[35:0] bus when cc\_valid is asserted, and generates gam\_data[29:0] 30-bit width data along with the validity signal gam\_valid. Imaging devices have non-linear characteristics, but the transfer function is approximated by a power function. The intensity of each of the linear RGB components is transformed to a non-linear signal through the use of the gamma correction submodule. The power function is linearly interpolated using 64 breakpoints. This also performs a 12-bit to 10-bit compression. The polynomial for the linear interpolation between breakpoints is  $i$  and  $i + 1$ . Consequently, for each breakpoint, two values are required: constant and slope. The table values are programmable through the user interface when the gamma correction module is disabled (ISC\_GAM\_CTRL.ENABLE is cleared). ISC\_GAM\_RENTRY is used for Red gamma correction. ISC\_GAM\_GENTRY is used for Green gamma correction. ISC\_GAM\_BENTRY is used for Blue gamma correction. Each table entry is composed of a 10-bit (signed) slope and a 10-bit constant.

**Figure 51-23. GAM Block Diagram**

ISC_GAM_CTRL.ENABLE	ISC_GAM_CTRL.XLUT	GAM_DATA Slice	Value
0	0	gam_data[29:0]	cc_data[29:0]
1	0	gam_data[29:20]	cc_data[35:26]
		gam_data[19:10]	cc_data[23:14]
		gam_data[9:0]	cc_data[11:2]
1	1	gam_data[29:20]	R=piecewise_itpol(cc_data_r[35:24])
		gam_data[19:10]	G=piecewise_itpol(cc_data_r[23:12])
		gam_data[9:0]	B=piecewise_itpol(cc_data_r[11:0])

**Figure 51-24. Piecewise Linear Interpolation Block Diagram**

The interpolation consists of three tables that store the function values GAM\_XENTRY[0:63] where X stands for R, G and B. The input of the table has six bits. It outputs a slope and a constant. The slope is later multiplied by the data lsb (6-bit) and added to a constant. The final value is the gamma-corrected value of the input. This module performs a 12-to-10 compression.

### 51.5.10 Color Space Conversion (CSC) Module

By converting an image from RGB to YCbCr color space, it is possible to separate Y, Cb and Cr information. The CSC samples the gam\_data[29:0] 30-bit data bus, extracts YCbCr information from the sampled data, and then generates the color-converted data csc\_data[29:0] and the validity signal csc\_valid.

**Figure 51-25. CSC Block Diagram**

ISC_CSC_CTRL.ENABLE	CSC_DATA Slice	Value
0	csc_data[29:0]	gam_data[29:0]
1	csc_data[29:20]	$Y = \text{clipped}(\text{sum}(\text{gam\_data\_x} * \text{gain\_Yx}) + \text{offset\_y} \ll 2)$
	csc_data[19:10]	$Cb = \text{clipped}(\text{sum}(\text{gam\_data\_x} * \text{gain\_Cbx}) + \text{offset\_cb} \ll 2)$
	csc_data[9:0]	$Cr = \text{clipped}(\text{sum}(\text{gam\_data\_x} * \text{gain\_Crx}) + \text{offset\_cr} \ll 2)$

$$\begin{bmatrix} Y \\ CB \\ CR \end{bmatrix} = \begin{bmatrix} YR & YG & YB \\ CBR & CBG & CBB \\ CRR & CRG & CRB \end{bmatrix} \times \begin{bmatrix} \text{gam\_data}[29:20] \\ \text{gam\_data}[19:10] \\ \text{gam\_data}[9:0] \end{bmatrix} + \begin{bmatrix} \text{YOFST} \\ \text{CBOFST} \\ \text{CROFST} \end{bmatrix}$$

### 51.5.11 Contrast and Brightness

Luminance is adjusted through the use of Brightness Offset and Contrast Gain. Chrominance is left unchanged. The CBC samples the csc\_data[29:0] 30-bit bus when csc\_valid is asserted and generates cbc\_data[29:0] with the validity signal cbc\_valid.

**Figure 51-26. CBC Block Diagram**

ISC_CBC_CTRL.ENABLE	ISC_CBC_CFG.CCIR	CBC_DATA Slice	Value
0	0	cbc_data[29:0]	csc_data[29:0]
1	0	cbc_data[29:20]	$Y = \text{clipped}((\text{csc\_data}[29:20] + \text{offset}) * \text{gain})$
		cbc_data[19:10]	$C_b = \text{csc\_data}[19:10]$
		cbc_data[9:0]	$C_r = \text{csc\_data}[9:0]$
1	1	cbc_data[29:10]	0
		cbc_data[9:0]	ccir656 stream with luminance correction

### 51.5.12 4:4:4 To 4:2:2 Chrominance Horizontal Subampler (SUB422) Module

The color space conversion output stream is a full-bandwidth YCbCr 4:4:4 signal. The chrominance subsampling divides the horizontal chrominance sampling rate by two. A horizontal low pass filter is applied to avoid aliasing effect. The SUB422 module samples 444 full scale YCbCr cbc\_data[29:0] 30-bit data, performs horizontal subsampling and generates the sub422\_data[39:0] 40-bit data bus with its validity signal sub422\_valid.

**Figure 51-27. SUB422 Block Diagram**

ISC_SUB422_CTRL.ENABLE	ISC_SUB422_CFG.CCIR	SUB422_DATA Slice	Value
0	0	sub422_data[29:0]	cbc_data[29:0]
1	0	sub422_data[39:30]	$Y_1 = \text{cbc\_data}[29:20]$
		sub422_data[29:20]	$Y_0 = \text{cbc\_data}[29:20]$
		sub422_data[19:10]	$C_b = \text{filter\_hor}(\text{cbc\_data}[19:10])$
		sub422_data[9:0]	$C_r = \text{filter\_hor}(\text{cbc\_data}[9:0])$

.....continued

ISC_SUB422_CTRL.ENABLE	ISC_SUB422_CFG.CCIR	SUB422_DATA Slice	Value
1	1	sub422_data[39:30]	Y1 = cbc_data[9:0]
		sub422_data[29:20]	Y0 = cbc_data[9:0]
		sub422_data[19:10]	Cb = cbc_data[9:0]
		sub422_data[9:0]	Cr = cbc_data[9:0]

The filter\_hor function included in the sub422 module is the chrominance horizontal filter.

sub422 data slice	YCbCr mapping
sub422_data[39:30]	Y1 (sample n)
sub422_data[29:20]	Y0 (sample n-1)
sub422_data[19:10]	Cb (from filter)
sub422_data[9:0]	Cr (from filter)

The filter chrominance position is selectable through the use of ISC\_SUB422\_CFG.FILTER.

**Figure 51-28. Cosited Filter Configuration**

**Figure 51-29. Centered Filter Configuration**

The SUB422 module performs luminance and chrominance packing. When the line length is odd, the missing luminance is a copy of the last but one luminance. It also means that the final dma stream written to memory is equal to the original horizontal size plus one when the line length is odd.

SUB422_DATA Slice	Line Length Even	Line Length Odd
sub422_data[39:30]	Y(n)	Y(n-1)
sub422_data[29:20]	Y(n-1)	Y(n-1)
sub422_data[19:10]	Cb (filtered)	Cb (filtered)
sub422_data[9:0]	Cr (filtered)	Cr (filtered)

### 51.5.13 4:2:2 To 4:2:0 Chrominance Vertical Subampler (SUB420) Module

The chrominance subsampling divides the vertical chrominance sampling rate by two. A vertical low pass filter is applied to avoid aliasing effect. Two different filters are used when the source frame is interlaced, and the filter configuration depends on the field value (the field is propagated in the video pipeline).

**Figure 51-30. SUB420 Block Diagram**

The SUB420 module samples the sub422\_data[39:0] 40-bit data when sub422\_valid is asserted, then it performs a vertical subsampling and generates a valid sub420\_data[39:0] 40-bit word and the corresponding sub420\_valid signal.

ISC_CFA_CTRL.ENABLE	SUB420_DATA Slice	Value
0	sub420_data[39:0]	sub422_data[39:0]
1	sub420_data[39:30]	Y1 = sub422_data[39:30]
	sub420_data[29:20]	Y0 = sub422_data[29:20]
	sub420_data[19:10]	Cb = filter_ver(sub422[19:10])
	sub420_data[9:0]	Cr = filter_ver(sub422[9:0])

The vertical filter is a two-tap filter; for progressive content the coefficient  $i$  {1, 1}. When an interlaced field is downsampled, the coefficients are different between the top and the bottom fields.

**Figure 51-31. Vertical Chrominance Filter for Progressive Content (Cosited Chrominance Example)**

**Figure 51-32. Field-dependent Chrominance Filter for Interlaced Content (Cosited Chrominance Example)**

**Table 51-1. Filter Configuration**

ISC_SUB420_CTRL.FILTER	Field	Filter Configuration
0	progressive	{1, 1}
1	0 (TOP)	{3, 1}
	1 (BOTTOM)	{1, 3}

**Table 51-2. Output Line Length Configuration**

SUB420 Input Number of Rows	SUB420 Luminance Rows	SUB420 Chrominance Rows
M rows, M odd	M rows	(M+1)/2 rows
M rows, M even	M rows	M/2 rows

### 51.5.14 Rounding, Limiting and Packing (RLP) Module

This module is used to round, limit and pack in the incoming pixel stream before the DMA master module. The RLP samples the sub420\_data[39:0] 40-bit data bus and generates rlp\_data[31:0] 32-bit data words with the associated validity signal rlp\_valid.

**Figure 51-33. RLP Block Diagram**

ISC_RLP_CFG	RLP_DATA Slice	Value
DAT8	rlp_data[31:8]	0
	rlp_data[7:0]	sub420_data[11:4]
DAT9	rlp_data[31:9]	0
	rlp_data[8:0]	sub420_data[11:3]
DAT10	rlp_data[31:10]	0
	rlp_data[9:0]	sub420_data[11:2]

### 51.5.15 DMA Interface

The descriptor-based DMA interface supports multiple buffers. A DMA stride value shows the offset between two consecutive lines (in bytes). If the stride is set to zero, the frame buffer is contiguous. When ISC\_DCTRL.WB is set (Write Back), the DMA interface performs a single write operation to the ISC\_DCTRL register, and sets ISC\_DCTRL[7] to one and ISC\_DCTRL[6] to the value of the frame field when interlaced content is being used. That means that interlaced fields are tagged with their relevant field values. The Write Back operation is always performed when the whole frame has been transferred to memory.

**Figure 51-34. DMA Engine Block Diagram**

ISC_DCFG.IMODE	DMA Engine Input Data
PACKED8	rlp_data[7:0]
PACKED16	rlp_data[15:0]
PACKED32	rlp_data[31:0]
YC422SP	rlp_data[31:0]
YC422P	rlp_data[31:0]
YC420SP	rlp_data[31:0]
YC420P	rlp_data[31:0]

When a bus error is detected, an interrupt flag is set. If the error occurs on a write operation, ISC\_INTSR.WERR is asserted. If the error occurs on a read operation, ISC\_INTSR.RERR is asserted. ISC\_INTSR.WERRID gives details on the first error channel identifier.

### 51.5.15.1 Descriptor Memory Address Mapping

YC420P	Y address	Cb address	Cr address

### 51.5.15.2 Descriptor Memory Mapping

Three descriptor views are available. Descriptor view 0 is used when the pixel or data stream is packed. Descriptor view 1 is used for YCbCr semi-planar pixel stream. Descriptor view 2 is used for YCbCr planar pixel stream.

### 51.5.16 Histogram Module

For each possible pixel value, the histogram counts the number of times the value was encountered in the current image. RGG B Bayer, RAW data or luminance histogram are available. There are 512 entries

in the histogram entries, and each histogram bin can count up to  $2^{20}$  data. As the table entries are limited, each bin is actually a range, i.e., least significant bits are ignored. A write to `ISC_CTRLLEN.HISREQ` initiates a new histogram. The counting operation ends when `ISC_INTSR.HISDONE` is set. At that time, a software or hardware dma transfer copies the table from the interface to the internal or external memory. To clear the table content (for a new operation), use `ISC_CTRLLEN.HISCLR`. An automatic clear (reset after read) is available when `ISC_HIS_CFG.RAR` is set. In that case, as soon as the data is read from the table, the table entry is cleared.

### 51.6.1 ISC Control Enable Register 0

**Name:** ISC\_CTRLLEN  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding command.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
							FUPPRO	
Access							W	
Reset							–	
Bit	7	6	5	4	3	2	1	0
					HISCLR	HISREQ	UPPRO	CAPTURE
Access					W	W	W	W
Reset					–	–	–	–

**Bit 9 – FUPPRO** Force Update Color Profile

**Bit 3 – HISCLR** Histogram Clear

**Bit 2 – HISREQ** Histogram Request

**Bit 1 – UPPRO** Update Profile

**Bit 0 – CAPTURE** Capture Input Stream Command

### 51.6.2 ISC Control Disable Register 0

**Name:** ISC\_CTRLDIS  
**Offset:** 0x04  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Performs the corresponding command.

**Bit 8 – SWRST** Software Reset

**Bit 0 – DISABLE** Capture Disable

### 51.6.3 ISC Control Status Register 0

**Name:** ISC\_CTRLISR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24	
	SIP								
Access	R								
Reset	0								
Bit	23	22	21	20	19	18	17	16

Bit	7	6	5	4	3	2	1	0	
				FIELD		HISREQ	UPPRO	CAPTURE	
Access				R			R	R	R
Reset				0			0	0	0

#### Bit 31 – SIP Synchronization In Progress

Value	Description
0	The double domain synchronization is terminated.
1	The double domain synchronization is in progress.

#### Bit 4 – FIELD Field Status (only relevant when the video stream is interlaced)

Value	Description
0	The current field/segment is a top field
1	The current field/segment is a bottom field.

#### Bit 2 – HISREQ Histogram Request Pending

Value	Description
0	There is no histogram pending request.
1	Indicates that the histogram request is still pending.

#### Bit 1 – UPPRO Profile Update Pending

Value	Description
0	There is no profile update pending request.
1	Indicates that the profile update request is still pending.

**Bit 0 – CAPTURE** Capture pending

Value	Description
0	Capture mode is disabled.
1	Capture is pending.

### 51.6.4 ISC Parallel Front End Configuration 0 Register

**Name:** ISC\_PFE\_CFG0  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bit 31 – REP Up Multiply with Replication

Value	Description
0	Unused bits are stuck at 0.
1	Unused bits are copied from MSB.

#### Bits 30:28 – BPS[2:0] Bits Per Sample

Value	Name	Description
0	TWELVE	12-bit input
1	ELEVEN	11-bit input
2	TEN	10-bit input
3	NINE	9-bit input
4	EIGHT	8-bit input

#### Bit 27 – CCIR\_REP CCIR Replication

Value	Description
0	Unused bits are stuck at 0.
1	Unused bits are copied from MSB.

#### Bits 23:16 – SKIPCNT[7:0] Frame Skipping Counter

**Bit 13 – ROWEN** Row Cropping Enable

Value	Description
0	Row Cropping is disabled.
1	Row Cropping is enabled.

**Bit 12 – COLEN** Column Cropping Enable

Value	Description
0	Column Cropping is disabled.
1	Column Cropping is enabled.

**Bit 11 – CCIR10\_8N** CCIR 10 bits or 8 bits

Value	Description
0	8-bit mode.
1	10-bit mode.

**Bit 10 – CCIR\_CRC** CCIR656 CRC Decoder

Value	Description
0	Embedded CRC is discarded.
1	Embedded CRC is decoded.

**Bit 9 – CCIR656** CCIR656 input mode

Value	Description
0	HSYNC and VSYNC signals are used to synchronize the input stream.
1	Embedded synchronization is used.

**Bit 8 – GATED** Gated input clock

Value	Description
0	The external pixel clock is free running.
1	The external pixel clock is gated.

**Bit 7 – CONT** Continuous Acquisition

Value	Description
0	Single Shot mode.
1	Video mode.

**Bits 6:4 – MODE[2:0]** Parallel Front End Mode

Value	Name	Description
0	PROGRESSIVE	Video source is progressive.
1	DF_TOP	Video source is interlaced, two fields are captured starting with top field.
2	DF_BOTTOM	Video source is interlaced, two fields are captured starting with bottom field.
3	DF_IMMEDIATE	Video source is interlaced, two fields are captured immediately.
4	SF_TOP	Video source is interlaced, one field is captured starting with the top field.

# SAMA5D2 Series

## Image Sensor Controller (ISC)

Value	Name	Description
5	SF_BOTTOM	Video source is interlaced, one field is captured starting with the bottom field.
6	SF_IMMEDIATE	Video source is interlaced, one field is captured starting immediately.

### Bit 3 – FPOL Field Polarity

Value	Description
0	Top field is sampled when F value is 0; Bottom field is sampled when F value is 1.
1	Top field is sampled when F value is 1; Bottom field is sampled when F value is 0.

### Bit 2 – PPOL Pixel Clock Polarity

Value	Description
0	The pixel stream is sampled on the rising edge of the pixel clock.
1	The pixel stream is sampled on the falling edge of the pixel clock.

### Bit 1 – VPOL Vertical Synchronization Polarity

Value	Description
0	VSYNC signal is active high, i.e. valid pixels are sampled when VSYNC is asserted.
1	VSYNC signal is active low, i.e. valid pixels are sampled when VSYNC is deasserted.

### Bit 0 – HPOL Horizontal Synchronization Polarity

Value	Description
0	HSYNC signal is active high, i.e. valid pixels are sampled when HSYNC is asserted.
1	HSYNC signal is active low, i.e. valid pixels are sampled when HSYNC is deasserted.

### 51.6.5 ISC Parallel Front End Configuration 1 Register

**Name:** ISC\_PFE\_CFG1  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	COLMAX[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	COLMAX[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	COLMIN[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	COLMIN[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:16 – COLMAX[15:0]** Column Maximum Limit  
 Horizontal ending position of the cropping area.

**Bits 15:0 – COLMIN[15:0]** Column Minimum Limit  
 Horizontal starting position of the cropping area.

### 51.6.6 ISC Parallel Front End Configuration 2 Register

**Name:** ISC\_PFE\_CFG2  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
ROWMAX[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
ROWMAX[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

ROWMIN[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
ROWMIN[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:16 – ROWMAX[15:0]** Row Maximum Limit  
 Vertical ending position of the cropping area.

**Bits 15:0 – ROWMIN[15:0]** Row Minimum Limit  
 Vertical starting position of the cropping area.

### 51.6.7 ISC Clock Enable Register

**Name:** ISC\_CLKEN  
**Offset:** 0x18  
**Reset:** –  
**Property:** Write-only

#### Bit 1 – MCEN Master Clock Enable

Value	Description
0	No effect.
1	Enables the master clock.

#### Bit 0 – ICEN ISP Clock Enable

Value	Description
0	No effect.
1	Enables the ISP clock.

### 51.6.8 ISC Clock Disable Register

**Name:** ISC\_CLKDIS  
**Offset:** 0x1C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Performs the corresponding command.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
							MCSWRST	ICSWRST
Access							W	W
Reset							–	–
Bit	7	6	5	4	3	2	1	0
							MCDIS	ICDIS
Access							W	W
Reset							–	–

**Bit 9 – MCSWRST** Master Clock Software Reset

**Bit 8 – ICSWRST** ISP Clock Software Reset

**Bit 1 – MCDIS** Master Clock Disable

**Bit 0 – ICDIS** ISP Clock Disable

### 51.6.9 ISC Clock Status Register

**Name:** ISC\_CLKSR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	SIP							
Access	R							
Reset	0							
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
							MCSR	ICSR
Access							R	R
Reset							0	0

#### Bit 31 – SIP Synchronization In Progress

Value	Description
0	The double domain synchronization operation is over.
1	The double domain synchronization operation is in progress.

#### Bit 1 – MCSR Master Clock Status Register

Value	Description
0	The master clock is disabled.
1	The master clock is enabled.

#### Bit 0 – ICSR ISP Clock Status Register

Value	Description
0	The ISP clock is disabled.
1	The ISP clock is enabled.

### 51.6.10 ISC Clock Configuration Register

**Name:** ISC\_CLKCFG  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24	
							MCSEL[1:0]		
Access							R/W	R/W	
Reset							0	0	
Bit	23	22	21	20	19	18	17	16	
	MCDIV[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	
								ICSEL	
Access								R/W	
Reset								0	
Bit	7	6	5	4	3	2	1	0	
	ICDIV[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	0	

#### Bits 25:24 – MCSEL[1:0] Master Clock Reference Clock Selection

Value	Description
0	HCLOCK is selected.
1	ISCCLK is selected.
2	GCK is selected.

#### Bits 23:16 – MCDIV[7:0] Master Clock Divider

$$f_{mc} = \frac{f_{mcref}}{MCDIV + 1}$$

#### Bit 8 – ICSEL ISP Clock Selection

Value	Description
0	HCLOCK is selected.
1	ISCCLK is selected.

#### Bits 7:0 – ICDIV[7:0] ISP Clock Divider

$$f_{cc} = \frac{f_{ccref}}{ICDIV + 1}$$

### 51.6.11 ISC Interrupt Enable Register

**Name:** ISC\_INTEN  
**Offset:** 0x28  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the interrupt.

	Bit	31	30	29	28	27	26	25	24
					CCIRERR	HDTO	VDTO	DAOV	VFPOV
Access					W	W	W	W	W
Reset					–	–	–	–	–
	Bit	23	22	21	20	19	18	17	16

Reset				–	–			–	–

**Bit 28 – CCIRERR** CCIR Decoder Error Interrupt Enable

**Bit 27 – HDTO** Horizontal Synchronization Timeout Interrupt Enable

**Bit 26 – VDTO** Vertical Synchronization Timeout Interrupt Enable

**Bit 25 – DAOV** Data Overflow Interrupt Enable

**Bit 24 – VFPOV** Vertical Front Porch Overflow Interrupt Enable

**Bit 20 – RERR** Read Channel Error Interrupt Enable

**Bit 16 – WERR** Write Channel Error Interrupt Enable

**Bit 13 – HISCLR** Histogram Clear Interrupt Enable

**Bit 12 – HISDONE** Histogram Completed Interrupt Enable

**Bit 9 – LDONE** DMA List Done Interrupt Enable

**Bit 8 – DDONE** DMA Done Interrupt Enable

**Bit 5 – DIS** Disable Completed Interrupt Enable

**Bit 4 – SWRST** Software Reset Completed Interrupt Enable

**Bit 1 – HD** Horizontal Synchronization Detection Interrupt Enable

**Bit 0 – VD** Vertical Synchronization Detection Interrupt Enable

### 51.6.12 ISC Interrupt Disable Register

**Name:** ISC\_INTDIS  
**Offset:** 0x2C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the interrupt.

	Bit	31	30	29	28	27	26	25	24
					CCIRERR	HDTO	VDTO	DAOV	VFPOV
Access					W	W	W	W	W
Reset					–	–	–	–	–

**Bit 28 – CCIRERR** CCIR Decoder Error Interrupt Disable

**Bit 27 – HDTO** Horizontal Synchronization Timeout Interrupt Disable

**Bit 26 – VDTO** Vertical Synchronization Timeout Interrupt Disable

**Bit 25 – DAOV** Data Overflow Interrupt Disable

**Bit 24 – VFPOV** Vertical Front Porch Overflow Interrupt Disable

**Bit 20 – RERR** Read Channel Error Interrupt Disable

**Bit 16 – WERR** Write Channel Error Interrupt Disable

**Bit 13 – HISCLR** Histogram Clear Interrupt Disable

**Bit 12 – HISDONE** Histogram Completed Interrupt Disable

**Bit 9 – LDONE** DMA List Done Interrupt Disable

**Bit 8 – DDONE** DMA Done Interrupt Disable

**Bit 5 – DIS** Disable Completed Interrupt Disable

**Bit 4 – SWRST** Software Reset Completed Interrupt Disable

**Bit 1 – HD** Horizontal Synchronization Detection Interrupt Disable

**Bit 0 – VD** Vertical Synchronization Detection Interrupt Disable

### 51.6.13 ISC Interrupt Mask Register

**Name:** ISC\_INTMASK  
**Offset:** 0x30  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The interrupt is disabled.

1: The interrupt is enabled.

	Bit	31	30	29	28	27	26	25	24
					CCIRERR	HDTO	VDTO	DAOV	VFPOV
Access					R	R	R	R	R
Reset					0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
					RERR				WERR
Access					R				R
Reset					0				0
	Bit	15	14	13	12	11	10	9	8
				HISCLR	HISDONE			LDONE	DDONE

Reset				0	0			0	0
	Bit	7	6	5	4	3	2	1	0
				DIS	SWRST			HD	VD
Access				R	R			R	R
Reset				0	0			0	0

**Bit 28 – CCIRERR** CCIR Decoder Error Interrupt Mask

**Bit 27 – HDTO** Horizontal Synchronization Timeout Interrupt Mask

**Bit 26 – VDTO** Vertical Synchronization Timeout Interrupt Mask

**Bit 25 – DAOV** Data Overflow Interrupt Mask

**Bit 24 – VFPOV** Vertical Front Porch Overflow Interrupt Mask

**Bit 20 – RERR** Read Channel Error Interrupt Mask

**Bit 16 – WERR** Write Channel Error Interrupt Mask

**Bit 13 – HISCLR** Histogram Clear Interrupt Mask

**Bit 12 – HISDONE** Histogram Completed Interrupt Mask

**Bit 9 – LDONE** DMA List Done Interrupt Mask

**Bit 8 – DDONE** DMA Done Interrupt Mask

**Bit 5 – DIS** Disable Completed Interrupt Mask

**Bit 4 – SWRST** Software Reset Completed Interrupt Mask

**Bit 1 – HD** Horizontal Synchronization Detection Interrupt Mask

**Bit 0 – VD** Vertical Synchronization Detection Interrupt Mask

### 51.6.14 ISC Interrupt Status Register

**Name:** ISC\_INTSR  
**Offset:** 0x34  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
				CCIRERR	HDTO	VDTO	DAOV	VFPOV
Access				R	R	R	R	R
Reset				0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
				RERR		WERRID[1:0]		WERR
Access				R		R	R	R
Reset				0		0	0	0
Bit	15	14	13	12	11	10	9	8
			HISCLR	HISDONE			LDONE	DDONE
Access			R	R			R	R
Reset			0	0			0	0
Bit	7	6	5	4	3	2	1	0
			DIS	SWRST			HD	VD
Access			R	R			R	R
Reset			0	0			0	0

**Bit 28 – CCIRERR** CCIR Decoder Error Interrupt (cleared on read)

Value	Description
0	No CCIR CRC error detected since the last read of the Interrupt Status register.
1	A CCIR CRC error has been detected.

**Bit 27 – HDTO** Horizontal Synchronization Timeout Interrupt (cleared on read)

Value	Description
0	A horizontal synchronization is detected.
1	No horizontal synchronization is detected.

**Bit 26 – VDTO** Vertical Synchronization Timeout Interrupt (cleared on read)

Value	Description
0	A vertical synchronization is detected.
1	No vertical synchronization is detected.

**Bit 25 – DAOV** Data Overflow Interrupt (cleared on read)

Value	Description
0	No data overflow error occurred since the last reset of the Interrupt Status register.
1	A data overflow occurred.

**Bit 24 – VFPOV** Vertical Front Porch Overflow Interrupt (cleared on read)

Value	Description
0	No vertical front porch error occurred since the last read of the Interrupt Status register.
1	The vertical synchronization has been detected but the DMA channel is still busy.

**Bit 20 – RERR** Read Channel Error Interrupt (cleared on read)

Value	Description
0	No read channel error since the last read of the Interrupt Status register.
1	A read channel error occurred when the ISC read the descriptor.

**Bits 18:17 – WERRID[1:0]** Write Channel Error Identifier (cleared on read)

Value	Name	Description
0	CH0	An error occurred for Channel 0 (RAW/RGB/Y)
1	CH1	An error occurred for Channel 1 (CbCr/Cb)
2	CH2	An error occurred for Channel 2 (Cr)
3	WB	Write back channel error

**Bit 16 – WERR** Write Channel Error Interrupt (cleared on read)

Value	Description
0	No write channel error since the last read of the Interrupt Status register.
1	A write channel error occurred.

**Bit 13 – HISCLR** Histogram Clear Interrupt (cleared on read)

Value	Description
0	No Histogram Clear Interrupt has been raised since the last read of the Interrupt Status register.
1	The Histogram Clear Interrupt has occurred.

**Bit 12 – HISDONE** Histogram Completed Interrupt (cleared on read)

Value	Description
0	No Histogram Completed Interrupt has been raised since the last read of the Interrupt Status register.
1	The Histogram Completed Interrupt has occurred.

**Bit 9 – LDONE** DMA List Done Interrupt (cleared on read)

Value	Description
0	No DMA List Done Interrupt has occurred since the last read of the Interrupt Status register.
1	The DMA List Done Interrupt has occurred.

**Bit 8 – DDONE** DMA Done Interrupt (cleared on read)

Value	Description
0	No DMA Transfer Done Interrupt has occurred since the last read of the Interrupt Status register.
1	The DMA Transfer Done Interrupt has occurred.

**Bit 5 – DIS** Disable Completed Interrupt (cleared on read)

Value	Description
0	The disable has not occurred since the last read of the Interrupt Status register.
1	The disable has completed.

**Bit 4 – SWRST** Software Reset Completed Interrupt (cleared on read)

Value	Description
0	No software reset completion since the last read of the Interrupt Status register.
1	The software reset has completed.

**Bit 1 – HD** Horizontal Synchronization Detected Interrupt (cleared on read)

Value	Description
0	No horizontal synchronization detection since the last read of the Interrupt Status register.
1	A horizontal synchronization has been detected.

**Bit 0 – VD** Vertical Synchronization Detected Interrupt (cleared on read)

Value	Description
0	No vertical synchronization detection since the last read of the Interrupt Status register.
1	A vertical synchronization has been detected.

### 51.6.15 ISC White Balance Control Register

**Name:** ISC\_WB\_CTRL  
**Offset:** 0x58  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – ENABLE** White Balance Enable

Value	Description
0	The white balance is disabled.
1	The white balance is enabled.

### 51.6.16 ISC White Balance Configuration Register

**Name:** ISC\_WB\_CFG  
**Offset:** 0x5C  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 1:0 – BAYCFG[1:0] White Balance Bayer Configuration (Pixel Color Pattern)

Value	Name	Description
0	GRGR	Starting Row configuration is G R G R (Red Row).
1	RGRG	Starting Row configuration is R G R G (Red Row).
2	GBGB	Starting Row configuration is G B G B (Blue Row).
3	BGBG	Starting Row configuration is B G B G (Blue Row).

### 51.6.17 ISC White Balance Offset for R, GR Register

**Name:** ISC\_WB\_O\_RGR  
**Offset:** 0x60  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
				GROFST[12:8]				
Access				R/W	R/W	R/W	R/W	R/W
Reset				0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	GROFST[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	BGAIN[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 28:16 – GBGAIN[12:0]** Green Component (Blue row) Gain (unsigned 13 bits, 0:4:9)

**Bits 12:0 – BGAIN[12:0]** Blue Component Gain (unsigned 13 bits, 0:4:9)

### 51.6.21 ISC Color Filter Array Control Register

**Name:** ISC\_CFA\_CTRL  
**Offset:** 0x70  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – ENABLE** Color Filter Array Interpolation Enable

Value	Description
0	Color Filter Array Interpolation is disabled.
1	Color Filter Array Interpolation is enabled.

### 51.6.22 ISC Color Filter Array Configuration Register

**Name:** ISC\_CFA\_CFG  
**Offset:** 0x74  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bit 4 – EITPOL Edge Interpolation

Value	Description
0	Edges are not interpolated.
1	Edge interpolation is performed.

#### Bits 1:0 – BAYCFG[1:0] Color Filter Array Pattern

Value	Name	Description
0	GRGR	Starting row configuration is G R G R (red row).
1	RGRG	Starting row configuration is R G R G (red row).
2	GBGB	Starting row configuration is G B G B (blue row).
3	BGBG	Starting row configuration is B G B G (blue row).

### 51.6.23 ISC Color Correction Control Register

**Name:** ISC\_CC\_CTRL  
**Offset:** 0x78  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – ENABLE** Color Correction Enable

Value	Description
0	Color correction is disabled.
1	Color correction is enabled.

### 51.6.24 ISC Color Correction RR RG Register

**Name:** ISC\_CC\_RR\_RG  
**Offset:** 0x7C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	RGGAIN[11:8]							
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	23	22	21	20	19	18	17	16

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 28:16 – BOFST[12:0]** Blue Component Offset (signed 13 bits, 1:12:0)

**Bits 11:0 – BBGAIN[11:0]** Blue Gain for Blue Component (signed 12 bits, 1:3:8)

### 51.6.30 ISC Gamma Correction Control Register

**Name:** ISC\_GAM\_CTRL  
**Offset:** 0x94  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bit 4 – BIPART Bipartite Table Configuration

Value	Description
0	Bipartite table is disabled. There are 64 points of interpolation from 0 to 4095.
1	Bipartite table is enabled. There are 32 points of interpolation (spacing is 8) from 0 to 255, then there are 30 points of interpolation from 256 to 4095.

#### Bit 3 – RENABLE Gamma Correction Enable for R Channel

Value	Description
0	12-bit to 10-bit compression is performed skipping two bits.
1	Piecewise interpolation is used to perform 12-bit to 10-bit compression for the red channel.

#### Bit 2 – GENABLE Gamma Correction Enable for G Channel

Value	Description
0	12-bit to 10-bit compression is performed skipping two bits.
1	Piecewise interpolation is used to perform 12-bit to 10-bit compression for the green channel.

#### Bit 1 – BENABLE Gamma Correction Enable for B Channel

# SAMA5D2 Series

## Image Sensor Controller (ISC)

---

---

Value	Description
0	12-bit to 10-bit compression is performed skipping two bits.
1	Piecewise interpolation is used to perform 12-bit to 10-bit compression for the blue channel.

**Bit 0 – ENABLE** Gamma Correction Enable

Value	Description
0	Gamma correction is disabled.
1	Gamma correction is enabled.

### 51.6.31 ISC Gamma Correction Blue Entry Register x [x=0..63]

**Name:** ISC\_GAM\_BENTRYx  
**Offset:** 0x98 + x\*0x04 [x=0..63]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

**Bits 26:16 – CROFST[10:0]** Red Chrominance Offset (signed 11 bits 1:10:0)

**Bits 11:0 – CRBGAIN[11:0]** Blue Gain for Red Chrominance (signed 12 bits 1:3:8)

### 51.6.41 ISC Contrast And Brightness Control Register

**Name:** ISC\_CBC\_CTRL  
**Offset:** 0x3B4  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – ENABLE** Contrast and Brightness Control Enable

Value	Description
0	Contrast and brightness control are disabled.
1	Contrast and brightness control are enabled.

### 51.6.42 ISC Contrast And Brightness Configuration Register

**Name:** ISC\_CBC\_CFG  
**Offset:** 0x3B8  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 2:1 – CCIRMODE[1:0] CCIR656 Byte Ordering

Value	Name	Description
0	CBY	Byte ordering Cb0, Y0, Cr0, Y1
1	CRY	Byte ordering Cr0, Y0, Cb0, Y1
2	YCB	Byte ordering Y0, Cb0, Y1, Cr0
3	YCR	Byte ordering Y0, Cr0, Y1, Cb0

#### Bit 0 – CCIR CCIR656 Stream Enable

Value	Description
0	Raw mode.
1	CCIR656 stream.

### 51.6.43 ISC Contrast And Brightness, Brightness Register

**Name:** ISC\_CBC\_BRIGHT  
**Offset:** 0x3BC  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

	BRIGHT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 10:0 – BRIGHT[10:0]** Image Brightness Control (signed 11 bits 1:10:0)  
 Brightness value is added or subtracted from the luminance Y data.

### 51.6.44 ISC Contrast And Brightness, Contrast Register

**Name:** ISC\_CBC\_CONTRAST  
**Offset:** 0x3C0  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
					CONTRAST[11:8]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CONTRAST[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 11:0 – CONTRAST[11:0]** Contrast (unsigned 12 bits 0:4:8)  
 Adjusts the image contrast by multiplying with YCbCr data.

### 51.6.45 ISC Subsampling 4:4:4 to 4:2:2 Control Register

**Name:** ISC\_SUB422\_CTRL  
**Offset:** 0x3C4  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – ENABLE** 4:4:4 to 4:2:2 Chrominance Horizontal Subsampling Filter Enable

Value	Description
0	Subsampler is disabled.
1	Subsampler is enabled.

### 51.6.46 ISC Subsampling 4:4:4 to 4:2:2 Configuration Register

**Name:** ISC\_SUB422\_CFG  
**Offset:** 0x3C8  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 5:4 – FILTER[1:0] Low Pass Filter Selection

Value	Name	Description
0	FILT0CO	Cosited, {1}
1	FILT1CE	Centered {1, 1}
2	FILT2CO	Cosited {1,2,1}
3	FILT3CE	Centered {1, 3, 3, 1}

#### Bits 2:1 – CCIRMODE[1:0] CCIR656 Byte Ordering

Value	Name	Description
0	CBY	Byte ordering Cb0, Y0, Cr0, Y1
1	CRY	Byte ordering Cr0, Y0, Cb0, Y1
2	YCB	Byte ordering Y0, Cb0, Y1, Cr0
3	YCR	Byte ordering Y0, Cr0, Y1, Cb0

#### Bit 0 – CCIR CCIR656 Input Stream

Value	Description
0	Raw mode.
1	CCIR mode.

### 51.6.47 ISC Subsampling 4:2:2 to 4:2:0 Control Register

**Name:** ISC\_SUB420\_CTRL  
**Offset:** 0x3CC  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 4 – FILTER** Interlaced or Progressive Chrominance Filter

Value	Description
0	Progressive filter {0.5, 0.5}.
1	Field-dependent filter, top field filter is {0.75, 0.25}, bottom field filter is {0.25, 0.75}.

**Bit 0 – ENABLE** 4:2:2 to 4:2:0 Vertical Subsampling Filter Enable (Center Aligned)

Value	Description
0	Subsampler disabled.
1	Subsampler enabled.

### 51.6.48 ISC Rounding, Limiting and Packing Configuration Register

**Name:** ISC\_RLP\_CFG  
**Offset:** 0x3D0  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 15:8 – ALPHA[7:0]** Alpha Value for Alpha-enabled RGB Mode

**Bits 3:0 – MODE[3:0]** Rounding, Limiting and Packing Mode

Value	Name	Description
0	DAT8	8-bit data
1	DAT9	9-bit data
2	DAT10	10-bit data
3	DAT11	11-bit data
4	DAT12	12-bit data
5	DATY8	8-bit luminance only
6	DATY10	10-bit luminance only
7	ARGB444	12-bit RGB+4-bit Alpha (MSB)
8	ARGB555	15-bit RGB+1-bit Alpha (MSB)
9	RGB565	16-bit RGB
10	ARGB32	24-bits RGB mode+8-bit Alpha
11	YYCC	YCbCr mode (full range, [0–255])
12	YYCC_LIMITED	YCbCr mode (limited range)

### 51.6.49 ISC Histogram Control Register

**Name:** ISC\_HIS\_CTRL  
**Offset:** 0x3D4  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – ENABLE** Histogram Sub Module Enable

Value	Description
0	Histogram disabled.
1	Histogram enabled.

### 51.6.50 ISC Histogram Configuration Register

**Name:** ISC\_HIS\_CFG  
**Offset:** 0x3D8  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
								RAR
Access								R/W
Reset								0
Bit	7	6	5	4	3	2	1	0
			BAYSEL[1:0]				MODE[2:0]	
Access			R/W	R/W			R/W	R/W
Reset			0	0			0	0

#### Bit 8 – RAR Histogram Reset After Read

Value	Description
0	Reset after read mode is disabled.
1	Reset after read mode is enabled.

#### Bits 5:4 – BAYSEL[1:0] Bayer Color Component Selection

Value	Name	Description
0	GRGR	Starting row configuration is G R G R (red row)
1	RGRG	Starting row configuration is R G R G (red row)
2	GBGB	Starting row configuration is G B G B (blue row)
3	BGBG	Starting row configuration is B G B G (blue row)

#### Bits 2:0 – MODE[2:0] Histogram Operating Mode

Value	Name	Description
0	GR	Gr sampling
1	R	R sampling
2	GB	Gb sampling
3	B	B sampling
4	Y	Luminance-only mode

# SAMA5D2 Series

## Image Sensor Controller (ISC)

Value	Name	Description
5	RAW	Raw sampling
6	YCCIR656	Luminance only with CCIR656 10-bit or 8-bit mode

### 51.6.51 ISC DMA Configuration Register

**Name:** ISC\_DCFG  
**Offset:** 0x3E0  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 9:8 – CMBSIZE[1:0] DMA Memory Burst Size C channel

Value	Name	Description
0	SINGLE	DMA single access
1	BEATS4	4-beat burst access
2	BEATS8	8-beat burst access
3	BEATS16	16-beat burst access

#### Bits 5:4 – YMBSIZE[1:0] DMA Memory Burst Size Y channel

Value	Name	Description
0	SINGLE	DMA single access
1	BEATS4	4-beat burst access
2	BEATS8	8-beat burst access
3	BEATS16	16-beat burst access

#### Bits 2:0 – IMODE[2:0] DMA Input Mode Selection

Value	Name	Description
0	PACKED8	8 bits, single channel packed
1	PACKED16	16 bits, single channel packed
2	PACKED32	32 bits, single channel packed

# SAMA5D2 Series

## Image Sensor Controller (ISC)

Value	Name	Description
3	YC422SP	32 bits, dual channel
4	YC422P	32 bits, triple channel
5	YC420SP	32 bits, dual channel
6	YC420P	32 bits, triple channel

### 51.6.52 ISC DMA Control Register

**Name:** ISC\_DCTRL  
**Offset:** 0x3E4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	DONE	FIELD	WB	IE		DVIEW[1:0]		DE
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	0	0		0	0	0

**Bit 7 – DONE** Descriptor Processing Status

This bit appears only in the descriptor located in memory and can be used only if WB (Write Back) is set.

Value	Description
0	Descriptor not processed yet.
1	Descriptor processed.

**Bit 6 – FIELD** Value of Captured Frame Field Signal

This bit is only relevant for interlaced content. It appears only in the descriptor located in memory and can be used only if WB (Write Back) is set.

Value	Description
0	Field value is 0.
1	Field value is 1.

**Bit 5 – WB** Write Back Operation Enable

Value	Description
0	Write Back operation is skipped.
1	Write Back operation is performed.

**Bit 4 – IE** Interrupt Enable

# SAMA5D2 Series

## Image Sensor Controller (ISC)

Value	Description
0	DMA Done interrupt is generated.
1	DMA Done interrupt is not set.

### Bits 2:1 – DVIEW[1:0] Descriptor View

Value	Name	Description
0	PACKED	Address {0} Stride {0} are updated
1	SEMIPLANAR	Address {0,1} Stride {0,1} are updated
2	PLANAR	Address {0,1,2} Stride {0,1,2} are updated

### Bit 0 – DE Descriptor Enable

Value	Description
0	Descriptor disabled.
1	Descriptor enabled.

### 51.6.53 ISC DMA Descriptor Address Register

**Name:** ISC\_DNDA  
**Offset:** 0x3E8  
**Reset:** 0x00000000

## 52. Controller Area Network (MCAN)

### 52.1 Description

The Controller Area Network (MCAN) performs communication according to CAN Protocol Version 2.0 Part A,B and Bosch CAN FD Specification V1.0 (Non-ISO). Additional transceiver hardware is required for connection to the physical layer.

All functions concerning the handling of messages are implemented by the Rx Handler and the Tx Handler. The Rx Handler manages message acceptance filtering, the transfer of received messages from the CAN core to the Message RAM, as well as providing receive message status information. The Tx Handler is responsible for the transfer of transmit messages from the Message RAM to the CAN core, as well as providing transmit status information.

Acceptance filtering is implemented by a combination of up to 128 filter elements, where each element can be configured as a range, as a bit mask, or as a dedicated ID filter.

MCAN implements the non-ISO CAN FD frame format and therefore does not pass the CAN FD Conformance Test according to ISO 16845-1:2016.

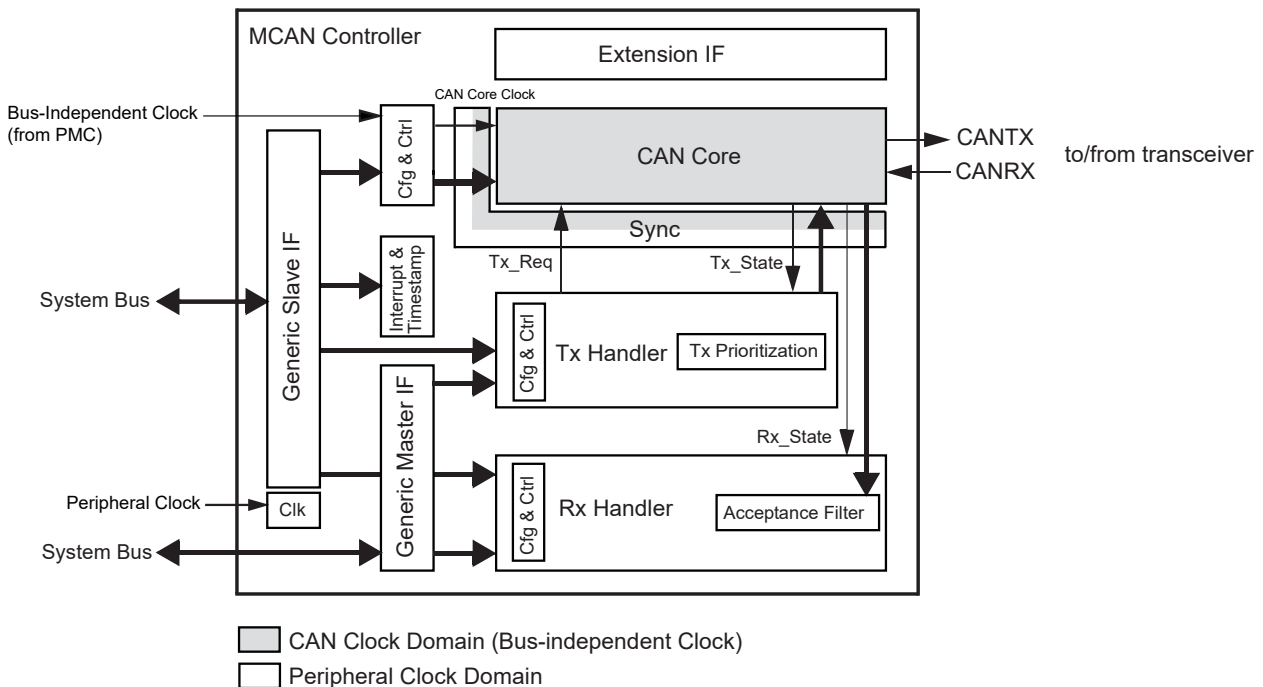

---

### 52.2 Embedded Characteristics

- Classic CAN (2.0 A,B) in Conformance with ISO11898-1:2015 and ISO16845-1:2016
- CAN FD Frame Format according to Bosch CAN FD Specification V1.0 (Non-ISO)
- CAN-FD with up to 64 Data Bytes Supported
- CAN Error Logging
- AUTOSAR Optimized
- SAE J1939 Optimized
- Improved Acceptance Filtering
- Two Configurable Receive FIFOs
- Separate Signalling on Reception of High Priority Messages
- Up to 64 Dedicated Receive Buffers
- Up to 32 Dedicated Transmit Buffers
- Configurable Transmit FIFO
- Configurable Transmit Queue
- Configurable Transmit Event FIFO
- Direct Message RAM Access for Processor
- Multiple MCANs May Share the Same Message RAM
- Programmable Loop-back Test Mode
- Maskable Module Interrupts
- Support for Asynchronous CAN and System Bus Clocks
- Power-down Support
- Debug on CAN Support

## 52.3 Block Diagram

Figure 52-1. MCAN Block Diagram

**Note:** Refer to section “Power Management Controller (PMC)” for details about the bus-independent clock (GCLK).

## 52.4 Product Dependencies

### 52.4.1 I/O Lines

The pins used to interface to the compliant external devices can be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the CAN pins to their peripheral functions.

### 52.4.2 Power Management

The MCAN can be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the MCAN clock.

In order to achieve a stable function of the MCAN, the system bus clock must always be faster than or equal to the CAN clock.

It is recommended to use the CAN clock at frequencies of 20, 40 or 80 MHz. To achieve these frequencies, PMC GCLK must select the UPLLCK (480 MHz) as source clock and divide by 24, 12, or 6. GCLK allows the system bus and processor clock to be modified without affecting the bit rate communication.

### 52.4.3 Interrupt Sources

The two MCAN interrupt lines (MCAN\_INT0, MCAN\_INT1) are connected on internal sources of the Interrupt Controller.

Using the MCAN interrupts requires the Interrupt Controller to be programmed first.

Interrupt sources can be routed either to MCAN\_INT0 or to MCAN\_INT1. By default, all interrupt sources are routed to interrupt line MCAN\_INT0/1. By programming MCAN\_ILE.EINT0 and MCAN\_ILE.EINT1, the interrupt sources can be enabled or disabled separately.

### 52.4.4 Address Configuration

The LSBs [bits 15:2] for each section of the CAN Message RAM are configured in the respective buffer configuration registers as detailed in [Message RAM](#).

The MSBs [bits 31:16] of the CAN Message RAM for CAN0 and CAN1 are configured in 0x00200000.

## 52.5 Functional Description

### 52.5.1 Operating Modes

#### 52.5.1.1 Software Initialization

Software initialization is started by setting bit MCAN\_CCCR.INIT, either by software or by a hardware reset, when an uncorrected bit error was detected in the Message RAM, or by going Bus\_Off. While MCAN\_CCCR.INIT is set, message transfer from and to the CAN bus is stopped and the status of the CAN bus output CANTX is recessive (HIGH). The counters of the Error Management Logic EML are unchanged. Setting MCAN\_CCCR.INIT does not change any configuration register. Resetting MCAN\_CCCR.INIT finishes the software initialization. Afterwards the Bit Stream Processor BSP synchronizes itself to the data transfer on the CAN bus by waiting for the occurrence of a sequence of 11 consecutive recessive bits ( $\equiv$  Bus\_Idle) before it can take part in bus activities and start the message transfer.

Access to the MCAN configuration registers is only enabled when both bits MCAN\_CCCR.INIT and MCAN\_CCCR.CCE are set (protected write).

MCAN\_CCCR.CCE can only be configured when MCAN\_CCCR.INIT = '1'. MCAN\_CCCR.CCE is automatically cleared when MCAN\_CCCR.INIT = '0'.

The following registers are cleared when MCAN\_CCCR.CCE = '1':

- High Priority Message Status (MCAN\_HPMS)
- Receive FIFO 0 Status (MCAN\_RXF0S)
- Receive FIFO 1 Status (MCAN\_RXF1S)
- Transmit FIFO/Queue Status (MCAN\_TXFQS)
- Transmit Buffer Request Pending (MCAN\_TXBRP)
- Transmit Buffer Transmission Occurred (MCAN\_TXBTO)
- Transmit Buffer Cancellation Finished (MCAN\_TXBCF)
- Transmit Event FIFO Status (MCAN\_TXEFS)

The Timeout Counter value MCAN\_TOCV.TOC is loaded with the value configured by MCAN\_TOCC.TOP when MCAN\_CCCR.CCE = '1'.

In addition, the state machines of the Tx Handler and Rx Handler are held in idle state while MCAN\_CCCR.CCE = '1'.

The following registers are only writeable while MCAN\_CCCR.CCE = '0'

- Transmit Buffer Add Request (MCAN\_TXBAR)
- Transmit Buffer Cancellation Request (MCAN\_TXBCR)

MCAN\_CCCR.TEST and MCAN\_CCCR.MON can only be set when MCAN\_CCCR.INIT = '1' and MCAN\_CCCR.CCE = '1'. Both bits may be cleared at any time. MCAN\_CCCR.DAR can only be configured when MCAN\_CCCR.INIT = '1' and MCAN\_CCCR.CCE = '1'.

### 52.5.1.2 Normal Operation

Once the MCAN is initialized and MCAN\_CCCR.INIT is cleared, the MCAN synchronizes itself to the CAN bus and is ready for communication.

After passing the acceptance filtering, received messages including Message ID and DLC are stored into a dedicated Rx Buffer or into Rx FIFO 0 or Rx FIFO 1.

For messages to be transmitted, dedicated Tx Buffers and/or a Tx FIFO or a Tx Queue can be initialized or updated. Automated transmission on reception of remote frames is not implemented.

### 52.5.1.3 CAN FD Operation

There are two variants in the CAN FD frame format, first the CAN FD frame without bit rate switching where the data field of a CAN frame may be longer than 8 bytes. The second variant is the CAN FD frame where control field, data field, and CRC field of a CAN frame are transmitted with a higher bit rate than the beginning and the end of the frame.

The previously reserved bit in CAN frames with 11-bit identifiers and the first previously reserved bit in CAN frames with 29-bit identifiers will now be decoded as FDF bit. FDF = recessive signifies a CAN FD frame, FDF = dominant signifies a Classic CAN frame. In a CAN FD frame, the two bits following FDF, res and BRS, decide whether the bit rate inside of this CAN FD frame is switched. A CAN FD bit rate switch is signified by res = dominant and BRS = recessive. The coding of res = recessive is reserved for future expansion of the protocol. In case the MCAN receives a frame with FDF = recessive and res = recessive, it will signal a Protocol Exception Event by setting bit MCAN\_PSR.PXE. When Protocol Exception Handling is enabled (MCAN\_CCCR.PXHD = 0), this causes the operation state to change from Receiver (MCAN\_PSR.ACT = 2) to Integrating (MCAN\_PSR.ACT = 00) at the next sample point. In case Protocol Exception Handling is disabled (MCAN\_CCCR.PXHD = 1), the MCAN will treat a recessive res bit as an form error and will respond with an error frame.

CAN FD operation is enabled by programming CCCR.FDOE. In case CCCR.FDOE = '1', transmission and reception of CAN FD frames is enabled. Transmission and reception of Classic CAN frames is always possible. Whether a CAN FD frame or a Classic CAN frame is transmitted can be configured via bit FDF in the respective Tx Buffer element. With CCCR.FDOE = '0', received frames are interpreted as Classic CAN frames, which leads to the transmission of an error frame when receiving a CAN FD frame. When CAN FD operation is disabled, no CAN FD frames are transmitted even if bit FDF of a Tx Buffer element is set. CCCR.FDOE and CCCR.BRSE can only be changed while CCCR.INIT and CCCR.CCE are both set.

With MCAN\_CCCR.FDOE = 0, the setting of bits FDF and BRS is ignored and frames are transmitted in Classic CAN format. With MCAN\_CCCR.FDOE = 1 and MCAN\_CCCR.BRSE = 0, only bit FDF of a Tx Buffer element is evaluated. With MCAN\_CCCR.FDOE = 1 and MCAN\_CCCR.BRSE = 1, transmission of CAN FD frames with bit rate switching is enabled. All Tx Buffer elements with bits FDF and BRS set are transmitted in CAN FD format with bit rate switching.

A mode change during CAN operation is only recommended under the following conditions:

- The failure rate in the CAN FD data phase is significant higher than in the CAN FD arbitration phase. In this case disable the CAN FD bit rate switching option for transmissions.
- During system startup all nodes are transmitting according to ISO11898-1 until it is verified that they are able to communicate in CAN FD format. If this is true, all nodes switch to CAN FD operation.
- Wake-up messages in CAN Partial Networking have to be transmitted in Classic CAN format.

- End-of-line programming in case not all nodes are CAN FD-capable. Non-CAN FD nodes are held in Silent mode until programming has completed. Then all nodes revert to Classic CAN communication.

In the CAN FD format, the coding of the DLC differs from the standard CAN format. The DLC codes 0 to 8 have the same coding as in standard CAN, the codes 9 to 15, which in standard CAN all code a data field of 8 bytes, are coded according to the table below.

**Table 52-1. Coding of DLC in CAN FD**

DLC	9	10	11	12	13	14	15
Number of Data Bytes	12	16	20	24	32	48	64

In CAN FD frames, the bit timing will be switched inside the frame, after the BRS (Bit Rate Switch) bit, if this bit is recessive. Before the BRS bit, in the CAN FD arbitration phase, the nominal CAN bit timing is used as defined by the Nominal Bit Timing and Prescaler register (MCAN\_NBTP). In the following CAN FD data phase, the data phase CAN bit timing is used as defined by the FastData Bit Timing and Prescaler register (MCAN\_DBTP). The bit timing reverts back from the data phase timing at the CRC delimiter or when an error is detected, whichever occurs first.

The maximum configurable bit rate in the CAN FD data phase depends on the CAN core clock frequency. Example: with a CAN clock frequency of 20 MHz and the shortest configurable bit time of  $4 t_q$ , the bit rate in the data phase is 5 Mbit/s.

In both data frame formats, CAN FD and CAN FD with bit rate switching, the value of the bit ESI (Error Status Indicator) is determined by the transmitter's error state at the start of the transmission. If the transmitter is error passive, ESI is transmitted recessive, else it is transmitted dominant.

#### 52.5.1.4 Transmitter Delay Compensation

During the data phase of a CAN FD transmission only one node is transmitting, all others are receivers. The length of the bus line has no impact. When transmitting via pin CANTX the protocol controller receives the transmitted data from its local CAN transceiver via pin CANRX. The received data is delayed by the transmitter delay. In case this delay is greater than TSEG1 (time segment before sample point), a bit error is detected. In order to enable a data phase bit time that is even shorter than the transmitter delay, the delay compensation is introduced. Without delay compensation, the bit rate in the data phase of a CAN FD frame is limited by the delay.

##### 52.5.1.4.1 Description

The MCAN protocol unit has implemented a delay compensation mechanism to compensate the delay, thereby enabling transmission with higher bit rates during the CAN FD data phase independent of the delay of a specific CAN transceiver.

To check for bit errors during the data phase, the delayed transmit data is compared against the received data at the secondary sample point. If a bit error is detected, the transmitter will react to this bit error at the next following regular sample point. During arbitration phase the delay compensation is always disabled.

The transmitter delay compensation enables configurations where the data bit time is shorter than the transmitter delay, it is described in detail in the new ISO11898-1. It is enabled by setting bit MCAN\_DBTP.TDC.

The received bit is compared against the transmitted bit at the SSP. The SSP position is defined as the sum of the measured delay from the MCAN's transmit output CANTX through the transceiver to the receive input CANRX plus the transmitter delay compensation offset as configured by

MCAN\_TDCR.TDCO. The transmitter delay compensation offset is used to adjust the position of the SSP inside the received bit (e.g. half of the bit time in the data phase). The position of the secondary sample point is rounded down to the next integer number of CAN core clock periods.

MCAN\_PSR.TDCV shows the actual transmitter delay compensation value. MCAN\_PSR.TDCV is cleared when MCAN\_CCCR.INIT is set and is updated at each transmission of an FD frame while MCAN\_DBTP.TDC is set.

The following boundary conditions have to be considered for the delay compensation implemented in the MCAN:

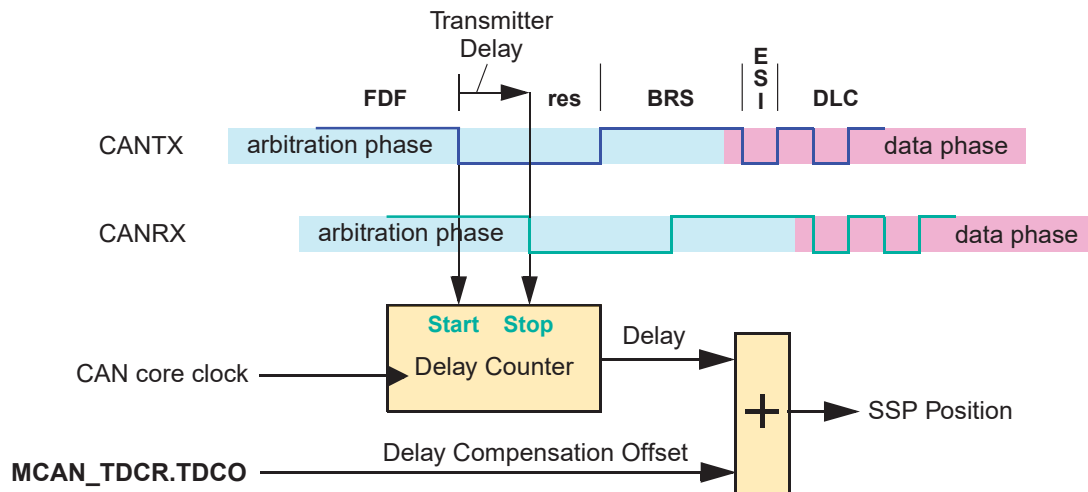

- The sum of the measured delay from CANTX to CANRX and the configured delay compensation offset MCAN\_TDCR.TDCO has to be less than 6 bit times in the data phase.
- The sum of the measured delay from CANTX to CANRX and the configured delay compensation offset MCAN\_TDCR.TDCO has to be less or equal 127 CAN core clock periods. In case this sum exceeds 127 CAN core clock periods, the maximum value of 127 CAN core clock periods is used for delay compensation.
- The data phase ends at the sample point of the CRC delimiter, that stops checking of receive bits at the SSPs.

### 52.5.1.4.2 Transmitter Delay Measurement

If transmitter delay compensation is enabled by programming MCAN\_DBTP.TDC = '1', the measurement is started within each transmitted CAN FD frame at the falling edge of bit FDF to bit res. The measurement is stopped when this edge is seen at the receive input CANRX of the transmitter.

The resolution of this measurement is one mtq.

**Figure 52-2. Transmitter Delay Measurement**

To avoid that a dominant glitch inside the received FDF bit ends the delay compensation measurement before the falling edge of the received res bit, resulting in a too early SSP position, the use of a transmitter delay compensation filter window can be enabled by programming MCAN\_TDCR.TDCF.

This defines a minimum value for the SSP position. Dominant edges on CANRX, that would result in an earlier SSP position are ignored for transmitter delay measurement. The measurement is stopped when the SSP position is at least MCAN\_TDCR.TDCF AND CANRX is low.

### 52.5.1.5 Restricted Operation Mode

In Restricted Operation mode, the node is able to receive data and remote frames and to give acknowledge to valid frames, but it does not send data frames, remote frames, active error frames, or

overload frames. In case of an error condition or overload condition, it does not send dominant bits, instead it waits for the occurrence of bus idle condition to resynchronize itself to the CAN communication. The error counters are not incremented. The processor can set the MCAN into Restricted Operation mode by setting bit MCAN\_CCCR.ASM. The bit can only be set by the processor when both MCAN\_CCCR.CCE and MCAN\_CCCR.INIT are set to '1'. The bit can be reset by the processor at any time.

Restricted Operation mode is automatically entered when the Tx Handler was not able to read data from the Message RAM in time. To leave Restricted Operation mode, the processor has to reset MCAN\_CCCR.ASM.

The Restricted Operation mode can be used in applications that adapt themselves to different CAN bit rates. In this case the application tests different bit rates and leaves the Restricted Operation mode after it has received a valid frame.

**Note:** The Restricted Operation Mode must not be combined with the Loop Back mode (internal or external).

### 52.5.1.6 Bus Monitoring Mode

The MCAN is set in Bus Monitoring mode by setting MCAN\_CCCR.MON. In Bus Monitoring mode (see ISO11898-1, 10.12 Bus monitoring), the MCAN is able to receive valid data frames and valid remote frames, but cannot start a transmission. In this mode, it sends only recessive bits on the CAN bus. If the MCAN is required to send a dominant bit (ACK bit, overload flag, active error flag), the bit is rerouted internally so that the MCAN monitors this dominant bit, although the CAN bus may remain in recessive state. In Bus Monitoring mode, the Tx Buffer Request Pending register (MCAN\_TXBRP) is held in reset state.

The Bus Monitoring mode can be used to analyze the traffic on a CAN bus without affecting it by the transmission of dominant bits. The figure below shows the connection of signals CANTX and CANRX to the MCAN in Bus Monitoring mode.

**Figure 52-3. Pin Control in Bus Monitoring Mode**

**Bus Monitoring Mode**

### 52.5.1.7 Disabled Automatic Retransmission

According to the CAN Specification (see ISO11898-1, 6.3.3 Recovery Management), the MCAN provides means for automatic retransmission of frames that have lost arbitration or that have been disturbed by errors during transmission. By default automatic retransmission is enabled. To support time-triggered communication as described in ISO 11898-1, chapter 9.2, the automatic retransmission may be disabled via MCAN\_CCCR.DAR.

### 52.5.1.7.1 Frame Transmission in DAR Mode

In DAR mode, all transmissions are automatically cancelled after they start on the CAN bus. A Tx Buffer's Tx Request Pending bit TXBRP.TRPx is reset after successful transmission, when a transmission has not yet been started at the point of cancellation, has been aborted due to lost arbitration, or when an error occurred during frame transmission.

- Successful transmission:  
Corresponding Tx Buffer Transmission Occurred bit MCAN\_TXBTO.TOx set  
Corresponding Tx Buffer Cancellation Finished bit MCAN\_TXBCF.CFx not set
- Successful transmission in spite of cancellation:  
Corresponding Tx Buffer Transmission Occurred bit MCAN\_TXBTO.TOx set  
Corresponding Tx Buffer Cancellation Finished bit MCAN\_TXBCF.CFx set
- Arbitration lost or frame transmission disturbed:  
Corresponding Tx Buffer Transmission Occurred bit MCAN\_TXBTO.TOx not set  
Corresponding Tx Buffer Cancellation Finished bit MCAN\_TXBCF.CFx set

In case of a successful frame transmission, and if storage of Tx events is enabled, a Tx Event FIFO element is written with Event Type ET = "10" (transmission in spite of cancellation).

### 52.5.1.8 Power-down (Sleep Mode)

The MCAN can be set into Power-down mode via bit MCAN\_CCCR.CSR.

When all pending transmission requests have completed, the MCAN waits until bus idle state is detected. Then the MCAN sets MCAN\_CCCR.INIT to prevent any further CAN transfers. Now the MCAN acknowledges that it is ready for power down by setting to one the bit MCAN\_CCCR.CSA. In this state, before the clocks are switched off, further register accesses can be made. A write access to MCAN\_CCCR.INIT will have no effect. Now the bus clock (peripheral clock) and the CAN core clock may be switched off.

To leave Power-down mode, the application has to turn on the MCAN clocks before clearing CC Control Register flag MCAN\_CCCR.CSR. The MCAN will acknowledge this by clearing MCAN\_CCCR.CSA. The application can then restart CAN communication by clearing the bit CCCR.INIT.

### 52.5.1.9 Test Modes

To enable write access to the MCAN Test register (MCAN\_TEST) (see Section 7.6), bit MCAN\_CCCR.TEST must be set. This allows the configuration of the test modes and test functions.

Four output functions are available for the CAN transmit pin CANTX by programming MCAN\_TEST.TX. Additionally to its default function – the serial data output – it can drive the CAN Sample Point signal to monitor the MCAN's bit timing and it can drive constant dominant or recessive values. The actual value at pin CANRX can be read from MCAN\_TEST.RX. Both functions can be used to check the CAN bus' physical layer.

Due to the synchronization mechanism between CAN clock and system bus clock domain, there may be a delay of several system bus clock periods between writing to MCAN\_TEST.TX until the new configuration is visible at output pin CANTX. This applies also when reading input pin CANRX via MCAN\_TEST.RX.

**Note:** Test modes should be used for production tests or self-test only. The software control for pin CANTX interferes with all CAN protocol functions. It is not recommended to use test modes for application.

### 52.5.1.9.1 External Loop Back Mode

The MCAN can be set in External Loop Back mode by setting the bit MCAN\_TEST.LBCK. In Loop Back mode, the MCAN treats its own transmitted messages as received messages and stores them (if they pass acceptance filtering) into an Rx Buffer or an Rx FIFO. The figure below shows the connection of signals CANTX and CANRX to the MCAN in External Loop Back mode.

This mode is provided for hardware self-test. To be independent from external stimulation, the MCAN ignores acknowledge errors (recessive bit sampled in the acknowledge slot of a data/remote frame) in Loop Back mode. In this mode, the MCAN performs an internal feedback from its Tx output to its Rx input. The actual value of the CANRX input pin is disregarded by the MCAN. The transmitted messages can be monitored at the CANTX pin.

### 52.5.1.9.2 Internal Loop Back Mode

Internal Loop Back mode is entered by setting bits MCAN\_TEST.LBCK and MCAN\_CCCR.MON. This mode can be used for a “Hot Selftest”, meaning the MCAN can be tested without affecting a running CAN system connected to the pins CANTX and CANRX. In this mode, pin CANRX is disconnected from the MCAN, and pin CANTX is held recessive. The figure below shows the connection of CANTX and CANRX to the MCAN when Internal Loop Back mode is enabled.

**Figure 52-4. Pin Control in Loop Back Modes**

### 52.5.2 Timestamp Generation

For timestamp generation, the MCAN supplies a 16-bit wrap-around counter. A prescaler TSCC.TCP can be configured to clock the counter in multiples of CAN bit times (1...16). The counter is readable via MCAN\_TSCV.TSC. A write access to the Timestamp Counter Value register (MCAN\_TSCV) resets the counter to zero. When the timestamp counter wraps around, the interrupt flag MCAN\_IR.TSW is set.

On start of frame reception / transmission, the counter value is captured and stored into the timestamp section of an Rx Buffer / Rx FIFO (RXTS[15:0]) or Tx Event FIFO (TXTS[15:0]) element.

By programming bit MCAN\_TSCC.TSS, an external 16-bit timestamp can be used.

### 52.5.3 Timeout Counter

To signal timeout conditions for Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO, the MCAN supplies a 16-bit Timeout Counter. It operates as down-counter and uses the same prescaler controlled by TSCC.TCP as the Timestamp Counter. The Timeout Counter is configured via the Timeout Counter Configuration register (MCAN\_TOCC). The actual counter value can be read from MCAN\_TOCV.TOC. The Timeout Counter can only be started while MCAN\_CCCR.INIT = '0'. It is stopped when MCAN\_CCCR.INIT = '1', e.g. when the MCAN enters Bus\_Off state.

The operating mode is selected by MCAN\_TOCC.TOS. When operating in Continuous mode, the counter starts when MCAN\_CCCR.INIT is reset. A write to MCAN\_TOCV presets the counter to the value configured by MCAN\_TOCC.TOP and continues down-counting.

When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MCAN\_TOCC.TOP. Down-counting is started when the first FIFO element is stored. Writing to MCAN\_TOCV has no effect.

When the counter reaches zero, interrupt flag MCAN\_IR.TOO is set. In Continuous mode, the counter is immediately restarted at MCAN\_TOCC.TOP.

**Note:** The clock signal for the Timeout Counter is derived from the CAN Core's sample point signal. Therefore the point in time where the Timeout Counter is decremented may vary due to the synchronization / re-synchronization mechanism of the CAN Core. If the bit rate switch feature in CAN FD is used, the timeout counter is clocked differently in arbitration and data field.

### 52.5.4 Rx Handling

The Rx Handler controls the acceptance filtering, the transfer of received messages to the Rx Buffers or to one of the two Rx FIFOs, as well as the Rx FIFO's Put and Get Indices.

#### 52.5.4.1 Acceptance Filtering

The MCAN offers the possibility to configure two sets of acceptance filters, one for standard identifiers and one for extended identifiers. These filters can be assigned to an Rx Buffer or to Rx FIFO 0,1. For acceptance filtering each list of filters is executed from element #0 until the first matching element. Acceptance filtering stops at the first matching element. The following filter elements are not evaluated for this message.

The main features are:

- Each filter element can be configured as
  - range filter (from - to)
  - filter for one or two dedicated IDs
  - classic bit mask filter
- Each filter element is configurable for acceptance or rejection filtering
- Each filter element can be enabled / disabled individually
- Filters are checked sequentially, execution stops with the first matching filter element

Related configuration registers are:

- Global Filter Configuration (MCAN\_GFC)
- Standard ID Filter Configuration (MCAN\_SIDFC)
- Extended ID Filter Configuration (MCAN\_XIDFC)
- Extended ID and Mask (MCAN\_XIDAM)

Depending on the configuration of the filter element (SFEC/EFEC) a match triggers one of the following actions:

- Store received frame in FIFO 0 or FIFO 1
- Store received frame in Rx Buffer
- Store received frame in Rx Buffer and generate pulse at filter event pin
- Reject received frame
- Set High Priority Message interrupt flag (MCAN\_IR.HPM)

- Set High Priority Message interrupt flag (MCAN\_IR.HPM) and store received frame in FIFO 0 or FIFO 1

Acceptance filtering is started after the complete identifier has been received. After acceptance filtering has completed, and if a matching Rx Buffer or Rx FIFO has been found, the Message Handler starts writing the received message data in portions of 32 bit to the matching Rx Buffer or Rx FIFO. If the CAN protocol controller has detected an error condition (e.g. CRC error), this message is discarded with the following impact on the effected Rx Buffer or Rx FIFO:

- Rx Buffer  
New Data flag of matching Rx Buffer is not set, but Rx Buffer (partly) overwritten with received data. For error type, see MCAN\_PSR.LEC and MCAN\_PSR.DLEC.
- Rx FIFO  
Put index of matching Rx FIFO is not updated, but related Rx FIFO element (partly) overwritten with received data. For error type, see MCAN\_PSR.LEC and MCAN\_PSR.DLEC. In case the matching Rx FIFO is operated in Overwrite mode, the boundary conditions described in [Rx FIFO Overwrite Mode](#) have to be considered.  
**Note:** When an accepted message is written to one of the two Rx FIFOs, or into an Rx Buffer, the unmodified received identifier is stored independent of the filter(s) used. The result of the acceptance filter process is strongly depending on the sequence of configured filter elements.

#### 52.5.4.1.1 Range Filter

The filter matches for all received frames with Message IDs in the range defined by SF1ID/SF2ID resp. EF1ID/EF2ID.

There are two possibilities when range filtering is used together with extended frames:

- EFT = "00": The Message ID of received frames is ANDed with MCAN\_XIDAM before the range filter is applied.
- EFT = "11": MCAN\_XIDAM is not used for range filtering.

#### 52.5.4.1.2 Filter for Specific IDs

A filter element can be configured to filter for one or two specific Message IDs. To filter for one specific Message ID, the filter element has to be configured with SF1ID = SF2ID resp. EF1ID = EF2ID.

#### 52.5.4.1.3 Classic Bit Mask Filter

Classic bit mask filtering is intended to filter groups of Message IDs by masking single bits of a received Message ID. With classic bit mask filtering SF1ID/EF1ID is used as Message ID filter, while SF2ID/EF2ID is used as filter mask.

A zero bit at the filter mask will mask out the corresponding bit position of the configured ID filter, e.g. the value of the received Message ID at that bit position is not relevant for acceptance filtering. Only those bits of the received Message ID where the corresponding mask bits are one are relevant for acceptance filtering.

In case all mask bits are one, a match occurs only when the received Message ID and the Message ID filter are identical. If all mask bits are zero, all Message IDs match.

#### 52.5.4.1.4 Standard Message ID Filtering

The figure below shows the flow for standard Message ID (11-bit Identifier) filtering. The Standard Message ID Filter element is described in [52.5.7.5 Standard Message ID Filter Element](#).

Controlled by MCAN\_GFC and MCAN\_SIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

**Figure 52-5. Standard Message ID Filter Path**

**Extended Message ID Filtering**

The figure below shows the flow for extended Message ID (29-bit Identifier) filtering. The Extended Message ID Filter element is described in [52.5.7.6 Extended Message ID Filter Element](#).

Controlled by MCAN\_GFC and MCAN\_XIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

MCAN\_XIDAM is ANDed with the received identifier before the filter list is executed.

**Figure 52-6. Extended Message ID Filter Path**

#### 52.5.4.2 Rx FIFOs

Rx FIFO 0 and Rx FIFO 1 can be configured to hold up to 64 elements each. Configuration of the two Rx FIFOs is done via the Rx FIFO 0 Configuration register (MCAN\_RXF0C) and the Rx FIFO 1 Configuration register (MCAN\_RXF1C).

Received messages that passed acceptance filtering are transferred to the Rx FIFO as configured by the matching filter element. For a description of the filter mechanisms available for Rx FIFO 0 and Rx FIFO 1, see [Acceptance Filtering](#). The Rx FIFO element is described in [Rx Buffer and FIFO Element](#).

To avoid an Rx FIFO overflow, the Rx FIFO watermark can be used. When the Rx FIFO fill level reaches the Rx FIFO watermark configured by MCAN\_RXFnC.FnWM, interrupt flag MCAN\_IR.RFnW is set. When the Rx FIFO Put Index reaches the Rx FIFO Get Index, an Rx FIFO Full condition is signalled by MCAN\_RXFnS.FnF. In addition, the interrupt flag MCAN\_IR.RFnF is set.

**Figure 52-7. Rx FIFO Status**

When reading from an Rx FIFO, Rx FIFO Get Index `MCAN_RXFnS.FnGI` × FIFO Element Size has to be added to the corresponding Rx FIFO start address `MCAN_RXFnC.FnSA`.

**Table 52-2. Rx Buffer / FIFO Element Size**

<code>MCAN_RXESC.RBDS[2:0]</code> <code>MCAN_RXESC.FnDS[2:0]</code>	Data Field [bytes]	FIFO Element Size [RAM words]
0	8	4
1	12	5
2	16	6
3	20	7
4	24	8
5	32	10
6	48	14
7	64	18

**52.5.4.2.1 Rx FIFO Blocking Mode**

The Rx FIFO Blocking mode is configured by `MCAN_RXFnC.FnOM = '0'`. This is the default operating mode for the Rx FIFOs.

When an Rx FIFO full condition is reached (`MCAN_RXFnS.FnPI = MCAN_RXFnS.FnGI`), no further messages are written to the corresponding Rx FIFO until at least one message has been read out and the Rx FIFO Get Index has been incremented. An Rx FIFO full condition is signalled by `MCAN_RXFnS.FnF = '1'`. In addition, the interrupt flag `MCAN_IR.RFnF` is set.

In case a message is received while the corresponding Rx FIFO is full, this message is discarded and the message lost condition is signalled by `MCAN_RXFnS.RFnL = '1'`. In addition, the interrupt flag `MCAN_IR.RFnL` is set.

**52.5.4.2.2 Rx FIFO Overwrite Mode**

The Rx FIFO Overwrite mode is configured by `MCAN_RXFnC.FnOM = '1'`.

When an Rx FIFO full condition (MCAN\_RXFnS.FnPI = MCAN\_RXFnS.FnGI) is signalled by MCAN\_RXFnS.FnF = '1', the next message accepted for the FIFO will overwrite the oldest FIFO message. Put and get index are both incremented by one.

When an Rx FIFO is operated in Overwrite mode and an Rx FIFO full condition is signalled, reading of the Rx FIFO elements should start at least at get index + 1. The reason for that is, that it might happen, that a received message is written to the Message RAM (put index) while the processor is reading from the Message RAM (get index). In this case inconsistent data may be read from the respective Rx FIFO element. Adding an offset to the get index when reading from the Rx FIFO avoids this problem. The offset depends on how fast the processor accesses the Rx FIFO. The figure below shows an offset of two with respect to the get index when reading the Rx FIFO. In this case the two messages stored in element 1 and 2 are lost.

**Figure 52-8. Rx FIFO Overflow Handling**

After reading from the Rx FIFO, the number of the last element read has to be written to the Rx FIFO Acknowledge Index MCAN\_RXFnA.FnA. This increments the get index to that element number. In case the put index has not been incremented to this Rx FIFO element, the Rx FIFO full condition is reset (MCAN\_RXFnS.FnF = '0').

### 52.5.4.3 Dedicated Rx Buffers

The MCAN supports up to 64 dedicated Rx Buffers. The start address of the dedicated Rx Buffer section is configured via MCAN\_RXBC.RBSA.

For each Rx Buffer, a Standard or Extended Message ID Filter Element with SFEC / EFEC = 7 and SFID2 / EFID2[10:9] = 0 has to be configured.

After a received message has been accepted by a filter element, the message is stored into the Rx Buffer in the Message RAM referenced by the filter element. The format is the same as for an Rx FIFO element. In addition, the flag MCAN\_IR.DRX (Message stored in dedicated Rx Buffer) in MCAN\_IR is set.

**Table 52-3. Example Filter Configuration for Rx Buffers**

Filter Element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
0	ID message 1	0	0

.....continued			
Filter Element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
1	ID message 2	0	1
2	ID message 3	0	2

After the last word of a matching received message has been written to the Message RAM, the respective New Data flag in the New Data 1 register (MCAN\_NDAT1) and New Data 2 register (MCAN\_NDAT2) is set. As long as the New Data flag is set, the respective Rx Buffer is locked against updates from received matching frames. The New Data flags have to be reset by the processor by writing a '1' to the respective bit position.

While an Rx Buffer's New Data flag is set, a Message ID Filter Element referencing this specific Rx Buffer will not match, causing the acceptance filtering to continue. Following Message ID Filter Elements may cause the received message to be stored into another Rx Buffer, or into an Rx FIFO, or the message may be rejected, depending on filter configuration.

#### 52.5.4.3.1 Rx Buffer Handling

- Reset interrupt flag IR.DRX
- Read New Data registers
- Read messages from Message RAM
- Reset New Data flags of processed messages

#### 52.5.4.4 Debug on CAN Support

Debug messages are stored into Rx Buffers. For debug handling three consecutive Rx buffers (e.g. #61, #62, #63) have to be used for storage of debug messages A, B, and C. The format is the same as for an Rx Buffer or an Rx FIFO element (see [Rx Buffer and FIFO Element](#)).

Advantage: Fixed start address for the DMA transfers (relative to MCAN\_RXBC.RBSA), no additional configuration required.

For filtering of debug messages Standard / Extended Filter Elements with SFEC / EFEC = '111' have to be set up. Messages matching these filter elements are stored into the Rx Buffers addressed by SFID2 / EFID2[5:0].

After message C has been stored, the DMA request output m\_can\_dma\_req is activated and the three messages can be read from the Message RAM under DMA control. The RAM words holding the debug messages will not be changed by the MCAN while m\_can\_dma\_req is activated. The behavior is similar to that of an Rx Buffer with its New Data flag set.

After the DMA has completed, the MCAN is prepared to receive the next set of debug messages.

##### 52.5.4.4.1 Filtering for Debug Messages

Filtering for debug messages is done by configuring one Standard / Extended Message ID Filter Element for each of the three debug messages. To enable a filter element to filter for debug messages SFEC / EFEC has to be programmed to "111". In this case fields SFID1 / SFID2 and EFID1 / EFID2 have a different meaning. While SFID2 / EFID2[10:9] controls the debug message handling state machine, SFID2 / EFID2[5:0] controls the location for storage of a received debug message.

When a debug message is stored, neither the respective New Data flag nor MCAN\_IR.DRX are set. The reception of debug messages can be monitored via RXF1S.DMS.

**Table 52-4. Example Filter Configuration for Debug Messages**

Filter Element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
0	ID debug message A	1	11 1101
1	ID debug message B	2	11 1110
2	ID debug message C	3	11 1111

#### 52.5.4.4.2 Debug Message Handling

The debug message handling state machine ensures that debug messages are stored to three consecutive Rx Buffers in the correct order. If some messages are missing, the process is restarted. The DMA request is activated only when all three debug messages A, B, C have been received in the correct order.

The status of the debug message handling state machine is signalled via MCAN\_RXF1S.DMS.

**Figure 52-9. Debug Message Handling State Machine**

- T0: reset m\_can\_dma\_req output, enable reception of debug messages A, B, and C
- T1: reception of debug message A
- T2: reception of debug message A
- T3: reception of debug message C
- T4: reception of debug message B
- T5: reception of debug messages A, B
- T6: reception of debug message C
- T7: DMA transfer completed
- T8: reception of debug message A,B,C (message rejected)

#### 52.5.5 Tx Handling

The Tx Handler handles transmission requests for the dedicated Tx Buffers, the Tx FIFO, and the Tx Queue. It controls the transfer of transmit messages to the CAN Core, the Put and Get Indices, and the Tx Event FIFO. Up to 32 Tx Buffers can be set up for message transmission. The CAN mode for transmission (Classic CAN or CAN FD) can be configured separately for each Tx Buffer element. The Tx

Buffer element is described in [Tx Buffer Element](#). The table below describes the possible configurations for frame transmission.

**Table 52-5. Possible Configurations for Frame Transmission**

MCAN_CCCR		Tx Buffer Element		Frame Transmission
BRSE	FDOE	FDF	BRS	
ignored	0	ignored	ignored	Classic CAN
0	1	0	ignored	Classic CAN
0	1	1	ignored	FD without bit rate switching
1	1	0	ignored	Classic CAN
1	1	1	0	FD without bit rate switching
1	1	1	1	FD with bit rate switching

**Note:** AUTOSAR requires at least three Tx Queue Buffers and support of transmit cancellation.

The Tx Handler starts a Tx scan to check for the highest priority pending Tx request (Tx Buffer with lowest Message ID) when MCAN\_TXBRP is updated, or when a transmission has been started.

### 52.5.5.1 Transmit Pause

The transmit pause feature is intended for use in CAN systems where the CAN message identifiers are (permanently) specified to specific values and cannot easily be changed. These message identifiers may have a higher CAN arbitration priority than other defined messages, while in a specific application their relative arbitration priority should be inverse. This may lead to a case where one ECU sends a burst of CAN messages that cause another ECU's CAN messages to be delayed because that other messages have a lower CAN arbitration priority.

If e.g. CAN ECU-1 has the transmit pause feature enabled and is requested by its application software to transmit four messages, it will, after the first successful message transmission, wait for two CAN bit times of bus idle before it is allowed to start the next requested message. If there are other ECUs with pending messages, those messages are started in the idle time, they would not need to arbitrate with the next message of ECU-1. After having received a message, ECU-1 is allowed to start its next transmission as soon as the received message releases the CAN bus.

The transmit pause feature is controlled by bit MCAN\_CCCR.TXP. If the bit is set, the MCAN will, each time it has successfully transmitted a message, pause for two CAN bit times before starting the next transmission. This enables other CAN nodes in the network to transmit messages even if their messages have lower prior identifiers. Default is transmit pause disabled (MCAN\_CCCR.TXP = '0').

This feature looses up burst transmissions coming from a single node and it protects against “babbling idiot” scenarios where the application program erroneously requests too many transmissions.

### 52.5.5.2 Dedicated Tx Buffers

Dedicated Tx Buffers are intended for message transmission under complete control of the processor. Each dedicated Tx Buffer is configured with a specific Message ID. In case that multiple Tx Buffers are configured with the same Message ID, the Tx Buffer with the lowest buffer number is transmitted first.

If the data section has been updated, a transmission is requested by an Add Request via MCAN\_TXBAR.ARn. The requested messages arbitrate internally with messages from an optional Tx FIFO or Tx Queue and externally with messages on the CAN bus, and are sent out according to their Message ID.

A dedicated Tx Buffer allocates Element Size 32-bit words in the Message RAM (see the table below). Therefore the start address of a dedicated Tx Buffer in the Message RAM is calculated by adding transmit buffer index (0...31) × Element Size to the Tx Buffer Start Address TXBC.TBSA.

**Table 52-6. Tx Buffer / FIFO / Queue Element Size**

TXESC.TBDS[2:0]	Data Field [bytes]	Element Size [RAM words]
0	8	4
1	12	5
2	16	6
3	20	7
4	24	8
5	32	10
6	48	14
7	64	18

### 52.5.5.3 Tx FIFO

Tx FIFO operation is configured by programming MCAN\_TXBC.TFQM to '0'. Messages stored in the Tx FIFO are transmitted starting with the message referenced by the Get Index MCAN\_TXFQS.TFGI. After each transmission the Get Index is incremented cyclically until the Tx FIFO is empty. The Tx FIFO enables transmission of messages with the same Message ID from different Tx Buffers in the order these messages have been written to the Tx FIFO. The MCAN calculates the Tx FIFO Free Level MCAN\_TXFQS.TFFL as difference between Get and Put Index. It indicates the number of available (free) Tx FIFO elements.

New transmit messages have to be written to the Tx FIFO starting with the Tx Buffer referenced by the Put Index MCAN\_TXFQS.TFQPI. An Add Request increments the Put Index to the next free Tx FIFO element. When the Put Index reaches the Get Index, Tx FIFO Full (MCAN\_TXFQS.TFQF = '1') is signalled. In this case no further messages should be written to the Tx FIFO until the next message has been transmitted and the Get Index has been incremented.

When a single message is added to the Tx FIFO, the transmission is requested by writing a '1' to the TXBAR bit related to the Tx Buffer referenced by the Tx FIFO's Put Index.

When multiple (n) messages are added to the Tx FIFO, they are written to n consecutive Tx Buffers starting with the Put Index. The transmissions are then requested via MCAN\_TXBAR. The Put Index is then cyclically incremented by n. The number of requested Tx buffers should not exceed the number of free Tx Buffers as indicated by the Tx FIFO Free Level.

When a transmission request for the Tx Buffer referenced by the Get Index is cancelled, the Get Index is incremented to the next Tx Buffer with pending transmission request and the Tx FIFO Free Level is recalculated. When transmission cancellation is applied to any other Tx Buffer, the Get Index and the FIFO Free Level remain unchanged.

A Tx FIFO element allocates Element Size 32-bit words in the Message RAM (see the table [Table 52-6](#)). Therefore the start address of the next available (free) Tx FIFO Buffer is calculated by adding Tx FIFO/ Queue Put Index MCAN\_TXFQS.TFQPI (0...31) × Element Size to the Tx Buffer Start Address MCAN\_TXBC.TBSA.

### 52.5.5.4 Tx Queue

Tx Queue operation is configured by programming MCAN\_TXBC.TFQM to '1'. Messages stored in the Tx Queue are transmitted starting with the message with the lowest Message ID (highest priority). In case that multiple Queue Buffers are configured with the same Message ID, the Queue Buffer with the lowest buffer number is transmitted first.

New messages have to be written to the Tx Buffer referenced by the Put Index MCAN\_TXFQS.TFQPI. An Add Request cyclically increments the Put Index to the next free Tx Buffer. In case that the Tx Queue is full (MCAN\_TXFQS.TFQF = '1'), the Put Index is not valid and no further message should be written to the Tx Queue until at least one of the requested messages has been sent out or a pending transmission request has been cancelled.

The application may use register MCAN\_TXBRP instead of the Put Index and may place messages to any Tx Buffer without pending transmission request.

A Tx Queue Buffer allocates Element Size 32-bit words in the Message RAM (see the table [Tx Buffer / FIFO / Queue Element Size](#)). Therefore the start address of the next available (free) Tx Queue Buffer is calculated by adding Tx FIFO/Queue Put Index MCAN\_TXFQS.TFQPI (0...31) × Element Size to the Tx Buffer Start Address MCAN\_TXBC.TBSA.

### 52.5.5.5 Mixed Dedicated Tx Buffers / Tx FIFO

In this case the Tx Buffers section in the Message RAM is subdivided into a set of dedicated Tx Buffers and a Tx FIFO. The number of dedicated Tx Buffers is configured by MCAN\_TXBC.NDTB. The number of Tx Buffers assigned to the Tx FIFO is configured by MCAN\_TXBC.TFQS. In case MCAN\_TXBC.TFQS is programmed to zero, only dedicated Tx Buffers are used.

**Figure 52-10. Example of Mixed Configuration Dedicated Tx Buffers / Tx FIFO**

Tx prioritization:

- Scan dedicated Tx Buffers and oldest pending Tx FIFO Buffer (referenced by MCAN\_TXFS.TFGI)
- Buffer with lowest Message ID gets highest priority and is transmitted next

### 52.5.5.6 Mixed Dedicated Tx Buffers / Tx Queue

In this case the Tx Buffers section in the Message RAM is subdivided into a set of dedicated Tx Buffers and a Tx Queue. The number of dedicated Tx Buffers is configured by MCAN\_TXBC.NDTB. The number of Tx Queue Buffers is configured by MCAN\_TXBC.TFQS. In case MCAN\_TXBC.TFQS is programmed to zero, only dedicated Tx Buffers are used.

**Figure 52-11. Example of Mixed Configuration Dedicated Tx Buffers / Tx Queue**

Tx prioritization:

- Scan all Tx Buffers with activated transmission request
- Tx Buffer with lowest Message ID gets highest priority and is transmitted next

### 52.5.5.7 Transmit Cancellation

The MCAN supports transmit cancellation. This feature is especially intended for gateway applications and AUTOSAR-based applications. To cancel a requested transmission from a dedicated Tx Buffer or a Tx Queue Buffer, the processor has to write a '1' to the corresponding bit position (=number of Tx Buffer) of register MCAN\_TXBCR. Transmit cancellation is not intended for Tx FIFO operation.

Successful cancellation is signalled by setting the corresponding bit of register MCAN\_TXBCF to '1'.

In case a transmit cancellation is requested while a transmission from a Tx Buffer is already ongoing, the corresponding TXBRP bit remains set as long as the transmission is in progress. If the transmission was successful, the corresponding MCAN\_TXBTO and MCAN\_TXBCF bits are set. If the transmission was not successful, it is not repeated and only the corresponding MCAN\_TXBCF bit is set.

**Note:** In case a pending transmission is cancelled immediately before this transmission could have been started, there follows a short time window where no transmission is started even if another message is also pending in this node. This may enable another node to transmit a message which may have a lower priority than the second message in this node.

### 52.5.5.8 Tx Event Handling

To support Tx event handling the MCAN has implemented a Tx Event FIFO. After the MCAN has transmitted a message on the CAN bus, Message ID and timestamp are stored in a Tx Event FIFO element. To link a Tx event to a Tx Event FIFO element, the Message Marker from the transmitted Tx Buffer is copied into the Tx Event FIFO element.

The Tx Event FIFO can be configured to a maximum of 32 elements. The Tx Event FIFO element is described in [Debug on CAN Support](#).

When a Tx Event FIFO full condition is signalled by IR.TEFF, no further elements are written to the Tx Event FIFO until at least one element has been read out and the Tx Event FIFO Get Index has been incremented. In case a Tx event occurs while the Tx Event FIFO is full, this event is discarded and interrupt flag MCAN\_IR.TEFL is set.

To avoid a Tx Event FIFO overflow, the Tx Event FIFO watermark can be used. When the Tx Event FIFO fill level reaches the Tx Event FIFO watermark configured by MCAN\_TXEFC.EFWM, interrupt flag MCAN\_IR.TEFW is set.

When reading from the Tx Event FIFO, two times the Tx Event FIFO Get Index MCAN\_TXEFS.EFGI has to be added to the Tx Event FIFO start address MCAN\_TXEFC.EFSA.

### 52.5.6 FIFO Acknowledge Handling

The Get Indices of Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO are controlled by writing to the corresponding FIFO Acknowledge Index in the registers MCAN\_RXF0A, MCAN\_RXF1A and MCAN\_TXEFA. Writing to the FIFO Acknowledge Index will set the FIFO Get Index to the FIFO Acknowledge Index plus one and thereby updates the FIFO Fill Level. There are two use cases:

When only a single element has been read from the FIFO (the one being pointed to by the Get Index), this Get Index value is written to the FIFO Acknowledge Index.

When a sequence of elements has been read from the FIFO, it is sufficient to write the FIFO Acknowledge Index only once at the end of that read sequence (value: Index of the last element read), to update the FIFO's Get Index.

Due to the fact that the processor has free access to the MCAN's Message RAM, special care has to be taken when reading FIFO elements in an arbitrary order (Get Index not considered). This might be useful when reading a High Priority Message from one of the two Rx FIFOs. In this case the FIFO's Acknowledge Index should not be written because this would set the Get Index to a wrong position and also alters the FIFO's Fill Level. In this case some of the older FIFO elements would be lost.

**Note:** The application has to ensure that a valid value is written to the FIFO Acknowledge Index. The MCAN does not check for erroneous values.

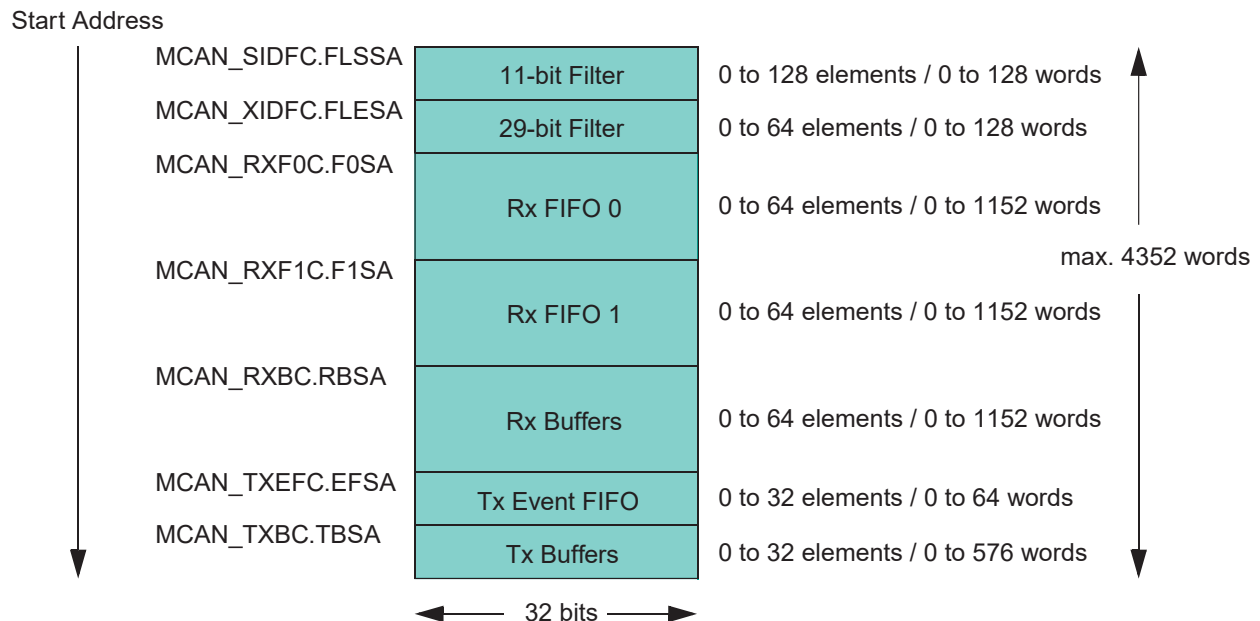

### 52.5.7 Message RAM

#### 52.5.7.1 Message RAM Configuration

The Message RAM has a width of 32 bits. The MCAN module can be configured to allocate up to 4352 words in the Message RAM. It is not necessary to configure each of the sections listed in the figure below, nor is there any restriction with respect to the sequence of the sections.

When operated in CAN FD mode, the required Message RAM size depends on the element size configured for Rx FIFO0, Rx FIFO1, Rx Buffers, and Tx Buffers via MCAN\_RXESC.F0DS, MCAN\_RXESC.F1DS, MCAN\_RXESC.RBDS, and MCAN\_TXESC.TBDS.

**Figure 52-12. Message RAM Configuration**

When the MCAN addresses the Message RAM, it addresses 32-bit words, not single bytes. The configurable start addresses are 32-bit word addresses; i.e., only bits 15 to 2 are evaluated, the two least significant bits are ignored.

**Note:** The MCAN does not check for erroneous configuration of the Message RAM. The configuration of the start addresses of the different sections and the number of elements of each section must be checked carefully to avoid falsification or loss of data.

### 52.5.7.2 Rx Buffer and FIFO Element

Up to 64 Rx Buffers and two Rx FIFOs can be configured in the Message RAM. Each Rx FIFO section can be configured to store up to 64 received messages. The structure of a Rx Buffer / FIFO element is shown in the table below. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register MCAN\_RXESC.

**Table 52-7. Rx Buffer and FIFO Element**

	31				24	23						16	15			8	7			0
R0	ESI	XTD	RTR	ID[28:0]																
R1	ANMF	FIDX[6:0]				–	FDX	BRS	DLC[3:0]				RXTS[15:0]							
R2	DB3[7:0]				DB2[7:0]				DB1[7:0]				DB0[7:0]							
R3	DB7[7:0]				DB6[7:0]				DB5[7:0]				DB4[7:0]							
...	...				...				...				...							
Rn	DBm[7:0]				DBm-1[7:0]				DBm-2[7:0]				DBm-3[7:0]							

- R0 Bit 31 ESI: Error State Indicator

0: Transmitting node is error active.

1: Transmitting node is error passive.

- R0 Bit 30 XTD: Extended Identifier

Signals to the processor whether the received frame has a standard or extended identifier.

0: 11-bit standard identifier.

1: 29-bit extended identifier.

- R0 Bit 29 RTR: Remote Transmission Request

Signals to the processor whether the received frame is a data frame or a remote frame.

0: Received frame is a data frame.

1: Received frame is a remote frame.

**Note:** There are no remote frames in CAN FD format. In case a CAN FD frame was received (FDX = 1), bit RTR reflects the state of the reserved bit r1.

- R0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

- R1 Bit 31 ANMF: Accepted Non-matching Frame

Acceptance of non-matching frames may be enabled via MCAN\_GFC.ANFS and MCAN\_GFC.ANFE.

0: Received frame matching filter index FIDX.

1: Received frame did not match any Rx filter element.

- R1 Bits 30:24 FIDX[6:0]: Filter Index

0-127: Index of matching Rx acceptance filter element (invalid if ANMF = '1').  
Range is 0 to MCAN\_SIDFC.LSS - 1 resp. MCAN\_XIDFC.LSE - 1.

- R1 Bit 21 FDF: FD Format

0: Standard frame format.

1: CAN FD frame format (new DLC-coding and CRC).

- R1 Bit 20 BRS: Bit Rate Switch

0: Frame received without bit rate switching.

1: Frame received with bit rate switching.

**Note:**

Bits ESI, FDF, and BRS are only evaluated when CAN FD operation is enabled (MCAN\_CCCR.FDOE = 1). Bit BRS is only evaluated when in addition MCAN\_CCCR.BRSE = 1.

- R1 Bits 19:16 DLC[3:0]: Data Length Code

0-8: CAN + CAN FD: received frame has 0-8 data bytes.

9-15: CAN: received frame has 8 data bytes.

9-15: CAN FD: received frame has 12/16/20/24/32/48/64 data bytes.

- R1 Bits 15:0 RXTS[15:0]: Rx Timestamp

Timestamp Counter value captured on start of frame reception. Resolution depending on configuration of the Timestamp Counter Prescaler MCAN\_TSCC.TCP.

- R2 Bits 31:24 DB3[7:0]: Data Byte 3

- R2 Bits 23:16 DB2[7:0]: Data Byte 2

- R2 Bits 15:8 DB1[7:0]: Data Byte 1

- R2 Bits 7:0 DB0[7:0]: Data Byte 0

- R3 Bits 31:24 DB7[7:0]: Data Byte 7

- R3 Bits 23:16 DB6[7:0]: Data Byte 6

- R3 Bits 15:8 DB5[7:0]: Data Byte 5

- R3 Bits 7:0 DB4[7:0]: Data Byte 4

... ..

- Rn Bits 31:24 DBm[7:0]: Data Byte m

- Rn Bits 23:16 DBm-1[7:0]: Data Byte m-1

- Rn Bits 15:8 DBm-2[7:0]: Data Byte m-2

- Rn Bits 7:0 DBm-3[7:0]: Data Byte m-3

**Note:** Depending on the configuration of the element size (MCAN\_RXESC), between two and sixteen 32-bit words (Rn = 3 .. 17) are used for storage of a CAN message's data field.

### 52.5.7.3 Tx Buffer Element

The Tx Buffers section can be configured to hold dedicated Tx Buffers as well as a Tx FIFO / Tx Queue. In case that the Tx Buffers section is shared by dedicated Tx buffers and a Tx FIFO / Tx Queue, the dedicated Tx Buffers start at the beginning of the Tx Buffers section followed by the buffers assigned to the Tx FIFO or Tx Queue. The Tx Handler distinguishes between dedicated Tx Buffers and Tx FIFO / Tx Queue by evaluating the Tx Buffer configuration TXBC.TFQS and TXBC.NDTB. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register TXESC.

**Table 52-8. Tx Buffer Element**

	31			24	23						16	15				8	7					0
T0	ESI	XTD	RTR	ID[28:0]																		
T1	MM[7:0]				EFC	reserved	fdf	BRS	DLC[3:0]				reserved									
T2	DB3[7:0]				DB2[7:0]								DB1[7:0]				DB0[7:0]					
T3	DB7[7:0]				DB6[7:0]								DB5[7:0]				DB4[7:0]					
...	...				...								...				...					
Tn	DBm[7:0]				DBm-1[7:0]								DBm-2[7:0]				DBm-3[7:0]					

- T0 Bit 30 ESI: Error State Indicator

T0 Bit 31 ESI: Error State Indicator

0: ESI bit in CAN FD format depends only on error passive flag

1: ESI bit in CAN FD format transmitted recessive

**Note:** The ESI bit of the transmit buffer is or'ed with the error passive flag to decide the value of the ESI bit in the transmitted FD frame. As required by the CAN FD protocol specification, an error active node may optionally transmit the ESI bit recessive, but an error passive node will always transmit the ESI bit recessive. This feature can be used in gateway applications when a message from an error passive node is routed to another CAN network.

- T0 Bit 30 XTD: Extended Identifier

0: 11-bit standard identifier.

1: 29-bit extended identifier.

- T0 Bit 29 RTR: Remote Transmission Request

0: Transmit data frame.

1: Transmit remote frame.

**Note:** When RTR = 1, the MCAN transmits a remote frame according to ISO11898-1, even if MCAN\_CCCR.FDOE enables the transmission in CAN FD format.

- T0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier has to be written to ID[28:18].

- T1 Bits 31:24 MM[7:0]: Message Marker

Written by processor during Tx Buffer configuration. Copied into Tx Event FIFO element for identification of Tx message status.

- T1 Bit 23 EFC: Event FIFO Control

0: Do not store Tx events.

1: Store Tx events.

- T1 Bit 21 FDF: FD Format

0: Frame transmitted in Classic CAN format

1: Frame transmitted in CAN FD format

- T1 Bit 20 BRS: Bit Rate Switching

0: CAN FD frames transmitted without bit rate switching

1: CAN FD frames transmitted with bit rate switching

**Note:**

Bits ESI, FDF, and BRS are only evaluated when CAN FD operation is enabled (MCAN\_CCCR.FDOE = 1). Bit BRS is only evaluated when in addition MCAN\_CCCR.BRSE = 1.

- T1 Bits 19:16 DLC[3:0]: Data Length Code

0-8: CAN + CAN FD: transmit frame has 0-8 data bytes.

9-15: CAN: transmit frame has 8 data bytes.

9-15: CAN FD: transmit frame has 12/16/20/24/32/48/64 data bytes.

- T2 Bits 31:24 DB3[7:0]: Data Byte 3

- T2 Bits 23:16 DB2[7:0]: Data Byte 2

- T2 Bits 15:8 DB1[7:0]: Data Byte 1

- T2 Bits 7:0 DB0[7:0]: Data Byte 0

- T3 Bits 31:24 DB7[7:0]: Data Byte 7

- T3 Bits 23:16 DB6[7:0]: Data Byte 6

- T3 Bits 15:8 DB5[7:0]: Data Byte 5

- T3 Bits 7:0 DB4[7:0]: Data Byte 4

... ..

- Tn Bits 31:24 DBm[7:0]: Data Byte m

- Tn Bits 23:16 DBm-1[7:0]: Data Byte m-1

- Tn Bits 15:8 DBm-2[7:0]: Data Byte m-2

- Tn Bits 7:0 DBm-3[7:0]: Data Byte m-3

**Note:** Depending on the configuration of the element size (MCAN\_TXESC), between two and sixteen 32-bit words (Tn = 3 ..17) are used for storage of a CAN message's data field.

#### 52.5.7.4 Tx Event FIFO Element

Each element stores information about transmitted messages. By reading the Tx Event FIFO the processor gets this information in the order the messages were transmitted. Status information about the Tx Event FIFO can be obtained from register TXEFS.

**Table 52-9. Tx Event FIFO Element**

	31				24	23					16	15	8	7	0
E0	ESI	XTD	RTR	ID[28:0]											
E1	MM[7:0]					ET [1:0]	FDF	BRS	DLC[3:0]	TXTS[15:0]					

- E0 Bit 31 ESI: Error State Indicator  
0: Transmitting node is error active.  
1: Transmitting node is error passive.
- E0 Bit 30 XTD: Extended Identifier  
0: 11-bit standard identifier.  
1: 29-bit extended identifier.
- E0 Bit 29 RTR: Remote Transmission Request  
0: Data frame transmitted.  
1: Remote frame transmitted.
- E0 Bits 28:0 ID[28:0]: Identifier  
Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].
- E1 Bits 31:24 MM[7:0]: Message Marker  
Copied from Tx Buffer into Tx Event FIFO element for identification of Tx message status.
- E1 Bit 23:22 ET[1:0]: Event Type  
0: Reserved  
1: Tx event  
2: Transmission in spite of cancellation (always set for transmissions in DAR mode)  
3: Reserved
- E1 Bit 21 FDF: FD Format  
0: Standard frame format.  
1: CAN FD frame format (new DLC-coding and CRC).
- E1 Bit 20 BRS: Bit Rate Switch  
0: Frame transmitted without bit rate switching.  
1: Frame transmitted with bit rate switching.
- E1 Bits 19:16 DLC[3:0]: Data Length Code  
0-8: CAN + CAN FD: frame with 0-8 data bytes transmitted.  
9-15: CAN: frame with 8 data bytes transmitted.  
9-15: CAN FD: frame with 12/16/20/24/32/48/64 data bytes transmitted
- E1 Bits 15:0 TXTS[15:0]: Tx Timestamp

Timestamp Counter value captured on start of frame transmission. Resolution depending on configuration of the Timestamp Counter Prescaler MCAN\_TSCC.TCP.

#### 52.5.7.5 Standard Message ID Filter Element

Up to 128 filter elements can be configured for 11-bit standard IDs. When accessing a Standard Message ID Filter element, its address is the Filter List Standard Start Address MCAN\_SIDFC.FLSSA plus the index of the filter element (0...127).

**Table 52-10. Standard Message ID Filter Element**

	31					24	23		16	15		8	7		0
S0	SFT[1:0]		SFEC [2:0]		SFID1[10:0]			–	SFID2[10:0]						

- Bits 31:30 SFT[1:0]: Standard Filter Type
  - 0: Range filter from SF1ID to SF2ID (SF2ID ≥ SF1ID)
  - 1: Dual ID filter for SF1ID or SF2ID
  - 2: Classic filter: SF1ID = filter, SF2ID = mask
  - 3: Reserved
- Bit 29:27 SFEC[2:0]: Standard Filter Element Configuration

All enabled filter elements are used for acceptance filtering of standard frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If SFEC = “100”, “101”, or “110” a match sets interrupt flag MCAN\_IR.HPM and, if enabled, an interrupt is generated. In this case register HPMS is updated with the status of the priority match.

- 0: Disable filter element
- 1: Store in Rx FIFO 0 if filter matches
- 2: Store in Rx FIFO 1 if filter matches
- 3: Reject ID if filter matches
- 4: Set priority if filter matches
- 5: Set priority and store in FIFO 0 if filter matches
- 6: Set priority and store in FIFO 1 if filter matches
- 7: Store into Rx Buffer or as debug message, configuration of SFT[1:0] ignored

- Bits 26:16 SFID1[10:0]: Standard Filter ID 1  
First ID of standard ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of a standard message to be stored. The received identifiers must match exactly, no masking mechanism is used.

- Bits 10:0 SFID2[10:0]: Standard Filter ID 2

This field has a different meaning depending on the configuration of SFEC:

- SFEC = “001”...“110”–Second ID of standard ID filter element
- SFEC = “111”–Filter for Rx Buffers or for debug messages

SFID2[10:9] decides whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.

- 0: Store message in a Rx buffer
- 1: Debug Message A
- 2: Debug Message B
- 3: Debug Message C

SFID2[5:0] defines the index of the dedicated Rx Buffer element to which a matching message is stored.

### 52.5.7.6 Extended Message ID Filter Element

Up to 64 filter elements can be configured for 29-bit extended IDs. When accessing an Extended Message ID Filter element, its address is the Filter List Extended Start Address MCAN\_XIDFC.FLESA plus two times the index of the filter element (0...63).

**Table 52-11. Extended Message ID Filter Element**

	31			24	23		16	15	8	7	0
F0	EFEC [2:0]			EFID1[28:0]							
F1	EFT[1:0]		–	EFID2[28:0]							

- F0 Bit 31:29 EFEC[2:0]: Extended Filter Element Configuration

All enabled filter elements are used for acceptance filtering of extended frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If EFEC = “100”, “101”, or “110”, a match sets the interrupt flag MCAN\_IR.HPM and, if enabled, an interrupt is generated. In this case, register MCAN\_HPMS is updated with the status of the priority match.

- 0: Disable filter element
- 1: Store in Rx FIFO 0 if filter matches
- 2: Store in Rx FIFO 1 if filter matches
- 3: Reject ID if filter matches
- 4: Set priority if filter matches
- 5: Set priority and store in FIFO 0 if filter matches
- 6: Set priority and store in FIFO 1 if filter matches
- 7: Store into Rx Buffer or as debug message, configuration of EFT[1:0] ignored

- F0 Bits 28:0 EFID1[28:0]: Extended Filter ID 1

First ID of extended ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of an extended message to be stored. The received identifiers must match exactly, only MCAN\_XIDAM masking mechanism (see [Extended Message ID Filtering](#)) is used.

- F1 Bits 31:30 EFT[1:0]: Extended Filter Type
- 0: Range filter from EF1ID to EF2ID (EF2ID ≥ EF1ID)

1: Dual ID filter for EF1ID or EF2ID

2: Classic filter: EF1ID = filter, EF2ID = mask

3: Range filter from EF1ID to EF2ID ( $EF2ID \geq EF1ID$ ), MCAN\_XIDAM mask not applied

- F1 Bits 28:0 EFID2[28:0]: Extended Filter ID 2

This field has a different meaning depending on the configuration of EFEC:

- EFEC = “001”...“110”–Second ID of extended ID filter element

- EFEC = “111”–Filter for Rx Buffers or for debug messages

EFID2[10:9] decides whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.

0: Store message in an Rx buffer

1: Debug Message A

2: Debug Message B

3: Debug Message C

EFID2[5:0] defines the index of the dedicated Rx Buffer element to which a matching message is stored.

#### **52.5.8 Hardware Reset Description**

After hardware reset, the registers of the MCAN hold the reset values listed in the register descriptions. Additionally the Bus\_Off state is reset and the output CANTX is set to recessive (HIGH). The value 0x0001 (MCAN\_CCCR.INIT = ‘1’) in the CC Control register enables software initialization. The MCAN does not influence the CAN bus until the processor resets MCAN\_CCCR.INIT to ‘0’.

#### **52.5.9 Access to Reserved Register Addresses**

In case the application software accesses one of the reserved addresses in the MCAN register map (read or write access), interrupt flag MCAN\_IR.ARA is set and, if enabled, the selected interrupt line is risen.

## 52.6 Register Summary

Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – CSV[31:0]** Customer-specific Value  
 Customer-specific value.

### 52.6.3 MCAN Data Bit Timing and Prescaler Register

**Name:** MCAN\_DBTP  
**Offset:** 0x0C  
**Reset:** 0x00000A33  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

The CAN bit time may be programmed in the range of 4 to 25 time quanta. The CAN time quantum may be programmed in the range of 1 to 32 CAN core clock periods.  $t_q = (DBRP + 1)$  CAN core clock periods.

DTSEG1 is the sum of Prop\_Seg and Phase\_Seg1. DTSEG2 is Phase\_Seg2.

Therefore the length of the bit time is (programmed values)  $[DTSEG1 + DTSEG2 + 3] t_q$   
 or (functional values)  $[Sync\_Seg + Prop\_Seg + Phase\_Seg1 + Phase\_Seg2] t_q$ .

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

With a CAN core clock frequency of 8 MHz, the reset value of 0x00000A33 configures the MCAN for a fast bit rate of 500 kbit/s.

The bit rate configured for the CAN FD data phase via MCAN\_DBTP must be higher than or equal to the bit rate configured for the arbitration phase via MCAN\_NBTP.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	TDC				DBRP[4:0]			
Access	R/W		R/W		R/W	R/W	R/W	R/W
Reset	0		0		0	0	0	0
Bit	15	14	13	12	11	10	9	8
					DTSEG1[4:0]			
Access			R/W		R/W	R/W	R/W	R/W
Reset			0		1	0	1	0
Bit	7	6	5	4	3	2	1	0
	DTSEG2[3:0]					DSJW[2:0]		
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	1	1		0	1	1

**Bit 23 – TDC** Transmitter Delay Compensation  
 0 (DISABLED): Transmitter Delay Compensation disabled.  
 1 (ENABLED): Transmitter Delay Compensation enabled.

**Bits 20:16 – DBRP[4:0]** Data Bit Rate Prescaler

The value by which the peripheral clock is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Bit Rate Prescaler are 0 to 31. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

**Bits 12:8 – DTSEG1[4:0]** Data Time Segment Before Sample Point

0: Forbidden.

1 to 31: The duration of time segment is  $t_q \times (DTSEG1 + 1)$ .

**Bits 7:4 – DTSEG2[3:0]** Data Time Segment After Sample Point

The duration of time segment is  $t_q \times (DTSEG2 + 1)$ .

**Bits 2:0 – DSJW[2:0]** Data (Re) Synchronization Jump Width

The duration of a synchronization jump is  $t_q \times (DSJW + 1)$ .

### 52.6.4 MCAN Test Register

**Name:** MCAN\_TEST  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

Write access to the Test Register has to be enabled by setting bit MCAN\_CCCR.TEST to '1'.

All MCAN Test Register functions are set to their reset values when bit MCAN\_CCCR.TEST is cleared.

Loop Back mode and software control of pin CANTX are hardware test modes. Programming of TX ≠ 0 disturbs the message transfer on the CAN bus.

The reset value for MCAN\_TEST.RX is undefined.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	RX	TX[1:0]		LBCK				
Access	R	R/W		R/W				
Reset	x	0		0				

**Bit 7 – RX** Receive Pin (read-only)  
Monitors the actual value of pin CANRX.

The reset value for this bit is undefined.

Value	Description
0	The CAN bus is dominant (CANRX = '0').
1	The CAN bus is recessive (CANRX = '1').

**Bits 6:5 – TX[1:0]** Control of Transmit Pin (read/write)

Value	Name	Description
0	RESET	Reset value, CANTX controlled by the CAN Core, updated at the end of the CAN bit time.
1	SAMPLE_POINT_MONITORING	Sample Point can be monitored at pin CANTX.
2	DOMINANT	Dominant ('0') level at pin CANTX.

# SAMA5D2 Series

## Controller Area Network (MCAN)

---

---

Value	Name	Description
3	RECESSIVE	Recessive ('1') at pin CANTX.

**Bit 4 – LBCK** Loop Back Mode (read/write)

0 (DISABLED): Reset value. Loop Back mode is disabled.

1 (ENABLED): Loop Back mode is enabled (see [Test Modes](#)).

### 52.6.5 MCAN RAM Watchdog Register

**Name:** MCAN\_RWD  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read/Write

The RAM Watchdog monitors the Message RAM response time. A Message RAM access via the MCAN's Generic Master Interface starts the Message RAM Watchdog Counter with the value configured by MCAN\_RWD.WDC. The counter is reloaded with MCAN\_RWD.WDC when the Message RAM signals successful completion by activating its READY output. In case there is no response from the Message RAM until the counter has counted down to zero, the counter stops and interrupt flag MCAN\_IR.WDI is set. The RAM Watchdog Counter is clocked by the system bus clock (peripheral clock).

	31	30	29	28	27	26	25	24
Access								
Reset								
	23	22	21	20	19	18	17	16
Access								
Reset								
	15	14	13	12	11	10	9	8
	WDV[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
	WDC[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 15:8 – WDV[7:0]** Watchdog Value (read-only)  
 Watchdog Counter Value for the current message located in RAM.

**Bits 7:0 – WDC[7:0]** Watchdog Configuration (read/write)  
 Start value of the Message RAM Watchdog Counter. The counter is disabled when WDC is cleared.

### 52.6.6 MCAN CC Control Register

**Name:** MCAN\_CCCR  
**Offset:** 0x18  
**Reset:** 0x00000001  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
		TXP	EFBI	PXHD			BRSE	FDOE
Access		R/W	R/W	R/W			R/W	R/W
Reset		0	0	0			0	0
Bit	7	6	5	4	3	2	1	0
	TEST	DAR	MON	CSR	CSA	ASM	CCE	INIT
Access	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	1

**Bit 14 – TXP** Transmit Pause (read/write, write protection)

If this bit is set, the MCAN pauses for two CAN bit times before starting the next transmission after itself has successfully transmitted a frame (see [Tx Handling](#)).

Value	Description
0	Transmit pause disabled.
1	Transmit pause enabled.

**Bit 13 – EFBI** Edge Filtering during Bus Integration (read/write, write protection)

Value	Description
0	Edge filtering is disabled.
1	Edge filtering is enabled. Two consecutive dominant tq required to detect an edge for hard synchronization.

**Bit 12 – PXHD** Protocol Exception Event Handling (read/write, write protection)

Value	Description
0	Protocol exception handling enabled.
1	Protocol exception handling disabled.

**Bit 9 – BRSE** Bit Rate Switching Enable (read/write, write protection)

0 (DISABLED): Bit rate switching for transmissions disabled.

1 (ENABLED): Bit rate switching for transmissions enabled.

**Bit 8 – FDOE** CAN FD Operation Enable (read/write, write protection)

0 (DISABLED): FD operation disabled.

1 (ENABLED): FD operation enabled.

**Bit 7 – TEST** Test Mode Enable (read/write, write protection against '1')

0 (DISABLED): Normal operation, MCAN\_TEST register holds reset values.

1 (ENABLED): Test mode, write access to MCAN\_TEST register enabled.

**Bit 6 – DAR** Disable Automatic Retransmission (read/write, write protection)

0 (AUTO\_RETX): Automatic retransmission of messages not transmitted successfully enabled.

1 (NO\_AUTO\_RETX): Automatic retransmission disabled.

**Bit 5 – MON** Bus Monitoring Mode (read/write, write protection against '1')

0 (DISABLED): Bus Monitoring mode is disabled.

1 (ENABLED): Bus Monitoring mode is enabled.

**Bit 4 – CSR** Clock Stop Request (read/write)

0 (NO\_CLOCK\_STOP): No clock stop is requested.

1 (CLOCK\_STOP): Clock stop requested. When clock stop is requested, first INIT and then CSA will be set after all pending transfer requests have been completed and the CAN bus reached idle.

**Bit 3 – CSA** Clock Stop Acknowledge (read-only)

Value	Description
0	No clock stop acknowledged.
1	MCAN may be set in power down by stopping the peripheral clock and the CAN core clock.

**Bit 2 – ASM** Restricted Operation Mode (read/write, write protection against '1')

For a description of the Restricted Operation mode see [Restricted Operation Mode](#).

0 (NORMAL): Normal CAN operation.

1 (RESTRICTED): Restricted Operation mode active.

**Bit 1 – CCE** Configuration Change Enable (read/write, write protection)

0 (PROTECTED): The processor has no write access to the protected configuration registers.

1 (CONFIGURABLE): The processor has write access to the protected configuration registers (while MCAN\_CCCR.INIT = '1').

**Bit 0 – INIT** Initialization (read/write)

Due to the synchronization mechanism between the two clock domains, there may be a delay until the value written to INIT can be read back. Therefore the programmer has to ensure that the previous value written to INIT has been accepted by reading INIT before setting INIT to a new value.

0 (DISABLED): Normal operation.

1 (ENABLED): Initialization is started.

### 52.6.7 MCAN Nominal Bit Timing and Prescaler Register

**Name:** MCAN\_NBTP  
**Offset:** 0x1C  
**Reset:** 0x06000A03  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN\_CCCR.

The CAN bit time may be programmed in the range of 4 to 385 time quanta. The CAN time quantum may be programmed in the range of 1 to 512 CAN core clock periods.  $t_q = t_{\text{core clock}} \times (\text{NBRP} + 1)$ .

NTSEG1 is the sum of Prop\_Seg and Phase\_Seg1. NTSEG2 is Phase\_Seg2.

Therefore the length of the bit time is (programmed values)  $[\text{NTSEG1} + \text{NTSEG2} + 3] t_q$   
 or (functional values)  $[\text{Sync\_Seg} + \text{Prop\_Seg} + \text{Phase\_Seg1} + \text{Phase\_Seg2}] t_q$ .

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

With a CAN core clock frequency of 8 MHz, the reset value of 0x06000A03 configures the MCAN for a bit rate of 500 kbit/s.

	Bit	31	30	29	28	27	26	25	24
		NSJW[6:0]						NBRP[8:8]	
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	1	1	0
	Bit	23	22	21	20	19	18	17	16
		NBRP[7:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		NTSEG1[7:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	1	0	1	0
	Bit	7	6	5	4	3	2	1	0
			NTSEG2[6:0]						
Access			R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	1	1

**Bits 31:25 – NSJW[6:0]** Nominal (Re) Synchronization Jump Width  
 0 to 127: The duration of a synchronization jump is  $t_q \times (\text{NSJW} + 1)$ .

**Bits 24:16 – NBRP[8:0]** Nominal Bit Rate Prescaler  
 0 to 511: The value by which the oscillator frequency is divided for generating the CAN time quanta. The CAN time is built up from a multiple of this quanta. CAN time quantum ( $t_q$ ) =  $t_{\text{core clock}} \times (\text{NBRP} + 1)$

**Bits 15:8 – NTSEG1[7:0]** Nominal Time Segment Before Sample Point

# SAMA5D2 Series

## Controller Area Network (MCAN)

Value	Description
0	Reserved; do not use.
1 to 255	The duration of time segment is $t_q \times (\text{NTSEG1} + 1)$ .

### Bits 6:0 – NTSEG2[6:0] Nominal Time Segment After Sample Point

Value	Description
0	Reserved; do not use.
1 to 127	The duration of time segment is $t_q \times (\text{NTSEG2} + 1)$ .

### 52.6.8 MCAN Timestamp Counter Configuration Register

**Name:** MCAN\_TSCC  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read/Write

For a description of the Timestamp Counter see [Timestamp Generation](#).

With CAN FD, an external counter is required for timestamp generation (TSS = 2).

**Bits 19:16 – TCP[3:0]** Timestamp Counter Prescaler

Configures the timestamp and timeout counters time unit in multiples of CAN bit times [ 1...16 ]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

**Bits 1:0 – TSS[1:0]** Timestamp Select

Value	Name	Description
0	ALWAYS_0	Timestamp counter value always 0x0000
1	TCP_INC	Timestamp counter value incremented according to TCP
2	EXT_TIMESTAMP	External timestamp counter value used
3	ALWAYS_0	Timestamp counter value always 0x0000

### 52.6.9 MCAN Timestamp Counter Value Register

**Name:** MCAN\_TSCV  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 15:0 – TSC[15:0]** Timestamp Counter (cleared on write)

The internal/external Timestamp Counter value is captured on start of frame (both Receive and Transmit). When MCAN\_TSCC.TSS = 1, the Timestamp Counter is incremented in multiples of CAN bit times [ 1... 16 ] depending on the configuration of MCAN\_TSCC.TCP. A wrap around sets interrupt flag MCAN\_IR.TSW. Write access resets the counter to zero.

When MCAN\_TSCC.TSS = 2, TSC reflects the external Timestamp Counter value. Thus a write access has no impact.

**Note:** A “wrap around” is a change of the Timestamp Counter value from non-zero to zero not caused by write access to MCAN\_TSCV.

### 52.6.10 MCAN Timeout Counter Configuration Register

**Name:** MCAN\_TOCC  
**Offset:** 0x28  
**Reset:** 0xFFFF0000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

For a description of the Timeout Counter, see [Timeout Counter](#).

Bit	31	30	29	28	27	26	25	24	
	TOP[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	1	1	1	1	1	1	1	1	
Bit	23	22	21	20	19	18	17	16	
	TOP[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	1	1	1	1	1	1	1	1	
Bit	15	14	13	12	11	10	9	8	
Access									
Reset									
Bit	7	6	5	4	3	2	1	0	
						TOS[1:0]		ETOC	
Access						R/W	R/W	R/W	
Reset						0	0	0	

**Bits 31:16 – TOP[15:0]** Timeout Period

Start value of the Timeout Counter (down-counter). Configures the Timeout Period.

**Bits 2:1 – TOS[1:0]** Timeout Select

When operating in Continuous mode, a write to MCAN\_TOCV presets the counter to the value configured by MCAN\_TOCC.TOP and continues down-counting. When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MCAN\_TOCC.TOP. Down-counting is started when the first FIFO element is stored.

Value	Name	Description
0	CONTINUOUS	Continuous operation.
1	TX_EV_TIMEOUT	Timeout controlled by Tx Event FIFO.
2	RX0_EV_TIMEOUT	Timeout controlled by Receive FIFO 0.
3	RX1_EV_TIMEOUT	Timeout controlled by Receive FIFO 1.

**Bit 0 – ETOC** Enable Timeout Counter

0 (NO\_TIMEOUT): Timeout Counter disabled.

1 (TOS\_CONTROLLED): Timeout Counter enabled.

# SAMA5D2 Series

## Controller Area Network (MCAN)

---

---

For use of timeout function with CAN FD, see [Timeout Counter](#).

### 52.6.11 MCAN Timeout Counter Value Register

**Name:** MCAN\_TOCV  
**Offset:** 0x2C  
**Reset:** 0x0000FFFF  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	TOC[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1
Bit	7	6	5	4	3	2	1	0
	TOC[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

**Bits 15:0 – TOC[15:0]** Timeout Counter (cleared on write)

The Timeout Counter is decremented in multiples of CAN bit times [ 1...16 ] depending on the configuration of MCAN\_TSCC.TCP. When decremented to zero, interrupt flag MCAN\_IR.TOO is set and the Timeout Counter is stopped. Start and reset/restart conditions are configured via MCAN\_TOCC.TOS.

### 52.6.12 MCAN Error Counter Register

**Name:** MCAN\_ECR  
**Offset:** 0x40  
**Reset:** 0x00000000  
**Property:** Read-only

When MCAN\_CCCR.ASM is set, the CAN protocol controller does not increment TEC and REC when a CAN protocol error is detected, but CEL is still incremented.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	CEL[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	RP	REC[6:0]						
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	TEC[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 23:16 – CEL[7:0]** CAN Error Logging (cleared on read)

The counter is incremented each time when a CAN protocol error causes the Transmit Error Counter or the Receive Error Counter to be incremented. It is reset by read access to CEL. The counter stops at 0xFF; the next increment of TEC or REC sets interrupt flag IR.ELO.

**Bit 15 – RP** Receive Error Passive

Value	Description
0	The Receive Error Counter is below the error passive level of 128.
1	The Receive Error Counter has reached the error passive level of 128.

**Bits 14:8 – REC[6:0]** Receive Error Counter

Actual state of the Receive Error Counter, values between 0 and 127.

**Bits 7:0 – TEC[7:0]** Transmit Error Counter

Actual state of the Transmit Error Counter, values between 0 and 255.

### 52.6.13 MCAN Protocol Status Register

**Name:** MCAN\_PSR  
**Offset:** 0x44  
**Reset:** 0x00000707  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	[Greyed out]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	TDCV[6:0]							
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	PXE		RFDF	RBRS	RESI	DLEC[2:0]		
Access								
Reset		0	0	0	0	1	1	1
Bit	7	6	5	4	3	2	1	0
	BO	EW	EP	ACT[1:0]		LEC[2:0]		
Access	R	R	R	R	R			
Reset	0	0	0	0	0	1	1	1

**Bits 22:16 – TDCV[6:0]** Transmitter Delay Compensation Value  
 0 to 127: Position of the secondary sample point, in CAN core clock periods, defined by the sum of the measured delay from CANTX to CANRX and MCAN\_TDCR.TDCO.

**Bit 14 – PXE** Protocol Exception Event (cleared on read)

Value	Description
0	No protocol exception event occurred since last read access
1	Protocol exception event occurred

**Bit 13 – RFDF** Received a CAN FD Message (cleared on read)  
 This bit is set independently from acceptance filtering.

Value	Description
0	Since this bit was reset by the CPU, no CAN FD message has been received
1	Message in CAN FD format with FDF flag set has been received

**Bit 12 – RBRS** BRS Flag of Last Received CAN FD Message (cleared on read)  
 This bit is set together with RFDF, independently from acceptance filtering.

Value	Description
0	Last received CAN FD message did not have its BRS flag set.

# SAMA5D2 Series

## Controller Area Network (MCAN)

Value	Description
1	Last received CAN FD message had its BRS flag set.

**Bit 11 – RESI** ESI Flag of Last Received CAN FD Message (cleared on read)  
This bit is set together with RFDF, independently from acceptance filtering.

Value	Description
0	Last received CAN FD message did not have its ESI flag set.
1	Last received CAN FD message had its ESI flag set.

**Bits 10:8 – DLEC[2:0]** Data Phase Last Error Code (set to 111 on read)  
Type of last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. Coding is the same as for LEC. This field will be cleared to zero when a CAN FD format frame with its BRS flag set has been transferred (reception or transmission) without error.

**Bit 7 – BO** Bus\_Off Status

Value	Description
0	The MCAN is not Bus_Off.
1	The MCAN is in Bus_Off state.

**Bit 6 – EW** Warning Status

Value	Description
0	Both error counters are below the Error_Warning limit of 96.
1	At least one of error counter has reached the Error_Warning limit of 96.

**Bit 5 – EP** Error Passive

Value	Description
0	The MCAN is in the Error_Active state. It normally takes part in bus communication and sends an active error flag when an error has been detected.
1	The MCAN is in the Error_Passive state.

**Bits 4:3 – ACT[1:0]** Activity  
Monitors the CAN communication state of the CAN module.

Value	Name	Description
0	SYNCHRONIZING	Node is synchronizing on CAN communication
1	IDLE	Node is neither receiver nor transmitter
2	RECEIVER	Node is operating as receiver
3	TRANSMITTER	Node is operating as transmitter

**Bits 2:0 – LEC[2:0]** Last Error Code (set to 111 on read)  
The LEC indicates the type of the last error to occur on the CAN bus. This field is cleared when a message has been transferred (reception or transmission) without error.

Value	Name	Description
0	NO_ERROR	No error occurred since LEC has been reset by successful reception or transmission.
1	STUFF_ERROR	More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed.

# SAMA5D2 Series

## Controller Area Network (MCAN)

Value	Name	Description
2	FORM_ERROR	A fixed format part of a received frame has the wrong format.
3	ACK_ERROR	The message transmitted by the MCAN was not acknowledged by another node.
4	BIT1_ERROR	During transmission of a message (with the exception of the arbitration field), the device tried to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant.
5	BIT0_ERROR	During transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device tried to send a dominant level (data or identifier bit logical value '0'), but the monitored bus value was recessive. During Bus_Off recovery, this status is set each time a sequence of 11 recessive bits has been monitored. This enables the processor to monitor the proceeding of the Bus_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed).
6	CRC_ERROR	The CRC check sum of a received message was incorrect. The CRC of an incoming message does not match the CRC calculated from the received data.
7	NO_CHANGE	Any read access to the Protocol Status Register re-initializes the LEC to '7'. When the LEC shows value '7', no CAN bus event was detected since the last processor read access to the Protocol Status Register.

**52.6.14 MCAN Transmitter Delay Compensation Register**

**Name:** MCAN\_TDCR  
**Offset:** 0x48  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 14:8 – TDCO[6:0]** Transmitter Delay Compensation Offset  
 0 to 127: Offset value, in CAN core clock periods, defining the distance between the measured delay from CANTX to CANRX and the secondary sample point.

**Bits 6:0 – TDCF[6:0]** Transmitter Delay Compensation Filter  
 0 to 127: defines the minimum value for the SSP position, in CAN core clock periods. Dominant edges on CANRX that would result in an earlier SSP position are ignored for transmitter delay measurement. The feature is enabled when TDCF is configured to a value greater than TDCO.

### 52.6.15 MCAN Interrupt Register

**Name:** MCAN\_IR  
**Offset:** 0x50  
**Reset:** 0x00000000  
**Property:** Read/Write

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the processor clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register. The configuration of IE controls whether an interrupt is generated. The configuration of ILS controls on which interrupt line an interrupt is signalled.

	Bit	31	30	29	28	27	26	25	24
				ARA	PED	PEA	WDI	BO	EW
Access				R/W	R/W	R/W	R/W	R/W	R/W
Reset				0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		EP	ELO			DRX	TOO	MRAF	TSW
Access		R/W	R/W			R/W	R/W	R/W	R/W
Reset		0	0			0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		TEFL	TEFF	TEFW	TEFN	TFE	TCF	TC	HPM
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		RF1L	RF1F	RF1W	RF1N	RF0L	RF0F	RF0W	RF0N
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0

#### Bit 29 – ARA Access to Reserved Address

Value	Description
0	No access to reserved address occurred
1	Access to reserved address occurred

#### Bit 28 – PED Protocol Error in Data Phase

Value	Description
0	No protocol error in data phase
1	Protocol error in data phase detected (MCAN_PSR.DLEC differs from 0 or 7)

#### Bit 27 – PEA Protocol Error in Arbitration Phase

Value	Description
0	No protocol error in arbitration phase
1	Protocol error in arbitration phase detected (MCAN_PSR.LEC differs from 0 or 7)

**Bit 26 – WDI** Watchdog Interrupt

Value	Description
0	No Message RAM Watchdog event occurred.
1	Message RAM Watchdog event due to missing READY.

**Bit 25 – BO** Bus\_Off Status

Value	Description
0	Bus_Off status unchanged.
1	Bus_Off status changed.

**Bit 24 – EW** Warning Status

Value	Description
0	Error_Warning status unchanged.
1	Error_Warning status changed.

**Bit 23 – EP** Error Passive

Value	Description
0	Error_Passive status unchanged.
1	Error_Passive status changed.

**Bit 22 – ELO** Error Logging Overflow

Value	Description
0	CAN Error Logging Counter did not overflow.
1	Overflow of CAN Error Logging Counter occurred.

**Bit 19 – DRX** Message stored to Dedicated Receive Buffer

The flag is set whenever a received message has been stored into a dedicated Receive Buffer.

Value	Description
0	No Receive Buffer updated.
1	At least one received message stored into a Receive Buffer.

**Bit 18 – TOO** Timeout Occurred

Value	Description
0	No timeout.
1	Timeout reached.

**Bit 17 – MRAF** Message RAM Access Failure

The flag is set, when the Rx Handler

- has not completed acceptance filtering or storage of an accepted message until the arbitration field of the following message has been received. In this case acceptance filtering or message storage is aborted and the Rx Handler starts processing of the following message.
- was not able to write a message to the Message RAM. In this case message storage is aborted.

In both cases the FIFO put index is not updated resp. the New Data flag for a dedicated Receive Buffer is not set, a partly stored message is overwritten when the next message is stored to this location.

The flag is also set when the Tx Handler was not able to read a message from the Message RAM in time. In this case message transmission is aborted. In case of a Tx Handler access failure the MCAN is switched into Restricted Operation mode (see [Restricted Operation Mode](#)). To leave Restricted Operation mode, the processor has to reset MCAN\_CCCR.ASM.

Value	Description
0	No Message RAM access failure occurred.
1	Message RAM access failure occurred.

### Bit 16 – TSW Timestamp Wraparound

Value	Description
0	No timestamp counter wrap-around.
1	Timestamp counter wrapped around.

### Bit 15 – TEFL Tx Event FIFO Element Lost

Value	Description
0	No Tx Event FIFO element lost.
1	Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero.

### Bit 14 – TEFF Tx Event FIFO Full

Value	Description
0	Tx Event FIFO not full.
1	Tx Event FIFO full.

### Bit 13 – TEFW Tx Event FIFO Watermark Reached

Value	Description
0	Tx Event FIFO fill level below watermark.
1	Tx Event FIFO fill level reached watermark.

### Bit 12 – TEFN Tx Event FIFO New Entry

Value	Description
0	Tx Event FIFO unchanged.
1	Tx Handler wrote Tx Event FIFO element.

### Bit 11 – TFE Tx FIFO Empty

Value	Description
0	Tx FIFO non-empty.
1	Tx FIFO empty.

### Bit 10 – TCF Transmission Cancellation Finished

Value	Description
0	No transmission cancellation finished.
1	Transmission cancellation finished.

### Bit 9 – TC Transmission Completed

Value	Description
0	No transmission completed.
1	Transmission completed.

**Bit 8 – HPM** High Priority Message

Value	Description
0	No high priority message received.
1	High priority message received.

**Bit 7 – RF1L** Receive FIFO 1 Message Lost

Value	Description
0	No Receive FIFO 1 message lost.
1	Receive FIFO 1 message lost, also set after write attempt to Receive FIFO 1 of size zero.

**Bit 6 – RF1F** Receive FIFO 1 Full

Value	Description
0	Receive FIFO 1 not full.
1	Receive FIFO 1 full.

**Bit 5 – RF1W** Receive FIFO 1 Watermark Reached

Value	Description
0	Receive FIFO 1 fill level below watermark.
1	Receive FIFO 1 fill level reached watermark.

**Bit 4 – RF1N** Receive FIFO 1 New Message

Value	Description
0	No new message written to Receive FIFO 1.
1	New message written to Receive FIFO 1.

**Bit 3 – RF0L** Receive FIFO 0 Message Lost

Value	Description
0	No Receive FIFO 0 message lost.
1	Receive FIFO 0 message lost, also set after write attempt to Receive FIFO 0 of size zero.

**Bit 2 – RF0F** Receive FIFO 0 Full

Value	Description
0	Receive FIFO 0 not full.
1	Receive FIFO 0 full.

**Bit 1 – RF0W** Receive FIFO 0 Watermark Reached

Value	Description
0	Receive FIFO 0 fill level below watermark.
1	Receive FIFO 0 fill level reached watermark.

**Bit 0 – RF0N** Receive FIFO 0 New Message

<b>Value</b>	<b>Description</b>
0	No new message written to Receive FIFO 0.
1	New message written to Receive FIFO 0.

### 52.6.16 MCAN Interrupt Enable Register

**Name:** MCAN\_IE  
**Offset:** 0x54  
**Reset:** 0x00000000  
**Property:** Read/Write

The following configuration values are valid for all listed bit names of this register:

0: Disables the corresponding interrupt.

1: Enables the corresponding interrupt.

	Bit	31	30	29	28	27	26	25	24
				ARAE	PEDE	PEAE	WDIE	BOE	EWE
Access				R/W	R/W	R/W	R/W	R/W	R/W
Reset				0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		EPE	ELOE			DRXE	TOOE	MRAFE	TSWE
Access		R/W	R/W			R/W	R/W	R/W	R/W
Reset		0	0			0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		TEFLE	TEFFE	TEFWE	TEFNE	TFEE	TCFE	TCE	HPME
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		RF1LE	RF1FE	RF1WE	RF1NE	RF0LE	RF0FE	RF0WE	RF0NE
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0

**Bit 29 – ARAE** Access to Reserved Address Enable

**Bit 28 – PEDE** Protocol Error in Data Phase Enable

**Bit 27 – PEAE** Protocol Error in Arbitration Phase Enable

**Bit 26 – WDIE** Watchdog Interrupt Enable

**Bit 25 – BOE** Bus\_Off Status Interrupt Enable

**Bit 24 – EWE** Warning Status Interrupt Enable

**Bit 23 – EPE** Error Passive Interrupt Enable

**Bit 22 – ELOE** Error Logging Overflow Interrupt Enable

**Bit 19 – DRXE** Message stored to Dedicated Receive Buffer Interrupt Enable

- Bit 18 – TOOE** Timeout Occurred Interrupt Enable
- Bit 17 – MRAFE** Message RAM Access Failure Interrupt Enable
- Bit 16 – TSWE** Timestamp Wraparound Interrupt Enable
- Bit 15 – TEFLE** Tx Event FIFO Event Lost Interrupt Enable
- Bit 14 – TEFLE** Tx Event FIFO Full Interrupt Enable
- Bit 13 – TEFWE** Tx Event FIFO Watermark Reached Interrupt Enable
- Bit 12 – TEFNE** Tx Event FIFO New Entry Interrupt Enable
- Bit 11 – TFEE** Tx FIFO Empty Interrupt Enable
- Bit 10 – TCFE** Transmission Cancellation Finished Interrupt Enable
- Bit 9 – TCE** Transmission Completed Interrupt Enable
- Bit 8 – HPME** High Priority Message Interrupt Enable
- Bit 7 – RF1LE** Receive FIFO 1 Message Lost Interrupt Enable
- Bit 6 – RF1FE** Receive FIFO 1 Full Interrupt Enable
- Bit 5 – RF1WE** Receive FIFO 1 Watermark Reached Interrupt Enable
- Bit 4 – RF1NE** Receive FIFO 1 New Message Interrupt Enable
- Bit 3 – RF0LE** Receive FIFO 0 Message Lost Interrupt Enable
- Bit 2 – RF0FE** Receive FIFO 0 Full Interrupt Enable
- Bit 1 – RF0WE** Receive FIFO 0 Watermark Reached Interrupt Enable
- Bit 0 – RF0NE** Receive FIFO 0 New Message Interrupt Enable

### 52.6.17 MCAN Interrupt Line Select Register

**Name:** MCAN\_ILS  
**Offset:** 0x58  
**Reset:** 0x00000000  
**Property:** Read/Write

The Interrupt Line Select register assigns an interrupt generated by a specific interrupt flag from the Interrupt Register to one of the two module interrupt lines.

0: Interrupt assigned to interrupt line MCAN\_INT0.

1: Interrupt assigned to interrupt line MCAN\_INT1.

	Bit	31	30	29	28	27	26	25	24
				ARAL	PEDL	PEAL	WDIL	BOL	EWL
Access				R/W	R/W	R/W	R/W	R/W	R/W
Reset				0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		EPL	ELOL			DRXL	TOOL	MRAFL	TSWL
Access		R/W	R/W			R/W	R/W	R/W	R/W
Reset		0	0			0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		TEFLL	TEFFL	TEFWL	TEFNL	TFEL	TCFL	TCL	HPML
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		RF1LL	RF1FL	RF1WL	RF1NL	RF0LL	RF0FL	RF0WL	RF0NL
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0

**Bit 29 – ARAL** Access to Reserved Address Line

**Bit 28 – PEDL** Protocol Error in Data Phase Line

**Bit 27 – PEAL** Protocol Error in Arbitration Phase Line

**Bit 26 – WDIL** Watchdog Interrupt Line

**Bit 25 – BOL** Bus\_Off Status Interrupt Line

**Bit 24 – EWL** Warning Status Interrupt Line

**Bit 23 – EPL** Error Passive Interrupt Line

**Bit 22 – ELOL** Error Logging Overflow Interrupt Line

**Bit 19 – DRXL** Message stored to Dedicated Receive Buffer Interrupt Line

- Bit 18 – TOOL** Timeout Occurred Interrupt Line
- Bit 17 – MRAFL** Message RAM Access Failure Interrupt Line
- Bit 16 – TSWL** Timestamp Wraparound Interrupt Line
- Bit 15 – TEFL** Tx Event FIFO Event Lost Interrupt Line
- Bit 14 – TEFFL** Tx Event FIFO Full Interrupt Line
- Bit 13 – TEFWL** Tx Event FIFO Watermark Reached Interrupt Line
- Bit 12 – TEFNL** Tx Event FIFO New Entry Interrupt Line
- Bit 11 – TFEL** Tx FIFO Empty Interrupt Line
- Bit 10 – TCFL** Transmission Cancellation Finished Interrupt Line
- Bit 9 – TCL** Transmission Completed Interrupt Line
- Bit 8 – HPML** High Priority Message Interrupt Line
- Bit 7 – RF1LL** Receive FIFO 1 Message Lost Interrupt Line
- Bit 6 – RF1FL** Receive FIFO 1 Full Interrupt Line
- Bit 5 – RF1WL** Receive FIFO 1 Watermark Reached Interrupt Line
- Bit 4 – RF1NL** Receive FIFO 1 New Message Interrupt Line
- Bit 3 – RF0LL** Receive FIFO 0 Message Lost Interrupt Line
- Bit 2 – RF0FL** Receive FIFO 0 Full Interrupt Line
- Bit 1 – RF0WL** Receive FIFO 0 Watermark Reached Interrupt Line
- Bit 0 – RF0NL** Receive FIFO 0 New Message Interrupt Line

### 52.6.18 MCAN Interrupt Line Enable

**Name:** MCAN\_ILE  
**Offset:** 0x5C  
**Reset:** 0x00000000  
**Property:** Read/Write

Each of the two interrupt lines to the processor can be enabled/disabled separately by programming bits EINT0 and EINT1.

#### Bit 1 – EINT1 Enable Interrupt Line 1

Value	Description
0	Interrupt line MCAN_INT1 disabled.
1	Interrupt line MCAN_INT1 enabled.

#### Bit 0 – EINT0 Enable Interrupt Line 0

Value	Description
0	Interrupt line MCAN_INT0 disabled.
1	Interrupt line MCAN_INT0 enabled.

### 52.6.19 MCAN Global Filter Configuration

**Name:** MCAN\_GFC  
**Offset:** 0x80  
**Reset:** 0x00000000  
**Property:** Read/Write

Global settings for Message ID filtering. The Global Filter Configuration controls the filter path for standard and extended messages as illustrated in [Standard Message ID Filter Path](#) and [Extended Message ID Filter Path](#).

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

**Bits 5:4 – ANFS[1:0]** Accept Non-matching Frames Standard

Defines how received messages with 11-bit IDs that do not match any element of the filter list are treated.

Value	Name	Description
0	RX_FIFO_0	Accept in Rx FIFO 0
1	RX_FIFO_1	Accept in Rx FIFO 1
2-3	REJECTED	Message rejected

**Bits 3:2 – ANFE[1:0]** Accept Non-matching Frames Extended

Defines how received messages with 29-bit IDs that do not match any element of the filter list are treated.

Value	Name	Description
0	RX_FIFO_0	Accept in Rx FIFO 0
1	RX_FIFO_1	Accept in Rx FIFO 1
2-3	REJECTED	Message rejected

**Bit 1 – RRFS** Reject Remote Frames Standard

0 (FILTER): Filter remote frames with 11-bit standard IDs.

1 (REJECT): Reject all remote frames with 11-bit standard IDs.

**Bit 0 – RRFE** Reject Remote Frames Extended

0 (FILTER): Filter remote frames with 29-bit extended IDs.

1 (REJECT): Reject all remote frames with 29-bit extended IDs.

### 52.6.20 MCAN Standard ID Filter Configuration

**Name:** MCAN\_SIDFC  
**Offset:** 0x84  
**Reset:** 0x00000000  
**Property:** Read/Write

Settings for 11-bit standard Message ID filtering. The Standard ID Filter Configuration controls the filter path for standard messages as illustrated in [Standard Message ID Filter Path](#).

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	LSS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	FLSSA[13:6]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	FLSSA[5:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W		
Reset	0	0	0	0	0	0		

**Bits 23:16 – LSS[7:0]** List Size Standard  
 >128: Values greater than 128 are interpreted as 128.

Value	Description
0	No standard Message ID filter.
1-128	Number of standard Message ID filter elements.

**Bits 15:2 – FLSSA[13:0]** Filter List Standard Start Address  
 Start address of standard Message ID filter list (32-bit word address, see [Message RAM Configuration](#)).

Write FLSSA with the bits [15:2] of the 32-bit address.

### 52.6.21 MCAN Extended ID Filter Configuration

**Name:** MCAN\_XIDFC  
**Offset:** 0x88  
**Reset:** 0x00000000  
**Property:** Read/Write

Settings for 29-bit extended Message ID filtering. The Extended ID Filter Configuration controls the filter path for standard messages as described in [Extended Message ID Filter Path](#).

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
	LSE[6:0]								
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset		0	0	0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	
	FLESA[13:6]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
	FLESA[5:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W			
Reset	0	0	0	0	0	0			

#### Bits 22:16 – LSE[6:0] List Size Extended

Value	Description
0	No extended Message ID filter.
1–64	Number of extended Message ID filter elements.
>64	Values greater than 64 are interpreted as 64.

#### Bits 15:2 – FLESA[13:0] Filter List Extended Start Address

Start address of extended Message ID filter list (32-bit word address, see [Message RAM Configuration](#)).

Write FLESA with the bits [15:2] of the 32-bit address.

### 52.6.22 MCAN Extended ID AND Mask

**Name:** MCAN\_XIDAM  
**Offset:** 0x90  
**Reset:** 0x1FFFFFFF  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

Bit	31	30	29	28	27	26	25	24
	EIDM[28:24]							
Access				R/W	R/W	R/W	R/W	R/W
Reset				1	1	1	1	1
Bit	23	22	21	20	19	18	17	16
	EIDM[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1
Bit	15	14	13	12	11	10	9	8
	EIDM[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1
Bit	7	6	5	4	3	2	1	0
	EIDM[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

#### Bits 28:0 – EIDM[28:0] Extended ID Mask

For acceptance filtering of extended frames the Extended ID AND Mask is ANDed with the Message ID of a received frame. Intended for masking of 29-bit IDs in SAE J1939. With the reset value of all bits set to one the mask is not active.

### 52.6.23 MCAN High Priority Message Status

**Name:** MCAN\_HPMS  
**Offset:** 0x94  
**Reset:** 0x00000000  
**Property:** Read-only

This register is updated every time a Message ID filter element configured to generate a priority event matches. This can be used to monitor the status of incoming high priority messages and to enable fast access to these messages.

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
Access									
Reset									
Bit	15	14	13	12	11	10	9	8	
	FLST		FIDX[6:0]						
Access	R	R	R	R	R	R	R	R	
Reset	0	0	0	0	0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
	MSI[1:0]		BIDX[5:0]						
Access	R	R	R	R	R	R	R	R	
Reset	0	0	0	0	0	0	0	0	

**Bit 15 – FLST** Filter List  
Indicates the filter list of the matching filter element.

Value	Description
0	Standard filter list
1	Extended filter list

**Bits 14:8 – FIDX[6:0]** Filter Index  
Index of matching filter element. Range is 0 to MCAN\_SIDFC.LSS - 1 resp. MCAN\_XIDFC.LSE - 1.

**Bits 7:6 – MSI[1:0]** Message Storage Indicator

Value	Name	Description
0	NO_FIFO_SEL	No FIFO selected.
1	LOST	FIFO message lost.
2	FIFO_0	Message stored in FIFO 0.
3	FIFO_1	Message stored in FIFO 1.

**Bits 5:0 – BIDX[5:0]** Buffer Index

Index of Receive FIFO element to which the message was stored. Only valid when MSI[1] = '1'.

### 52.6.24 MCAN New Data 1

**Name:** MCAN\_NDAT1  
**Offset:** 0x98  
**Reset:** 0x00000000

The register holds the New Data flags of Receive Buffers 0 to 31. The flags are set when the respective Receive Buffer has been updated from a received frame. The flags remain set until the processor clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register.

Value	Description
0	Receive Buffer not updated
1	Receive Buffer updated from new message

### 52.6.25 MCAN New Data 2

**Name:** MCAN\_NDAT2  
**Offset:** 0x9C  
**Reset:** 0x00000000

The register holds the New Data flags of Receive Buffers 32 to 63. The flags are set when the respective Receive Buffer has been updated from a received frame. The flags remain set until the processor clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register.

Value	Description
0	Receive Buffer not updated.
1	Receive Buffer updated from new message.

### 52.6.26 MCAN Receive FIFO 0 Configuration

**Name:** MCAN\_RXF0C  
**Offset:** 0xA0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

	Bit	31	30	29	28	27	26	25	24	
		F0OM		F0WM[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset		0	0	0	0	0	0	0	0	
	Bit	23	22	21	20	19	18	17	16	
		F0S[6:0]								
Access			R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset			0	0	0	0	0	0	0	
	Bit	15	14	13	12	11	10	9	8	
		F0SA[13:6]								
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset		0	0	0	0	0	0	0	0	
	Bit	7	6	5	4	3	2	1	0	
		F0SA[5:0]								
Access		R/W	R/W	R/W	R/W	R/W	R/W			
Reset		0	0	0	0	0	0			

#### Bit 31 – F0OM FIFO 0 Operation Mode

FIFO 0 can be operated in Blocking or in Overwrite mode (see [Rx FIFOs](#)).

Value	Description
0	FIFO 0 Blocking mode.
1	FIFO 0 Overwrite mode.

#### Bits 30:24 – F0WM[6:0] Receive FIFO 0 Watermark

Value	Description
0	Watermark interrupt disabled.
1–64	Level for Receive FIFO 0 watermark interrupt (MCAN_IR.RF0W).
>64	Watermark interrupt disabled.

#### Bits 22:16 – F0S[6:0] Receive FIFO 0 Size

The Receive FIFO 0 elements are indexed from 0 to F0S-1.

Value	Description
0	No Receive FIFO 0
1–64	Number of Receive FIFO 0 elements.
>64	Values greater than 64 are interpreted as 64.

**Bits 15:2 – F0SA[13:0]** Receive FIFO 0 Start Address

Start address of Receive FIFO 0 in Message RAM (32-bit word address, see [Message RAM Configuration](#)).

Write F0SA with the bits [15:2] of the 32-bit address.

### 52.6.27 MCAN Receive FIFO 0 Status

**Name:** MCAN\_RXF0S  
**Offset:** 0xA4  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
							RF0L	F0F
Access							R	R
Reset							0	0
Bit	23	22	21	20	19	18	17	16
			F0PI[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
			F0GI[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	F0FL[6:0]							
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0

**Bit 25 – RF0L** Receive FIFO 0 Message Lost

This bit is a copy of interrupt flag MCAN\_IR.RF0L. When MCAN\_IR.RF0L is reset, this bit is also reset.

Overwriting the oldest message when MCAN\_RXF0C.F0OM = '1' will not set this flag.

Value	Description
0	No Receive FIFO 0 message lost
1	Receive FIFO 0 message lost, also set after write attempt to Receive FIFO 0 of size zero

**Bit 24 – F0F** Receive FIFO 0 Full

Value	Description
0	Receive FIFO 0 not full.
1	Receive FIFO 0 full.

**Bits 21:16 – F0PI[5:0]** Receive FIFO 0 Put Index

Receive FIFO 0 write index pointer, range 0 to 63.

**Bits 13:8 – F0GI[5:0]** Receive FIFO 0 Get Index

Receive FIFO 0 read index pointer, range 0 to 63.

**Bits 6:0 – F0FL[6:0]** Receive FIFO 0 Fill Level

Number of elements stored in Receive FIFO 0, range 0 to 64.

### 52.6.28 MCAN Receive FIFO 0 Acknowledge

**Name:** MCAN\_RXF0A  
**Offset:** 0xA8  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 5:0 – F0AI[5:0]** Receive FIFO 0 Acknowledge Index

After the processor has read a message or a sequence of messages from Receive FIFO 0 it has to write the buffer index of the last element read from Receive FIFO 0 to F0AI. This will set the Receive FIFO 0 Get Index MCAN\_RXF0S.F0GI to F0AI + 1 and update the FIFO 0 Fill Level MCAN\_RXF0S.F0FL.

**52.6.29 MCAN Receive Buffer Configuration**

**Name:** MCAN\_RXBC  
**Offset:** 0xAC  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 15:2 – RBSA[13:0] Receive Buffer Start Address**

Configures the start address of the Receive Buffers section in the Message RAM (32-bit word address, see [Message RAM Configuration](#)). Also used to reference debug messages A,B,C.

Write RBSA with the bits [15:2] of the 32-bit address.

### 52.6.30 MCAN Receive FIFO 1 Configuration

**Name:** MCAN\_RXF1C  
**Offset:** 0xB0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

Bit	31	30	29	28	27	26	25	24	
	F1OM		F1WM[6:0]						
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	0	
Bit	23	22	21	20	19	18	17	16	
			F1S[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset		0	0	0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	
	F1SA[13:6]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
	F1SA[5:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W			
Reset	0	0	0	0	0	0			

#### Bit 31 – F1OM FIFO 1 Operation Mode

FIFO 1 can be operated in Blocking or in Overwrite mode (see [Rx FIFOs](#)).

Value	Description
0	FIFO 1 Blocking mode.
1	FIFO 1 Overwrite mode.

#### Bits 30:24 – F1WM[6:0] Receive FIFO 1 Watermark

Value	Description
0	Watermark interrupt disabled
1–64	Level for Receive FIFO 1 watermark interrupt (MCAN_IR.RF1W).
>64	Watermark interrupt disabled.

#### Bits 22:16 – F1S[6:0] Receive FIFO 1 Size

The elements in Receive FIFO 1 are indexed from 0 to F1S - 1.

Value	Description
0	No Receive FIFO 1
1–64	Number of elements in Receive FIFO 1.
>64	Values greater than 64 are interpreted as 64.

**Bits 15:2 – F1SA[13:0]** Receive FIFO 1 Start Address

Start address of Receive FIFO 1 in Message RAM (32-bit word address, see [Message RAM Configuration](#)).

Write F1SA with the bits [15:2] of the 32-bit address.

### 52.6.31 MCAN Receive FIFO 1 Status

**Name:** MCAN\_RXF1S  
**Offset:** 0xB4  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24	
	DMS[1:0]						RF1L	F1F	
Access	R	R					R	R	
Reset	0	0					0	0	
Bit	23	22	21	20	19	18	17	16	
			F1PI[5:0]						
Access			R	R	R	R	R	R	
Reset			0	0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	
			F1GI[5:0]						
Access			R	R	R	R	R	R	
Reset			0	0	0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
		F1FL[6:0]							
Access		R	R	R	R	R	R	R	
Reset		0	0	0	0	0	0	0	

#### Bits 31:30 – DMS[1:0] Debug Message Status

Value	Name	Description
0	IDLE	Idle state, wait for reception of debug messages, DMA request is cleared.
1	MSG_A	Debug message A received.
2	MSG_AB	Debug messages A, B received.
3	MSG_ABC	Debug messages A, B, C received, DMA request is set.

#### Bit 25 – RF1L Receive FIFO 1 Message Lost

This bit is a copy of interrupt flag IR.RF1L. When IR.RF1L is reset, this bit is also reset.

Overwriting the oldest message when MCAN\_RXF1C.F1OM = '1' will not set this flag.

Value	Description
0	No Receive FIFO 1 message lost.
1	Receive FIFO 1 message lost, also set after write attempt to Receive FIFO 1 of size zero.

#### Bit 24 – F1F Receive FIFO 1 Full

Value	Description
0	Receive FIFO 1 not full.
1	Receive FIFO 1 full.

**Bits 21:16 – F1PI[5:0]** Receive FIFO 1 Put Index  
Receive FIFO 1 write index pointer, range 0 to 63.

**Bits 13:8 – F1GI[5:0]** Receive FIFO 1 Get Index  
Receive FIFO 1 read index pointer, range 0 to 63.

**Bits 6:0 – F1FL[6:0]** Receive FIFO 1 Fill Level  
Number of elements stored in Receive FIFO 1, range 0 to 64.

### 52.6.32 MCAN Receive FIFO 1 Acknowledge

**Name:** MCAN\_RXF1A  
**Offset:** 0xB8  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 5:0 – F1AI[5:0]** Receive FIFO 1 Acknowledge Index

After the processor has read a message or a sequence of messages from Receive FIFO 1 it has to write the buffer index of the last element read from Receive FIFO 1 to F1AI. This will set the Receive FIFO 1 Get Index MCAN\_RXF1S.F1GI to F1AI + 1 and update the FIFO 1 Fill Level MCAN\_RXF1S.F1FL.

### 52.6.33 MCAN Receive Buffer / FIFO Element Size Configuration

**Name:** MCAN\_RXESC  
**Offset:** 0xBC  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

Configures the number of data bytes belonging to a Receive Buffer / Receive FIFO element. Data field sizes >8 bytes are intended for CAN FD operation only.

In case the data field size of an accepted CAN frame exceeds the data field size configured for the matching Receive Buffer or Receive FIFO, only the number of bytes as configured by MCAN\_RXESC are stored to the Receive Buffer resp. Receive FIFO element. The rest of the frame's data field is ignored.

#### Bits 10:8 – RBDS[2:0] Receive Buffer Data Field Size

Value	Name	Description
0	8_BYTE	8-byte data field
1	12_BYTE	12-byte data field
2	16_BYTE	16-byte data field
3	20_BYTE	20-byte data field
4	24_BYTE	24-byte data field
5	32_BYTE	32-byte data field
6	48_BYTE	48-byte data field
7	64_BYTE	64-byte data field

#### Bits 6:4 – F1DS[2:0] Receive FIFO 1 Data Field Size

# SAMA5D2 Series

## Controller Area Network (MCAN)

Value	Name	Description
0	8_BYTE	8-byte data field
1	12_BYTE	12-byte data field
2	16_BYTE	16-byte data field
3	20_BYTE	20-byte data field
4	24_BYTE	24-byte data field
5	32_BYTE	32-byte data field
6	48_BYTE	48-byte data field
7	64_BYTE	64-byte data field

### Bits 2:0 – F0DS[2:0] Receive FIFO 0 Data Field Size

Value	Name	Description
0	8_BYTE	8-byte data field
1	12_BYTE	12-byte data field
2	16_BYTE	16-byte data field
3	20_BYTE	20-byte data field
4	24_BYTE	24-byte data field
5	32_BYTE	32-byte data field
6	48_BYTE	48-byte data field
7	64_BYTE	64-byte data field

### 52.6.34 MCAN Tx Buffer Configuration

**Name:** MCAN\_TXBC  
**Offset:** 0xC0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

The sum of TFQS and NDTB may not exceed 32. There is no check for erroneous configurations. The Tx Buffers section in the Message RAM starts with the dedicated Tx Buffers.

Bit	31	30	29	28	27	26	25	24
		TFQM	TFQS[5:0]					
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
			NDTB[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	TBSA[13:6]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	TBSA[5:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W		
Reset	0	0	0	0	0	0		

#### Bit 30 – TFQM Tx FIFO/Queue Mode

Value	Description
0	Tx FIFO operation.
1	Tx Queue operation.

#### Bits 29:24 – TFQS[5:0] Transmit FIFO/Queue Size

Value	Description
0	No Tx FIFO/Queue.
1–32	Number of Tx Buffers used for Tx FIFO/Queue.
>32	Values greater than 32 are interpreted as 32.

#### Bits 21:16 – NDTB[5:0] Number of Dedicated Transmit Buffers

Value	Description
0	No dedicated Tx Buffers.
1–32	Number of dedicated Tx Buffers.
>32	Values greater than 32 are interpreted as 32.

**Bits 15:2 – TBSA[13:0]** Tx Buffers Start Address

Start address of Tx Buffers section in Message RAM (32-bit word address, see [Message RAM Configuration](#)).

Write TBSA with the bits [15:2] of the 32-bit address.

### 52.6.35 MCAN Tx FIFO/Queue Status

**Name:** MCAN\_TXFQS  
**Offset:** 0xC4  
**Reset:** 0x00000000  
**Property:** Read-only

The Tx FIFO/Queue status is related to the pending Tx requests listed in register MCAN\_TXBRP. Therefore the effect of Add/Cancellation requests may be delayed due to a running Tx scan (MCAN\_TXBRP not yet updated).

In case of mixed configurations where dedicated Tx Buffers are combined with a Tx FIFO or a Tx Queue, the Put and Get Indices indicate the number of the Tx Buffer starting with the first dedicated Tx Buffers. Example: For a configuration of 12 dedicated Tx Buffers and a Tx FIFO of 20 Buffers a Put Index of 15 points to the fourth buffer of the Tx FIFO.

	Bit	31	30	29	28	27	26	25	24	
Access										
Reset										
	Bit	23	22	21	20	19	18	17	16	
				TFQF	TFQPI[4:0]					
Access				R	R	R	R	R	R	
Reset				0	0	0	0	0	0	
	Bit	15	14	13	12	11	10	9	8	
					TFGI[4:0]					
Access					R	R	R	R	R	
Reset					0	0	0	0	0	
	Bit	7	6	5	4	3	2	1	0	
				TFFL[5:0]						
Access				R	R	R	R	R	R	
Reset				0	0	0	0	0	0	

#### Bit 21 – TFQF Tx FIFO/Queue Full

Value	Description
0	Tx FIFO/Queue not full.
1	Tx FIFO/Queue full.

#### Bits 20:16 – TFQPI[4:0] Tx FIFO/Queue Put Index

Tx FIFO/Queue write index pointer, range 0 to 31.

#### Bits 12:8 – TFGI[4:0] Tx FIFO Get Index

Tx FIFO read index pointer, range 0 to 31. Read as zero when Tx Queue operation is configured (MCAN\_TXBC.TFQM = '1').

**Bits 5:0 – TFFL[5:0]** Tx FIFO Free Level

Number of consecutive free Tx FIFO elements starting from TFGI, range 0 to 32. Read as zero when Tx Queue operation is configured (MCAN\_TXBC.TFQM = '1').

### 52.6.36 MCAN Tx Buffer Element Size Configuration

**Name:** MCAN\_TXESC  
**Offset:** 0xC8  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

Configures the number of data bytes belonging to a Tx Buffer element. Data field sizes > 8 bytes are intended for CAN FD operation only.

In case the data length code DLC of a Tx Buffer element is configured to a value higher than the Tx Buffer data field size MCAN\_TXESC.TBDS, the bytes not defined by the Tx Buffer are transmitted as "0xCC" (padding bytes).

#### Bits 2:0 – TBDS[2:0] Tx Buffer Data Field Size

Value	Name	Description
0	8_BYTE	8-byte data field
1	12_BYTE	12-byte data field
2	16_BYTE	16-byte data field
3	20_BYTE	20-byte data field
4	24_BYTE	24-byte data field
5	32_BYTE	32-byte data field
6	48_BYTE	48- byte data field
7	64_BYTE	64-byte data field

### 52.6.37 MCAN Transmit Buffer Request Pending

**Name:** MCAN\_TXBRP  
**Offset:** 0xCC  
**Reset:** 0x00000000  
**Property:** Read-only

MCAN\_TXBRP bits which are set while a Tx scan is in progress are not considered during this particular Tx scan. In case a cancellation is requested for such a Tx Buffer, this Add Request is cancelled immediately, the corresponding MCAN\_TXBRP bit is reset.

Bit	31	30	29	28	27	26	25	24
	TRP31	TRP30	TRP29	TRP28	TRP27	TRP26	TRP25	TRP24
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	TRP7	TRP6	TRP5	TRP4	TRP3	TRP2	TRP1	TRP0
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – TRPx** Transmission Request Pending for Buffer x

Each Tx Buffer has its own Transmission Request Pending bit. The bits are set via register MCAN\_TXBAR. The bits are reset after a requested transmission has completed or has been cancelled via register MCAN\_TXBCR.

TXBRP bits are set only for those Tx Buffers configured via MCAN\_TXBC. After a MCAN\_TXBRP bit has been set, a Tx scan (see [Tx Handling](#)) is started to check for the pending Tx request with the highest priority (Tx Buffer with lowest Message ID).

A cancellation request resets the corresponding transmission request pending bit of register MCAN\_TXBRP. In case a transmission has already been started when a cancellation is requested, this is done at the end of the transmission, regardless whether the transmission was successful or not. The cancellation request bits are reset directly after the corresponding TXBRP bit has been reset.

After a cancellation has been requested, a finished cancellation is signalled via MCAN\_TXBCF.

- after successful transmission together with the corresponding MCAN\_TXBTO bit.
- when the transmission has not yet been started at the point of cancellation.

# SAMA5D2 Series

## Controller Area Network (MCAN)

---

---

- when the transmission has been aborted due to lost arbitration.
- when an error occurred during frame transmission.

In DAR mode, all transmissions are automatically cancelled if they are not successful. The corresponding MCAN\_TXBCF bit is set for all unsuccessful transmissions.

Value	Description
0	No transmission request pending
1	Transmission request pending

### 52.6.38 MCAN Transmit Buffer Add Request

**Name:** MCAN\_TXBAR  
**Offset:** 0xD0  
**Reset:** 0x00000000  
**Property:** Read/Write

If an add request is applied for a Transmit Buffer with pending transmission request (corresponding MCAN\_TXBRP bit already set), this Add Request is ignored.

Bit	31	30	29	28	27	26	25	24
	AR31	AR30	AR29	AR28	AR27	AR26	AR25	AR24

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – ARx Add Request for Transmit Buffer x**

Each Transmit Buffer has its own Add Request bit. Writing a '1' will set the corresponding Add Request bit; writing a '0' has no impact. This enables the processor to set transmission requests for multiple Transmit Buffers with one write to MCAN\_TXBAR. MCAN\_TXBAR bits are set only for those Transmit Buffers configured via TXBC. When no Transmit scan is running, the bits are reset immediately, else the bits remain set until the Transmit scan process has completed.

Value	Description
0	No transmission request added.
1	Transmission requested added.

### 52.6.39 MCAN Transmit Buffer Cancellation Request

**Name:** MCAN\_TXBCR  
**Offset:** 0xD4  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – CRx Cancellation Request for Transmit Buffer x**

Each Transmit Buffer has its own Cancellation Request bit. Writing a '1' will set the corresponding Cancellation Request bit; writing a '0' has no impact. This enables the processor to set cancellation requests for multiple Transmit Buffers with one write to MCAN\_TXBCR. MCAN\_TXBCR bits are set only for those Transmit Buffers configured via TXBC. The bits remain set until the corresponding bit of MCAN\_TXBRP is reset.

Value	Description
0	No cancellation pending.
1	Cancellation pending.

### 52.6.40 MCAN Transmit Buffer Transmission Occurred

**Name:** MCAN\_TXBTO  
**Offset:** 0xD8  
**Reset:** 0x00000000  
**Property:** Read-only

Each Transmit Buffer has its own Cancellation Finished bit. The bits are set when the corresponding MCAN\_TXBRP bit is cleared after a cancellation was requested via MCAN\_TXBCR. In case the corresponding MCAN\_TXBRP bit was not set at the point of cancellation, CF is set immediately. The bits are reset when a new transmission is requested by writing a '1' to the corresponding bit of register MCAN\_TXBAR.

Value	Description
0	No transmit buffer cancellation.
1	Transmit buffer cancellation finished.

### 52.6.42 MCAN Transmit Buffer Transmission Interrupt Enable

Bit	15	14	13	12	11	10	9	8	
	EFSA[13:6]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
	EFSA[5:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W			
Reset	0	0	0	0	0	0			

#### Bits 29:24 – EFWM[5:0] Event FIFO Watermark

Value	Description
0	Watermark interrupt disabled.
1–32	Level for Tx Event FIFO watermark interrupt (MCAN_IR.TEFW).
>32	Watermark interrupt disabled.

#### Bits 21:16 – EFS[5:0] Event FIFO Size

The Tx Event FIFO elements are indexed from 0 to EFS - 1.

Value	Description
0	Tx Event FIFO disabled.
1–32	Number of Tx Event FIFO elements.
>32	Values greater than 32 are interpreted as 32.

#### Bits 15:2 – EFSA[13:0] Event FIFO Start Address

Start address of Tx Event FIFO in Message RAM (32-bit word address, see [Message RAM Configuration](#)).

Write EFSA with the bits [15:2] of the 32-bit address.

### 52.6.45 MCAN Tx Event FIFO Status

**Name:** MCAN\_TXEFS  
**Offset:** 0xF4  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
							TEFL	EFF
Access							R	R
Reset							0	0
Bit	23	22	21	20	19	18	17	16
				EFPI[4:0]				
Access				R	R	R	R	R
Reset				0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
				EFGI[4:0]				
Access				R	R	R	R	R
Reset				0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
			EFFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

**Bit 25 – TEFL** Tx Event FIFO Element Lost

This bit is a copy of interrupt flag MCAN\_IR.TEFL. When MCAN\_IR.TEFL is reset, this bit is also reset.

Value	Description
0	No Tx Event FIFO element lost.
1	Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero.

**Bit 24 – EFF** Event FIFO Full

Value	Description
0	Tx Event FIFO not full.
1	Tx Event FIFO full.

**Bits 20:16 – EFPI[4:0]** Event FIFO Put Index

Tx Event FIFO write index pointer, range 0 to 31.

**Bits 12:8 – EFGI[4:0]** Event FIFO Get Index

Tx Event FIFO read index pointer, range 0 to 31.

**Bits 5:0 – EFFL[5:0]** Event FIFO Fill Level

Number of elements stored in Tx Event FIFO, range 0 to 32.

**52.6.46 MCAN Tx Event FIFO Acknowledge**

**Name:** MCAN\_TXEFA  
**Offset:** 0xF8  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 4:0 – EFAI[4:0] Event FIFO Acknowledge Index**

After the processor has read an element or a sequence of elements from the Tx Event FIFO, it has to write the index of the last element read from Tx Event FIFO to EFAI. This will set the Tx Event FIFO Get Index MCAN\_TXEFS.EFGI to EFAI + 1 and update the FIFO 0 Fill Level MCAN\_TXEFS.EFFL.

## **53. Timer Counter (TC)**

### **53.1 Description**

A Timer Counter (TC) module includes three identical TC channels. The number of implemented TC modules is device-specific.

Each TC channel can be independently programmed to perform a wide range of functions including frequency measurement, event counting, interval measurement, pulse generation, delay timing and pulse width modulation.

Each channel has three external clock inputs, five internal clock inputs and two multipurpose input/output signals which can be configured by the user. Each channel drives an internal interrupt signal which can be programmed to generate processor interrupts.

The TC embeds a quadrature decoder (QDEC) connected in front of the timers and driven by TIOA0, TIOB0 and TIOB1 inputs. When enabled, the QDEC performs the input lines filtering, decoding of quadrature signals and connects to the timers/counters in order to read the position and speed of the motor through the user interface.

The TC block has two global registers which act upon all TC channels:

- Block Control register (TC\_BCR)—allows channels to be started simultaneously with the same instruction
- Block Mode register (TC\_BMR)—defines the external clock inputs for each channel, allowing them to be chained

### **53.2 Embedded Characteristics**

- Total of 6 Channels
- 32-bit Channel Size
- Wide Range of Functions Including:
  - Frequency measurement
  - Event counting
  - Interval measurement
  - Pulse generation
  - Delay timing
  - Pulse Width Modulation
  - Up/down capabilities
  - Quadrature decoder
  - 2-bit Gray up/down count for stepper motor
- Each Channel is User-Configurable and Contains:
  - Three external clock inputs
  - Five Internal clock inputs
  - Two multipurpose input/output signals acting as trigger event
  - Trigger/capture events can be directly synchronized by PWM signals
- Internal Interrupt Signal

- Read of the Capture Registers by the DMAC
- Compare Event Fault Generation for PWM
- Register Write Protection

### 53.3 Block Diagram

**Table 53-1. Timer Counter Clock Assignment**

Name	Definition
TIMER_CLOCK1	GCLK[35], GCLK[36]
TIMER_CLOCK2	System bus clock divided by 8
TIMER_CLOCK3	System bus clock divided by 32
TIMER_CLOCK4	System bus clock divided by 128
TIMER_CLOCK5 (See Notes)	slow_clock

**Note:**

1. The GCLK frequency must be at least three times lower than peripheral clock frequency.

**Figure 53-1. Timer Counter Block Diagram**

**Note:**

The QDEC connections are detailed in [Figure 53-17](#).

**Table 53-2. Channel Signal Description**

Signal Name	Description
XC0, XC1, XC2	External Clock Inputs
TIOAx	Capture Mode: Timer Counter Input Waveform Mode: Timer Counter Output
TIOBx	Capture Mode: Timer Counter Input Waveform Mode: Timer Counter Input/Output
INT	Interrupt Signal Output (internal signal)
SYNC	Synchronization Input Signal (from configuration register)

## 53.4 Pin List

**Table 53-3. Pin List**

Pin Name	Description	Type
TCLK0–TCLK2	External Clock Input	Input
TIOA0–TIOA2	I/O Line A	I/O
TIOB0–TIOB2	I/O Line B	I/O

## 53.5 Product Dependencies

### 53.5.1 I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the TC pins to their peripheral functions.

### 53.5.2 Power Management

The TC is clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the Timer Counter clock.

### 53.5.3 Interrupt Sources

The TC has an interrupt line connected to the interrupt controller. Handling the TC interrupt requires programming the interrupt controller before configuring the TC.

### 53.5.4 Synchronization Inputs from PWM

The TC has trigger/capture inputs internally connected to the PWM. Refer to [“Synchronization with PWM”](#) and to the implementation of the Pulse Width Modulation (PWM) in this product.

### 53.5.5 Fault Output

The TC has the FAULT output internally connected to the fault input of PWM. Refer to [“Fault Mode”](#) and to the implementation of the Pulse Width Modulation (PWM) in this product.

### 53.6 Functional Description

#### 53.6.1 Description

All channels of the Timer Counter are independent and identical in operation except when the QDEC is enabled. The registers for channel programming are listed in [53.7 Register Summary](#).

#### 53.6.2 32-bit Counter

Each 32-bit channel is organized around a 32-bit counter. The value of the counter is incremented at each positive edge of the selected clock. When the counter has reached the value  $2^{32}-1$  and passes to zero, an overflow occurs and the COVFS bit in the Interrupt Status register (TC\_SR) is set.

The current value of the counter is accessible in real time by reading the Counter Value register (TC\_CV). The counter can be reset by a trigger. In this case, the counter value passes to zero on the next valid edge of the selected clock.

#### 53.6.3 Clock Selection

At block level, input clock signals of each channel can be connected either to the external inputs TCLKx, or to the internal I/O signals TIOAx for chaining<sup>(1)</sup> by programming the Block Mode register (TC\_BMR). See [Clock Chaining Selection](#).

Each channel can independently select an internal or external clock source for its counter<sup>(2)</sup>:

- External clock signals: XC0, XC1 or XC2
- Internal clock signals: GCLK[35], GCLK[36], System bus clock divided by 8, System bus clock divided by 32, System bus clock divided by 128, slow\_clock

This selection is made by the TCCLKS bits in the Channel Mode register (TC\_CMRx).

The selected clock can be inverted with TC\_CMRx.CLKI. This allows counting on the opposite edges of the clock.

The burst function allows the clock to be validated when an external signal is high. The BURST parameter in the TC\_CMRx defines this signal (none, XC0, XC1, XC2). See [Clock Selection](#).

#### Note:

1. In Waveform mode, to chain two timers, it is mandatory to initialize some parameters:
  - Configure TIOx outputs to 1 or 0 by writing the required value to TC\_CMRx.ASWTRG.
  - Bit TC\_BCR.SYNC must be written to 1 to start the channels at the same time.
2. In all cases, if an external clock or asynchronous internal clock GCLK is used, the duration of each of its levels must be longer than the peripheral clock period, so the clock frequency will be at least 2.5 times lower than the peripheral clock.

**Figure 53-2. Clock Chaining Selection**

**Figure 53-3. Clock Selection**

Regardless of the trigger used, it will be taken into account at the following active edge of the selected clock. This means that the counter value can be read differently from zero just after a trigger, especially when a low frequency signal is selected as the clock.

The following triggers are common to both modes:

- Software Trigger: Each channel has a software trigger, available by setting TC\_CCR.SWTRG.
- SYNC: Each channel has a synchronization signal SYNC. When asserted, this signal has the same effect as a software trigger. The SYNC signals of all channels are asserted simultaneously by writing TC\_BCR with SYNC set.
- Compare RC Trigger: RC is implemented in each channel and can provide a trigger when the counter value matches the RC value if TC\_CMRx.CPCTRG is set .

The channel can also be configured to have an external trigger. In Capture mode, the external trigger signal can be selected between TIOAx and TIOBx. In Waveform mode, an external event can be programmed on one of the following signals: TIOBx, XC0, XC1 or XC2. This external event can then be programmed to perform a trigger by setting TC\_CMRx.ENETRГ.

If an external trigger is used, the duration of the pulses must be longer than the peripheral clock period in order to be detected.

### 53.6.7 Capture Mode

Capture mode is entered by clearing TC\_CMRx.WAVE.

Capture mode allows the TC channel to perform measurements such as pulse timing, frequency, period, duty cycle and phase on TIOAx and TIOBx signals which are considered as inputs.

Figure 53-6 shows the configuration of the TC channel when programmed in Capture mode.

### 53.6.8 Capture Registers A and B

Registers A and B (TC\_RA and TC\_RB) are used as capture registers. They can be loaded with the counter value when a programmable event occurs on the signal TIOAx.

TC\_CMRx.LDRA defines the TIOAx selected edge for the loading of TC\_RA, and TC\_CMRx.LDRB defines the TIOAx selected edge for the loading of TC\_RB.

The subsampling ratio defined by TC\_CMRx.SBSMPLR is applied to these selected edges, so that the loading of Register A and Register B occurs once every 1, 2, 4, 8 or 16 selected edges.

TC\_RA is loaded only if it has not been loaded since the last trigger or if TC\_RB has been loaded since the last loading of TC\_RA.

TC\_RB is loaded only if TC\_RA has been loaded since the last trigger or the last loading of TC\_RB.

Loading TC\_RA or TC\_RB before the read of the last value loaded sets TC\_SR.LOVRS. In this case, the old value is overwritten.

When DMA is used, the Register AB (TC\_RAB) address must be configured as source address of the transfer. TC\_RAB provides the next unread value from TC\_RA and TC\_RB. It may be read by the DMA after a request has been triggered upon loading TC\_RA or TC\_RB.

### 53.6.9 Transfer with DMAC in Capture Mode

The DMAC can perform access from the TC to system memory in Capture mode only.

The following figure illustrates how TC\_RA and TC\_RB can be loaded in the system memory without processor intervention.

**Figure 53-5. Example of Transfer with DMAC in Capture Mode**

ETRGEDG = 1, LDRA = 1, LDRB = 2, ABETRG = 0

T1,T2,T3,T4 = System Bus load dependent ( $t_{min} = 8$  Peripheral Clocks)

ETRGEDG = 3, LDRA = 3, LDRB = 0, ABETRG = 0

T1,T2,T3,T4 = System Bus load dependent ( $t_{min} = 8$  Peripheral Clocks)

### 53.6.10 Trigger Conditions

In addition to the SYNC signal, the software trigger and the RC compare trigger, an external trigger can be defined.

The ABETRG bit in the TC\_CMCR selects TIOAx or TIOBx input signal as an external trigger or the trigger signal from the output comparator of the PWM module. The External Trigger Edge Selection parameter (ETRGEDG field in TC\_CMCR) defines the edge (rising, falling, or both) detected to generate an external trigger. If ETRGEDG = 0 (none), the external trigger is disabled.

**Figure 53-6. Capture Mode**

### 53.6.11 Waveform Mode

Waveform mode is entered by setting the TC\_CMRx.WAVE bit.

In Waveform mode, the TC channel generates one or two PWM signals with the same frequency and independently programmable duty cycles, or generates different types of one-shot or repetitive pulses.

In this mode, TIOAx is configured as an output and TIOBx is defined as an output if it is not used as an external event (EEVT parameter in TC\_CMR).

[Waveform Mode](#) shows the configuration of the TC channel when programmed in Waveform operating mode.

### 53.6.12 Waveform Selection

Depending on the WAVSEL parameter in TC\_CMR, the behavior of TC\_CV varies.

With any selection, TC\_RA, TC\_RB and TC\_RC can all be used as compare registers.

RA Compare is used to control the TIOAx output, RB Compare is used to control the TIOBx output (if correctly configured) and RC Compare is used to control TIOAx and/or TIOBx outputs.

**Figure 53-7. Waveform Mode**

### 53.6.12.1 WAVESEL = 00

When WAVESEL = 00, the value of TC\_CV is incremented from 0 to  $2^{32}-1$ . Once  $2^{32}-1$  has been reached, the value of TC\_CV is reset. Incrementation of TC\_CV starts again and the cycle continues.

An external event trigger or a software trigger can reset the value of TC\_CV. It is important to note that the trigger may occur at any time.

Refer to the figures below.

RC Compare cannot be programmed to generate a trigger in this configuration. At the same time, RC Compare can stop the counter clock (CPCSTOP = 1 in TC\_CMR) and/or disable the counter clock (CPCDIS = 1 in TC\_CMR).

**Figure 53-8. WAVSEL = 00 without Trigger**

**Figure 53-9. WAVSEL = 00 with Trigger**

### 53.6.12.2 WAVSEL = 10

When WAVSEL = 10, the value of TC\_CV is incremented from 0 to the value of RC, then automatically reset on a RC Compare. Once the value of TC\_CV has been reset, it is then incremented and so on.

It is important to note that TC\_CV can be reset at any time by an external event or a software trigger if both are programmed correctly.

Refer to the figures below.

In addition, RC Compare can stop the counter clock (CPCSTOP = 1 in TC\_CMR) and/or disable the counter clock (CPCDIS = 1 in TC\_CMR).

**Figure 53-10. WAVSEL = 10 without Trigger**

**Figure 53-11. WAVSEL = 10 with Trigger**

**53.6.12.3 WAVSEL = 01**

When WAVSEL = 01, the value of TC\_CV is incremented from 0 to  $2^{32}-1$ . Once  $2^{32}-1$  is reached, the value of TC\_CV is decremented to 0, then reincremented to  $2^{32}-1$  and so on.

A trigger such as an external event or a software trigger can modify TC\_CV at any time. If a trigger occurs while TC\_CV is incrementing, TC\_CV then decrements. If a trigger is received while TC\_CV is decrementing, TC\_CV then increments.

Refer to the figures below.

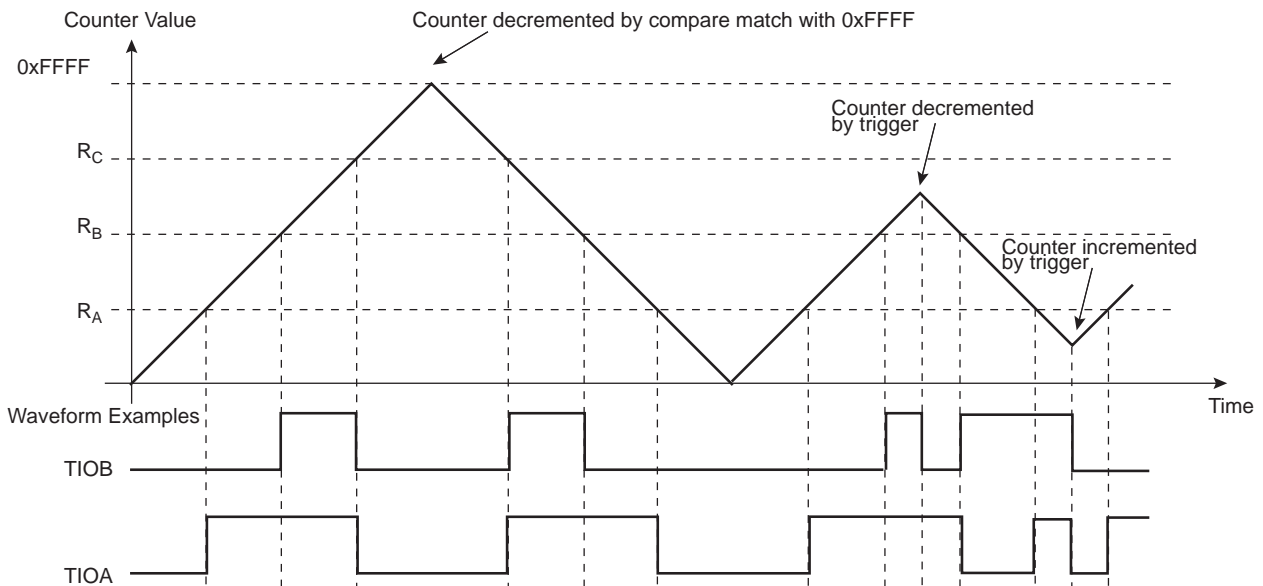

RC Compare cannot be programmed to generate a trigger in this configuration.

At the same time, RC Compare can stop the counter clock (CPCSTOP = 1) and/or disable the counter clock (CPCDIS = 1).

**Figure 53-12. WAVSEL = 01 without Trigger**

**Figure 53-13. WAVSEL = 01 with Trigger**

### 53.6.12.4 WAVSEL = 11

When WAVSEL = 11, the value of TC\_CV is incremented from 0 to RC. Once RC is reached, the value of TC\_CV is decremented to 0, then reincremented to RC and so on.

A trigger such as an external event or a software trigger can modify TC\_CV at any time. If a trigger occurs while TC\_CV is incrementing, TC\_CV then decrements. If a trigger is received while TC\_CV is decrementing, TC\_CV then increments.

Refer to the figures below.

RC Compare can stop the counter clock (CPCSTOP = 1) and/or disable the counter clock (CPCDIS = 1).

**Figure 53-14. WAVSEL = 11 without Trigger**

**Figure 53-15. WAVSEL = 11 with Trigger**

### 53.6.13 External Event/Trigger Conditions

An external event can be programmed to be detected on one of the clock sources (XC0, XC1, XC2) or TIOBx. The external event selected can then be used as a trigger.

The event trigger is selected using TC\_CMR.EEVT. The trigger edge (rising, falling or both) for each of the possible external triggers is defined in TC\_CMR.EEVTEDG. If EEVTEDG is cleared (none), no external event is defined.

If TIOBx is defined as an external event signal (EEVT = 0), TIOBx is no longer used as an output and the compare register B is not used to generate waveforms and subsequently no IRQs. In this case, the TC channel can only generate a waveform on TIOAx.

When an external event is defined, it can be used as a trigger by setting TC\_CMR.ENETRIG.

As in Capture mode, the SYNC signal and the software trigger are also available as triggers. RC Compare can also be used as a trigger depending on the parameter WAVSEL.

### 53.6.14 Synchronization with PWM

The inputs TIOAx/TIOBx can be bypassed, and thus channel trigger/capture events can be directly driven by the independent PWM module.

PWM comparator outputs (internal signals without dead-time insertion - OCx), respectively source of the PWMH/L[2:0] outputs, are routed to the internal TC inputs. These specific TC inputs are multiplexed with TIOA/B input signal to drive the internal trigger/capture events.

The selection is made in the Extended Mode register (TC\_EMR) fields TRIGSRCA and TRIGSRCB (see [“TC Extended Mode Register”](#)).

Each channel of the TC module can be synchronized by a different PWM channel as described in the following figure.

**Figure 53-16. Synchronization with PWM**

### 53.6.15 Output Controller

The output controller defines the output level changes on TIOAx and TIOBx following an event. TIOBx control is used only if TIOBx is defined as output (not as an external event).

The following events control TIOAx and TIOBx:

- Software trigger

- External event
- RC compare

RA Compare controls TIOAx, and RB Compare controls TIOBx. Each of these events can be programmed to set, clear or toggle the output as defined in the corresponding parameter in TC\_CMR.

### 53.6.16 Quadrature Decoder

#### 53.6.16.1 Description

The quadrature decoder (QDEC) is driven by TIOA0, TIOB0 and TIOB1 input pins and drives the timer counter of channel 0 and 1. Channel 2 can be used as a time base in case of speed measurement requirements (refer to [Predefined Connection of the Quadrature Decoder with Timer Counters](#)).

When writing a '0' to TC\_BMR.QDEN, the QDEC is bypassed and the IO pins are directly routed to the timer counter function.

TIOA0 and TIOB0 are to be driven by the two dedicated quadrature signals from a rotary sensor mounted on the shaft of the off-chip motor.

A third signal from the rotary sensor can be processed through pin TIOB1 and is typically dedicated to be driven by an index signal if it is provided by the sensor. This signal is not required to decode the quadrature signals PHA, PHB.

TC\_CMRx.TCCLKS must be configured to select XC0 input (i.e., 0x101). Field TC0XC0S has no effect as soon as the QDEC is enabled.

Either speed or position/revolution can be measured. Position channel 0 accumulates the edges of PHA, PHB input signals giving a high accuracy on motor position whereas channel 1 accumulates the index pulses of the sensor, therefore the number of rotations. Concatenation of both values provides a high level of precision on motion system position.

In Speed mode, position cannot be measured but revolution can be measured.

Inputs from the rotary sensor can be filtered prior to downstream processing. Accommodation of input polarity, phase definition and other factors are configurable.

Interruptions can be generated on different events.

A compare function (using TC\_RC) is available on channel 0 (speed/position) or channel 1 (rotation) and can generate an interrupt by means of TC\_SRx.CPCS.

**Figure 53-17. Predefined Connection of the Quadrature Decoder with Timer Counters**

### 53.6.16.2 Input Preprocessing

Input preprocessing consists of capabilities to take into account rotary sensor factors such as polarities and phase definition followed by configurable digital filtering.

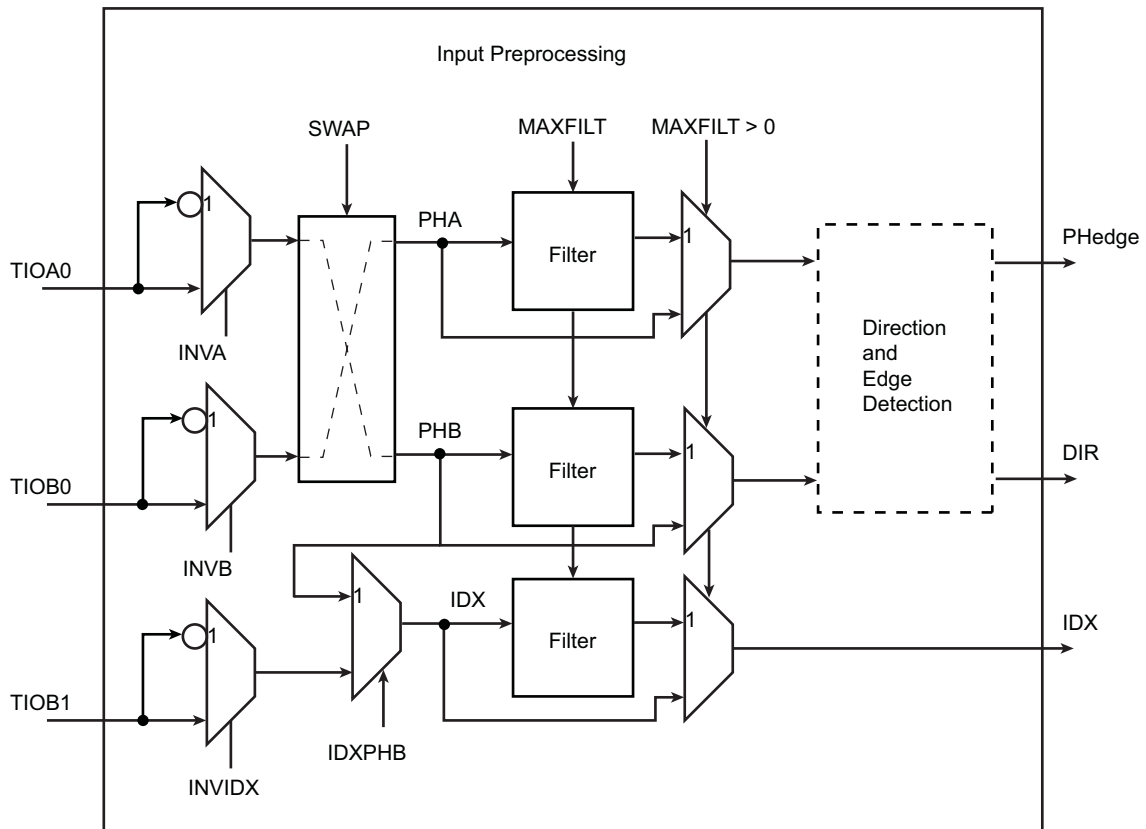

Each input can be negated and swapping PHA, PHB is also configurable.

TC\_BMR. MAXFILT is used to configure a minimum duration for which the pulse is stated as valid. When the filter is active, pulses with a duration lower than  $(MAXFILT + 1) \times t_{\text{peripheral clock}}$  are not passed to downstream logic.

The value of  $(MAXFILT + 1) \times t_{\text{peripheral clock}}$  must not be greater than 10% of the minimum pulse on PHA, PHB or index when the rotary encoder speed is at its maximum. This speed depends on the application.

**Figure 53-18. Input Stage**

Input filtering can efficiently remove spurious pulses that might be generated by the presence of particulate contamination on the optical or magnetic disk of the rotary sensor.

Spurious pulses can also occur in environments with high levels of electromagnetic interference. Or, simply if vibration occurs even when rotation is fully stopped and the shaft of the motor is in such a position that the beginning of one of the reflective or magnetic bars on the rotary sensor disk is aligned with the light or magnetic (Hall) receiver cell of the rotary sensor. Any vibration can make the PHA, PHB signals toggle for a short duration.

**Figure 53-19. Filtering Examples**

**53.6.16.3 Direction Status and Change Detection**

After filtering, the quadrature signals are analyzed to extract the rotation direction and edges of the two quadrature signals detected in order to be counted by TC logic downstream.

The direction status can be directly read at anytime in the TC\_QISR. The polarity of the direction flag status depends on the configuration written in TC\_BMR. INVA, INV B, INVIDX, SWAP modify the polarity of DIR flag.

Any change in rotation direction is reported in the TC\_QISR and can generate an interrupt.

The direction change condition is reported as soon as two consecutive edges on a phase signal have sampled the same value on the other phase signal and there is an edge on the other signal. The two consecutive edges of one phase signal sampling the same value on other phase signal is not sufficient to declare a direction change, as particulate contamination may mask one or more reflective bars on the optical or magnetic disk of the sensor. Refer to the following figure for waveforms.

**Figure 53-20. Rotation Change Detection**

The direction change detection is disabled when TC\_BMR.QDTRANS is set. In this case, the DIR flag report must not be used.

A quadrature error is also reported by the QDEC via TC\_QISR.QERR. This error is reported if the time difference between two edges on PHA, PHB is lower than a predefined value. This predefined value is configurable and corresponds to  $(TC\_BMR.MAXFILT + 1) \times t_{\text{peripheral clock}}$  ns. After being filtered, there is no reason to have two edges closer than  $(TC\_BMR.MAXFILT + 1) \times t_{\text{peripheral clock}}$  ns under normal mode of operation.

**Figure 53-21. Quadrature Error Detection**

MAXFILT must be tuned according to several factors such as the peripheral clock frequency, type of rotary sensor and rotation speed to be achieved.

#### 53.6.16.4 Position and Rotation Measurement

When TC\_BMR.POSEN is set, the motor axis position is processed on channel 0 (by means of the PHA, PHB edge detections) and the number of motor revolutions are recorded on channel 1 if the IDX signal is provided on the TIOB1 input. If no IDX signal is available, the internal counter can be cleared for each revolution if the number of counts per revolution is configured in TC\_RC0.RC and the TC\_CMR.CPCTRG bit is written to '1'. The position measurement can be read in the TC\_CV0 register and the rotation measurement can be read in the TC\_CV1 register.

Channel 0 and 1 must be configured in Capture mode (TC\_CMR0.WAVE = 0). 'Rising edge' must be selected as the External Trigger Edge (TC\_CMR.ETRGEDG = 0x01) and 'TIOAx' must be selected as the External Trigger (TC\_CMR.ABETRG = 0x1). The process must be started by configuring TC\_CCR.CLKEN and TC\_CCR.SWTRG.

In parallel, the number of edges are accumulated on TC channel 0 and can be read on the TC\_CV0 register.

Therefore, the accurate position can be read on both TC\_CV registers and concatenated to form a 32-bit word.

The TC channel 0 is cleared for each increment of IDX count value.

Depending on the quadrature signals, the direction is decoded and allows to count up or down in TC channels 0 and 1. The direction status is reported on TC\_QISR.

### 53.6.16.5 Speed Measurement

When TC\_BMR.SPEEDEN is set, the speed measure is enabled on channel 0.

A time base must be defined on channel 2 by writing the TC\_RC2 period register. Channel 2 must be configured in Waveform mode (WAVE bit set) in TC\_CMR2. The WAVSEL field must be defined with 0x10 to clear the counter by comparison and matching with TC\_RC value. Field ACPC must be defined at 0x11 to toggle TIOAx output.

This time base is automatically fed back to TIOAx of channel 0 when QDEN and SPEEDEN are set.

Channel 0 must be configured in Capture mode (WAVE = 0 in TC\_CMR0). TC\_CMR0.ABETRG must be configured at 1 to select TIOAx as a trigger for this channel.

EDGTRG must be set to 0x01, to clear the counter on a rising edge of the TIOAx signal and field LDRA must be set accordingly to 0x01, to load TC\_RA0 at the same time as the counter is cleared (LDRB must be set to 0x01). As a consequence, at the end of each time base period the differentiation required for the speed calculation is performed.

The process must be started by configuring bits CLKEN and SWTRG in the TC\_CCR.

The speed can be read on field RA in TC\_RA0.

Channel 1 can still be used to count the number of revolutions of the motor.

### 53.6.16.6 Detecting a Missing Index Pulse

To detect a missing index pulse due contamination, dust, etc., the TC\_SR0.CPCS flag can be used. It is also possible to assert the interrupt line if the TC\_SR0.CPCS flag is enabled as a source of the interrupt by writing a '1' to TC\_IER0.CPCS.

The TC\_RC0.RC field must be written with the nominal number of counts per revolution provided by the rotary encoder, plus a margin to eliminate potential noise (e.g., if nominal count per revolution is 1024, then TC\_RC0.RC=1026).

If the index pulse is missing, the timer value is not cleared and the nominal value is exceeded, then the comparator on the RC triggers an event, TC\_SR0.CPCS=1, and the interrupt line is asserted if TC\_IER0.CPCS=1.

The missing index pulse detection is only valid if the bit TC\_QISR.DIRCHG=0.

### 53.6.16.7 Detecting Contamination/Dust at Rotary Encoder Low Speed

The contamination/dust that can be filtered when the rotary encoder speed is high may not be filtered at low speed, thus creating unsolicited direction change, etc.

At low speed, even a minor contamination may appear as a long pulse, and thus not filtered and processed as a standard quadrature encoder pulse.

This contamination can be detected by using the similar method as the missing index detection.

A contamination exists on a phase line if TC\_SR.CPCS = 1 and TC\_QISR.DIRCHG = 1 when there is no solicited change of direction.

### 53.6.16.8 Missing Pulse Detection and Autocorrection

The QDEC is equipped with a circuitry which detects and corrects some errors that may result from contamination on optical disks or other materials producing the quadrature phase signals.

The detection and autocorrection only works if the Count mode is configured for both phases (EDGPHA = 1 in TC\_BMR) and is enabled (AUTOC = 1 in TC\_BMR).

If a pulse is missing on a phase signal, it is automatically detected and the pulse count reported in the CV field of the TC\_CV0/1 is automatically corrected.

There is no detection if both phase signals are affected at the same location on the device providing the quadrature signals because the detection requires a valid phase signal to detect the contamination on the other phase signal.

**Figure 53-22. Detection and Autocorrection of Missing Pulses**

If a quadrature device is undamaged, the number of pulses counted for a predefined period of time must be the same with or without detection and autocorrection feature.

Therefore, if the measurement results differ, a contamination exists on the device producing the quadrature signals.

This does not substitute the measurements of the number of pulses between two index pulses (if available) but provides a complementary method to detect damaged quadrature devices.

When the device providing quadrature signals is severely damaged, potentially leading to a number of consecutive missing pulses greater than 1, the downstream processing may be affected. It is possible to define the maximum admissible number of consecutive missing pulses before issuing a Missing Pulse Error flag (MPE in TC\_QISR). The threshold triggering an MPE flag report can be configured in TC\_BMR.MAXCMP. If the field MAXCMP is cleared, MPE never rises. The flag MAXCMP can trigger an interrupt while the QDEC is operating, thus providing a real time report of a potential problem on the quadrature device.

### 53.6.17 2-bit Gray Up/Down Counter for Stepper Motor

Each channel can be independently configured to generate a 2-bit Gray count waveform on corresponding TIOAx, TIOBx outputs by means of TC\_SMMRx.GCEN.

Up or Down count can be defined by writing TC\_SMMRx.DOWN.

It is mandatory to configure the channel in Waveform mode in the TC\_CMR.

The period of the counters can be programmed in TC\_RCx.

**Figure 53-23. 2-bit Gray Up/Down Counter**

**53.6.18 Fault Mode**

At any time, the TC\_RCx registers can be used to perform a comparison on the respective current channel counter value (TC\_CVx) with the value of TC\_RCx register.

The CPCSx flags can be set accordingly and an interrupt can be generated.

This interrupt is processed but requires an unpredictable amount of time to be achieved the required action.

It is possible to trigger the FAULT output of the TIMER1 with CPCS from TC\_SR0 and/or CPCS from TC\_SR1. Each source can be independently enabled/disabled in the TC\_FMR.

This can be useful to detect an overflow on speed and/or position when QDEC is processed and to act immediately by using the FAULT output.

**Figure 53-24. Fault Output Generation**

**53.6.19 Register Write Protection**

To prevent any single software error from corrupting TC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [TC Write Protection Mode Register \(TC\\_WPMR\)](#).

The Timer Counter clock of the first channel must be enabled to access TC\_WPMR.

The following registers can be write-protected when WPEN is set:

- [TC Block Mode Register](#)
- [TC Channel Mode Register Capture Mode](#)
- [TC Channel Mode Register Waveform Mode](#)
- [TC Fault Mode Register](#)
- [TC Stepper Motor Mode Register](#)
- [TC Register A](#)
- [TC Register B](#)
- [TC Register C](#)
- [TC Extended Mode Register](#)

### 53.7 Register Summary

**Note:** The register TC\_CMCR has two modes, Capture Mode and Waveform Mode. In this register summary, both modes are displayed

### 53.7.1 TC Channel Control Register

**Name:** TC\_CCRx  
**Offset:** 0x00 + x\*0x40 [x=0..2]  
**Reset:** –  
**Property:** Write-only

#### Bit 2 – SWTRG Software Trigger Command

Value	Description
0	No effect.
1	A software trigger is performed: the counter is reset and the clock is started.

#### Bit 1 – CLKDIS Counter Clock Disable Command

Value	Description
0	No effect.
1	Disables the clock.

#### Bit 0 – CLKEN Counter Clock Enable Command

Value	Description
0	No effect.
1	Enables the clock if CLKDIS is not 1.

### 53.7.2 TC Channel Mode Register: Capture Mode

**Name:** TC\_CM Rx  
**Offset:** 0x04 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can be written only if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24

Reset	0	0	0	0	0	0	0	0

#### Bits 22:20 – SBSMPLR[2:0] Loading Edge Subsampling Ratio

Value	Name	Description
0	ONE	Load a Capture register each selected edge.
1	HALF	Load a Capture register every 2 selected edges.
2	FOURTH	Load a Capture register every 4 selected edges.
3	EIGHTH	Load a Capture register every 8 selected edges.
4	SIXTEENTH	Load a Capture register every 16 selected edges.

#### Bits 19:18 – LDRB[1:0] RB Loading Edge Selection

Value	Name	Description
0	NONE	None
1	RISING	Rising edge of TIOAx
2	FALLING	Falling edge of TIOAx
3	EDGE	Each edge of TIOAx

#### Bits 17:16 – LDRA[1:0] RA Loading Edge Selection

Value	Name	Description
0	NONE	None

Value	Name	Description
1	RISING	Rising edge of TIOAx
2	FALLING	Falling edge of TIOAx
3	EDGE	Each edge of TIOAx

**Bit 15 – WAVE** Waveform Mode

Value	Description
0	Capture mode is enabled.
1	Capture mode is disabled (Waveform mode is enabled).

**Bit 14 – CPCTRG** RC Compare Trigger Enable

Value	Description
0	RC Compare has no effect on the counter and its clock.
1	RC Compare resets the counter and starts the counter clock.

**Bit 10 – ABETRG** TIOAx or TIOBx External Trigger Selection

Value	Description
0	TIOBx is used as an external trigger.
1	TIOAx is used as an external trigger.

**Bits 9:8 – ETRGEDG[1:0]** External Trigger Edge Selection

Value	Name	Description
0	NONE	The clock is not gated by an external signal.
1	RISING	Rising edge
2	FALLING	Falling edge
3	EDGE	Each edge

**Bit 7 – LBDIS** Counter Clock Disable with RB Loading

Value	Description
0	Counter clock is not disabled when RB loading occurs.
1	Counter clock is disabled when RB loading occurs.

**Bit 6 – LDBSTOP** Counter Clock Stopped with RB Loading

Value	Description
0	Counter clock is not stopped when RB loading occurs.
1	Counter clock is stopped when RB loading occurs.

**Bits 5:4 – BURST[1:0]** Burst Signal Selection

Value	Name	Description
0	NONE	The clock is not gated by an external signal.
1	XC0	XC0 is ANDed with the selected clock.
2	XC1	XC1 is ANDed with the selected clock.
3	XC2	XC2 is ANDed with the selected clock.

**Bit 3 – CLKI** Clock Invert

# SAMA5D2 Series

## Timer Counter (TC)

Value	Description
0	Counter is incremented on rising edge of the clock.
1	Counter is incremented on falling edge of the clock.

### Bits 2:0 – TCCLKS[2:0] Clock Selection

To operate at maximum peripheral clock frequency, refer to [“TC Extended Mode Register”](#).

Value	Name	Description
0	TIMER_CLOCK1	Clock selected: internal GCLK[35], GCLK[36] clock signal (from PMC)
1	TIMER_CLOCK2	Clock selected: internal System bus clock divided by 8 clock signal (from PMC)
2	TIMER_CLOCK3	Clock selected: internal System bus clock divided by 32 clock signal (from PMC)
3	TIMER_CLOCK4	Clock selected: internal System bus clock divided by 128 clock signal (from PMC)
4	TIMER_CLOCK5	Clock selected: internal slow_clock clock signal (from PMC)
5	XC0	Clock selected: XC0
6	XC1	Clock selected: XC1
7	XC2	Clock selected: XC2

### 53.7.3 TC Channel Mode Register: Waveform Mode

**Name:** TC\_CMRx  
**Offset:** 0x04 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24

1	SET	Set
2	CLEAR	Clear
3	TOGGLE	Toggle

### Bit 15 – WAVE Waveform Mode

Value	Description
0	Waveform mode is disabled (Capture mode is enabled).
1	Waveform mode is enabled.

### Bits 14:13 – WAVSEL[1:0] Waveform Selection

Value	Name	Description
0	UP	UP mode without automatic trigger on RC Compare
1	UPDOWN	UPDOWN mode without automatic trigger on RC Compare
2	UP_RC	UP mode with automatic trigger on RC Compare
3	UPDOWN_RC	UPDOWN mode with automatic trigger on RC Compare

**Bit 12 – ENETRГ** External Event Trigger Enable

Whatever the value programmed in ENETRГ, the selected external event only controls the TIOAx output and TIOBx if not used as input (trigger event input or other input used).

Value	Description
0	The external event has no effect on the counter and its clock.
1	The external event resets the counter and starts the counter clock.

**Bits 11:10 – EEVT[1:0]** External Event Selection

Signal selected as external event.

Value	Name	Description	TIOB Direction
0	TIOB	TIOB	Input
1	XC0	XC0	Output
2	XC1	XC1	Output
3	XC2	XC2	Output

**Note:** If TIOB is chosen as the external event signal, it is configured as an input and no longer generates waveforms and subsequently no IRQs.

**Bits 9:8 – EEVTEDG[1:0]** External Event Edge Selection

Value	Name	Description
0	NONE	None
1	RISING	Rising edge
2	FALLING	Falling edge
3	EDGE	Each edge

**Bit 7 – CPCDIS** Counter Clock Disable with RC Compare

Value	Description
0	Counter clock is not disabled when counter reaches RC.
1	Counter clock is disabled when counter reaches RC.

**Bit 6 – CPCSTOP** Counter Clock Stopped with RC Compare

Value	Description
0	Counter clock is not stopped when counter reaches RC.
1	Counter clock is stopped when counter reaches RC.

**Bits 5:4 – BURST[1:0]** Burst Signal Selection

# SAMA5D2 Series

## Timer Counter (TC)

Value	Name	Description
0	NONE	The clock is not gated by an external signal.
1	XC0	XC0 is ANDed with the selected clock.
2	XC1	XC1 is ANDed with the selected clock.
3	XC2	XC2 is ANDed with the selected clock.

### Bit 3 – CLKI Clock Invert

Value	Description
0	Counter is incremented on rising edge of the clock.
1	Counter is incremented on falling edge of the clock.

### Bits 2:0 – TCCLKS[2:0] Clock Selection

To operate at maximum peripheral clock frequency, refer to [“TC Extended Mode Register”](#).

Value	Name	Description
0	TIMER_CLOCK1	Clock selected: internal GCLK[35], GCLK[36] clock signal (from PMC)
1	TIMER_CLOCK2	Clock selected: internal System bus clock divided by 8 clock signal (from PMC)
2	TIMER_CLOCK3	Clock selected: internal System bus clock divided by 32 clock signal (from PMC)
3	TIMER_CLOCK4	Clock selected: internal System bus clock divided by 128 clock signal (from PMC)
4	TIMER_CLOCK5	Clock selected: internal slow_clock clock signal (from PMC)
5	XC0	Clock selected: XC0
6	XC1	Clock selected: XC1
7	XC2	Clock selected: XC2

### 53.7.4 TC Stepper Motor Mode Register

**Name:** TC\_SMMRx  
**Offset:** 0x08 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

#### Bit 1 – DOWN Down Count

Value	Description
0	Up counter.
1	Down counter.

#### Bit 0 – GCEN Gray Count Enable

Value	Description
0	TIOAx [x=0..2] and TIOBx [x=0..2] are driven by internal counter of channel x.
1	TIOAx [x=0..2] and TIOBx [x=0..2] are driven by a 2-bit Gray counter.

### 53.7.5 TC Register AB

**Name:** TC\_RABx  
**Offset:** 0x0C + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read-only

	Bit	31	30	29	28	27	26	25	24
		RAB[31:24]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		RAB[23:16]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		RAB[15:8]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		RAB[7:0]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0

**Bits 31:0 – RAB[31:0]** Register A or Register B

RAB contains the next unread capture Register A or Register B value in real time. It is usually read by the DMA after a request due to a valid load edge on TIOAx.

When DMA is used, the RAB register address must be configured as source address of the transfer.

### 53.7.6 TC Counter Value Register

**Name:** TC\_CVx  
**Offset:** 0x10 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read-only

	Bit	31	30	29	28	27	26	25	24
		CV[31:24]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0

	Bit	7	6	5	4	3	2	1	0
		CV[7:0]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0

**Bits 31:0 – CV[31:0]** Counter Value  
 CV contains the counter value in real time.

**Important:**

### 53.7.7 TC Register A

**Name:** TC\_RA<sub>x</sub>  
**Offset:** 0x14 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register has access Read-only if TC\_CMRA<sub>x</sub>.WAVE = 0, Read/Write if TC\_CMRA<sub>x</sub>.WAVE = 1.  
 This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	RA[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	RA[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	RA[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	RA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – RA[31:0] Register A**  
 RA contains the Register A value in real time.

**Important:**

### 53.7.8 TC Register B

**Name:** TC\_RBx  
**Offset:** 0x18 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register has access Read-only if TC\_CMRx.WAVE = 0, Read/Write if TC\_CMRx.WAVE = 1.  
 This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	RB[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	RB[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	RB[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	RB[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – RB[31:0] Register B**  
 RB contains the Register B value in real time.

**Important:**

### 53.7.9 TC Register C

**Name:** TC\_RCx  
**Offset:** 0x1C + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	RC[31:24]							
Access								
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	RC[23:16]							
Access

#### Bit 18 – MTIOB TIOBx Mirror

Value	Description
0	TIOBx is low. If TC_CMRx.WAVE = 0, TIOBx pin is low. If TC_CMRx.WAVE = 1, TIOBx is driven low.
1	TIOBx is high. If TC_CMRx.WAVE = 0, TIOBx pin is high. If TC_CMRx.WAVE = 1, TIOBx is driven high.

#### Bit 17 – MTIOA TIOAx Mirror

Value	Description
0	TIOAx is low. If TC_CMRx.WAVE = 0, TIOAx pin is low. If TC_CMRx.WAVE = 1, TIOAx is driven low.
1	TIOAx is high. If TC_CMRx.WAVE = 0, TIOAx pin is high. If TC_CMRx.WAVE = 1, TIOAx is driven high.

#### Bit 16 – CLKSTA Clock Enabling Status

Value	Description
0	Clock is disabled.
1	Clock is enabled.

**Bit 7 – ETRGS** External Trigger Status (cleared on read)

Value	Description
0	External trigger has not occurred since the last read of the Status Register.
1	External trigger has occurred since the last read of the Status Register.

**Bit 6 – LDRBS** RB Loading Status (cleared on read)

Value	Description
0	RB Load has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 1.
1	RB Load has occurred since the last read of the Status Register, if TC_CM Rx.WAVE = 0.

**Bit 5 – LDRAS** RA Loading Status (cleared on read)

Value	Description
0	RA Load has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 1.
1	RA Load has occurred since the last read of the Status Register, if TC_CM Rx.WAVE = 0.

**Bit 4 – CPCS** RC Compare Status (cleared on read)

Value	Description
0	RC Compare has not occurred since the last read of the Status Register.
1	RC Compare has occurred since the last read of the Status Register.

**Bit 3 – CPBS** RB Compare Status (cleared on read)

Value	Description
0	RB Compare has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 0.
1	RB Compare has occurred since the last read of the Status Register, if TC_CM Rx.WAVE = 1.

**Bit 2 – CPAS** RA Compare Status (cleared on read)

Value	Description
0	RA Compare has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 0.
1	RA Compare has occurred since the last read of the Status Register, if TC_CM Rx.WAVE = 1.

**Bit 1 – LOVRS** Load Overrun Status (cleared on read)

Value	Description
0	Load overrun has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 1.
1	RA or RB have been loaded at least twice without any read of the corresponding register since the last read of the Status Register, if TC_CM Rx.WAVE = 0.

**Bit 0 – COVFS** Counter Overflow Status (cleared on read)

# SAMA5D2 Series

## Timer Counter (TC)

Value	Description
0	No counter overflow has occurred since the last read of the Status Register.
1	A counter overflow has occurred since the last read of the Status Register.

### 53.7.11 TC Interrupt Enable Register

**Name:** TC\_IERx  
**Offset:** 0x24 + x\*0x40 [x=0..2]  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access

### 53.7.14 TC Extended Mode Register

**Name:** TC\_EMRx  
**Offset:** 0x30 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

#### Bit 8 – NODIVCLK No Divided Clock

Value	Description
0	The selected clock is defined by field TCCLKS in TC_CMRx.
1	The selected clock is peripheral clock and TCCLKS field (TC_CMRx) has no effect.

#### Bits 5:4 – TRIGSRCB[1:0] Trigger Source for Input B

Value	Name	Description
0	EXTERNAL_TIOBx	The trigger/capture input B is driven by external pin TIOBx
1	PWMx	For TC0 to TC10: The trigger/capture input B is driven internally by the comparator output (see <a href="#">Synchronization with PWM</a> ) of the PWMx. For TC11: The trigger/capture input B is driven internally by the GTSUCOMP signal of the Ethernet MAC (GMAC).

#### Bits 1:0 – TRIGSRCA[1:0] Trigger Source for Input A

Value	Name	Description
0	EXTERNAL_TIOAx	The trigger/capture input A is driven by external pin TIOAx
1	PWMx	The trigger/capture input A is driven internally by PWMx

### 53.7.15 TC Block Control Register

**Name:** TC\_BCR  
**Offset:** 0xC0  
**Reset:** –  
**Property:** Write-only

#### Bit 0 – SYNC Synchro Command

Value	Description
0	No effect.
1	Asserts the SYNC signal which generates a software trigger simultaneously for each of the channels.

### 53.7.16 TC Block Mode Register

**Name:** TC\_BMR  
**Offset:** 0xC4  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24

Reset			0	0	0	0	0	0

#### Bits 29:26 – MAXCMP[3:0] Maximum Consecutive Missing Pulses

Value	Description
0	The flag MPE in TC_QISR never rises.
1–15	Defines the number of consecutive missing pulses before a flag report.

#### Bits 25:20 – MAXFILT[5:0] Maximum Filter

Pulses with a period shorter than MAXFILT+1 peripheral clock cycles are discarded. For more details on MAXFILT constraints, see [“Input Preprocessing”](#)

Value	Description
1–63	Defines the filtering capabilities.

#### Bit 18 – AUTO AutoCorrection of missing pulses

0 (DISABLED): The detection and autocorrection function is disabled.

1 (ENABLED): The detection and autocorrection function is enabled.

#### Bit 17 – IDXP Index Pin is PHB Pin

Value	Description
0	IDX pin of the rotary sensor must drive TIOA1.

Value	Description
1	IDX pin of the rotary sensor must drive TIOB0.

**Bit 16 – SWAP** Swap PHA and PHB

Value	Description
0	No swap between PHA and PHB.
1	Swap PHA and PHB internally, prior to driving the QDEC.

**Bit 15 – INVIDX** Inverted Index

Value	Description
0	IDX (TIOA1) is directly driving the QDEC.
1	IDX is inverted before driving the QDEC.

**Bit 14 – INVB** Inverted PHB

Value	Description
0	PHB (TIOB0) is directly driving the QDEC.
1	PHB is inverted before driving the QDEC.

**Bit 13 – INVA** Inverted PHA

Value	Description
0	PHA (TIOA0) is directly driving the QDEC.
1	PHA is inverted before driving the QDEC.

**Bit 12 – EDGPHA** Edge on PHA Count Mode

Value	Description
0	Edges are detected on PHA only.
1	Edges are detected on both PHA and PHB.

**Bit 11 – QDTRANS** Quadrature Decoding Transparent

Value	Description
0	Full quadrature decoding logic is active (direction change detected).
1	Quadrature decoding logic is inactive (direction change inactive) but input filtering and edge detection are performed.

**Bit 10 – SPEEDEN** Speed Enabled

Value	Description
0	Disabled.
1	Enables the speed measure on channel 0, the time base being provided by channel 2.

**Bit 9 – POSEN** Position Enabled

Value	Description
0	Disable position.
1	Enables the position measure on channel 0 and 1.

**Bit 8 – QDEN** Quadrature Decoder Enabled

Quadrature decoding (direction change) can be disabled using QDTRANS bit.

One of the POSEN or SPEEDEN bits must be also enabled.

Value	Description
0	Disabled.
1	Enables the QDEC (filter, edge detection and quadrature decoding).

**Bits 5:4 – TC2XC2S[1:0]** External Clock Signal 2 Selection

Value	Name	Description
0	TCLK2	Signal connected to XC2: TCLK2
1	–	Reserved
2	TIOA0	Signal connected to XC2: TIOA0
3	TIOA1	Signal connected to XC2: TIOA1

**Bits 3:2 – TC1XC1S[1:0]** External Clock Signal 1 Selection

Value	Name	Description
0	TCLK1	Signal connected to XC1: TCLK1
1	–	Reserved
2	TIOA0	Signal connected to XC1: TIOA0
3	TIOA2	Signal connected to XC1: TIOA2

**Bits 1:0 – TC0XC0S[1:0]** External Clock Signal 0 Selection

Value	Name	Description
0	TCLK0	Signal connected to XC0: TCLK0
1	–	Reserved
2	TIOA1	Signal connected to XC0: TIOA1
3	TIOA2	Signal connected to XC0: TIOA2

### 53.7.17 TC QDEC Interrupt Enable Register

**Name:** TC\_QIER  
**Offset:** 0xC8  
**Reset:** –  
**Property:** Write-only

#### Bit 3 – MPE Consecutive Missing Pulse Error

Value	Description
0	No effect.
1	Enables the interrupt when an occurrence of MAXCMP consecutive missing pulses is detected.

#### Bit 2 – QERR Quadrature Error

Value	Description
0	No effect.
1	Enables the interrupt when a quadrature error occurs on PHA, PHB.

#### Bit 1 – DIRCHG Direction Change

Value	Description
0	No effect.
1	Enables the interrupt when a change on rotation direction is detected.

#### Bit 0 – IDX Index

Value	Description
0	No effect.

# SAMA5D2 Series

## Timer Counter (TC)

---

---

Value	Description
1	Enables the interrupt when a rising edge occurs on IDX input.

### 53.7.18 TC QDEC Interrupt Disable Register

**Name:** TC\_QIDR  
**Offset:** 0xCC  
**Reset:** –  
**Property:** Write-only

#### Bit 3 – MPE Consecutive Missing Pulse Error

Value	Description
0	No effect.
1	Disables the interrupt when an occurrence of MAXCMP consecutive missing pulses has been detected.

#### Bit 2 – QERR Quadrature Error

Value	Description
0	No effect.
1	Disables the interrupt when a quadrature error occurs on PHA, PHB.

#### Bit 1 – DIRCHG Direction Change

Value	Description
0	No effect.
1	Disables the interrupt when a change on rotation direction is detected.

#### Bit 0 – IDX Index

Value	Description
0	No effect.

# SAMA5D2 Series

## Timer Counter (TC)

---

---

Value	Description
1	Disables the interrupt when a rising edge occurs on IDX input.

### 53.7.19 TC QDEC Interrupt Mask Register

**Name:** TC\_QIMR  
**Offset:** 0xD0  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bit 3 – MPE Consecutive Missing Pulse Error

Value	Description
0	The interrupt on the maximum number of consecutive missing pulses specified in MAXCMP is disabled.
1	The interrupt on the maximum number of consecutive missing pulses specified in MAXCMP is enabled.

#### Bit 2 – QERR Quadrature Error

Value	Description
0	The interrupt on quadrature error is disabled.
1	The interrupt on quadrature error is enabled.

#### Bit 1 – DIRCHG Direction Change

Value	Description
0	The interrupt on rotation direction change is disabled.
1	The interrupt on rotation direction change is enabled.

#### Bit 0 – IDX Index

# SAMA5D2 Series

## Timer Counter (TC)

Value	Description
0	The interrupt on IDX input is disabled.
1	The interrupt on IDX input is enabled.

### 53.7.20 TC QDEC Interrupt Status Register

**Name:** TC\_QISR  
**Offset:** 0xD4  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
Access									
Reset									
Bit	15	14	13	12	11	10	9	8	
								DIR	
Access								R	
Reset								0	
Bit	7	6	5	4	3	2	1	0	
						MPE	QERR	DIRCHG	IDX
Access						R	R	R	R
Reset						0	0	0	0

**Bit 8 – DIR** Direction  
 Returns an image of the current rotation direction.

**Bit 3 – MPE** Consecutive Missing Pulse Error

Value	Description
0	The number of consecutive missing pulses has not reached the maximum value specified in MAXCMP since the last read of TC_QISR.
1	An occurrence of MAXCMP consecutive missing pulses has been detected since the last read of TC_QISR.

**Bit 2 – QERR** Quadrature Error

Value	Description
0	No quadrature error since the last read of TC_QISR.
1	A quadrature error occurred since the last read of TC_QISR.

**Bit 1 – DIRCHG** Direction Change

Value	Description
0	No change on rotation direction since the last read of TC_QISR.
1	The rotation direction changed since the last read of TC_QISR.

---

---

**Bit 0 – IDX** Index

Value	Description
0	No Index input change since the last read of TC_QISR.
1	The IDX input has changed since the last read of TC_QISR.

### 53.7.21 TC Fault Mode Register

**Name:** TC\_FMR  
**Offset:** 0xD8  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

#### Bit 1 – ENCF1 Enable Compare Fault Channel 1

Value	Description
0	Disables the FAULT output source (CPCS flag) from channel 1.
1	Enables the FAULT output source (CPCS flag) from channel 1.

#### Bit 0 – ENCF0 Enable Compare Fault Channel 0

Value	Description
0	Disables the FAULT output source (CPCS flag) from channel 0.
1	Enables the FAULT output source (CPCS flag) from channel 0.

### 53.7.22 TC Write Protection Mode Register

**Name:** TC\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPEN
Access								R/W
Reset								0

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x54494D	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit.
D		Always reads as 0.

#### Bit 0 – WPEN Write Protection Enable

The Timer Counter clock of the first channel must be enabled to access this register.

See [“Register Write Protection”](#) for a list of registers that can be write-protected and Timer Counter clock conditions.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x54494D (“TIM” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x54494D (“TIM” in ASCII).

## 54. Pulse Density Modulation Interface Controller (PDMIC)

### 54.1 Description

The Pulse Density Modulation Interface Controller (PDMIC) is a PDM interface controller and decoder that support mono PDM format. It integrates a clock generator driving the PDM microphone and embeds filters which decimate the incoming bitstream to obtain most common audio rates.

### 54.2 Embedded Characteristics

- 16-bit Resolution
- DMA Controller Support
- Up to 4 Conversions Stored
- PDM Clock Source can be Independent from Core Clock
- Register Write Protection

### 54.3 Block Diagram

Figure 54-1. PDMIC Block Diagram

### 54.4 Signal Description

Table 54-1. PDMIC Pin Description

Pin Name	Description	Type
PDMIC_CLK	Pulse Density Modulation Bitstream Sampling Clock	Output
PDMIC_DAT	Pulse Density Modulation Data	Input

## 54.5 Product Dependencies

### 54.5.1 I/O Lines

The pins used for interfacing the PDMIC are multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the peripheral functions to PDMIC pins.

### 54.5.2 Power Management

The PDMIC is not continuously clocked. The user must first enable the PDMIC peripheral clocks (PDMIC Channel 0 and PDMIC Channel 1) and the PDMIC Generic Clock in the Power Management Controller (PMC) before using the controller.

### 54.5.3 Interrupt Sources

The PDMIC interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the PDMIC interrupt requires the Interrupt Controller to be programmed first.

## 54.6 Functional Description

### 54.6.1 PDM Interface

#### 54.6.1.1 Description

The PDM clock (PDMIC\_CLK) is used to sample the PDM bitstream.

The PDMIC\_CLK frequency range is between peripheral clock/2 and peripheral clock/256 or between GCLK clock/2 and GCLK clock/256, depending on the selected clock source.

The GCLK clock frequency must always be at least three times lower than the peripheral clock frequency.

The field PRESCAL in the Mode Register (PDMIC\_MR) must be programmed in order to provide a PDMIC\_CLK frequency compliant with the microphone parameters.

#### 54.6.1.2 Start-up Sequence

To start processing the bitstream coming from the PDM interface, follow the steps below:

1. Clear all bits in the Control Register (PDMIC\_CR) or compute a soft reset using the SWRST bit of PDMIC\_CR.
2. Configure the PRESCAL field in PDMIC\_MR according to the microphone specifications.
3. Enable the PDM mode and start the conversions using the ENPDM bit in PDMIC\_CR.

### 54.6.2 Digital Signal Processing (Digital Filter)

#### 54.6.2.1 Description

The PDMIC includes a DSP section containing a decimation filter, a droop compensation filter, a sixth-order low pass filter, a first-order high pass filter and an offset and gain compensation stage. A block diagram of the DSP section is represented in [Figure 54-2](#).

Data processed by the filtering section are two's complement signals defined on 24 bits.

The filtering of the decimation stage is performed by a fourth-order sinc-based filter whose zeros are placed in order to minimize aliasing effects of the decimation. The decimation ratio of this filter is either 32 or 64. The droop induced by this filter can be compensated by the droop compensation stage.

The sixth-order low pass filter is used to decimate the sinc filter output by a ratio of 2.

An optional first-order high pass filter is implemented in order to eliminate the DC component of the incoming signal.

The overall decimation ratio of this DSP section is either 64 or 128. This fits an audio sampling rate of 48 kHz with a PDM microphone sampling frequency of either 3.072 or 6.144 MHz. The frequency response of the filters optimizes the gain flatness between 0 and 20 kHz (when the droop compensation filter is implemented and the high pass filter is bypassed) and highly reduces the aliasing effects of the decimation.

**Figure 54-2. DSP Block Diagram**

### 54.6.2.2 Decimation Filter

The sigma-delta architecture of the PDM microphone implies a filtering and a decimation of the bitstream at the output of the microphone bitstream. The decimation filter decimates the bitstream by either 32 or 64. To perform this operation, a fourth-order sinc filter with an Over-Sampling Ratio (OSR) of 32 or 64 is implemented with the following transfer function:

$$H(z) = \frac{1}{OSR^4} \left( \sum_{i=0}^{OSR-1} z^{-i} \right)^4$$

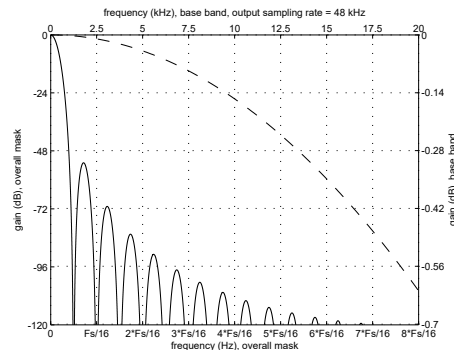

The DC gain of this filter is unity and does not depend on its OSR. However, as it generates a fourth-order zero at  $F_s/OSR$  frequency multiples ( $F_s$  being the sampling frequency of the microphone), the frequency response of the decimation filter depends on the OSR parameter. See [54.6.2.3 Droop Compensation](#) for frequency plots.

Its non-flat frequency response can be compensated over the 0 to 20 kHz band by using the droop compensation filter when the decimated frequency is set to 48 kHz. See [54.6.2.3 Droop Compensation](#).

If the decimated sampling rate is modified, the frequency response of this filter is scaled proportionally to the new frequency.

In [Figure 54-3](#) and [Figure 54-4](#),  $F_s$  is the sampling rate of the PDM microphone.

**Figure 54-3. Spectral mask of an OSR = 32,  $F_s = 6.144$  MHz, Fourth-Order Sinc Filter: Overall Response (continuous line) and 0 to 20 kHz Bandwidth Response (dashed line)**

The zeros of this filter are located at multiples of  $F_s/32$

**Figure 54-4. Spectral Mask of an OSR = 64,  $F_s = 3.072$  MHz, Fourth-order Sinc Filter: Overall Response (continuous line) and 0 to 20 kHz Bandwidth Response (dashed line)**

The zeros of this filter are located at multiples of  $F_s/64$ .

### 54.6.2.3 Droop Compensation

The droop effect introduced by the sinc filter can be compensated in the 0 to 20 kHz by the droop compensation filter (see [Figure 54-5](#)). This is a second-order IIR filter which is applied on the signal output by the sinc. The default coefficients of the droop compensation filter are computed to optimize the droop of the sinc filter with the decimated frequency equal to 48 kHz.

This filter compensates the droop of the sinc filter regardless of the OSR value.

If the decimated sampling rate is modified, the frequency response of this filter is scaled proportionally to the new frequency.

This filter can be bypassed by setting the SINBYP bit in the [PDMIC DSP Configuration Register 0](#) (PDMIC\_DSPR0).

**Figure 54-5. Droop Compensation Filter Overall Frequency Response**

**Figure 54-6. Droop Compensation Filter 0 to 20 kHz Band Flatness**

#### 54.6.2.4 Low Pass Filter

The PDMIC includes a sixth-order IIR filter that performs a low pass transfer function and decimates by 2 the output of the sinc filter. The coefficients are computed for a decimated sampling rate of 48 kHz and optimize the 0 to 20 kHz band flatness while rejecting the aliasing of the PDM microphone by at least 60 dB in the 28 to 48 kHz band.

If the decimated sampling rate is modified, the frequency response of this filter is scaled proportionally to the new frequency.

Figure 54-7 and Figure 54-8 are drawn for an output sampling frequency of 48 kHz.

**Figure 54-7. Low Pass Filter Spectral Mask**

**Figure 54-8. Low Pass Filter Ripple in the 0 to 20 kHz Band**

#### 54.6.2.5 High Pass Filter

The PDMIC includes an optional first-order IIR filter performing a high pass transfer function after the low pass filter and before the decimation. The coefficients are computed for a decimated sampling rate of 48 kHz to obtain a -3dB cutoff frequency at 15 Hz.

If the decimated sampling rate is modified, the frequency response of this filter is scaled proportionally to the new frequency.

This filter can be bypassed by setting the HPFBYP bit in PDMIC\_DSPR0 (see 54.7.8 PDMIC\_DSPR0).

Figure 54-9 is drawn for an output sampling frequency of 48 kHz.

**Figure 54-9. High Pass Filter Spectral Mask in the 0 to 100 Hz Band**

#### 54.6.2.6 Gain and Offset Compensation

An offset, a gain, a scaling factor and a shift can be applied to a converted PDM microphone value using the following operation:

$$\text{data} = \frac{(\text{data}_0 + \text{offset} \times 2^8) \times \text{dgain}}{2^{\text{scale} + \text{shift} + 8}}$$

where:

- $\text{data}_0$  is a signed integer defined on 24 bits. It is the output of the filtering channel.
- $\text{offset}$  is a signed integer defined on 16 bits (see [PDMIC DSP Configuration Register 1](#)). It is multiplied by  $2^8$  to have the same weight as  $\text{data}_0$ .
- $\text{dgain}$  is an unsigned integer defined on 15 bits (see [PDMIC DSP Configuration Register 1](#)). Only the 32 MSBs of the multiplication operation are used for scaling and shifting operations.  $\text{dgain}$  defaults to 0 after reset, which forces CDR to 0. It must be programmed to a non-zero value to read non-zero data into the PDMIC\_CDR register.
- $\text{scale}$  is an unsigned integer defined on 4 bits (see [PDMIC DSP Configuration Register 0](#)). It shifts the multiplication operation result by  $\text{scale}$  bits to the right. Maximum allowed value is 15.
- $\text{shift}$  is an unsigned integer defined on 4 bits (see [PDMIC DSP Configuration Register 0](#)). It shifts the multiplication operation result by  $\text{shift}$  bits to the right. Maximum allowed value is 15.

If the data transfer is configured in 32-bit mode (see [PDMIC DSP Configuration Register 0](#)), the  $2^{\text{shift}}$  division is not performed and the 32-bit result of the remaining operation is sent.

If the data transfer is configured in 16-bit mode, the  $2^{\text{shift}}$  division is performed. The result is then saturated to be within  $\pm(2^{15}-1)$  and the 16 LSBs of this saturation operation are sent to the controller as the result of the PDM microphone conversion.

Default parameters are defined to output a 16-bit result whatever the data transfer configuration may be.

#### 54.6.3 Conversion Results

When a conversion is completed, the resulting 16-bit digital value is stored in the PDMIC Converted Data Register (PDMIC\_CDR).

The DRDY bit in the Interrupt Status Register (PDMIC\_ISR) is set. In the case of a connected DMA Controller channel, DRDY rising triggers a data transfer request. In any case, DRDY can trigger an interrupt.

Reading PDMIC\_CDR clears the DRDY flag.

**Figure 54-10. DRDY Flag Behavior**

If PDMIC\_CDR is not read before further incoming data is converted, the Overrun Error (OVRE) flag is set in PDMIC\_ISR. Likewise, new data converted when DRDY is high sets the OVRE bit (Overrun Error) in PDMIC\_ISR. In case of overrun, the newly converted data is lost.

The OVRE flag is automatically cleared when PDMIC\_ISR is read.

#### 54.6.4 Register Write Protection

To prevent any single software error from corrupting PDMIC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [PDMIC Write Protection Mode Register](#) (PDMIC\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the [PDMIC Write Protection Status Register](#) (PDMIC\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading PDMIC\_WPSR.

The following registers can be write-protected:

- [PDMIC Mode Register](#)
- [PDMIC DSP Configuration Register 0](#)
- [PDMIC DSP Configuration Register 1](#)

### 54.7.1 PDMIC Control Register

**Name:** PDMIC\_CR  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bit 4 – ENPDM Enable PDM

Value	Description
0	Disables the PDM and stops the conversions.
1	Enables the PDM and starts the conversions.

#### Bit 0 – SWRST Software Reset

Warning: The read value of this bit is always 0.

Value	Description
0	No effect.
1	Resets the PDMIC, simulating a hardware reset.

### 54.7.2 PDMIC Mode Register

**Name:** PDMIC\_MR  
**Offset:** 0x04  
**Reset:** 0x00F00000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PDMIC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	[Greyed out]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Greyed out]							
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	PRESCAL[6:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	[Greyed out]			CLKS	[Greyed out]			
Access				R/W				
Reset				0				

#### Bits 14:8 – PRESCAL[6:0] Prescaler Rate Selection

PRESCAL determines the frequency of the PDM bitstream sampling clock (PDMIC\_CLK):

$$\text{PRESCAL} = \frac{\text{SELCK}}{2 \times f_{\text{PDMIC\_CLK}}} - 1$$

where SELCK is either  $f_{\text{peripheral clock}}$  or  $f_{\text{GCLK clock}}$  depending on the value of bit CLKS ( $f_{\text{peripheral clock}}$  or  $f_{\text{GCLK clock}}$  is the clock frequency in Hz).

#### Bit 4 – CLKS Clock Source Selection

Value	Description
0	Peripheral clock selected
1	GCLK clock selected (This clock source can be independent of the processor clock.)

### 54.7.3 PDMIC Converted Data Register

**Name:** PDMIC\_CDR  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	DATA[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	DATA[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	DATA[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	DATA[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – DATA[31:0] Data Converted

The filtered output data is placed into this register at the end of a conversion and remains until it is read.

### 54.7.4 PDMIC Interrupt Enable Register

**Name:** PDMIC\_IER  
**Offset:** 0x18  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
							OVRE	DRDY
Access							W	W
Reset							–	–

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

**Bit 25 – OVRE** Overrun Error Interrupt Enable

**Bit 24 – DRDY** Data Ready Interrupt Enable

### 54.7.5 PDMIC Interrupt Disable Register

**Name:** PDMIC\_IDR  
**Offset:** 0x1C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
							OVRE	DRDY
Access							W	W
Reset							–	–

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

**Bit 25 – OVRE** General Overrun Error Interrupt Disable

**Bit 24 – DRDY** Data Ready Interrupt Disable

### 54.7.6 PDMIC Interrupt Mask Register

**Name:** PDMIC\_IMR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
							OVRE	DRDY
Access							R	R
Reset							0	0

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

**Bit 25 – OVRE** General Overrun Error Interrupt Mask

**Bit 24 – DRDY** Data Ready Interrupt Mask

### 54.7.7 PDMIC Interrupt Status Register

**Name:** PDMIC\_ISR  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
							OVRE	DRDY
Access							R	R
Reset							0	0
Bit	23	22	21	20	19	18	17	16
	FIFOCNT[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access								
Reset								

**Bit 25 – OVRE** Overrun Error (cleared on read)

Value	Description
0	No overrun error has occurred since the last read of PDMIC_ISR.
1	At least one overrun error has occurred since the last read of PDMIC_ISR.

**Bit 24 – DRDY** Data Ready (cleared by reading PDMIC\_CDR)

Value	Description
0	No data has been converted since the last read of PDMIC_CDR.
1	At least one data has been converted and is available in PDMIC_CDR.

**Bits 23:16 – FIFOCNT[7:0]** FIFO Count

Number of conversions available in the FIFO (not a source of interrupt).

### 54.7.8 PDMIC DSP Configuration Register 0

**Name:** PDMIC\_DSPR0  
**Offset:** 0x58  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PDMIC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access	SHIFT[3:0]				SCALE[3:0]			
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Access		OSR[2:0]			SIZE	SINBYP	HPFBYP	
Reset		0	0	0	0	0	0	

**Bits 15:12 – SHIFT[3:0]** Data Shift  
 Shifts the scaled result by SHIFT bits to the right.

**Bits 11:8 – SCALE[3:0]** Data Scale  
 Shifts the multiplication operation result by SCALE bits to the right.

**Bits 6:4 – OSR[2:0]** Global Oversampling Ratio  
 Values not listed are reserved.

Value	Name	Description
0	128	Global Oversampling ratio is 128 (SINC filter oversampling ratio is 64)
1	64	Global Oversampling ratio is 64 (SINC filter oversampling ratio is 32)

**Bit 3 – SIZE** Data Size

Value	Description
0	Converted data size is 16 bits.
1	Converted data size is 32 bits.

**Bit 2 – SINBYP** SINCC Filter Bypass

---

---

Value	Description
0	Droop compensation filter enabled.
1	Bypasses the droop compensation filter.

**Bit 1 – HPFBYP** High-Pass Filter Bypass

Value	Description
0	High-pass filter enabled.
1	Bypasses the high-pass filter.

### 54.7.9 PDMIC DSP Configuration Register 1

**Name:** PDMIC\_DSPR1  
**Offset:** 0x5C  
**Reset:** 0x00000001  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PDMIC Write Protection Mode Register](#).

DGAIN and OFFSET values can be determined using the formula in [54.6.2.6 Gain and Offset Compensation](#).

Bit	31	30	29	28	27	26	25	24
	OFFSET[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	OFFSET[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
		DGAIN[14:8]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	DGAIN[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	1

**Bits 31:16 – OFFSET[15:0]** Offset Correction  
 Offset correction to apply to the final result.

**Bits 14:0 – DGAIN[14:0]** Gain Correction  
 Gain correction to apply to the final result.

## 54.7.10 PDMIC Write Protection Mode Register

**Name:** PDMIC\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPEN
Access								R/W
Reset								0

**Bits 31:8 – WPKEY[23:0]** Write Protection Key

Value	Name	Description
0x414444	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit.
3		Always reads as 0.

**Bit 0 – WPEN** Write Protection Enable

See [54.6.4 Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x414443 (“ADC” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x414443 (“ADC” in ASCII).

### 54.7.11 PDMIC Write Protection Status Register

**Name:** PDMIC\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPVS
Access								R
Reset								0

#### Bits 23:8 – WPVSR[15:0] Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

#### Bit 0 – WPVS Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of PDMIC_WPSR.
1	A write protection violation has occurred since the last read of PDMIC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

## **55. Pulse Width Modulation Controller (PWM)**

### **55.1 Description**

The Pulse Width Modulation Controller (PWM) generates output pulses on 4 channels independently according to parameters defined per channel. Each channel controls two complementary square output waveforms. Characteristics of the output waveforms such as period, duty-cycle, polarity and dead-times (also called dead-bands or non-overlapping times) are configured through the user interface. Each channel selects and uses one of the clocks provided by the clock generator. The clock generator provides several clocks resulting from the division of the PWM peripheral clock. External triggers can be managed to allow output pulses to be modified in real time.

All accesses to the PWM are made through registers mapped on the peripheral bus. All channels integrate a double buffering system in order to prevent an unexpected output waveform while modifying the period, the spread spectrum, the duty-cycle or the dead-times.

Channels can be linked together as synchronous channels to be able to update their duty-cycle or dead-times at the same time.

The update of duty-cycles of synchronous channels can be performed by the DMA Controller channel which offers buffer transfer without processor Intervention.

The PWM includes a spread-spectrum counter to allow a constantly varying period (only for Channel 0). This counter may be useful to minimize electromagnetic interference or to reduce the acoustic noise of a PWM driven motor.

The PWM provides 1 independent comparison units capable of comparing a programmed value to the counter of the synchronous channels (counter of channel 0). These comparisons are intended to generate software interrupts, to trigger pulses on the 2 independent event lines (in order to synchronize ADC conversions with a lot of flexibility independently of the PWM outputs) and to trigger DMA Controller transfer requests.

PWM outputs can be overridden synchronously or asynchronously to their channel counter.

The PWM provides a fault protection mechanism with 6 fault inputs, capable to detect a fault condition and to override the PWM outputs asynchronously (outputs forced to '0', '1' or Hi-Z).

For safety usage, some configuration registers are write-protected.

### **55.2 Embedded Characteristics**

- 4 Channels
- Common Clock Generator Providing Thirteen Different Clocks
  - A Modulo n Counter Providing Eleven Clocks
  - Two Independent Linear Dividers Working on Modulo n Counter Outputs
- Independent Channels
  - Independent 16-bit Counter for Each Channel
  - Independent Complementary Outputs with 16-bit Dead-Time Generator (Also Called Dead-Band or Non-Overlapping Time) for Each Channel
  - Independent Push-Pull Mode for Each Channel
  - Independent Enable Disable Command for Each Channel

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

---

---

- Independent Clock Selection for Each Channel
- Independent Period, Duty-Cycle and Dead-Time for Each Channel
- Independent Double Buffering of Period, Duty-Cycle and Dead-Times for Each Channel
- Independent Programmable Selection of The Output Waveform Polarity for Each Channel, with Double Buffering
- Independent Programmable Center- or Left-aligned Output Waveform for Each Channel
- Independent Output Override for Each Channel
- Independent Interrupt for Each Channel, at Each Period for Left-Aligned or Center-Aligned Configuration
- Independent Update Time Selection of Double Buffering Registers (Polarity, Duty Cycle) for Each Channel, at Each Period for Left-Aligned or Center-Aligned Configuration
- External Trigger Input Management (e.g., for DC/DC or Lighting Control)
  - External PWM Reset Mode
  - External PWM Start Mode
  - Cycle-By-Cycle Duty Cycle Mode
  - Leading-Edge Blanking
- Two 2-bit Gray Up/Down Channels for Stepper Motor Control
- Spread Spectrum Counter to Allow a Constantly Varying Duty Cycle (only for Channel 0)
- Synchronous Channel Mode
  - Synchronous Channels Share the Same Counter
  - Mode to Update the Synchronous Channels Registers after a Programmable Number of Periods
  - Synchronous Channels Supports Connection of one DMA Controller Channel Which Offers Buffer Transfer Without Processor Intervention To Update Duty-Cycle Registers
- 2 Independent Events Lines Intended to Synchronize ADC Conversions
  - Programmable delay for Events Lines to delay ADC measurements
- 1 Comparison Units Intended to Generate Interrupts, Pulses on Event Lines and DMA Controller Transfer Requests
- 6 Programmable Fault Inputs Providing an Asynchronous Protection of PWM Outputs
  - 2 User Driven through PIO Inputs
  - PMC Driven when Crystal Oscillator Clock Fails
  - ADC Controller Driven through Configurable Comparison Function
  - Timer/Counter Driven through Configurable Comparison Function
- Register Write Protection

### 55.3 Block Diagram

Figure 55-1. Pulse Width Modulation Controller Block Diagram

**Note:** For a more detailed illustration of the fault protection circuitry, refer to [55.6.2.7 Fault Protection](#).

### 55.4 I/O Lines Description

Each channel outputs two complementary external I/O lines.

**Table 55-1. I/O Line Description**

Name	Description	Type
PWMHx	PWM Waveform Output High for channel x	Output
PWMLx	PWM Waveform Output Low for channel x	Output
PWMFlx	PWM Fault Input x	Input
PWMEXTRGy	PWM Trigger Input y	Input

## 55.5 Product Dependencies

### 55.5.1 I/O Lines

The pins used for interfacing the PWM are multiplexed with PIO lines. The programmer must first program the PIO controller to assign the desired PWM pins to their peripheral function. If I/O lines of the PWM are not used by the application, they can be used for other purposes by the PIO controller.

All of the PWM outputs may or may not be enabled. If an application requires only four channels, then only four PIO lines are assigned to PWM outputs.

### 55.5.2 Power Management

The PWM is not continuously clocked. The programmer must first enable the PWM clock in the Power Management Controller (PMC) before using the PWM. However, if the application does not require PWM operations, the PWM clock can be stopped when not needed and be restarted later. In this case, the PWM will resume its operations where it left off.

### 55.5.3 Interrupt Sources

The PWM interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the PWM interrupt requires the Interrupt Controller to be programmed first.

### 55.5.4 Fault Inputs

The PWM has the fault inputs connected to the different modules. Refer to the implementation of these modules within the product for detailed information about the fault generation procedure. The PWM receives faults from:

- PIO inputs
- the PMC
- the ADC controller
- Timer/Counters

**Table 55-2. Fault Inputs**

Fault Generator	External PWM Fault Input Number	Polarity Level <sup>(1)</sup>	Fault Input ID
PB2	PWMFI0	User-defined	0
PB9	PWMFI1	User-defined	1
PMC	–	To be configured to 1	2

.....continued

Fault Generator	External PWM Fault Input Number	Polarity Level <sup>(1)</sup>	Fault Input ID
ADC	–	To be configured to 1	3
Timer0	–	To be configured to 1	4
Timer1	–	To be configured to 1	5

**Note:**

1. FPOL field in PWMC\_FMR.

### 55.6 Functional Description

The PWM controller is primarily composed of a clock generator module and 4 channels.

- Clocked by the peripheral clock, the clock generator module provides 13 clocks.
- Each channel can independently choose one of the clock generator outputs.
- Each channel generates an output waveform with attributes that can be defined independently for each channel through the user interface registers.

#### 55.6.1 PWM Clock Generator

**Figure 55-2. Functional View of the Clock Generator Block Diagram**

The PWM peripheral clock is divided in the clock generator module to provide different clocks available for all channels. Each channel can independently select one of the divided clocks.

The clock generator is divided into different blocks:

- a modulo n counter which provides 11 clocks:
  - $f_{\text{peripheral clock}}$
  - $f_{\text{peripheral clock}}/2$
  - $f_{\text{peripheral clock}}/4$
  - $f_{\text{peripheral clock}}/8$
  - $f_{\text{peripheral clock}}/16$
  - $f_{\text{peripheral clock}}/32$
  - $f_{\text{peripheral clock}}/64$
  - $f_{\text{peripheral clock}}/128$
  - $f_{\text{peripheral clock}}/256$
  - $f_{\text{peripheral clock}}/512$
  - $f_{\text{peripheral clock}}/1024$
- two linear dividers (1, 1/2, 1/3, ... 1/255) that provide two separate clocks: clkA and clkB

Each linear divider can independently divide one of the clocks of the modulo n counter. The selection of the clock to be divided is made according to the PREA (PREB) field of the PWM Clock register (PWM\_CLK). The resulting clock clkA (clkB) is the clock selected divided by DIVA (DIVB) field value.

After a reset of the PWM controller, DIVA (DIVB) and PREA (PREB) are set to '0'. This implies that after reset clkA (clkB) are turned off.

At reset, all clocks provided by the modulo n counter are turned off except the peripheral clock. This situation is also true when the PWM peripheral clock is turned off through the Power Management Controller.

Before using the PWM controller, the programmer must first enable the peripheral clock in the Power Management Controller (PMC).

---

### 55.6.2 PWM Channel

#### 55.6.2.1 Channel Block Diagram

**Figure 55-3. Functional View of the Channel Block Diagram**

Each of the 4 channels is composed of six blocks:

- A clock selector which selects one of the clocks provided by the clock generator (described in [PWM Clock Generator](#) ).
- A counter clocked by the output of the clock selector. This counter is incremented or decremented according to the channel configuration and comparators matches. The size of the counter is 16 bits.
- A comparator used to compute the OCx output waveform according to the counter value and the configuration. The counter value can be the one of the channel counter or the one of the channel 0 counter according to SYNCx bit in the [PWM Sync Channels Mode Register](#) (PWM\_SCM).
- A 2-bit configurable Gray counter enables the stepper motor driver. One Gray counter drives 2 channels.
- A dead-time generator providing two complementary outputs (DTHx/DTLx) which allows to drive external power control switches safely.
- An output override block that can force the two complementary outputs to a programmed value (OOHx/OOLx).
- An asynchronous fault protection mechanism that has the highest priority to override the two complementary outputs (PWHx/PWLx) in case of fault detection (outputs forced to '0', '1' or Hi-Z).

#### 55.6.2.2 Comparator

The comparator continuously compares its counter value with the channel period defined by CPRD in the [PWM Channel Period Register](#) (PWM\_CPRDx) and the duty-cycle defined by CDTY in the [PWM Channel Duty Cycle Register](#) (PWM\_CDTYx) to generate an output signal OCx accordingly.

The different properties of the waveform of the output OCx are:

- the clock selection. The channel counter is clocked by one of the clocks provided by the clock generator described in the previous section. This channel parameter is defined in the CPRE field of the [PWM Channel Mode Register](#) (PWM\_CMRx). This field is reset at '0'.

- the waveform period. This channel parameter is defined in the CPRD field of the PWM\_CPRDx register.

If the waveform is left-aligned, then the output waveform period depends on the counter source clock and can be calculated:

By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(X \times \text{CPRD})}{f_{\text{peripheral clock}}}$$

By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(X \times \text{CPRD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(X \times \text{CPRD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

If the waveform is center-aligned, then the output waveform period depends on the counter source clock and can be calculated:

By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(2 \times X \times \text{CPRD})}{f_{\text{peripheral clock}}}$$

By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(2 \times X \times \text{CPRD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or }$$

$$\frac{(2 \times X \times \text{CPRD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

- the waveform duty-cycle. This channel parameter is defined in the CDTY field of the PWM\_CDTYx register.

If the waveform is left-aligned, then:

$$\text{duty cycle} = \frac{(\text{period} - 1/f_{\text{channel}_x\text{ clock}} \times \text{CDTY})}{\text{period}}$$

If the waveform is center-aligned, then:

$$\text{duty cycle} = \frac{((\text{period}/2) - 1/f_{\text{channel}_x\text{ clock}} \times \text{CDTY})}{(\text{period}/2)}$$

- the waveform polarity. At the beginning of the period, the signal can be at high or low level. This property is defined in the CPOL bit of PWM\_CMRx. By default, the signal starts by a low level. The DPOLI bit in PWM\_CMRx defines the PWM polarity when the channel is disabled (CHIDx = 0 in PWM\_SR). For more details, see the figure *Waveform Properties*.
  - DPOLI = 0: PWM polarity when the channel is disabled is the same as the one defined for the beginning of the PWM period.

- DPOLI = 1: PWM polarity when the channel is disabled is inverted compared to the one defined for the beginning of the PWM period.
- the waveform alignment. The output waveform can be left- or center-aligned. Center-aligned waveforms can be used to generate non-overlapped waveforms. This property is defined in the CALG bit of PWM\_CMRx. The default mode is left-aligned.

**Figure 55-4. Non-Overlapped Center-Aligned Waveforms**

**Note:** See the figure [Figure 55-5](#) for a detailed description of center-aligned waveforms.

When center-aligned, the channel counter increases up to CPRD and decreases down to 0. This ends the period.

When left-aligned, the channel counter increases up to CPRD and is reset. This ends the period.

Thus, for the same CPRD value, the period for a center-aligned channel is twice the period for a left-aligned channel.

Waveforms are fixed at 0 when:

- CDTY = CPRD and CPOL = 0 (Note that if TRGMODE = MODE3, the PWM waveform switches to 1 at the external trigger event (see [Cycle-By-Cycle Duty Mode](#))).
- CDTY = 0 and CPOL = 1

Waveforms are fixed at 1 (once the channel is enabled) when:

- CDTY = 0 and CPOL = 0
- CDTY = CPRD and CPOL = 1 (Note that if TRGMODE = MODE3, the PWM waveform switches to 0 at the external trigger event (see [Cycle-By-Cycle Duty Mode](#))).

The waveform polarity must be set before enabling the channel. This immediately affects the channel output level.

Modifying CPOL in [PWM Channel Mode Register](#) while the channel is enabled can lead to an unexpected behavior of the device being driven by PWM.

In addition to generating the output signals OCx, the comparator generates interrupts depending on the counter value. When the output waveform is left-aligned, the interrupt occurs at the end of the counter period. When the output waveform is center-aligned, the bit CES of PWM\_CMRx defines when the channel counter interrupt occurs. If CES is set to '0', the interrupt occurs at the end of the counter period. If CES is set to '1', the interrupt occurs at the end of the counter period and at half of the counter period.

The figure below illustrates the counter interrupts depending on the configuration.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

**Figure 55-5. Waveform Properties**

### 55.6.2.3 Trigger Selection for Timer Counter

The PWM controller can be used as a trigger source for the Timer Counter (TC) to achieve the two application examples described below.

#### 55.6.2.3.1 Delay Measurement

To measure the delay between the channel x comparator output (OCx) and the feedback from the bridge driver of the MOSFETs (see the figure below), the bit TCTS in the [PWM Channel Mode Register](#) must be at 0. This defines the comparator output of the channel x as the TC trigger source. The TIOB trigger (TC internal input) is used to start the TC; the TIOA input (from PAD) is used to capture the delay.

**Figure 55-6. Triggering the TC: Delay Measurement**

#### 55.6.2.3.2 Cumulated ON Time Measurement

To measure the cumulated “ON” time of MOSFETs (see the figure below), the bit TCTS of the [PWM Channel Mode Register](#) must be set to 1 to define the counter event (see the figure *Waveform Properties*) as the Timer Counter trigger source.

**Figure 55-7. Triggering the TC: Cumulated “ON” Time Measurement**

#### 55.6.2.4 2-bit Gray Up/Down Counter for Stepper Motor

A pair of channels may provide a 2-bit Gray count waveform on two outputs. Dead-time generator and other downstream logic can be configured on these channels.

Up or Down Count mode can be configured on-the-fly by means of PWM\_SMMR configuration registers.

When GCEN0 is set to '1', channels 0 and 1 outputs are driven with a Gray counter.

**Figure 55-8. 2-bit Gray Up/Down Counter**

#### 55.6.2.5 Dead-Time Generator

The dead-time generator uses the comparator output OCx to provide the two complementary outputs DTOHx and DTOLx, which allows the PWM macrocell to drive external power control switches safely. When the dead-time generator is enabled by setting the bit DTE to 1 or 0 in the [PWM Channel Mode Register](#) (PWM\_CMRx), dead-times (also called dead-bands or non-overlapping times) are inserted between the edges of the two complementary outputs DTOHx and DTOLx. Note that enabling or disabling the dead-time generator is allowed only if the channel is disabled.

The dead-time is adjustable by the [PWM Channel Dead Time Register](#) (PWM\_DT<sub>x</sub>). Each output of the dead-time generator can be adjusted separately by DTH and DTL. The dead-time values can be updated synchronously to the PWM period by using the [PWM Channel Dead Time Update Register](#) (PWM\_DTUPD<sub>x</sub>).

The dead-time is based on a specific counter which uses the same selected clock that feeds the channel counter of the comparator. Depending on the edge and the configuration of the dead-time, DTOHx and DTOLx are delayed until the counter has reached the value defined by DTH or DTL. An inverted configuration bit (DTHI and DTLI bit in PWM\_CMRx) is provided for each output to invert the dead-time outputs. The following figure shows the waveform of the dead-time generator.

**Figure 55-9. Complementary Output Waveforms**

### 55.6.2.5.1 PWM Push-Pull Mode

When a PWM channel is configured in Push-Pull mode, the dead-time generator output is managed alternately on each PWM cycle. The polarity of the PWM line during the idle state of the Push-Pull mode is defined by the DPOLI bit in the [PWM Channel Mode Register \(PWM\\_CMRx\)](#). The Push-Pull mode can be enabled separately on each channel by writing a one to bit PPM in the [PWM Channel Mode Register](#).

**Figure 55-10. PWM Push-Pull Mode**

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

**Figure 55-11. PWM Push-Pull Waveforms: Left-Aligned Mode**

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

**Figure 55-12. PWM Push-Pull Waveforms: Center-Aligned Mode**

The PWM Push-Pull mode can be useful in transformer-based power converters, such as a half-bridge converter. The Push-Pull mode prevents the transformer core from being saturated by any direct current.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

CPOL (PWM\_CMRx) = 1  
DPOLI (PWM\_CMRx) = 1

**Figure 55-14. Half-Bridge Converter Application: Feedback Regulation**

### 55.6.2.6 Output Override

The two complementary outputs DTOHx and DTOLx of the dead-time generator can be forced to a value defined by the software.

**Figure 55-15. Override Output Selection**

The fields OSHx and OSLx in the [PWM Output Selection Register](#) (PWM\_OS) allow the outputs of the dead-time generator DTOHx and DTOLx to be overridden by the value defined in the fields OOVHx and OOVLx in the [PWM Output Override Value Register](#) (PWM\_OOV).

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

The set registers [PWM Output Selection Set Register \(PWM\\_OSS\)](#) and [PWM Output Selection Set Update Register \(PWM\\_OSSUPD\)](#) enable the override of the outputs of a channel regardless of other channels. In the same way, the clear registers [PWM Output Selection Clear Register \(PWM\\_OSC\)](#) and [PWM Output Selection Clear Update Register \(PWM\\_OSCUPD\)](#) disable the override of the outputs of a channel regardless of other channels.

By using buffer registers PWM\_OSSUPD and PWM\_OSCUPD, the output selection of PWM outputs is done synchronously to the channel counter, at the beginning of the next PWM period.

By using registers PWM\_OSS and PWM\_OSC, the output selection of PWM outputs is done asynchronously to the channel counter, as soon as the register is written.

The value of the current output selection can be read in PWM\_OS.

While overriding PWM outputs, the channel counters continue to run, only the PWM outputs are forced to user defined values.

### 55.6.2.7 Fault Protection

6 inputs provide fault protection which can force any of the PWM output pairs to a programmable value. This mechanism has priority over output overriding.

**Figure 55-16. Fault Protection**

The polarity level of the fault inputs is configured by the FPOL field in the [PWM Fault Mode Register \(PWM\\_FMR\)](#). For fault inputs coming from internal peripherals such as ADC or Timer Counter, the polarity level must be FPOL = 1. For fault inputs coming from external GPIO pins the polarity level depends on the user's implementation.

The configuration of the Fault Activation mode (FMOD field in PWM\_FMR) depends on the peripheral generating the fault. If the corresponding peripheral does not have "Fault Clear" management, then the

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

FMOD configuration to use must be FMOD = 1, to avoid spurious fault detection. Refer to the corresponding peripheral documentation for details on handling fault generation.

Fault inputs may or may not be glitch-filtered depending on the FFIL field in PWM\_FMR. When the filter is activated, glitches on fault inputs with a width inferior to the PWM peripheral clock period are rejected.

A fault becomes active as soon as its corresponding fault input has a transition to the programmed polarity level. If the corresponding bit FMOD is set to '0' in PWM\_FMR, the fault remains active as long as the fault input is at this polarity level. If the corresponding FMOD field is set to '1', the fault remains active until the fault input is no longer at this polarity level and until it is cleared by writing the corresponding bit FCLR in the [PWM Fault Clear Register](#) (PWM\_FCR). In the [PWM Fault Status Register](#) (PWM\_FSR), the field FIV indicates the current level of the fault inputs and the field FIS indicates whether a fault is currently active.

Each fault can be taken into account or not by the fault protection mechanism in each channel. To be taken into account in the channel x, the fault y must be enabled by the bit FPEx[y] in the PWM Fault Protection Enable registers (PWM\_FPE1). However, synchronous channels (see [Synchronous Channels](#)) do not use their own fault enable bits, but those of the channel 0 (bits FPE0[y]).

The fault protection on a channel is triggered when this channel is enabled and when any one of the faults that are enabled for this channel is active. It can be triggered even if the PWM peripheral clock is not running but only by a fault input that is not glitch-filtered.

When the fault protection is triggered on a channel, the fault protection mechanism resets the counter of this channel and forces the channel outputs to the values defined by the fields FPVHx and FVLx in the [PWM Fault Protection Value Register 1](#) (PWM\_FPV) and fields FPZHx/FPZLx in the [PWM Fault Protection Value Register 2](#), as shown in the table below. The output forcing is made asynchronously to the channel counter.

**Table 55-3. Forcing Values of PWM Outputs by Fault Protection**

FPZH/Lx	FPVH/Lx	Forcing Value of PWMH/Lx
0	0	0
0	1	1
1	–	High impedance state (Hi-Z)

**⚠ CAUTION**

- To prevent any unexpected activation of the status flag FSy in PWM\_FSR, the FMODy bit can be set to '1' only if the FPOLy bit has been previously configured to its final value.
- To prevent any unexpected activation of the Fault Protection on the channel x, the bit FPEx[y] can be set to '1' only if the FPOLy bit has been previously configured to its final value.

If a comparison unit is enabled (see [PWM Comparison Units](#)) and if a fault is triggered in the channel 0, then the comparison cannot match.

As soon as the fault protection is triggered on a channel, an interrupt (different from the interrupt generated at the end of the PWM period) can be generated but only if it is enabled and not masked. The interrupt is reset by reading the interrupt status register, even if the fault which has caused the trigger of the fault protection is kept active.

### 55.6.2.7.1 Recoverable Fault

The PWM provides a Recoverable Fault mode on fault 1 and 2 (see figure *Fault Protection*).

The recoverable fault signal is an internal signal generated as soon as an external trigger event occurs (see [PWM External Trigger Mode](#)).

When the fault 1 or 2 is defined as a recoverable fault, the corresponding fault input pin is ignored and bits FFIL1/2, FMOD1/2 and FFIL1/2 are not taken into account.

The fault 1 is managed as a recoverable fault by the PWMEXTRG1 input trigger when PWM\_ETRG1.RFEN = 1, PWM\_ENA.CHID1 = 1, and PWM\_ETRG1.TRGMODE ≠ 0.

The fault 2 is managed as a recoverable fault by the PWMEXTRG2 input trigger when PWM\_ETRG2.RFEN = 1, PWM\_ENA.CHID2 = 1, and PWM\_ETRG2.TRGMODE ≠ 0.

Recoverable fault 1 and 2 can be taken into account by all channels by enabling the bit FPEX[1/2] in the PWM Fault Protection Enable registers (PWM\_FPEX). However the synchronous channels (see [Synchronous Channels](#)) do not use their own fault enable bits, but those of the channel 0 (bits FPE0[1/2]).

When a recoverable fault is triggered (according to the PWM\_ETRGx.TRGMODE setting), the PWM counter of the affected channels is not cleared (unlike in the classic fault protection mechanism) but the channel outputs are forced to the values defined by the fields FPVHx and FPVLx in the [PWM Fault Protection Value Register 1](#) (PWM\_FPV), as per table *Forcing Values of PWM Outputs by Fault Protection*. The output forcing is made asynchronously to the channel counter and lasts from the recoverable fault occurrence to the end of the next PWM cycle (if the recoverable fault is no longer present) (see the figure below).

The recoverable fault does not trigger an interrupt. The Fault Status FSy (with y = 1 or 2) is not reported in the [PWM Fault Status Register](#) when the fault y is a recoverable fault.

**Figure 55-17. Recoverable Fault Management**

### 55.6.2.8 Spread Spectrum Counter

The PWM macrocell includes a spread spectrum counter allowing the generation of a constantly varying duty cycle on the output PWM waveform (only for the channel 0). This feature may be useful to minimize electromagnetic interference or to reduce the acoustic noise of a PWM driven motor.

This is achieved by varying the effective period in a range defined by a spread spectrum value which is programmed by the field SPRD in the [PWM Spread Spectrum Register](#) (PWM\_SSPR). The effective

period of the output waveform is the value of the spread spectrum counter added to the programmed waveform period CPRD in the [PWM Channel Period Register](#) (PWM\_CPRD0).

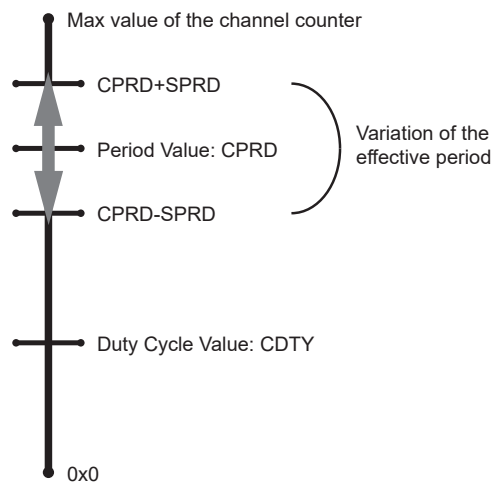

It will cause the effective period to vary from  $CPRD - SPRD$  to  $CPRD + SPRD$ . This leads to a constantly varying duty cycle on the PWM output waveform because the duty cycle value programmed is unchanged.

The value of the spread spectrum counter can change in two ways depending on the bit SPRDM in PWM\_SSPR.

If  $SPRDM = 0$ , the Triangular mode is selected. The spread spectrum counter starts to count from  $-SPRD$  when the channel 0 is enabled or after reset and counts upwards at each period of the channel counter. When it reaches  $SPRD$ , it restarts to count from  $-SPRD$  again.

If  $SPRDM = 1$ , the Random mode is selected. A new random value is assigned to the spread spectrum counter at each period of the channel counter. This random value is between  $-SPRD$  and  $+SPRD$  and is uniformly distributed.

**Figure 55-18. Spread Spectrum Counter**

### 55.6.2.9 Synchronous Channels

Some channels can be linked together as synchronous channels. They have the same source clock, the same period, the same alignment and are started together. In this way, their counters are synchronized together.

The synchronous channels are defined by the SYNCx bits in the [PWM Sync Channels Mode Register](#) (PWM\_SCM). Only one group of synchronous channels is allowed.

When a channel is defined as a synchronous channel, the channel 0 is also automatically defined as a synchronous channel. This is because the channel 0 counter configuration is used by all the synchronous channels.

If a channel x is defined as a synchronous channel, the fields/bits for the channel 0 are used instead of those of channel x:

- CPRE in PWM\_CMRO instead of CPRE in PWM\_CMRx (same source clock)
- CPRD in PWM\_CPRD0 instead of CPRD in PWM\_CPRDx (same period)
- CALG in PWM\_CMRO instead of CALG in PWM\_CMRx (same alignment)

Modifying the fields CPRE, CPRD and CALG of for channels with index greater than 0 has no effect on output waveforms.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

Because counters of synchronous channels must start at the same time, they are all enabled together by enabling the channel 0 (by the CHID0 bit in PWM\_ENA register). In the same way, they are all disabled together by disabling channel 0 (by the CHID0 bit in PWM\_DIS register). However, a synchronous channel x different from channel 0 can be enabled or disabled independently from others (by the CHIDx bit in PWM\_ENA and PWM\_DIS registers).

Defining a channel as a synchronous channel while it is an asynchronous channel (by writing the bit SYNCx to '1' while it was at '0') is allowed only if the channel is disabled at this time (CHIDx = 0 in PWM\_SR). In the same way, defining a channel as an asynchronous channel while it is a synchronous channel (by writing the SYNCx bit to '0' while it was '1') is allowed only if the channel is disabled at this time.

The UPDM field (Update Mode) in the PWM\_SCM register selects one of the three methods to update the registers of the synchronous channels:

- Method 1 (UPDM = 0): The period value, the duty-cycle values and the dead-time values must be written by the processor in their respective update registers (respectively PWM\_CPRDUPDx, PWM\_CDTYUPDx and PWM\_DTUPDx). The update is triggered at the next PWM period as soon as the bit UPDULOCK in the [PWM Sync Channels Update Control Register](#) (PWM\_SCUC) is set to '1'.
- Method 2 (UPDM = 1): The period value, the duty-cycle values, the dead-time values and the update period value must be written by the processor in their respective update registers (respectively PWM\_CPRDUPDx, PWM\_CDTYUPDx and PWM\_DTUPD). The update of the period value and of the dead-time values is triggered at the next PWM period as soon as the bit UPDULOCK in the PWM\_SCUC register is set to '1'. The update of the duty-cycle values and the update period value is triggered automatically after an update period defined by the field UPR in the [PWM Sync Channels Update Period Register](#) (PWM\_SCUP).
- Method 3 (UPDM = 2): Same as Method 2 apart from the fact that the duty-cycle values of ALL synchronous channels are written by the DMA Controller. The user can choose to synchronize the DMA Controller transfer request with a comparison match (see [Section 7.3 "PWM Comparison Units"](#)), by the fields PTRM and PTRCS in the PWM\_SCM register. The DMA destination address must be configured to access only the [PWM DMA Register](#) (PWM\_DMAR). The DMA buffer data structure must consist of sequentially repeated duty cycles. The number of duty cycles in each sequence corresponds to the number of synchronized channels. Duty cycles in each sequence must be ordered from the lowest to the highest channel index. The size of the duty cycle is 16 bits.

**Table 55-4. Summary of the Update of Registers of Synchronous Channels**

Register	UPDM = 0	UPDM = 1	UPDM = 2
Period Value (PWM_CPRDUPDx)	Write by the processor		
	Update is triggered at the next PWM period as soon as the bit UPDULOCK is set to '1'		
Dead-Time Values (PWM_DTUPDx)	Write by the processor		
	Update is triggered at the next PWM period as soon as the bit UPDULOCK is set to '1'		

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

.....continued			
Register	UPDM = 0	UPDM = 1	UPDM = 2
Duty-Cycle Values (PWM_CDTYUPDx)	Write by the processor	Write by the processor	Write by the DMA Controller
	Update is triggered at the next PWM period as soon as the bit UPDULOCK is set to '1'	Update is triggered at the next PWM period as soon as the update period counter has reached the value UPR	
Update Period Value (PWM_SCUPUPD)	Not applicable	Write by the processor	
	Not applicable	Update is triggered at the next PWM period as soon as the update period counter has reached the value UPR	

### 55.6.2.9.1 Method 1: Manual write of duty-cycle values and manual trigger of the update

In this mode, the update of the period value, the duty-cycle values and the dead-time values must be done by writing in their respective update registers with the processor (respectively PWM\_CPRDUPDx, PWM\_CDTYUPDx and PWM\_DTUPDx).

To trigger the update, the user must use the bit UPDULOCK in the PWM\_SCUC register which allows to update synchronously (at the same PWM period) the synchronous channels:

- If the bit UPDULOCK is set to '1', the update is done at the next PWM period of the synchronous channels.
- If the UPDULOCK bit is not set to '1', the update is locked and cannot be performed.

After writing the UPDULOCK bit to '1', it is held at this value until the update occurs, then it is read 0.

Sequence for Method 1:

1. Select the manual write of duty-cycle values and the manual update by setting the UPDM field to '0' in the PWM\_SCM register.
2. Define the synchronous channels by the SYNCx bits in the PWM\_SCM register.
3. Enable the synchronous channels by writing CHID0 in the PWM\_ENA register.
4. If an update of the period value and/or the duty-cycle values and/or the dead-time values is required, write registers that need to be updated (PWM\_CPRDUPDx, PWM\_CDTYUPDx and PWM\_DTUPDx).
5. Set UPDULOCK to '1' in PWM\_SCUC.
6. The update of the registers will occur at the beginning of the next PWM period. When the UPDULOCK bit is reset, go to [Step 4.](#) for new values.

**Figure 55-19. Method 1 (UPDM = 0)**

### 55.6.2.9.2 Method 2: Manual write of duty-cycle values and automatic trigger of the update

In this mode, the update of the period value, the duty-cycle values, the dead-time values and the update period value must be done by writing in their respective update registers with the processor (respectively PWM\_CPRDUPDx, PWM\_CDTYUPDx, PWM\_DTUPDx and PWM\_SCUPUPD).

To trigger the update of the period value and the dead-time values, the user must use the bit UPDULOCK in the PWM\_SCUC register, which updates synchronously (at the same PWM period) the synchronous channels:

- If the bit UPDULOCK is set to '1', the update is done at the next PWM period of the synchronous channels.
- If the UPDULOCK bit is not set to '1', the update is locked and cannot be performed.

After writing the UPDULOCK bit to '1', it is held at this value until the update occurs, then it is read 0.

The update of the duty-cycle values and the update period is triggered automatically after an update period.

To configure the automatic update, the user must define a value for the update period by the UPR field in the PWM\_SCUP register. The PWM controller waits UPR+1 period of synchronous channels before updating automatically the duty values and the update period value.

The status of the duty-cycle value write is reported in the [PWM Interrupt Status Register 2 \(PWM\\_ISR2\)](#) by the following flags:

- **WRDY:** this flag is set to '1' when the PWM Controller is ready to receive new duty-cycle values and a new update period value. It is reset to '0' when the PWM\_ISR2 register is read.

Depending on the interrupt mask in the [PWM Interrupt Mask Register 2 \(PWM\\_IMR2\)](#), an interrupt can be generated by these flags.

Sequence for Method 2:

1. Select the manual write of duty-cycle values and the automatic update by setting the field UPDM to '1' in the PWM\_SCM register
2. Define the synchronous channels by the bits SYNCx in the PWM\_SCM register.
3. Define the update period by the field UPR in the PWM\_SCUP register.
4. Enable the synchronous channels by writing CHID0 in the PWM\_ENA register.
5. If an update of the period value and/or of the dead-time values is required, write registers that need to be updated (PWM\_CPRDUPDx, PWM\_DTUPDx), else go to [Step 8](#).
6. Set UPDULOCK to '1' in PWM\_SCUC.

7. The update of these registers will occur at the beginning of the next PWM period. At this moment the bit UPDULOCK is reset, go to [Step 5](#). for new values.
8. If an update of the duty-cycle values and/or the update period is required, check first that write of new update values is possible by polling the flag WRDY (or by waiting for the corresponding interrupt) in PWM\_ISR2.
9. Write registers that need to be updated (PWM\_CDTYUPDx, PWM\_SCUPUPD).
10. The update of these registers will occur at the next PWM period of the synchronous channels when the Update Period is elapsed. Go to [Step 8](#). for new values.

**Figure 55-20. Method 2 (UPDM = 1)**

### 55.6.2.9.3 Method 3: Automatic write of duty-cycle values and automatic trigger of the update

In this mode, the update of the duty cycle values is made automatically by the DMA Controller. The update of the period value, the dead-time values and the update period value must be done by writing in their respective update registers with the processor (respectively PWM\_CPRDUPDx, PWM\_DTUPDx and PWM\_SCUPUPD).

To trigger the update of the period value and the dead-time values, the user must use the bit UPDULOCK which allows to update synchronously (at the same PWM period) the synchronous channels:

- If the bit UPDULOCK is set to '1', the update is done at the next PWM period of the synchronous channels.
- If the UPDULOCK bit is not set to '1', the update is locked and cannot be performed.

After writing the UPDULOCK bit to '1', it is held at this value until the update occurs, then it is read 0.

The update of the duty-cycle values and the update period value is triggered automatically after an update period.

To configure the automatic update, the user must define a value for the Update Period by the field UPR in the PWM\_SCUP register. The PWM controller waits UPR+1 periods of synchronous channels before updating automatically the duty values and the update period value.

Using the DMA Controller removes processor overhead by reducing its intervention during the transfer. This significantly reduces the number of clock cycles required for a data transfer, which improves microcontroller performance.

The DMA Controller must write the duty-cycle values in the synchronous channels index order. For example if the channels 0, 1 and 3 are synchronous channels, the DMA Controller must write the duty-

cycle of the channel 0 first, then the duty-cycle of the channel 1, and finally the duty-cycle of the channel 3.

The status of the DMA Controller transfer is reported in PWM\_ISR2 by the following flags:

- **WRDY:** this flag is set to '1' when the PWM Controller is ready to receive new duty-cycle values and a new update period value. It is reset to '0' when PWM\_ISR2 is read. The user can choose to synchronize the WRDY flag and the DMA Controller transfer request with a comparison match (see [PWM Comparison Units](#)), by the fields PTRM and PTRCS in the PWM\_SCM register.
- **UNRE:** this flag is set to '1' when the update period defined by the UPR field has elapsed while the whole data has not been written by the Peripheral DMA Controller. It is reset to '0' when PWM\_ISR2 is read.

Depending on the interrupt mask in PWM\_IMR2, an interrupt can be generated by these flags.

Sequence for Method 3:

1. Select the automatic write of duty-cycle values and automatic update by setting the field UPDM to 2 in the PWM\_SCM register.
2. Define the synchronous channels by the bits SYNCx in the PWM\_SCM register.
3. Define the update period by the field UPR in the PWM\_SCUP register.
4. Define when the WRDY flag and the corresponding DMA Controller transfer request must be set in the update period by the PTRM bit and the PTRCS field in the PWM\_SCM register (at the end of the update period or when a comparison matches).
5. Define the DMA Controller transfer settings for the duty-cycle values and enable it in the DMA Controller registers
6. Enable the synchronous channels by writing CHID0 in the PWM\_ENA register.
7. If an update of the period value and/or of the dead-time values is required, write registers that need to be updated (PWM\_CPRDUPDx, PWM\_DTUPDx), else go to [Step 10](#).
8. Set UPDULOCK to '1' in PWM\_SCUC.
9. The update of these registers will occur at the beginning of the next PWM period. At this moment the bit UPDULOCK is reset, go to [Step 7](#) for new values.
10. If an update of the update period value is required, check first that write of a new update value is possible by polling the flag WRDY (or by waiting for the corresponding interrupt) in PWM\_ISR2, else go to [Step 14](#).
11. Write the register that needs to be updated (PWM\_SCUPUPD).
12. The update of this register will occur at the next PWM period of the synchronous channels when the Update Period is elapsed. Go to [Step 10](#) for new values.
13. Wait for the DMA status flag indicating that the buffer transfer is complete. If the transfer has ended, define a new DMA transfer for new duty-cycle values. Go to [Step 5](#).

14. **Figure 55-21. Method 3 (UPDM = 2 and PTRM = 0)**

**Figure 55-22. Method 3 (UPDM = 2 and PTRM = 1 and PTRCS = 0)**

### 55.6.2.10 Update Time for Double-Buffering Registers

All channels integrate a double-buffering system in order to prevent an unexpected output waveform while modifying the period, the spread spectrum value, the polarity, the duty-cycle, the dead-times, the output override, and the synchronous channels update period.

This double-buffering system comprises the following update registers:

- [PWM Sync Channels Update Period Update Register](#)
- [PWM Output Selection Set Update Register](#)
- [PWM Output Selection Clear Update Register](#)
- [PWM Spread Spectrum Update Register](#)
- [PWM Channel Duty Cycle Update Register](#)
- [PWM Channel Period Update Register](#)
- [PWM Channel Dead Time Update Register](#)
- [PWM Channel Mode Update Register](#)

When one of these update registers is written to, the write is stored, but the values are updated only at the next PWM period border. In Left-aligned mode (CALG = 0), the update occurs when the channel counter reaches the period value CPRD. In Center-aligned mode, the update occurs when the channel counter value is decremented and reaches the 0 value.

In Center-aligned mode, it is possible to trigger the update of the polarity and the duty-cycle at the next half period border. This mode concerns the following update registers:

- [PWM Channel Duty Cycle Update Register](#)
- [PWM Channel Mode Update Register](#)

The update occurs at the first half period following the write of the update register (either when the channel counter value is incrementing and reaches the period value CPRD, or when the channel counter value is decrementing and reaches the 0 value). To activate this mode, the user must write a one to the bit UPDS in the [PWM Channel Mode Register](#).

### 55.6.3 PWM Comparison Units

The PWM provides 1 independent comparison units able to compare a programmed value with the current value of the channel 0 counter (which is the channel counter of all synchronous channels, “[Synchronous Channels](#)”). These comparisons are intended to generate pulses on the event lines (used to synchronize ADC, see [PWM Event Lines](#)), to generate software interrupts and to trigger DMA Controller transfer requests for the synchronous channels (see [Method 3: Automatic write of duty-cycle values and automatic trigger of the update](#)).

**Figure 55-23. Comparison Unit Block Diagram**

The comparison x matches when it is enabled by the bit CEN in the [PWM Comparison x Mode Register](#) (PWM\_CMPMx for the comparison x) and when the counter of the channel 0 reaches the comparison value defined by the field CV in [PWM Comparison x Value Register](#) (PWM\_CMPVx for the comparison x). If the counter of the channel 0 is center-aligned (CALG = 1 in [PWM Channel Mode Register](#)), the bit CVM in PWM\_CMPVx defines if the comparison is made when the counter is counting up or counting down (in Left-alignment mode CALG = 0, this bit is useless).

If a fault is active on the channel 0, the comparison is disabled and cannot match (see [Fault Protection](#)).

The user can define the periodicity of the comparison x by the fields CTR and CPR in PWM\_CMPMx. The comparison is performed periodically once every CPR+1 periods of the counter of the channel 0, when

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

the value of the comparison period counter CPRCNT in PWM\_CMPMx reaches the value defined by CTR. CPR is the maximum value of the comparison period counter CPRCNT. If  $CPR = CTR = 0$ , the comparison is performed at each period of the counter of the channel 0.

The comparison x configuration can be modified while the channel 0 is enabled by using the [PWM Comparison x Mode Update Register](#) (PWM\_CMPMUPDx registers for the comparison x). In the same way, the comparison x value can be modified while the channel 0 is enabled by using the [PWM Comparison x Value Update Register](#) (PWM\_CMPVUPDx registers for the comparison x).

The update of the comparison x configuration and the comparison x value is triggered periodically after the comparison x update period. It is defined by the field CUPR in PWM\_CMPMx. The comparison unit has an update period counter independent from the period counter to trigger this update. When the value of the comparison update period counter CUPRCNT (in PWM\_CMPMx) reaches the value defined by CUPR, the update is triggered. The comparison x update period CUPR itself can be updated while the channel 0 is enabled by using the PWM\_CMPMUPDx register.

**CAUTION** The write of PWM\_CMPVUPDx must be followed by a write of PWM\_CMPMUPDx.

The comparison match and the comparison update can be source of an interrupt, but only if it is enabled and not masked. These interrupts can be enabled by the [PWM Interrupt Enable Register 2](#) and disabled by the [PWM Interrupt Disable Register 2](#). The comparison match interrupt and the comparison update interrupt are reset by reading the [PWM Interrupt Status Register 2](#).

**Figure 55-24. Comparison Waveform**

### 55.6.4 PWM Event Lines

The PWM provides 2 independent event lines intended to trigger actions in other peripherals (e.g., for the Analog-to-Digital Converter (ADC)).

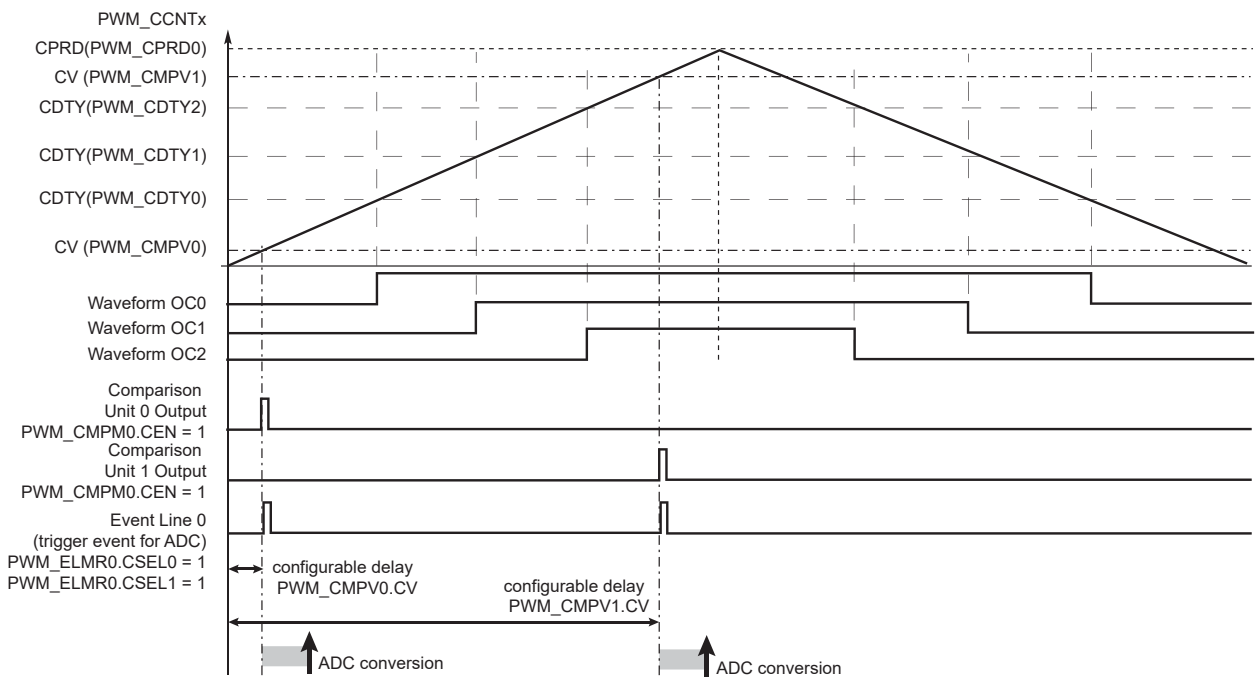

A pulse (one cycle of the peripheral clock) is generated on an event line, when at least one of the selected comparisons is matching. The comparisons can be selected or unselected independently by the CSEL bits in the [PWM Event Line x Register](#) (PWM\_ELMRx for the Event Line x).

An example of event generation is provided in the figure [Event Line Generation Waveform \(Example\)](#).

**Figure 55-25. Event Line Block Diagram**

**Figure 55-26. Event Line Generation Waveform (Example)**

### 55.6.5 PWM External Trigger Mode

The PWM channels 1 and 2 can be configured to use an external trigger for generating specific PWM signals. The external trigger source can be selected through the bit TRGSRC of the [PWM External Trigger Register](#) (see the table below).

**Table 55-5. External Event Source Selection**

Channel	Trigger Source Selection	Trigger Source
1	PWM_ETRG1.TRGSRC = 0	From PWMEXTRG1 input
	PWM_ETRG1.TRGSRC = 1	From Analog Comparator Controller
2	PWM_ETRG2.TRGSRC = 0	From PWMEXTRG2 input
	PWM_ETRG2.TRGSRC = 1	From Analog Comparator Controller

Each external trigger source can be filtered by writing a one to the TRGFILT bit in the corresponding [PWM External Trigger Register](#) (PWM\_ETRGx).

Each time an external trigger event is detected, the corresponding PWM channel counter value is stored in the MAXCNT field of the PWM\_ETRGx register if it is greater than the previously stored value. Reading the PWM\_ETRGx register will clear the MAXCNT value.

Three different modes are available for channels 1 and 2 depending on the value of the TRGMODE field of the PWM\_ETRGx register:

- TRGMODE = 1: External PWM Reset Mode
- TRGMODE = 2: External PWM Start Mode
- TRGMODE = 3: Cycle-By-Cycle Duty Mode

See the following sections.

This feature is disabled when TRGMODE = 0.

This feature should only be enabled if the corresponding channel is left-aligned (CALG = 0 in [PWM Channel Mode Register](#) of channel 1 or 2) and not managed as a synchronous channel (SYNCx = 0 in [PWM Sync Channels Mode Register](#) where x = 1 or 2). Programming the channel to be center-aligned or synchronous while TRGMODE is not 0 could lead to unexpected behavior.

### 55.6.5.1 External PWM Reset Mode

External PWM Reset mode is selected by programming TRGMODE = 1 in the PWM\_ETRGx register.

In this mode, when an edge is detected on the PWMEXTRGx input, the internal PWM counter is cleared and a new PWM cycle is restarted. The edge polarity can be selected by programming the TRGEDGE bit in the PWM\_ETRGx register. If no trigger event is detected when the internal channel counter has reached the CPRD value in the [PWM Channel Period Register](#), the internal counter is cleared and a new PWM cycle starts.

Note that this mode does not guarantee a constant  $t_{ON}$  or  $t_{OFF}$  time.

**Figure 55-27. External PWM Reset Mode**

### 55.6.5.1.1 Application Example

The external PWM Reset mode can be used in power factor correction applications.

In the example below, the external trigger input is the PWMEXTRG1 (therefore the PWM channel used for regulation is the channel 1). The PWM channel 1 period (CPRD in the [PWM Channel Period Register](#) of the channel 1) must be programmed so that the TRGIN1 event always triggers before the PWM channel 1 period elapses.

In the figure below, an external circuit (not shown) is required to sense the inductor current  $I_L$ . The internal PWM counter of the channel 1 is cleared when the inductor current falls below a specific threshold ( $I_{REF}$ ). This starts a new PWM period and increases the inductor current.

**Figure 55-28. External PWM Reset Mode: Power Factor Correction Application**

### 55.6.5.2 External PWM Start Mode

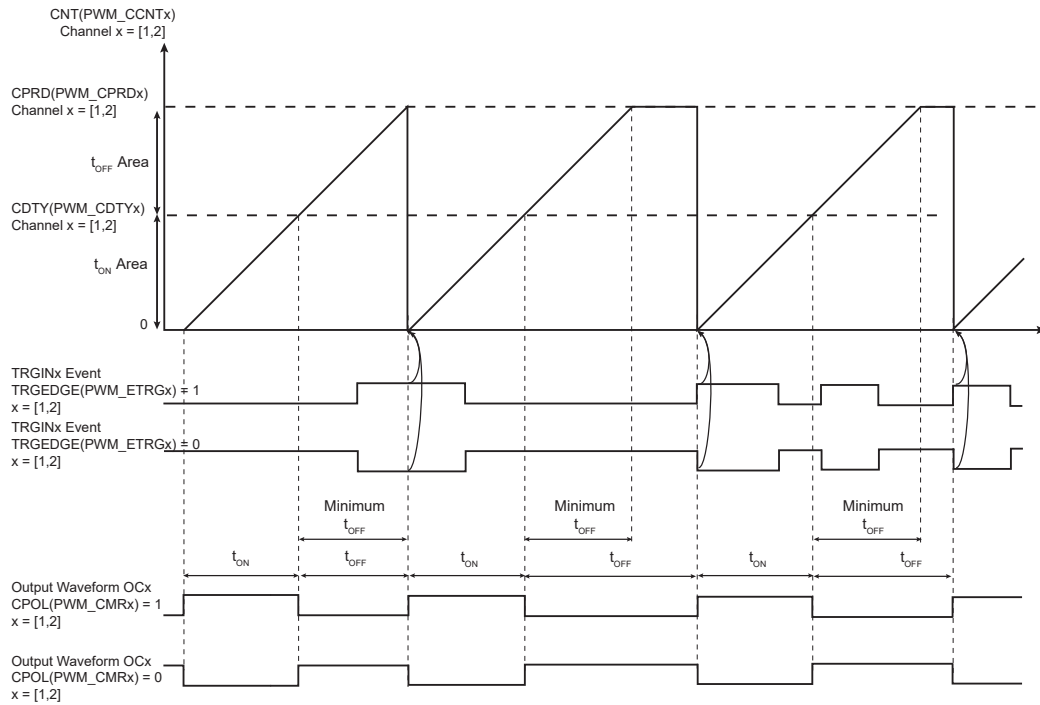

External PWM Start mode is selected by programming  $TRGMODE = 2$  in the `PWM_ETRGx` register.

In this mode, the internal PWM counter can only be reset once it has reached the `CPRD` value in the [PWM Channel Period Register](#) and when the correct level is detected on the corresponding external trigger input. Both conditions have to be met to start a new PWM period. The active detection level is defined by the bit `TRGEDGE` of the `PWM_ETRGx` register.

Note that this mode guarantees a constant  $t_{ON}$  time and a minimum  $t_{OFF}$  time.

**Figure 55-29. External PWM Start Mode**

### 55.6.5.2.1 Application Example

The external PWM Start mode generates a modulated frequency PWM signal with a constant active level duration ( $t_{ON}$ ) and a minimum inactive level duration (minimum  $t_{OFF}$ ).

The  $t_{ON}$  time is defined by the CDTY value in the [PWM Channel Duty Cycle Register](#). The minimum  $t_{OFF}$  time is defined by CDTY - CPRD ([PWM Channel Period Register](#)). This mode can be useful in Buck DC/DC Converter applications.

When the output voltage  $V_{OUT}$  is above a specific threshold ( $V_{ref}$ ), the PWM inactive level is maintained as long as  $V_{OUT}$  remains above this threshold. If  $V_{OUT}$  is below this specific threshold, this mode guarantees a minimum  $t_{OFF}$  time required for MOSFET driving (see the figure below).

**Figure 55-30. External PWM Start Mode: Buck DC/DC Converter**

### 55.6.5.3 Cycle-By-Cycle Duty Mode

#### 55.6.5.3.1 Description

Cycle-by-cycle duty mode is selected by programming  $TRGMODE = 3$  in  $PWM\_ETRGx$ .

In this mode, the PWM frequency is constant and is defined by the CPRD value in the [PWM Channel Period Register](#).

An external trigger event has no effect on the PWM output if it occurs while the internal PWM counter value is above the CDTY value of the [PWM Channel Duty Cycle Register](#).

If the internal PWM counter value is below the value of CDTY of the [PWM Channel Duty Cycle Register](#), an external trigger event makes the PWM output inactive.

The external trigger event can be detected on rising or falling edge according to the TRGEDGE bit in  $PWM\_ETRGx$ .

**Figure 55-31. Cycle-By-Cycle Duty Mode**

### 55.6.5.3.2 Application Example

The figure below illustrates an application example of the Cycle-by-cycle Duty mode.

In an LED string control circuit, Cycle-by-cycle Duty mode can be used to automatically limit the current in the LED string.

**Figure 55-32. Cycle-By-Cycle Duty Mode: LED String Control**

#### 55.6.5.4 Leading-Edge Blanking (LEB)

PWM channels 1 and 2 support leading-edge blanking. Leading-edge blanking masks the external trigger input when a transient occurs on the corresponding PWM output. It masks potential spurious external events due to power transistor switching.

The blanking delay on each external trigger input is configured by programming the  $LEBDELAYx$  in the [PWM Leading-Edge Blanking Register](#).

The LEB can be enabled on both the rising and the falling edges for the PWMH and PWML outputs through the bits  $PWMLFEN$ ,  $PWMLREN$ ,  $PWMHFEN$ ,  $PWMHREN$ .

Any event on the  $PWMEXTRGx$  input which occurs during the blanking time is ignored.

**Figure 55-33. Leading-Edge Blanking**

### 55.6.6 PWM Controller Operations

#### 55.6.6.1 Initialization

Before enabling the channels, they must be configured by the software application as described below:

- Unlock User Interface by writing the WPCMD field in PWM\_WPCR.
- Configuration of the clock generator (DIVA, PREA, DIVB, PREB in the PWM\_CLK register if required).
- Selection of the clock for each channel (CPRE field in PWM\_CMRx)
- Configuration of the waveform alignment for each channel (CALG field in PWM\_CMRx)
- Selection of the counter event selection (if CALG = 1) for each channel (CES field in PWM\_CMRx)
- Configuration of the output waveform polarity for each channel (CPOL bit in PWM\_CMRx)
- Configuration of the period for each channel (CPRD in the PWM\_CPRDx register). Writing in PWM\_CPRDx register is possible while the channel is disabled. After validation of the channel, the user must use PWM\_CPRDUPDx register to update PWM\_CPRDx as explained below.
- Configuration of the duty-cycle for each channel (CDTY in the PWM\_CDTYx register). Writing in PWM\_CDTYx register is possible while the channel is disabled. After validation of the channel, the user must use PWM\_CDTYUPDx register to update PWM\_CDTYx as explained below.
- Configuration of the dead-time generator for each channel (DTH and DTL in PWM\_DTx) if enabled (DTE bit in PWM\_CMRx). Writing in the PWM\_DTx register is possible while the channel is disabled. After validation of the channel, the user must use PWM\_DTUPDx register to update PWM\_DTx
- Selection of the synchronous channels (SYNCx in the PWM\_SCM register)
- Selection of the moment when the WRDY flag and the corresponding DMA Controller transfer request are set (PTRM and PTRCS in the PWM\_SCM register)
- Configuration of the Update mode (UPDM in PWM\_SCM register)
- Configuration of the update period (UPR in PWM\_SCUP register) if needed
- Configuration of the comparisons (PWM\_CMPVx and PWM\_CMPMx)
- Configuration of the event lines (PWM\_ELMRx)
- Configuration of the fault inputs polarity (FPOL in PWM\_FMR)

- Configuration of the fault protection (FMOD and FFIL in PWM\_FMR, PWM\_FPV and PWM\_FPE1)
- Enable of the interrupts (writing CHIDx and FCHIDx in PWM\_IER1, and writing WRDY, UNRE, CMPMx and CMPUX in PWM\_IER2)
- Enable of the PWM channels (writing CHIDx in the PWM\_ENA register)

### 55.6.6.2 Source Clock Selection Criteria

The large number of source clocks can make selection difficult. The relationship between the value in the [PWM Channel Period Register](#) (PWM\_CPRDx) and the [PWM Channel Duty Cycle Register](#) (PWM\_CDTYx) helps the user select the appropriate clock. The event number written in the Period Register gives the PWM accuracy. The Duty-Cycle quantum cannot be lower than 1/CPRDx value. The higher the value of PWM\_CPRDx, the greater the PWM accuracy.

For example, if the user sets 15 (in decimal) in PWM\_CPRDx, the user is able to set a value from between 1 up to 14 in PWM\_CDTYx. The resulting duty-cycle quantum cannot be lower than 1/15 of the PWM period.

### 55.6.6.3 Changing the Duty-Cycle, the Period and the Dead-Times

It is possible to modulate the output waveform duty-cycle, period and dead-times.

To prevent unexpected output waveform, the user must use the [PWM Channel Duty Cycle Update Register](#) (PWM\_CDTYUPDx), the [PWM Channel Period Update Register](#) (PWM\_CPRDUPDx) and the [PWM Channel Dead Time Update Register](#) (PWM\_DTUPDx) to change waveform parameters while the channel is still enabled.

- If the channel is an asynchronous channel (SYNCx = 0 in [PWM Sync Channels Mode Register](#) (PWM\_SCM)), these registers hold the new period, duty-cycle and dead-times values until the end of the current PWM period and update the values for the next period.
- If the channel is a synchronous channel and update method 0 is selected (SYNCx = 1 and UPDM = 0 in PWM\_SCM register), these registers hold the new period, duty-cycle and dead-times values until the bit UPDULOCK is written at '1' (in [PWM Sync Channels Update Control Register](#) (PWM\_SCUC)) and the end of the current PWM period, then update the values for the next period.
- If the channel is a synchronous channel and update method 1 or 2 is selected (SYNCx = 1 and UPDM = 1 or 2 in PWM\_SCM register):
  - registers PWM\_CPRDUPDx and PWM\_DTUPDx hold the new period and dead-times values until the bit UPDULOCK is written at '1' (in PWM\_SCUC) and the end of the current PWM period, then update the values for the next period.
  - register PWM\_CDTYUPDx holds the new duty-cycle value until the end of the update period of synchronous channels (when UPRCNT is equal to UPR in [PWM Sync Channels Update Period Register](#) (PWM\_SCUP)) and the end of the current PWM period, then updates the value for the next period.

**Note:** If the update registers PWM\_CDTYUPDx, PWM\_CPRDUPDx and PWM\_DTUPDx are written several times between two updates, only the last written value is taken into account.

**Figure 55-34. Synchronized Period, Duty-Cycle and Dead-Time Update**

#### 55.6.6.4 Changing the Update Period of Synchronous Channels

It is possible to change the update period of synchronous channels while they are enabled. See [Method 2: Manual write of duty-cycle values and automatic trigger of the update](#) and [Method 3: Automatic write of duty-cycle values and automatic trigger of the update](#).

To prevent an unexpected update of the synchronous channels registers, the user must use the [PWM Sync Channels Update Period Update Register \(PWM\\_SCUPUPD\)](#) to change the update period of synchronous channels while they are still enabled. This register holds the new value until the end of the update period of synchronous channels (when UPRCNT is equal to UPR in PWM\_SCUP) and the end of the current PWM period, then updates the value for the next period.

**Note:**

1. If the update register PWM\_SCUPUPD is written several times between two updates, only the last written value is taken into account.
2. Changing the update period does make sense only if there is one or more synchronous channels and if the update method 1 or 2 is selected (UPDM = 1 or 2 in [PWM Sync Channels Mode Register](#)).

**Figure 55-35. Synchronized Update of Update Period Value of Synchronous Channels**

#### 55.6.6.5 Changing the Comparison Value and the Comparison Configuration

It is possible to change the comparison values and the comparison configurations while the channel 0 is enabled (see [PWM Comparison Units](#)).

To prevent unexpected comparison match, the user must use the [PWM Comparison x Value Update Register](#) (PWM\_CMPVUPDx) and the [PWM Comparison x Mode Update Register](#) (PWM\_CMPMUPDx) to change, respectively, the comparison values and the comparison configurations while the channel 0 is still enabled. These registers hold the new values until the end of the comparison update period (when CUPRCNT is equal to CUPR in [PWM Comparison x Mode Register](#) (PWM\_CMPMx) and the end of the current PWM period, then update the values for the next period.

The write of the register PWM\_CMPVUPDx must be followed by a write of the register PWM\_CMPMUPDx.

**Note:** If the update registers PWM\_CMPVUPDx and PWM\_CMPMUPDx are written several times between two updates, only the last written value are taken into account.

**Figure 55-36. Synchronized Update of Comparison Values and Configurations**

### 55.6.6.6 Interrupt Sources

Depending on the interrupt mask in PWM\_IMR1 and PWM\_IMR2, an interrupt can be generated at the end of the corresponding channel period (CHIDx in the PWM Interrupt Status Register 1 (PWM\_ISR1)), after a fault event (FCHIDx in PWM\_ISR1), after a comparison match (CMPMx in PWM\_ISR2), after a comparison update (CMPUx in PWM\_ISR2) or according to the Transfer mode of the synchronous channels (WRDY and UNRE in PWM\_ISR2).

If the interrupt is generated by the flags CHIDx or FCHIDx, the interrupt remains active until a read operation in PWM\_ISR1 occurs.

If the interrupt is generated by the flags WRDY or UNRE or CMPMx or CMPUx, the interrupt remains active until a read operation in PWM\_ISR2 occurs.

**A channel interrupt is enabled by setting the corresponding bit in PWM\_IER1 and PWM\_IER2. A channel interrupt is disabled by setting the corresponding bit in PWM\_IDR1 and PWM\_IDR2.**

### 55.6.7 Register Write Protection

To prevent any single software error that may corrupt PWM behavior, the registers listed below can be write-protected by writing the field WPCMD in the [PWM Write Protection Control Register \(PWM\\_WPCR\)](#). They are divided into six groups:

- Register group 0:
  - [PWM Clock Register](#)
- Register group 1:
  - [PWM Disable Register](#)
- Register group 2:
  - [PWM Sync Channels Mode Register](#)
  - [PWM Channel Mode Register](#)
  - [PWM Stepper Motor Mode Register](#)
  - [PWM Fault Protection Value Register 2](#)

- [PWM Leading-Edge Blanking Register](#)
- [PWM Channel Mode Update Register](#)
- Register group 3:
  - [PWM Spread Spectrum Register](#)
  - [PWM Spread Spectrum Update Register](#)
  - [PWM Channel Period Register](#)
  - [PWM Channel Period Update Register](#)
- Register group 4:
  - [PWM Channel Dead Time Register](#)
  - [PWM Channel Dead Time Update Register](#)
- Register group 5:
  - [PWM Fault Mode Register](#)
  - [PWM Fault Protection Value Register 1](#)

There are two types of write protection:

- SW write protection—can be enabled or disabled by software
- HW write protection—can be enabled by software but only disabled by a hardware reset of the PWM controller

Both types of write protection can be applied independently to a particular register group by means of the WPCMD and WPRGx fields in PWM\_WPCR. If at least one type of write protection is active, the register group is write-protected. The value of field WPCMD defines the action to be performed:

- 0: Disables SW write protection of the register groups of which the bit WPRGx is at '1'
- 1: Enables SW write protection of the register groups of which the bit WPRGx is at '1'
- 2: Enables HW write protection of the register groups of which the bit WPRGx is at '1'

At any time, the user can determine whether SW or HW write protection is active in a particular register group by the fields WPSWS and WPHWS in the [PWM Write Protection Status Register](#) (PWM\_WPSR).

If a write access to a write-protected register is detected, the WPVS flag in PWM\_WPSR is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS and WPVSRC fields are automatically cleared after reading PWM\_WPSR.

## Pulse Width Modulation Controller (PWM)

### 55.7.1 PWM Clock Register

**Name:** PWM\_CLK  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS0 and WPHWS0 are cleared in the [PWM Write Protection Status Register](#).

Bit	31	30	29	28	27	26	25	24
					PREB[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	23	22	21	20	19	18	17	16
	DIVB[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
					PREA[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	DIVA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 27:24 – PREB[3:0] CLKB Source Clock Selection

Value	Name	Description
0	CLK	Peripheral clock
1	CLK_DIV2	Peripheral clock/2
2	CLK_DIV4	Peripheral clock/4
3	CLK_DIV8	Peripheral clock/8
4	CLK_DIV16	Peripheral clock/16
5	CLK_DIV32	Peripheral clock/32
6	CLK_DIV64	Peripheral clock/64
7	CLK_DIV128	Peripheral clock/128
8	CLK_DIV256	Peripheral clock/256
9	CLK_DIV512	Peripheral clock/512
10	CLK_DIV1024	Peripheral clock/1024
Other	–	Reserved

#### Bits 23:16 – DIVB[7:0] CLKB Divide Factor

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

Value	Name	Description
0	CLKB_POFF	CLKB clock is turned off
1	PREB	CLKB clock is clock selected by PREB
2-255	PREB_DIV	CLKB clock is clock selected by PREB divided by DIVB factor

### Bits 11:8 – PREA[3:0] CLKA Source Clock Selection

Value	Name	Description
0	CLK	Peripheral clock
1	CLK_DIV2	Peripheral clock/2
2	CLK_DIV4	Peripheral clock/4
3	CLK_DIV8	Peripheral clock/8
4	CLK_DIV16	Peripheral clock/16
5	CLK_DIV32	Peripheral clock/32
6	CLK_DIV64	Peripheral clock/64
7	CLK_DIV128	Peripheral clock/128
8	CLK_DIV256	Peripheral clock/256
9	CLK_DIV512	Peripheral clock/512
10	CLK_DIV1024	Peripheral clock/1024
Other	–	Reserved

### Bits 7:0 – DIVA[7:0] CLKA Divide Factor

Value	Name	Description
0	CLKA_POFF	CLKA clock is turned off
1	PREA	CLKA clock is clock selected by PREA
2-255	PREA_DIV	CLKA clock is clock selected by PREA divided by DIVA factor

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.2 PWM Enable Register

**Name:** PWM\_ENA  
**Offset:** 0x04  
**Reset:** –  
**Property:** Write-only

#### Bits 0, 1, 2, 3 – CHIDx Channel ID

Value	Description
0	No effect.
1	Enable PWM output for channel x.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.3 PWM Disable Register

**Name:** PWM\_DIS  
**Offset:** 0x08  
**Reset:** –  
**Property:** Write-only

This register can only be written if bits WPSWS1 and WPHWS1 are cleared in the [PWM Write Protection Status Register](#).

#### Bits 0, 1, 2, 3 – CHIDx Channel ID

Value	Description
0	No effect.
1	Disable PWM output for channel x.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.4 PWM Status Register

**Name:** PWM\_SR  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bits 0, 1, 2, 3 – CHIDx Channel ID

Value	Description
0	PWM output for channel x is disabled.
1	PWM output for channel x is enabled.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.5 PWM Interrupt Enable Register 1

**Name:** PWM\_IER1  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
					FCHID3	FCHID2	FCHID1	FCHID0
Access					W	W	W	W
Reset					0	0	0	–
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
					CHID3	CHID2	CHID1	CHID0
Access					W	W	W	W
Reset					0	0	0	–

**Bits 16, 17, 18, 19 – FCHIDx** Fault Protection Trigger on Channel x Interrupt Enable

**Bits 0, 1, 2, 3 – CHIDx** Counter Event on Channel x Interrupt Enable

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.6 PWM Interrupt Disable Register 1

**Name:** PWM\_IDR1  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
					FCHID3	FCHID2	FCHID1	FCHID0
Access					W	W	W	W
Reset					0	0	0	–
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
					CHID3	CHID2	CHID1	CHID0
Access					W	W	W	W
Reset					0	0	0	–

**Bits 16, 17, 18, 19 – FCHIDx** Fault Protection Trigger on Channel x Interrupt Disable

**Bits 0, 1, 2, 3 – CHIDx** Counter Event on Channel x Interrupt Disable

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.7 PWM Interrupt Mask Register 1

**Name:** PWM\_IMR1  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
					FCHID3	FCHID2	FCHID1	FCHID0
Access					R	R	R	R
Reset					0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
					CHID3	CHID2	CHID1	CHID0
Access					R	R	R	R
Reset					0	0	0	0

**Bits 16, 17, 18, 19 – FCHIDx** Fault Protection Trigger on Channel x Interrupt Mask

**Bits 0, 1, 2, 3 – CHIDx** Counter Event on Channel x Interrupt Mask

### 55.7.8 PWM Interrupt Status Register 1

**Name:** PWM\_ISR1  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

**Note:** Reading PWM\_ISR1 automatically clears CHIDx and FCHIDx flags.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
					FCHID3	FCHID2	FCHID1	FCHID0
Access					R	R	R	R
Reset					0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
					CHID3	CHID2	CHID1	CHID0
Access					R	R	R	R
Reset					0	0	0	0

**Bits 16, 17, 18, 19 – FCHIDx** Fault Protection Trigger on Channel x

Value	Description
0	No new trigger of the fault protection since the last read of PWM_ISR1.
1	At least one trigger of the fault protection since the last read of PWM_ISR1.

**Bits 0, 1, 2, 3 – CHIDx** Counter Event on Channel x

Value	Description
0	No new counter event has occurred since the last read of PWM_ISR1.
1	At least one counter event has occurred since the last read of PWM_ISR1.

### 55.7.9 PWM Sync Channels Mode Register

**Name:** PWM\_SCM  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the [PWM Write Protection Status Register](#).

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits 31-24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	PTRCS[2:0]			PTRM			UPDM[1:0]	
Access	R/W	R/W	R/W	R/W			R/W	R/W
Reset	0	0	0	0			0	0
Bit	15	14	13	12	11	10	9	8
	[Greyed out bits 15-8]							
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	[Greyed out bits 7-4]				SYNC3	SYNC2	SYNC1	SYNC0
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

**Bits 23:21 – PTRCS[2:0]** DMA Controller Transfer Request Comparison Selection  
 Selection of the comparison used to set the flag WRDY and the corresponding DMA Controller transfer request.

**Bit 20 – PTRM** DMA Controller Transfer Request Mode

UPDM	PTRM	WRDY Flag and DMA Controller Transfer Request
0	x	The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> and the DMA transfer request are never set to '1'.
1	x	The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> is set to '1' as soon as the update period is elapsed, the DMA Controller transfer request is never set to '1'.
2	0	The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> and the DMA transfer request are set to '1' as soon as the update period is elapsed.
	1	The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> and the DMA transfer request are set to '1' as soon as the selected comparison matches.

**Bits 17:16 – UPDM[1:0]** Synchronous Channels Update Mode

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

Value	Name	Description
0	MODE0	Manual write of double buffer registers and manual update of synchronous channels 1 <sup>(1)</sup> .
1	MODE1	Manual write of double buffer registers and automatic update of synchronous channels 2 <sup>(2)</sup> .
2	MODE2	The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> and the DMA transfer request are set to '1' as soon as the update period is elapsed.

**Note:**

1. The update occurs at the beginning of the next PWM period, when the UPDULOCK bit in [PWM Sync Channels Update Control Register](#) is set.
2. The update occurs when the Update Period is elapsed.

**Bits 0, 1, 2, 3 – SYNCx** Synchronous Channel x

Value	Description
0	Channel x is not a synchronous channel.
1	Channel x is a synchronous channel.

### 55.7.10 PWM DMA Register

**Name:** PWM\_DMAR  
**Offset:** 0x24  
**Reset:** –  
**Property:** Write-only

Only the first 16 bits (channel counter size) are significant.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	DMADUTY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	DMADUTY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	DMADUTY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	–

**Bits 23:0 – DMADUTY[23:0]** Duty-Cycle Holding Register for DMA Access

Each write access to PWM\_DMAR sequentially updates PWM\_CDTYUPDx.CDTYUPD with DMADUTY (only for channel configured as synchronous). See [“Method 3: Automatic write of duty-cycle values and automatic trigger of the update”](#) .

**55.7.11 PWM Sync Channels Update Control Register**

**Name:** PWM\_SCUC  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – UPDULOCK** Synchronous Channels Update Unlock  
This bit is automatically reset when the update is done.

Value	Description
0	No effect
1	If the UPDM field is set to '0' in <a href="#">PWM Sync Channels Mode Register</a> , writing the UPDULOCK bit to '1' triggers the update of the period value, the duty-cycle and the dead-time values of synchronous channels at the beginning of the next PWM period. If the field UPDM is set to '1' or '2', writing the UPDULOCK bit to '1' triggers only the update of the period value and of the dead-time values of synchronous channels.

### 55.7.12 PWM Sync Channels Update Period Register

**Name:** PWM\_SCUP  
**Offset:** 0x2C  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 7:4 – UPRCNT[3:0]** Update Period Counter  
Reports the value of the update period counter.

**Bits 3:0 – UPR[3:0]** Update Period  
Defines the time between each update of the synchronous channels if automatic trigger of the update is activated (UPDM = 1 or UPDM = 2 in [PWM Sync Channels Mode Register](#)). This time is equal to UPR+1 periods of the synchronous channels.

### 55.7.13 PWM Sync Channels Update Period Update Register

**Name:** PWM\_SCUPUPD  
**Offset:** 0x30  
**Reset:** –  
**Property:** Write-only

This register acts as a double buffer for the UPR value. This prevents an unexpected automatic trigger of the update of synchronous channels.

**Bits 3:0 – UPRUPD[3:0] Update Period Update**

Defines the wanted time between each update of the synchronous channels if automatic trigger of the update is activated (UPDM = 1 or UPDM = 2 in [PWM Sync Channels Mode Register](#)). This time is equal to UPR+1 periods of the synchronous channels.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.14 PWM Interrupt Enable Register 2

**Name:** PWM\_IER2  
**Offset:** 0x34  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

					UNRE			WRDY
Access					R			R
Reset					0			0

#### Bits 16, 17, 18, 19, 20, 21, 22, 23 – CMPUx Comparison x Update

Value	Description
0	The comparison x has not been updated since the last read of the PWM_ISR2 register.
1	The comparison x has been updated at least one time since the last read of the PWM_ISR2 register.

#### Bits 8, 9, 10, 11, 12, 13, 14, 15 – CMPMx Comparison x Match

Value	Description
0	The comparison x has not matched since the last read of the PWM_ISR2 register.
1	The comparison x has matched at least one time since the last read of the PWM_ISR2 register.

#### Bit 3 – UNRE Synchronous Channels Update Underrun Error

Value	Description
0	No Synchronous Channels Update Underrun has occurred since the last read of the PWM_ISR2 register.
1	At least one Synchronous Channels Update Underrun has occurred since the last read of the PWM_ISR2 register.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

---

---

**Bit 0 – WRDY** Write Ready for Synchronous Channels Update

Value	Description
0	New duty-cycle and dead-time values for the synchronous channels cannot be written.
1	New duty-cycle and dead-time values for the synchronous channels can be written.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.18 PWM Output Override Value Register

**Name:** PWM\_OOV  
**Offset:** 0x44  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits 31-24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Greyed out bits 23-20]				OOVL3	OOVL2	OOVL1	OOVL0
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	15	14	13	12	11	10	9	8
	[Greyed out bits 15-8]							
Access

Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

**Bits 16, 17, 18, 19 – OOVLx** Output Override Value for PWML output of the channel x

Value	Description
0	Override value is 0 for PWML output of channel x.
1	Override value is 1 for PWML output of channel x.

**Bits 0, 1, 2, 3 – OOVHx** Output Override Value for PWMH output of the channel x

Value	Description
0	Override value is 0 for PWMH output of channel x.
1	Override value is 1 for PWMH output of channel x.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.19 PWM Output Selection Register

**Name:** PWM\_OS  
**Offset:** 0x48  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
					OSL3	OSL2	OSL1	OSL0

**Bits 16, 17, 18, 19 – OSCUPLx** Output Selection Clear for PWML output of the channel x

Value	Description
0	No effect.
1	Dead-time generator output DTOLx selected as PWML output of channel x at the beginning of the next channel x PWM period.

**Bits 0, 1, 2, 3 – OSCUPHx** Output Selection Clear for PWMH output of the channel x

Value	Description
0	No effect.
1	Dead-time generator output DTOHx selected as PWMH output of channel x at the beginning of the next channel x PWM period.

### 55.7.24 PWM Fault Mode Register

**Name:** PWM\_FMR  
**Offset:** 0x5C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the [PWM Write Protection Status Register](#).

See [Fault Inputs](#) for details on fault generation.

To prevent an unexpected activation of the status flag F<sub>Sy</sub> in the [PWM Fault Status Register](#), the bit F<sub>MODy</sub> can be set to '1' only if the F<sub>POLy</sub> bit has been previously configured to its final value.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 23:16 – FFIL[7:0] Fault Filtering

For each bit y of FFIL, where y is the fault input number:

0: The fault input y is not filtered.

1: The fault input y is filtered.

#### Bits 15:8 – FMOD[7:0] Fault Activation Mode

For each bit y of FMOD, where y is the fault input number:

0: The fault y is active until the fault condition is removed at the peripheral<sup>(1)</sup> level.

1: The fault y stays active until the fault condition is removed at the peripheral level<sup>(1)</sup> AND until it is cleared in the [PWM Fault Clear Register](#).

**Note:**

1. The peripheral generating the fault.

**Bits 7:0 – FPOL[7:0] Fault Polarity**

For each bit  $y$  of FPOL, where  $y$  is the fault input number:

0: The fault  $y$  becomes active when the fault input  $y$  is at 0.

1: The fault  $y$  becomes active when the fault input  $y$  is at 1.

### 55.7.25 PWM Fault Status Register

**Name:** PWM\_FSR  
**Offset:** 0x60  
**Reset:** 0x00000000  
**Property:** Read-only

Refer to [Fault Inputs](#) for details on fault generation.

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits 31-24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Greyed out bits 23-16]							
Access								
Reset								
Bit	15	14	13	12	11	10	9	8

Bit	7	6	5	4	3	2	1	0
	FIV[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 15:8 – FS[7:0] Fault Status

For each bit  $y$  of FS, where  $y$  is the fault input number:

0: The fault  $y$  is not currently active.

1: The fault  $y$  is currently active.

#### Bits 7:0 – FIV[7:0] Fault Input Value

For each bit  $y$  of FIV, where  $y$  is the fault input number:

0: The current sampled value of the fault input  $y$  is 0 (after filtering if enabled).

1: The current sampled value of the fault input  $y$  is 1 (after filtering if enabled).

### 55.7.26 PWM Fault Clear Register

**Name:** PWM\_FCR  
**Offset:** 0x64  
**Reset:** –  
**Property:** Write-only

See [Fault Inputs](#) for details on fault generation.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access

	FCLR[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	–

#### Bits 7:0 – FCLR[7:0] Fault Clear

For each bit y of FCLR, where y is the fault input number:

0: No effect.

1: If bit y of FMODE field is set to '1' and if the fault input y is not at the level defined by the bit y of FPOL field, the fault y is cleared and becomes inactive (FMODE and FPOL fields belong to [PWM Fault Mode Register](#)), else writing this bit to '1' has no effect.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.27 PWM Fault Protection Value Register 1

**Name:** PWM\_FPV1  
**Offset:** 0x68  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the [PWM Write Protection Status Register](#).

See [Fault Inputs](#) for details on fault generation.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
					FPVL3	FPVL2	FPVL1	FPVL0
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
					FPVH3	FPVH2	FPVH1	FPVH0
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

**Bits 16, 17, 18, 19 – FPVLx** Fault Protection Value for PWML output on channel x

This bit is taken into account only if the bit FPZLx is set to '0' in [PWM Fault Protection Value Register 2](#).

Value	Description
0	PWML output of channel x is forced to '0' when fault occurs.
1	PWML output of channel x is forced to '1' when fault occurs.

**Bits 0, 1, 2, 3 – FPVHx** Fault Protection Value for PWMH output on channel x

This bit is taken into account only if the bit FPZHx is set to '0' in [PWM Fault Protection Value Register 2](#).

Value	Description
0	PWMH output of channel x is forced to '0' when fault occurs.
1	PWMH output of channel x is forced to '1' when fault occurs.

### 55.7.28 PWM Fault Protection Enable Register

**Name:** PWM\_FPE  
**Offset:** 0x6C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the [PWM Write Protection Status Register](#).

Only the first 6 bits (number of fault input pins) of the register fields are significant.

Refer to [Section 6.4 “Fault Inputs”](#) for details on fault generation.

	Bit	31	30	29	28	27	26	25	24
		FPE3[7:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		FPE2[7:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		FPE1[7:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		FPE0[7:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0

**Bits 0:7, 8:15, 16:23, 24:31 – FPE<sub>x</sub>** Fault Protection Enable for channel x

For each bit y of FPE<sub>x</sub>, where y is the fault input number:

0: Fault y is not used for the fault protection of channel x.

1: Fault y is used for the fault protection of channel x.

To prevent an unexpected activation of the fault protection, the bit y of FPE<sub>x</sub> field can be set to ‘1’ only if the corresponding FPOL field has been previously configured to its final value in [PWM Fault Mode Register](#).

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.29 PWM Event Line x Mode Register

**Name:** PWM\_ELMRx  
**Offset:** 0x7C + x\*0x04 [x=0..1]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 0, 1, 2, 3, 4, 5, 6, 7 – CSELy Comparison y Selection

Value	Description
0	A pulse is not generated on the event line x when the comparison y matches.
1	A pulse is generated on the event line x when the comparison y match.

### 55.7.30 PWM Spread Spectrum Register

**Name:** PWM\_SSPR  
**Offset:** 0xA0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the [PWM Write Protection Status Register](#).

Only the first 16 bits (channel counter size) are significant.

Bit	31	30	29	28	27	26	25	24
								SPRDM
Access								R/W
Reset								0
Bit	23	22	21	20	19	18	17	16
	SPRD[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	SPRD[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	SPRD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bit 24 – SPRDM Spread Spectrum Counter Mode

Value	Description
0	Triangular mode. The spread spectrum counter starts to count from -SPRD when the channel 0 is enabled and counts upwards at each PWM period. When it reaches +SPRD, it restarts to count from -SPRD again.
1	Random mode. The spread spectrum counter is loaded with a new random value at each PWM period. This random value is uniformly distributed and is between -SPRD and +SPRD.

#### Bits 23:0 – SPRD[23:0] Spread Spectrum Limit Value

The spread spectrum limit value defines the range for the spread spectrum counter. It is introduced in order to achieve constant varying PWM period for the output waveform.

### 55.7.31 PWM Spread Spectrum Update Register

**Name:** PWM\_SSPUP  
**Offset:** 0xA4  
**Reset:** –  
**Property:** Write-only

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the [PWM Write Protection Status Register](#).

This register acts as a double buffer for the SPRD value. This prevents an unexpected waveform when modifying the spread spectrum limit value.

Only the first 16 bits (channel counter size) are significant.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

	[Gray Counter Enable Bits]						GCEN1	GCEN0
Access							R/W	R/W
Reset							0	0

#### Bits 16, 17 – DOWNx Down Count

Value	Description
0	Up counter.
1	Down counter.

#### Bits 0, 1 – GCENx Gray Count Enable

Value	Description
0	Disable Gray count generation on PWML[2*x], PWMH[2*x], PWML[2*x + 1], PWMH[2*x + 1]
1	Enable Gray count generation on PWML[2*x], PWMH[2*x], PWML[2*x + 1], PWMH[2*x + 1].

### 55.7.33 PWM Fault Protection Value Register 2

**Name:** PWM\_FPV2  
**Offset:** 0xC0  
**Reset:** 0x000F000F  
**Property:** Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the [PWM Write Protection Status Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Reset					1	1	1	1

**Bits 16, 17, 18, 19 – FPZLx** Fault Protection to Hi-Z for PWML output on channel x

Value	Description
0	When fault occurs, PWML output of channel x is forced to value defined by the bit FPVLx in <a href="#">PWM Fault Protection Value Register 1</a> .
1	When fault occurs, PWML output of channel x is forced to high-impedance state.

**Bits 0, 1, 2, 3 – FPZHx** Fault Protection to Hi-Z for PWMH output on channel x

Value	Description
0	When fault occurs, PWMH output of channel x is forced to value defined by the bit FPVHx in <a href="#">PWM Fault Protection Value Register 1</a> .
1	When fault occurs, PWMH output of channel x is forced to high-impedance state.

### 55.7.34 PWM Write Protection Control Register

**Name:** PWM\_WPCR  
**Offset:** 0xE4  
**Reset:** –  
**Property:** Write-only

See [Register Write Protection](#) for the list of registers that can be write-protected.

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0

Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	–	0	–

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x50574D	PASSWD	Writing any other value in this field aborts the write operation of the WPCMD field.
D		Always reads as 0

#### Bits 2, 3, 4, 5, 6, 7 – WPRGx Write Protection Register Group x

Value	Description
0	The WPCMD command has no effect on the register group x.
1	The WPCMD command is applied to the register group x.

#### Bits 1:0 – WPCMD[1:0] Write Protection Command

This command is performed only if the WPKEY corresponds to 0x50574D (“PWM” in ASCII).

Value	Name	Description
0	DISABLE_SW_PROT	Disables the software write protection of the register groups of which the bit WPRGx is at ‘1’.
1	ENABLE_SW_PROT	Enables the software write protection of the register groups of which the bit WPRGx is at ‘1’.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

Value	Name	Description
2	ENABLE_HW_PROT	Enables the hardware write protection of the register groups of which the bit WPRGx is at '1'. Only a hardware reset of the PWM controller can disable the hardware write protection. Moreover, to meet security requirements, the PIO lines associated with the PWM can not be configured through the PIO interface.

### 55.7.35 PWM Write Protection Status Register

**Name:** PWM\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

Reset	0		0	0	0	0	0	0

#### Bits 31:16 – WPVSR[15:0] Write Protect Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

#### Bits 8, 9, 10, 11, 12, 13 – WPHWSx Write Protect HW Status

Value	Description
0	The HW write protection x of the register group x is disabled.
1	The HW write protection x of the register group x is enabled.

#### Bit 7 – WPVS Write Protect Violation Status

Value	Description
0	No write protection violation has occurred since the last read of PWM_WPSR.
1	At least one write protection violation has occurred since the last read of PWM_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

#### Bits 0, 1, 2, 3, 4, 5 – WPSWSx Write Protect SW Status

Value	Description
0	The SW write protection x of the register group x is disabled.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

---

---

Value	Description
1	The SW write protection x of the register group x is enabled.

### 55.7.36 PWM Comparison x Value Register

**Name:** PWM\_CMPVx  
**Offset:** 0x0130 + x\*0x10 [x=0..7]  
**Reset:** 0x00000000  
**Property:** Read/Write

Only the first 16 bits (channel counter size) of field CV are significant.

Bit	31	30	29	28	27	26	25	24
								CVM
Access								R/W
Reset								0
Bit	23	22	21	20	19	18	17	16
	CV[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	CV[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CV[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bit 24 – CVM Comparison x Value Mode

Value	Description
0	The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is incrementing.
1	The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is decrementing.  Note: This bit is not relevant if the counter of the channel 0 is left-aligned (CALG = 0 in <a href="#">PWM Channel Mode Register</a> )

#### Bits 23:0 – CV[23:0] Comparison x Value

Define the comparison x value to be compared with the counter of the channel 0.

### 55.7.37 PWM Comparison x Value Update Register

**Name:** PWM\_CMPVUPDx  
**Offset:** 0x0134 + x\*0x10 [x=0..7]  
**Reset:** –  
**Property:** Write-only

This register acts as a double buffer for the CV and CVM values. This prevents an unexpected comparison x match.

Only the first 16 bits (channel counter size) of field CVUPD are significant.

The write of the register PWM\_CMPVUPDx must be followed by a write of the register PWM\_CMPMUPDx.

	Bit	31	30	29	28	27	26	25	24
									CVMUPD
Access									W
Reset									–
	Bit	23	22	21	20	19	18	17	16

Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	–

#### Bit 24 – CVMUPD Comparison x Value Mode Update

**Note:** This bit is not relevant if the counter of the channel 0 is left-aligned (CALG = 0 in [PWM Channel Mode Register](#))

Value	Description
0	The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is incrementing.
1	The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is decrementing.

#### Bits 23:0 – CVUPD[23:0] Comparison x Value Update

Define the comparison x value to be compared with the counter of the channel 0.

### 55.7.38 PWM Comparison x Mode Register

**Name:** PWM\_CMPMx  
**Offset:** 0x0138 + x\*0x10 [x=0..7]  
**Reset:** 0x00000000  
**Property:** R/W

Bit	31	30	29	28	27	26	25	24	
	[Greyed out register bits 31-24]								
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
	CUPRCNT[3:0]				CUPR[3:0]				
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	
	CPRCNT[3:0]				CPR[3:0]				
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
	CTR[3:0]				[Greyed out bits 3-2]		[Greyed out bits 1-0]		CEN
Access	R/W	R/W	R/W	R/W			R/W		
Reset	0	0	0	0			0		

**Bits 23:20 – CUPRCNT[3:0]** Comparison x Update Period Counter  
 Reports the value of the comparison x update period counter.

Note: The field CUPRCNT is read-only

**Bits 19:16 – CUPR[3:0]** Comparison x Update Period  
 Defines the time between each update of the comparison x mode and the comparison x value. This time is equal to CUPR+1 periods of the channel 0 counter.

**Bits 15:12 – CPRCNT[3:0]** Comparison x Period Counter  
 Reports the value of the comparison x period counter.

Note: The field CPRCNT is read-only

**Bits 11:8 – CPR[3:0]** Comparison x Period  
 CPR defines the maximum value of the comparison x period counter (CPRCNT). The comparison x value is performed periodically once every CPR+1 periods of the channel 0 counter.

**Bits 7:4 – CTR[3:0]** Comparison x Trigger  
 The comparison x is performed when the value of the comparison x period counter (CPRCNT) reaches the value defined by CTR.

**Bit 0 – CEN** Comparison x Enable

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

---

---

Value	Description
0	The comparison x is disabled and can not match.
1	The comparison x is enabled and can match.

### 55.7.39 PWM Comparison x Mode Update Register

**Name:** PWM\_CMPMUPDx  
**Offset:** 0x013C + x\*0x10 [x=0..7]  
**Reset:** –  
**Property:** W

This register acts as a double buffer for the CEN, CTR, CPR and CUPR values. This prevents an unexpected comparison x match.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
					CUPRUPD[3:0]			
Access					W	W	W	W
Reset					0	0	0	–
Bit	15	14	13	12	11	10	9	8
					CPRUPD[3:0]			
Access					W	W	W	W
Reset					0	0	0	–
Bit	7	6	5	4	3	2	1	0
	CTRUPD[3:0]							CENUPD
Access	W	W	W	W				W
Reset	0	0	0	–				–

**Bits 19:16 – CUPRUPD[3:0]** Comparison x Update Period Update

Defines the time between each update of the comparison x mode and the comparison x value. This time is equal to CUPR+1 periods of the channel 0 counter.

**Bits 11:8 – CPRUPD[3:0]** Comparison x Period Update

CPR defines the maximum value of the comparison x period counter (CPRCNT). The comparison x value is performed periodically once every CPR+1 periods of the channel 0 counter.

**Bits 7:4 – CTRUPD[3:0]** Comparison x Trigger Update

The comparison x is performed when the value of the comparison x period counter (CPRCNT) reaches the value defined by CTR.

**Bit 0 – CENUPD** Comparison x Enable Update

Value	Description
0	The comparison x is disabled and can not match.
1	The comparison x is enabled and can match.

### 55.7.40 PWM Channel Mode Register

**Name:** PWM\_CMRx  
**Offset:** 0x0200 + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the [PWM Write Protection Status Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
					PPM	DTLI	DTHI	DTE
Access					R/W			
Reset					0	0	0	0
Bit	15	14	13	12	11	10	9	8
			TCTS	DPOLI	UPDS	CES	CPOL	CALG
Access					R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
					CPRE[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

#### Bit 19 – PPM Push-Pull Mode

The Push-Pull mode is enabled for channel x.

Value	Description
0	The Push-Pull mode is disabled for channel x.
1	The Push-Pull mode is enabled for channel x.

#### Bit 18 – DTLI Dead-Time PWMLx Output Inverted

Value	Description
0	The dead-time PWMLx output is not inverted.
1	The dead-time PWMLx output is inverted.

#### Bit 17 – DTHI Dead-Time PWMHx Output Inverted

Value	Description
0	The dead-time PWMHx output is not inverted.
1	The dead-time PWMHx output is inverted.

#### Bit 16 – DTE Dead-Time Generator Enable

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

Value	Description
0	The dead-time generator is disabled.
1	The dead-time generator is enabled.

### Bit 13 – TCTS Timer Counter Trigger Selection

Value	Description
0	The comparator of the channel x (OCx) is used as the trigger source for the Timer Counter (TC).
1	The counter events of the channel x is used as the trigger source for the Timer Counter (TC).

### Bit 12 – DPOLI Disabled Polarity Inverted

Value	Description
0	When the PWM channel x is disabled (CHIDx(PWM_SR) = 0), the OCx output waveform is the same as the one defined by the CPOL bit.
1	When the PWM channel x is disabled (CHIDx(PWM_SR) = 0), the OCx output waveform is inverted compared to the one defined by the CPOL bit.

### Bit 11 – UPDS Update Selection

If the PWM period is center-aligned (CALG=1):

0: The update occurs at the next end of the PWM period after writing the update register(s).

1: The update occurs at the next end of the PWM half period after writing the update register(s).

If the PWM period is left-aligned (CALG=0), the update always occurs at the end of the PWM period after writing the update register(s).

### Bit 10 – CES Counter Event Selection

If the PWM period is center-aligned (CALG=1):

0: The channel counter event occurs at the end of the PWM period.

1: The channel counter event occurs at the end of the PWM period and at half the PWM period.

If the PWM period is left-aligned (CALG=0), the channel counter event occurs at the end of the period and the CES bit has no effect.

### Bit 9 – CPOL Channel Polarity

Value	Description
0	The OCx output waveform (output from the comparator) starts at a low level.
1	The OCx output waveform (output from the comparator) starts at a high level.

### Bit 8 – CALG Channel Alignment

Value	Description
0	The period is left-aligned.
1	The period is center-aligned.

### Bits 3:0 – CPRE[3:0] Channel Prescaler

Value	Name	Description
	MCK	Peripheral clock

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

Value	Name	Description
1	MCK_DIV_2	Peripheral clock/2
2	MCK_DIV_4	Peripheral clock/4
3	MCK_DIV_8	Peripheral clock/8
4	MCK_DIV_16	Peripheral clock/16
5	MCK_DIV_32	Peripheral clock/32
6	MCK_DIV_64	Peripheral clock/64
7	MCK_DIV_128	Peripheral clock/128
8	MCK_DIV_256	Peripheral clock/256
9	MCK_DIV_512	Peripheral clock/512
10	MCK_DIV_1024	Peripheral clock/1024
11	CLKA	Clock A
12	CLKB	Clock B

### 55.7.41 PWM Channel Duty Cycle Register

**Name:** PWM\_CDTYx  
**Offset:** 0x0204 + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

Only the first 16 bits (channel counter size) are significant.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	CDTY[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	CDTY[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CDTY[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 23:0 – CDTY[23:0] Channel Duty-Cycle**

Defines the waveform duty-cycle. This value must be defined between 0 and CPRD (PWM\_CPRDx).

### 55.7.42 PWM Channel Duty Cycle Update Register

**Name:** PWM\_CDTYUPDx  
**Offset:** 0x0208 + x\*0x20 [x=0..3]  
**Reset:** –  
**Property:** Write-only

This register acts as a double buffer for the CDTY value. This prevents an unexpected waveform when modifying the waveform duty-cycle.

Only the first 16 bits (channel counter size) are significant.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	CDTYUPD[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	CDTYUPD[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0

	CDTYUPD[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	–

**Bits 23:0 – CDTYUPD[23:0] Channel Duty-Cycle Update**

Defines the waveform duty-cycle. This value must be defined between 0 and CPRD (PWM\_CPRDx).

### 55.7.43 PWM Channel Period Register

**Name:** PWM\_CPRDx  
**Offset:** 0x020C + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the [PWM Write Protection Status Register](#).

Only the first 16 bits (channel counter size) are significant.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	CPRD[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	CPRD[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CPRD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 23:0 – CPRD[23:0] Channel Period

If the waveform is left-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:

– By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(X \times \text{CPRD})}{f_{\text{peripheral clock}}}$$

– By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(X \times \text{CPRD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(X \times \text{CPRD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

If the waveform is center-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

---

– By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(2 \times X \times \text{CPRD})}{f_{\text{peripheral clock}}}$$

– By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(2 \times X \times \text{CPRD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(2 \times X \times \text{CPRD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

### 55.7.44 PWM Channel Period Update Register

**Name:** PWM\_CPRDUPDx  
**Offset:** 0x0210 + x\*0x20 [x=0..3]  
**Reset:** –  
**Property:** Write-only

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the [PWM Write Protection Status Register](#).

This register acts as a double buffer for the CPRD value. This prevents an unexpected waveform when modifying the waveform period.

Only the first 16 bits (channel counter size) are significant.

	Bit	31	30	29	28	27	26	25	24
Access									
Reset									
	Bit	23	22	21	20	19	18	17	16

		CPRDUPD[7:0]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	–

#### Bits 23:0 – CPRDUPD[23:0] Channel Period Update

If the waveform is left-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:

– By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(X \times \text{CPRDUPD})}{f_{\text{peripheral clock}}}$$

– By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(X \times \text{CPRDUPD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(X \times \text{CPRDUPD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

---

---

If the waveform is center-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:

– By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(2 \times X \times \text{CPRDUPD})}{f_{\text{peripheral clock}}}$$

– By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(2 \times X \times \text{CPRDUPD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(2 \times X \times \text{CPRDUPD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

### 55.7.45 PWM Channel Counter Register

**Name:** PWM\_CCNTx  
**Offset:** 0x0214 + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read-only

Only the first 16 bits (channel counter size) are significant.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	CNT[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	CNT[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CNT[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 23:0 – CNT[23:0]** Channel Counter Register

Channel counter value. This register is reset when:

- the channel is enabled (writing CHIDx in the PWM\_ENA register).
- the channel counter reaches CPRD value defined in the PWM\_CPRDx register if the waveform is left-aligned.

### 55.7.46 PWM Channel Dead Time Register

**Name:** PWM\_DT<sub>x</sub>  
**Offset:** 0x0218 + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS4 and WPHWS4 are cleared in the [PWM Write Protection Status Register](#).

Only the first 16 bits (dead-time counter size) of fields DTH and DTL are significant.

	Bit	31	30	29	28	27	26	25	24
		DTL[15:8]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		DTL[7:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		DTH[15:8]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		DTH[7:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0

**Bits 31:16 – DTL[15:0]** Dead-Time Value for PWML<sub>x</sub> Output

Defines the dead-time value for PWML<sub>x</sub> output. This value must be defined between 0 and CDTY (PWM\_CDTY<sub>x</sub>).

**Bits 15:0 – DTH[15:0]** Dead-Time Value for PWMH<sub>x</sub> Output

Defines the dead-time value for PWMH<sub>x</sub> output. This value must be defined between 0 and the value (CPRD – CDTY) (PWM\_CPRD<sub>x</sub> and PWM\_CDTY<sub>x</sub>).

### 55.7.47 PWM Channel Dead Time Update Register

**Name:** PWM\_DTUPDx  
**Offset:** 0x021C + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Write-only

This register can only be written if bits WPSWS4 and WPHWS4 are cleared in the [PWM Write Protection Status Register](#).

This register acts as a double buffer for the DTH and DTL values. This prevents an unexpected waveform when modifying the dead-time values.

Only the first 16 bits (dead-time counter size) of fields DTHUPD and DTLUPD are significant.

	Bit	31	30	29	28	27	26	25	24
		DTLUPD[15:8]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		DTLUPD[7:0]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	–
	Bit	15	14	13	12	11	10	9	8
		DTHUPD[15:8]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		DTHUPD[7:0]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	–

**Bits 31:16 – DTLUPD[15:0]** Dead-Time Value Update for PWMLx Output

Defines the dead-time value for PWMLx output. This value must be defined between 0 and CDTY (PWM\_CDTYx). This value is applied only at the beginning of the next channel x PWM period.

**Bits 15:0 – DTHUPD[15:0]** Dead-Time Value Update for PWMHx Output

Defines the dead-time value for PWMHx output. This value must be defined between 0 and the value (CPRD – CDTY) (PWM\_CPRDx and PWM\_CDTYx). This value is applied only at the beginning of the next channel x PWM period.

### 55.7.48 PWM Channel Mode Update Register

**Name:** PWM\_CMUPDx  
**Offset:** 0x0400 + x\*0x20 [x=0..3]  
**Reset:** –  
**Property:** Write-only

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the [PWM Write Protection Status Register](#).

This register acts as a double buffer for the CPOL value. This prevents an unexpected waveform when modifying the polarity value.

**Bit 13 – CPOLINVUP** Channel Polarity Inversion Update

If this bit is written at '1', the write of the bit CPOLUP is not taken into account.

Value	Description
0	No effect.
1	The OCx output waveform (output from the comparator) is inverted.

**Bit 9 – CPOLUP** Channel Polarity Update

The write of this bit is taken into account only if the bit CPOLINVUP is written at '0' at the same time.

Value	Description
0	The OCx output waveform (output from the comparator) starts at a low level.
1	The OCx output waveform (output from the comparator) starts at a high level.

### 55.7.49 PWM External Trigger Register

**Name:** PWM\_ETRGx  
**Offset:** 0x042C + x\*0x20 [x=0..1]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	RFEN	TRGSRC	TRGFILT	TRGEDGE			TRGMODE[1:0]	
Access	R/W	R/W	R/W	R/W			R/W	R/W
Reset	0	0	0	0			0	0
Bit	23	22	21	20	19	18	17	16
	MAXCNT[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	MAXCNT[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	MAXCNT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bit 31 – RFEN** Recoverable Fault Enable

Value	Description
0	The TRGINx signal does not generate a recoverable fault.
1	The TRGINx signal generate a recoverable fault in place of the fault x input.

**Bit 30 – TRGSRC** Trigger Source

Value	Description
0	The TRGINx signal is driven by the PWMEXTRGx input.
1	The TRGINx signal is driven by the Analog Comparator Controller.

**Bit 29 – TRGFILT** Filtered input

Value	Description
0	The external trigger input x is not filtered.
1	The external trigger input x is filtered.

**Bit 28 – TRGEDGE** Edge Selection

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

Value	Name	Description
0	FALLING_ZERO	TRGMODE = 1: TRGINx event detection on falling edge. TRGMODE = 2, 3: TRGINx active level is 0
1	RISING_ONE	TRGMODE = 1: TRGINx event detection on rising edge. TRGMODE = 2, 3: TRGINx active level is 1

### Bits 25:24 – TRGMODE[1:0] External Trigger Mode

Value	Name	Description
0	OFF	External trigger is not enabled.
1	MODE1	External PWM Reset Mode
2	MODE2	External PWM Start Mode
3	MODE3	Cycle-by-cycle Duty Mode

### Bits 23:0 – MAXCNT[23:0] Maximum Counter value

Maximum channel x counter value measured at the TRGINx event since the last read of the register.

At the TRGINx event, if the channel x counter value is greater than the stored MAXCNT value, then MAXCNT is updated by the channel x counter value.

### 55.7.50 PWM Leading-Edge Blanking Register

**Name:** PWM\_LEBRx  
**Offset:** 0x0430 + x\*0x20 [x=0..1]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
					PWMHREN	PWMHFEN	PWMLREN	PWMLFEN
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
		LEBDELAY[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

**Bit 19 – PWMHREN** PWMH Rising Edge Enable  
 Leading-edge blanking is enabled on PWMHx output rising edge.

Value	Description
0	Leading-edge blanking is disabled on PWMHx output rising edge.
1	Leading-edge blanking is enabled on PWMHx output rising edge.

**Bit 18 – PWMHFEN** PWMH Falling Edge Enable

Value	Description
0	Leading-edge blanking is disabled on PWMHx output falling edge.
1	Leading-edge blanking is enabled on PWMHx output falling edge.

**Bit 17 – PWMLREN** PWML Rising Edge Enable

Value	Description
0	Leading-edge blanking is disabled on PWMLx output rising edge.
1	Leading-edge blanking is enabled on PWMLx output rising edge.

**Bit 16 – PWMLFEN** PWML Falling Edge Enable

Value	Description
0	Leading-edge blanking is disabled on PWMLx output falling edge.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

---

---

Value	Description
1	Leading-edge blanking is enabled on PWMLx output falling edge.

**Bits 6:0 – LEBDELAY[6:0]** Leading-Edge Blanking Delay for TRGINx

Leading-edge blanking duration for external trigger x input. The delay is calculated according to the following formula:

$$\text{LEBDELAY} = (f_{\text{peripheral clock}} \times \text{Delay}) + 1$$

## **56. Secure Fuse Controller (SFC)**

### **56.1 Description**

The Secure Fuse Controller (SFC) interfaces the system with electrical fuses in a secure way.

The default value of a fuse is logic '0' (not programmed). A programmed fuse is logic '1'.

An electrical fuse matrix is a type of non-volatile memory. Each fuse in the matrix can be programmed only one time. They are typically used to store calibration bits for analog cells such as oscillators, configuration settings, chip identifiers or cryptographic keys.

A specific number of fuse bits are programmed during the production tests through the test interface. The remaining 544 fuse bits are programmed by the user and by software through the user interface.

The SFC automatically reads the fuse values on start-up and stores them in 32-bit registers in order to make them accessible by the software. Only fuses set to level '1' are programmed.

Several security mechanisms make irregular data recovery more complex to achieve.

### **56.2 Embedded Characteristics**

- Fuse bits partitioned into two areas:
  - Reserved area
  - 544-bit user area
- Program and read the fuse states by software
- Automatic check of programmed fuses
- Detection of irregular alteration of the fuse states in reserved area during startup and report
- Live detection of irregular alteration of all the fuse states and report
- Part of fuse states maskable for reading

## 56.3 Block Diagram

Figure 56-1. SFC Block Diagram

## 56.4 Functional Description

### 56.4.1 Accessing the SFC

Setting the write-once FUSE bit in the SFR\_SECURE register disables access to the Secure Fuse Controller (SFC).

### 56.4.2 Fuse Partitioning

The fuses are split into a user area of 544 bits and a reserved area.

The reserved area is typically used to store calibration bits for analog cells such as oscillators, configuration settings, chip identifiers, etc. The user area fuses are programmed later on by the user.

### 56.4.3 Fuse Integrity Checking

The SFC automatically reads the fuses values at start-up and stores them in 32-bit registers in order to make them accessible by software. At this time, the SFC checks the integrity of the fuse states in the reserved area.

If an inconsistency is detected, the CHECK error flag (named ACE for the reserved area) in the Status Register (SFC\_SR) is set to '1' and can trigger an interrupt. This flag is automatically cleared at '0', when the Status Register (SFC\_SR) is read.

### 56.4.4 Fuse Integrity Live Checking

The SFC automatically checks the integrity of all fuse states at every time after the start-up is finished. This ensures that the fuses states cannot be changed without notice.

If an inconsistency is detected, the LCHECK error flag in the Status Register (SFC\_SR) is set to '1' and can trigger an interrupt. This flag is automatically cleared at '0', when the Status Register (SFC\_SR) is read.

### 56.4.5 Fuse Access

#### 56.4.5.1 Fuse Reading

The fuse states are automatically latched at core start-up and are available for reading in the Data Registers (SFC\_DRx).

The fuse states of bits 0 to 31 are available in the Data Register 0 (SFC\_DR0), the fuse states of bits 32 to 63 are available in the Data Register 1 (SFC\_DR1) and so on.

When fuse programming is performed, the fuse states are automatically updated in the Data Registers (SFC\_DRx).

#### 56.4.5.2 Fuse Programming

All the fuses can be written by software.

The sequence of instructions to program fuses is the following:

1. Write the key code 0xFB in the Key Register (SFC\_KR).
2. Write the word to program in the corresponding Data Register (SFC\_DRx).  
For example, if fuses 0 to 31 must be programmed, Data Register 0 (SFC\_DR0) must be written. If fuses 32 to 61 must be programmed, Data Register 1 (SFC\_DR1) must be written. Only the data bits set to level '1' are programmed.
3. Wait for flag PGMC to rise in the Status Register (SFC\_SR) by polling or interrupt.
4. Check the value of flag PGMF: if it is set to 1, it means that the programming procedure failed. After programming, the fuses are read back in the corresponding SFC\_DRx.

#### 56.4.5.3 Fuse Masking

It is possible to mask a fuse array. Once the fuse masking is enabled, the data registers from SFC\_DR0 to SFC\_DR7 are read at a value of '0', regardless of the fuse state (the registers that are masked depend on the SFC hardware customizing).

To activate fuse masking, the MSK bit of the SFC Mode Register (SFC\_MR) must be written to level '1'. The MSK bit is set-only. Only a hardware reset can disable fuse masking.

The MSK bit has no effect on the programming of masked fuses.

### 56.4.6 Fuse Functions

The "Fuse Box Controller" section defines the fuse bits that can be used as general purpose bits when standard boot is used.

If secure boot is used, refer to the device "Secure Boot Strategy" application note included in the Secure Package.

### 56.5 Register Summary

Offset	Name	Bit Pos.

### 56.5.1 SFC Key Register

**Name:** SFC\_KR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

**Bits 7:0 – KEY[7:0] Key Code**

This field must be written with the correct key code (0xFB) prior to any write in a Data Register (SFC\_DRx) in order to enable the fuse programming. For each write of SFC\_DRx, this field must be written immediately before.

### 56.5.2 SFC Mode Register

**Name:** SFC\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bit 4 – SASEL Sense Amplifier Selection

Value	Description
0	Comparator type sense amplifier selected
1	Latch type sense amplifier selected

#### Bit 0 – MSK Mask Data Registers

The MSK bit is set-only. Only a hardware reset can disable fuse masking.

Value	Description
0	No effect
1	The data registers from SFC_DR0 to SFC_DR7 are always read at 0x00000000.

### 56.5.3 SFC Interrupt Enable Register

**Name:** SFC\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt

**Bit 17 – ACE** Manufacturer Area Check Error (cleared on read)

Value	Description
0	No check error in the reserved area since the last read of SFC_SR.
1	At least one check error in the reserved area since the last read of SFC_SR.

**Bit 16 – APLE** Area Programming Lock Error (cleared on read)

Value	Description
0	No programming attempt has been made in the locked area since the last read of SFC_SR.
1	A programming attempt has been made in the locked area since the last read of SFC_SR.

**Bit 4 – LCHECK** Live Integrity Checking Error (cleared on read)

Value	Description
0	No live integrity check error since the last read of SFC_SR.
1	At least one live integrity check error since the last read of SFC_SR.

**Bit 1 – PGMF** Programming Sequence Failed (cleared on read)

Value	Description
0	No programming failure occurred during last programming sequence since the last read of SFC_SR.

# SAMA5D2 Series

## Secure Fuse Controller (SFC)

---

---

Value	Description
1	A programming failure occurred since the last read of SFC_SR.

**Bit 0 – PGMC** Programming Sequence Completed (cleared on read)

Value	Description
0	No programming sequence completion since the last read of SFC_SR.
1	At least one programming sequence completion since the last read of SFC_SR.

### 56.5.7 SFC Data Register x

**Name:** SFC\_DRx  
**Offset:** 0x20 + x\*0x04 [x=0..16]

#### Bits 31:0 – DATA[31:0] Fuse Data

Value	Description
READ	Reports the state of the corresponding fuses.
WRITE	The data to be programmed in the corresponding fuses. Only bits with a value of '1' are programmed. Writing this register automatically triggers a programming sequence of the corresponding fuses. Note that a write to the Key Register (SFC_KR) with the correct key code must always precede any write to SFC_DRx.

## 57. Integrity Check Monitor (ICM)

### 57.1 Description

The Integrity Check Monitor (ICM) is a DMA controller that performs hash calculation over multiple memory regions through the use of transfer descriptors located in memory (ICM Descriptor Area). The Hash function is based on the Secure Hash Algorithm (SHA). The ICM integrates two modes of operation. The first one is used to hash a list of memory regions and save the digests to memory (ICM Hash Area). The second mode is an active monitoring of the memory. In that mode, the hash function is evaluated and compared to the digest located at a predefined memory address (ICM Hash Area). If a mismatch occurs, an interrupt is raised. See the figure below for an example of four-region monitoring. Hash and Descriptor areas are located in Memory instance i2, and the four regions are split in memory instances i0 and i1.

**Figure 57-1. Four-region Monitoring Example**

The ICM SHA engine is compliant with the American FIPS (Federal Information Processing Standard) Publication 180-2 specification.

The following terms are concise definitions of the ICM concepts used throughout this document:

- Region—a partition of instruction or data memory space
- Region Descriptor—a data structure stored in memory, defining region attributes
- Region Attributes—region start address, region size, region SHA engine processing mode, Write Back or Compare function mode
- Context Registers—a set of ICM non-memory-mapped, internal registers which are automatically loaded, containing the attributes of the region being processed
- Main List—a list of region descriptors. Each element associates the start address of a region with a set of attributes.
- Secondary List—a linked list defined on a per region basis that describes the memory layout of the region (when the region is non-contiguous)

- Hash Area—predefined memory space where the region hash results (digest) are stored

## **57.2 Embedded Characteristics**

- DMA AHB Master Interface
- Supports Monitoring of up to 4 Non-Contiguous Memory Regions
- Supports Block Gathering Using Linked Lists
- Supports Secure Hash Algorithm (SHA1, SHA224, SHA256)
- Compliant with FIPS Publication 180-2
- Configurable Processing Period:
  - When SHA1 algorithm is processed, the runtime period is either 85 or 209 clock cycles.
  - When SHA256 or SHA224 algorithm is processed, the runtime period is either 72 or 194 clock cycles.
- Programmable Bus Burden

### 57.3 Block Diagram

Figure 57-2. Integrity Check Monitor Block Diagram

### 57.4 Product Dependencies

#### 57.4.1 Power Management

The peripheral clock is not continuously provided to the ICM. The programmer must first enable the ICM clock in the Power Management Controller (PMC) before using the ICM.

#### 57.4.2 Interrupt Sources

The ICM interface has an interrupt line connected to the Interrupt Controller.

Handling the ICM interrupt requires programming the interrupt controller before configuring the ICM.

## 57.5 Functional Description

### 57.5.1 Overview

The Integrity Check Monitor (ICM) is a DMA controller that performs SHA-based memory hashing over memory regions. As shown in figure [Integrity Check Monitor Block Diagram](#), it integrates a DMA interface, a Monitoring Finite State Machine (FSM), an integrity scheduler, a set of context registers, a SHA engine, an interface for configuration and status registers.

The ICM integrates a Secure Hash Algorithm engine (SHA). This engine requires a message padded according to FIPS180-2 specification when used as a SHA calculation unit only. Otherwise, if the ICM is used as integrated check for memory content, the padding is not mandatory. The SHA module produces an N-bit message digest each time a block is read and a processing period ends. N is 160 for SHA1, 224 for SHA224, 256 for SHA256.

When the ICM module is enabled, it sequentially retrieves a circular list of region descriptors from the memory (Main List described in figure [ICM Region Descriptor and Hash Areas](#)). Up to four regions may be monitored. Each region descriptor is composed of four words indicating the layout of the memory region (see figure [Region Descriptor](#)). It also contains the hashing engine configuration on a per-region basis. As soon as the descriptor is loaded from the memory and context registers are updated with the data structure, the hashing operation starts. A programmable number of blocks (see TRSIZE field of the ICM\_RCTRL structure member) is transferred from the memory to the SHA engine. When the desired number of blocks have been transferred, the digest is either moved to memory (Write Back function) or compared with a digest reference located in the system memory (Compare function). If a digest mismatch occurs, an interrupt is triggered if unmasked. The ICM module passes through the region descriptor list until the end of the list marked by an end of list marker (WRAP or EOM bit in ICM\_RCFG structure member set to one). To continuously monitor the list of regions, the WRAP bit must be set to one in the last data structure and EOM must be cleared.

**Figure 57-3. ICM Region Descriptor and Hash Areas**

Each region descriptor supports gathering of data through the use of the Secondary List. Unlike the Main List, the Secondary List cannot modify the configuration attributes of the region. When the end of the Secondary List has been encountered, the ICM returns to the Main List. Memory integrity monitoring can be considered as a background service and the mandatory bandwidth shall be very limited. In order to limit the ICM memory bandwidth, use ICM\_CFG.BBC to control the ICM memory load.

**Figure 57-4. Region Descriptor**

The figure below shows an example of the mandatory ICM settings required to monitor three memory data blocks of the system memory (defined as two regions) with one region being not contiguous (two separate areas) and one contiguous memory area. For each region, the SHA algorithm may be independently selected (different for each region). The wrap allows continuous monitoring.

**Figure 57-5. Example: Monitoring of 3 Memory Data Blocks (Defined as 2 Regions)**

### 57.5.2 ICM Region Descriptor Structure

The ICM Region Descriptor Area is a contiguous area of system memory that the controller and the processor can access. When the ICM is activated, the controller performs a descriptor fetch operation at  $*(ICM\_DSCR)$  address. If the Main List contains more than one descriptor (i.e., more than one region is to be monitored), the fetch address is  $*(ICM\_DSCR) + (RID \ll 4)$  where RID is the region identifier.

**Table 57-1. Region Descriptor Structure (Main List)**

Offset	Structure Member	Name
$ICM\_DSCR+0x000+RID*(0x10)$	ICM Region Start Address	ICM_RADDR
$ICM\_DSCR+0x004+RID*(0x10)$	ICM Region Configuration	ICM_RCFG
$ICM\_DSCR+0x008+RID*(0x10)$	ICM Region Control	ICM_RCTRL
$ICM\_DSCR+0x00C+RID*(0x10)$	ICM Region Next Address	ICM_RNEXT

### 57.5.2.1 ICM Region Start Address Structure Member

**Name:** ICM\_RADDR

**Property:** Read/Write

Register offset is calculated as  $ICM\_DSCR + 0x000 + RID * (0x10)$ .

**Bits 31:0 – RADDR[31:0]** Region Start Address

This field indicates the first byte address of the region.

### 57.5.2.2 ICM Region Configuration Structure Member

**Name:** ICM\_RCFG  
**Property:** Read/Write

Register offset is calculated as  $ICM\_DSCR + 0x004 + RID * (0x10)$ .

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16

#### Bits 14:12 – ALGO[2:0] SHA Algorithm

Values which are not listed in the table must be considered as “reserved”.

Value	Name	Description
0	SHA1	SHA1 algorithm processed
1	SHA256	SHA256 algorithm processed

#### Bit 10 – PROCDLY Processing Delay

When SHA1 algorithm is processed, the runtime period is either 85 or 209 clock cycles.

When SHA256 algorithm is processed, the runtime period is either 72 or 194 clock cycles.

Value	Name	Description
0	SHORTEST	SHA processing runtime is the shortest one.
1	LONGEST	SHA processing runtime is the longest one.

#### Bit 9 – SUIEN Monitoring Status Updated Condition Interrupt (Default Enabled)

Value	Name	Description
0		The ICM_ISR.RSU[i] flag is set when the corresponding descriptor is loaded from memory to ICM.
1		The ICM_ISR.RSU[i] flag remains cleared even if the setting condition is met.

#### Bit 8 – ECIEN End Bit Condition Interrupt (Default Enabled)

# SAMA5D2 Series

## Integrity Check Monitor (ICM)

Value	Name	Description
0		The ICM_ISR.REC[i] flag is set when the descriptor with the EOM bit set is processed.
1		The ICM_ISR.REC[i] flag remains cleared even if the setting condition is met.

**Bit 7 – WCIEN** Wrap Condition Interrupt Disable (Default Enabled)

Value	Name	Description
0		The ICM_ISR.RWC[i] flag is set when the WRAP bit is set in a descriptor of the main list.
1		ICM_ISR.RWC[i] flag remains cleared even if the setting condition is met.

**Bit 6 – BEIEN** Bus Error Interrupt Disable (Default Enabled)

Value	Name	Description
0		The flag is set when an error is reported on the system bus by the bus matrix.
1		The flag remains cleared even if the setting condition is met.

**Bit 5 – DMIEN** Digest Mismatch Interrupt Disable (Default Enabled)

Value	Name	Description
0		The ICM_ISR.RBE[i] flag is set when the hash value just calculated from the processed region differs from expected hash value.
1		The ICM_ISR.RBE[i] flag remains cleared even if the setting condition is met.

**Bit 4 – RHIEEN** Region Hash Completed Interrupt Disable (Default Enabled)

Value	Name	Description
0		The ICM_ISR.RHC[i] flag is set when the field NEXT = 0 in a descriptor of the main or second list.
1		The ICM_ISR.RHC[i] flag remains cleared even if the setting condition is met.

**Bit 2 – EOM** End Of Monitoring

Value	Name	Description
0		The current descriptor does not terminate the monitoring.
1		The current descriptor terminates the Main List. WRAP value has no effect.

**Bit 1 – WRAP** Wrap Command

Value	Name	Description
0		The next region descriptor address loaded is the current region identifier descriptor address incremented by 0x10.
1		The next region descriptor address loaded is ICM_DSCR.

**Bit 0 – CDWBN** Compare Digest or Write Back Digest

Value	Name	Description
0		The digest is written to the Hash area.
1		The digest value is compared to the digest stored in the Hash area.

### 57.5.2.3 ICM Region Control Structure Member

**Name:** ICM\_RCTRL  
**Property:** Read/Write

Register offset is calculated as  $ICM\_DSCR + 0x008 + RID * (0x10)$ .

**Bits 15:0 – TRSIZE[15:0]** Transfer Size for the Current Chunk of Data

.....continued

Memory Address	Address Offset / Byte Lane							
	0x7 / 63:56	0x6 / 55:48	0x5 / 47:40	0x4 / 39:32	0x3 / 31:24	0x2 / 23:16	0x1 / 15:8	0x0 / 7:0
0x008–0x070	00	00	00	00	00	00	00	00
0x078	18	00	00	00	00	00	00	00

### 57.5.4 Using ICM as SHA Engine

The ICM can be configured to only calculate a SHA1, SHA224, SHA256 digest value.

#### 57.5.4.1 Settings for Simple SHA Calculation

The start address of the system memory containing the data to hash must be configured in the transfer descriptor of the DMA embedded in the ICM.

The transfer descriptor is a system memory area integer multiple of 4 x 32-bit words and the start address of the descriptor must be configured in ICM\_DSCR (the start address must be aligned on 64-bytes; six LSB must be cleared). If the data to hash is already padded according to SHA standards, only a single descriptor is required, and ICM\_RCFG.EOM must be written to 1. If the data to hash does not contain a padding area, it is possible to define the padding area in another system memory location, the ICM can be configured to automatically jump from a memory area to another one by configuring the descriptor register ICM\_RNEXT with a value that differs from 0. Configuring ICM\_RNEXT.NEXT with the start address of the padding area forces the ICM to concatenate both areas, thus providing the SHA result from the start address of the hash area configured in ICM\_HASH.

Whether the system memory is configured as a single or multiple data block area, ICM\_RCFG.CDWBN and ICM\_RCFG.WRAP must be cleared. The bits WBDIS, EOMDIS, SLBDIS must be cleared in ICM\_CFG.

ICM\_RCTRL.RHIEN and ICM\_RCTRL.ECIEN must be written to 1. The flag RHC[i], i being the region index, is set (if RHIEN is set) when the hash result is available at address defined in ICM\_HASH. The flag REC[i], i being the region index, is set (if ECIEN is set) when the hash result is available at the address defined in ICM\_HASH.

An interrupt is generated if the bit RHC[i] is written to 1 in the ICM\_IER (if RHC[i] is set in ICM\_RCTRL of region i) or if the bit REC[i] is written to 1 in the ICM\_IER (if REC[i] is set in ICM\_RCTRL of region i).

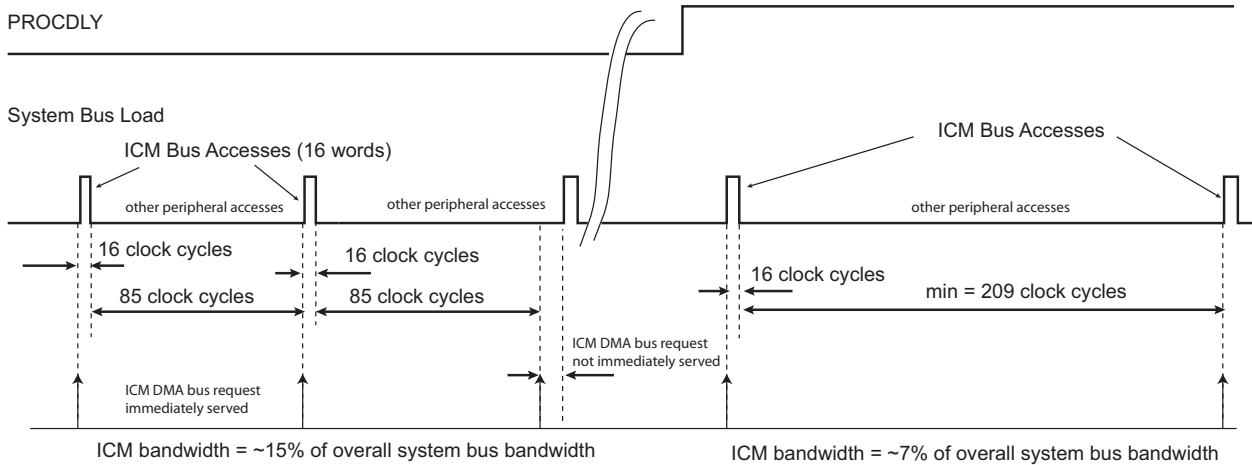

#### 57.5.4.2 Processing Period

The ICM engine has a core (SHA) inherent processing period that may result, depending on the application, in a significant bandwidth usage at system bus level. In some applications, it may be important to keep as much bandwidth as possible for the other peripherals (e.g. CPU, DMA). The ICM SHA engine processing period can be configured to reduce the bandwidth required by writing ICM\_RCFG.PROCDLY=1.

In SHA1 mode, the shortest processing period is 85 clock cycles + 2 clock cycles for start command synchronization (ICM\_RCFG.PROCDLY=0). The longest period is 209 clock cycles + 2 clock cycles when ICM\_RCFG.PROCDLY=1 (see the figure below).

In SHA256 or SHA224 mode, the shortest processing period is 72 clock cycles + 2 clock cycles for start command synchronization. The longest period is 194 clock cycles + 2 clock cycles.

**Figure 57-6. Bandwidth Usage in SHA1 Mode**

### 57.5.5 ICM Automatic Monitoring Mode

ICM\_CFG.ASCD is used to activate the ICM Automatic Monitoring mode. When ICM\_CFG.ASCD is set and bits CDWBN and EOM in ICM.RCFG equal 0, the ICM performs the following actions:

1. The ICM passes through the Main List once to calculate the message digest of the monitored area.
2. When WRAP = 1 in ICM\_RCFG, the ICM begins monitoring. CDWBN in ICM\_RCFG is now automatically set and EOM is cleared. These bits have no effect during the monitoring period that ends when EOM is set.

### 57.5.6 Programming the ICM

**Table 57-6. Region Attributes**

Transfer Type		Main List	ICM_RCFG			ICM_RNEXT	Comments
			CDWBN	WRAP	EOM	NEXT	
Single Region	Contiguous list of blocks Digest written to memory Monitoring disabled	1 item	0	0	1	0	The Main List contains only one descriptor. The Secondary List is empty for that descriptor. The digest is computed and saved to memory.
	Non-contiguous list of blocks Digest written to memory Monitoring disabled	1 item	0	0	1	Secondary List address of the current region identifier	The Main List contains only one descriptor. The Secondary List describes the layout of the non-contiguous region.
	Contiguous list of blocks Digest comparison enabled Monitoring enabled	1 item	1	1	0	0	When the hash computation is terminated, the digest is compared with the one saved in memory.

.....continued

Transfer Type		Main List	ICM_RCFG			ICM_RNEXT	Comments
			CDWBN	WRAP	EOM	NEXT	
Multiple Regions	Contiguous list of blocks Digest written to memory Monitoring disabled	More than one item	0	0	1 for the last, 0 otherwise	0	ICM passes through the list once.
	Contiguous list of blocks Digest comparison is enabled Monitoring is enabled	More than one item	1	1 for the last, 0 otherwise	0	0	ICM performs active monitoring of the regions. If a mismatch occurs, an interrupt is raised.
	Non-contiguous list of blocks Digest is written to memory Monitoring is disabled	More than one item	0	0	1	Secondary List address	ICM performs hashing and saves digests to the Hash area.
	Non-contiguous list of blocks Digest comparison is enabled Monitoring is enabled	More than one item	1	1	0	Secondary List address	ICM performs data gathering on a per region basis.

### 57.5.7 Security Features

When an undefined register access occurs, the URAD bit in the Interrupt Status Register (ICM\_ISR) is set if unmasked. Its source is then reported in the Undefined Access Status Register (ICM\_UASR). Only the first undefined register access is available through the ICM\_UASR.URAT field.

Several kinds of unspecified register accesses can occur:

- Unspecified structure member set to one detected when the descriptor is loaded
- Configuration register (ICM\_CFG) modified during active monitoring
- Descriptor register (ICM\_DSCR) modified during active monitoring
- Hash register (ICM\_HASH) modified during active monitoring
- Write-only register read access

The URAD bit and the URAT field can only be reset by writing a 1 to the ICM\_CTRL.SWRST bit.

# SAMA5D2 Series

### 57.6.1 ICM Configuration Register

**Name:** ICM\_CFG  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	UALGO[2:0]			UIHASH			DUALBUFF	ASCD
Access	R/W	R/W	R/W	R/W			R/W	R/W
Reset	0	0	0	0			0	0
Bit	7	6	5	4	3	2	1	0
	BBC[3:0]					SLBDIS	EOMDIS	WBDIS
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	0	0		0	0	0

#### Bits 15:13 – UALGO[2:0] User SHA Algorithm

Value	Name	Description
0	SHA1	SHA1 algorithm processed
1	SHA256	SHA256 algorithm processed
4	SHA224	SHA224 algorithm processed

#### Bit 12 – UIHASH User Initial Hash Value

Value	Description
0	The secure hash standard provides the initial hash value.
1	The initial hash value is programmable. Field UALGO provides the SHA algorithm. The ALGO field of the ICM_RCFG structure member has no effect.

#### Bit 9 – DUALBUFF Dual Input Buffer

Value	Description
0	Dual Input Buffer mode is disabled.
1	Dual Input Buffer mode is enabled (better performances, higher bandwidth required on system bus).

#### Bit 8 – ASCD Automatic Switch To Compare Digest

Value	Description
0	Automatic monitoring mode is disabled.
1	The ICM passes through the Main List once to calculate the message digest of the monitored area. When WRAP = 1 in ICM_RCFG, the ICM begins monitoring.

**Bits 7:4 – BBC[3:0]** Bus Burden Control

This field is used to control the burden of the ICM system bus. The number of system clock cycles between the end of the current processing and the next block transfer is set to  $2^{BBC}$ . Up to 32,768 cycles can be inserted.

**Bit 2 – SLBDIS** Secondary List Branching Disable

Value	Description
0	Branching to the Secondary List is permitted.
1	Branching to the Secondary List is forbidden. The NEXT field of the ICM_RNEXT structure member has no effect and is always considered as zero.

**Bit 1 – EOMDIS** End of Monitoring Disable

Value	Description
0	End of Monitoring is permitted.
1	End of Monitoring is forbidden. The EOM bit of the ICM_RCFG structure member has no effect.

**Bit 0 – WBDIS** Write Back Disable

When ASCD is set, WBDIS has no effect.

Value	Description
0	Write Back operations are permitted.
1	Write Back operations are forbidden. Context register CDWBN bit is internally set to one and cannot be modified by a linked list element. ICM_RCFG.CDWBN has no effect.

### 57.6.2 ICM Control Register

**Name:** ICM\_CTRL  
**Offset:** 0x04  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	[Greyed out register bits 31-24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Greyed out register bits 23-16]							
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	RMEN[3:0]				RMDIS[3:0]			
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	–	0	0	0	–
Bit	7	6	5	4	3	2	1	0
	REHASH[3:0]					SWRST	DISABLE	ENABLE
Access	W	W	W	W		W	W	W
Reset	0	0	0	–		–	–	–

**Bits 15:12 – RMEN[3:0]** Region Monitoring Enable  
Monitoring is activated by default.

Value	Description
0	No effect
1	When bit RMEN[i] is set to one, the monitoring of region with identifier i is activated.

**Bits 11:8 – RMDIS[3:0]** Region Monitoring Disable

Value	Description
0	No effect
1	When bit RMDIS[i] is set to one, the monitoring of region with identifier i is disabled.

**Bits 7:4 – REHASH[3:0]** Recompute Internal Hash

Value	Description
0	No effect
1	When REHASH[i] is set to one, Region i digest is re-computed. This bit is only available when region monitoring is disabled.

**Bit 2 – SWRST** Software Reset

# SAMA5D2 Series

## Integrity Check Monitor (ICM)

Value	Description
0	No effect
1	Resets the ICM.

### Bit 1 – DISABLE ICM Disable Register

Value	Description
0	No effect
1	The ICM is disabled. If a region is active, this region is terminated.

### Bit 0 – ENABLE ICM Enable

Value	Description
0	No effect
1	When set to one, the ICM is activated.

### 57.6.3 ICM Status Register

**Name:** ICM\_SR  
**Offset:** 0x08  
**Reset:** –  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits 31-24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Greyed out bits 23-16]							
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	RMDIS[3:0]				RAWRMDIS[3:0]			
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	–	0	0	0	–
Bit	7	6	5	4	3	2	1	0
	[Greyed out bits 7-1]							ENABLE
Access								R
Reset								–

#### Bits 15:12 – RMDIS[3:0] Region Monitoring Disabled Status

Value	Description
0	Region i is being monitored (occurs after integrity check value has been calculated and written to Hash area).
1	Region i monitoring is not being monitored.

#### Bits 11:8 – RAWRMDIS[3:0] Region Monitoring Disabled Raw Status

Value	Description
0	Region i monitoring has been activated by writing a 1 in RMEN[i] of ICM_CTRL.
1	Region i monitoring has been deactivated by writing a 1 in RMDIS[i] of ICM_CTRL.

#### Bit 0 – ENABLE ICM Enable Register

Value	Description
0	ICM is disabled.
1	ICM is activated.

### 57.6.4 ICM Interrupt Enable Register

**Name:** ICM\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
								URAD
Access								W
Reset								–
Bit	23	22	21	20	19	18	17	16
	RSU[3:0]				REC[3:0]			
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	–	0	0	0	–
Bit	15	14	13	12	11	10	9	8
	RWC[3:0]				RBE[3:0]			
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	–	0	0	0	–
Bit	7	6	5	4	3	2	1	0
	RDM[3:0]				RHC[3:0]			
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	–	0	0	0	–

#### Bit 24 – URAD Undefined Register Access Detection Interrupt Enable

Value	Description
0	No effect.
1	The Undefined Register Access interrupt is enabled.

#### Bits 23:20 – RSU[3:0] Region Status Updated Interrupt Disable

Value	Description
0	No effect.
1	When RSU[i] is set to one, the region i Status Updated interrupt is enabled.

#### Bits 19:16 – REC[3:0] Region End bit Condition Detected Interrupt Enable

Value	Description
0	No effect.
1	When REC[i] is set to one, the region i End bit Condition interrupt is enabled.

#### Bits 15:12 – RWC[3:0] Region Wrap Condition detected Interrupt Enable

Value	Description
0	No effect.
1	When RWC[i] is set to one, the Region i Wrap Condition interrupt is enabled.

**Bits 11:8 – RBE[3:0]** Region Bus Error Interrupt Enable

Value	Description
0	No effect.
1	When RBE[i] is set to one, the Region i Bus Error interrupt is enabled.

**Bits 7:4 – RDM[3:0]** Region Digest Mismatch Interrupt Enable

Value	Description
0	No effect.
1	When RDM[i] is set to one, the Region i Digest Mismatch interrupt is enabled.

**Bits 3:0 – RHC[3:0]** Region Hash Completed Interrupt Enable

Value	Description
0	No effect.
1	When RHC[i] is set to one, the Region i Hash Completed interrupt is enabled.

### 57.6.5 ICM Interrupt Disable Register

**Name:** ICM\_IDR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
								URAD
Access								W
Reset								–
Bit	23	22	21	20	19	18	17	16
	RSU[3:0]				REC[3:0]			
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	–	0	0	0	–
Bit	15	14	13	12	11	10	9	8
	RWC[3:0]				RBE[3:0]			
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	–	0	0	0	–
Bit	7	6	5	4	3	2	1	0
	RDM[3:0]				RHC[3:0]			
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	–	0	0	0	–

**Bit 24 – URAD** Undefined Register Access Detection Interrupt Disable

Value	Description
0	No effect.
1	Undefined Register Access Detection interrupt is disabled.

**Bits 23:20 – RSU[3:0]** Region Status Updated Interrupt Disable

Value	Description
0	No effect.
1	When RSU[i] is set to one, the region i Status Updated interrupt is disabled.

**Bits 19:16 – REC[3:0]** Region End bit Condition detected Interrupt Disable

Value	Description
0	No effect.
1	When REC[i] is set to one, the region i End bit Condition interrupt is disabled.

**Bits 15:12 – RWC[3:0]** Region Wrap Condition Detected Interrupt Disable

Value	Description
0	No effect.
1	When RWC[i] is set to one, the Region i Wrap Condition interrupt is disabled.

**Bits 11:8 – RBE[3:0]** Region Bus Error Interrupt Disable

Value	Description
0	No effect.
1	When RBE[i] is set to one, the Region i Bus Error interrupt is disabled.

**Bits 7:4 – RDM[3:0]** Region Digest Mismatch Interrupt Disable

Value	Description
0	No effect.
1	When RDM[i] is set to one, the Region i Digest Mismatch interrupt is disabled.

**Bits 3:0 – RHC[3:0]** Region Hash Completed Interrupt Disable

Value	Description
0	No effect.
1	When RHC[i] is set to one, the Region i Hash Completed interrupt is disabled.

### 57.6.6 ICM Interrupt Mask Register

**Name:** ICM\_IMR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
								URAD
Access								R
Reset								0
Bit	23	22	21	20	19	18	17	16
	RSU[3:0]				REC[3:0]			
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	RWC[3:0]				RBE[3:0]			
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	RDM[3:0]				RHC[3:0]			
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bit 24 – URAD** Undefined Register Access Detection Interrupt Mask

Value	Description
0	Interrupt is disabled
1	Interrupt is enabled.

**Bits 23:20 – RSU[3:0]** Region Status Updated Interrupt Mask

Value	Description
0	When RSU[i] is set to zero, the interrupt is disabled for region i.
1	When RSU[i] is set to one, the interrupt is enabled for region i.

**Bits 19:16 – REC[3:0]** Region End Bit Condition Detected Interrupt Mask

Value	Description
0	When REC[i] is set to zero, the interrupt is disabled for region i.
1	When REC[i] is set to one, the interrupt is enabled for region i.

**Bits 15:12 – RWC[3:0]** Region Wrap Condition Detected Interrupt Mask

Value	Description
0	When RWC[i] is set to zero, the interrupt is disabled for region i.
1	When RWC[i] is set to one, the interrupt is enabled for region i.

**Bits 11:8 – RBE[3:0]** Region Bus Error Interrupt Mask

Value	Description
0	When RBE[i] is set to zero, the interrupt is disabled for region i.
1	When RBE[i] is set to one, the interrupt is enabled for region i.

**Bits 7:4 – RDM[3:0]** Region Digest Mismatch Interrupt Mask

Value	Description
0	When RDM[i] is set to zero, the interrupt is disabled for region i.
1	When RDM[i] is set to one, the interrupt is enabled for region i.

**Bits 3:0 – RHC[3:0]** Region Hash Completed Interrupt Mask

Value	Description
0	When RHC[i] is set to zero, the interrupt is disabled for region i.
1	When RHC[i] is set to one, the interrupt is enabled for region i.

### 57.6.7 ICM Interrupt Status Register

**Name:** ICM\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

	Bit	31	30	29	28	27	26	25	24
									URAD
Access									R
Reset									0
	Bit	23	22	21	20	19	18	17	16
		RSU[3:0]				REC[3:0]			
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		RWC[3:0]				RBE[3:0]			
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		RDM[3:0]				RHC[3:0]			
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0

**Bit 24 – URAD** Undefined Register Access Detection Status

The URAD bit is only reset by the SWRST bit in ICM\_CTRL.

The URAT field in ICM\_UASR indicates the unspecified access type.

Value	Description
0	No undefined register access has been detected since the last SWRST.
1	At least one undefined register access has been detected since the last SWRST.

**Bits 23:20 – RSU[3:0]** Region Status Updated Detected

When RSU[i] is set, it indicates that a region status updated condition has been detected.

**Bits 19:16 – REC[3:0]** Region End Bit Condition Detected

When REC[i] is set, it indicates that an end bit condition has been detected.

**Bits 15:12 – RWC[3:0]** Region Wrap Condition Detected

When RWC[i] is set, it indicates that a wrap condition has been detected.

**Bits 11:8 – RBE[3:0]** Region Bus Error

When RBE[i] is set, it indicates that a bus error has been detected while hashing memory region i.

**Bits 7:4 – RDM[3:0]** Region Digest Mismatch

When RDM[i] is set, it indicates that there is a digest comparison mismatch between the hash value of the region with identifier i and the reference value located in the Hash Area.

**Bits 3:0 – RHC[3:0]** Region Hash Completed

When RHC[i] is set, it indicates that the ICM has completed the region with identifier i.

### 57.6.8 ICM Undefined Access Status Register

**Name:** ICM\_UASR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bits 2:0 – URAT[2:0] Undefined Register Access Trace

Only the first Undefined Register Access Trace is available through the URAT field.

The URAT field is only reset by the SWRST bit in the ICM\_CTRL register.

Value	Name	Description
0	UNSPEC_STRUCT_MEMBER	Unspecified structure member set to one detected when the descriptor is loaded.
1	ICM_CFG_MODIFIED	ICM_CFG modified during active monitoring.
2	ICM_DSCR_MODIFIED	ICM_DSCR modified during active monitoring.
3	ICM_HASH_MODIFIED	ICM_HASH modified during active monitoring
4	READ_ACCESS	Write-only register read access

### 57.6.9 ICM Descriptor Area Start Address Register

**Name:** ICM\_DSCR  
**Offset:** 0x30  
**Reset:** 0x00000000  
**Property:** Read/Write

	Bit	31	30	29	28	27	26	25	24
		DASA[25:18]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		DASA[17:10]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		DASA[9:2]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		DASA[1:0]							
Access		R/W	R/W						
Reset		0	0						

**Bits 31:6 – DASA[25:0]** Descriptor Area Start Address

The start address is a multiple of the total size of the data structure (64 bytes).

### 57.6.10 ICM Hash Area Start Address Register

**Name:** ICM\_HASH  
**Offset:** 0x34  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
HASA[24:17]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
HASA[16:9]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
HASA[8:1]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
HASA[0:0]								
Access	R/W							
Reset	0							

**Bits 31:7 – HASA[24:0]** Hash Area Start Address

This field points at the Hash memory location. The address must be a multiple of 128 bytes.

### 57.6.11 ICM User Initial Hash Value Register

**Name:** ICM\_UIHVALx  
**Offset:** 0x38 + x\*0x04 [x=0..7]  
**Reset:** –  
**Property:** Write-only

	Bit	31	30	29	28	27	26	25	24
		VAL[31:24]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		VAL[23:16]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		VAL[15:8]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		VAL[7:0]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	–

#### Bits 31:0 – VAL[31:0] Initial Hash Value

When ICM\_CFG.UIHASH is set, the Initial Hash Value is user-programmable.

To meet the desired standard, use the following example values.

For ICM\_UIHVAL0 field:

Example	Comment
0x67452301	SHA1 algorithm
0xC1059ED8	SHA224 algorithm
0x6A09E667	SHA256 algorithm

For ICM\_UIHVAL1 field:

Example	Comment
0xEFCDAB89	SHA1 algorithm
0x367CD507	SHA224 algorithm
0xBB67AE85	SHA256 algorithm

For ICM\_UIHVAL2 field:

# SAMA5D2 Series

## Integrity Check Monitor (ICM)

Example	Comment
0x98BADCFE	SHA1 algorithm
0x3070DD17	SHA224 algorithm
0x3C6EF372	SHA256 algorithm

For ICM\_UIHVAL3 field:

Example	Comment
0x10325476	SHA1 algorithm
0xF70E5939	SHA224 algorithm
0xA54FF53A	SHA256 algorithm

For ICM\_UIHVAL4 field:

Example	Comment
0xC3D2E1F0	SHA1 algorithm
0xFFC00B31	SHA224 algorithm
0x510E527F	SHA256 algorithm

For ICM\_UIHVAL5 field:

Example	Comment
0x68581511	SHA224 algorithm
0x9B05688C	SHA256 algorithm

For ICM\_UIHVAL6 field:

Example	Comment
0x64F98FA7	SHA224 algorithm
0x1F83D9AB	SHA256 algorithm

For ICM\_UIHVAL7 field:

Example	Comment
0xBEFA4FA4	SHA224 algorithm
0x5BE0CD19	SHA256 algorithm

Example of Initial Value for SHA-1 Algorithm

Register Address	Address Offset / Byte Lane			
	0x3 / 31:24	0x2 / 23:16	0x1 / 15:8	0x0 / 7:0

## 58. Advanced Encryption Standard Bridge (AESB)

### 58.1 Description

The Advanced Encryption Standard Bridge (AESB) is intended to provide on-the-fly off-chip memory encryption/decryption compliant with the American *FIPS (Federal Information Processing Standard) Publication 197* specification.

The AESB supports three confidentiality modes of operation for symmetrical key block cipher algorithms (ECB, CBC and CTR), as specified in the *NIST Special Publication 800-38A Recommendation*.

The AESB key is loaded by the software.

The 128-bit AESB key is stored in the AESB Key register made of four 32-bit write-only AESB Key Word registers (AESB\_KEYWR0–3).

The 128-bit input data and initialization vector (for some modes) are each stored in four 32-bit registers (AESB\_IDATARx and AESB\_IVRx) which are all write-only.

As soon as the initialization vector, the input data and the key are configured, the encryption/decryption process may be started. Then the encrypted/decrypted data will be ready to be read out on the four 32-bit output data registers (AESB\_ODATARx).

### 58.2 Embedded Characteristics

- On-The-Fly Off-Chip Memory Encryption/Decryption
- Compliant with FIPS Publication 197, Advanced Encryption Standard (AES)
- 128-bit Cryptographic Key
- On-The-Fly Encryption/Decryption
- 10 Clock Cycles Encryption/Decryption Inherent Processing Time
- Double Input Buffer Optimizes Runtime
- Support of the Three Standard Modes of Operation Specified in *NIST Special Publication 800-38A, Recommendation for Block Cipher Modes of Operation - Methods and Techniques*:
  - Electronic Code Book (ECB)
  - Cipher Block Chaining (CBC) including CBC-MAC
  - Counter (CTR)
- Last Output Data Mode Allows Optimized Message Authentication Code (MAC) Generation

### 58.3 Product Dependencies

#### 58.3.1 Power Management

The AESB may be clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the AESB clock.

#### 58.3.2 Interrupt

The AESB interface has an interrupt line connected to the Interrupt Controller.

Handling the AESB interrupt requires programming the Interrupt Controller before configuring the AESB.

## 58.4 Functional Description

The Advanced Encryption Standard Bridge (AESB) specifies a FIPS-approved cryptographic algorithm that can be used to protect electronic data. The AESB algorithm is a symmetric block cipher that can encrypt (encipher) and decrypt (decipher) information.

Encryption converts data to an unintelligible form called ciphertext. Decrypting the ciphertext converts the data back into its original form, called plaintext. CIPHER in the AESB Mode register (AESB\_MR) allows selection between the encryption and the decryption processes.

The AESB is capable of using cryptographic keys of 128 bits to encrypt and decrypt data in blocks of 128 bits. This 128-bit key is defined in the Key registers (AESB\_KEYWRx).

The input to the encryption processes of the CBC mode includes, in addition to the plaintext, a 128-bit data block called the initialization vector (IV), which must be set in the Initialization Vector Registers (AESB\_IVRx). The initialization vector is used in an initial step in the encryption of a message and in the corresponding decryption of the message. The Initialization Vector registers are also used by the CTR mode to set the counter value.

### 58.4.1 Operating Modes

The AESB supports the following modes of operation:

- ECB—Electronic Code Book
- CBC—Cipher Block Chaining
- CTR—Counter

The data pre-processing, post-processing and data chaining for the operating modes are performed automatically. Refer to *NIST Special Publication 800-38A Recommendation* for more complete information.

The modes are selected in AESB\_MR.OPMOD.

In CTR mode, the size of the block counter embedded in the module is 16 bits. Therefore, there is a rollover after processing 1 megabyte of data. If the file to be processed is greater than 1 megabyte, this file must be split into fragments of 1 megabyte or less for the first fragment if the initial value of the counter is greater than 0. Prior to loading the first fragment into AESB\_IDATARx registers, the AESB\_IVRx registers must be cleared. For any fragment, after the transfer is completed and prior to transferring the next fragment, AESB\_IVR0 must be programmed so that the fragment number (0 for the first fragment, 1 for the second one, and so on) is written in the 16 MSB of AESB\_IVR0.

If the initial value of the counter is greater than 0 and the data buffer size to be processed is greater than 1 megabyte, the size of the first fragment to be processed must be 1 megabyte minus 16x(initial value) to prevent a rollover of the internal 1-bit counter.

### 58.4.2 Double Input Buffer

The input data register can be double-buffered to reduce the runtime of large files.

This mode allows writing a new message block when the previous message block is being processed.

AESB\_MR.DUALBUFF must be set to '1' to access the double buffer.

### 58.4.3 Start Modes

AESB\_MR.SMOD allows selection of the Encryption or Decryption Start mode.

### 58.4.3.1 Manual Mode

The sequence is as follows:

1. Write AESB\_MR with all required fields, including but not limited to SMOD and OPMOD.
2. Write the 128-bit key in the Key registers (AESB\_KEYWRx).
3. Write the initialization vector (or counter) in the Initialization Vector registers (AESB\_IVRx).  
**Note:** The Initialization Vector registers concern all modes except ECB.
4. Set DATRDY (Data Ready) in the AESB Interrupt Enable register (AESB\_IER) depending on whether an interrupt is required, or not, at the end of processing.
5. Write the data to be encrypted/decrypted in the authorized Input Data registers (see the table below).

**Table 58-1. Authorized Input Data Registers**

Operating Mode	Input Data Registers to Write
ECB	All
CBC	All
CTR	All

6. Set the START bit in the AESB Control register (AESB\_CR) to begin the encryption or decryption process.
7. When processing is complete, DATRDY in the AESB Interrupt Status register (AESB\_ISR) rises. If an interrupt has been enabled by setting AESB\_IER.DATRDY, the interrupt line of the AESB is activated.
8. When the software reads one of the Output Data registers (AESB\_ODATARx), AESB\_ISR.DATRDY is automatically cleared.

### 58.4.3.2 Auto Mode

In Auto mode, as soon as the correct number of Input Data registers is written, processing starts automatically without any action in AESB\_CR.

### 58.4.4 Last Output Data Mode

Last Output Data mode is used to generate cryptographic checksums on data (MAC) by means of a cipher block chaining encryption algorithm (e.g., the CBC-MAC algorithm).

After each end of encryption/decryption, the output data are available on the output data registers for Manual and Auto modes.

AESB\_MR.LOD allows retrieval of only the last data of several encryption/decryption processes.

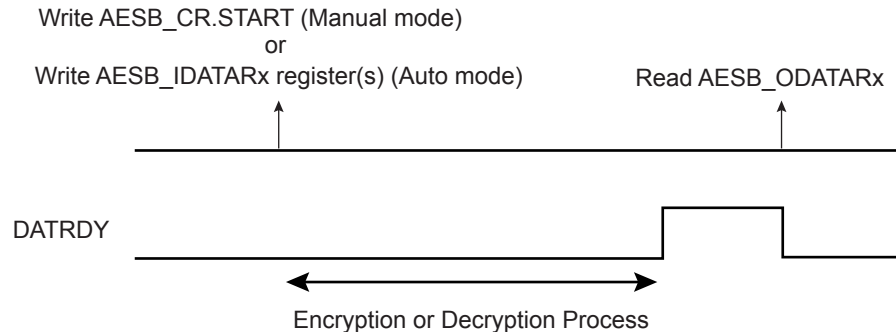

Those data are only available on the Output Data registers (AESB\_ODATARx).

### 58.4.5 Manual and Auto Modes

#### 58.4.5.1 If AESB\_MR.LOD = 0

AESB\_ISR.DATRDY is cleared when at least one of the Output Data registers is read (see the figure below).

**Figure 58-1. Manual and Auto Modes with AESB\_MR.LOD = 0**

If the user does not want to read the output data registers between each encryption/decryption, AESB\_ISR.DATRDY will not be cleared. If AESB\_ISR.DATRDY is not cleared, the user cannot know the end of the following encryptions/decryptions.

### 58.4.5.2 If AESB\_MR.LOD = 1

AESB\_ISR.DATRDY is cleared when at least one Input Data register is written, so before the start of a new transfer (see the figure below). No more Output Data register reads are necessary between consecutive encryptions/decryptions.

**Figure 58-2. Manual and Auto Modes with AESB\_MR.LOD = 1**

## 58.4.6 Automatic Bridge Mode

### 58.4.6.1 Description

The Automatic Bridge mode, when the AESB block is connected between the system bus and a DDR port and the QSPI, provides automatic encryption/decryption without any action on the part of the user. For Automatic Bridge mode, AESB\_MR.OPMOD must be configured to 0x4 (see [AESB Mode Register](#)). If AESB\_MR.AAHB is set and AESB\_MR.OPMOD = 0x4, there is no compliance with the standard CTR mode of operation.

In case of write transfer, this mode automatically encrypts the data before writing it to the final slave destination. In case of read transfer, this mode automatically decrypts the data read from the target slave before putting it on the system bus.

Therefore, this mode does not work if the automatically encrypted data is moved at another address outside of the AESB. This means that for a given data, the encrypted value is not the same if written at different addresses.

### 58.4.6.2 Configuration

The Automatic Bridge mode can be enabled by setting AESB\_MR.AAHB.

The IV (Initialization Vector) field of the AESB Initialization Vector register x (AESB\_IVRx) can be used to add a nonce in the encryption process in order to bring even more security (ignored if not filled). In this

case, any value encrypted with a given nonce can only be decrypted with this nonce. If another nonce is set for the AESB\_IVRx.IV, any value encrypted with the previous nonce can no longer be decrypted (see [AESB Initialization Vector Register x](#)).

Dual buffer usage (AESB\_MR.DUALBUFF='1') is recommended for improved performance.

### 58.4.7 Security Features

#### 58.4.7.1 Unspecified Register Access Detection

When an unspecified register access occurs, AESB\_ISR.URAD rises. Its source is then reported in AESB\_ISR.URAT. Only the last unspecified register access is available through the URAT field.

Several kinds of unspecified register accesses can occur:

- Input Data register written during the data processing when SMOD = IDATAR0\_START
- Output Data register read during data processing
- Mode register written during data processing
- Output Data register read during sub-keys generation
- Mode register written during sub-keys generation
- Write-only register read access

URAD and URAT can only be reset by AESB\_CR.SWRST.

### 58.5.1 AESB Control Register

**Name:** AESB\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

#### Bit 8 – SWRST Software Reset

Value	Description
0	No effect
1	Resets the AESB. A software triggered hardware reset of the AESB interface is performed.

#### Bit 0 – START Start Processing

Value	Description
0	No effect
1	Starts manual encryption/decryption process

# SAMA5D2 Series

## Advanced Encryption Standard Bridge (AESB)

### 58.5.2 AESB Mode Register

**Name:** AESB\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits 31-24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	CKEY[3:0]				[Greyed out bits 19-16]			
Access	W	W	W	W				
Reset	0	0	0	–				
Bit	15	14	13	12	11	10	9	8
	LOD	OPMOD[2:0]			[Greyed out bits 11-10]		SMOD[1:0]	
Access	R/W	R/W	R/W	R/W			R/W	R/W
Reset	0	0	0	0			0	0
Bit	7	6	5	4	3	2	1	0
	PROCDLY[3:0]				DUALBUFF	AAHB	[Greyed out bits 1-0]	
Access	R/W	R/W	R/W	R/W	R/W	R/W		
Reset	0	0	0	0	0	0		

#### Bits 23:20 – CKEY[3:0] Key

Value	Name	Description
0xE	PASSWD	Must be written with 0xE the first time that AESB_MR is programmed. For subsequent programming of the AESB_MR, any value can be written, including that of 0xE.  Always reads as 0.

#### Bit 15 – LOD Last Output Data Mode

Value	Description
0	No effect.  After each end of encryption/decryption, the output data will be available either on the output data registers (Manual and Auto modes).  In Manual and Auto modes, AESB_ISR.DATRDY is cleared when at least one of the Output Data registers is read.
1	AESB_ISR.DATRDY is cleared when at least one of the Input Data registers is written.  No additional Output Data register reads are necessary between consecutive encryptions/decryptions (see <a href="#">Last Output Data Mode</a> ).

# SAMA5D2 Series

## Advanced Encryption Standard Bridge (AESB)

### Bits 14:12 – OPMOD[2:0] Operating Mode

Values which are not listed in the table must be considered as “reserved”.

For CBC-MAC operating mode, configure OPMOD to 0x1 (CBC) and set LOD to 1.

If OPMOD is set to 4 and AAHB = 1, there is no compliance with the standard CTR mode of operation.

Value	Name	Description
0	ECB	Electronic Code Book mode
1	CBC	Cipher Block Chaining mode
2	–	Reserved
3	–	Reserved
4	CTR	Counter mode (16-bit internal counter)

### Bits 9:8 – SMOD[1:0] Start Mode

Value	Name	Description
0	MANUAL_START	Manual mode
1	AUTO_START	Auto mode
2	IDATAR0_START	AESB_IDATAR0 access only Auto mode

### Bits 7:4 – PROCDLY[3:0] Processing Delay

Processing Time = 12 × (PROCDLY + 1)

The Processing Time represents the number of clock cycles that the AESB needs in order to perform one encryption/decryption .

**Note:** The best performance is achieved with PROCDLY = 0.

### Bit 3 – DUALBUFF Dual Input Buffer

Value	Name	Description
0	INACTIVE	AESB_IDATARx cannot be written during processing of previous block.
1	ACTIVE	AESB_IDATARx can be written during processing of previous block when SMOD = 2. It speeds up the overall runtime of large files.

### Bit 2 – AAHB Automatic Bridge Mode

Value	Description
0	Automatic Bridge mode disabled.
1	Automatic Bridge mode enabled.

### Bit 0 – CIPHER Processing Mode

Value	Description
0	Decrypts data.
1	Encrypts data.

### 58.5.3 AESB Interrupt Enable Register

**Name:** AESB\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Mask

**Bit 0 – DATRDY** Data Ready Interrupt Mask

### 58.5.6 AESB Interrupt Status Register

**Name:** AESB\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

**Bits 15:12 – URAT[3:0]** Unspecified Register Access

Only the last Unspecified Register Access Type is available through URAT.

URAT field is reset only by AESB\_CR.SWRST.

Value	Name	Description
0x0	IDR_WR_PROCESSING	Input Data register written during the data processing when SMOD = 0x2 mode
0x1	ODR_RD_PROCESSING	Output Data register read during the data processing
0x2	MR_WR_PROCESSING	Mode register written during the data processing
0x3	ODR_RD_SUBKGEN	Output Data register read during the sub-keys generation
0x4	MR_WR_SUBKGEN	Mode register written during the sub-keys generation
0x5	WOR_RD_ACCESS	Write-only register read access

**Bit 8 – URAD** Unspecified Register Access Detection Status

URAD is reset only by AESB\_CR.SWRST.

Value	Description
0	No unspecified register access has been detected since the last SWRST.
1	At least one unspecified register access has been detected since the last SWRST.

# SAMA5D2 Series

## Advanced Encryption Standard Bridge (AESB)

---

---

### Bit 0 – DATRDY Data Ready

DATRDY is cleared when a Manual encryption/decryption occurs (AESB\_CR.START) or when a software triggered hardware reset of the AESB interface is performed (AESB\_CR.SWRST).

AESB\_MR.LOD = 0: In Manual and Auto modes, DATRDY can also be cleared when at least one of the Output Data registers is read.

AESB\_MR.LOD = 1: In Manual and Auto modes, DATRDY can also be cleared when at least one of the Input Data registers is written.

Value	Description
0	Output data not valid.
1	Encryption or decryption process is completed.

# SAMA5D2 Series

## Advanced Encryption Standard Bridge (AESB)

### 58.5.7 AESB Key Word Register x

**Name:** AESB\_KEYWRx  
**Offset:** 0x20 + x\*0x04 [x=0..3]  
**Reset:** –  
**Property:** Write-only

	Bit	31	30	29	28	27	26	25	24
		KEYW[31:24]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		KEYW[23:16]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		KEYW[15:8]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		KEYW[7:0]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	–

**Bits 31:0 – KEYW[31:0] Key Word**

The four 32-bit Key Word registers set the 128-bit cryptographic key used for encryption/decryption.

AESB\_KEYWR0 corresponds to the first word of the key, AESB\_KEYWR3 to the last one.

These registers are write-only to prevent the key from being read by another application.

# SAMA5D2 Series

## Advanced Encryption Standard Bridge (AESB)

### 58.5.8 AESB Input Data Register x

**Name:** AESB\_IDATARx  
**Offset:** 0x00 + x\*0x04 [x=0..3]  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	IDATA[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	IDATA[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	IDATA[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	IDATA[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	–

**Bits 31:0 – IDATA[31:0] Input Data Word**

The four 32-bit Input Data registers set the 128-bit data block used for encryption/decryption.

AESB\_IDATAR0 corresponds to the first word of the data to be encrypted/decrypted, AESB\_IDATAR3 to the last one.

These registers are write-only to prevent the input data from being read by another application.

# SAMA5D2 Series

## Advanced Encryption Standard Bridge (AESB)

### 58.5.9 AESB Output Data Register x

**Name:** AESB\_ODATARx  
**Offset:** 0x00 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read-only

	Bit	31	30	29	28	27	26	25	24
		ODATA[31:24]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		ODATA[23:16]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		ODATA[15:8]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		ODATA[7:0]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	–

**Bits 31:0 – ODATA[31:0] Output Data**

The four 32-bit Output Data registers contain the 128-bit data block that has been encrypted/decrypted.

AESB\_ODATAR0 corresponds to the first word, AESB\_ODATAR3 to the last one.

### 58.5.10 AESB Initialization Vector Register x

**Name:** AESB\_IVRx  
**Offset:** 0x00 + x\*0x04 [x=0..3]  
**Reset:** –  
**Property:** Write-only

	Bit	31	30	29	28	27	26	25	24
		IV[31:24]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		IV[23:16]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		IV[15:8]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		IV[7:0]							
Access		W	W	W	W	W	W	W	W
Reset		0	0	0	0	0	0	0	–

**Bits 31:0 – IV[31:0] Initialization Vector**

The four 32-bit Initialization Vector registers set the 128-bit Initialization Vector data block that is used by some modes of operation as an additional initial input.

AESB\_IVR0 corresponds to the first word of the Initialization Vector, AESB\_IVR3 to the last one.

These registers are write-only to prevent the Initialization Vector from being read by another application.

For CBC mode, the IV input value corresponds to the initialization vector.

For CTR mode, the IV input value corresponds to the initial counter value.

**Note:** These registers are not used in ECB mode and must not be written. For Automatic Bridge dedicated mode, the IV input value corresponds to the initial nonce.

## 59. Advanced Encryption Standard (AES)

### 59.1 Description

The Advanced Encryption Standard (AES) is compliant with the American FIPS (Federal Information Processing Standard) Publication 197 specification.

The AES supports the following confidentiality modes of operation for symmetrical key block cipher algorithms: ECB, CBC, OFB, CFB, CTR, and XTS), as specified in the NIST Special Publication 800-38A Recommendation, as well as Galois/Counter Mode (GCM) as specified in the NIST Special Publication 800-38D Recommendation. It is compatible with all these modes via DMA Controller channels, minimizing processor intervention for large buffer transfers.

The AES key is loaded by the software.

The 128-bit/192-bit/256-bit AES key is stored in the AES Key Register made of four/six/eight 32-bit write-only AES Key Word registers (AES\_KEYWR0–7).

The 128-bit input data and initialization vector (for some modes) are each stored in four 32-bit write-only AES Input Data registers (AES\_IDATAR0–3) and AES Initialization Vector registers (AES\_IVR0–3).

As soon as the initialization vector, the input data and the key are configured, the encryption/decryption process may be started. Then the encrypted/decrypted data are ready to be read out on the four 32-bit AES Output Data registers (AES\_ODATAR0–3) or through the DMA channels.

### 59.2 Embedded Characteristics

- Compliant with FIPS Publication 197, Advanced Encryption Standard (AES)
- 128-bit/192-bit/256-bit Cryptographic Key
- 10/12/14 Clock Cycles Encryption/Decryption Inherent Processing Time with a 128-bit/192-bit/256-bit Cryptographic Key
- Double Input Buffer Optimizes Runtime
- Automatic Padding supported for IPSEC and SSL standards
- IPSEC and SSL Protocol Layers Improved Performances (Tightly coupled with SHA)
- Support of the Modes of Operation Specified in the NIST Special Publication 800-38A and NIST Special Publication 800-38D:
  - Electronic Codebook (ECB)
  - Cipher Block Chaining (CBC) including CBC-MAC
  - Cipher Feedback (CFB)
  - Output Feedback (OFB)
  - Counter (CTR)
  - Galois/Counter Mode (GCM)
  - XEX-Based Tweaked-Codebook Mode (XTS)
- 8, 16, 32, 64 and 128-bit Data Sizes Possible in CFB Mode
- Last Output Data Mode Allows Optimized Message Authentication Code (MAC) Generation
- Connection to DMA Optimizes Data Transfers for all Operating Modes

## 59.3 Product Dependencies

### 59.3.1 Power Management

The AES is clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the AES clock.

### 59.3.2 Interrupt Sources

The AES interface has an interrupt line connected to the Interrupt Controller.

Handling the AES interrupt requires programming the Interrupt Controller before configuring the AES.

## 59.4 Functional Description

The Advanced Encryption Standard (AES) specifies a FIPS-approved cryptographic algorithm that can be used to protect electronic data. The AES algorithm is a symmetric block cipher that can encrypt (encipher) and decrypt (decipher) information.

Encryption converts data to an unintelligible form called ciphertext. Decrypting the ciphertext converts the data back into its original form, called plaintext. The CIPHER bit in the AES Mode register (AES\_MR) allows selection between the encryption and the decryption processes.

The AES is capable of using cryptographic keys of 128/192/256 bits to encrypt and decrypt data in blocks of 128 bits. This 128-bit/192-bit/256-bit key is defined in the user interface AES\_KEYWRx register.

The input to the encryption processes of the CBC, CFB, and OFB modes includes, in addition to the plaintext, a 128-bit data block called the initialization vector (IV), which must be set in AES\_IVRx. The initialization vector is used in an initial step in the encryption of a message and in the corresponding decryption of the message. AES\_IVRx are also used by the CTR mode to set the counter value.

### 59.4.1 AES Register Endianness

In ARM processor-based products, the system bus and processors manipulate data in little-endian form. The AES interface requires little-endian format words. However, in accordance with the protocol of the FIPS 197 specification, data is collected, processed and stored by the AES algorithm in big-endian form.

The following example illustrates how to configure the AES:

If the first 64 bits of a message (according to FIPS 197, i.e., big-endian format) to be processed is 0xcafedeca\_01234567, then AES\_IDATAR0 and AES\_IDATAR1 registers must be written with the following pattern:

- AES\_IDATAR0 = 0xcadefeca
- AES\_IDATAR1 = 0x67452301

### 59.4.2 Operating Modes

The AES supports the following modes of operation:

- ECB: Electronic Codebook
- CBC: Cipher Block Chaining
  - CBC-MAC: Useful for CMAC hardware acceleration
- OFB: Output Feedback
- CFB: Cipher Feedback

- CFB8 (CFB where the length of the data segment is 8 bits)
- CFB16 (CFB where the length of the data segment is 16 bits)
- CFB32 (CFB where the length of the data segment is 32 bits)
- CFB64 (CFB where the length of the data segment is 64 bits)
- CFB128 (CFB where the length of the data segment is 128 bits)
- CTR: Counter
- GCM: Galois/Counter Mode
- XTS: XEX-based Tweaked-codebook Mode

The data preprocessing, data postprocessing and data chaining for the concerned modes are performed automatically. Refer to the NIST Special Publication 800-38A and NIST Special Publication 800-38D for more complete information.

Mode selection is done by configuring the OPMOD field in AES\_MR.

In CFB mode, five data sizes are possible (8, 16, 32, 64 or 128 bits), configurable by means of AES\_MR.CFBS.

In CTR mode, the size of the block counter embedded in the module is 16 bits. Therefore, there is a rollover after processing 1 Mbyte of data. If the file to be processed is greater than 1 Mbyte, this file must be split into fragments of 1 Mbyte or less for the first fragment if the initial value of the counter is greater than 0. Prior to loading the first fragment into AES\_IDATARx, AES\_IVRx must be fully programmed with the initial counter value. For any fragment, after the transfer is completed and prior to transferring the next fragment, AES\_IVRx must be programmed with the appropriate counter value.

### **59.4.3 Last Output Data Mode (CBC-MAC)**

This mode is used to generate cryptographic checksums on data (MAC) by means of cipher block chaining encryption algorithm (CBC-MAC algorithm for example).

The CMAC algorithm is a variant of CBC-MAC with post-processing requiring one-block encryption in ECB mode. Thus CBC-MAC is useful to accelerate CMAC.

After each end of encryption/decryption, the output data are available either on AES\_ODATARx for Manual and Auto mode, or at the address specified in the receive buffer pointer for DMA mode (see the table "Last Output Data Mode Behavior versus Start Modes").

AES\_MR.LOD allows retrieval of only the last data of several encryption/decryption processes.

Therefore, there is no need to define a read buffer in DMA mode.

This data are only available in AES\_ODATARx.

#### **59.4.3.1 Manual and Auto Modes**

##### **59.4.3.1.1 If AES\_MR.LOD = 0**

The DATRDY flag is cleared when at least one AES\_ODATARx is read (see the figure below).

**Figure 59-1. Manual and Auto Modes with AES\_MR.LOD = 0**

If the user does not want to read AES\_ODATARx between each encryption/decryption, the DATRDY flag will not be cleared. If the DATRDY flag is not cleared, the user cannot know the end of the following encryptions/decryptions.

### 59.4.3.1.2 If AES\_MR.LOD = 1

This mode is optimized to process AES CBC-MAC operating mode.

The DATRDY flag is cleared when at least one AES\_IDATAR is written (see the figure below). No additional AES\_ODATAR reads are necessary between consecutive encryptions/decryptions.

**Figure 59-2. Manual and Auto Modes with AES\_MR.LOD = 1**

### 59.4.3.2 DMA Mode

#### 59.4.3.2.1 If AES\_MR.LOD = 0

This mode may be used for all AES operating modes except CBC-MAC where AES\_MR.LOD = 1 mode is recommended.

The end of the encryption/decryption is indicated by the end of DMA transfer associated to AES\_ODATARx (see the figure below). Two DMA channels are required: one for writing message blocks to AES\_IDATARx and one to obtain the result from AES\_ODATARx.

**Figure 59-3. DMA Transfer with AES\_MR.LOD = 0**

### 59.4.3.2.2 If AES\_MR.LOD = 1

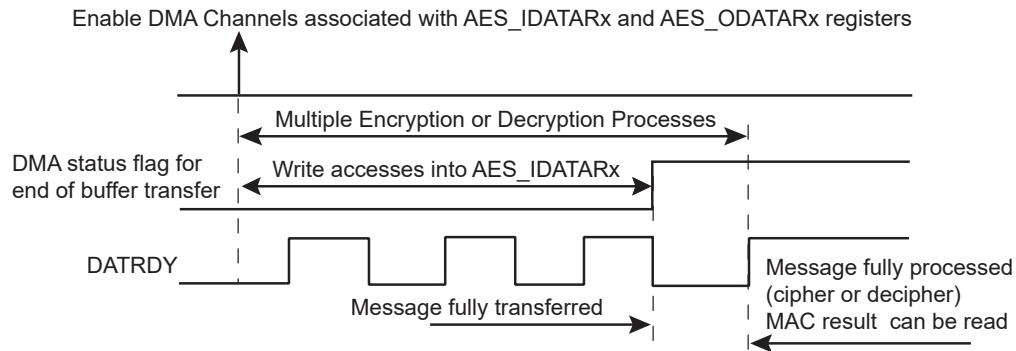

This mode is optimized to process AES CBC-MAC operating mode.

The user must first wait for the DMA buffer transfer complete flag, then for the flag DATRDY to rise to ensure that the encryption/decryption is completed (see the figure below).

The DMA receive channel must not be used. Prior to reading the CBC-MAC result, AES\_MR.SMOD must be written to '0'. To restart a CBC-MAC on a new buffer, AES\_MR.SMOD must be written to '2'.

The output data are only available on AES\_ODATARx.

**Figure 59-4. DMA Transfer with AES\_MR.LOD = 1**

The table below summarizes the different cases.

**Table 59-1. Last Output Data Mode Behavior versus Start Modes**

Sequence	Manual and Auto Modes		DMA Transfer	
	AES_MR.LOD = 0	AES_MR.LOD = 1	AES_MR.LOD = 0	AES_MR.LOD = 1
DATRDY Flag Clearing Condition <sup>(1)</sup>	At least one AES_ODATAR must be read	At least one AES_IDATAR must be written	Not used	Managed by the DMA
End of Encryption/Decryption Notification	DATRDY	DATRDY	2 DMA Buffer transfer complete flags (channel m and channel n)	DMA buffer transfer complete flag, then AES DATRDY flag
Encrypted/Decrypted Data Result Location	In AES_ODATARx	In AES_ODATARx	At the address specified in the Channel Buffer Transfer Descriptor	In AES_ODATARx

**Note:**

- Depending on the mode, there are other ways of clearing the DATRDY flag. See [AES Interrupt Status Register](#).

**WARNING** In DMA mode, reading AES\_ODATARx before the last data transfer may lead to unpredictable results.

**59.4.4 Galois/Counter Mode (GCM)**

**59.4.4.1 Description**

GCM comprises the AES engine in CTR mode along with a universal hash function (GHASH engine) that is defined over a binary Galois field to produce a message authentication tag (the AES CTR engine and the GHASH engine are depicted in the figure below).

The GHASH engine processes data packets after the AES operation. GCM assures the confidentiality of data through the AES Counter mode of operation for encryption. Authenticity of the confidential data is assured through the GHASH engine. GCM can also provide assurance of data that is not encrypted. Refer to the NIST Special Publication 800-38D for more complete information.

GCM can be used with or without the DMA master. Messages may be processed as a single complete packet of data or they may be broken into multiple packets of data over time.

GCM processing is computed on 128-bit input data fields. There is no support for unaligned data. The AES key length can be whatever length is supported by the AES module.

The recommended programming procedure when using DMAPDC is described in the section [GCM Processing](#).

**Figure 59-5. GCM Block Diagram**

Note: 1. Optional

#### 59.4.4.2 Key Writing and Automatic Hash Subkey Calculation

Whenever a new key is written to the hardware, two automatic actions are processed:

- GCM Hash Subkey  $H$  generation—The GCM hash subkey ( $H$ ) is automatically generated. The GCM hash subkey generation must be complete before doing any other action. AES\_ISR.DATRDY indicates when the subkey generation is complete (with interrupt if configured). The GCM hash subkey calculation is processed with the formula  $H = \text{CIPHER}(\text{Key}, <128 \text{ bits to zero}>)$ . The generated GCM  $H$  value is then available in AES\_GCMHRx. If the application software requires a specific hash subkey, the automatically generated  $H$  value can be overwritten in AES\_GCMHRx. AES\_GCMHRx can be written after the end of the hash subkey generation (see AES\_ISR.DATRDY) and prior to starting the input data feed.
- AES\_GHASHRx Clear—AES\_GHASHRx are automatically cleared. If a hash initial value is needed for the GHASH, it must be written to AES\_GHASHRx
  - after a write to the AES Key Register, if any
  - before starting the input data feed

#### 59.4.4.3 GCM Processing

GCM processing is made up of three phases:

1. Processing the Additional Authenticated Data (AAD), hash computation only.
2. Processing the Ciphertext (C), hash computation + ciphering/deciphering.
3. Generating the Tag using length of AAD, length of C and  $J_0$  (refer to NIST documentation for details).

The Tag generation can be done either automatically, after the end of AAD/C processing if AES\_MR.GTAGEN is set, or manually using AES\_GHASHRx.GHASH (see subsections [Processing a Complete Message with Tag Generation](#) and [Manual GCM Tag Generation](#) for details).

##### 59.4.4.3.1 Processing a Complete Message with Tag Generation

Use this procedure only if  $J_0$  four LSB bytes  $\neq 0xFFFFFFFF$ .

**Note:** If  $J_0$  four LSB bytes =  $0xFFFFFFFF$  or if the value is unknown, use the procedure described in [Processing a Complete Message without Tag Generation](#) followed by the procedure in [Manual GCM Tag Generation](#).

**Figure 59-6. Full Message Alignment**

To process a complete message with Tag generation, the sequence is as follows:

1. Set AES\_MR.OPMOD to GCM and AES\_MR.GTAGEN to '1'.
2. Set the AES Key Register and wait until AES\_ISR.DATRDY is set (GCM hash subkey generation complete); use interrupt if needed. See [Key Writing and Automatic Hash Subkey Calculation](#).
3. Calculate the  $J_0$  value as described in NIST documentation  $J_0 = \text{IV} \parallel 0^{31} \parallel 1$  when  $\text{len}(\text{IV}) = 96$  and  $J_0 = \text{GHASH}_H(\text{IV} \parallel 0^{s+64} \parallel [\text{len}(\text{IV})]64)$  if  $\text{len}(\text{IV}) \neq 96$ . See [Processing a Message with only AAD \(GHASHH\)](#) for  $J_0$  generation.
4. Set AES\_IVRx.IV with  $\text{inc32}(J_0)$  ( $J_0 + 1$  on 32 bits).
5. Configure AES\_AADLENR.AADLEN and AES\_CLENR.CLEN.

6. Fill AES\_IDATARx.IDATA with the message to process according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing AAD).
7. Wait for TAGRDY to be set (use interrupt if needed), then read AES\_TAGRx.TAG to obtain the authentication tag of the message.

#### 59.4.4.3.2 Processing a Complete Message without Tag Generation

Processing a message without generating the Tag can be used to customize the Tag generation, or to process a fragmented message. To manually generate the GCM Tag, see [Manual GCM Tag Generation](#).

To process a complete message without Tag generation, the sequence is as follows:

1. Set AES\_MR.OPMOD to GCM and AES\_MR.GTAGEN to '0'.
2. Set the AES Key Register and wait until AES\_ISR.DATRDY is set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES\_GCMHRx. See [Key Writing and Automatic Hash Subkey Calculation](#).
3. Calculate the  $J_0$  value as described in NIST documentation  $J_0 = IV \parallel 0^{31} \parallel 1$  when  $\text{len}(IV) = 96$  and  $J_0 = \text{GHASH}_H(IV \parallel 0^{s+64} \parallel [\text{len}(IV)]64)$  if  $\text{len}(IV) \neq 96$ . See [Processing a Message with only AAD \(GHASHH\)](#) for  $J_0$  generation example when  $\text{len}(IV) \neq 96$ .
4. Set AES\_IVRx.IV with  $\text{inc32}(J_0)$  ( $J_0 + 1$  on 32 bits).
5. Configure AES\_AADLENR.AADLEN and AES\_CLENR.CLEN.
6. Fill AES\_IDATARx.IDATA with the message to process according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing AAD).
7. Make sure the last output data have been read if AES\_CLENR.CLEN  $\neq 0$  (or wait for DATRDY), then read AES\_GHASHRx.GHASH to obtain the hash value after the last processed data.

#### 59.4.4.3.3 Processing a Fragmented Message without Tag Generation

If needed, a message can be processed by fragments, in such case automatic GCM Tag generation is not supported.

To process a message by fragments, the sequence is as follows:

- First fragment:
  1. Set AES\_MR.OPMOD to GCM and AES\_MR.GTAGEN to '0'.
  2. Set the AES Key Register and wait for AES\_ISR.DATRDY to be set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES\_GCMHRx. See [Key Writing and Automatic Hash Subkey Calculation](#).
  3. Calculate the  $J_0$  value as described in NIST documentation  $J_0 = IV \parallel 0^{31} \parallel 1$  when  $\text{len}(IV) = 96$  and  $J_0 = \text{GHASH}_H(IV \parallel 0^{s+64} \parallel [\text{len}(IV)]64)$  if  $\text{len}(IV) \neq 96$ . See [Processing a Message with only AAD \(GHASHH\)](#) for  $J_0$  generation example when  $\text{len}(IV) \neq 96$ .
  4. Set AES\_IVRx.IV with  $\text{inc32}(J_0)$  ( $J_0 + 1$  on 32 bits).
  5. Configure AES\_AADLENR.AADLEN and AES\_CLENR.CLEN according to the length of the first fragment, or set the fields with the full message length (both configurations work).
  6. Fill AES\_IDATARx.IDATA with the first fragment of the message to process (aligned on 16-byte boundary) according to the SMOD configuration used. If Manual Mode or Auto Mode is used the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing AAD).

7. Make sure the last output data have been read if the fragment ends in C phase (or wait for DATRDY if the fragment ends in AAD phase), then read AES\_GHASHRx.GHASH to obtain the value of the hash after the last processed data and finally read AES\_CTR.CTR to obtain the value of the CTR encryption counter (not needed when the fragment ends in AAD phase).
- Next fragment (or last fragment):
1. Set AES\_MR.OPMOD to GCM and AES\_MR.GTAGEN to '0'.
  2. Set the AES Key Register and wait until AES\_ISR.DATRDY is set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES\_GCMHRx. See [Key Writing and Automatic Hash Subkey Calculation](#).
  3. Set AES\_IVRx.IV as follows:
    - If the first block of the fragment is a block of Additional Authenticated data, set AES\_IVRx.IV with the  $J_0$  initial value
    - If the first block of the fragment is a block of Plaintext data, set AES\_IVRx.IV with a value constructed as follows: 'LSB96( $J_0$ ) || CTR' value, (96 bit LSB of  $J_0$  concatenated with saved CTR value from previous fragment).
  4. Configure AES\_AADLENR.AADLEN and AES\_CLENR.CLEN according to the length of the current fragment, or set the fields with the remaining message length, both configurations work.
  5. Fill AES\_GHASHRx.GHASH with the value stored after the previous fragment.
  6. Fill AES\_IDATARx.IDATA with the current fragment of the message to process (aligned on 16 byte boundary) according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing AAD).
  7. Make sure the last output data have been read if the fragment ends in C phase (or wait for DATRDY if the fragment ends in AAD phase), then read AES\_GHASHRx.GHASH to obtain the value of the hash after the last processed data and finally read AES\_CTR.CTR to obtain the value of the CTR encryption counter (not needed when the fragment ends in AAD phase).

**Note:** Step 1 and 2 are required only if the value of the concerned registers has been modified.

Once the last fragment has been processed, the GHASH value will allow manual generation of the GCM tag. See [Manual GCM Tag Generation](#).

#### 59.4.4.3.4 Manual GCM Tag Generation

This section describes the last steps of the GCM Tag generation.

The Manual GCM Tag Generation is used to complete the GCM Tag Generation when the message has been processed without Tag Generation.

**Note:** The Message Processing without Tag Generation must be finished before processing the Manual GCM Tag Generation.

To generate a GCM Tag manually, the sequence is as follows:

Processing  $S = \text{GHASH}_H(\text{AAD} \parallel 0v \parallel C \parallel 0u \parallel [\text{len}(\text{AAD})]64 \parallel [\text{len}(C)]64)$ :

1. Set AES\_MR.OPMOD to GCM and AES\_MR.GTAGEN to '0'.
2. Set the AES Key Register and wait for AES\_ISR.DATRDY to be set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES\_GCMHRx. See [Key Writing and Automatic Hash Subkey Calculation](#).

3. Configure AES\_AADLENR.AADLEN to 0x10 (16 bytes) and AES\_CLENR.CLEN to '0'. This will allow running a single GHASH<sub>H</sub> on a 16-byte input data (see the figure below).
4. Fill AES\_GHASHRx.GHASH with the state of the GHASH field stored at the end of the message processing.
5. Fill AES\_IDATARx.IDATA according to the SMOD configuration used with 'len(AAD)64 || len(C)64' value as described in the NIST documentation and wait for DATRDY to be set; use interrupt if needed.
6. Read AES\_GHASHRx.GHASH to obtain the current value of the hash.

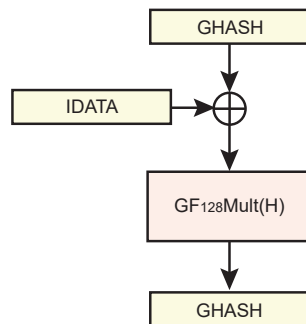

Processing  $T = \text{GCTRK}(J_0, S)$ :

1. Set AES\_MR.OPMOD to CTR.
2. Set AES\_IVRx.IV with ' $J_0$ ' value.
3. Fill AES\_IDATARx.IDATA with the GHASH value read at step 6 and wait for DATRDY to be set (use interrupt if needed).
4. Read AES\_ODATARx.ODATA to obtain the GCM Tag value.

**Note:** Step 4 is optional if the GHASH field is to be filled with value '0' (0 length packet for instance).

#### 59.4.4.3.5 Processing a Message with only AAD (GHASHH)

**Figure 59-7. Single GHASH<sub>H</sub> Block Diagram (AADLEN ≤ 0x10 and CLEN = 0)**

It is possible to process a message with only AAD setting the CLEN field to '0' in AES\_CLENR, this can be used for  $J_0$  generation when  $\text{len}(IV) \neq 96$  for instance.

Example: Processing  $J_0$  when  $\text{len}(IV) \neq 96$

To process  $J_0 = \text{GHASH}_H(IV || 0^{s+64} || [\text{len}(IV)]64)$ , the sequence is as follows:

1. Set AES\_MR.OPMOD to GCM and AES\_MR.GTAGEN to '0'.
  1. Set the AES Key Register and wait until AES\_ISR.DATRDY is set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES\_GCMHRx. See [Key Writing and Automatic Hash Subkey Calculation](#).
  2. Configure AES\_AADLENR.AADLEN with ' $\text{len}(IV || 0^{s+64} || [\text{len}(IV)]64)$ ' in and AES\_CLENR.CLEN to '0'. This will allow running a GHASH<sub>H</sub> only.
  3. Fill AES\_IDATARx.IDATA with the message to process ( $IV || 0^{s+64} || [\text{len}(IV)]64$ ) according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when a GHASH<sub>H</sub> step is over (use interrupt if needed).
  4. Read AES\_GHASHRx.GHASH to obtain the  $J_0$  value.
 

**Note:** The GHASH value can be overwritten at any time by writing the value of AES\_GHASHRx.GHASH, used to perform a GHASH<sub>H</sub> with an initial value for GHASH (write GHASH field between step 3 and step 4 in this case).

### 59.4.4.3.6 Processing a Single GF128 Multiplication

The AES can also be used to process a single multiplication in the Galois field on 128 bits ( $GF_{128}$ ) using a single  $GHASH_H$  with custom  $H$  value (see the figure above).

To run a  $GF_{128}$  multiplication ( $A \times B$ ), the sequence is as follows:

1. Set AES\_MR.OPMOD to GCM and AES\_MR.GTAGEN to '0'.
  1. Configure AES\_AADLENR.AADLEN with 0x10 (16 bytes) and AES\_CLENR.CLEN to '0'. This will allow running a single  $GHASH_H$ .
  2. Fill AES\_GCMHRx.H with B value.
  3. Fill AES\_IDATARx.IDATA with the A value according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when a  $GHASH_H$  computation is over (use interrupt if needed).
  4. Read AES\_GHASHRx.GHASH to obtain the result.

**Note:** AES\_GHASHRx.GHASH can be initialized with a value C between step 3 and step 4 to run a  $((A \text{ XOR } C) \times B)$   $GF_{128}$  multiplication.

### 59.4.5 XEX-based Tweaked-codebook Mode (XTS)

XTS mode comprises the AES engine with XOR on inputs and outputs. After each encryption/decryption, the value used for the XOR is multiplied by the first  $GF(2^{128})$  alpha primitive (0x2) and then used for the next encryption/decryption. The XTS mode uses two different keys and defines a Tweak Value (i) as additional input.

XTS processing is computed on 128-bit input data fields. There is no support for unaligned data (padding must be done manually if needed). The AES key length can be any length supported by the AES module.

**Figure 59-8. XTS Block Diagram**

#### 59.4.5.1 XTS Processing Procedure

XTS processing comprises two phases:

1. Generate encrypted tweak with Key2 (this step is only required for the first processing, further consecutive processing does not require this step).
2. Process the data giving encrypted tweak and first alpha primitive for the first encryption/decryption.

##### 59.4.5.1.1 Encrypted Tweak Generation

In the case of a new encryption/decryption, it is necessary to first encrypt the Tweak Value (i) with Key2. Here are the steps to follow to perform this step:

1. Set AES\_MR.OPMODE to ECB and AES\_MR.CIPHER to '1'.
2. Set the AES Key Register with Key2.
3. Fill AES\_IDATARx.IDATA with the Tweak value (i) according to the SMOD configuration used. If Manual mode or Auto mode is used, the DATRDY bit indicates when the data have been processed and can be read in AES\_ODATARx.

##### 59.4.5.1.2 Data Processing

To process data using XTS mode, follow the steps below:

1. Set AES\_MR.OPMODE to XTS.
2. Set the AES Key Register with Key1.
3. Only if the data to process is the first to be processed in the data unit, or if the data block to process is not consecutive to the previous processed data block in the same data unit, then two additional mandatory steps are required:
  - a. AES\_TWRx must be written with the encrypted Tweak Value (see [Encrypted Tweak Generation](#) for details) with bytes swapped as described in [AES Register Endianness](#).
  - b. Write AES\_ALPHARx with the alpha primitive corresponding to the block number in the data unit.
4. Fill AES\_IDATARx.IDATA with the data to process according to the SMOD configuration used. If Manual mode or Auto mode is used, the DATRDY bit indicates when the data have been processed and can be read in AES\_ODATARx. Repeat Step 4 as long as consecutive data blocks are processed in the same data unit.

#### 59.4.6 Double Input Buffer

AES\_IDATARx can be double-buffered to reduce the runtime of large files.

This mode allows a new message block to be written when the previous message block is being processed. This is only possible when DMA accesses are performed (AES\_MR.SMODO = 2).

AES\_MR.DUALBUFF must be set to '1' to access the double buffer.

#### 59.4.7 Start Modes

AES\_MR.SMODO allows selection of the encryption (or decryption) Start mode.

##### 59.4.7.1 Manual Mode

The sequence of actions is as follows:

1. Write AES\_MR with all required fields, including but not limited to SMODO and OPMODO.
2. Write the 128-bit/192-bit/256-bit AES key in AES\_KEYWRx.
3. Write the initialization vector (or counter) in AES\_IVRx.  
Note: AES\_IVRx concerns all modes except ECB.
4. Set the bit DATRDY (Data Ready) in the AES Interrupt Enable register (AES\_IER), depending on whether an interrupt is required or not at the end of processing.

5. Write the data to be encrypted/decrypted in the authorized AES\_IDATARx (see the table below).
6. Set the START bit in the AES Control register (AES\_CR) to begin the encryption or the decryption process.
7. When processing completes, the DATRDY flag in the AES Interrupt Status register (AES\_ISR) is raised. If an interrupt has been enabled by setting AES\_IER.DATRDY, the interrupt line of the AES is activated.
8. When software reads one of AES\_ODATARx, AES\_IER.DATRDY is automatically cleared.

**Table 59-2. Authorized Input Data Registers**

Operating Mode	Input Data Registers to Write
ECB	All
CBC	All
OFB	All
128-bit CFB	All
64-bit CFB	AES_IDATAR0 and AES_IDATAR1
32-bit CFB	AES_IDATAR0
16-bit CFB	AES_IDATAR0
8-bit CFB	AES_IDATAR0
CTR	All
GCM	All
XTS	All

**Note:**

1. In 64-bit CFB mode, writing to AES\_IDATAR2 and AES\_IDATAR3 is not allowed and may lead to errors in processing.
2. In 32, 16, and 8-bit CFB modes, writing to AES\_IDATAR1, AES\_IDATAR2 and AES\_IDATAR3 is not allowed and may lead to errors in processing.

### 59.4.7.2 Auto Mode

The Auto Mode is similar to the manual one, except that in this mode, as soon as the correct number of AES\_IDATARx is written, processing is automatically started without any action in AES\_CR.

### 59.4.7.3 DMA Mode

The DMA Controller can be used in association with the AES to perform an encryption/decryption of a buffer without any action by software during processing.

AES\_MR.SMOD must be configured to 2 and the DMA must be configured with non-incremental addresses.

For all operating modes except CBC-MAC (AES\_MR.LOD=1), 2 DMA channels must be programmed (transmit and receive). In CBC-MAC, only 1 transmit channel must be programmed.

The start address of any transfer descriptor must be configured with the address of AES\_IDATAR0.

The DMA chunk size configuration depends on the AES mode of operation and is listed in the table below.

When writing data to AES with a first DMA channel, data are first fetched from a memory buffer (source data). It is recommended to configure the size of source data to “words” even for CFB modes. On the contrary, the destination data size depends on the mode of operation. When reading data from the AES with the second DMA channel, the source data is the data read from AES and data destination is the memory buffer. In this case, the source data size depends on the AES mode of operation and is listed in the table below.

**Table 59-3. DMA Data Transfer Type for the Different Operating Modes**

Operating Mode	Chunk Size	Destination/Source Data Transfer Type
ECB	4	Word
CBC	4	Word
OFB	4	Word
CFB 128-bit	4	Word
CFB 64-bit	1	Word
CFB 32-bit	1	Word
CFB 16-bit	1	Half-word
CFB 8-bit	1	Byte
CTR	4	Word
GCM	4	Word
XTS	4	Word

### 59.4.8 Automatic Padding Mode

When Automatic Padding mode is configured, the message is automatically padded after the last block is written. Depending on the size of the message, either a padding is performed after the last part of the message and padding blocks are added, or only padding blocks are added.

IPSEC and SSL padding standards are both supported.

The auto padding feature only supports CBC and CTR modes.

**Note:** When automatic padding is enabled and AES\_MR.SMOD=2, AES\_MR.DUALBUFF must be cleared.

#### 59.4.8.1 IPSEC Padding

Automatic Padding is enabled by writing a ‘1’ to the APEN bit in the AES Extended Mode register (AES\_EMR).IPSEC padding mode is selected by writing a ‘0’ to AES\_EMR.APM.

**Figure 59-9. IPSEC Padding**

Each byte of the padding area contains incremental integer values.

The “Pad Length” in bytes is configured in AES\_EMR.PADLEN and the “Next Header” value is configured in AES\_EMR.NHEAD. AES\_EMR.PADLEN must be configured with the length of the padding section, not including the length of the “Pad Length” and “Next Header” sections.

The BCNT field in the AES Byte Counter register (AES\_BCNT) defines the length, in bytes, of the message to process. It must be configured before writing the first data in AES\_IDATARx and the remaining bytes to process can be read at any time (BCNT value is decremented after each AES\_IDATARx access).

AES\_BCNT.BCNT and AES\_EMR.PADLEN must be configured so that the sum of the length of the message (Payload Data) and of the length of the Padding, Pad Length (1 byte) and Next Header (1 byte) sections is a multiple of the AES block size (128 bits).

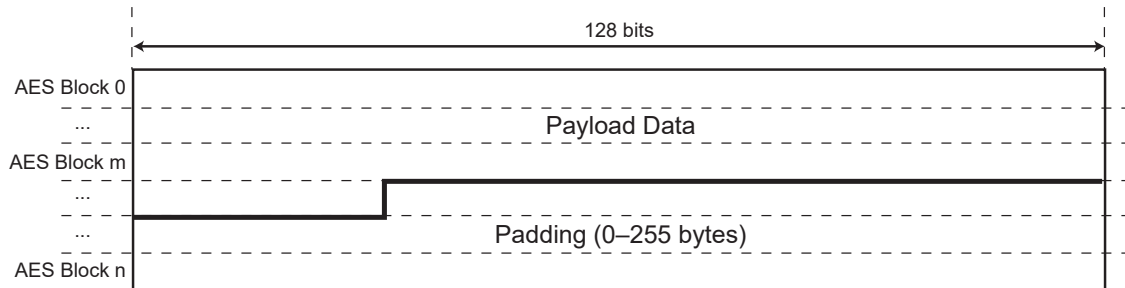

To process an IPSEC message using auto-padding, the sequence is as follows:

1. Set AES\_MR.OPMOD to either CBC or CTR mode.
2. Set AES\_EMR.APEN to ‘1’, AES\_EMR.APM to ‘0’, AES\_EMR.PADLEN to the desired padding length in byte and AES\_EMR.NHEAD to the desired Next Header field value.
3. Configure AES\_BCNT.BCNT with the whole message length, without padding, in byte.
4. Set the AES Key Register.
5. Set AES\_IVRx.IV if needed.
6. Fill AES\_IDATARx.IDATA with the message to process according to the SMOD configuration used. On the last data block, write only what is necessary (e.g., write only AES\_IDATAR0 if last block size is  $\leq 32$  bits).
7. Wait for the DATRDY flag to be raised, meaning auto-padding completion and last block processing.

#### 59.4.8.2 SSL Padding

Auto Padding is enabled by writing a ‘1’ to AES\_EMR.APEN and SSL padding mode is selected by writing a ‘1’ to AES\_EMR.APM.

**Figure 59-10. SSL Padding**

Each byte of the padding area contains the padding length.

The padding length is configured in AES\_EMR.PADLEN.

AES\_BCNT.BCNT defines the length, in bytes, of the message to process. It must be configured before writing the first data in AES\_IDATARx and the remaining bytes to process can be read at anytime (BCNT value is decremented after each AES\_IDATARx access).

AES\_BCNT.BCNT and AES\_EMR.PADLEN must be configured so that the length of the message plus the length of the padding section is a multiple of the AES block size (128 bits).

To process a complete SSL message, the sequence is as follows:

1. Set AES\_MR.OPMOD to either CBC or CTR mode.
2. Set AES\_EMR.APEN to '1', AES\_EMR.APM to '1', AES\_EMR.PADLEN to the desired padding length in bytes.
3. Set AES\_BCNT.BCNT with the whole message length, without padding, in bytes.
4. Set the AES Key Register.
5. Set AES\_IVRx.IV if needed.
6. Fill AES\_IDATARx.IDATA with the message to process according to the SMOD configuration used. On the last data block write only what is necessary (e.g., write only AES\_IDATAR0 if last block size is  $\leq 32$  bits).
7. Wait for the DATRDY flag to be raised, meaning auto-padding completion and last block processing.

#### 59.4.8.3 Flags

AES\_ISR.EOPAD rises as soon as the automatic padding phase is over, meaning that all the extra padding blocks have been processed. Reading AES\_ISR clears this flag.

AES\_ISR.PLENERR indicates an error in the frame configuration, meaning that the whole message length including padding does not respect the standard selected. AES\_ISR.PLENERR rises at the end of the frame in case of wrong message length and is cleared reading AES\_ISR.

In IPSEC/SSL standard message length including padding must be a multiple of the AES block size when CBC mode is used and multiple of 32-bit if CTR mode is used.

#### 59.4.9 Secure Protocol Layers Improved Performances

Secure protocol layers such as IPsec require encryption and authentication. For IPsec, the authentication is based on HMAC, thus SHA is required. To optimize performance, the AES embeds a mode of operation that enables the SHA module to process the input or output data of the AES module. If this mode is enabled, write access is required only into AES\_IDATARx registers, since SHA input data registers are automatically written by AES without software intervention. When the DMA is configured to transfer a buffer of data (input frame), only one transfer descriptor is required for both authentication and

encryption/decryption processes and only one buffer is transferred through the system bus (reducing the load of the system bus).

Improved performance for secure protocol layers requires AES\_EMR.PLIPEN to be set.

**Figure 59-11. Secure Protocol Layers Improved Performances Block Diagram**

### 59.4.9.1 Cipher Mode

When AES\_EMR.PLIPD is cleared and AES\_EMR.PLIPEN=1, the message written into AES\_IDATARx is first encrypted with the AES module and the encrypted message is authenticated with the SHA module. Therefore, when AES\_EMR.PLIPD is cleared, AES\_ODATARx are selected and sent to SHA\_IDATARx as soon as AES\_ODATARx are read. A read access in AES corresponds to a write access to the corresponding SHA\_IDATARx. The number of SHA\_IDATARx is greater than the number of AES\_ODATARx, but the SHA module embeds the decoding logic to automatically dispatch AES\_ODATARx values into the corresponding SHA\_IDATARx without software intervention.

### 59.4.9.2 Decipher Mode

When AES\_EMR.PLIPD is written to '1' and AES\_EMR.PLIPEN=1, the message written into AES\_IDATARx is decrypted with the AES module and also sent to SHA for authentication. Therefore, when AES\_EMR.PLIPD=1, AES\_IDATARx are selected and sent to SHA\_IDATARx as soon as AES\_IDATARx are written. A write access in AES corresponds to a write access to the corresponding SHA\_IDATARx. The number of SHA\_IDATARx is greater than the number of AES\_ODATARx, but the SHA module embeds the decoding logic to automatically dispatch AES\_IDATARx values into the corresponding SHA\_IDATARx without software intervention.

### 59.4.9.3 Encapsulating Security Payload (ESP) IPsec Examples

The following examples describe how to configure AES and SHA to optimize processing an ESP IPsec frame for maximum performance.

The cipher (or decipher) of an ESP IPsec frame requires both encryption (or decryption) and authentication.

For cipher, the input frame located in the system memory must first be padded and the resulting buffer encrypted. The encrypted frame must be written back to the system memory and sent to the authentication module.

When the AES module is configured to improve the performance of the secure protocol layers (AES\_EMR.PLIPEN = 1), the data transfers are simplified, limiting the bandwidth requirements on the system bus.

Before configuring the DMA to start the transfer of the data buffer (input frame) to the AES, the following actions must be taken in registers:

- AES\_BCNT.BCNT must be configured with the length of the message (Input Frame).
- The padding length of the AES must be configured in AES\_EMR.PADLEN. See [Automatic Padding Mode](#) for details.
- The next header value must be configured in AES\_EMR.NHEAD.
- AES\_MR.SMOD and SHA\_MR.SMOD must be configured to 2.  
**Note:** When automatic padding is enabled and AES\_MR.SMOD = 2, AES\_MR.DUALBUFF must be cleared.
- The SHA\_MSR.MSGSIZE must be configured with the length of the authentication message including the optional extended sequence number (ESN) and header and trailer information required by the authentication algorithm used (HMAC, etc.). Refer to the section “Secure Hash Algorithm (SHA)” for more details on configurations for optimized processing of the header information.
- The Security Parameter Index (SPI, sequence number (SEQ#)) and the optional Initialization Vector (IV) must be configured sequentially in SHA\_IDATAR0.
- A first DMA transfer descriptor must be configured to transfer the input frame from the system memory to the AES input data registers (AES\_IDATARx), and a second DMA descriptor must be configured to transfer the encrypted frame from AES to the system memory.  
**Note:** If AES\_EMR.PLIPEN = 1, there is no need to define a transfer descriptor to load the encrypted frame into the SHA input data registers because the transfer is automatically performed while the second descriptor transfer is in progress.

See the figures below.

**Figure 59-12. Generation of an ESP IPsec Frame without ESN**

If the optional extended sequence number is required for authentication, wait for the AES-to-system memory DMA buffer transfer to complete before configuring the ESN value. The ESN value must be configured in the SHA by writing sequentially each 32-bit word of the ESN into the SHA\_IDATAR0 register. Wait for SHA\_ISR.WRDY=1 before each write in the SHA\_IDATAR0 register. See the figure below.

**Figure 59-13. Generation of an ESP IPsec Frame with ESN**

To decipher an ESP IPsec frame without the optional ESN trailer information, two DMA channels are required and the SHA must be configured in Automatic padding mode.

**Note:** AES automatic padding must be disabled when deciphering a frame.

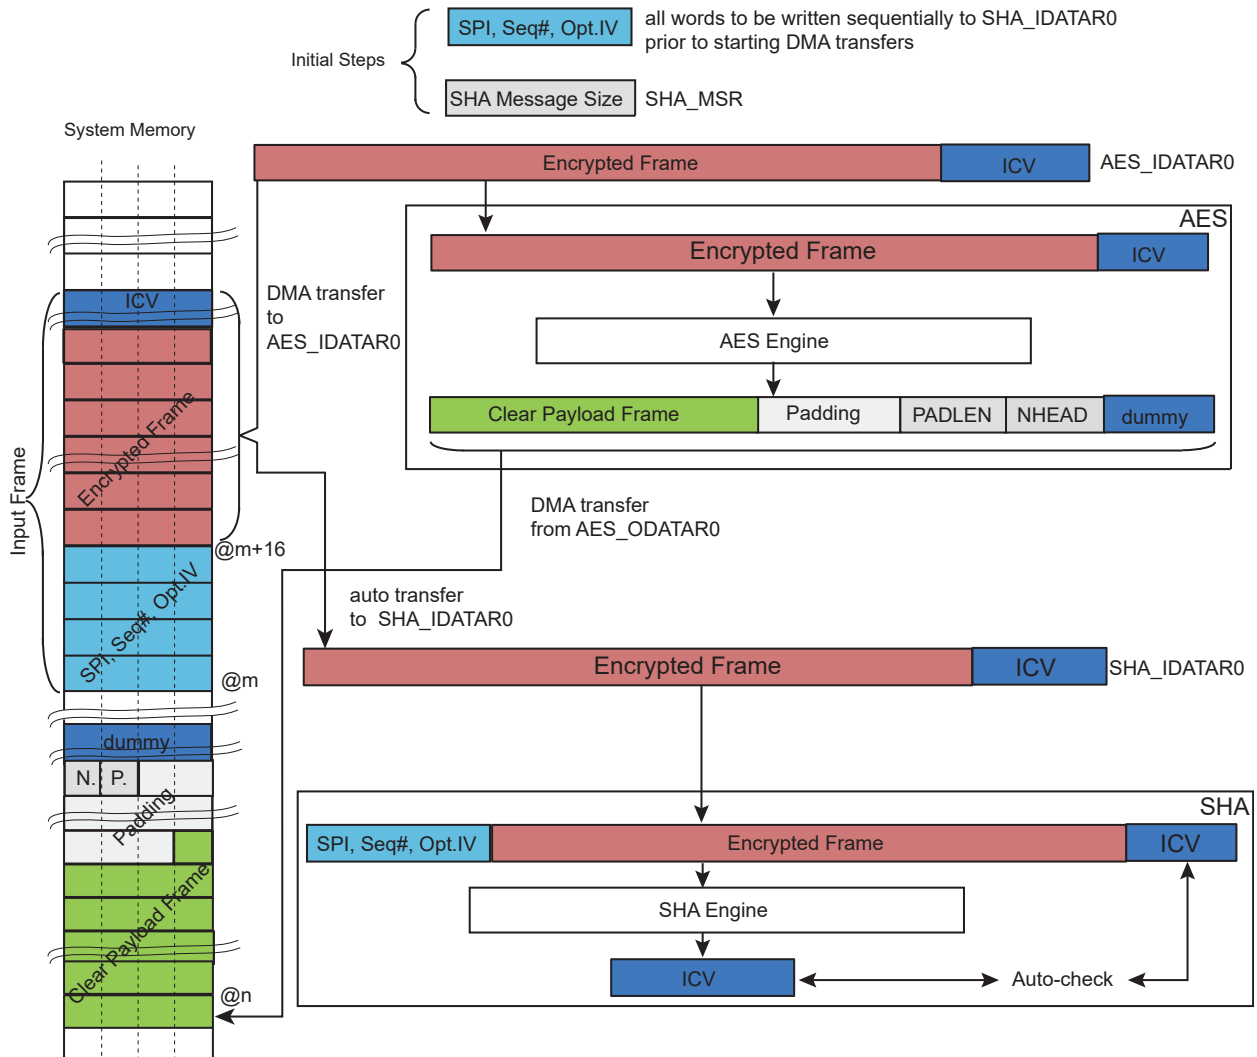

- A first DMA transfer descriptor must be configured to load the received encrypted frame from the system memory to AES\_IDATARx for decryption. The start address of the first transfer descriptor must be defined after the SPI, SEQ#, and optional IV (see the figure below).
- A second DMA descriptor must be configured to transfer the decrypted frame from AES\_ODATARx to the system memory.
- AES\_EMR.PLIPEN and AES\_EMR.PLIPD must be written to '1' so that the data buffer is written in AES\_IDATARx and in SHA\_IDATARx.

The SHA has the capability to perform an automatic check with an expected integrity check value if this value is appended at the end of the frame buffer (SHA\_MR.CHECK=2). Thus, if the first transfer

descriptor includes the ICV for SHA, the first DMA transfer allows the decryption and authentication processes including the automatic check. The decrypted part resulting from ICV is not required for downstream processing and must be considered as dummy data.

The end of the decryption and authentication processes occur when flag `SHA_ISR.CHECKF=1`. The authentication status is provided by `SHA_ISR.CHKST`.

**Figure 59-14. Decryption of an ESP IP Sec Frame without ESN**

If the optional ESN trailer information is part of the ICV (see the figure below), the ESN must be manually written into `SHA_IDATAR0`. The ESN value must be written after completion of the system memory-to-AES DMA buffer transfer. The ESN value must be configured in the SHA by writing sequentially each 32-bit word of the ESN into the `SHA_IDATAR0` register. Wait for `SHA_ISR.WRDY=1` before each write in the `SHA_IDATAR0` register.

When the optional ESN trailer information is part of the ICV, it is not possible to include the ICV received in the input frame to the first transfer descriptor. Moreover, if the HMAC algorithm is used for authentication, no automatic check can be performed when optimizing the processing performances of the SHA module. For more details, refer to the section "Secure Hash Algorithm (SHA)". The result of the HMAC read in the `SHA_IODATARx` must be manually compared with the ICV value of the input frame.

The comparison must be performed after the end of the authentication process. The authentication process is completed when the SHA\_ISR.DATRDY flag is set.

**Figure 59-15. Decryption of an ESP IPsec Frame with ESN**

### 59.4.10 Security Features

#### 59.4.10.1 Unspecified Register Access Detection

When an unspecified register access occurs, AES\_ISR.URAD is raised. Its source is then reported in AES\_ISR.URAT. Only the last unspecified register access is available through the AES\_ISR.URAT.

Several kinds of unspecified register accesses can occur:

- Input Data register written during the data processing when SMOD = IDATAR0\_START
- Output Data register read during data processing
- Mode register written during data processing
- Output Data register read during sub-keys generation
- Mode register written during sub-keys generation

- Write-only register read access

AES\_ISR.URAD and AES\_ISR.URAT can only be reset by AES\_CR.SWRST.

### 59.5.1 AES Control Register

**Name:** AES\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

#### Bit 8 – SWRST Software Reset

Value	Description
0	No effect.
1	Resets the AES. A software-triggered hardware reset of the AES interface is performed.

### 59.5.2 AES Mode Register

**Name:** AES\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	[Greyed out register bits]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	CKEY[3:0]				[Greyed out]	CFBS[2:0]		
Access	W	W	W	W		R/W	R/W	R/W
Reset	0	0	0	–		0	0	0
Bit	15	14	13	12	11	10	9	8
	LOD	OPMOD[2:0]			KEYSIZE[1:0]		SMOD[1:0]	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	PROCDLY[3:0]				DUALBUFF	[Greyed out]	GTAGEN	CIPHER
Access	R/W	R/W	R/W	R/W	R/W		R/W	R/W
Reset	0	0	0	0	0		0	0

#### Bits 23:20 – CKEY[3:0] Key

Value	Name	Description
0xE	PASSWD	This field must be written with 0xE the first time AES_MR is programmed. For subsequent programming of AES_MR, any value can be written, including that of 0xE.  Always reads as 0.

#### Bits 18:16 – CFBS[2:0] Cipher Feedback Data Size

Value	Name	Description
0	SIZE_128BIT	128-bit
1	SIZE_64BIT	64-bit
2	SIZE_32BIT	32-bit
3	SIZE_16BIT	16-bit
4	SIZE_8BIT	8-bit

### Bit 15 – LOD Last Output Data Mode

In DMA mode, reading to the Output Data registers before the last data encryption/decryption process may lead to unpredictable results.

Value	Description
0	<p>No effect.</p> <p>After each end of encryption/decryption, the output data are available either on the output data registers (Manual and Auto modes) or at the address specified in the Channel Buffer Transfer Descriptor for DMA mode.</p> <p>In Manual and Auto modes, the DATRDY flag is cleared when at least one of the Output Data registers is read.</p>
1	<p>The DATRDY flag is cleared when at least one of the Input Data Registers is written.</p> <p>No more Output Data Register reads are necessary between consecutive encryptions/decryptions (see <a href="#">Last Output Data Mode</a>).</p>

### Bits 14:12 – OPMOD[2:0] Operating Mode

For CBC-MAC operating mode, set OPMOD to CBC and LOD to 1.

Value	Name	Description
0	ECB	ECB: Electronic Codebook mode
1	CBC	CBC: Cipher Block Chaining mode
2	OFB	OFB: Output Feedback mode
3	CFB	CFB: Cipher Feedback mode
4	CTR	CTR: Counter mode (16-bit internal counter)
5	GCM	GCM: Galois/Counter mode
6	XTS	XTS: XEX-based tweaked-codebook mode

### Bits 11:10 – KEYSIZE[1:0] Key Size

Value	Name	Description
0	AES128	AES Key Size is 128 bits
1	AES192	AES Key Size is 192 bits
2	AES256	AES Key Size is 256 bits

### Bits 9:8 – SMOD[1:0] Start Mode

If a DMA transfer is used, configure SMOD to 2. See [DMA Mode](#) for more details.

Value	Name	Description
0	MANUAL_START	Manual Mode
1	AUTO_START	Auto Mode
2	IDATAR0_START	AES_IDATAR0 access only Auto Mode (DMA)

### Bits 7:4 – PROCDLY[3:0] Processing Delay

Processing Time =  $N \times (\text{PROCDLY} + 1)$

where

- $N = 10$  when KEYSIZE = 0

- N = 12 when KEYSIZE = 1
- N = 14 when KEYSIZE = 2

The processing time represents the number of clock cycles that the AES needs in order to perform one encryption/decryption.

**Note:** The best performance is achieved with PROCDLY equal to 0.

### Bit 3 – DUALBUFF Dual Input Buffer

Value	Name	Description
0	INACTIVE	AES_IDATARx cannot be written during processing of previous block.
1	ACTIVE	AES_IDATARx can be written during processing of previous block when SMOD = 2. It speeds up the overall runtime of large files.

### Bit 1 – GTAGEN GCM Automatic Tag Generation Enable

Value	Description
0	Automatic GCM Tag generation disabled.
1	Automatic GCM Tag generation enabled.

### Bit 0 – CIPHER Processing Mode

Value	Description
0	Decrypts data.
1	Encrypts data.

### 59.5.3 AES Interrupt Enable Register

**Name:** AES\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
						PLENERR	EOPAD	TAGRDY
Access						W	W	W
Reset						–	–	–
Bit	15	14	13	12	11	10	9	8
								URAD
Access								W
Reset								–
Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								W
Reset								–

**Bit 18 – PLENERR** Padding Length Error Interrupt Enable

**Bit 17 – EOPAD** End of Padding Interrupt Enable

**Bit 16 – TAGRDY** GCM Tag Ready Interrupt Enable

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Enable

**Bit 0 – DATRDY** Data Ready Interrupt Enable

### 59.5.4 AES Interrupt Disable Register

**Name:** AES\_IDR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
						PLENERR	EOPAD	TAGRDY
Access						W	W	W
Reset						–	–	–
Bit	15	14	13	12	11	10	9	8
								URAD
Access								W
Reset								–
Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								W
Reset								–

**Bit 18 – PLENERR** Padding Length Error Interrupt Disable

**Bit 17 – EOPAD** End of Padding Interrupt Disable

**Bit 16 – TAGRDY** GCM Tag Ready Interrupt Disable

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Disable

**Bit 0 – DATRDY** Data Ready Interrupt Disable

### 59.5.5 AES Interrupt Mask Register

**Name:** AES\_IMR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

Access  
Reset

Access						R	R	R
Reset						0	0	0

Access								R
Reset								0

Access								R
Reset								0

**Bit 18 – PLENERR** Padding Length Error Interrupt Mask

**Bit 17 – EOPAD** End of Padding Interrupt Mask

**Bit 16 – TAGRDY** GCM Tag Ready Interrupt Mask

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Mask

**Bit 0 – DATRDY** Data Ready Interrupt Mask

### 59.5.6 AES Interrupt Status Register

**Name:** AES\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24	
	[Greyed out bits 31-24]								
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
	[Greyed out bits 23-19]					PLENERR	EOPAD	TAGRDY	
Access						R	R	R	
Reset						0	0	0	
Bit	15	14	13	12	11	10	9	8	
	URAT[3:0]				[Greyed out bits 11-10]			URAD	
Access	R	R	R	R				R	
Reset	0	0	0	0				0	
Bit	7	6	5	4	3	2	1	0	
	[Greyed out bits 7-1]							DATRDY	
Access								R	
Reset								0	

#### Bit 18 – PLENERR Padding Length Error

Value	Description
0	No Padding Length Error occurred.
1	Padding Length Error detected.

#### Bit 17 – EOPAD End of Padding

Value	Description
0	Padding is not over.
1	Padding phase is over.

#### Bit 16 – TAGRDY GCM Tag Ready

Value	Description
0	GCM Tag is not valid.
1	GCM Tag generation is complete (cleared by reading GCM Tag, starting another processing or when writing a new key).

**Bits 15:12 – URAT[3:0]** Unspecified Register Access (cleared by writing SWRST in AES\_CR)  
 Only the last Unspecified Register Access Type is available through the URAT field.

# SAMA5D2 Series

## Advanced Encryption Standard (AES)

Value	Name	Description
0	IDR_WR_PROCESSING	Input Data register written during the data processing when SMOD = 2 mode.
1	ODR_RD_PROCESSING	Output Data register read during the data processing.
2	MR_WR_PROCESSING	Mode register written during the data processing.
3	ODR_RD_SUBKGEN	Output Data register read during the sub-keys generation.
4	MR_WR_SUBKGEN	Mode register written during the sub-keys generation.
5	WOR_RD_ACCESS	Write-only register read access.

**Bit 8 – URAD** Unspecified Register Access Detection Status (cleared by writing SWRST in AES\_CR)

Value	Description
0	No unspecified register access has been detected since the last SWRST.
1	At least one unspecified register access has been detected since the last SWRST.

**Bit 0 – DATRDY** Data Ready (cleared by setting bit START or bit SWRST in AES\_CR or by reading AES\_ODATARx)

Value	Description
0	Output data not valid.
1	Encryption or decryption process is completed.

**Note:** If AES\_MR.LOD = 1: In Manual and Auto mode, the DATRDY flag can also be cleared by writing at least one AES\_IDATARx.

### 59.5.7 AES Key Word Register x

**Name:** AES\_KEYWRx  
**Offset:** 0x20 + x\*0x04 [x=0..7]  
**Reset:** –  
**Property:** Write-only

These registers are write-only to prevent the key from being read by another application.

Bit	31	30	29	28	27	26	25	24
	KEYW[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	KEYW[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	KEYW[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	KEYW[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	–

#### Bits 31:0 – KEYW[31:0] Key Word

The four/six/eight 32-bit Key Word registers set the 128-bit/192-bit/256-bit cryptographic key used for AES encryption/decryption.

AES\_KEYWR0 corresponds to the first word of the key and respectively AES\_KEYWR3/AES\_KEYWR5/AES\_KEYWR7 to the last one.

Whenever a new key (AES\_KEYWRx) is written to the hardware, two automatic actions are processed:

- GCM hash subkey generation
- AES\_GHASHRx Clear

See [Key Writing and Automatic Hash Subkey Calculation](#) for details.

### 59.5.8 AES Input Data Register x

**Name:** AES\_IDATARx  
**Offset:** 0x40 + x\*0x04 [x=0..3]  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	IDATA[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	IDATA[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	IDATA[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	IDATA[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	–

#### Bits 31:0 – IDATA[31:0] Input Data Word

The four 32-bit Input Data registers set the 128-bit data block used for encryption/decryption.

AES\_IDATAR0 corresponds to the first word of the data to be encrypted/decrypted, and AES\_IDATAR3 to the last one.

These registers are write-only to prevent the input data from being read by another application.

### 59.5.9 AES Output Data Register x

**Name:** AES\_ODATARx  
**Offset:** 0x50 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	ODATA[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	ODATA[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	ODATA[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	ODATA[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – ODATA[31:0] Output Data**

The four 32-bit Output Data registers contain the 128-bit data block that has been encrypted/decrypted.

AES\_ODATAR0 corresponds to the first word, AES\_ODATAR3 to the last one.

### 59.5.10 AES Initialization Vector Register x

**Name:** AES\_IVRx  
**Offset:** 0x60 + x\*0x04 [x=0..3]  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	IV[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	IV[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	IV[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	IV[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	–

**Bits 31:0 – IV[31:0] Initialization Vector**

The four 32-bit Initialization Vector registers set the 128-bit Initialization Vector data block that is used by some modes of operation as an additional initial input.

AES\_IVR0 corresponds to the first word of the Initialization Vector, AES\_IVR3 to the last one.

These registers are write-only to prevent the Initialization Vector from being read by another application.

For CBC, OFB and CFB modes, the IV input value corresponds to the initialization vector.

For CTR mode, the IV input value corresponds to the initial counter value.

**Note:** These registers are not used in ECB mode and must not be written.

### 59.5.11 AES Additional Authenticated Data Length Register

**Name:** AES\_AADLENR  
**Offset:** 0x70  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
AADLEN[31:24]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
AADLEN[23:16]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
AADLEN[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
AADLEN[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – AADLEN[31:0]** Additional Authenticated Data Length  
 Length in bytes of the Additional Authenticated Data (AAD) that is to be processed.

**Note:** The maximum byte length of the AAD portion of a message is limited to the 32-bit counter length.

### 59.5.12 AES Plaintext/Ciphertext Length Register

**Name:** AES\_CLENR  
**Offset:** 0x74  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
CLEN[31:24]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
CLEN[23:16]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
CLEN[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
CLEN[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – CLEN[31:0]** Plaintext/Ciphertext Length  
 Length in bytes of the plaintext/ciphertext (C) data that is to be processed.

**Note:** The maximum byte length of the C portion of a message is limited to the 32-bit counter length.

### 59.5.13 AES GCM Intermediate Hash Word Register x

**Name:** AES\_GHASHRx  
**Offset:** 0x78 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** R/W

Bit	31	30	29	28	27	26	25	24
	GHASH[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	GHASH[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	GHASH[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	GHASH[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – GHASH[31:0] Intermediate GCM Hash Word x

The four 32-bit Intermediate Hash Word registers expose the intermediate GHASH value. May be read to save the current GHASH value so processing can later be resumed, presumably on a later message fragment. Whenever a new key is written to the AES Key Register two automatic actions are processed:

- GCM hash subkey generation
- AES\_GHASHRx Clear

See [Key Writing and Automatic Hash Subkey Calculation](#) for details.

If an application software-specific hash initial value is needed for the GHASH, it must be written to AES\_GHASHRx:

- after a write to the AES Key Register, if any,
- before starting the input data feed.

### 59.5.14 AES GCM Authentication Tag Word Register x

**Name:** AES\_TAGRx  
**Offset:** 0x88 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	TAG[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	TAG[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	TAG[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	TAG[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – TAG[31:0]** GCM Authentication Tag x

The four 32-bit Tag registers contain the final 128-bit GCM Authentication tag (*T*) when GCM processing is complete. TAG0 corresponds to the first word, TAG3 to the last word.

### 59.5.15 AES GCM Encryption Counter Value Register

**Name:** AES\_CTRR  
**Offset:** 0x98  
**Reset:** 0x00000000  
**Property:** Read-only

	Bit	31	30	29	28	27	26	25	24
		CTR[31:24]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		CTR[23:16]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		CTR[15:8]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		CTR[7:0]							
Access		R	R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0	0

**Bits 31:0 – CTR[31:0]** GCM Encryption Counter  
 Reports the current value of the 32-bit GCM counter.

**59.5.16 AES GCM H Word Register x**

**Name:** AES\_GCMHRx  
**Offset:** 0x9C + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** R/W

Bit	31	30	29	28	27	26	25	24
	H[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	H[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	H[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	H[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – H[31:0] GCM H Word x**

The four 32-bit H Word registers contain the 128-bit GCM hash subkey *H* value.

Whenever a new key is written to the AES Key Register, two automatic actions are processed:

- GCM hash subkey *H* generation
- AES\_GHASHRx Clear

If the application software requires a specific hash subkey, the automatically-generated *H* value can be overwritten in AES\_GCMHRx. See [Key Writing and Automatic Hash Subkey Calculation](#) for details.

Generating a GCM hash subkey *H* by a write in AES\_GCMHRx enables to:

- select the GCM hash subkey *H* for GHASH operations,
- select one operand to process a single GF128 multiply.

### 59.5.17 AES Extended Mode Register

**Name:** AES\_EMR  
**Offset:** 0xB0  
**Reset:** 0x00000000  
**Property:** Read/Write

	Bit	31	30	29	28	27	26	25	24
		[Greyed out bits 31-24]							
Access									
Reset									
	Bit	23	22	21	20	19	18	17	16
		NHEAD[7:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	15	14	13	12	11	10	9	8
		PADLEN[7:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	7	6	5	4	3	2	1	0
		[Greyed out bits 7-6]		PLIPD	PLIPEN	[Greyed out bits 3-2]		APM	APEN
Access				R/W	R/W			R/W	R/W
Reset				0	0			0	0

#### Bits 23:16 – NHEAD[7:0] IPSEC Next Header

Value	Description
0-255	IPSEC Next Header field

#### Bits 15:8 – PADLEN[7:0] Auto Padding Length

Value	Description
0-255	Padding length in bytes

#### Bit 5 – PLIPD Protocol Layer Improved Performance Decipher

Value	Description
0	Protocol layer improved performance is in ciphering mode.
1	Protocol layer improved performance is in deciphering mode.

#### Bit 4 – PLIPEN Protocol Layer Improved Performance Enable

Value	Description
0	Protocol layer improved performance is disabled.
1	Protocol layer improved performance is enabled.

#### Bit 1 – APM Auto Padding Mode

# SAMA5D2 Series

## Advanced Encryption Standard (AES)

---

---

Value	Description
0	Auto Padding performed according to IPSEC standard.
1	Auto Padding performed according to SSL standard.

**Bit 0 – APEN** Auto Padding Enable

Value	Description
0	Auto Padding feature is disabled.
1	Auto Padding feature is enabled.

### 59.5.18 AES Byte Counter Register

**Name:** AES\_BCNT  
**Offset:** 0xB4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	BCNT[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	BCNT[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	BCNT[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	BCNT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – BCNT[31:0]** Auto Padding Byte Counter  
 Auto padding byte counter value. BCNT must be greater than 0.

### 59.5.19 AES Tweak Word Register x

**Name:** AES\_TWRx  
**Offset:** 0xC0 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** R/W

Bit	31	30	29	28	27	26	25	24
TWEAK[31:24]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
TWEAK[23:16]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
TWEAK[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
TWEAK[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – TWEAK[31:0]** Tweak Word x

The four 32-bit Tweak Word registers contain the 128-bit Tweak value.

### 59.5.20 AES Alpha Word Register x

**Name:** AES\_ALPHARx  
**Offset:** 0xD0 + x\*0x04 [x=0..3]  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	ALPHA[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	ALPHA[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	ALPHA[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	ALPHA[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	–

**Bits 31:0 – ALPHA[31:0] Alpha Word x**

The four 32-bit Alpha Word registers contain the 128-bit primitive of GF(2<sup>128</sup>) to use for the first processing.

## 60. Secure Hash Algorithm (SHA)

### 60.1 Description

The Secure Hash Algorithm (SHA) is compliant with the American FIPS (Federal Information Processing Standard) Publication 180-2 specification.

The 512/1024-bit block of message is respectively stored in 16/32 x 32-bit registers, (SHA\_IDATARx/SHA\_IODATARx) which are write-only.

As soon as the input data is written, the hash processing may be started. The registers comprising the block of a padded message must be entered consecutively. Then the message digest is ready to be read out on the 5 up to 8/16 x 32-bit output data registers (SHA\_IODATARx) or through the DMA channels.

### 60.2 Embedded Characteristics

- Supports Hash-based Message Authentication Code (HMAC) Algorithm (HMAC-SHA1, HMAC-SHA224, HMAC-SHA256, HMAC-SHA384, HMAC-SHA512, )
- Compliant with FIPS Publication 180-2
- Supports Automatic Padding of Messages
- Supports Up to 2 Sets of Initial Hash Values Registers (HMAC Acceleration or other)
- Supports Automatic Check of the Hash (HMAC Acceleration or other)
- Tightly Coupled to AES for Protocol Layers Improved Performances
- Configurable Processing Period:
  - 85 Clock Cycles to obtain a fast SHA1 runtime, 88 clock cycles for SHA384, SHA512 or 209 Clock Cycles for Maximizing Bandwidth of Other Applications
  - 72 Clock Cycles to obtain a fast SHA224, SHA256 runtime or 194 Clock Cycles for Maximizing Bandwidth of Other Applications
- Connection to DMA Channel Capabilities Optimizes Data Transfers
- Double Input Buffer Optimizes Runtime

### 60.3 Product Dependencies

#### 60.3.1 Power Management

The SHA may be clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the SHA clock.

#### 60.3.2 Interrupt Sources

The SHA interface has an interrupt line connected to the Interrupt Controller.

Handling the SHA interrupt requires programming the Interrupt Controller before configuring the SHA.

### 60.4 Functional Description

The Secure Hash Algorithm (SHA) module requires a padded message according to FIPS180-2 specification. This message can be provided with the padding to the SHA module, or the padding can be

automatically computed by the SHA module if the size of the message is provided. The first block of the message must be indicated to the module by a specific command. The SHA module produces an N-bit message digest each time a block is written and processing period ends, where N is 160 for SHA1, 224 for SHA224, 256 for SHA256, 384 for SHA384, 512 for SHA512. The SHA module is also capable of computing Hash-based Message Authentication Code (HMAC) algorithm.

### 60.4.1 SHA Algorithm

The SHA can process SHA1, SHA224, SHA256, SHA384, SHA512 by configuring the ALGO field in the SHA Mode register (SHA\_MR).

### 60.4.2 HMAC Algorithm

The HMAC algorithm is as follows:

$$\text{HMAC}_K(m) = h((K_0 \oplus \text{opad}) \parallel h((K_0 \oplus \text{ipad}) \parallel m))$$

where:

- $h$  = SHA function
- $K_0$  = the key  $K$  after any necessary pre-processing to form a block size key
- $m$  = message to authenticate
- $\parallel$  = concatenation operator
- $\oplus$  = XOR operator
- $\text{ipad}$  = predefined constant (0x3636...3636)
- $\text{opad}$  = predefined constant (0x5C5C...5C5C)

The SHA provides a fully optimized processing of the HMAC algorithm by executing the following operations:

- starting the SHA algorithm from any user predefined hash value, thus ' $h(K_0 \oplus \text{ipad})$ ' for first HMAC hash and ' $h(K_0 \oplus \text{opad})$ ' for second HMAC hash
- performing automatic padding
- routing automatically the first hash result ' $h((K_0 \oplus \text{ipad}) \parallel m)$ ' to the source of the second hash processing ' $h((K_0 \oplus \text{opad}) \parallel (\text{first hash result}))$ ' including the concatenation of the first hash result to ' $K_0 \oplus \text{opad}$ '.

To perform the HMAC operation, the ALGO field value must be greater than 7, the automatic padding feature must be enabled (MSGSIZE and BYTCNT fields differ from 0) and the SHA internal initial hash value registers 0 and 1 must be configured, respectively, with the hash results of input blocks " $K_0 \oplus \text{ipad}$ " and " $K_0 \oplus \text{opad}$ " (see [Internal Registers for Initial Hash Value or Expected Hash Result](#)).

The size of the message (' $m$ ') must be written in the MSGSIZE and BYTCNT fields.

The FIRST bit in the SHA Control register (SHA\_CR) should be set before writing the first block of the message.

The SHA can process HMAC-SHA1, HMAC-SHA256, HMAC-SHA384, HMAC-SHA512 by configuring the ALGO field in the SHA\_MR.

### 60.4.3 Processing Period

The processing period can be configured.

The short processing period allocates bandwidth to the SHA module, whereas the long processing period allocates more bandwidth on the system bus to other applications. An example is DMA channels not associated with SHA.

In SHA1 mode, the shortest processing period is 85 clock cycles + 2 clock cycles for start command synchronization. The longest period is 209 clock cycles + 2 clock cycles.

In SHA384, SHA512 mode, the shortest processing period is 88 clock cycles + 2 clock cycles for start command synchronization. The longest period is 209 clock cycles + 2 clock cycles.

In SHA256 and SHA224 mode, the shortest processing period is 72 clock cycles + 2 clock cycles for start command synchronization. The longest period is 194 clock cycles + 2 clock cycles.

#### 60.4.4 Double Input Buffer

The SHA Input Data registers (SHA\_IDATARx) can be double-buffered to reduce the runtime of large files.

Double-buffering allows a new message block to be written while the previous message block is being processed. This is only possible when DMA accesses are performed (SMOD = 2).

The DUALBUFF bit in the SHA\_MR must be set to have double input buffer access.

#### 60.4.5 Internal Registers for Initial Hash Value or Expected Hash Result

The SHA module embeds two sets of internal registers (IR0, IR1) to store different data used by the SHA or HMAC algorithms (See the figure below). These internal registers are accessed through SHA Input Data registers (SHA\_IDATARx).

When the ALGO field selects SHA algorithms, IR0 can be configured with a user initial hash value. This initial hash value can be used to compute a custom hash algorithm with two sets of different initial constants, or to continue a hash computation by providing the intermediate hash value previously returned by the SHA module.

When the ALGO field selects SHA algorithms, IR1 can be configured with either a user initial hash value or an expected hash result. The expected hash result must be configured in the IR1 if the field CHECK = 1 (refer to [Automatic Check](#)). If the field CHECK = 0 or 2, IR1 can be configured with a user initial hash value that differs from IR0 value.

When the ALGO field selects HMAC algorithms, IR0 must be configured with the hash result of  $K_0 \oplus \text{ipad}$  and IR1 must be configured with the hash result of  $K_0 \oplus \text{opad}$ . These pre-computed first blocks speed up the HMAC computation by saving the time to compute the intermediate hash values of the first block which is constant while the secret key is constant (See [HMAC Algorithm](#)).

**Table 60-1. Configuration Values of Internal Registers**

Register	SHA Modes (ALGO < 8)			HMAC Modes (ALGO > 7)
	CHECK = 0	CHECK = 1	CHECK = 2	
IR0	User Initial Hash	User Initial Hash	User Initial Hash	hash( $K_0 \oplus \text{ipad}$ )
IR1	User Initial Hash	Expected Hash Result	User Initial Hash	hash( $K_0 \oplus \text{opad}$ )

To calculate the initial HMAC values, follow this sequence:

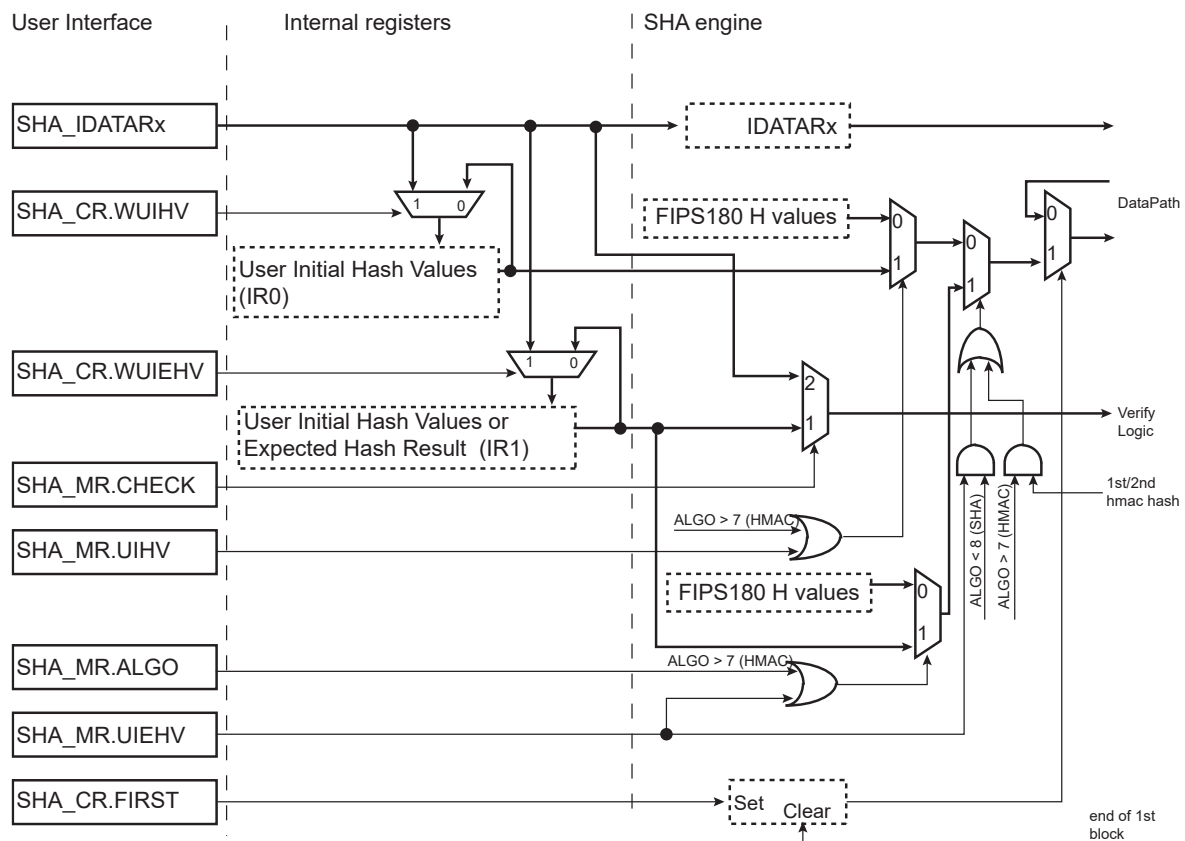

1. Calculate  $K_0$ .
2. Calculate  $K_0 \oplus \text{ipad}$  and  $K_0 \oplus \text{opad}$ .
3. Perform a hash of the result of  $K_0 \oplus \text{ipad}$  and  $K_0 \oplus \text{opad}$  (auto-padding must be disabled for that type of hash).
4. Write  $h(K_0 \oplus \text{ipad})$  and  $h(K_0 \oplus \text{opad})$  in IR0 and IR1 respectively.

To write IR0 or IR1, follow this sequence:

1. Set SHA\_CR.WUIHV (IR0) or SHA\_CR.WUIEHV (IR1).
2. Write the data in SHA\_IDATARx. The number of registers to write depends on the type of data (user initial hash values or expected hash result) and on the type of algorithm selected:
  - SHA\_IDATAR0 to SHA\_IDATAR4 for data used in algorithms based on SHA1
  - SHA\_IDATAR0 to SHA\_IDATAR7 for data used in algorithms based on SHA256
  - SHA\_IDATAR0 to SHA\_IDATAR15 for data used in algorithms based on SHA512
  - SHA\_IDATAR0 to SHA\_IDATAR6 for expected hash result of algorithms based on SHA224
  - SHA\_IDATAR0 to SHA\_IDATAR11 for expected hash result of algorithms based on SHA384
3. Clear SHA\_CR.WUIHV or SHA\_CR.WUIEHV.

IR0 and IR1 are automatically selected for HMAC processing if the field ALGO selects HMAC algorithms. If SHA algorithms are selected, the internal registers are selected if the corresponding UIHV or UIEHV bits are set.

**Figure 60-1. User Initial Hash Value and Expected Hash Internal Register Access**

### 60.4.6 Automatic Padding

The SHA module features an automatic padding computation to speed up the execution of the algorithm.

The automatic padding function requires the following information:

- Complete message size in bytes to be written in the MSGSIZE field of the SHA Message Size register (SHA\_MSR).  
The size of the message is written at the end of the last block, as required by the FIPS180-2 specification (the size is automatically converted into a bit-size).

- Number of remaining bytes (to write in the SHA\_IDATARx) to be written in the BYTCNT field of the SHA Bytes Count register (SHA\_BCR).  
Automatic padding occurs when the BYTCNT field reaches 0. At each write in the SHA Input registers, the BYTCNT field value is decreased by the number of bytes written.

The BYTCNT field value must be written with the same value as the MSGSIZE field value if the full message is processed. If the message is partially preprocessed and an initial hash value is used, BYTCNT must be written with the remaining bytes to hash while MSGSIZE holds the message size.

To disable the automatic padding feature, the MSGSIZE and BYTCNT fields must be configured with 0.

### 60.4.7 Automatic Check

The SHA module features an automatic check of the hash result with the expected hash. A check failure can generate an interrupt if configured in the SHA Interrupt Enable register (SHA\_IER).

Automatic check requires the automatic padding feature to be enabled (MSGSIZE and BYTCNT fields must be greater than 0).

There are two methods to configure the expected hash result:

- if SHA\_MR.CHECK = 1, the expected hash result is read from the internal register (IR1). This method cannot be used when HMAC algorithms is selected because this register is already used to store user initial hash values for the second hash processing. IR1 cannot be read by software.
- If SHA\_MR.CHECK = 2, the expected hash result is written in the SHA\_IDATARx after the message.

When SHA\_MR.CHECK = 2, the method can provide more flexibility of use if a message is stored in system memory together with its expected hash result. A DMA with linked list can be used to ease the transfer of the message and its expected hash result.

**Figure 60-2. Message and Expected Hash Result Memory Mapping**

The number of 32-bit words of the hash result to check with the expected hash can be selected with SHA\_MR.CHKCNT. The status of the check is available in the CHKST field in the SHA Interrupt Status register (SHA\_ISR).

An interrupt can be generated (if enabled) when the check is completed. The check occurs several clock cycles after the computation of the requested hash, so the interrupt and the CHECKF bit are set several clock cycles after the DATRDY flag of the SHA\_ISR.

### 60.4.8 Protocol Layers Improved Performances

The SHA can be tightly coupled to the AES module to improve performances when processing protocol layers such as IPsec or OpenSSL.

When the AES is configured to be tightly coupled to SHA (AES\_MR), SHA must be always configured in Double Buffer mode (SHA\_MR.DUALBUFF = 1).

Refer to the section “Advanced Encryption Standard (AES)” for details.

### 60.4.9 Start Modes

SHA\_MR.SMOD is used to select the Hash Processing Start mode.

#### 60.4.9.1 Manual Mode

In Manual mode, the sequence is as follows:

1. Set SHA\_IER.DATRDY (Data Ready) , depending on whether an interrupt is required at the end of processing.
2. If the initial hash values differ from the FIPS standard, set SHA\_MR.UIHV and/or SHA\_MR.UIEHV. If the initial hash values comply with the FIPS180-2 specification, clear SHA\_MR.UIHV and/or SHA\_MR.UIEHV.
3. If automatic padding is required, configure SHA\_MSR.MSGSIZE with the number of bytes of the message, and configure SHA\_BCR.BYTCNT with the remaining number of bytes to write. The BYTCNT field must be written with a value different from MSGSIZE field value if the message is preprocessed and completed by using user initial hash values.  
If automatic padding is not required, configure SHA\_MSR.MSGSIZE and SHA\_BCR.BYTCNT to 0.
4. For the first block of a message, the FIRST command must be set by writing a 1 into the corresponding bit of the Control register (SHA\_CR). For the other blocks, there is nothing to write.
5. Write the block to be processed in the SHA\_IDATARx.
6. To begin processing, set SHA\_CR.START.
7. When processing is completed, the bit DATRDY in the Interrupt Status register (SHA\_ISR) rises. If an interrupt has been enabled by setting SHA\_IER.DATRDY, the interrupt line of the SHA is activated.
8. Repeat the write procedure for each block, start procedure and wait for the interrupt procedure up to the last block of the entire message. Each time the start procedure is complete, the DATRDY flag is cleared.
9. After the last block is processed (DATRDY flag is set, if an interrupt has been enabled by setting SHA\_IER.DATRDY, the interrupt line of the SHA is activated), read the message digest in the Output Data registers. The DATRDY flag is automatically cleared when reading the SHA\_IODATARx registers.

#### 60.4.9.2 Auto Mode

In Auto mode, processing starts as soon as the correct number of SHA\_IDATARx is written. No action in the SHA\_CR is necessary.

### 60.4.9.3 DMA Mode

The DMA can be used in association with the SHA to perform the algorithm on a complete message without any action by the software during processing.

SHA\_MR.SMOD must be configured to 2.

The DMA must be configured with non-incremental addresses.

The start address of any transfer descriptor must be set to point to the SHA\_IDATAR0.

The DMA chunk size must be set to transfer, for each trigger request, 16 words of 32 bits.

The FIRST bit of the SHA\_CR must be set before starting the DMA when the first block is transferred.

The DMA generates an interrupt when the end of buffer transfer is completed but the SHA processing is still in progress. The end of SHA processing is indicated by the flag DATRDY in the SHA\_ISR.

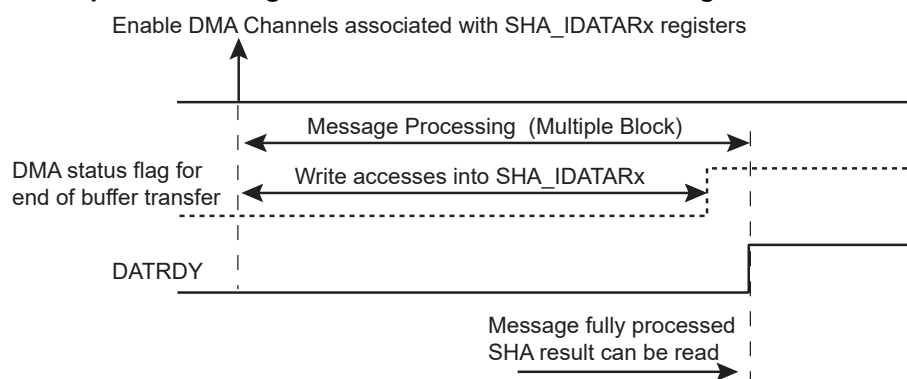

If automatic padding is disabled, the end of SHA processing requires two interrupts to be verified. The DMA end of transfer interrupt must be verified first, then the SHA DATRDY interrupt must be enabled and verified.

If automatic padding is enabled, the end of SHA processing requires only one interrupt to be verified. The DMA end of transfer is not required, so the SHA DATRDY interrupt must be enabled prior to start the DMA and DATRDY interrupt is the only one to be verified. Refer to the figures below.

**Figure 60-3. Interrupts Processing with DMA**

**Figure 60-4. Interrupts Processing with DMA and Automatic Padding**

### 60.4.9.4 SHA Register Endianness

In ARM processor-based products, the system bus and processors manipulate data in little-endian form. The SHA interface requires little-endian format words. However, in accordance with the protocol of FIPS 180-2 specification, data is collected, processed and stored by the SHA algorithm in big-endian form.

### 60.4.10 Security Features

#### 60.4.10.1 Unspecified Register Access Detection

When an unspecified register access occurs, the URAD bit in the SHA\_ISR is set. Its source is then reported in the Unspecified Register Access Type field (URAT). Only the last unspecified register access is available through the URAT field.

Several kinds of unspecified register accesses can occur:

- SHA\_IDATARx written during data processing in DMA mode
- SHA\_IODATARx read during data processing
- SHA\_MR written during data processing
- Write-only register read access

The URAD bit and the URAT field can only be reset by the SWRST bit in the SHA\_CR.

### 60.5 Register Summary

Offset	Name	Bit Pos.							
0x00	SHA_CR	7:0			FIRST				START
		15:8		WUIEHV	WUIHV				SWRST
		23:16							
		31:24							
0x04	SHA_MR	7:0	UIEHV	UIHV	PROCDLY			SMOD[1:0]

### 60.5.1 SHA Control Register

**Name:** SHA\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24	
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
Access									
Reset									
Bit	15	14	13	12	11	10	9	8	
			WUIEHV	WUIHV					SWRST
Access			W	W					W
Reset			–	–					–
Bit	7	6	5	4	3	2	1	0	
					FIRST			START	
Access					W			W	
Reset					–			–	

#### Bit 13 – WUIEHV Write User Initial or Expected Hash Values

Value	Description
0	SHA_IDATARx accesses are routed to the data registers.
1	SHA_IDATARx accesses are routed to the internal registers (IR1).

#### Bit 12 – WUIHV Write User Initial Hash Values

Value	Description
0	SHA_IDATARx accesses are routed to the data registers.
1	SHA_IDATARx accesses are routed to the internal registers (IR0).

#### Bit 8 – SWRST Software Reset

Value	Description
0	No effect.
1	Resets the SHA. A software-triggered hardware reset of the SHA interface is performed.

#### Bit 4 – FIRST First Block of a Message

Value	Description
0	No effect.
1	Indicates that the next block to process is the first one of a message.

**Bit 0 – START** Start Processing

Value	Description
0	No effect.
1	Starts manual hash algorithm process.

### 60.5.2 SHA Mode Register

**Name:** SHA\_MR  
**Offset:** 0x04  
**Reset:** 0x0000100  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	CHKCNT[3:0]						CHECK[1:0]	
Access	R/W	R/W	R/W	R/W			R/W	R/W
Reset	0	0	0	0			0	0
Bit	23	22	21	20	19	18	17	16
								DUALBUFF
Access								R/W
Reset								0
Bit	15	14	13	12	11	10	9	8
					ALGO[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	1
Bit	7	6	5	4	3	2	1	0
		UIEHV	UIHV	PROCDLY			SMOD[1:0]	
Access		R/W	R/W	R/W			R/W	R/W
Reset		0	0	0			0	0

#### Bits 31:28 – CHKCNT[3:0] Check Counter

Number of 32-bit words to check. The value 0 indicates that the number of words to compare will be based on the algorithm selected (5 words for SHA1, 7 words for SHA224, 8 words for SHA256, 12 words for SHA384, 16 words for SHA512).

#### Bits 25:24 – CHECK[1:0] Hash Check

Values not listed in table must be considered as “reserved”.

Value	Name	Description
0	NO_CHECK	No check is performed
1	CHECK_EHV	Check is performed with expected hash stored in internal expected hash value registers.
2	CHECK_MESSAGE	Check is performed with expected hash provided after the message.

#### Bit 16 – DUALBUFF Dual Input Buffer

Value	Name	Description
0	INACTIVE	SHA_IDATARx and SHA_IODATARx cannot be written during processing of previous block.
1	ACTIVE	SHA_IDATARx and SHA_IODATARx can be written during processing of previous block when SMOD value = 2. It speeds up the overall runtime of large files.

### Bits 11:8 – ALGO[3:0] SHA Algorithm

Values not listed in the table must be considered as “reserved”.

Value	Name	Description
0	SHA1	SHA1 algorithm processed
1	SHA256	SHA256 algorithm processed
2	SHA384	SHA384 algorithm processed
3	SHA512	SHA512 algorithm processed
4	SHA224	SHA224 algorithm processed
8	HMAC_SHA1	HMAC algorithm with SHA1 Hash processed
9	HMAC_SHA256	HMAC algorithm with SHA256 Hash processed
10	HMAC_SHA384	HMAC algorithm with SHA384 Hash processed
11	HMAC_SHA512	HMAC algorithm with SHA512 Hash processed
12	HMAC_SHA224	HMAC algorithm with SHA224 Hash processed
13	Reserved	–
14	Reserved	–

### Bit 6 – UIEHV User Initial or Expected Hash Value Registers

Value	Description
0	The SHA algorithm is started with the standard initial values as defined in the FIPS180-2 specification.
1	The SHA algorithm is started with the user initial hash values stored in the internal register 1 (IR1). If HMAC is configured, UIEHV has no effect (i.e. IR1 is always selected).

### Bit 5 – UIHV User Initial Hash Values

Value	Description
0	The SHA algorithm is started with the standard initial values as defined in the FIPS180-2 specification.
1	The SHA algorithm is started with the user initial hash values stored in the internal register 0 (IR0). If HMAC is configured, UIHV has no effect (i.e. IR0 is selected).

### Bit 4 – PROCDLY Processing Delay

When SHA1 algorithm is processed, runtime period is either 85 or 209 clock cycles.

When SHA256 or SHA224 algorithm is processed, runtime period is either 72 or 194 clock cycles.

When SHA384 or SHA512 algorithm is processed, runtime period is either 88 or 209 clock cycles.

Value	Name	Description
0	SHORTEST	SHA processing runtime is the shortest one
1	LONGEST	SHA processing runtime is the longest one (reduces the SHA bandwidth requirement, reduces the system bus overload)

### Bits 1:0 – SMOD[1:0] Start Mode

Values not listed in the table must be considered as “reserved”.

If a DMA transfer is used, configure the SMOD value to 2. See [DMA Mode](#) for details.

Value	Name	Description
0	MANUAL_START	Manual mode

# SAMA5D2 Series

## Secure Hash Algorithm (SHA)

Value	Name	Description
1	AUTO_START	Auto mode
2	IDATAR0_START	SHA_IDATAR0 access only mode (mandatory when DMA is used)

### 60.5.3 SHA Interrupt Enable Register

**Name:** SHA\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

### 60.5.6 SHA Interrupt Status Register

**Name:** SHA\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits 31-24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	CHKST[3:0]						CHECKF	
Access	R	R	R	R				R
Reset	0	0	0	0				0
Bit	15	14	13	12	11	10	9	8
	URAT[2:0]						URAD	
Access		R	R	R				R
Reset		0	0	0				0
Bit	7	6	5	4	3	2	1	0
	[Greyed out bits 7-5]			WRDY	[Greyed out bits 3-2]			DATRDY
Access				R				R
Reset				0				0

**Bits 23:20 – CHKST[3:0]** Check Status (cleared by writing START or SWRST bits in SHA\_CR or by reading SHA\_IODATARx)  
 Value 5 indicates identical hash values (expected hash = hash result). Any other value indicates different hash values.

**Bit 16 – CHECKF** Check Done Status (cleared by writing START or SWRST bits in SHA\_CR or by reading SHA\_IODATARx)

Value	Description
0	Hash check has not been computed.
1	Hash check has been computed, status is available in the CHKST bits.

**Bits 14:12 – URAT[2:0]** Unspecified Register Access Type (cleared by writing a 1 to SWRST bit in SHA\_CR)  
 Only the last Unspecified Register Access Type is available through the URAT field.

Value	Name
0	SHA_IDATAR0 to SHA_IDATAR15 written during the data processing in DMA mode (URAD = 1 and URAT = 0 can occur only if DUALBUFF is cleared in SHA_MR).
1	Output Data Register read during the data processing.
2	SHA_MR written during the data processing.
3	Write-only register read access.

**Bit 8 – URAD** Unspecified Register Access Detection Status (cleared by writing a 1 to SWRST bit in SHA\_CR)

Value	Description
0	No unspecified register access has been detected since the last SWRST.
1	At least one unspecified register access has been detected since the last SWRST.

**Bit 4 – WRDY** Input Data Register Write Ready

Value	Description
0	SHA_IDATAR0 cannot be written
1	SHA_IDATAR0 can be written

**Bit 0 – DATRDY** Data Ready (cleared by writing a 1 to bit SWRST or START in SHA\_CR, or by reading SHA\_IODATARx)

Value	Description
0	Output data is not valid.
1	512/1024-bit block process is completed. DATRDY is cleared when one of the following conditions is met: <ul style="list-style-type: none"><li>• Bit START in SHA_CR is set.</li><li>• Bit SWRST in SHA_CR is set.</li><li>• The hash result is read.</li></ul>

### 60.5.7 SHA Message Size Register

**Name:** SHA\_MSR  
**Offset:** 0x20  
**Reset:** 0x0  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

Bit	7	6	5	4	3	2	1	0
	MSGSIZE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – MSGSIZE[31:0] Message Size**

The size in bytes of the message. When MSGSIZE differs from 0, the SHA appends the corresponding value converted in bits after the padding section, as described in the FIPS180-2 specification.

To disable automatic padding, MSGSIZE field must be written to 0.

### 60.5.8 SHA Bytes Count Register

**Name:** SHA\_BCR  
**Offset:** 0x30  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
BYTCNT[31:24]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
BYTCNT[23:16]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
BYTCNT[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
BYTCNT[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – BYTCNT[31:0]** Remaining Byte Count Before Auto Padding

When the hash processing starts from the beginning of a message (without preprocessed hash part), BYTCNT must be written with the same value as the MSGSIZE. If a part of the message has been already hashed and the hash does not start from the beginning, BYTCNT must be configured with the number of bytes remaining to process before padding section.

When read, provides the size in bytes of message remaining to be written before the automatic padding starts.

BYTCNT field is automatically updated each time a write occurs in the SHA\_IDATARx and SHA\_IODATARx.

When BYTCNT reaches 0, the MSGSIZE is converted into bit count and appended at the end of the message after the padding as described in the FIPS180-2 specification.

To disable automatic padding, MSGSIZE and BYTCNT fields must be written to 0.

### 60.5.9 SHA Input Data x Register

**Name:** SHA\_IDATARx  
**Offset:** 0x40 + x\*0x04 [x=0..15]  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	IDATA[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	IDATA[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	IDATA[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	IDATA[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	–

#### Bits 31:0 – IDATA[31:0] Input Data

The 32-bit Input Data registers allow to load the data block used for hash processing.

These registers are write-only to prevent the input data from being read by another application.

SHA\_IDATAR0 corresponds to the first word of the block, SHA\_IDATAR15 to the last word of the last block in case SHA algorithm is set to SHA1, SHA224, SHA256 or SHA\_IODATA15R to the last word of the block if SHA algorithm is SHA384 or SHA512 (see [SHA Input/Output Data Register x](#)).

### 60.5.10 SHA Input/Output Data Register x

**Name:** SHA\_IODATARx  
**Offset:** 0x80 + x\*0x04 [x=0..15]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	IODATA[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	IODATA[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	IODATA[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	IODATA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – IODATA[31:0] Input/Output Data

These registers can be used to read the resulting message digest and to write the second part of the message block when the SHA algorithm is SHA-384 or SHA-512.

SHA\_IODATA0R to SHA\_IODATA15R can be written or read but reading these offsets does not return the content of corresponding parts (words) of the message block. Only results from SHA calculation can be read through these registers.

When SHA processing is in progress, these registers return 0x0000.

SHA\_IODATAR0 corresponds to the first word of the message digest; SHA\_IODATAR4 to the last one in SHA1 mode, SHA\_ODATAR6 in SHA224, SHA\_IODATAR7 in SHA256, SHA\_IODATAR11 in SHA384 or SHA\_IODATAR15 in SHA512.

When SHA224 is selected, the content of SHA\_ODATAR7 must be ignored.

When SHA384 is selected, the content of SHA\_IODATAR12 to SHA\_IODATAR15 must be ignored.

## **61. Triple Data Encryption Standard (TDES)**

### **61.1 Description**

The Triple Data Encryption Standard (TDES) is compliant with the American FIPS (Federal Information Processing Standard) Publication 46-3 specification.

The TDES supports the four different confidentiality modes of operation (ECB, CBC, OFB and CFB), specified in the FIPS (Federal Information Processing Standard) Publication 81 and is compatible with the Peripheral Data Controller channels for all of these modes, minimizing processor intervention for large buffer transfers.

The TDES key is loaded by the software.

The software can write up to three 64-bit keys, each stored in two 32-bit write-only registers, i.e., Key x Word Registers TDES\_KEYxWR0 and TDES\_KEYxWR1.

The input data (and initialization vector for some modes) are stored in two corresponding 32-bit write-only registers:

- Input Data Registers TDES\_IDATAR0 and TDES\_IDATAR1
- Initialization Vector Registers TDES\_IVR0 and TDES\_IVR1

As soon as the initialization vector, the input data and the keys are configured, the encryption/decryption process may be started. Then the encrypted/decrypted data is ready to be read out on the two 32-bit Output Data registers (TDES\_ODATARx) or through the DMA channels.

### **61.2 Embedded Characteristics**

- Supports Single Data Encryption Standard (DES) and Triple Data Encryption Standard (TDES)
- Compliant with FIPS Publication 46-3, Data Encryption Standard (DES)
- 64-bit Cryptographic Key for TDES
- Two-key or Three-key Algorithms for TDES
- 18-clock Cycles Encryption/Decryption Processing Time for DES
- 50-clock Cycles Encryption/Decryption Processing Time for TDES
- Supports eXtended Tiny Encryption Algorithm (XTEA)
- 128-bit key for XTEA and Programmable Round Number up to 64
- Supports the Four Standard Modes of Operation specified in the FIPS Publication 81, DES Modes of Operation
  - Electronic Code Book (ECB)
  - Cipher Block Chaining (CBC)
  - Cipher Feedback (CFB)
  - Output Feedback (OFB)
- 8-, 16-, 32- and 64-bit Data Sizes Possible in CFB Mode
- Last Output Data Mode Allowing Optimized Message (Data) Authentication Code (MAC) Generation
- Connection to DMA Optimizes Data Transfers for all Operating Modes

## 61.3 Product Dependencies

### 61.3.1 Power Management

The TDES may be clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the TDES clock.

### 61.3.2 Interrupt Sources

The TDES interface has an interrupt line connected to the Interrupt Controller. In order to handle interrupts, the Interrupt Controller must be programmed before configuring the TDES.

## 61.4 Functional Description

The Data Encryption Standard (DES) and the Triple Data Encryption Algorithm (TDES) specify FIPS-approved cryptographic algorithms that can be used to protect electronic data. The TDES bit in the TDES Mode Register (TDES\_MR) is used to select either the single DES or the Triple DES mode.

Encryption (enciphering) converts data to an unintelligible form called ciphertext. Decrypting (deciphering) the ciphertext converts the data back into its original form, called plaintext. The CIPHER bit in TDES\_MR is used to choose between encryption and decryption.

A DES is capable of using cryptographic keys of 64 bits to encrypt and decrypt data in blocks of 64 bits. This 64-bit key is defined in the Key 1 Registers (TDES\_KEY1WRx).

A TDES key consists of three DES keys, which is also referred to as a key bundle. These three 64-bit keys are defined, respectively, in the Key 1, 2 and 3 Registers (TDES\_KEY1WRx, TDES\_KEY2WRx and TDES\_KEY3WRx). In Triple DES mode (TDESMOD = 1 in TDES\_MR), the KEYMOD bit in TDES\_MR is used to choose between a two- and a three-key algorithm, as summarized in the table below.

**Table 61-1. TDES Algorithms Summary**

Algorithm	Mode	Data Processing Sequence Steps		
		First	Second	Third
Three-key	Encryption	Encryption with Key 1	Decryption with Key 2	Encryption with Key 3
	Decryption	Decryption with Key 3	Encryption with Key 2	Decryption with Key 1
Two-key	Encryption	Encryption with Key 1	Decryption with Key 2	Encryption with Key 1
	Decryption	Decryption with Key 1	Encryption with Key 2	Decryption with Key 1

The input to the encryption processes of the CBC, CFB, and OFB modes includes, in addition to the plaintext, a 64-bit data block called the initialization vector (IV), which must be set in the Initialization Vector Registers (TDES\_IVRx). The initialization vector is used in an initial step in the encryption of a message and in the corresponding decryption of the message.

The XTEA algorithm can be used instead of DES/TDES by configuring the TDESMOD field in TDES\_MR with the appropriate value 0x2. An XTEA key consists of a 128-bit key. They are defined in the Key 1 and 2 Registers.

The number of rounds of XTEA is defined in TDES\_XTEA\_RNDR and can be programmed up to 64 (1 round = 2 Feistel network rounds).

All the start and operating modes of the TDES algorithm can be applied to the XTEA algorithm.

### 61.4.1 Operating Modes

The TDES supports the following operating modes:

- ECB—Electronic Code Book
- CBC—Cipher Block Chaining
- OFB—Output Feedback
- CFB—Cipher Feedback
  - CFB8 (CFB where the length of the data segment is 8 bits)
  - CFB16 (CFB where the length of the data segment is 16 bits)
  - CFB32 (CFB where the length of the data segment is 32 bits)
  - CFB64 (CFB where the length of the data segment is 64 bits)

The data pre-processing, post-processing and data chaining for each mode are automatically performed. Refer to the FIPS Publication 81 for more complete information.

These modes are selected by setting the OPMOD field in TDES\_MR.

In CFB mode, four data sizes are possible (8, 16, 32 and 64 bits), configurable by means of the CFBS field in TDES\_MR (see [TDES Mode Register](#)).

### 61.4.2 Start Modes

The SMOD field in TDES\_MR selects the Encryption (or Decryption) start mode.

#### 61.4.2.1 Manual Mode

The sequence is as follows:

1. Write the TDES\_MR register with all required fields, including but not limited to SMOD and OPMOD.
2. Write the 64-bit key(s) in the different Key Registers (TDES\_KEYxWRx), depending on whether one, two or three keys are required.
3. Write the initialization vector (or counter) in the Initialization Vector Registers (TDES\_IVRx).  
**Note:** The Initialization Vector Registers concern all modes except ECB.
4. Set the bit DATRDY (Data Ready) in the TDES Interrupt Enable register (TDES\_IER), depending on whether an interrupt is required or not at the end of processing.
5. Write the data to be encrypted/decrypted in the authorized Input Data Registers (see the table below).  
**Note:** In 32-, 16- and 8-bit CFB modes, writing to TDES\_IDATAR1 is not allowed and may lead to processing errors.
6. Set the START bit in the TDES Control Register (TDES\_CR) to begin the encryption or decryption process.
7. When the processing completes, the bit DATRDY in the TDES Interrupt Status Register (TDES\_ISR) rises. If an interrupt has been enabled by setting the bit DATRDY in TDES\_IER, the interrupt line of the TDES is activated.
8. When the software reads one of the Output Data Registers (TDES\_ODATARx), the DATRDY bit is automatically cleared.

**Table 61-2. Authorized Input Data Registers**

Operating Mode	Input Data Registers to Write
ECB	All

.....continued	
Operating Mode	Input Data Registers to Write
CBC	All
OFB	All
CFB 64-bit	All
CFB 32-bit	TDES_IDATAR0
CFB 16-bit	TDES_IDATAR0
CFB 8-bit	TDES_IDATAR0

**61.4.2.2 Auto Mode**

The Auto Mode is similar to the Manual Mode, except that as soon as the correct number of Input Data registers is written, processing is automatically started without any action in TDES\_CR.

**61.4.2.3 DMA Mode**

The DMA Controller can be used in association with the TDES to perform an encryption/decryption of a buffer without any action by the software during processing.

The SMOD field of TDES\_MR must be set to 0x2 and the DMA must be configured with non-incremental addresses.

For all operating modes except CBC-MAC (TDES\_MR.LOD=1), 2 DMA channels must be programmed (transmit and receive). In CBC-MAC, only 1 transmit channel must be programmed.

The start address of any transfer descriptor must be set in TDES\_IDATAR0.

The DMA chunk size configuration depends on the TDES mode of operation and is listed in the table below.

When writing data to TDES with the first DMA channel, data will be fetched from a memory buffer (source data). It is recommended to configure the size of source data to “words” even for CFB modes. On the contrary, the destination data size depends on the mode of operation. When reading data from the TDES with the second DMA channel, the source data is the data read from TDES and data destination is the memory buffer. In this case, source data size depends on the TDES mode of operation and is listed in the table below.

**Table 61-3. DMA Data Transfer Type for the Different Operating Modes**

Operating Mode	Chunk Size	Destination/Source Data Transfer Type
ECB	1	Word
CBC	1	Word
OFB	1	Word
CFB 64-bit	1	Word
CFB 32-bit	1	Word
CFB 16-bit	1	Half-word
CFB 8-bit	1	Byte

### 61.4.3 Last Output Data Mode (CBC-MAC)

This mode is used to generate cryptographic checksums on data (MAC) using a CBC-MAC or a CFB encryption algorithm (refer to *FIPS Publication 81 Appendix F*).

The CMAC algorithm is a variant of CBC-MAC with post-processing requiring one-block encryption in ECB mode. Thus CBC-MAC is useful to accelerate CMAC.

After each end of encryption/decryption, the output data is available either on the output data registers for Manual and Auto modes or at the address specified in the receive buffer pointer for DMA mode (See [Last Output Data Mode Behavior versus Start Modes](#)).

The Last Output Data bit (LOD) in TDES\_MR can be used to retrieve only the last data of several encryption/decryption processes.

This data is only available on the Output Data Registers (TDES\_ODATARx).

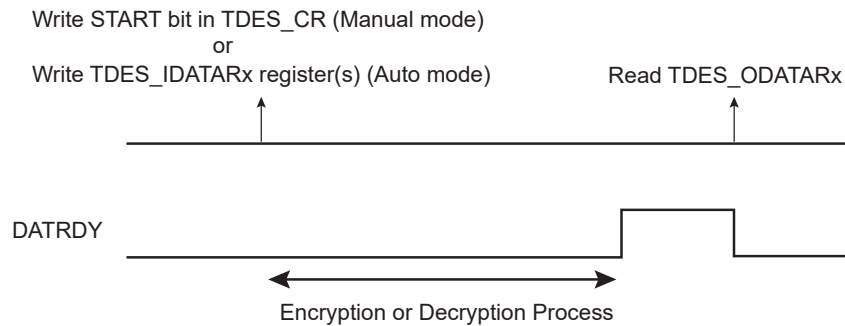

Therefore, there is no need to define a read buffer in DMA mode.

#### 61.4.3.1 Manual and Auto Modes

##### 61.4.3.1.1 TDES\_MR.LOD = 0

The DATRDY flag is cleared when at least one of the Output Data Registers is read. See the figure below.

**Figure 61-1. Manual and Auto Modes with LOD = 0**

If the user does not want to read the output data registers between each encryption/decryption, the DATRDY flag will not be cleared. If the DATRDY flag is not cleared, the user will not be informed of the end of the encryptions/decryptions that follow.

##### 61.4.3.1.2 TDES\_MR.LOD = 1

The DATRDY flag is cleared when at least one Input Data Register is written, before the start of a new transfer. See the figure below. No further Output Data Register reads are necessary between consecutive encryptions/decryptions.

**Figure 61-2. Manual and Auto Modes with LOD = 1**

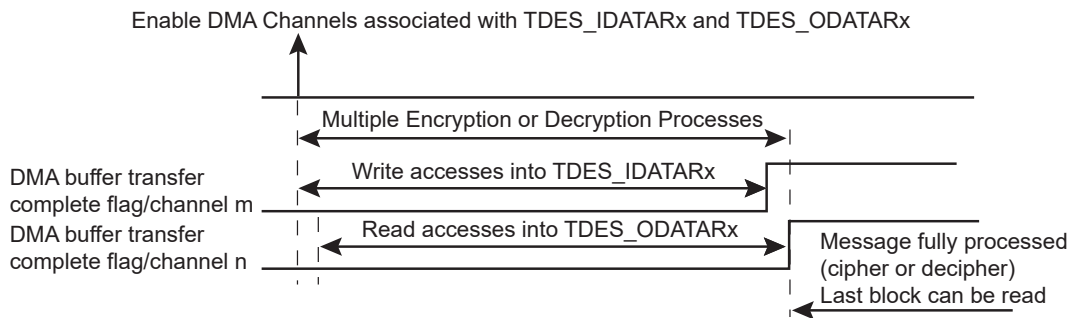

### 61.4.3.2 DMA Mode

#### 61.4.3.2.1 TDES\_MR.LOD = 0

This mode may be used for all TDES operating modes except CBC-MAC where LOD = 1 mode is recommended.

The end of the encryption/decryption is indicated by the end of DMA transfer associated to TDES\_ODATARx (see the figure below). Two DMA channels are required: one for writing message blocks to TDES\_IDATARx and one to obtain the result from TDES\_ODATARx.

**Figure 61-3. DMA Transfer with LOD = 0**

#### 61.4.3.2.2 TDES\_MR.LOD = 1

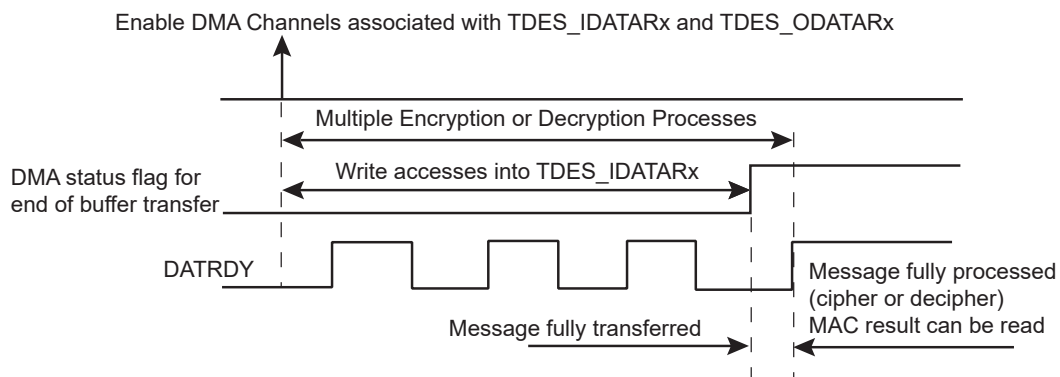

This mode is optimized to process the TDES CBC-MAC operating mode.

The user must first wait for the DMA buffer transfer complete flag, then for the flag DATRDY to rise to ensure that the encryption/decryption is completed (see the figure below).

The DMA receive channel must not be used. Prior to reading the CBC-MAC result, TDES\_MR.SMODO must be written to '0'. To restart a CBC-MAC on a new buffer, TDES\_MR.SMODO must be written to '2'.

The output data is only available on TDES\_ODATARx.

**Figure 61-4. DMA Transfer with LOD = 1**

The table below summarizes the different cases.

**Table 61-4. Last Output Data Mode Behavior versus Start Modes**

Sequence	Manual and Auto Modes		DMA Transfer	
	LOD = 0	LOD = 1	LOD = 0	LOD = 1
DATRDY Flag Clearing Condition <sup>(1)</sup>	At least one Output Data Register must be read	At least one Input Data Register must be written	Not used	Managed by the DMA

# SAMA5D2 Series

## Triple Data Encryption Standard (TDES)

.....continued				
Sequence	Manual and Auto Modes		DMA Transfer	
	LOD = 0	LOD = 1	LOD = 0	LOD = 1
End of Encryption/ Decryption	DATRDY	DATRDY	2 DMA Buffer transfer complete flags (channel m and channel n)	DMA buffer transfer complete flag, then TDES DATRDY flag
Encrypted/ Decrypted Data Result Location	In the Output Data Registers	In the Output Data Registers	Not available	In the Output Data Registers

**Note:** Depending on the mode, there are other ways of clearing the DATRDY flag. See [TDES Interrupt Status Register](#).

In DMA mode, reading to the Output Data registers before the last data transfer may lead to unpredictable results.

### 61.4.4 Security Features

#### 61.4.4.1 Unspecified Register Access Detection

When an unspecified register access occurs, the URAD bit in TDES\_ISR is set. Its source is then reported in the Unspecified Register Access Type field (URAT). Only the last unspecified register access is available through the URAT field.

Several kinds of unspecified register accesses can occur:

- Input Data Register written during the data processing in DMA mode
- Output Data Register read during the data processing
- Mode Register written during the data processing
- Write-only register read access

The URAD bit and the URAT field can only be reset by the SWRST bit in TDES\_CR.

# SAMA5D2 Series

### 61.5.1 TDES Control Register

**Name:** TDES\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

#### Bit 8 – SWRST Software Reset

Value	Description
0	No effect
1	Resets the TDES. A software triggered hardware reset of the TDES interface is performed.

#### Bit 0 – START Start Processing

Value	Description
0	No effect
1	Starts Manual encryption/decryption process.

### 61.5.2 TDES Mode Register

**Name:** TDES\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
							CFBS[1:0]	
Access							R/W	R/W
Reset							0	0
Bit	15	14	13	12	11	10	9	8
	LOD		OPMOD[1:0]				SMOD[1:0]

				KEYMOD		TDESMOD[1:0]		CIPHER
Access				R/W		R/W	R/W	R/W
Reset				0		0	0	0

#### Bits 17:16 – CFBS[1:0] Cipher Feedback Data Size

Value	Name	Description
0	SIZE_64BIT	64-bit
1	SIZE_32BIT	32-bit
2	SIZE_16BIT	16-bit
3	SIZE_8BIT	8-bit

#### Bit 15 – LOD Last Output Data Mode

In DMA mode, reading to the Output Data registers before the last data encryption/decryption process may lead to unpredictable result.

Value	Description
0	<p>No effect.</p> <p>After each end of encryption/decryption, the output data is available either on the output data registers (Manual and Auto modes) .</p> <p>In Manual and Auto modes, the DATRDY flag is cleared when at least one of the Output Data registers is read.</p>

Value	Description
1	The DATRDY flag is cleared when at least one of the Input Data Registers is written.  No more Output Data Register reads are necessary between consecutive encryptions/decryptions (see <a href="#">Last Output Data Mode</a> ).

**Bits 13:12 – OPMOD[1:0]** Operating Mode

For CBC-MAC operating mode, set OPMOD to CBC and LOD to 1.

Value	Name	Description
0	ECB	Electronic Code Book mode
1	CBC	Cipher Block Chaining mode
2	OFB	Output Feedback mode
3	CFB	Cipher Feedback mode

**Bits 9:8 – SMOD[1:0]** Start Mode

If a DMA transfer is used, 0x2 must be configured. See [DMA Mode](#) for more details.

Value	Name	Description
0	MANUAL_START	Manual Mode
1	AUTO_START	Auto Mode
2	IDATAR0_START	TDES_IDATAR0 accesses only Auto Mode

**Bit 4 – KEYMOD** Key Mode

Value	Description
0	Three-key algorithm is selected.
1	Two-key algorithm is selected. There is no need to write Key 3 Registers TDES_KEY3WRx.

**Bits 2:1 – TDESMOD[1:0]** ALGORITHM Mode

Values which are not listed in the table must be considered as “reserved”.

Value	Name	Description
0	SINGLE_DES	Single DES processing using Key 1 Registers
1	TRIPLE_DES	Triple DES processing using Key 1, Key 2 and Key 3 Registers
2	XTEA	XTEA processing using Key 1 and Key 2 Registers

**Bit 0 – CIPHER** Processing Mode

Value	Name	Description
0	DECRYPT	Decrypts data.
1	ENCRYPT	Encrypts data.

### 61.5.3 TDES Interrupt Enable Register

**Name:** TDES\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Access  
Reset

Access

### 61.5.6 TDES Interrupt Status Register

**Name:** TDES\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

**Bits 13:12 – URAT[1:0]** Unspecified Register Access (cleared by setting bit TDES\_CR.SWRST)  
 Only the last Unspecified Register Access Type is available through the URAT field.

Value	Name	Description
0	IDR_WR_PROCESSING	Input Data Register written during data processing when SMOD = 0x2 mode.
1	ODR_RD_PROCESSING	Output Data Register read during data processing.
2	MR_WR_PROCESSING	Mode Register written during data processing.
3	WOR_RD_ACCESS	Write-only register read access.

**Bit 8 – URAD** Unspecified Register Access Detection Status (cleared by setting bit TDES\_CR.SWRST)

Value	Description
0	No unspecified register access has been detected since the last write of bit TDES_CR.SWRST.
1	At least one unspecified register access has been detected since the last write of bit TDES_CR.SWRST.

**Bit 0 – DATRDY** Data Ready (cleared by setting bit START or bit SWRST in TDES\_CR or by reading TDES\_ODATARx)

If TDES\_MR.LOD = 1: In Manual and Auto modes, the DATRDY flag can also be cleared by writing at least one TDES\_IDATARx.

# SAMA5D2 Series

## Triple Data Encryption Standard (TDES)

---

---

Value	Description
0	Output data is not valid.
1	Encryption or decryption process is completed.

### 61.5.7 TDES Key 1 Word Register x

**Name:** TDES\_KEY1WRx  
**Offset:** 0x20 + x\*0x04 [x=0..1]  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	KEY1W[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

#### Bits 31:0 – KEY1W[31:0] Key 1 Word

The two 32-bit Key 1 Word registers are used to set the 64-bit cryptographic key used for encryption/decryption.

KEY1W0 refers to the first word of the key and KEY1W1 to the last one.

These registers are write-only to prevent the key from being read by another application.

In XTEA mode, the key is defined on 128 bits. These registers contain the 64 LSB bits of the encryption/decryption key.

### 61.5.8 TDES Key 2 Word Register x

**Name:** TDES\_KEY2WRx  
**Offset:** 0x28 + x\*0x04 [x=0..1]  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	KEY2W[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	KEY2W[23:16]

	KEY2W[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	KEY2W[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 31:0 – KEY2W[31:0] Key 2 Word**

The two 32-bit Key 2 Word registers are used to set the 64-bit cryptographic key used for encryption/decryption.

KEY2W0 refers to the first word of the key and KEY2W1 to the last one.

These registers are write-only to prevent the key from being read by another application.

TDES\_KEY2WRx registers are not used in DES mode.

In XTEA mode, the key is defined on 128 bits. These registers contain the 64 MSB bits of the encryption/decryption key.

### 61.5.9 TDES Key 3 Word Register x

**Name:** TDES\_KEY3WRx  
**Offset:** 0x30 + x\*0x04 [x=0..1]  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	KEY3W[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	KEY3W[23:16]

	KEY3W[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	KEY3W[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

#### Bits 31:0 – KEY3W[31:0] Key 3 Word

The two 32-bit Key 3 Word registers are used to set the 64-bit cryptographic key used for encryption/decryption.

KEY3W0 refers to the first word of the key and KEY3W1 to the last one.

These registers are write-only to prevent the key from being read by another application.

TDES\_KEY3WRx registers are not used in DES mode, TDES with two-key algorithm selected and XTEA mode.

### 61.5.10 TDES Input Data Register x

**Name:** TDES\_IDATARx  
**Offset:** 0x40 + x\*0x04 [x=0..1]  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	IDATA[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	IDATA[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	IDATA[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

#### Bits 31:0 – IDATA[31:0] Input Data

The two 32-bit Input Data registers are used to set the 64-bit data block used for encryption/decryption.

IDATA0 refers to the first word of the data to be encrypted/decrypted, and IDATA1 to the last one.

These registers are write-only to prevent the input data from being read by another application.

### 61.5.11 TDES Output Data Register x

**Name:** TDES\_ODATARx  
**Offset:** 0x50 + x\*0x04 [x=0..1]  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	ODATA[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	ODATA[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	ODATA[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	ODATA[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – ODATA[31:0] Output Data

The two 32-bit Output Data registers contain the 64-bit data block which has been encrypted/decrypted.

ODATA1 refers to the first word, ODATA2 to the last one.

### 61.5.12 TDES Initialization Vector Register x

**Name:** TDES\_IVRx  
**Offset:** 0x60 + x\*0x04 [x=0..1]  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	IV[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	IV[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	IV[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	IV[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

#### Bits 31:0 – IV[31:0] Initialization Vector

The two 32-bit Initialization Vector registers are used to set the 64-bit initialization vector data block, which is used by some modes of operation as an additional initial input.

IV1 refers to the first word of the Initialization Vector, IV2 to the last one.

These registers are write-only to prevent the Initialization Vector from being read by another application.

These registers are not used for the ECB mode and must not be written.

### 61.5.13 TDES XTEA Rounds Register

**Name:** TDES\_XTEA\_RNDR  
**Offset:** 0x70  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 5:0 – XTEA\_RNDS[5:0] Number of Rounds

This 6-bit field is used to define the number of complete rounds (1 complete round = 2 Feistel rounds) processed in XTEA algorithm.

The value of XTEA\_RNDS has no effect if the TDESMOD field in TDES\_MR is set to 0x0 or 0x1.

0x00 corresponds to 1 complete round, 0x01 corresponds to 2 complete rounds, etc.

## 62. True Random Number Generator (TRNG)

### 62.1 Description

The True Random Number Generator (TRNG) passes the American *NIST Special Publication 800-22 (A Statistical Test Suite for Random and Pseudorandom Number Generators for Cryptographic Applications)* and the *Diehard Suite of Tests*.

The TRNG may be used as an entropy source for seeding an NIST approved DRNG (Deterministic RNG) as required by FIPS PUB 140-2 and 140-3.

### 62.2 Embedded Characteristics

- Passes *NIST Special Publication 800-22 Test Suite*
- Passes *Diehard Suite of Tests*
- May be Used as Entropy Source for seeding a NIST-approved DRNG (Deterministic RNG) as required by FIPS PUB 140-2 and 140-3
- Provides a 32-bit Random Number Every 84 Clock Cycles

### 62.3 Block Diagram

**Figure 62-1. TRNG Block Diagram**

### 62.4 Product Dependencies

#### 62.4.1 Power Management

The TRNG interface may be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the TRNG user interface clock. The user interface clock is independent from any clock that may be used in the entropy source logic circuitry. The source of entropy can be enabled before enabling the user interface clock.

#### 62.4.2 Interrupt Sources

The TRNG interface has an interrupt line connected to the Interrupt Controller. In order to handle interrupts, the Interrupt Controller must be programmed before configuring the TRNG.

## **62.5 Functional Description**

As soon as the TRNG is enabled in the Control register (TRNG\_CR), the generator provides one 32-bit random value every 84 clock cycles.

The TRNG interrupt line can be enabled in the Interrupt Enable register (TRNG\_IER), and disabled in the Interrupt Disable register (TRNG\_IDR). This interrupt is set when a new random value is available and is cleared when the Status register (TRNG\_ISR) is read. The flag TRNG\_ISR.DATRDY is set when the random data is ready to be read out on the 32-bit Output Data register (TRNG\_ODATA).

Bit	7	6	5	4	3	2	1	0
								ENABLE
Access								W
Reset								–

#### Bits 31:8 – WAKEY[23:0] Register Write Access Key

Value	Name	Description
0x524E47	PASSWD	Writing any other value in this field aborts the write operation.

#### Bit 0 – ENABLE Enable TRNG to Provide Random Values

Value	Description
0	Disables the TRNG if 0x524E47 (“RNG” in ASCII) is written in WAKEY field at the same time.
1	Enables the TRNG if 0x524E47 (“RNG” in ASCII) is written in WAKEY field at the same time.

### 62.6.2 TRNG Interrupt Enable Register

**Name:** TRNG\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

**Bit 0 – DATRDY** Data Ready Interrupt Enable

Value	Description
0	No effect.
1	Enables the corresponding interrupt.

### 62.6.3 TRNG Interrupt Disable Register

**Name:** TRNG\_IDR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

#### Bit 0 – DATRDY Data Ready Interrupt Disable

Value	Description
0	No effect.
1	Disables the corresponding interrupt.

### 62.6.4 TRNG Interrupt Mask Register

**Name:** TRNG\_IMR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bit 0 – DATRDY Data Ready Interrupt Mask

Value	Description
0	The corresponding interrupt is not enabled.
1	The corresponding interrupt is enabled.

### 62.6.5 TRNG Interrupt Status Register

**Name:** TRNG\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

**Bit 0 – DATRDY** Data Ready (cleared on read)

Value	Description
0	Output data is not valid or TRNG is disabled.
1	New random value is completed since the last read of TRNG_ODATA.

### 62.6.6 TRNG Output Data Register

**Name:** TRNG\_ODATA  
**Offset:** 0x50  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
ODATA[31:24]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
ODATA[23:16]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
ODATA[7:0]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – ODATA[31:0] Output Data

The 32-bit Output Data register contains the 32-bit random data.

## 63. Analog Comparator Controller (ACC)

### 63.1 Description

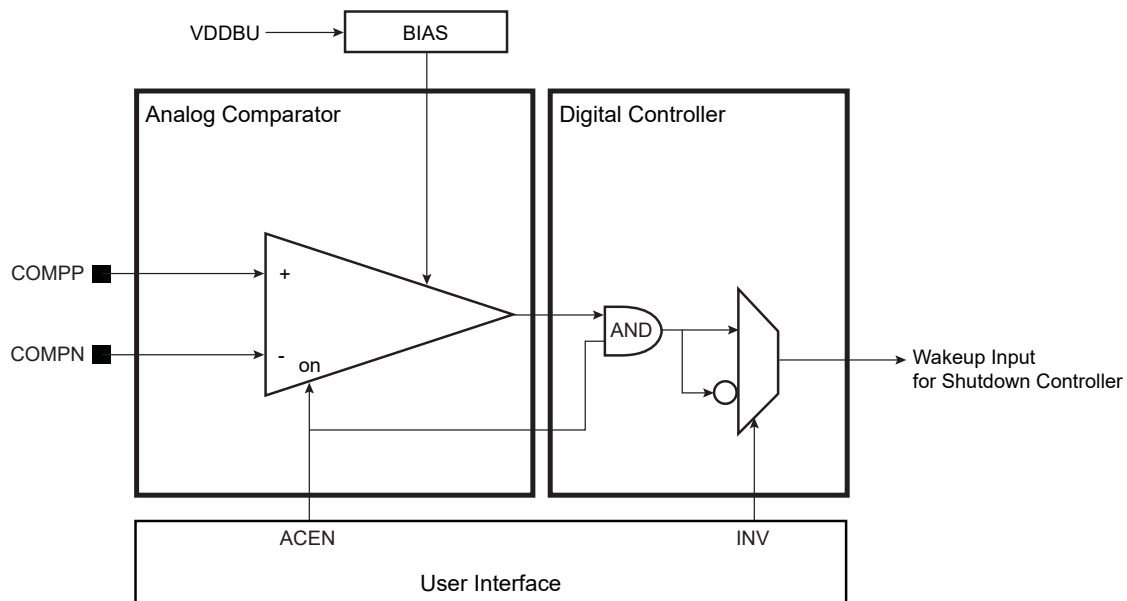

The Analog Comparator Controller (ACC) controls the analog comparator in order to provide an additional source of wakeup when the system wakes up from Wait mode.

### 63.2 Embedded Characteristics

- Source of Wakeup When System Wakes Up from Wait Mode and ULP1 Mode

### 63.3 Block Diagram

Figure 63-1. Analog Comparator Controller Block Diagram

### 63.4 Signal Description

Table 63-1. ACC Signal Description

Pin Name	Description	Type
COMPP, COMPN	External analog data inputs	Input

### 63.5 Product Dependencies

#### 63.5.1 I/O Lines

The analog input pins (COMPP and COMPN) are not multiplexed with digital functions (PIO) on the I/O line.

### 63.5.2 Power Management

By clearing the ACEN bit in the ACC Mode Register (ACC\_MR), the analog comparator power consumption is reduced to current leakage only.

## 63.6 Functional Description

### 63.6.1 Description

The analog comparator is enabled by writing a one to the ACEN bit in the ACC Mode Register (ACC\_MR) and the polarity of the comparator output can be configured with bit ACC\_MR.INV.

The ACC registers are listed in the Register Summary.

### 63.6.2 Register Write Protection

To prevent any single software error from corrupting ACC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the ACC Write Protection Mode Register (ACC\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the [ACC Write Protection Status Register](#) (ACC\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the ACC\_WPSR register.

The following registers can be write-protected:

- [ACC Mode Register](#)

### 63.7 Register Summary

Offset	Name	Bit Pos.							
0x00	ACC_CR	7:0							SWRST
		15:8							
		23:16							
		31:24							
0x04	ACC_MR	7:0

## Analog Comparator Controller (ACC)

### 63.7.1 ACC Control Register

**Name:** ACC\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

#### Bit 0 – SWRST Software Reset

Value	Description
0	No effect.
1	Resets the module.

### 63.7.2 ACC Mode Register

**Name:** ACC\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ACC Write Protection Mode Register](#).

**Bit 12 – INV** Invert Comparator Output  
 0 (DIS): Analog comparator output is directly processed.  
 1 (EN): Analog comparator output is inverted prior to being processed.

**Bit 8 – ACEN** Analog Comparator Enable  
 0 (DIS): Analog comparator disabled.  
 1 (EN): Analog comparator enabled.

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x414343	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit.
3		Always reads as 0.

#### Bit 0 – WPEN Write Protection Enable

Refer to [Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x414343 (“ACC” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x414343 (“ACC” in ASCII).

### 63.7.4 ACC Write Protection Status Register

**Name:** ACC\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bit 0 – WPVS Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of ACC_WPSR.
1	A write protection violation (WPEN = 1) has occurred since the last read of ACC_WPSR.

## **64. Security Module (SECUMOD)**

### **64.1 Description**

The Security Module (SECUMOD) features different levels of security depending on the device reference. This section describes the protections embedded in the SECUMOD available on all SAMA5D2 devices.

This module embeds the secure memories (5 Kbytes of SRAM and a 256-bit register bank) dedicated to the storage of sensitive data. These memories are scrambled with a programmable 32-bit key.

When a fault is detected, regardless of the source, a clear signal can be sent automatically to the secure memories and clear their contents.

For information specific to dynamic tamper protection (PIOBU), refer to the document “SAMA5D2 External Tamper Protections”(document no. 44095).

For information specific to temperature, voltage and frequency monitoring for SAMA5D23 and SAMA5D28, refer to the document “SAMA5D23 and SAMA5D28 Environmental Monitors” (document no. 44036).

### **64.2 Embedded Characteristics**

A PIO Controller managing up to eight pads (PIOBU) and offering:

- Standard I/O function powered in the backup domain
- Eight external switch state change detectors
- Memory erase and scrambling
- Backup SRAM access and Zeroisation process

### 64.3 Block Diagram

Figure 64-1. SECUMOD Block Diagram

The above figure represents the logic inside the SECUMOD. Analog cells are external to the IP and highlighted in green.

#### 64.3.1 I/O Lines Description

Table 64-1. I/O Lines Description

Name	Description	Type
CLK32KHZ	32 kHz system clock from crystal or RC oscillator (SLCK)	Input
ICLK	64 kHz RC Oscillator	Input
PIOBU[7:0]	Parallel IO backup controller, 8 pads	I/O

.....continued		
Name	Description	Type
IRQ[1:0]	Interrupt signals going to secure AIC	Output
SWKUP	Wakeup signal going to system controller WKUP1 pin	Output
FNTRST	Force Cortex-A5 test port reset	Output

## 64.4 Product Dependencies

### 64.4.1 Interrupt Sources

The SECUMOD provides two interrupt lines, each connected to one of the internal sources of the Advanced Interrupt Controller. Using these interrupts requires the AIC to be programmed first. Note that it is not recommended to use the interrupt lines in Edge-sensitive mode.

The first interrupt line (SECURAM ID) is dedicated to backup memories access right violations signaling, or end of erase (automatic or software erase) signaling.

The second interrupt line (SECUMOD ID) is shared by all the protection mechanisms.

See the [Register Summary](#) section for more information about interrupt acknowledgement.

The SECURAM and the SECUMOD interrupt lines are connected to the Interrupt Controller. The Interrupt Controller must be programmed before configuring the SECURAM or the SECUMOD.

## 64.5 Functional Description

### 64.5.1 Memory Mapping

The SECUMOD embeds 5 Kbytes of SRAM split in two parts: the lower 4 Kbytes are erased in case of intrusion (BUSRAM4KB) while the upper 1 Kbyte is never erased (BUSRAM1KB). A 256-bit register bank is available as an additional memory and is totally erased in case of intrusion (BUREG256b).

All memories support 8-bit, 16-bit and 32-bit access sizes.

For power optimization, the transfers between the processor and these memories are decreased by a factor of 4.

The base address value of the SECURAM is 0xF8044000.

**Figure 64-2. SECUMOD Internal Memory Map**

### 64.5.2 Scrambling Keys

The secure memories (BUSRAM4KB, BUSRAM1KB and BUREG256b) are scrambled. The scrambling is enabled after reset and a scrambling key is automatically generated. The scrambling key can be modified through the Scrambling Key register (SECUMOD\_SCRKEY).

Scrambling can be disabled using the Control register (SECUMOD\_CR).

### 64.5.3 Internal Random Number Generator (IRNG)

The RNG cannot be read through the User Interface (a TrueRNG external to the SECUMOD is available for this purpose).

### 64.5.4 Protection Mechanisms

#### 64.5.4.1 PIO Backup Controller

The SECUMOD includes a PIO Controller powered by VDDDBU which handles the eight PIOBU I/O pins.

Each I/O line is controlled by the PIO Controller and each pin can be configured to be driven. This is done by writing in the corresponding SECUMOD PIO Backup register (SECUMOD\_PIOBUx). When SECUMOD\_PIOBUx.OUTPUT is at '0', the corresponding I/O line is used as an input only. When this bit is at '1', the corresponding I/O line is driven by the PIO Backup Controller.

##### 64.5.4.1.1 Output Mode

When SECUMOD\_PIOBUx.OUTPUT is set, the level driven on an I/O line can be determined by setting or clearing the PIO\_SOD bit (Set Output Data). The value of this bit represents the data driven on the corresponding I/O line.

##### 64.5.4.1.2 Input Mode

The level on an I/O line can be read through the PIO\_PDS bit (Pin Data Status) in the corresponding SECUMOD\_PIOBUx. This bit indicates the level of the I/O line regardless of its configuration, whether as an input or driven by the PIO Controller.

##### 64.5.4.1.3 Static Intrusion Detectors and Programmable Internal Pullup/Pulldown

Intrusion detectors can be placed around the system to detect any intrusion attempt. This requires the corresponding I/O lines to be configured as inputs (SECUMOD\_PIOBUx.OUTPUT = 0).

##### 64.5.4.1.4 Static Intrusion Detection

The detectors can be configured to detect either the rising edge or the falling edge on switches via SECUMOD\_PIOBUx.SWITCH.

Example: A detector can consist of a normally-closed switch which sends a zero signal to the Protection Unit. When an intrusion attempt occurs, the switch state changes to an open position. The debounce filter waits until an intrusion has been detected for a programmable continuous period to send an alarm signal to the Protection Unit. This is to prevent erroneous intrusion detections.

##### 64.5.4.1.5 Internal Pullup/Pulldown

The user has the possibility to connect an internal pullup or pulldown (around 100 kΩ) by configuring SECUMOD\_PIOBUx.PULLUP accordingly.

Configuring this field with a pullup or pulldown value activates the corresponding pullup/pulldown permanently.

**Note:** Internal pullups are connected at reset state.

##### 64.5.4.1.6 Scheduled Pullup/Pulldown

In order to reduce the power consumption on the VDDDBU power supply, all activated pullups/pulldowns can be scheduled by following the steps below:

1. Activate the required pullup/pulldown.
2. Measure the level on the PIOBUx pin.
3. Deactivate the pullup/pulldown.

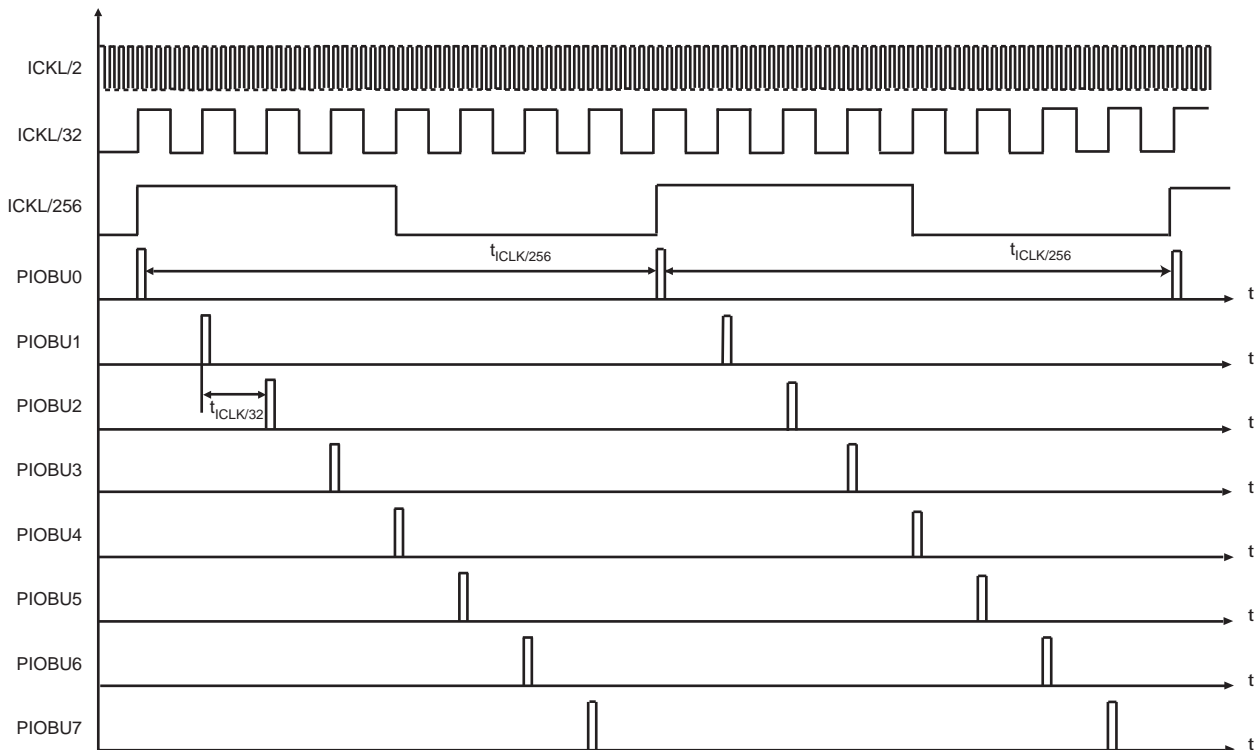

Scheduling is enabled by setting SECUMOD\_PIOBUx.SCHEDULE.

**Note:** This feature is only effective if the PULLUP field indicates that a pullup or a pulldown is connected.

### 64.5.4.1.7 Debouncing Time

The debouncing time is common to all I/Os. The principle is presented in the following figure. A period ( $f_{\text{CLK}}/2$ ) is allocated to each I/O. During that period, if SECUMOD\_PIOBUx.SCHEDULE is set and if a pullup/pulldown is needed (PULLUP field different from 0), the pullup/pulldown is activated, the level is measured and the pullup/pulldown is deactivated. Otherwise, only the level is measured. Measurement is performed at the end of the allocated period.

**Figure 64-3. Schedule Principle**

**Table 64-2. Timings vs.  $f_{\text{CLK}}$**

Timing	$f_{\text{CLK}}$ (kHz)			Units
	Min = 38	Typ = 64	Max = 90	
$t_{\text{CLK}/2}$	53	31	22	$\mu\text{s}$
$t_{\text{CLK}/32}$	842	500	356	$\mu\text{s}$
$t_{\text{CLK}/256}$	6.74	4.00	2.84	ms

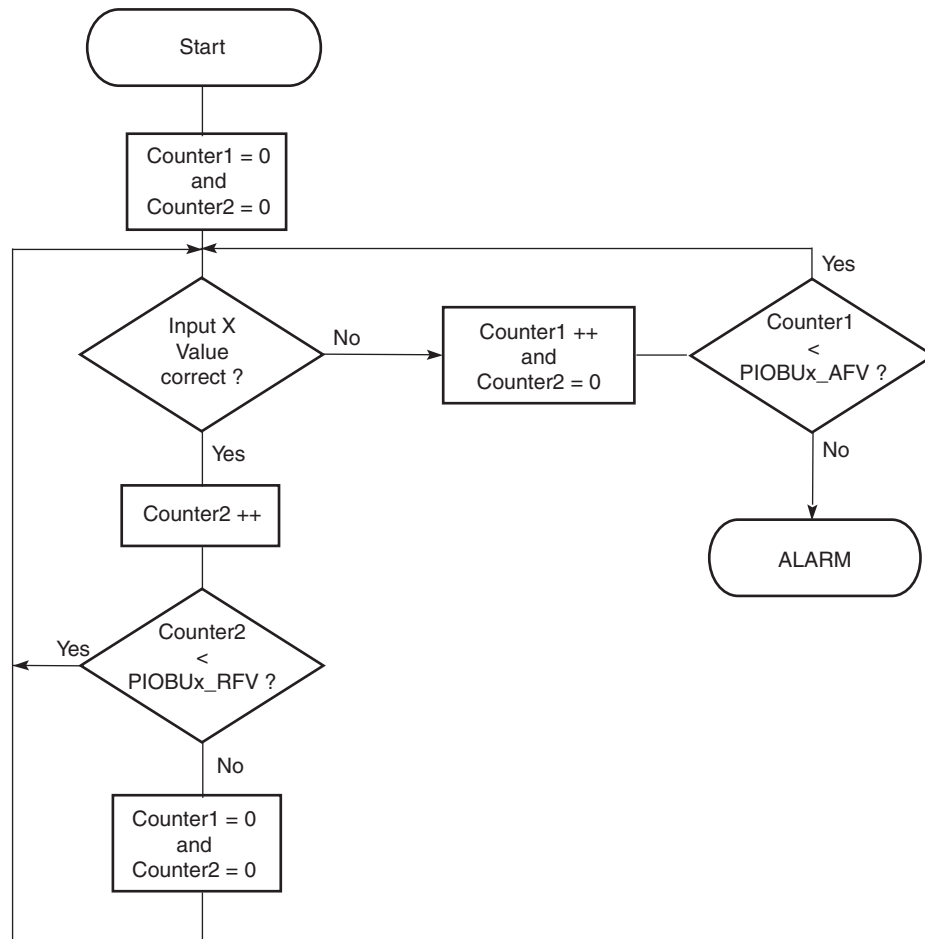

### 64.5.4.1.8 PIOBUx Alarm Filtering in Static Mode

It is possible to filter the PIOBUx alarm detection by programming SECUMOD\_PIOBUx.PIOBU\_AFV. The steps are as follows:

1. A 9-bit counter is incremented each time the value present on the corresponding input is not the expected one.
2. An alarm is sent to the Protection Unit if the counter value reaches the value programmed in PIOBU\_AFV.

The previous 9-bit counter is reset only if the value present on the input is correct and stable for a continuous programmable period defined by SECUMOD\_PIOBUx.PIOBU\_RFV (a second counter is used for that operation). See the figure below.

**Figure 64-4. PIOBUx Alarm Filtering Principle**

At reset state, the debouncers are not activated (PIOBU\_AFV and PIOBU\_RFV fields set to 0), which implies that no alarm can be generated.

Once both the PIOBU\_AFV and the PIOBU\_RFV fields have been programmed, the corresponding protection is activated and a CLR signal is generated automatically when an intrusion is detected. It is possible to generate an interrupt (or a wakeup signal) instead of clearing the secure memories content. To do so, the user must disable the protection in the Normal Mode Protection register (SECUMOD\_NMPR) and configure the Normal Interrupt Enable Protection register (SECUMOD\_NIEPR).

**Note:** If the Normal Mode Protection/Backup Mode Protection registers are not hidden, their configuration has priority on the debouncer activation in the PIOBUx configuration registers, which means that CLR signal generation is enabled/disabled in those two registers. Setting the PIOBU\_AFV and PIOBU\_RFV fields configure the debouncer sensitivity and does not generate any clear signal when an intrusion is detected.

**Table 64-3. Debouncing Time vs.  $f_{ICLK}$**

Debouncing Time	$f_{ICLK}$ (kHz)			Unit
	Min = 38	Typ = 64	Max = 90	
Min (PIOBU_AFV = 1)	6.74	4.00	2.84	ms
Max (PIOBU_AFV = 9)	3.45	2.05	1.46	s

**Note:** At reset state, the PIOBU\_AFV and PIOBU\_RFV fields are set to 0.

### 64.5.4.2 JTAG Prevention

#### 64.5.4.2.1 Debug Interface Access Prevention

The SECUMOD can be used to block access to the system through the ARM processor's Debug Access Port interface. This feature is implemented via SECUMOD\_JTAGCR, which enables assertion of the nDBGRESET reset input of the debug interface. Writing a '1' to SECUMOD\_JTAGCR.FNTRST prevents any activity on the TAP (Test Access Port) controller.

On standard devices, FNTRST resets to '0' and thus does not prevent debug access.

FNTRST also locks the boundary scan when set.

#### 64.5.4.2.2 Physical Restrictions for JTAG Debug Mode

Invasive and non-invasive debug modes are controlled by four input pins of the Debug Access Port: DBGEN, SPIDEN, NIDEN and SPNIDEN.

In order to restrict the debug to nonsecure software parts only, the SEC\_DEBUG\_DIS fuse has to be configured in the customer fuse matrix.

Programming this fuse prevents JTAG secure debug irreversibly, but does not lock non-secure debug.

#### 64.5.4.2.3 Software Restrictions for JTAG Debug Mode

Setting SECUMOD\_JTAGCR.CA5\_DEBUG\_MODE sets the DBGEN, SPIDEN, NIDEN and SPNIDEN Cortex inputs to the appropriate level in order to allow different debug permission levels. See [64.6.7 SECUMOD\\_JTAGCR](#) for more information.

#### 64.5.4.2.4 Software Prevention for JTAG Debug

It is possible to prevent JTAG Debug accesses by forcing the reset signal of Debug Access Port by software.

While the reset signal is maintained low, the JTAG Debug interface cannot be used. To maintain the Debug Access Port in reset state, set SECUMOD\_JTAGCR.FNTRST (in this case, Boundary JTAG is also disabled).

The key used for the BUREG256b scrambler/descrambler is derived from the BUSRAM4KB key and thus benefits from the same protection.

### 64.5.5 Erasing Secure Memories

#### 64.5.5.1 BUSRAM4KB Erase Sequence

##### 64.5.5.1.1 Principle

The BUSRAM4KB Erase sequence is controlled by an automaton which is activated by the CLR signal.

The following table shows the time to perform a partial erase (one erased word out of eight on the entire BUSRAM4KB), and the time to perform a full erase.

**Table 64-4. Erase Time Evaluation vs.  $f_{\text{CLK}}$**

Erase	$f_{\text{CLK}}$ Frequency (kHz)			Unit
	Min = 38	Typ = 64	Max = 90	
Partial Erase	1.68	1.00	0.71	ms
Full Erase (4 Kbytes)	13.47	8.00	5.69	

During the Erase sequence, the upper 1 Kbyte of memory (BUSRAM1KB) is still accessible by the system.

The erase is a write of random values instead of erase to zero.

### 64.5.5.2 BUREG256b Erase Sequence

In parallel to the BUSRAM4KB Erase, the BUREG256b register bank is erased.

BUREG256b is always reset after a VDDBU powerup.

These registers are seen as zero after reset or after an erase.

#### 64.5.5.2.1 During and After BUSRAM4KB and BUREG256b Erase Sequence

Some flags can be read to know the real-time erase state of the memories. On completion of the Erase sequence, the SECURAM ID interrupt line is asserted.

### 64.5.6 Operating Modes

The SECUMOD is supplied by the VDDBU power supply. It is not possible to program the SECUMOD if VDDBU is not present.

The SECUMOD macrocell is able to operate in two different modes:

- When all supplies are present and can be monitored, the SECUMOD can be switched to Normal mode.
- Otherwise, the SECUMOD must be in Backup mode.

**Note:** After a powerup reset, the SECUMOD is in Backup mode.

The mode is selected by setting either SECUMOD\_CR.NORMAL or SECUMOD\_CR.BACKUP.

**Note:** The user must set SECUMOD\_CR.BACKUP to enter Backup mode prior to shutting off the VDDCORE power supplies.

In both modes, the user can enable or disable a protection by writing in the corresponding Mode Protection register. See [64.5.7 Activation or Deactivation of Protections](#) for more information.

#### 64.5.6.1 Protection Unit

The Protection Unit is used to centralize all alarms coming from the different monitors. When an alarm is detected, the Protection Unit sends a Clear signal to the automaton, which starts the secure memories Erase sequence if the memory is not empty.

The Protection Unit can also send:

- an IRQ interrupt signal (only in Normal mode)
- an SWKUP wakeup signal (only in Backup mode).

When an interrupt or a wakeup signal is generated, it is up to the user to detect the source of the alarm and to act accordingly, i.e., to clear the secure memories content or not.

As soon as an alarm is detected, the corresponding bit is set in the Status register (SECUMOD\_SR). The only way to clear this bit is to set it in the Status Clear register (SECUMOD\_SCR).

**Note:** Once a status bit is raised, it should not be cleared before the next slow clock period. If a clear does occur, the status bit rises again and the same alarm will be seen twice. To prevent this, it is recommended to wait at least one slow clock period after reading the Status register before clearing the status bits.

If a Clear of the secure memories content has been performed by the automaton, an ERASE\_DONE flag is set to indicate that the secure memories content is not valid anymore. While the secure memories are erased, write accesses have no effect and read accesses return a static and invalid value (except for BUSRAM1KB).

### 64.5.7 Activation or Deactivation of Protections

It is possible to activate or deactivate each protection separately by writing in the Normal and Backup Mode Protection registers. These registers are hidden and the only way to make them appear is to write SECUMOD\_CR.KEY with the correct value. This command field acts on a toggle basis: writing the correct value makes the registers appear and disappear.

At reset state, all protections are activated except the sixteen corresponding to the intrusion detectors (need to program PIOBUx).

### 64.5.8 Powerup Reset

After a powerup reset, the SECUMOD is in Backup mode, but in an unpredictable state.

The Slow Clock oscillator takes about one second to startup. It is also possible that monitors send alarms to the Protection Unit. However, a Clear command can be performed because the secure memories content is empty.

Care must be taken when writing in BUSRAM4KB or BUREG256b after reset. The user must make sure that no Erase sequence is running, otherwise the write access to BUSRAM4KB or BUREG256b is aborted. It is recommended to wait for the system to be established before accessing BUSRAM4KB or BUREG256b. This can last for at least one or two seconds. The verification is performed by reading the Status register. If there is no error for a continuous period (one second, for example), the user can access BUSRAM4KB or BUREG256b. If at least one error is detected, the user has to wait first for the ERASE\_DONE flag to rise, and then wait again for at least one slow clock period after reading the Status register before writing content in the Status Clear register. At this stage, all status bits should be cleared. The user must then ensure that no error is raised in the Status register during the next second, for example.

Access						W	W	W	
Reset						–	–	–	

#### Bits 31:16 – KEY[15:0] Password

This command field acts on a toggle basis: writing the value 0x89CA alternatively makes the Normal or Backup Protection Registers appear and disappear.

Writing any other value in this field has no effect.

#### Bits 10:9 – SCRAMB[1:0] Memory Scrambling Enable

Value	Description
10	Memories are not scrambled.
01	Memories are scrambled (default).
00	No effect
11	No effect

#### Bit 2 – SWPROT Software Protection

Value	Description
0	No effect.
1	Starts the BUSRAM4KB and BUREG256b Clear content.

#### Bit 1 – NORMAL Normal Mode

# SAMA5D2 Series

## Security Module (SECUMOD)

---

---

Value	Description
0	No effect.
1	Switches to Normal mode.

### Bit 0 – BACKUP Backup Mode

Value	Description
0	No effect.
1	Switches to Backup mode.

### 64.6.2 SECUMOD System Status Register

**Name:** SECUMOD\_SYSR  
**Offset:** 0x0004  
**Reset:** 0x000000D4  
**Property:** Read/Write

Value	Description
0	Disabled.
1	Enabled.

#### Bit 6 – AUTOBKP Automatic Backup Mode Enabled

Value	Description
0	Disabled.
1	Enabled.

#### Bit 3 – SWKUP SWKUP State

Value	Description
0	No SWKUP signal sent since the last clear.
1	SWKUP signal has been sent since the last clear.

#### Bit 2 – BACKUP Backup Mode

Value	Description
0	Normal mode active.
1	Backup mode active.

# SAMA5D2 Series

## Security Module (SECUMOD)

### Bit 1 – ERASE\_ON Erase Process Ongoing

When ERASE\_ON returns to 0, ERASE\_DONE is set after half a period of ICLK.

ERASE_ON	ERASE_DONE	Status	Action
0	0	No Erase ongoing or since the last Erase.	Nothing.
1	0	An Erase process is running.	Wait until the ERASE_ON flag is reset. ERASE_DONE will rise, see line below.
0	1	An Erase occurred and is finished.	Clear the ERASE_DONE flag.
1	1	An Erase process is running. The ERASE_DONE flag refers to a previous Erase process, but was not cleared.	Wait until the ERASE_ON flag is reset, then clear the ERASE_DONE flag.

Value	Description
0	Erase automaton is not running.
1	Erase automaton is currently running, memories are not accessible.

### Bit 0 – ERASE\_DONE Erasable Memories State

Value	Description
0	Secure memories content has not been erased since the last clear.
1	Secure memories content has been erased since the last clear. The user must write 1 into this bit to clear this flag. Note that not clearing this flag does not prevent the next erase processes. This flag also activates the SECURAM interrupt line as long as it is not cleared.

### 64.6.3 SECUMOD Status Register

**Name:** SECUMOD\_SR  
**Offset:** 0x0008  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: No alarm generated since the last clear.

1: An alarm has been generated by the corresponding monitor since the last clear.

Bit	31	30	29	28	27	26	25	24

Access  
Reset

Bit	23	22	21	20	19	18	17	16
	DET7	DET6	DET5	DET4	DET3	DET2	DET1	DET0

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8

Access  
Reset

Bit	7	6	5	4	3	2	1	0

Access  
Reset

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – DETx PIOBU Intrusion Detector**

### 64.6.4 SECUMOD Status Clear Register

**Name:** SECUMOD\_SCR  
**Offset:** 0x0010  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Clears the corresponding alarm flag bit.

If the corresponding alarm was programmed to generate a SWKUP signal, clearing the alarm also clears the SWKUP status bit in the SECUMOD Status register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	DET7	DET6	DET5	DET4	DET3	DET2	DET1	DET0

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – DETx PIOBU Intrusion Detector**

**64.6.5 SECUMOD RAM Access Ready Register**

**Name:** SECUMOD\_RAMRDY  
**Offset:** 0x0014  
**Reset:** Undefined  
**Property:** Read-only

**Bit 0 – READY** Ready for System Access Flag

When exiting Idle, System Reset or Backup mode, this flag must be read high before accessing the secure memories. The flag remains low until any ongoing process stops. Refer to the section “Real-time Clock (RTC) Register Summary” for more information.

### 64.6.6 SECUMOD PIO Backup Register x

**Name:** SECUMOD\_PIOBUx  
**Offset:** 0x18 + x\*0x04 [x=0..7]  
**Reset:** 0x00001000  
**Property:** Read/Write

**Note:** The FILTER3\_5 and DYNSTAT fields only exist for even PIOBUs.

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits 31-24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[Greyed out bits 23-16]							
Access

Bit	7	6	5	4	3	2	1	0
	PIOBU_RFV[3:0]				PIOBU_AFV[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bit 15 – SWITCH Switch State for Intrusion Detection

Value	Description
0	Input default state is low level.
1	Input default state is high level.

#### Bit 14 – SCHEDULE Pullup/Down Scheduled

Value	Description
0	Pullup/pulldown is not scheduled.
1	Pullup/pulldown is scheduled.

#### Bits 13:12 – PULLUP[1:0] Programmable Pullup State

This field is used to control the internal pullup or pulldown.

PULLUP0	PULLUP1	Status
0	0	No pullup/pulldown connected
0	1	Pullup connected
1	0	Pulldown connected

.....continued

PULLUP0		Status
1	1	Reserved

**Bit 10 – PIO\_PDS** Level on the Pin in Input Mode (OUTPUT = 0)

Value	Description
0	The I/O line is at level 0.
1	The I/O line is at level 1.

**Bit 9 – PIO\_SOD** Set/Clear the I/O Line when configured in Output Mode (OUTPUT =1)

Value	Description
0	Clears the data to be driven on the I/O line.
1	Sets the data to be driven on the I/O line.

**Bit 8 – OUTPUT** Configure I/O Line in Input/Output

Value	Description
0	The I/O line is a pure input.
1	The I/O line is enabled in output.

**Bits 7:4 – PIOBU\_RFV[3:0]** PIOBUx Reset Filter Value

This field is used to define the number of consecutive valid states to be reached before resetting the AFV counter.

PIOBU_RFV	Maximum Counter Value
0	0 (No static protection)
1	2
2	4
3	8
4	16
5	32
6	64
7	128
8	256
9	512

This field must be set to 0 when Dynamic Intrusion is selected.

**Bits 3:0 – PIOBU\_AFV[3:0]** PIOBU Alarm Filter Value

This field is used to define the filter value prior to generating an alarm.

# SAMA5D2 Series

## Security Module (SECUMOD)

PIOBU_AFV	Maximum Counter Value
0	0 (No static protection)
1	2
2	4
3	8
4	16
5	32
6	64
7	128
8	256
9	512

This field must be set to 0 when Dynamic Intrusion is selected.

### 64.6.7 SECUMOD JTAG Protection Control Register

**Name:** SECUMOD\_JTAGCR  
**Offset:** 0x0068  
**Reset:** 0x00000008  
**Property:** Read/Write

**Note:** Reset values are all 0 when fuse DEFDBG is programmed.

**Bit 4 – WZO** Write ZERO  
Must be written with 0.

**Bits 3:1 – CA5\_DEBUG\_MODE[2:0]** Cortex-A5 Invasive/Non-Invasive Secure/Non-Secure Debug Permissions

This field is used to set different debug permission levels. For instance, it can be used to prevent debug on secure parts of the code. The table below shows the effect of the field value on the Cortex-A5 pins (SPIDEN, DBGEN, SPNIDEN and NIDEN).

CA5_DEBUG_MODE Value	Cortex-A5 Debug Permissions	SPIDEN	DBGEN	SPNIDEN	NIDEN
b000	No Debug	0	0	0	0
b001	Non-Invasive, Non-Secure	0	0	0	1
b010	Full Non-Secure (Invasive and Non-Invasive)	0	1	0	0
b011	Full Non-Secure + Non-Invasive Secure	0	1	1	1
b100	Full Debug allowed	1	1	1	1

**Bit 0 – FNTRST** Force NTRST

<b>Value</b>	<b>Description</b>
0	The ARM processor's TAP controller access and Boundary JTAG are not blocked by the SECUMOD.
1	nDBGRESET of the ARM processor's TAP controller and Boundary JTAG reset are held low, preventing the processor to switch to debug state and Boundary JTAG to work.

**64.6.8 SECUMOD Scrambling Key Register**

**Name:** SECUMOD\_SCRKEY  
**Offset:** 0x0070  
**Reset:** Undefined  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	SCRKEY[31:24]							
Access	W	W	W	W	W	W	W	W
Reset

Reset								

**Bits 31:0 – SCRKEY[31:0] Scrambling Key Value**

This 32-bit key is used by the secure memories scrambler/descrambler logics. When changed, the readable content of the memories is made unintelligible instantaneously.

### 64.6.9 SECUMOD RAM Access Rights Register

**Name:** SECUMOD\_RAMACC  
**Offset:** 0x0074  
**Reset:** 0x00003FFFF  
**Property:** Read/Write

The following configuration values are valid for all listed bit names of this register:

00: No access allowed

01: Only write access allowed

10: Only read access allowed

11: Read and write accesses allowed

Accessing a forbidden area causes an interrupt (SECURAM ID).

**Bits 11:10 – RW5[1:0]** Access right for RAM region [5 Kbytes; 6 Kbytes] (register bank BUREG256b)

**Bits 9:8 – RW4[1:0]** Access right for RAM region [4 Kbytes; 5 Kbytes]

**Bits 7:6 – RW3[1:0]** Access right for RAM region [3 Kbytes; 4 Kbytes]

**Bits 5:4 – RW2[1:0]** Access right for RAM region [2 Kbytes; 3 Kbytes]

**Bits 3:2 – RW1[1:0]** Access right for RAM region [1 Kbyte; 2 Kbytes]

**Bits 1:0 – RW0[1:0]** Access right for RAM region [0; 1 Kbyte]

### 64.6.10 SECUMOD RAM Access Rights Status Register

**Name:** SECUMOD\_RAMACCSR  
**Offset:** 0x0078  
**Reset:** 0x00000000  
**Property:** Read/Write

The following configuration values are valid for all listed bit names of this register:

- 00: No access violation occurred
- 01: Write access violation occurred
- 10: Read access violation occurred
- 11: Read and write access violation occurred

Writing any value to this register resets the register and the associated interrupt line (SECURAM ID).

Bit	31	30	29	28	27	26	25	24

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – DETx PIOBU Intrusion Detector Protection Interrupt Mask**

Value	Description
0	The corresponding interrupt is disabled.
1	The corresponding interrupt is enabled.

**64.6.16 SECUMOD Wakeup Register**

**Name:** SECUMOD\_WKPR  
**Offset:** 0x0090  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – DETx PIOBU Intrusion Detector Protection**

Value	Description
0	No wakeup signal is generated if the corresponding alarm is detected.
1	A wakeup signal (SWKUP) is generated if the corresponding alarm is detected.

## 65. Analog-to-Digital Controller (ADC)

### 65.1 Description

The ADC is based on a 12-bit Analog-to-Digital Converter (ADC) managed by an ADC Controller providing enhanced resolution up to 14 bits. See [65.3 Block Diagram](#). It also integrates a 12-to-1 analog multiplexer, making possible the analog-to-digital conversions of 12 analog lines. The conversions extend from 0V to the voltage carried on pin ADVREF.

Conversion results are reported in a common register for all channels, as well as in a channel-dedicated register.

The 13-bit and 14-bit resolution modes are obtained by averaging multiple samples to decrease quantization noise. For the 13-bit mode, 4 samples are used, which gives a real sample rate of 1/4 of the actual sample frequency. For the 14-bit mode, 16 samples are used, giving a real sample rate of 1/16 of the actual sample frequency. This arrangement allows conversion speed to be traded off against for better accuracy.

The software trigger, external trigger on rising edge of the ADTRG pin or internal triggers from Timer Counter output(s) are configurable.

The comparison circuitry allows automatic detection of values below a threshold, higher than a threshold, in a given range or outside the range, thresholds and ranges being fully configurable.

The ADC Controller internal fault output is directly connected to the PWM fault input. This input can be asserted by means of comparison circuitry to immediately put the PWM output in a safe state (pure combinational path).

The ADC also integrates a Sleep mode and a conversion sequencer and connects with a DMA channel. These features reduce both power consumption and processor intervention.

This ADC has a selectable single-ended or fully differential input.

This ADC Controller includes a Resistive Touchscreen Controller. It supports 4-wire and 5-wire technologies.

### 65.2 Embedded Characteristics

- 12-bit Resolution with Enhanced Mode up to 14 bits
- 1 Msps Conversion Rate
- Digital Averaging Function providing Enhanced Resolution Mode up to 14 bits
- Wide Range of Power Supply Operation
- Selectable Single-Ended or Differential Input Voltage
- Digital correction of offset and gain errors
- Resistive 4-wire and 5-wire Touchscreen Controller
  - Position and Pressure Measurement for 4-wire Screens
  - Position Measurement for 5-wire Screens
  - Average of Up to 8 Measures for Noise Filtering
- Programmable Pen Detection Sensitivity
- Integrated Multiplexer Offering Up to 12 Independent Analog Inputs

- Individual Enable and Disable of Each Channel
- Hardware or Software Trigger from:
  - External Trigger Pin
  - Timer Counter Outputs (Corresponding TIOA Trigger)
  - ADC Internal Trigger Counter
  - Trigger on Pen Contact Detection
  - PWM Event Line
- Drive of PWM Fault Input
- DMA Support
- Two Sleep Modes (Automatic Wakeup on Trigger)
  - Lowest Power Consumption (Voltage Reference OFF Between Conversions)
  - Fast Wakeup Time Response on Trigger Event (Voltage Reference ON Between Conversions)
- Channel Sequence Customizing
- Automatic Window Comparison of Converted Values
- Asynchronous Partial Wakeup (SleepWalking) on External Trigger
- Register Write Protection

### 65.3 Block Diagram

Figure 65-1. Analog-to-Digital Converter Block Diagram

## 65.4 Signal Description

**Table 65-1. ADC Pin Description**

Pin Name	Description
VDDANA	Analog power supply
ADVREF	Reference voltage
AD0–AD11	Analog input channels
ADTRG	External trigger

## 65.5 Product Dependencies

### 65.5.1 Power Management

The ADC Controller is not continuously clocked. The programmer must first enable the ADC Controller peripheral clock in the Power Management Controller (PMC) before using the ADC Controller. However, if the application does not require ADC operations, the ADC Controller clock can be stopped when not needed and restarted when necessary. Configuring the ADC Controller does not require the ADC Controller clock to be enabled.

### 65.5.2 Interrupt Sources

The ADC interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the ADC interrupt requires the interrupt controller to be programmed first.

### 65.5.3 I/O Lines

The digital input ADTRG is multiplexed with digital functions on the I/O line and the selection of ADTRG is made using the PIO controller.

The ADC\_ADx analog inputs are multiplexed with digital functions on the I/O lines. ADC\_ADx inputs are selected as inputs of the ADCC when writing a one in the corresponding ADC\_CHER.CHx bit and the digital functions are not selected.

### 65.5.4 Hardware Triggers

The ADC can use internal signals to start conversions. See the ADC\_MR.TRGSEL field description in [65.7.2 ADC\\_MR](#) for exact wiring of internal triggers.

### 65.5.5 Fault Output

The ADC Controller has the FAULT output connected to the FAULT input of PWM. See [65.6.18 Fault Event](#) and section “Pulse Width Modulation Controller (PWM)”.

## 65.6 Functional Description

### 65.6.1 Analog-to-Digital Conversion

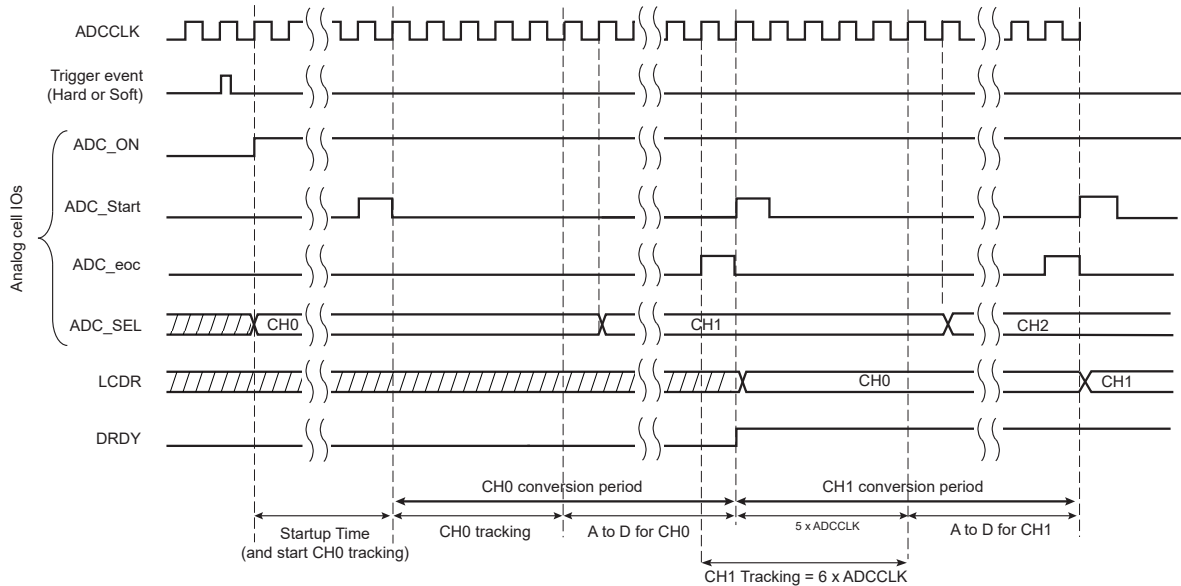

Once the programmed startup time (ADC\_MR.STARTUP) has elapsed, ADC conversions are sequenced by three operating times:

- Tracking time—the time for the ADC to charge its input sampling capacitor to the input voltage. When several channels are converted consecutively, the inherent tracking time is 6 ADC clock

cycles. However, the tracking time can be increased using the TRACKTIM field in the Mode register (ADC\_MR).

- ADC inherent conversion time—the time for the ADC to convert the sampled analog voltage. This time is constant and is defined from start of conversion to end of conversion.
- Channel conversion period—the effective time between the end of the current channel conversion and the end of the next channel conversion.

**Figure 65-2. Sequence of Consecutive ADC Conversions with TRACKTIM = 0**

**Figure 65-3. Sequence of Consecutive ADC Conversions with TRACKTIM = 15**

### 65.6.2 ADC Clock

The ADC uses the ADC clock (ADCCLK) to perform conversions. The ADC clock frequency is selected in the ADC\_MR.PRESCAL.

To generate the ADC clock, the prescaler has two clock sources: the peripheral clock and the GCLK clock. This clock source is selected using the SRCCLK bit in the Extended Mode register (ADC\_EMR).

If GCLK is selected as a source clock, the ADC clock frequency is independent of the processor/bus clock. At reset, the peripheral clock is selected.

If the ADC\_EMR.SRCCLK bit is cleared, the prescaler clock (presc\_clk) is driven by peripheral\_clock. If the ADC\_EMR.SRCCLK bit is set, the prescaler clock is driven by GCLK. The ADC clock frequency is between  $f_{presc\_clk}/2$ , if PRESCAL is 0, and  $f_{presc\_clk}/512$ , if PRESCAL is set to 255 (0xFF).

PRESCAL must be programmed to provide the ADC clock frequency parameter provided in the “Electrical Characteristics” section.

### 65.6.3 ADC Reference Voltage

The voltage reference input of the ADC is the ADVREF pin. Refer to the “Electrical Characteristics” section for further details.

### 65.6.4 Conversion Resolution

The ADC has a native resolution of 12 bits.

The ADC Controller provides enhanced resolution up to 14 bits by means of digital averaging.

If ADTRG is asynchronous to the ADC peripheral clock, the internal resynchronization introduces a jitter of 1 peripheral clock. This jitter may reduce the resolution of the converted signal.

The same applies when using the independent clock (ADC\_MR.SRCCLK = 1), if the provided clock is asynchronous to ADC peripheral clock.

### 65.6.5 Conversion Results

When a conversion is completed, the resulting digital value is stored in the Channel Data register (ADC\_CDRx) of the current channel and in the Last Converted Data register (ADC\_LCDR). By setting the TAG option in ADC\_EMR, ADC\_LCDR presents the channel number associated with the last converted data in the CHNB field.

When a conversion is completed, the channel EOC bit and the DRDY bit in the Interrupt Status register (ADC\_ISR) are set. In the case of a connected DMA channel, DRDY rising triggers a data request. In any case, either EOC and DRDY can trigger an interrupt.

Reading one of the ADC\_CDRx clears the corresponding EOC bit. Reading ADC\_LCDR clears the DRDY bit.

**Figure 65-4. EOCx and DRDY Flag Behavior**

If ADC\_CDR is not read before further incoming data is converted, the corresponding OVREx flag is set in the Overrun Status register (ADC\_OVER).

If new data is converted when DRDY is high, the ADC\_ISR.GOVRE bit is set.

The OVREx flag is automatically cleared when ADC\_OVER is read, and the GOVRE flag is automatically cleared when ADC\_ISR is read.

**Figure 65-5. EOCx, OVREx and GOVREx Flag Behavior**

If the corresponding channel is disabled during a conversion or if it is disabled and then reenabled during a conversion, its associated data and corresponding EOCx and GOVRE flags in ADC\_ISR and OVREx flags in ADC\_OVER are unpredictable.

### 65.6.6 Conversion Results Format

The conversion results can be signed (2's complement) or unsigned depending on the value of the ADC\_EMR.SIGNMODE field.

If conversion results are signed and resolution is less than 16 bits, the sign is extended up to the bit 15 (e.g., 0xF43 for 12-bit resolution is read as 0xFF43, and 0x467 is read as 0x0467).

### 65.6.7 Conversion Triggers

Conversions of the active analog channels are started with a software or hardware trigger. The software trigger is provided by writing the Control register (ADC\_CR) with the START bit at 1.

The list of external/internal events is provided in [65.7.2 ADC\\_MR](#). The hardware trigger is selected using the ADC\_MR.TRGSEL field. The selected hardware trigger is enabled if TRGMOD = 1, 2 or 3 in the Trigger register (ADC\_TRGR).

The ADC also provides a dual trigger mode (ADC\_LCTMR.DUALTRIG = 1) in which the higher index channel can be sampled at a rhythm different from the other channels. The trigger of the last channel is generated by the RTC. See [65.6.12 Last Channel Specific Measurement Trigger](#).

The ADC\_TRGR.TRGMOD field selects the hardware trigger from the following:

- any edge, either rising or falling or both, detected on the external trigger pin ADTRG
- the Pen Detect, depending on how the PENDET bit is set in the Touchscreen Mode register (ADC\_TSMR)
- a continuous trigger, meaning the ADC Controller restarts the next sequence as soon as it finishes the current one
- a periodic trigger, which is defined by programming the ADC\_TRGR.TRGPER field

The minimum time between two consecutive trigger events must be strictly greater than the duration time of the longest conversion sequence according to configuration of registers ADC\_MR, ADC\_CHSR, ADC\_SEQRx, and ADC\_TSMR.

If a hardware trigger is selected, the start of a conversion is triggered after a delay starting at each rising edge of the selected signal. Due to asynchronous handling, the delay may vary in a range of two peripheral clock periods to one ADC clock period. This delay introduces sampling jitter in the A/D conversion process and may therefore degrade the conversion performance (e.g., SNR, THD).

**Figure 65-6. Hardware Trigger Delay**

If one of the TIOA outputs is selected, the corresponding Timer Counter channel must be programmed in Waveform mode.

Only one start command is necessary to initiate a conversion sequence on all the channels. The ADC hardware logic automatically performs the conversions on the active channels, then waits for a new request. The Channel Enable (ADC\_CHER) and Channel Disable (ADC\_CHDR) registers enable the analog channels to be enabled or disabled independently.

If the ADC is used with a DMA, only the transfers of converted data from enabled channels are performed and the resulting data buffers should be interpreted accordingly.

### 65.6.8 Sleep Mode and Conversion Sequencer

The ADC Sleep mode maximizes power saving by automatically deactivating the ADC when it is not being used for conversions. Sleep mode is selected by setting the ADC\_MR.SLEEP bit.

Sleep mode is managed by a conversion sequencer, which automatically processes the conversions of all channels at lowest power consumption.

This mode can be used when the minimum period of time between two successive trigger events is greater than the startup period of the ADC. Refer to section “Electrical Characteristics”.

When a start conversion request occurs, the ADC is automatically activated. As the analog cell requires a startup time, the logic waits during this time and starts the conversion on the enabled channels. When all conversions are complete, the ADC is deactivated until the next trigger. Events triggered during the sequence are ignored.

The conversion sequencer allows automatic processing with minimum processor intervention and optimized power consumption. Conversion sequences can be performed periodically using the internal timer (ADC\_TRGR) or the PWM event line. The periodic acquisition of several samples can be processed automatically without any intervention of the processor via the DMA.

The sequence can be customized by programming the Sequence Channel registers ADC\_SEQR1 and ADC\_SEQR2 and setting the USEQ bit of the Mode register (ADC\_MR). The user can choose a specific order of channels and can program up to 12 conversions by sequence. The user is free to create a personal sequence by writing channel numbers in ADC\_SEQR1 and ADC\_SEQR2. Not only can channel numbers be written in any sequence, channel numbers can be repeated several times. When the ADC\_MR.USEQ bit is set, the ADC\_SEQR1.USCHx and ADC\_SEQR2.USCHx fields are used to define the sequence. Only enabled USCHx fields will be part of the sequence. Each USCHx field has a corresponding enable, CHx-1, in ADC\_CHER.

If all ADC channels (i.e., 12) are used on an application board, there is no restriction of usage of the user sequence. However, if some ADC channels are not enabled for conversion but rather used as pure digital inputs, the respective indexes of these channels cannot be used in the user sequence fields (see ADC\_SEQRx). For example, if channel 4 is disabled (ADC\_CHSR[4] = 0), ADC\_SEQRx fields USCH1 up to USCH12 must not contain the value 4. Thus the length of the user sequence may be limited by this behavior.

As an example, if only four channels over 12 (CH0 up to CH3) are selected for ADC conversions, the user sequence length cannot exceed four channels. Each trigger event may launch up to four successive conversions of any combination of channels 0 up to 3 but no more (i.e., in this case the sequence CH0, CH0, CH1, CH1 is impossible).

A sequence that repeats the same channel several times requires more enabled channels than channels actually used for conversion. For example, the sequence CH0, CH0, CH1, CH1 requires four enabled channels (four free channels on application boards) whereas only CH0, CH1 are really converted.

**Note:** The reference voltage pins always remain connected in Normal mode as in Sleep mode.

### 65.6.9 Comparison Window

The ADC Controller features automatic comparison functions. It compares converted values to a low threshold, a high threshold or both, depending on the value of the ADC\_EMR.CMPMODE field. The comparison can be done on all channels or only on the channel specified in the ADC\_EMR.CMPSEL field. To compare all channels, the ADC\_EMR.CMPALL bit must be set.

If set, the ADC\_EMR.CMPTYPE bit can be used to discard all conversion results that do not match the comparison conditions. Once a conversion result matches the comparison conditions, all the subsequent conversion results are stored in ADC\_LCDR (even if these results do not meet the comparison conditions). Setting the ADC\_CR.CMPRST bit immediately stops the conversion result storage until the next comparison match.

If the ADC\_EMR.CMPTYPE bit is cleared, all conversions are stored in ADC\_LCDR. Only the conversions that match the comparison conditions trigger the ADC\_ISR.COMPE flag.

Moreover, a filtering option can be set by writing the number of consecutive comparison matches needed to raise the flag. This number can be written and read in the ADC\_EMR.CMPFILTER field. The filtering option is dedicated to reinforcing the detection of an analog signal overpassing a predefined threshold. The filter is cleared as soon as ADC\_ISR is read, so this filtering function must be used with peripheral DMA controller and works only when using Interrupt mode (no polling).

The flag can be read on the ADC\_ISR.COMPE bit and can trigger an interrupt.

The high threshold and the low threshold can be read/write in the Compare Window register (ADC\_CWR).

Depending on the sign of the conversion, chosen with the ADC\_EMR.SIGNMODE field, the high threshold and low threshold values must be signed or unsigned to maintain consistency during the comparison. If the conversion is signed, both thresholds must also be signed; if the conversion is unsigned, both thresholds must be unsigned. If comparison occurs on all channels, the ADC\_EMR.SIGNMODE field must be set to ALL\_UNSIGNED or ALL\_SIGNED and the thresholds must be set accordingly.

### 65.6.10 Differential and Single-ended Input Modes

#### 65.6.10.1 Input-output Transfer Functions

The ADC can be configured to operate in the following input voltage modes:

- Single-ended—ADC\_COR.DIFFx = 0. This is the default mode after a reset.
- Differential—ADC\_COR.DIFFx = 1 (see figure below). In Differential mode, the ADC requires differential input signals having a VDD/2 common mode voltage (refer to section “Electrical Characteristics”).
- The following equations give the unsigned ADC input-output transfer function in each mode<sup>(1)</sup>. With signed conversions (see field ADC\_EMR.SIGNMODE), subtract 2047 from the ADC\_LCDR.DATA value given below.

Single-ended mode:

$$\text{ADC\_LCDR.LDATA} = \frac{\text{ADx} - \text{GNDANA}}{\text{ADVREF} - \text{GNDANA}} \times 2^{12}$$

Differential mode:

$$\text{ADC\_LCDR.LDATA} = \left(1 + \frac{\text{ADx} - \text{ADx+1}}{\text{ADVREF} - \text{GNDANA}}\right) \times 2^{11}$$

Note: 1. Equations assume ADC\_EMR.OSR = 1

If the ADC\_MR.ANACH bit is set, the ADC can manage both differential channels and single-ended channels. If the ADC\_MR.ANACH bit is cleared, the parameters defined in ADC\_COR are applied to all channels.

The following table gives the internal positive and negative ADC inputs assignment with respect to the programmed mode (ADC\_COR.DIFFx).

For example, if Differential mode is required on channel 0, input pins AD0 and AD1 are used. In this case, only channel 0 must be enabled by writing a 1 to ADC\_CHER.CH0.

**Table 65-2. Input Pins and Channel Numbers**

Input Pin	Channel Number	
	Single-ended Mode	Differential Mode
AD0	CH0	CH0
AD1	CH1	
AD2	CH2	CH2
AD3	CH3	
AD4	CH4	CH4
AD5	CH5	
AD6	CH6	CH6
AD7	CH7	
AD8	CH8	CH8
AD9	CH9	
AD10	CH10	CH10
AD11	CH11	

**Figure 65-7. Analog Full Scale Ranges in Single-Ended/Differential Applications**

**65.6.11 ADC Timings**

The ADC startup time is programmed through the ADC\_MR.STARTUP field. Refer to the “Electrical Characteristics” section.

The ADC Controller provides an inherent tracking time of six ADC clock cycles.

A minimal tracking time is necessary for the ADC to guarantee the best converted final value between two conversions. The tracking time can be adjusted to accommodate a range of source impedances. If more than six ADC clock cycles are required, the tracking time can be increased using the ADC\_MR.TRACKTIM field.

No input buffer amplifier to isolate the source is included in the ADC. Refer to the “Electrical Characteristics” section.

---

### 65.6.12 Last Channel Specific Measurement Trigger

The last channel (higher index available) embeds a specific mode allowing a measurement trigger period which differs from other active channels. This allows efficient management of the conversions especially if the channel is driven by a device with a variation of a different frequency from other converted channels (for example, but not limited to, temperature sensor).

The last channel can be sampled in different ways through the ADC Controller. The different methods of sampling depend on the ADC\_TRGR.TRGMOD configuration field and on the ADC\_CHSR.CH11 bit.

The last channel conversion can be triggered like the other channels by enabling the ADC\_CHER.CH11 bit.

The manual start can only be performed if field TRGMOD = 0. When the ADC\_CR.START bit is set, the last channel conversion is scheduled together with the other enabled channels (if any). The result of the conversion is placed in the ADC\_CDR11 register, and the associated ADC\_ISR.EOC11 flag is set.

If the last channel is enabled in the Channel Status register (ADC\_CHSR), ADC\_LCTMR.DUALTRIG is cleared and field TRGMOD = 1, 2, 3, 5, the last channel is periodically converted together with the other enabled channels and the result is placed in the ADC\_LCDR and ADC\_CDR11 registers. Thus the last channel conversion result is part of the DMA Controller buffer (see the following figure).

When the conversion result matches the conditions defined in ADC\_LCTMR and ADC\_LCCWR, the ADC\_ISR.LCCHG flag is set.

**Figure 65-8. Same Trigger for All Channels (ADC\_CHSR[LCI] = 1 and ADC\_TRGR.TRGMOD = 1, 2, 3, 5)**

Assuming ADC\_CHSR[0] = 1 and ADC\_CHSR[LCI] = 1

If the last channel is driven by a device with a slower variation compared to other channels (temperature sensor for example), the channel can be enabled/disabled at any time. However, this may not be optimal for downstream processing.

The ADC Controller allows a different way of triggering the measurement when DUALTRIG is set in the Last Channel Trigger Mode register (ADC\_LCTMR) but CH11 is not set in ADC\_CHSR.

Under these conditions, the last channel conversion is triggered with a period defined by the OUT1 field in the RTC\_MR (Real-time Clock Mode register) while other channels are still active. OUT1 configures an internal trigger generated by the RTC, totally independent of the internal/external triggers. The RTC event will be processed on the next internal/external trigger event as shown in the following figure. The internal/external trigger for other channels is selected through the ADC\_MR.TRGSEL field.

When DUALTRIG = 1, the result of each conversion of channel 11 is only uploaded in the ADC\_CDR11 register and not in ADC\_LCDR (see the following figure). Therefore, there is no change in the structure of the peripheral DMA controller buffer due to the conversion of the last channel: only the enabled channels are kept in the buffer. The end of conversion of the last channel is reported by the ADC\_ISR.EOC11 flag.

**Figure 65-9. Independent Trigger Measurement for Last Channel (ADC\_CHSR[LCI] = 0 and ADC\_TRGR.TRGMOD = 1, 2, 3, 5)**

Notes: ADC\_SEL: Command to the ADC analog cell  
 Cx: All ADC channel values except the last channel (highest index)  
 LCx: Last channel value  
 LCI: Last channel index

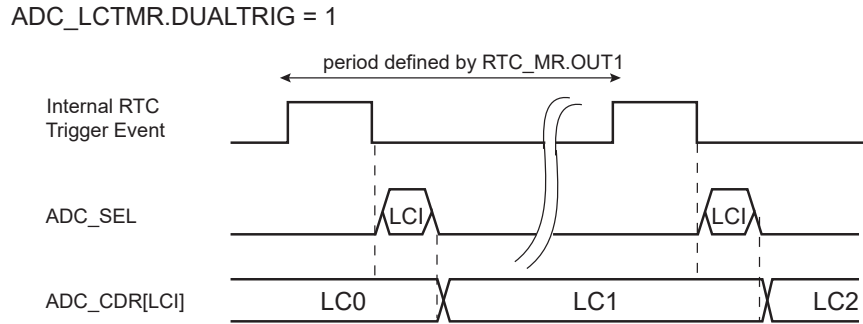

Assuming ADC\_CHSR[0] = 1

If DUALTRIG = 1 and field ADC\_TRGR.TRGMOD = 0 and none of the channels are enabled in ADC\_CHSR (ADC\_CHSR = 0), then only channel 11 is converted at a rate defined by the trigger event signal that can be configured in RTC\_MR.OUT1 (see the following figure).

This mode of operation, when combined with the Sleep mode operation of the ADC Controller, provides a low-power mode for last channel measure. This assumes there is no other ADC conversion to schedule at a high sampling rate or no other channel to convert.

**Figure 65-10. Only Last Channel Measurement Triggered at Low Speed (ADC\_CHSR[LCI] = 0 and ADC\_TRGR.TRGMOD = 0)**

Notes: ADC\_SEL: Command to the ADC analog cell  
LCx: Last channel value  
LCI: Last channel index

### 65.6.13 Enhanced Resolution Mode and Digital Averaging Function

#### 65.6.13.1 Enhanced Resolution Mode

The Enhanced Resolution mode is enabled if the OSR field is configured to 1 or 2 in ADC\_EMR. The enhancement is based on a digital averaging function.

There is no averaging on the last index channel if the measure is triggered by an RTC event.

In this mode, the ADC Controller will trade off conversion speed against accuracy by averaging multiple samples, thus providing a digital low-pass filter function.

The selected oversampling ratio applies to all enabled channels when triggered by an RTC event.

$$ADC\_LCDR.LDATA = \frac{1}{M} \times \sum_{k=0}^{k=N-1} ADC(k)$$

where N and M are given in the table below.

**Table 65-3. Digital Averaging Function Configuration versus OSR Values**

ADC_EMR.OSR Value	ADC_LCDR.LDATA Length	N Value	M Value	Full Scale Value	Maximum Value
0	12 bits	1	1	4095	4095
1	13 bits	4	2	8191	8190
2	14 bits	16	4	16383	16381

The average result is valid in ADC\_CDRx (x corresponds to the index of the channel) only if the ADC\_ISR.EOCn flag is set and if the ADC\_OVER.OVREN flag is cleared. The average result for all channels is valid in ADC\_LCDR only if the ADC\_ISR.DRDY bit is set and the ADC\_ISR.GOVRE bit is cleared.

Note that ADC\_CDRs are not buffered. Therefore, when an averaging sequence is ongoing, the value in these registers changes after each averaging sample. However, overrun flags in ADC\_OVER rise as soon as the first sample of an averaging sequence is received. Thus the previous averaged value is not read, even if the new averaged value is not ready.

Consequently, when an overrun flag rises in ADC\_OVER, it means that the previous unread data is lost but it does not mean that this data has been overwritten by the new averaged value as the averaging sequence concerning this channel can still be ongoing.

When an oversampling is performed, the maximum value that can be read on ADC\_CDRx or ADC\_LCDR is not the full-scale value, even if the maximum voltage is supplied on the analog input. See table above.

### 65.6.13.2 Averaging Function versus Trigger Events

The samples can be defined in different ways for the averaging function depending on the configuration of the ADC\_EMR.ASTE bit and the ADC\_MR.USEQ bit.

When USEQ = 0, there are two possible ways to generate the averaging through the trigger event. If ADC\_EMR.ASTE = 0, every trigger event generates one sample for each enabled channel, as described in the following figure. Therefore, four trigger events are required to obtain the result of averaging if OSR = 1.

**Figure 65-11. Digital Averaging Function Waveforms Over Multiple Trigger Events**

ADC\_EMR.OSR = 1, ASTE = 0, ADC\_CHSR[1:0] = 0x3 and ADC\_MR.USEQ = 0

Note: ADC\_SEL: Command to the ADC analog cell  
 0i1, 0i2, 0i3, 1i1, 1i2, 1i3 are intermediate results and CH0\_0, CH0\_1, CH1\_0 and CH1\_1 are final results of average function.

If ADC\_EMR.ASTE = 1 and ADC\_MR.USEQ = 0, the sequence to be converted, defined in ADC\_CHSR, is automatically repeated n times (where n corresponds to the oversampling ratio defined in the ADC\_EMR.OSR field). As a result, only one trigger is required to obtain the result of the averaging function as described in the following figure.

**Figure 65-12. Digital Averaging Function Waveforms on a Single Trigger Event**

ADC\_EMR.OSR = 1, ASTE = 1, ADC\_CHSR[1:0] = 0x3 and ADC\_MR.USEQ = 0

Note: ADC\_SEL: Command to the ADC analog cell  
 0i1, 0i2, 0i3, 1i1, 1i2, 1i3 are intermediate results and CH0\_0, CH0\_1, CH1\_0 and CH1\_1 are final results of average function.

When USEQ = 1, the user can define the channel sequence to be converted by configuring ADC\_SEQRx and ADC\_CHER so that channels are not interleaved during the averaging period. Under these conditions, a sample is defined for each end of conversion as described in the figure below.

When USEQ = 1 and ASTE = 1, OSR can be only configured to 1. Up to three channels can be converted in this mode. The averaging result will be placed in the corresponding ADC\_CDRx and in ADC\_LCDR for each trigger event. The ADC real sample rate remains the maximum ADC sample rate divided by 4.

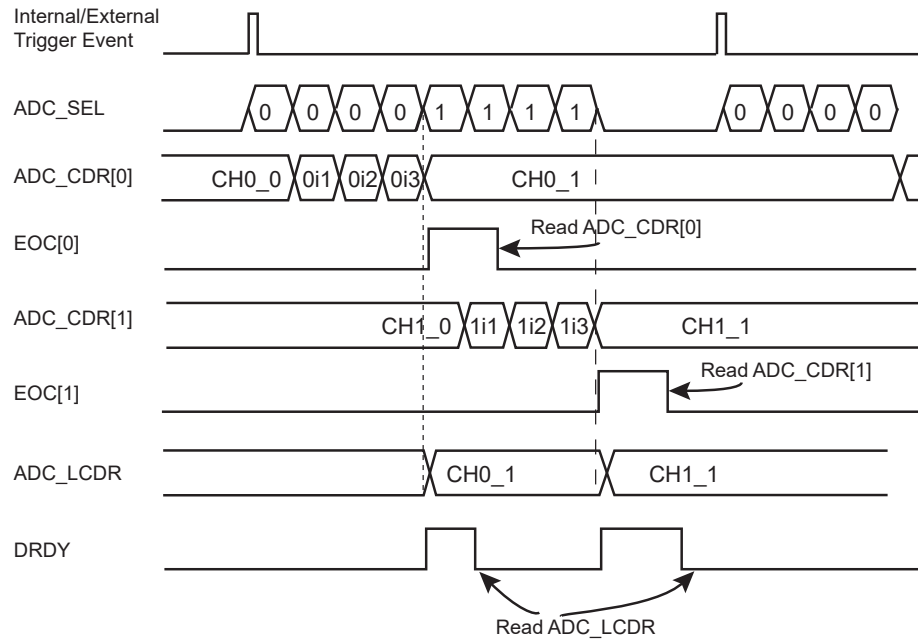

It is important that the user sequence follows a specific pattern. The user sequence must be programmed in such a way that it generates a stream of conversion, where a same channel is successively converted.

**Table 65-4. Example Sequence Configurations (USEQ = 1, ASTE = 1, OSR = 1)**

Register	Number of Channels Non-interleaved Averaging - Register Value		
	1 (e.g., CH0)	2 (e.g., CH0, CH1)	3 (e.g., CH0, CH1, CH2)
ADC_CHSR	0x0000_000F	0x0000_00FF	0x0000_0FFF
ADC_SEQR1	0x0000_0000	0x1111_0000	0x1111_0000
ADC_SEQR2	0x0000_0000	0x0000_0000	0x0000_2222

**Figure 65-13. Digital Averaging Function Waveforms on a Single Trigger Event, Non-interleaved**

ADC\_EMR.OSR = 1, ASTE = 1, ADC\_CHSR[7:0] = 0xFF and ADC\_MR.USEQ = 1  
ADC\_SEQR1 = 0x1111\_0000

Note: ADC\_SEL: Command to the ADC analog cell  
0i1, 0i2, 0i3, 1i1, 1i2, 1i3 are intermediate results and CH0\_0, CH0\_1, CH1\_0 and CH1\_1 are final results of average function.

#### 65.6.14 Automatic Error Correction

The ADC features automatic error correction of conversion results. Offset and gain error corrections are available. The correction can be enabled for each channel and correction values (offset and gain) are the same for all channels.

To enable error correction, the corresponding ECORRx bit must be set in the Channel Error Correction register (ADC\_CECR). The offset and gain values used to compensate the results are the same for all correction-enabled channels and programmed in the Correction Values register (ADC\_CVR).

The error correction for channels used with the touchscreen is available in the ADC Touchscreen Correction Values register (ADC\_TSCVR).

The ADC\_EMR.ADCMODE field is used to configure a running mode of the ADC Normal mode, Offset Error mode, or Gain Error mode (see 65.7.16 ADC\_EMR). ADCMODE uses 3 internal references to be measured and to extract the offset and gain error from 3 point-measurement codes. If some references already exist on the final application connected to some input channel ADx, they can be used as a replacement of the ADCMODE to generate the 2 or 3 points of calibration and used to extract the GAINCORR and OFFSETCORR.

After a reset, the running mode of the ADC is Normal mode. Offset Error mode and Gain Error mode are used to determine values of offset compensation and gain compensation, respectively, to apply to conversion results. The table below provides formulas to obtain the compensation values, with:

- OFFSETCORR—the Offset Correction value. OFFSETCORR is a signed value.
- GAINCORR—the Gain Correction value
- GCi—the intermediate Gain Compensation value

- Gs—the value 13
- ConvValue—the value converted by the ADC (as returned in ADC\_LCDR or ADC\_CDR)
- Resolution—the resolution used to process the conversion (either RESOLUTION, RESOLUTION+1 or RESOLUTION+2).

**Table 65-5. ADC Running Modes**

ADC_EMR.ADCMODE	Mode	Description
0	Normal	Normal mode of operation to perform conversions
1	Offset Error	For unsigned conversions: OFFSETCORR = ConvValue – 2 <sup>(Resolution – 1)</sup>
		For signed conversions: OFFSETCORR = ConvValue
2	Gain Error	G <sub>Ci</sub> = ConvValue
3		$GAINCORR = \frac{3584}{G_{Ci} - ConvValue} \times 2^{(Gs)}$

The final conversion result after error correction is obtained using the following formula:

$$\text{Corrected Data} = (\text{Converted Data} + \text{OFFSETCORR}) \times \frac{\text{GAINCORR}}{2^{(Gs)}}$$

## 65.6.15 Touchscreen

### 65.6.15.1 Touchscreen Mode

The ADC\_TSMR.TSMODE parameter is used to enable/disable the touchscreen functionality, to select the type of screen (4-wire or 5-wire) and, in the case of a 4-wire screen, to activate (or not) the pressure measurement.

In 4-wire mode, channels 0, 1, 2 and 3 must not be used for classic ADC conversions. Likewise, in 5-wire mode, channels 0, 1, 2, 3, and 4 must not be used for classic ADC conversions.

### 65.6.15.2 4-wire Resistive Touchscreen Principles

A resistive touchscreen is based on two resistive films, each one being fitted with a pair of electrodes, placed at the top and bottom on one film, and on the right and left on the other. In between, there is a layer acting as an insulator, but also enables contact when you press the screen. This is illustrated in the following figure.

The ADC Controller can perform the following tasks without external components:

- position measurement
- pressure measurement
- pen detection

**Figure 65-14. Touchscreen Position Measurement**

**65.6.15.3 4-wire Position Measurement Method**

As shown in the above figure, to detect the position of a contact, a supply is first applied from top to bottom. Due to the linear resistance of the film, there is a voltage gradient from top to bottom. When a contact is performed on the screen, the voltage propagates at the point the two surfaces come into contact. If the input impedance on the right and left electrodes is high enough, the film intrinsic resistor does not affect this voltage.

For the horizontal direction, the same method is used, but by applying supply from left to right. The range depends on the supply voltage and on the loss in the switches that connect to the top and bottom electrodes.

In an ideal world (linear, with no loss through switches), the horizontal position is equal to:

$$V_{Y_M} / V_{DD} \text{ or } V_{Y_P} / V_{DD}.$$

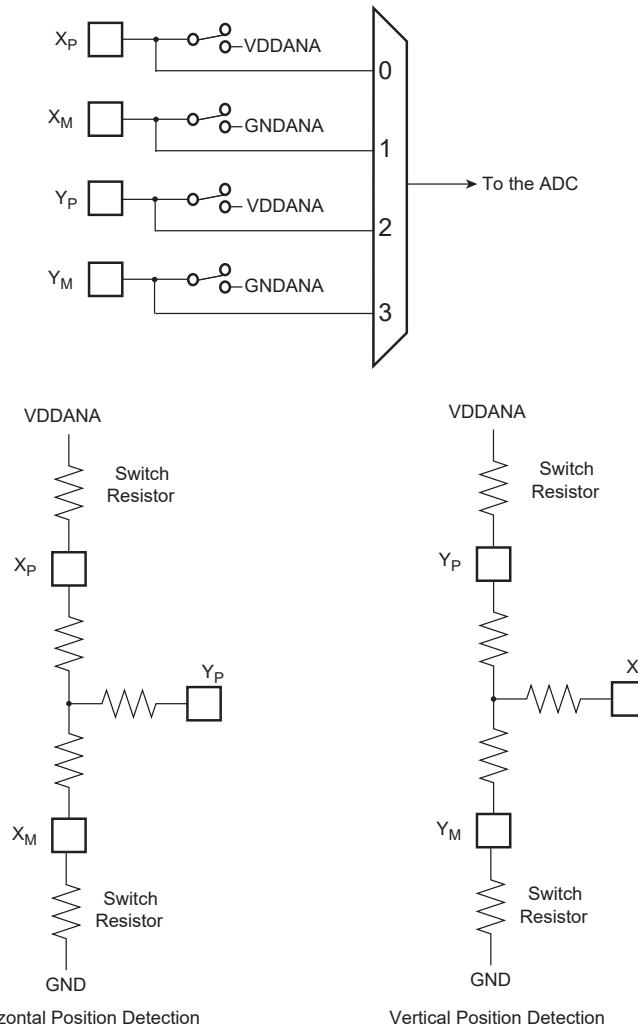

The implementation with on-chip power switches is shown in the figure below. The voltage measurement at the output of the switch compensates for the switches loss.

It is possible to correct for switch loss by performing the operation:

$$[V_{Y_P} - V_{X_M}] / [V_{X_P} - V_{X_M}].$$

This requires additional measurements, as shown in the figure below.

**Figure 65-15. Touchscreen Switches Implementation**

#### 65.6.15.4 4-wire Pressure Measurement Method

The method to measure the pressure ( $R_p$ ) applied to the touchscreen is based on the known resistance of the X-Panel resistance ( $R_{xp}$ ).

Three conversions ( $X_{pos}, Z_1, Z_2$ ) are necessary to determine the value of  $R_p$  ( $Z_{axis}$  resistance).

$$R_p = R_{xp} \times (X_{pos}/1024) \times [(Z_2/Z_1)-1]$$

**Figure 65-16. Pressure Measurement**

### 65.6.15.5 5-wire Resistive Touchscreen Principles

To make a 5-wire touchscreen, a resistive layer with a contact point at each corner and a conductive layer are used.

The 5-wire touchscreen differs from the 4-wire type mainly in that the voltage gradient is applied only to one layer, the resistive layer, while the other layer is the sense layer for both measurements.

The measurement of the X position is obtained by biasing the upper left corner and lower left corner to  $V_{DDANA}$  and the upper right corner and lower right to ground.

To measure along the Y axis, bias the upper left corner and upper right corner to  $V_{DDANA}$  and bias the lower left corner and lower right corner to ground.

**Figure 65-17. 5-Wire Principle**

### 65.6.15.6 5-wire Position Measurement Method

In an application only monitoring clicks, 100 points per second is typically needed. For handwriting or motion detection, the number of measurements to consider is approximately 200 points per second. This must take into account that multiple measurements are included (over sampling, filtering) to compute the correct point.

The 5-wire touchscreen panel works by applying a voltage at the corners of the resistive layer and measuring the vertical or horizontal resistive network with the sense input. The ADC converts the voltage measured at the point the panel is touched.

A measurement of the Y position of the pointing device is made by:

- Connecting Upper left (UL) and upper right (UR) corners to VDDANA
- Connecting Lower left (LL) and lower right (LR) corners to ground.

The voltage measured is determined by the voltage divider developed at the point of touch (Y position) and the SENSE input is converted by ADC.

A measurement of the X position of the pointing device is made by:

- Connecting the upper left (UL) and lower left (LL) corners to ground
- Connecting the upper right and lower right corners to VDDANA.

The voltage measured is determined by the voltage divider developed at the point of touch (X position) and the SENSE input is converted by ADC.

**Figure 65-18. Touchscreen Switches Implementation**

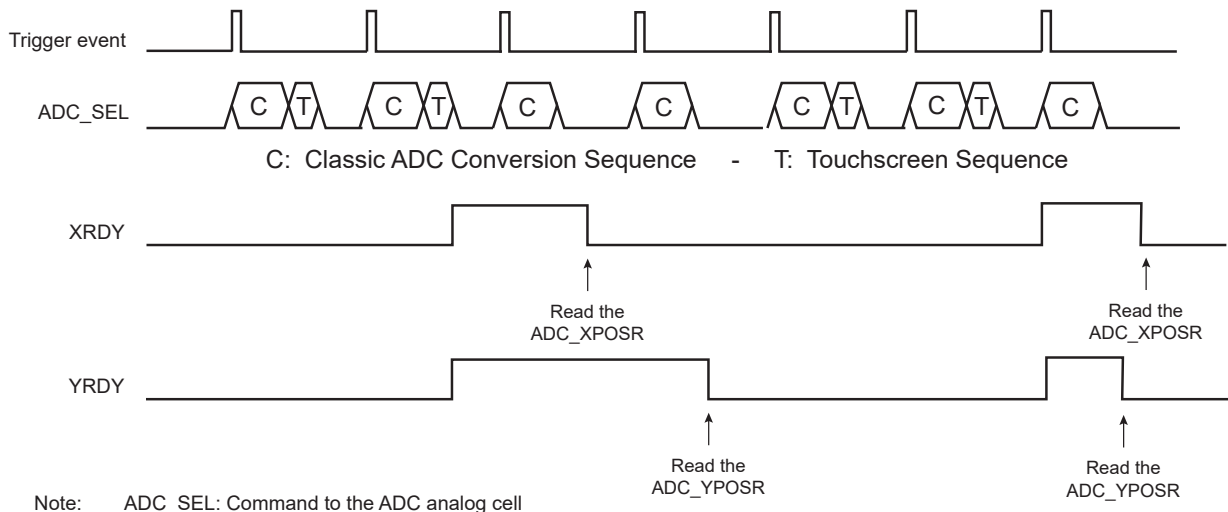

### 65.6.15.7 Sequence and Noise Filtering

The ADC Controller can manage ADC conversions and touchscreen measurement. On each trigger event the sequence of ADC conversions is performed as described in [65.6.8 Sleep Mode and Conversion Sequencer](#). The touchscreen measure frequency can be specified in number of trigger events

by writing the ADC\_TSMR.TSFREQ parameter. An internal counter counts triggers up to TSFREQ, and every time it rolls out, a touchscreen sequence is appended to the classic ADC conversion sequence (see figure below).

Additionally the user can average multiple touchscreen measures by writing the ADC\_TSMR.TSAV parameter. This can be 1, 2, 4 or 8 measures performed on consecutive triggers as illustrated in the figure below. Consequently, the ADC\_TSMR.TSFREQ parameter must be greater than or equal to the ADC\_TSMR.TSAV parameter.

**Figure 65-19. Insertion of Touchscreen Sequences (TSFREQ = 2; TSAV = 1)**

### 65.6.15.8 Measured Values, Registers and Flags

As soon as the controller finishes the Touchscreen sequence, XRDY, YRDY and PRDY are set and can generate an interrupt. These flags can be read in the Interrupt Status register (ADC\_ISR). They are reset independently by reading in the ADC Touchscreen X Position register (ADC\_XPOSR), the ADC Touchscreen Y Position register (ADC\_YPOSR) and the ADC Touchscreen Pressure register (ADC\_PRESSR).

ADC\_XPOSR presents XPOS (VX - VXmin) on its LSB and XSCALE (VXMAX - VXmin) aligned on the 16th bit.

ADC\_YPOSR presents YPOS (VY - VYmin) on its LSB and YSCALE (VYMAX - VYmin) aligned on the 16th bit.

To improve the quality of the measure, the user must calculate XPOS/XSCALE and YPOS/YSCALE.

VXMAX, VXmin, VYMAX, and VYmin are measured at the first startup of the controller. These values can change during use, so it can be necessary to refresh them. Refresh can be done by writing '1' in the ADC\_CR.TSCALIB field.

ADC\_PRESSR presents Z1 on its LSB and Z2 aligned on the 16th bit. See [65.6.15.4 4-wire Pressure Measurement Method](#).

### 65.6.15.9 Pen Detect Method

When there is no contact, it is not necessary to perform a conversion. However, it is important to detect a contact by keeping the power consumption as low as possible.

The implementation polarizes one panel by closing the switch on ( $X_p/U_L$ ) and ties the horizontal panel by an embedded resistor connected to  $Y_M$  / Sense. This resistor is enabled by a fifth switch. Since there is

no contact, no current is flowing and there is no related power consumption. As soon as a contact occurs, a current is flowing in the Touchscreen and a Schmitt trigger detects the voltage in the resistor.

The Touchscreen Interrupt configuration is entered by programming the ADC\_TSMR.PENDET bit. If this bit is written at 1, the controller samples the pen contact state when it is not converting and waiting for a trigger.

To complete the circuit, a programmable debouncer is placed at the output of the Schmitt trigger. This debouncer is programmable up to  $2^{15}$  ADC clock periods. The debouncer length can be selected by programming the ADC\_TSMR.PENDBC field.

Due to the analog switch's structure, the debouncer circuitry is only active when no conversion (touchscreen or classic ADC channels) is in progress. Thus, if the time between the end of a conversion sequence and the arrival of the next trigger event is lower than the debouncing time configured on ADC\_TSMR.PENDBC, the debouncer will not detect any contact.

**Figure 65-20. Touchscreen Pen Detect**

The touchscreen pen detect can be used to generate an ADC interrupt to wake up the system. The pen detect generates two types of status, reported in ADC\_ISR:

- the ADC\_ISR.PEN bit is set as soon as a contact exceeds the debouncing time as defined by the ADC\_TSMR.PENDBC field and remains set until ADC\_ISR is read.
- the ADC\_ISR.NOPEN bit is set as soon as no current flows for a time over the debouncing time as defined by PENDBC and remains set until ADC\_ISR is read.

Both bits are automatically cleared as soon as ADC\_ISR is read, and can generate an interrupt by writing ADC\_IER.

Moreover, the rising of either one of them clears the other, they cannot be set at the same time.

The ADC\_ISR.PENS bit shows the current status of the pen contact.

### **65.6.16 Asynchronous and Partial Wakeup (SleepWalking)**

This operating mode is a means of data preprocessing that qualifies an incoming event, thus allowing the ADC to decide whether or not to wake up the system. Asynchronous and partial wakeup is mainly used when the system is in Wait mode (refer to the Power Management Controller (PMC) section for further details). It can also be enabled when the system is fully running.

Once the Asynchronous and partial wakeup mode is enabled, no access must be performed in the ADC before a wakeup is performed by the ADC.

When the Asynchronous and partial wakeup mode is enabled for the ADC (refer to the Power Management Controller (PMC) section), the PMC decodes a clock request from the ADC. The clock request is generated as soon as a trigger event occurs. Only a trigger from RTC or ADTRG pin can be used in partial wakeup mode. The selection between RTC or ADTRG pin is performed through the ADC\_MR.TRGSEL field.

If the system is in Wait mode (processor and peripheral clocks switched off), the PMC restarts the fast RC oscillator and provides the clock only to the ADC.

To perform a conversion at regular intervals with RTC trigger, the RTC must be configured with the following settings: RTC\_MR.OUT0=7 and RTC\_MR.THIGH=7. The period of the trigger can be defined in RTC\_MR.TPERIOD.

To trigger a conversion using the ADTRG pin, the minimum high level duration of the ADTRG signal must be greater than 2 clock periods of the fast RC oscillator. The maximum duration of the high level must be limited to the amount of startup and conversion time.

As soon as the clock is provided by the PMC, the ADC processes the conversions and compares the converted values with the ADC\_CWR.LOWTHRES and ADC\_CWR.HIGHTHRES field values.

The ADC instructs the PMC to disable the clock if the converted value does not meet the conditions defined by the ADC\_CWR.LOWTHRES and ADC\_CWR.HIGHTHRES field values.

If the converted value meets the conditions, the ADC instructs the PMC to exit the full system from Wait mode.

If the processor and peripherals are running, the ADC can be configured in Asynchronous and partial wakeup mode by enabling PMC\_SLPWK\_ER (refer to the Power Management Controller (PMC) section). When a trigger event occurs, the ADC requests the clock from the PMC and the comparison is performed. If there is a comparison match, the ADC continues to request the clock. If there is no match, the clock is switched off for the ADC only, until a new trigger event is detected.

It is recommended to write a '1' to the ADC\_MR.SLEEP bit to reduce the power consumption of the ADC analog part when the system is waiting for a trigger event.

### **65.6.17 Buffer Structure**

The DMA read channel is triggered each time a new data is stored in ADC\_LCDR. The same data structure is repeatedly stored in ADC\_LCDR each time a trigger event occurs. Depending on user mode of operation (ADC\_MR, ADC\_CHSR, ADC\_SEQR1, ADC\_SEQR2, ADC\_TSMR) the structure differs. Each data read to DMA buffer, carried on a half-word (16-bit), consists of last converted data right-aligned and when the ADC\_EMR.TAG is set, the four most significant bits are carrying the channel number thus allowing an easier postprocessing in the DMA buffer or better checking the DMA buffer integrity.

**Figure 65-21. Buffer Structure**

As soon as touchscreen conversions are required, the pen detection function can help the postprocessing of the buffer. See [65.6.17.4 Pen Detection Status](#).

### 65.6.17.1 Classic ADC Channels Only (Touchscreen Disabled)

When no touchscreen conversion is required (i.e., ADC\_TSMR.TSMODE = 0), the data structure within the buffer is defined by ADC\_MR, ADC\_CHSR, ADC\_SEQRx. See figure [Buffer Structure](#).

If the user sequence is not used (i.e., ADC\_MR.USEQ is cleared) then only the value of ADC\_CHSR defines the data structure. For each trigger event, enabled channels will be consecutively stored in ADC\_LCDR and automatically read to the buffer.

When the user sequence is configured (i.e., ADC\_MR.USEQ is set) not only does ADC\_CHSR modify the data structure of the buffer, but ADC\_SEQRx registers may modify the data structure of the buffer as well.

### 65.6.17.2 Touchscreen Channels Only

When only touchscreen conversions are required (i.e., TSMODE ≠ 0 in ADC\_TSMR and ADC\_CHSR equals 0), the structure of data within the buffer is defined by ADC\_TSMR.

When TSMODE = 1 or 3, each trigger event adds two half-words in the buffer (assuming TSAV = 0), first half-word being ADC\_XPOSR.XPOS, then ADC\_YPOSR.YPOS. If TSAV/TSFREQ ≠ 0, the data structure remains unchanged. Not all trigger events add data to the buffer.

When TSMODE = 2, each trigger event adds four half-words to the buffer (assuming TSAV = 0), first half-word being ADC\_XPOSR.XPOS, followed by ADC\_YPOSR.YPOS and finally ADC\_PRESSR.Z1, followed by ADC\_PRESSR.Z2.

When ADC\_EMR.TAG is set, the CHNB field (four most significant bits of ADC\_LCDR) is cleared when ADC\_XPOSR.XPOS is transmitted and set when ADC\_YPOSR.YPOS is transmitted, allowing an easier post-processing of the buffer or a better checking of the buffer integrity. In case 4-wire with Pressure mode is selected, the Z1 value is transmitted to the buffer along with tag set to 2 and Z2 is tagged with value 3.

XSCALE and YSCALE (calibration values) are not transmitted to the buffer because they are supposed to be constant and moreover only measured at the very first startup of the controller or upon user request.

There is no change in buffer structure whatever the value of the PENDET.ADC\_TSMR bit configuration, but it is recommended to use the pen detection function for buffer postprocessing (see [65.6.17.4 Pen Detection Status](#)).

**Figure 65-22. Buffer Structure When Only Touchscreen Channels are Enabled**

Assuming ADC\_TSMR.TSMOD = 1 or 3  
 ADC\_TSMR.TSAV = 0  
 ADC\_CHSR = 0x000\_00000, ADC\_EMR.TAG = 1

Assuming ADC\_TSMR.TSMOD = 1 or 3  
 ADC\_TSMR.TSAV = 0  
 ADC\_CHSR = 0x000\_00000, ADC\_EMR.TAG = 0

Assuming ADC\_TSMR.TSMOD = 2  
 ADC\_TSMR.TSAV = 0  
 ADC\_CHSR = 0x000\_00000, ADC\_EMR.TAG = 1

Assuming ADC\_TSMR.TSMOD = 2  
 ADC\_TSMR.TSAV = 0  
 ADC\_CHSR = 0x000\_00000, ADC\_EMR.TAG = 0

### 65.6.17.3 Interleaved Channels

When both classic ADC channels (CH4/CH5 up to CH12) are set in ADC\_CHSR and touchscreen conversions are required (TSMODE ≠ 0 in ADC\_TSMR), the structure of the buffer differs according to the ADC\_TSMR.TSAV and ADC\_TSMR.TSFREQ values.

If TSFREQ ≠ 0, not all events generate touchscreen conversions, therefore the buffer structure is based on 2<sup>TSFREQ</sup> trigger events. Given a TSFREQ value, the location of touchscreen conversion results depends on TSAV value.

When TSFREQ = 0, TSAV must equal 0.

There is no change in buffer structure whatever the value of the ADC\_TSMR.PENDET bit configuration, but it is recommended to use the pen detection function for buffer post-processing (see [65.6.17.4 Pen Detection Status](#)).

**Figure 65-23. Buffer Structure When Classic ADC and Touchscreen Channels are Interleaved**

Assuming ADC\_TSMR.TSMOD = 1  
 ADC\_TSMR.TSAV = ADC\_TSMR.TSFREQ = 0  
 ADC\_CHSR = 0x000\_0100, ADC\_EMR.TAG = 1

Assuming ADC\_TSMR.TSMOD = 1  
 ADC\_TSMR.TSAV = ADC\_TSMR.TSFREQ = 0  
 ADC\_CHSR = 0x000\_0100, ADC\_EMR.TAG = 0

Assuming ADC\_TSMR.TSMOD = 1  
 ADC\_TSMR.TSAV = 0, ADC\_TSMR.TSFREQ = 1  
 ADC\_CHSR = 0x000\_0100, ADC\_EMR.TAG = 1

Assuming ADC\_TSMR.TSMOD = 1  
 ADC\_TSMR.TSAV = 1, ADC\_TSMR.TSFREQ = 1  
 ADC\_CHSR = 0x000\_0100, ADC\_EMR.TAG = 1

### 65.6.17.4 Pen Detection Status

If the pen detection measure is enabled (ADC\_TSMR.PENDET is set), the XPOS, YPOS, Z1, Z2 values transmitted to the buffer through ADC\_LCDR are cleared (including the CHNB field), if the ADC\_ISR.PENS flag is 0. When the ADC\_ISR.PENS flag is set, XPOS, YPOS, Z1, Z2 are normally transmitted.

Therefore, using pen detection together with tag function eases the post-processing of the buffer, especially to determine which touchscreen converted values correspond to a period of time when the pen was in contact with the screen.

When the pen detection is disabled or the tag function is disabled, XPOS, YPOS, Z1, Z2 are normally transmitted without tag and no relationship can be found with pen status, thus post-processing may not be easy.

**Figure 65-24. Buffer Structure With and Without Pen Detection Enabled**

### 65.6.18 Fault Event

The ADC Controller internal fault output is directly connected to the PWM fault input. The fault event may be asserted depending on the configuration of ADC\_EMR, ADC\_CWR, ADC\_LCMR and ADC\_LCCWR and converted values.

Two types of comparison can trigger a comparison event (fault output pulse):

- The first comparison type is based on ADC\_LCCWR settings, i.e., on all converted channels except the last one;
- The second comparison type is linked to the last channel.

As an example, overcurrent and temperature exceeding limits can trigger a fault to PWM.

When the comparison event occurs, the ADC fault output generates a pulse of one peripheral clock cycle to the PWM fault input. This fault line can be enabled or disabled within PWM. Should it be activated and asserted by the ADC Controller, the PWM outputs are immediately placed in a safe state (pure combinational path). Note that the ADC fault output connected to the PWM is not the COMPE bit. Thus the Fault mode (FMODE) within the PWM configuration must be FMODE = 1.

### 65.6.19 Register Write Protection

To prevent any single software error from corrupting ADC behavior, certain registers in the address space can be write-protected by setting the bit WPEN in the “[ADC Write Protection Mode Register](#)” (ADC\_WPMR).

If a write access to the protected registers is detected, the WPVS flag in the “[ADC Write Protection Status Register](#)” (ADC\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS flag is automatically reset by reading ADC\_WPSR.

The following registers are write-protected when ADC\_WPMR.WPEN is set:

- [ADC Mode Register](#)
- [ADC Channel Sequence 1 Register](#)
- [ADC Channel Sequence 2 Register](#)
- [ADC Channel Enable Register](#)
- [ADC Channel Disable Register](#)
- [ADC Last Channel Trigger Mode Register](#)
- [ADC Last Channel Compare Window Register](#)
- [ADC Extended Mode Register](#)
- [ADC Compare Window Register](#)
- [ADC Channel Offset Register](#)
- [ADC Analog Control Register](#)
- [ADC\\_Touchscreen Mode Register](#)
- [ADC Trigger Register](#)
- [ADC Correction Values Register](#)
- [ADC Channel Error Correction Register](#)
- [ADC Touchscreen Correction Values Register](#)

### 65.7.1 ADC Control Register

**Name:** ADC\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

#### Bit 4 – CMPRST Comparison Restart

Value	Description
0	No effect.
1	Stops the conversion result storage until the next comparison match.

#### Bit 2 – TSCALIB Touchscreen Calibration

If conversion is in progress, the calibration sequence starts at the beginning of a new conversion sequence. If no conversion is in progress, the calibration sequence starts at the second conversion sequence located after the TSCALIB command (Sleep mode, waiting for a trigger event).

TSCALIB measurement sequence does not affect the Last Converted Data register (ADC\_LCDR).

Value	Description
0	No effect.
1	Programs screen calibration (VDD/GND measurement)

#### Bit 1 – START Start Conversion

Value	Description
0	No effect.
1	Begins analog-to-digital conversion.

# SAMA5D2 Series

## Analog-to-Digital Controller (ADC)

---

---

### Bit 0 – SWRST Software Reset

Value	Description
0	No effect.
1	Resets the ADC, simulating a hardware reset.

### 65.7.2 ADC Mode Register

**Name:** ADC\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	USEQ	MAXSPEED	TRANSFER[1:0]		TRACKTIM[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	ANACH				STARTUP[3:0]			
Access	R/W				R/W	R/W	R/W	R/W
Reset	0				0	0	0	0
Bit	15	14	13	12	11	10	9	8
	PRESCAL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
		FWUP	SLEEP		TRGSEL[2:0]			
Access		R/W	R/W		R/W	R/W	R/W	
Reset		0	0		0	0	0	

#### Bit 31 – USEQ User Sequence Enable

Value	Name	Description
0	NUM_ORDER	Normal mode: The controller converts channels in a simple numeric order depending only on the channel index.
1	REG_ORDER	User Sequence mode: The sequence respects what is defined in ADC_SEQR1 and ADC_SEQR2 registers and can be used to convert the same channel several times.

**Bit 30 – MAXSPEED** Maximum Sampling Rate Enable in Freerun Mode  
 This bit should always be set to 0.

**Bits 29:28 – TRANSFER[1:0]** Transfer Time  
 The TRANSFER field must be set to 2 to guarantee the optimal transfer time.

**Bits 27:24 – TRACKTIM[3:0]** Tracking Time

Value	Name	Description
0	ADCCLK6	The tracking time is 6 ADC clock cycles.
1-14	–	The tracking time is 6 ADC clock cycles.
15	ADCCLK7	The tracking time is 7 ADC clock cycles.

### Bit 23 – ANACH Analog Change

Value	Name	Description
0	NONE	No analog change on channel switching: DIFF0 is used for all channels.
1	ALLOWED	Allows different analog settings for each channel. See <a href="#">ADC_COR</a> .

### Bits 19:16 – STARTUP[3:0] Startup Time

Value	Name	Description
0	SUT0	0 periods of ADCCLK
1	SUT8	8 periods of ADCCLK
2	SUT16	16 periods of ADCCLK
3	SUT24	24 periods of ADCCLK
4	SUT64	64 periods of ADCCLK
5	SUT80	80 periods of ADCCLK
6	SUT96	96 periods of ADCCLK
7	SUT112	112 periods of ADCCLK
8	SUT512	512 periods of ADCCLK
9	SUT576	576 periods of ADCCLK
10	SUT640	640 periods of ADCCLK
11	SUT704	704 periods of ADCCLK
12	SUT768	768 periods of ADCCLK
13	SUT832	832 periods of ADCCLK
14	SUT896	896 periods of ADCCLK
15	SUT960	960 periods of ADCCLK

### Bits 15:8 – PRESCAL[7:0] Prescaler Rate Selection

$PRESCAL = (f_{\text{peripheral clock}} / (2 \times f_{\text{ADCCLK}})) - 1$ .

### Bit 6 – FWUP Fast Wakeup

Value	Name	Description
0	OFF	If SLEEP is 1, then both ADC core and reference voltage circuitry are OFF between conversions
1	ON	If SLEEP is 1, then Fast Wakeup Sleep mode: The voltage reference is ON between conversions and ADC core is OFF

### Bit 5 – SLEEP Sleep Mode

Value	Name	Description
0	NORMAL	Normal Mode: The ADC core and reference voltage circuitry are kept ON between conversions.
1	SLEEP	Sleep Mode: The wakeup time can be modified by programming the FWUP bit.

### Bits 3:1 – TRGSEL[2:0] Trigger Selection

The trigger selection can be performed only if  $ADC\_TRGR.TRGMOD = 1, 2$  or  $3$ .

Value	Name	Description
0	ADC_TRIG0	ADTRG
1	ADC_TRIG1	TIOA0
2	ADC_TRIG2	TIOA1

# SAMA5D2 Series

## Analog-to-Digital Controller (ADC)

Value	Name	Description
3	ADC_TRIG3	TIOA2
4	ADC_TRIG4	PWM event line 0
5	ADC_TRIG5	PWM event line 1
6	ADC_TRIG6	TIOA3
7	ADC_TRIG7	RTCOUT0

### 65.7.3 ADC Channel Sequence 1 Register

**Name:** ADC\_SEQR1  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

	Bit	31	30	29	28	27	26	25	24
		USCH8[3:0]				USCH7[3:0]

**Bits 0:3, 4:7, 8:11, 12:15, 16:19, 20:23, 24:27, 28:31 – USCHx** User Sequence Number x

This register can be used only if the ADC\_MR.USEQ field is set to '1'.

Any USCHx field is processed only if the ADC\_CHSR.CHx-1 bit reads logical '1', else any value written in USCHx does not add the corresponding channel in the conversion sequence.

Configuring the same value in different fields leads to multiple samples of the same channel during the conversion sequence. This can be done consecutively, or not, according to user needs.

Example: for each trigger event, to obtain the "CH3 CH1 CH0 CH4 CH4" conversion sequence, use the following settings:

ADC\_SEQR1.USCH1=3, ADC\_CHSR.CH0=1

ADC\_SEQR1.USCH2=1, ADC\_CHSR.CH1=1

ADC\_SEQR1.USCH3=0, ADC\_CHSR.CH2=1

ADC\_SEQR1.USCH4=4, ADC\_CHSR.CH3=1

ADC\_SEQR1.USCH5=4, ADC\_CHSR.CH4=1

### 65.7.4 ADC Channel Sequence 2 Register

**Name:** ADC\_SEQR2  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

**Bits 3:0 – USCHx[3:0]** User Sequence Number x

This register can be used only if the ADC\_MR.USEQ field is set to '1'.

Any USCHx field is processed only if the ADC\_CHSR.CHx-1 bit reads logical '1', else any value written in USCHx does not add the corresponding channel in the conversion sequence.

Configuring the same value in different fields leads to multiple samples of the same channel during the conversion sequence. This can be done consecutively, or not, according to user needs.

### 65.7.5 ADC Channel Enable Register

**Name:** ADC\_CHER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

	CH7	CH6	CH5	CH4	CH3	CH2	CH1	CH0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – CHx Channel x Enable**

If ADC\_MR.USEQ = 1, CHx corresponds to the enable of sequence number x+1 described in ADC\_SEQR1 and ADC\_SEQR2 (e.g. CH0 enables sequence number USCH1).

Value	Description
0	No effect.
1	Enables the corresponding channel.

### 65.7.6 ADC Channel Disable Register

**Name:** ADC\_CHDR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – CHx Channel x Disable**

If the corresponding channel is disabled during a conversion or if it is disabled and then reenabled during a conversion, its associated data and corresponding EOCx and GOVRE flags in ADC\_ISR and OVREx flags in ADC\_OVER are unpredictable

Value	Description
0	No effect.
1	Disables the corresponding channel.

### 65.7.7 ADC Channel Status Register

**Name:** ADC\_CHSR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
					CH11	CH10	CH9	CH8
Access					W	W	W	W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CH7	CH6	CH5	CH4	CH3	CH2	CH1	CH0
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – CHx Channel x Status**

Value	Description
0	The corresponding channel (or part of sequence, see ADC_SEQyR.USCHx field) is disabled.
1	The corresponding channel (or part of sequence, see ADC_SEQyR.USCHx field) is enabled.  Note: As an example, when ADC_MR.USEQ=1 and a 1 is written to CH2, the channel defined in ADC_SEQ0R.USCH3 is part of the sequence of conversions.

### 65.7.8 ADC Last Converted Data Register

**Name:** ADC\_LCDR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	CHNBOSR[4:0]							
Access				R	R	R	R	R
Reset				0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	LDATA[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	LDATA[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 28:24 – CHNBOSR[4:0]** Channel Number in Oversampling Mode

Indicates the last converted channel when the ADC\_EMR.TAG bit is set and the ADC\_EMR.OSR field is not equal to 0. If the ADC\_EMR.TAG bit is not set, CHNBOSR = 0.

**Bits 15:0 – LDATA[15:0]** Last Data Converted

The analog-to-digital conversion data is placed into this register at the end of a conversion and remains until a new conversion is completed.

If OSR = 0 and TAG = 1 in ADC\_EMR, the 4 MSBs of LDATA carry the channel number to obtain a packed system memory buffer made of 1 converted data stored in a halfword (16-bit) instead of 1 converted data in a 32-bit word, thus dividing by 2 the size of the memory buffer.

### 65.7.9 ADC Interrupt Enable Register

**Name:** ADC\_IER  
**Offset:** 0x24  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
		NOPEN	PEN			COMPE	GOVRE	DRDY

#### Bit 31 – PENS Pen Detect Status

Value	Description
0	The pen does not press the screen.
1	The pen presses the screen.
	Note: PENS is not a source of interruption.

#### Bit 30 – NOPEN No Pen Contact (cleared on read)

Value	Description
0	No loss of pen contact since the last read of ADC_ISR.
1	At least one loss of pen contact since the last read of ADC_ISR.

#### Bit 29 – PEN Pen contact (cleared on read)

Value	Description
0	No pen contact since the last read of ADC_ISR.
1	At least one pen contact since the last read of ADC_ISR.

#### Bit 26 – COMPE Comparison Event (cleared on read)

Value	Description
0	No comparison event since the last read of ADC_ISR.
1	At least one comparison event (defined in ADC_EMR and ADC_CWR) has occurred since the last read of ADC_ISR.

**Bit 25 – GOVRE** General Overrun Error (cleared on read)

Value	Description
0	No general overrun error occurred since the last read of ADC_ISR.
1	At least one general overrun error has occurred since the last read of ADC_ISR.

**Bit 24 – DRDY** Data Ready (automatically set / cleared)

Value	Description
0	No data has been converted since the last read of ADC_LCDR.
1	At least one data has been converted and is available in ADC_LCDR.

**Bit 22 – PRDY** Touchscreen Pressure Measure Ready (cleared on read)

Value	Description
0	No measure has been performed since the last read of ADC_PRESSR.
1	At least one measure has been performed since the last read of ADC_ISR.

**Bit 21 – YRDY** Touchscreen YPOS Measure Ready (cleared on read)

Value	Description
0	No measure has been performed since the last read of ADC_YPOSR.
1	At least one measure has been performed since the last read of ADC_ISR.

**Bit 20 – XRDY** Touchscreen XPOS Measure Ready (cleared on read)

Value	Description
0	No measure has been performed since the last read of ADC_XPOSR.
1	At least one measure has been performed since the last read of ADC_ISR.

**Bit 19 – LCCHG** Last Channel Change (cleared on read)

Value	Description
0	There is no comparison match (defined in the Last Channel Compare Window register (ADC_LCCWR) since the last read of ADC_ISR.
1	The converted value reported on ADC_CDR11 has changed since the last read of ADC_ISR, according to what is defined in ADC_LCTMR and ADC_LCCWR.

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – EOCx** End of Conversion x (automatically set / cleared)

Value	Description
0	The corresponding analog channel is disabled, or the conversion is not finished. This flag is cleared when reading the corresponding ADC_CDRx registers.
1	The corresponding analog channel is enabled and conversion is complete.

### 65.7.13 ADC Last Channel Trigger Mode Register

**Name:** ADC\_LCTMR  
**Offset:** 0x34  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

#### Bits 5:4 – CMPMOD[1:0] Last Channel Comparison Mode

Value	Name	Description
0	LOW	Generates the ADC_ISR.LCCHG flag when the converted data is lower than the low threshold of the window.
1	HIGH	Generates the ADC_ISR.LCCHG flag when the converted data is higher than the high threshold of the window.
2	IN	Generates the ADC_ISR.LCCHG flag when the converted data is in the comparison window.
3	OUT	Generates the ADC_ISR.LCCHG flag when the converted data is out of the comparison window.

#### Bit 0 – DUALTRIG Dual Trigger ON

Value	Description
0	All channels are triggered by event defined by ADC_MR.TRGSEL.
1	Last channel (higher index) trigger period is defined by RTC_MR.OUT1.

### 65.7.14 ADC Last Channel Compare Window Register

**Name:** ADC\_LCCWR  
**Offset:** 0x38  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	HIGHTHRES[11:8]

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – OVREx** Overrun Error x

Value	Description
0	No overrun error on the corresponding channel since the last read of ADC_OVER.
1	An overrun error has occurred on the corresponding channel since the last read of ADC_OVER.

### 65.7.16 ADC Extended Mode Register

**Name:** ADC\_EMR  
**Offset:** 0x40  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24	
			ADCMODE[1:0]				SIGNMODE[1:0]		
Access			R/W	R/W		R/W	R/W	R/W	
Reset			0	0		0	0	0	
Bit	23	22	21	20	19	18	17	16	
			SRCCLK	ASTE			OSR[1:0]		
Access			R/W	R/W			R/W	R/W	
Reset			0	0			0	0	
Bit	15	14	13	12	11	10	9	8	
			CMPFILTER[1:0]					CMPALL	
Access			R/W	R/W			R/W		
Reset			0	0			0		
Bit	7	6	5	4	3	2	1	0	
	CMPSEL[3:0]					CMPTYPE	CMPMODE[1:0]		
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W	
Reset	0	0	0	0		0	0	0	

**Bits 29:28 – ADCMODE[1:0]** ADC Running Mode  
 See [65.6.14 Automatic Error Correction](#) for details on ADC running mode.

Value	Name	Description
0	NORMAL	Normal mode of operation.
1	OFFSET_ERROR	Offset Error mode to measure the offset error. See table <a href="#">ADC Running Modes</a> .
2	GAIN_ERROR_HIGH	Gain Error mode to measure the gain error. See table <a href="#">ADC Running Modes</a> .
3	GAIN_ERROR_LOW	Gain Error mode to measure the gain error. See table <a href="#">ADC Running Modes</a> .

**Bits 26:25 – SIGNMODE[1:0]** Sign Mode  
 If conversion results are signed and resolution is below 16 bits, the sign is extended up to the bit 15 (for example, 0xF43 for 12-bit resolution will be read as 0xFF43 and 0x467 will be read as 0x0467). See [65.6.6 Conversion Results Format](#).

Value	Name	Description
0	SE_UNSG_DF_SIGN	Single-Ended channels: Unsigned conversions. Differential channels: Signed conversions.

Value	Name	Description
1	SE_SIGN_DF_UNSG	Single-Ended channels: Signed conversions. Differential channels: Unsigned conversions.
2	ALL_UNSIGNED	All channels: Unsigned conversions.
3	ALL_SIGNED	All channels: Signed conversions.

### Bit 24 – TAG Tag of ADC\_LCDR

Value	Description
0	Sets ADC_LCDR.CHNB field to zero.
1	Appends the channel number to the conversion result in ADC_LCDR.

### Bit 21 – SRCCLK External Clock Selection

0 (PERIPH\_CLK): The peripheral clock is the source for the ADC prescaler.

1 (GCLK): GCLK is the source clock for the ADC prescaler, thus the ADC clock can be independent of the core/peripheral clock.

### Bit 20 – ASTE Averaging on Single Trigger Event

Value	Name	Description
0	MULTI_TRIG_AVERAGE	The average requests several trigger events.
1	SINGLE_TRIG_AVERAGE	The average requests only one trigger event.

### Bits 17:16 – OSR[1:0] Over Sampling Rate

Value	Name	Description
0	NO_AVERAGE	No averaging. ADC sample rate is maximum.
1	OSR4	1-bit enhanced resolution by averaging. ADC sample rate divided by 4.
2	OSR16	2-bit enhanced resolution by averaging. ADC sample rate divided by 16.
3	OSR64	3-bit enhanced resolution by averaging. ADC sample rate divided by 64.
4	OSR256	4-bit enhanced resolution by averaging. ADC sample rate divided by 256.

### Bits 13:12 – CMPFILTER[1:0] Compare Event Filtering

Number of consecutive compare events necessary to raise the flag = CMPFILTER+1

When programmed to 0, the flag rises as soon as an event occurs.

See [65.6.9 Comparison Window](#) when using the filtering option (CMPFILTER > 0).

### Bit 9 – CMPALL Compare All Channels

Value	Description
0	Only channel indicated in CMPSEL field is compared.
1	All channels are compared.

### Bits 7:4 – CMPSEL[3:0] Comparison Selected Channel

If CMPALL = 0: CMPSEL indicates which channel has to be compared.

If CMPALL = 1: No effect.

### Bit 2 – CMPTYPE Comparison Type

# SAMA5D2 Series

## Analog-to-Digital Controller (ADC)

Value	Name	Description
0	FLAG_ONLY	Any conversion is performed and comparison function drives the ADC_ISR.COMPE flag.
1	START_CONDITION	Comparison conditions must be met to start the storage of all conversions until the ADC_CR.CMPRST bit is set.

### Bits 1:0 – CMPMODE[1:0] Comparison Mode

Value	Name	Description
0	LOW	When the converted data is lower than the low threshold of the window, generates the ADC_ISR.COMPE flag or, in Partial Wakeup mode, defines the conditions to exit system from Wait mode.
1	HIGH	When the converted data is higher than the high threshold of the window, generates the ADC_ISR.COMPE flag or, in Partial Wakeup mode, defines the conditions to exit system from Wait mode.
2	IN	When the converted data is in the comparison window, generates the ADC_ISR.COMPE flag or, in Partial Wakeup mode, defines the conditions to exit system from Wait mode.
3	OUT	When the converted data is out of the comparison window, generates the ADC_ISR.COMPE flag or, in Partial Wakeup mode, defines the conditions to exit system from Wait mode.

### 65.7.17 ADC Compare Window Register

**Name:** ADC\_CWR  
**Offset:** 0x44  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
			HIGHTHRES[13:8]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	HIGHTHRES[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
			LOWTHRES[13:8]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	LOWTHRES[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 29:16 – HIGHTHRES[13:0]** High Threshold  
 High threshold associated to compare settings of ADC\_EMR.

**Bits 13:0 – LOWTHRES[13:0]** Low Threshold  
 Low threshold associated to compare settings of ADC\_EMR.

### 65.7.18 Channel Offset Register

**Name:** ADC\_COR  
**Offset:** 0x4C  
**Reset:** 0  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
					DIFF11	DIFF10	DIFF9	DIFF8
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access								
Reset								

**Bits 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27 – DIFFx** Differential Inputs for Channel x

Value	Description
0	Corresponding channel is set in Single-ended mode.
1	Corresponding channel is set in Differential mode.

### 65.7.19 ADC Channel Data Register

**Name:** ADC\_CDRx  
**Offset:** 0x50 + x\*0x04 [x=0..11]  
**Reset:** 0  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
			DATA[13:8]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	DATA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 13:0 – DATA[13:0]** Converted Data

The analog-to-digital conversion data is placed into this register at the end of a conversion and remains until a new conversion is completed. ADC\_CDRx is only loaded if the corresponding analog channel is enabled.

### 65.7.20 ADC Analog Control Register

**Name:** ADC\_ACR  
**Offset:** 0x94  
**Reset:** 0x00000101  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).  
 By default, bits 12 and 13 are set to 1 and 0, respectively, and must not be modified.

**Bits 9:8 – IBCTL[1:0]** ADC Bias Current Control

Adapts performance versus power consumption. Refer to the “Electrical Characteristics” section for further details.

**Bits 1:0 – PENDETSSENS[1:0]** Pen Detection Sensitivity

Modifies the pen detection input pull-up resistor value. Refer to the “Electrical Characteristics” section for further details.

### 65.7.21 ADC Touchscreen Mode Register

**Name:** ADC\_TSMR  
**Offset:** 0xB0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	PENDBC[3:0]							PENDET
Access	R/W	R/W	R/W	R/W				R/W
Reset	0	0	0	0				0
Bit	23	22	21	20	19	18	17	16
		NOTSDMA			TSSCTIM[3:0]			
Access		R/W			R/W	R/W	R/W	R/W
Reset		0			0	0	0	0
Bit	15	14	13	12	11	10	9	8
					TSFREQ[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
			TSAV[1:0]				TSMODE[1:0]	
Access			R/W	R/W			R/W	R/W
Reset			0	0			0	0

**Bits 31:28 – PENDBC[3:0]** Pen Detect Debouncing Period  
 Debouncing period =  $2^{\text{PENDBC}}$  ADCCLK periods.

**Bit 24 – PENDET** Pen Contact Detection Enable  
 When PENDET = 1, XPOS, YPOS, Z1, Z2 values of ADC\_XPOSR, ADC\_YPOSR, ADC\_PRESSR are automatically cleared when ADC\_ISR.PENS = 0.

Value	Description
0	Pen contact detection disabled.
1	Pen contact detection enabled.

**Bit 22 – NOTSDMA** No TouchScreen DMA

Value	Description
0	XPOS, YPOS, Z1, Z2 are transmitted in ADC_LCDR.
1	XPOS, YPOS, Z1, Z2 are never transmitted in ADC_LCDR, therefore the buffer does not contain touchscreen values.

**Bits 19:16 – TSSCTIM[3:0]** Touchscreen Switches Closure Time  
 Defines closure time of analog switches necessary to establish the measurement conditions.

The closure time is:

Switch Closure Time = (TSSCTIM × 4) ADCCLK periods.

**Bits 11:8 – TSFREQ[3:0]** Touchscreen Frequency

Defines the touchscreen frequency compared to the trigger frequency.

TSFREQ must be greater or equal to TSAV.

The touchscreen frequency is:

Touchscreen Frequency = Trigger Frequency /  $2^{\text{TSFREQ}}$

**Bits 5:4 – TSAV[1:0]** Touchscreen Average

Value	Name	Description
0	NO_FILTER	No Filtering. Only one ADC conversion per measure
1	AVG2CONV	Averages 2 ADC conversions
2	AVG4CONV	Averages 4 ADC conversions
3	AVG8CONV	Averages 8 ADC conversions

**Bits 1:0 – TSMODE[1:0]** Touchscreen Mode

When TSMOD equals 01 or 10 (i.e., 4-wire mode), channels 0, 1, 2 and 3 must not be used for classic ADC conversions. When TSMOD equals 11 (i.e., 5-wire mode), channels 0, 1, 2, 3, and 4 must not be used.

Value	Name	Description
0	NONE	No Touchscreen
1	4_WIRE_NO_PM	4-wire Touchscreen without pressure measurement
2	4_WIRE	4-wire Touchscreen with pressure measurement
3	5_WIRE	5-wire Touchscreen

**65.7.22 ADC Touchscreen X Position Register**

**Name:** ADC\_XPOSR  
**Offset:** 0xB4  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	XSCALE[11:8]							
Access					R	R	R	R
Reset					0	0	0	0
Bit	23	22	21	20	19	18	17	16
	XSCALE[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	XPOS[11:8]							
Access					R	R	R	R
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	XPOS[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 27:16 – XSCALE[11:0] Scale of XPOS**

Indicates the max value that XPOS can reach. This value should be close to  $2^{12}$ .

**Bits 11:0 – XPOS[11:0] X Position**

The position measured is stored here. If XPOS = 0 or XPOS = XSIZE, the pen is on the border.

When pen detection is enabled (ADC\_TSMR.PENDET set to '1'), XPOS is tied to 0 while there is no detection of contact on the touchscreen (i.e., when the ADC\_ISR.PENS bit is cleared).

**65.7.23 ADC Touchscreen Y Position Register**

**Name:** ADC\_YPOSR  
**Offset:** 0xB8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	YSCALE[11:8]							
Access					R	R	R	R
Reset					0	0	0	0
Bit	23	22	21	20	19	18	17	16
	YSCALE[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	YPOS[11:8]							
Access					R	R	R	R
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	YPOS[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 27:16 – YSCALE[11:0] Scale of YPOS**

Indicates the max value that YPOS can reach. This value should be close to  $2^{12}$ .

**Bits 11:0 – YPOS[11:0] Y Position**

The position measured is stored here. If YPOS = 0 or YPOS = YSIZE, the pen is on the border.

When pen detection is enabled (ADC\_TSMR.PENDET set to '1'), YPOS is tied to 0 while there is no detection of contact on the touchscreen (i.e., when the ADC\_ISR.PENS bit is cleared).

**65.7.24 ADC Touchscreen Pressure Register**

**Name:** ADC\_PRESSR  
**Offset:** 0xBC  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
					Z2[11:8]			
Access					R	R	R	R
Reset					0	0	0	0
Bit	23	22	21	20	19	18	17	16
	Z2[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
					Z1[11:8]			
Access					R	R	R	R
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	Z1[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 27:16 – Z2[11:0]** Data of Z2 Measurement

Data Z2 necessary to calculate pen pressure.

When pen detection is enabled (ADC\_TSMR.PENDET set to '1'), Z2 is tied to 0 while there is no detection of contact on the touchscreen (i.e., when the ADC\_ISR.PENS bit is cleared).

**Note:** These two values are unavailable if ADC\_TSMR.TSMODE is not set to 2.

**Bits 11:0 – Z1[11:0]** Data of Z1 Measurement

Data Z1 necessary to calculate pen pressure.

When pen detection is enabled (ADC\_TSMR.PENDET set to '1'), Z1 is tied to 0 while there is no detection of contact on the touchscreen (i.e., when the ADC\_ISR.PENS bit is cleared).

### 65.7.25 ADC Trigger Register

**Name:** ADC\_TRGR  
**Offset:** 0xC0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
TRGPER[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
TRGPER[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
						TRGMOD[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	0

**Bits 31:16 – TRGPER[15:0]** Trigger Period  
 Effective only if TRGMOD defines a periodic trigger.

Defines the periodic trigger period, with the following equation:

$$\text{Trigger Period} = (\text{TRGPER} + 1) / \text{ADCCLK}$$

The minimum time between two consecutive trigger events must be strictly greater than the duration time of the longest conversion sequence depending on the configuration of registers ADC\_MR, ADC\_CHSR, ADC\_SEQRx, ADC\_TSMR.

When TRGMOD is set to pen detect trigger (i.e., 100) and averaging is used (i.e., field TSAV ≠ 0 in ADC\_TSMR) only one measure is performed. Thus, XRDY, YRDY, PRDY, DRDY will not rise on pen contact trigger. To achieve measurement, several triggers must be provided either by software or by setting the TRGMOD on continuous trigger (i.e., 110) until flags rise.

**Bits 2:0 – TRGMOD[2:0]** Trigger Mode

Value	Name	Description
0	NO_TRIGGER	No trigger, only software trigger can start conversions
1	EXT_TRIG_RISE	Rising edge of the selected trigger event, defined in ADC_MR.TRGSEL
2	EXT_TRIG_FALL	Falling edge of the selected trigger event
3	EXT_TRIG_ANY	Any edge of the selected trigger event

# SAMA5D2 Series

## Analog-to-Digital Controller (ADC)

Value	Name	Description
4	PEN_TRIG	Pen Detect Trigger (shall be selected only if PENDET is set and TSMODE > 0)
5	PERIOD_TRIG	ADC internal periodic trigger (see field TRGPER)
6	CONTINUOUS	Continuous mode

### 65.7.26 ADC Correction Values Register

**Name:** ADC\_CVR  
**Offset:** 0xD4  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

	Bit	31	30	29	28	27	26	25	24
		GAINCORR[15:8]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0
	Bit	23	22	21	20	19	18	17	16
		GAINCORR[7:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0

Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0	0

**Bits 31:16 – GAINCORR[15:0]** Gain Correction

Gain correction to apply on converted data. Only bits 0 to 13 are relevant (other bits are ignored and read as 0).

**Bits 15:0 – OFFSETCORR[15:0]** Offset Correction

Offset correction to apply on converted data. The offset is signed (2's complement), only bits 0 to 11 are relevant (other bits are ignored and read as 0).

### 65.7.27 ADC Channel Error Correction Register

**Name:** ADC\_CECR  
**Offset:** 0xD8  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

	ECORR7	ECORR6	ECORR5	ECORR4	ECORR3	ECORR2	ECORR1	ECORR0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – ECORRx** Error Correction Enable for channel x

Value	Description
0	Automatic error correction is disabled for channel x.
1	Automatic error correction is enabled for channel x.

### 65.7.28 ADC Touchscreen Correction Values Register

**Name:** ADC\_TSCVR  
**Offset:** 0xDC  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
TSGAINCORR[15:8]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
TSGAINCORR[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

		WPEN							
Access									R/W
Reset									0

**Bits 31:8 – WPKEY[23:0] Write Protection Key**

Value	Name	Description
0x41444	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit.
3		Always reads as 0

**Bit 0 – WPEN Write Protection Enable**

See [65.6.19 Register Write Protection](#) for the list of write-protected registers.

Value	Description
0	Disables the write protection if WPKEY value corresponds to 0x414443 (“ADC” in ASCII).
1	Enables the write protection if WPKEY value corresponds to 0x414443 (“ADC” in ASCII).

### 65.7.30 ADC Write Protection Status Register

**Name:** ADC\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	[Greyed out bits]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	[Greyed out bits]							WPVS
Access								R
Reset								0

**Bits 23:8 – WPVSR[15:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of ADC_WPSR.
1	A write protection violation has occurred since the last read of ADC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

## 66. Electrical Characteristics

### 66.1 Absolute Maximum Ratings

**Table 66-1. Absolute Maximum Ratings\***

<b>Storage Temperature</b>	-60°C to + 150°C	<b>Note:</b> Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
<b>Voltage on Input Pins with Respect to Ground</b>	-0.3V to +4.0V	
<b>Maximum Voltage on Power Input Pins with Respect to Ground</b>		
VDDCORE, VDDPLLA, VDDUTMIC and VDDHSIC	1.5V	
VDDIODDR	2.0V	
VDDBU	4.0V	
VDDIOPx, VDDUTMII, VDDISC, VDDSDMMC, VDDOSC, VDDANA, VDDAUDIOPLL	4.0V	
VDDFUSE	3.0V	
<b>Total DC Output Current on all I/O lines</b>	350 mA	

### 66.2 DC Characteristics

The following characteristics are applicable to the ambient operating temperature range  $T_A = -40^{\circ}\text{C}$  to  $+105^{\circ}\text{C}$  for -CN devices, and  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  for -CU devices, unless otherwise specified.

**Table 66-2. Recommended Thermal Operating Conditions**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$T_A$	Ambient Temperature	–	-40	–	+105	°C
$T_J$	Junction Temperature	–	-40	–	+125	°C

### 66.3 Power Consumption

This section provides information about the current consumption on different power supply rails of the device. It gives current consumption in:

- Active mode when running a CoreMark and in predefined use cases
- Low-power modes: Backup mode, Idle mode and Ultra Low-power mode

- By peripheral with representative activity

### 66.4 Active Mode

Active mode is the normal running mode with the Arm core clock running off a PLL. The power management controller is used to adapt the frequency and to disable the peripheral clocks.

#### 66.4.1 Active Mode Power Consumption Versus Modes

The power consumption values are measured under the following operating conditions:

- Parts are from typical process
- $V_{DDIOPx} = 3.3V$
- $V_{DDSDMMC0}$  and  $V_{DDSDMMC1} = 1.8V$  to  $3.3V$  (high frequency)
- $V_{DDCORE} = 1.2V$  +/-2%
- $V_{DDBU} = 1.6V$  to  $3.6V$
- $T_A =$  as specified in tables "Typical Peripheral Power Consumption by Peripheral in Active Mode" and "Power Consumption in Active Mode: AMP2"
- There is no consumption on the device I/Os.
- All peripheral clocks are disabled.

**Figure 66-1. Measurement Schematics**

**Table 66-5. Typical Peripheral Power Consumption by Peripheral in Active Mode**

Measurements made at  $T_A = 25^\circ C$  and with peripheral clock enabled.

Peripheral	Clock	Consumption on VDDCORE	Conditions	Consumption (typ)	Unit
GMAC	MCK/2	–	See Note 1.	$12 * MCK + 1840 * DR$ (Data rate in Mbits/s)	μA

## Electrical Characteristics

.....continued

Peripheral	Clock	Consumption on VDDCORE	Conditions	Consumption (typ)	Unit
PDMIC	MCK/2	8.24	–	–	μA/MHz
QSPI0	MCK	1.94			
QSPI1	MCK	1.94			
I2SC0	MCK/2	0.61			
I2SC1	MCK/2	0.61			
CAN0	MCK/2	9.7			
CAN1	MCK/2	7.27			

**Note:**

1. In Linux OS, use the ‘iperf’ command to perform bidirectional data transfers. Measure GMAC consumption at different transfer speeds.
2. XDMAC is initialized and one channel performs a memory-to-memory transfer. During test, the data rate is adjusted by changing the DMA setting and the burst size.
3. DDR3 devices are initialized (fully functional). XDMAC performs a memory-to-memory transfer inside the DDR area. Total consumption of MPDDRC and XDMAC is measured. MPDDRC consumption is calculated by discounting XDMAC consumption.
4. In Linux OS, measure UPHPS consumption at different transfer speeds.
5. In Linux OS, build a mass storage using UDPHS. Measure UDPHS consumption at different transfer speeds.
6. The LCD timing engine and each display layer are switched on in sequence. The static image (using random data) is displayed under various resolutions. The 24-bpp RGB888 color space is set for all layers. Auxiliary functions such as rotation, scaling, color space conversion, color look-up table, and chroma upsampling are disabled.
7. ISC performs image sensor preview.

In order to maximize performance, each Peripheral Clock has been timed to H32MX clock frequency. The peripheral frequency can be reduced with the help of a divider in PMC\_PCR.

**Table 66-6. Power Consumption in Active Mode: AMP2**

Conditions $T_A = 25^\circ\text{C}$		Consumption	
		Dhrystone (mA)	CoreMark (mA)
PLL clock is 1000 MHz, Arm Core clock is 500 MHz, MCK is 166 MHz. – Caches L1 and L2 enabled – Code running off of internal SRAM – Code speed optimization – Run Dhrystone / CoreMark benchmark – Peripheral clock disabled	MRL C	114.4	108.8
	MRL B		
	MRL A	237.2	233.7

### 66.5 Low-power Modes

Low-power modes provide a way to balance device power consumption against wake-up time. The modes are described below, in the order of lowest to highest power consumption.

### 66.5.1 Backup Mode

Backup mode achieves the lowest power consumption in the system with limited functionality.

In this mode, only the backup area is powered, maintaining the RTC, the back-up registers, the back-up SRAM and the security module running. This mode is entered by shutting down all the power rails except the VDDBU (refer to the section [Shutdown Controller \(SHDWC\)](#)). To exit Backup mode, the SHDN pin (connected to the enable of the external Power Management IC) must be driven high by an internal event (RTC) or by one of the external events listed below:

- WKUP0 to WKUP9 pins (level transition, configurable debouncing)
- Character received on a serial com receiver (RXLP)
- Analog comparison

Backup mode functionality has been extended with the possibility to keep the DDR memory in Self-refresh state.

### 66.5.2 Backup Mode with DDR in Self-Refresh

Backup mode with DDR in Self-refresh is used to keep the DDR contents when the system is powered off. This mode is achieved by maintaining the backup area and the VDDIODDR powered. To enter Backup Self-refresh mode, follow the sequence below:

- Software saves all the context information to resume (application-dependent).
- Put the DDR in Self-refresh mode and wait until the Self-refresh status is OK (refer to the section [Multiport DDR-SDRAM Controller \(MPDDRC\)](#)).
- Set SFRBU\_DDRBUMCR.BUMEN (see [SFRBU DDR BU Mode Control Register](#)).
- Enter Backup mode as described above.

To exit this mode, follow the sequence below:

- Once the system is restarted, the software checks the state of SFRBU\_DDRBUMCR.BUMEN.
- Restore all the context information.
- Check that the Self-refresh status is OK (refer to the section [Multiport DDR-SDRAM Controller \(MPDDRC\)](#)).
- Disable SFRBU\_DDRBUMCR.BUMEN (see [SFRBU DDR BU Mode Control Register](#)).
- The DDR memory exits Self-refresh mode when a memory access in the DDR memory space is performed.

### 66.5.3 Ultra Low-power (ULP) Mode

Ultra Low-power mode achieves the lowest power consumption with the system in Retention mode and able to resume on wake-up events (any interrupt or hardware event). This mode is a combination of the Wait for Interrupt mode of the Arm core and a reduced frequency or shut-off of the system clocks.

To obtain the best results, care must be taken that the I/Os (pull-up/pull-down, etc.), USB transceivers, etc., are set to the appropriate state.

The Ultra Low-power mode features two submodes:

- ULP0 mode
- ULP1 mode

#### 66.5.3.1 ULP0 Mode

ULP0 mode maintains a very low frequency clock to wake up on any interrupt.

The selection of the clock depends on the current consumption target versus wake-up time. The higher the frequency, the higher the power consumption.

The sequence to enter ULP0 mode is detailed below. The code used to enter this mode must be executed out of the internal SRAM.

1. Set the DDR to Self-Refresh mode.
2. Set the interrupts to wake up the system.
3. Disable all peripheral clocks.
4. Set the I/Os to an appropriate state and disable the USB transceivers (refer to the section [Special Function Registers \(SFR\)](#)).
5. Switch the system clock to the selected clock (RC12MHZ, 32 KHz Slow Clock.) according to the power consumption and wake-up time awaited (see table [VDDCORE Power Consumption in Ultra Low-power Mode: AMP2](#)).
6. Disable the PLLs and all unused clocks (main oscillator, 12 MHz RC oscillator or 32 KHz oscillator).
7. Enter the Wait for Interrupt mode and disable the PCK clock in the PMC\_SCDR.

The wake-up from ULP0 mode is triggered by any enabled interrupt. When resuming, the software reconfigures the system (oscillator, PLL, etc.) in the same state as before WFI.

### 66.5.3.2 ULP1 Mode

Unlike ULP0 mode, all the clocks are off in ULP1 mode, but the number of wake-up sources is limited to the list below:

- WKUP0 pin (level transition, configurable debouncing)
- WKUP1 Secumod wake-up signal
- WKUP2 pin to WKUP9 pin (shared with PIOBU0 to PIOBU7)
- RTC alarm
- USB Resume from Suspend mode
- SDMMC card detect
- RXLP event
- ACC event
- Any SleepWalking event coming from TWI, FLEXCOMx, SPI, or ADC

The sequence to enter the ULP1 mode is detailed below. The code used to enter this mode must be executed out of the internal SRAM.

1. Set the DDR to Self-Refresh mode.
2. Set the events to enable a system wake-up.
3. Disable all peripheral clocks.
4. Set the I/Os to an appropriate state and disable the USB transceivers (refer to the section [Special Function Registers \(SFR\)](#)).
5. Switch the system clock to the 12 MHz RC oscillator.
6. Disable the PLLs and the main oscillator.
7. Enter the ULP1 mode by either:
  - 7.1. setting the WAITMODE bit in CKGR\_MOR, or
  - 7.2. setting the LPM bit in PMC\_FSMR and executing the processor WaitForEvent (WFE) instruction.
8. After setting the WAITMODE bit or using the WFE instruction, wait for the PMC\_SR.MCKRDY bit to be set.

### 66.5.4 Idle Mode

In Idle mode, power consumption of the device versus response time is optimized. In this mode, only the core clock is stopped. The peripheral clocks, including the DDR controller clock, can be enabled. The current consumption in this mode is application-dependent and can be reduced by enabling Dynamic Clock Gating (L2CC\_POWCR.DCKGATEN = 1).

This mode is entered via the Wait for Interrupt (WFI) instruction and PCK disabling.

The processor can be awakened from an interrupt. The system resumes where it was before entering WFI mode.

### 66.5.5 Low-power Mode Summary Table

The modes detailed above are the main low-power modes. Each part can be set to on or off separately and wake-up sources can be configured individually. The table below gives a summary of the low-power mode configurations.

**Table 66-7. Low-power Mode Configuration Summary**

Submode	Low-power Mode				
	Backup		Ultra-low-power		Idle
	–	Self-refresh	ULP0	ULP1	
64 kHz RC Oscillator, 32 kHz Oscillator, RTC, Backup Memory and Registers, POR	ON				
12 MHz RC Oscillator	OFF				ON
VDDCORE Regulator	OFF		ON		
Core	OFF (not powered)		Powered (not clocked)		
Memory, Peripherals	OFF (not powered)		Powered (512 Hz)	Powered (not clocked)	Powered (clocked)
Mode Entry	Shutdown Controller, FLEXCOM SleepWalking	DDR in Self-refresh, Shutdown Controller	DDR in Self-refresh, Frequency reduced in PMC, WFI	DDR in Self-refresh, CKGR_MOR.WAIT-MODE=1	DDR in Self-refresh, WFI
Potential Wake-up Sources	WKUP0 pin, any PIOBU configured as WKUP pin, RTC alarm, any level above comparator source or character received	Backup mode sources	Any interrupt	Wake-up pins, WOL	Any interrupt
Core at Wake-up	Reset		Clocked back at 512 Hz	Clocked back at 12 MHz	Clocked back at full speed
PIO State While in Low-power Mode	Reset		Previous state saved		
PIO State at Wake-up	Inputs with pull-ups	Unchanged			
Consumption <sup>(2)</sup>	I <sub>VDDDBU</sub> = 4.5 μA <sub>typ</sub> <sup>(3)</sup> at 25°C/3.0V	I <sub>VDDDBU</sub> = 4.5 μA <sub>typ</sub> <sup>(3)</sup> at 25°C/3.0V I <sub>VDDIODDR</sub> = 40 μA	0.21 mA at 25°C/1.1V 0.27 mA at 25°C/1.2V	0.17 mA at 25°C/1.1V 0.27 mA at 25°C/1.2V	28 mA at 25°C/1.2V <sup>(4)</sup>
Wake-up Time <sup>(1)</sup>	Start-up time	Start-up time	300 ms	15 μs	800 ns at 498 MHz

**Note:**

1. When considering wake-up time, the time required to start the PLL is not taken into account. Once started, the device works with the main oscillator. The user has to add the PLL start-up time if it is needed in the system. The wake-up time is defined as the time taken for wake-up until the first instruction is fetched.
2. The external loads on PIOs are not taken into account in the calculation.
3. Total current consumption.
4. Dynamic Clock Gating enabled (L2CC\_POWCR.DCKGATEN = 1).

### 66.5.6 Low-power Consumption Versus Modes

The low-power consumption values are measured under the following operating conditions:

- Parts are from typical process
- $V_{DDIOPx} = 3.3V$
- $V_{DDSDMMC0}$  and  $V_{DDSDMMC1} = 1.8V$  to  $3.3V$  (high frequency)
- $V_{DDCORE} = 1.2V \pm 2\%$
- $V_{DDBU} = 1.6V$  to  $3.6V$
- $T_A =$  as specified in the tables below
- There is no consumption on the device I/Os.
- All peripheral clocks are disabled.

**Figure 66-2. Measurement Schematics**

In order to maximize performances, each Peripheral Clock has been timed to H32MX clock frequency. The peripheral frequency can be reduced with the help of a divider in PMC\_PCR.

**Table 66-8. Typical Power Consumption in Idle Mode: AMP2**

Conditions	Consumption				Unit
	$T_A$ 25°C	$T_A$ 70°C	$T_A$ 85°C	$T_A$ 105°C	
PLL clock is 1000 MHz, Arm Core clock is 500 MHz, MCK is 166 MHz. – Core clock is stopped – Peripheral clocks, including the DDR Controller clock, can be enabled – Mode is entered via Wait for Interrupt (WFI) instruction and PCK disabling – Measure IDDCORE + IDDBU – Peripheral clock disabled	28.2	29.6	30.8	33.4	mA

**Table 66-9. VDDCORE Power Consumption in Ultra-Low-Power Mode: AMP2**

### 66.6 Clock Characteristics

The following characteristics are applicable to the ambient operating temperature range T<sub>A</sub> = -40°C to +105°C for -CN devices, and T<sub>A</sub> = -40°C to +85°C for -CU devices, unless otherwise specified.

### 66.6.1 Processor Clock Characteristics

**Table 66-11. Processor Clock Waveform Parameters**

Symbol	Parameter	Conditions	Min	Max	Unit
1/(tCPPCK)	Processor Clock Frequency	VDDCORE[1.1V, 1.32V]	250 <sup>(1)</sup>	400	MHz
		VDDCORE[1.2V, 1.32V]	250 <sup>(1)</sup>	500	

**Note:**

1. Limitation for DDR2 (125 MHz) usage only. There are no limitations to DDR3, DDR3L, LPDDR1, LPDDR2 and LPDDR3.

### 66.6.2 Master Clock Characteristics

The master clock is the maximum clock at which the system is able to run. It is given by the smallest value of the internal bus clock and EBI clock.

**Table 66-12. Master Clock Waveform Parameters**

Symbol	Parameter	Conditions	Min	Max	Unit
1/(tCPMCK)	Master Clock Frequency	VDDCORE[1.1V, 1.32V]	125 <sup>(1)</sup>	133	MHz
		VDDCORE[1.2V, 1.32V], in DDR2 or LPDDR1 mode, VDDIODDR[1.8V, 1.9V]	125 <sup>(1)</sup>	166 <sup>(2)</sup>	
		in LPDDR2 or LPDDR3 mode, VDDIODDR[1.2V, 1.30V]			
		in DDR3 mode, VDDIODDR[1.5V, 1.575V]			
in DDR3L mode, VDDIODDR[1.35V, 1.45V] Security disabled					

**Note:**

1. Limitation for DDR2 usage only. There are no limitations to DDR3, DDR3L, LPDDR1, LPDDR2 and LPDDR3.
2. The JEDEC standard specifies a maximum clock frequency of 125 MHz for DDR3 and DDR3L in DLL Off mode. However, check with memory suppliers for higher frequencies.

## 66.7 Oscillator Characteristics

### 66.7.1 Main Oscillator Characteristics

**Table 66-13. 8 to 24 MHz Crystal Oscillator Characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
fOSC	Operating Frequency	FREQ <sup>(2)</sup> = 00, 11	8		12	MHz
		FREQ = 01	12	–	16	
		FREQ = 10	16		24	
–	Duty Cycle	–	40	50	60	%

# SAMA5D2 Series

## Electrical Characteristics

.....continued

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
t <sub>START</sub>	Startup Time	FREQ <sup>(2)</sup> = 00, 11 FREQ = 01 FREQ = 10	–	–	18.5 10.5 6	ms
I <sub>DDON</sub>	Current Consumption (on VDDIO)	@ 12 MHz @ 24 MHz	–	1.2 1.7	3.5 4	mA
I <sub>DD_STDBY</sub>	Standby Current	–	–	0.02	0.1	μA
C <sub>PARA</sub>	Internal Parasitic Capacitance <sup>(1)</sup>	From XIN to XOUT	1.4	1.6	1.8	pF
P <sub>ON</sub>	Drive level	FREQ = 00 FREQ = 01, 11 FREQ = 10	–	–	150 300 400	μW

### Note:

- The values of external capacitors can be determined by using the following formula:

$$C_{LEXT} = (2 \times C_{CRYSTAL}) - C_{BOARD} - (C_{PARA} \times 2)$$

where:

- C<sub>LEXT</sub> is the external capacitor value which must be soldered from XIN to GND and XOUT to GND
  - C<sub>CRYSTAL</sub> is crystal targeted load
  - C<sub>BOARD</sub> is the external board parasitic capacitance (from XIN to GND or XOUT to GND)
  - C<sub>PARA</sub> is the internal parasitic capacitance
- The SFR\_UTMICKTRIM.FREQ field defines the input frequency for the UTMI and the main oscillator. It is important to select the correct FREQ value because this has a direct influence on USB frequency.

**Figure 66-3. Main Oscillator Schematics**

# SAMA5D2 Series

## Electrical Characteristics

### 66.7.1.1 Recommended Crystal Characteristics

**Table 66-14. Recommended Crystal Characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
ESR	Equivalent Series Resistance	FREQ = 00, 11	–	–	100	Ω
		FREQ = 10, 01	–	–	80	
C <sub>M</sub>	Motional Capacitance	FREQ = 00	5	–	9	fF
		FREQ = 01, 10, 11	1.3	–	3.2	
C <sub>S</sub>	Shunt Capacitance	FREQ = 00, 01, 10	–	–	3	pF
		FREQ = 11	–	–	1.3	
CCRYSTAL	Allowed crystal capacitive load	From crystal specification				pF
		FREQ = 00, 01, 11	12.5	–	18	
		FREQ = 10	8	–	12.5	

### 66.7.1.2 XIN Clock Characteristics

These characteristics apply only when the Main Oscillator is in Bypass mode (i.e., when MOSCRGEN = 0 and MOSCXTBY = 1 in CKGR\_MOR). Refer to [PMC Clock Generator Main Oscillator Register](#).

**Table 66-15. XIN Clock Electrical Characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
1/(t <sub>CPXIN</sub> )	XIN Clock Frequency	–	–	–	50	MHz
t <sub>CPXIN</sub>	XIN Clock Period	–	20	–	–	ns
t <sub>CHXIN</sub>	XIN Clock High Half-period	–	0.4 x t <sub>CPXIN</sub>	–	0.6 x t <sub>CPXIN</sub>	ns
t <sub>CLXIN</sub>	XIN Clock Low Half-period	–	0.4 x t <sub>CPXIN</sub>	–	0.6 x t <sub>CPXIN</sub>	ns
C <sub>IN</sub>	XIN Input Capacitance	–	–	–	25	pF
R <sub>IN</sub>	XIN Pull-down Resistor	–	–	–	500	kΩ
V <sub>IL_XIN</sub>	XIN Low-level Input Voltage	–	–	–	0.3 x V <sub>DDOSC</sub>	V
V <sub>IH_XIN</sub>	XIN High-level Input Voltage	–	0.7 x V <sub>DDOSC</sub>	–	–	V

### 66.7.2 12 MHz RC Oscillator Characteristics

**Table 66-16. 12 MHz RC Oscillator Characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f <sub>OSC</sub>	RC Oscillator Frequency	–	11.4	–	12.6	MHz
t <sub>START</sub>	Startup Time	–	–	–	15	μs
Duty	Duty Cycle	–	45	50	55	%
I <sub>DDON</sub>	Current Consumption	After startup time	–	160	350	μA

### 66.7.3 32.768 kHz Crystal Oscillator Characteristics

**Table 66-17. 32.768 kHz Crystal Oscillator Characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f <sub>OSC</sub>	Operating Frequency	Normal mode with crystal	–	32.768	–	kHz
t <sub>START</sub>	Startup Time	C <sub>m</sub> > 3fF	–	–	1200	ms

# SAMA5D2 Series

## Electrical Characteristics

.....continued

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
IDDON	Current Consumption	ESR < 50k ohm	-	C <sub>CRYSTAL32</sub> = 12.5 pF	440	900	nA
				C <sub>CRYSTAL32</sub> = 6 pF	600	900	
		ESR < 100k ohm		C <sub>CRYSTAL32</sub> = 12.5 pF	800	1200	
				C <sub>CRYSTAL32</sub> = 6 pF	700	1200	
C <sub>PARA32</sub>	Internal Parasitic Capacitance	Between XIN32 and XOUT32	1.4	1.6	1.8	pF	

**Figure 66-4. 32 kHz Oscillator Schematics**

**Table 66-18. Recommended 32.768 kHz Crystal Characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
ESR	Equivalent Series Resistor	Crystal at 32.768 kHz	-	-	100	kΩ
-	Duty Cycle	-	40	50	60	%
C <sub>m</sub>	Motional Capacitance	Crystal at 32.768 kHz	3	-	8	fF
C <sub>SHUNT</sub>	Shunt Capacitance	Crystal at 32.768 kHz	0.6	-	2	pF
C <sub>CRYSTAL32</sub>	Allowed Crystal Capacitance Load(1)	From crystal specification	6	-	12.5	pF
PON	Drive Level	-	-	-	0.2	μW

**Note:** The value of the external capacitors can be determined by using the following formula:

$$C_{LEXT32} = (2 \times C_{CRYSTAL32}) - C_{BOARD} - (C_{PARA32} \times 2)$$

where:

- C<sub>LEXT32</sub> is the external capacitor value which must be soldered from XIN to GND and XOUT to GND
- C<sub>CRYSTAL32</sub> is crystal targeted load
- C<sub>BOARD</sub> is the external board parasitic capacitance (from XIN to GND or XOUT to GND)
- C<sub>PARA32</sub> is the internal parasitic capacitance

### 66.7.4 64 kHz RC Oscillator Characteristics

**Table 66-19. 64 kHz RC Oscillator Characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f <sub>OSC</sub>	RC Oscillator Frequency	-	40	-	90	kHz

t <sub>START</sub>	Startup Time	–	11	17	30	μs
I <sub>DDON</sub>	Current Consumption	After startup time	–	93	140	nA

### 66.8 PLL Characteristics

**Table 66-20. PLLA Characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f <sub>IN</sub>	Input Frequency	–	12	–	24	MHz
f <sub>OUT</sub>	Output Frequency	–	600	–	1200	MHz
I <sub>PLL</sub>	Current Consumption	Active mode	–	–	14.5	mA
		Standby mode	–	–	2	μA
t <sub>START</sub>	Startup Time	–	–	–	60	μs

**Table 66-21. UTMI PLL Characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f <sub>IN</sub>	Input Frequency	–	12	–	24	MHz
f <sub>OUT</sub>	Output Frequency	–	480			MHz
I <sub>VDDUTMII</sub>	Current Consumption	In Active mode, on VDDUTMII, @480 MHz	–	6.3	7.0	mA
t <sub>START</sub>	Startup Time	–	–	–	60	μs

**Table 66-22. Audio PLL Characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f <sub>IN</sub>	Input Frequency	–	12	–	24	MHz
f <sub>AUDIOCORECLK</sub>	AUDIOCORECLK frequency range	–	620	–	700	MHz
f <sub>AUDIOPINCLK</sub>	AUDIOPINCLK frequency range	–	8	12.288	48	MHz
f <sub>AUDIOPLLCLK</sub>	AUDIOPLLCLK frequency range	–	–	–	150	MHz
I <sub>PLL</sub>	Current Consumption	On VDDAUDIOPLL	6	–	20	mA
t <sub>START</sub>	Startup Time	From OFF to stable AUDIOCORECLK frequency	–	–	100	μs
t <sub>SET</sub>	Settling Time <sup>(1)</sup>	When changing FRACR or NR in PMC_AUDIO_PLL0 or PMC_AUDIO_PLL1	–	–	100	μs

**Note:** Loop filter is set as recommended in fields BIAS\_FILTER and DCO\_FILTER of PMC\_AUDIO\_PLL0.

## 66.9 USB HS Characteristics

### 66.9.1 Electrical Characteristics

The device conforms to all voltage, power, and timing characteristics and specifications set forth in the USB 2.0 Specification. Refer to the USB 2.0 Specification for more information.

### 66.9.2 Dynamic Power Consumption

**Table 66-23. USB Transceiver Dynamic Power Consumption**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
IBIAS	Bias Generator Current Consumption	–	–	0.7	0.8	mA
IVDDUTMII	HS Transceiver Current Consumption	HS transmission	–	47	60	mA
	HS Transceiver Current Consumption	HS reception	–	18	27	mA
	LS / FS Transceiver Current Consumption	FS transmission 0m cable <sup>(1)</sup>	–	4	6	mA
	LS / FS Transceiver Current Consumption	FS transmission 5m cable <sup>(1)</sup>	–	26	30	mA
	LS / FS Transceiver Current Consumption	FS reception <sup>(1)</sup>	–	3	4.5	mA
IVDDUTMIC	Core	–	–	5.5	9	mA

**Note:** Including 1 mA due to pull-up/pull-down current consumption.

## 66.10 PTC Characteristics

**Table 66-24. PTC Characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
CC	Compensation Capacitance	Programmable max code 0x3FFF	30	–	–	pF
ERS	Error on Serial Filtering Resistance	20, 50, 100 kOhm	-20	–	20	%
IPTCT	PTC Current Consumption	–	–	–	500	μA

## 66.11 ADC Characteristics

The following characteristics are applicable to the ambient operating temperature range  $T_A = -40^{\circ}\text{C}$  to  $+105^{\circ}\text{C}$  for -CN devices, and  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  for -CU devices, unless otherwise specified.

ADVREF is the positive reference of the ADC.

### 66.11.1 ADC Power Supply

#### 66.11.1.1 Power Supply Characteristics

**Table 66-25. Power Supply Characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
IVDDIN	Analog Current Consumption	Sleep mode <sup>(1)</sup>	–	2	4	μA
		Fast Wake-up mode	–	0.4	0.6	mA
		Normal mode, single sampling	–	2.2	3.0	mA

# SAMA5D2 Series

## Electrical Characteristics

.....continued

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
IVDDCORE	Digital Current Consumption	Sleep mode <sup>(1)</sup>	–	1	2	μA
		Normal mode		80	100	μA

**Note:** In Sleep mode, the ADC core, the Sample and Hold and the internal reference operational amplifier are off.

### 66.11.1.2 ADC Bias Current

The field IBCTL in ADC\_ACR controls the ADC biasing current.

The table below gives the IBCTL settings according to the ADC sample rate value.

IBCTL	Max Data Rate (Ksps)
00	250
01	500
10	1000
11	1000

### 66.11.2 External Reference Voltage

$V_{ADVREF}$  is an external reference voltage applied on the pin ADVREF. The quality of the reference voltage  $V_{ADVREF}$  is critical to the performance of the ADC. A DC variation of the reference voltage  $V_{ADVREF}$  is converted to a gain error by the ADC. The noise generated by  $V_{ADVREF}$  is converted by the ADC to count noise.

**Table 66-26. ADVREF Electrical Characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{ADVREF}$	Voltage Range	Full operational	2	–	VDDANA	V
	RMS Noise	Bandwidth 10 kHz to 1 MHz	–	–	100	μV
$R_{ADVREF}$	Input DC Impedance	ADC reference resistance bridge <sup>(1)</sup>	6	8	10	kΩ
$I_{ADVREF}$	Current	$V_{ADVREF} = 3.3V$	–	–	460	μA

**Note:**

- When the ADC is off, the ADVREF impedance has a minimum of 1 MΩ.

### 66.11.3 ADC Timings

**Table 66-27. ADC Timing Characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{ADC\_Clock}$	Clock Frequency	–	0.2	–	20	MHz
$f_S$	Sampling Frequency <sup>(1)</sup>	–	–	–	1	MHz
$t_{START}$	ADC Start-up Time	Sleep mode to Normal mode	–	–	4	μs
		Fast Wake-up mode to Normal mode			2	

**Note:**  $t_{ADC\_Clock} = 1/f_{ADC\_Clock}$  ADC conversion time = 21  $t_{ADC\_Clock}$ . The Tracking time of the ADC has a minimal value of  $t_{TRACKTIM} = 15 t_{ADC\_Clock}$ .

### 66.11.4 ADC Transfer Function

The DATA code in ADC\_CDR is up to 12-bit positive integer or two's complement (signed integer).

#### 66.11.4.1 Differential Mode (12-bit mode)

A differential input voltage  $V_{IN} = V_{INP} - V_{INN}$  can be applied between two selected differential pins, e.g. ADC0\_AD0 and ADC0\_AD1. The ideal code  $C_i$  is calculated by using the following formula and rounding the result to the nearest positive integer.

$$C_i = \frac{2047}{V_{ADVREF}} \times V_{IN}$$

For the other resolution defined by RES, the code  $C_i$  is extended to the corresponding resolution.

The table below is a computation example for the above formula, where  $V_{ADVREF} = 3V$ .

**Table 66-28. Input Voltage Values in Differential Mode, Non-signed Output**

Signed $C_i$	$V_{IN}$
-2048	-3
0	0
2047	3

#### 66.11.4.2 Single-ended Mode (12-bit mode)

A single input voltage  $V_{IN}$  can be applied to selected pins, e.g., ADC0\_AD0 or ADC0\_AD1. The ideal code  $C_i$  is calculated using the following formula and rounding the result to the nearest positive integer.

The single-ended ideal code conversion formula is:

$$C_i = \frac{4095}{V_{ADVREF}} \times V_{IN}$$

For the other resolution defined by RES, the code  $C_i$  is extended to the corresponding resolution.

The table below is a computation example for the above formula, where  $V_{ADVREF} = 3V$ :

**Table 66-29. Input Voltage Values in Single-ended Mode**

Non-signed $C_i$	$V_{IN}$
0	0
2047	1.5
4095	3

#### 66.11.4.3 Example of LSB Computation

The LSB is relative to the analog scale  $V_{ADVREF}$ .

The term LSB expresses the quantization step in volts, also used for one ADC code variation.

- Single-ended (SE) (ex:  $V_{ADVREF} = 3.0V$ )
  - Gain = 1,  $LSB = (3.0V / 4096) = 732 \mu V$
- Differential (DIFF) (ex:  $V_{ADVREF} = 3.0V$ )
  - Gain = 0.5,  $LSB = (6.0V / 4096) = 1465 \mu V$

The data include the ADC performances, as the PGA and ADC core cannot be separated. The temperature and voltage dependencies are given as separate parameters.

### 66.11.4.4 Gain and Offset Errors

For:

- a given gain error:  $E_G$  (%)
  - a given ideal code ( $C_i$ )
  - a given offset error:  $E_O$  (LSB of 12 bits)
- in 12-bit mode, the actual code ( $C_A$ ) is calculated using the following formula

$$C_A = \left(1 + \frac{E_G}{100}\right) \times (C_i - 2047) + 2047 + E_O$$

#### Differential Mode

In Differential mode, the offset is defined when the differential input voltage is zero.

**Figure 66-5. Gain and Offset Errors in Differential Mode**

where:

- Full-scale error  $E_{FS} = (E_{FS+}) - (E_{FS-})$ , unit is LSB code
- Offset error  $E_O$  is the offset error measured for  $V_{IN} = 0V$
- Gain error  $E_G = 100 \times E_{FS} / 4096$ , unit in %

The error values in "ADC Offset and Gain Error,  $V_{ADVREF} = 3.3V$ " include the sample-and-hold error as well as the PGA gain error.

#### Single-ended Mode

The figure below illustrates the ADC output code relative to an input voltage  $V_{IN}$  between 0V (Ground) and  $V_{ADVREF}$ . The ADC is configured in Single-ended mode by connecting internally the negative differential input to  $V_{ADVREF} / 2$ . As the ADC continues to work internally in Differential mode, the offset is measured at  $V_{ADVREF} / 2$ . The offset at  $V_{INP} = 0$  can be computed using the transfer function and the corresponding  $E_G$  and  $E_O$ .

**Figure 66-6. Gain and Offset Errors in Single-ended Mode**

where:

- Full-scale error  $E_{FS} = (E_{FS+}) - (E_{FS-})$ , unit is LSB<sup>2</sup> code
- Offset error  $E_O$  is the offset error measured for  $V_{INP} = 0V$
- Gain error  $E_G = 100 \times E_{FS} / 2048$ , unit in %

The error values in the table "ADC Offset and Gain Error,  $V_{ADVREF} = 3.3V$ " include the DAC, the sample-and-hold error as well as the PGA gain error.

### 66.11.5 ADC Electrical Characteristics

**Table 66-30. ADC INL and DNL,  $V_{ADVREF} = 3.3V$**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
<b>Differential Mode</b>						
INL	Integral Non-Linearity	–	1	–	1	LSB
DNL	Differential Non-Linearity	–	1	–	1	LSB
<b>Single-Ended Mode</b>						
INL	Integral Non-Linearity	–	1.5	–	1.5	LSB
DNL	Differential Non-Linearity	–	1	–	1	LSB

**Table 66-31. ADC Offset and Gain Error,  $V_{ADVREF} = 3.3V$**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
<b>Differential Mode</b>						
$E_O$	Differential Offset Error	–	-2.0	–	2.0	LSB
$E_G$	Differential Gain Error	–	-0.2	–	0.2	%
<b>Single-Ended Mode</b>						
$E_O$	Single-ended Offset Error	–	-2.0	–	2.0	LSB
$E_G$	Single-ended Gain Error	–	-0.2	–	0.2	%

**Table 66-32. ADC Analog Input Characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>FS</sub>	Analog Input Full Scale Range <sup>(1)</sup>	ADC_COR.DIFFx = 0	0	–	V <sub>ADVREF</sub>	V
		ADC_COR.DIFFx = 1	-V <sub>ADVREF</sub>	–	V <sub>ADVREF</sub>	
V <sub>INCM</sub>	Common Mode input range <sup>(2)</sup>	ADC_COR.DIFFx = 1	0.4 × V <sub>DDANA</sub>	–	0.6 × V <sub>DDANA</sub>	V
C <sub>IN</sub>	ADC sampling capacitance	–	–	–	3	pF
C <sub>P_ADx</sub>	Analog input parasitic capacitance <sup>(4)</sup>	ADx pin configured as analog input	–	–	10	
Z <sub>IN</sub>	Common Mode Input impedance <sup>(3)</sup>	On ADx pin	1 / (f <sub>S</sub> × C <sub>P_ADx</sub> )	–	–	Ω

**Note:**

- V<sub>FS</sub> = V<sub>ADx</sub> in Single-ended mode, V<sub>FS</sub> = (V<sub>ADx</sub> - V<sub>ADx+1</sub>) in Differential mode.
- V<sub>INCM</sub> = (V<sub>ADx</sub> + V<sub>ADx+1</sub>) / 2.
- See the figure "Input Channel Model". When converting one single channel, most of the input parasitic capacitance is not switched, therefore the common mode input impedance reduces to Z<sub>IN</sub> = 1 / (f<sub>S</sub> × C<sub>IN</sub>).
- Includes C<sub>IN</sub>.

**66.11.6 Pen Detect Characteristics**

The pen detection sensibility is based on a programmable pull-down controlled by the field PENDETSENS of the ADC\_ACR register.

PENDETSENS	Detection Resistor (KOhm)
00	200
01	150
10	100
11	50

**66.11.7 ADC Channel Input Impedance**

**Figure 66-7. Input Channel Model**

where:

- Z<sub>IN</sub> is the input impedance in Single-ended or Differential mode

- $C_{IN} = 2 \text{ pF} \pm 20\%$  depending on the gain value and mode (SE or DIFF); temperature dependency is negligible
- $R_{ON}$  is typical  $2 \text{ k}\Omega$  and  $8 \text{ k}\Omega$  max (worst case process and high temperature)

The following formula is used to calculate input impedance:

$$Z_{IN} = \frac{1}{f_S \times C_{IN}}$$

where:

- $f_S$  is the sampling frequency of the ADC channel
- Typ values are used to compute ADC input impedance  $Z_{IN}$

**Table 66-33.  $Z_{IN}$  Input Impedance**

$f_S$ (MHz)	1	0.5	0.25	0.125	0.0625	0.03125	0.015625	0.007813
$C_{IN} = 2 \text{ pF}$								
$Z_{IN}$ (M $\Omega$ )	0.5	1	2	4	8	16	32	64

### Track and Hold Time versus Source Output Impedance

The figure below shows a simplified acquisition path.

**Figure 66-8. Simplified Acquisition Path**

During the tracking phase, the ADC tracks the input signal during the tracking time shown below:

$$t_{TRACK} = n \times C_{IN} \times (R_{ON} + Z_{SOURCE}) / 1000$$

where

- Tracking time expressed in ns and  $Z_{SOURCE}$  expressed in  $\Omega$
- $n = 8$  for 12-bit accuracy
- $R_{ON} = 2 \text{ k}\Omega$

**Table 66-34. Number of Tau:n**

Resolution (bits)	12
RES	0
n	8

The ADC already includes a tracking time of  $15 t_{ADC \text{ Clock}}$ .

### 66.12 Analog Comparator Characteristics

**Table 66-35. Analog Comparator Characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>DDBU</sub>	Power Supply Voltage Range (V <sub>DDBU</sub> )	–	1.65	3.3	3.6	V
V <sub>COMPx</sub>	Input Voltage Range	On COMPP or COMPN input	0	–	V <sub>DDBU</sub>	V
V <sub>hys</sub>	Hysteresis	–	35	–	70	mV
TPD	Propagation Delay	100mV Overdrive	–	–	350	μs
f <sub>in</sub>	COMPx Input Signal Frequency	Common mode and differential	–	–	1	kHz
I <sub>V<sub>DDBU</sub></sub>	Current Consumption (V <sub>DDBU</sub> )	OFF Mode (ACC_MR.ACEN = 0)	–	–	50	nA
		ON Mode (ACC_MR.ACEN = 1)	–	100	200	
t <sub>START</sub>	Startup Time	–	–	–	300	μs

### 66.13 POR Characteristics

The figure below provides a general presentation of Power-On-Reset (POR) characteristics.

**Figure 66-9. General Presentation of POR Behavior**

When a very slow (versus  $t_{RST}$ ) supply rising slope is applied on the POR VDD pin, the reset time becomes negligible and the reset signal is released when VDD raises higher than  $V_{T+}$ .

When a very fast (versus  $t_{RST}$ ) supply rising slope is applied on the POR VDD pin, the voltage threshold becomes negligible and the reset signal is released after  $t_{RST}$ . It is the smallest possible reset time.

**Table 66-36. V<sub>DDBU</sub> Power-On Reset Characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>T+</sub>	Threshold Voltage Rising	–	1.3	–	1.5	V
V <sub>T-</sub>	Threshold Voltage Falling	–	1.22	–	1.4	V
V <sub>hys</sub>	Hysteresis Voltage	–	50	–	160	mV
t <sub>RST</sub>	Reset Timeout Period	–	890	–	5100	μs

**Table 66-37. VDDCORE Power-On Reset Characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>T+</sub>	Threshold Voltage Rising	–	0.927	–	1.075	V
V <sub>T-</sub>	Threshold Voltage Falling	–	0.848	–	1.025	V
V <sub>hys</sub>	Hysteresis Voltage	–	38	–	109	mV
t <sub>RST</sub>	Reset Timeout Period	–	150	–	650	μs

**Table 66-38. VDDANA Power-On Reset Characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>T+</sub>	Threshold Voltage Rising	–	1.3	–	1.5	V
V <sub>T-</sub>	Threshold Voltage Falling	–	1.22	–	1.4	V
V <sub>hys</sub>	Hysteresis Voltage	–	50	–	160	mV
t <sub>RST</sub>	Reset Timeout Period	–	130	–	650	μs

## 66.14 SMC Timings

### 66.14.1 Timing Conditions

SMC timings are given in max corners.

Timings assuming a capacitance load on data, control and address pads are given in the table below.

**Table 66-39. Capacitance Load**

Supply	Corner	
	Max	Min
3.3V	50 pF	5 pF
1.8V	30 pF	5 pF

In the tables that follow, t<sub>CPMCK</sub> is the MCK period.

### 66.14.2 SMC IOSET1 Timing Extraction

#### 66.14.2.1 SMC IOSET1 Read Timings

**Table 66-40. SMC IOSET1 Read Signals - NRD Controlled (READ\_MODE = 1)**

Symbol	Parameter	Min		Unit
		1.8V	3.3V	
NO HOLD SETTINGS (nrd hold = 0)				
SMC <sub>1</sub>	Data Setup before NRD High	16.4	15	ns
SMC <sub>2</sub>	Data Hold after NRD High	0	0	ns
HOLD SETTINGS (nrd hold ≠ 0)				
SMC <sub>3</sub>	Data Setup before NRD High	14.4	13	ns
SMC <sub>4</sub>	Data Hold after NRD High	0	0	ns
HOLD or NO HOLD SETTINGS (nrd hold ≠ 0, nrd hold = 0)

**Figure 66-17. Minimum and Maximum Access Time for SPI Output Signal**

### 66.15.3 FLEXCOM TWI Timings

Refer to the section [TWI Timings](#).

### 66.16 USART in Asynchronous Modes

In Asynchronous modes, the maximum baud rate that can be achieved is  $MCK2 / 8$ , if the bit `USART_MR.OVER=1`.

Example: if  $MCK2 = 83 \text{ MHz}$ , the baud rate is  $10.375 \text{ Mbit/s}$ .

### 66.17 SPI Timings

#### 66.17.1 Maximum SPI Frequency

The following formulas give maximum SPI frequency in Master Read and Write modes and in Slave Read and Write modes.

- Master Write Mode  
The SPI sends data to a slave device only, e.g. an LCD. The limit is given by SPI<sub>2</sub> (or SPI<sub>5</sub>) timing.

- Master Read Mode

$$f_{\text{SPCKmax}} = \frac{1}{\text{SPI}_0(\text{or SPI}_3) + t_{\text{VALID}}}$$

$t_{\text{VALID}}$  is the slave time response to output data after deleting an SPCK edge.

The  $f_{\text{SPCKmax}}$  is given between the maximum frequency given by the above formula and the pad I/O limitation.

- Slave Read Mode

In Slave mode, SPCK is the input clock for the SPI. The max SPCK frequency is given by setup and hold timings SPI<sub>7</sub>/SPI<sub>8</sub> (or SPI<sub>10</sub>/SPI<sub>11</sub>). Since this gives a frequency well above the pad limit, the limit in Slave Read mode is given by the SPCK pad.

- Slave Write Mode

$$f_{\text{SPCKmax}} = \frac{1}{\text{SPI}_6(\text{or SPI}_9) + t_{\text{SETUP}}}$$

$t_{\text{SETUP}}$  is the setup time from the master before sampling data (6 ns).

The  $f_{\text{SPCKmax}}$  is given between the maximum frequency given by the above formula and the pad I/O limitation.

### 66.17.2 Timing Conditions

Timings assuming a capacitance load on MISO, SPCK and MOSI are given in the table below.

**Table 66-59. Capacitance Load for MISO, SPCK and MOSI (SPI0 and SPI1)**

Supply	Corner	
	Max	Min
3.3V	40 pF	5 pF
1.8V	20 pF	5 pF

### 66.17.3 Timing Extraction

In the first two figures below, “SPI Master Modes 1 and 2” and “SPI Master Modes 0 and 3”, the MOSI line shifting edge is represented with a hold time = 0. However, it is important to note that for this device, the MISO line is sampled prior to the MOSI line shifting edge. As shown in “MISO Capture in Master Mode”, the device sampling point extends the propagation delay ( $t_p$ ) for slave and routing delays to more than half the SPI clock period, whereas the common sampling point allows only less than half the SPI clock period.

As an example, an SPI Slave working in Mode 0 is safely driven if the SPI Master is configured in Mode 0.

**Figure 66-18. MISO Capture in Master Mode**

		f <sub>TWCK</sub> > 100 kHz	t <sub>LOW</sub>	–	μs

**Note:**

1. Required only for f<sub>TWCK</sub> > 100 kHz.
2. C<sub>B</sub> = capacitance of one bus line in pF. Per I2C Standard, C<sub>b</sub> Max = 400 pF
3. The TWCK low period is defined as follows: t<sub>LOW</sub> = ((CLDIV × 2<sup>CKDIV</sup>) + 3) × t<sub>MCK</sub>
4. The TWCK high period is defined as follows: t<sub>HIGH</sub> = ((CHDIV × 2<sup>CKDIV</sup>) + 3) × t<sub>MCK</sub>

## 66.19 QSPI Timings

### 66.19.1 Maximum QSPI Frequency

The following formulas give maximum QSPI frequency in Master Read and Write modes.

- Master Write Mode  
The QSPI sends data to a slave device only, e.g. an LCD. The limit is given by QSPI<sub>2</sub> (or QSPI<sub>5</sub>) timing.
- Master Read Mode

$$f_{QSCk}^{\max} = \frac{1}{QSPI_0(\text{or } QSPI_3) + t_{VALID}}$$

t<sub>VALID</sub> is the slave time response to output data after detecting a QSCk edge.

The  $f_{QSCCK}$  max is given between the maximum frequency given by the above formula and the pad I/O limitation.

### 66.19.2 Timing Conditions

Timings assuming a capacitance load are given in the table below.

**Table 66-66. Capacitance Load (QSPI 0 and QSPI1)**

Supply	Corner	
	Max	Min
3.3V	30 pF	5 pF
1.8V	20 pF	5 pF

### 66.19.3 Timing Extraction

### 66.20 MPDDRC Timings

The following characteristics are applicable to the ambient operating temperature range  $T_A = -40^{\circ}\text{C}$  to  $+105^{\circ}\text{C}$  for -CN devices, and  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  for -CU devices, unless otherwise specified.

#### 66.20.1 Board Design Constraints

As the SAMA5D2 series embeds impedance calibrated pads, there are no capacitive constraints on DDR signals. However, a board must be designed and equipped in order to respect propagation time and intrinsic delay in the SDRAM device. In all cases, line length to memory device must not exceed 5 cm.

#### 66.20.2 DDR2-SDRAM

**Note:** For DDR2 memory, the SHIFT\_SAMPLING field value in the MPRDDRC\_RD\_DATA\_PATH register must be configured to 1.

**Table 66-73. System Clock Waveform Parameters**

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{\text{DDRCK}}$	DDRCK Cycle Time	VDDCORE[1.1V, 1.32V]	7.5	8.0	ns
		VDDCORE[1.2V, 1.32V], VDDIODDR[1.8V, 1.9V]	6.0	8.0	ns

#### 66.20.3 LPDDR1-SDRAM

**Note:** For LPDDR1 memory, the SHIFT\_SAMPLING field value in the MPRDDRC\_RD\_DATA\_PATH register must be configured as follows:

SHIFT\_SAMPLING = 0 for 0 < DDR\_CLK < 94 MHz

SHIFT\_SAMPLING = 1 for 94 MHz < DDR\_CLK < 166 MHz

**Table 66-74. System Clock Waveform Parameters**

Symbol	Parameter	Conditions	Min	Max	Unit
t <sub>DDRCK</sub>	DDRCK Cycle Time	VDDCORE[1.1V, 1.32V]	7.5	–	ns
t <sub>DDRCK</sub>	DDRCK Cycle Time	VDDCORE[1.2V, 1.32V], VDDIODDR[1.8V, 1.9V]	6	–	ns

### 66.20.4 LPDDR2/LPDDR3-SDRAM

**Note:** For LPDDR2/LPDDR3 memory, the SHIFT\_SAMPLING field value in the MPRDDRC\_RD\_DATA\_PATH register must be configured as follows:

SHIFT\_SAMPLING = 0 for 0 < DDR\_CLK < 80 MHz

SHIFT\_SAMPLING = 1 for 80 MHz < DDR\_CLK < 166 MHz

**Table 66-75. System Clock Waveform Parameters**

Symbol	Parameter	Conditions	Min	Max	Unit
t <sub>DDRCK</sub>	DDRCK Cycle Time	VDDCORE[1.1V, 1.32V]	7.5	–	ns
t <sub>DDRCK</sub>	DDRCK Cycle Time	VDDCORE[1.1V, 1.32V], VDDIODDR[1.18V, 1.3V]	6	–	ns

### 66.20.5 DDR3/DDR3L-SDRAM

**Note:** For DDR3/DDR3L memory, the SHIFT\_SAMPLING field value in the MPRDDRC\_RD\_DATA\_PATH register must be configured to 2.

**Table 66-76. System Clock Waveform Parameters**

Symbol	Parameter	Conditions	Min	Max	Unit
t <sub>DDRCK</sub>	DDRCK Cycle Time	VDDCORE[1.1V, 1.32V]	8.0	–	ns
t <sub>DDRCK</sub>	DDRCK Cycle Time	VDDCORE[1.1V, 1.32V], VDDIODDR[1.18V, 1.3V]	8.0	–	ns

## 66.21 SSC Timings

ISC <sub>4</sub>	CONTROL VSYNC/HSYNC/FIELD hold time after PIXCLK rises	0.5	–	0.3	–	–	–	ns
ISC <sub>5</sub>	PIXCLK frequency	–	96	–	96	–	96	MHz

### 66.25 SDMMC Timings

The Secure Digital Multimedia Card (SDMMC) Controller supports the embedded MultiMedia Card (e.MMC) Specification V4.51, the SD Memory Card Specification V3.0, and the SDIO V3.0 specification. It is compliant with the SD Host Controller Standard V3.0 specification.

Features are different for the two instances of SDMMC:

SDMMC0: SD 3.0, eMMC 4.51, 8 bits

SDMMC1: SD 2.0, eMMC 4.41, 4 bits only

In SDR104 mode (SD 3.0), SDMMC0 is limited to 120 MHz (instead of 208 MHz). In HS200 mode (eMMC 4.51), SDMMC0 is limited to 120 MHz (instead of 200 MHz).

### 66.26 GMAC Timings

#### 66.26.1 Timing Conditions

Timings assuming a capacitance load on data and clock are given in the table below.

**Table 66-95. Capacitance Load on Data, Clock Pads**

Supply	Corner	
	Max	Min
3.3V	20 pF	0 pF

#### 66.26.2 Timing Constraints

**Table 66-96. Ethernet MAC Signals Relative to GMDC**

Symbol	Parameter	Min	Max	Unit
EMAC <sub>1</sub>	Setup for GMDIO from GMDC rising	10	–	ns
EMAC <sub>2</sub>	Hold for GMDIO from GMDC rising	10	–	ns
EMAC <sub>3</sub>	GMDIO toggling from GMDC rising <sup>(1)</sup>	0	300	ns

**Note:**

- For Ethernet MAC output signals, minimum and maximum access times are defined. The minimum access time is the time between the GMDC rising edge and the signal change. The maximum access time is the time between the GMDC rising edge and the signal stabilizes. The figure below illustrates minimum and maximum accesses for EMAC<sub>3</sub>.

**Figure 66-40. Minimum and Maximum Access Times of Ethernet MAC Output Signals**

#### 66.26.2.1 Ethernet MAC MII Mode

**Table 66-97. Ethernet MAC MII Specific Signals**

Symbol	Parameter	Min	Max	Unit
EMAC <sub>4</sub>	Setup for GCOL from GTXCK rising	10	–	ns

### 68. Schematic Checklist

The schematic checklist provides the user with the requirements regarding the different pin connections that must be considered before starting any new board design as well as information on the minimum hardware resources required to quickly develop an application with the SAMA5D2. It does not consider PCB layout constraints.

It also provides recommendations regarding low-power design constraints to minimize power consumption.

This information is not intended to be exhaustive. Its objective is to cover as many configurations of use as possible.

The checklist contains a column for use by designers, making it easy to track and verify each line item.

#### 68.1 Power Supply

The board design must comply with the power-up and power-down sequence guidelines provided in the data sheet to ensure reliable operation of the device.

---

Figure 68-1. 1.2V, 1.35V/1.5V, 2V, 2.5V, 3.3V Power Supplies Schematics<sup>(1)</sup>

**Note:**

1. These values are given only as typical examples.

**Table 68-1. Power Supply Connections**

☑	Signal Name	Recommended Pin Connection	Description
	VDDCORE	1.1V to 1.32V Decoupling/Filtering capacitors (10 $\mu$ F and 100 nF) <sup>(1)(2)</sup>	Powers the core  Supply ripple must not exceed 15 mVrms.
	VDDPLLA	1.1V to 1.32V Decoupling/Filtering capacitor (100 nF) <sup>(1)(2)</sup>	Powers the PLLA cell.  The VDDPLLA power supply pin draws small current, but it is noise-sensitive. Care must be taken in VDDPLLA power supply routing, decoupling and also on bypass capacitors.  Supply ripple must not exceed 20 mVrms.
	VDDIODDR	1.14V to 1.30V 1.283V to 1.45V 1.425V to 1.575V 1.7V to 1.9V Decoupling/Filtering capacitors (10 $\mu$ F and 100 nF) <sup>(1)(2)</sup>	Powers LPDDR2-LPDDR3 interface  Powers DDR3L interface  Powers DDR3 interface  Powers LPDDR1-DDR2 interface  Decoupling/filtering capacitors must be added to improve startup stability and reduce source voltage drop.
	VDDISC	1.65V to 3.6V Decoupling capacitor (100 nF) <sup>(1)(2)</sup>	Powers the ISC Interface I/O lines.
	VDDIOP0,1,2	1.65V to 3.6V Decoupling capacitor (100 nF) <sup>(1)(2)</sup>	Powers the peripherals I/O lines.  Decoupling/filtering capacitors must be added to improve startup stability and reduce source voltage drop.
	VDDBU	1.65V to 3.6V Decoupling capacitor (100 nF) <sup>(1)(2)</sup>	Powers the Slow Clock oscillator, the internal 64 kHz RC and a part of the System Controller.  Must be established first.  Supply ripple must not exceed 30 mVrms.
	VDDUTMIC	1.1V to 1.32V Decoupling capacitor (100 nF) <sup>(1)(2)</sup>	DC Supply UTMI Phy (Core) and PLL UTMI  Decoupling/filtering capacitors must be added to improve startup stability and reduce source voltage drop.

☑	Signal Name	Recommended Pin Connection	Description
	VDDUTMII	3.0V to 3.6V Decoupling capacitor (100 nF) <a href="#">(1)(2)</a>	DC Supply UTMI Phy (Interface) Decoupling/filtering capacitors must be added to improve startup stability and reduce source voltage drop.
	VDDHSIC	1.1V to 1.3V Decoupling capacitors (100 nF) <a href="#">(1)(2)</a>	DC Supply HSIC Phy
	VDDOSC	1.65V to 3.6V Decoupling/Filtering RLC circuit <sup>(1)</sup>	Powers the main oscillator cell. The VDDOSC power supply pin is noise-sensitive. Care must be taken in VDDOSC power supply routing, decoupling and also on bypass capacitors. Supply ripple must not exceed 30 mVrms.
	VDDSDMMC	1.65V to 3.6V Decoupling capacitor (100 nF) <a href="#">(1)(2)</a>	Powers the SDMMC I/O lines.
	VDDANA	1.65V to 3.6V Decoupling capacitor (100 nF) <a href="#">(1)(2)</a>	Powers the analog parts.
	VDDFUSE	2.25V to 2.75V Decoupling capacitor (100 nF) <a href="#">(1)(2)</a>	Powers the fuse box for programming. VDDFUSE must not be left floating.
	VDDAUDIOPLL	3.0V to 3.6V Decoupling capacitor (100 nF) <a href="#">(1)(2)</a>	Powers the Audio PLL.
	GNDCORE	Core Chip ground	GNDCORE pins are common to VDDCORE pins. GNDCORE pins should be connected as shortly as possible to the system ground plane.

# SAMA5D2 Series

## Schematic Checklist

.....continued			
☑	Signal Name	Recommended Pin Connection	Description
	GNDPLLA	PLLA cell ground	GNDPLL pin is provided for VDDPLLA pins. GNDPLL pin should be connected as shortly as possible to the system ground plane.
	GNDIODDR	DDR2/LPDDR1/LPDDR2/ DDR3/LPDDR3 interface I/O lines ground	GNDIODDR pins should be connected as shortly as possible to the system ground plane.
	GNDISC	VDDISC ground	GNDISC pins are common to VDDISC pins. GNDISC pins should be connected as shortly as possible to the system ground plane.
	GNDIOP0,1,2	Peripherals and ISC I/O lines ground	GNDIOPx pins are common to VDDIOPx pins. GNDIOP pins should be connected as shortly as possible to the system ground plane.
	GNDDBU	Backup ground	GNDDBU pin is provided for VDDDBU pins. GNDDBU pin should be connected as shortly as possible to the system ground plane.
	GNDUTMIC	VDDUTMIC and VDDHSIC ground	GNDUTMIC pins are common to VDDUTMIC and VDDHSIC pins. GNDUTMIC pins should be connected as shortly as possible to the system ground plane.
	GNDUTMII	UDPHS and UPHPS UTMI+ Core and Interface, and PLL UTMI ground	GNDUTMII pins are common to VDDUTMII and VDDUTMIC pins. GNDUTMII pins should be connected as shortly as possible to the system ground plane.
	GNDOSC	Oscillator ground	GNDOSC pin is provided for VDDOSC pins. GNDOSC pin should be connected as shortly as possible to the system ground plane.

# SAMA5D2 Series

## Schematic Checklist

.....continued

☑	Signal Name	Recommended Pin Connection	Description
	GNDSMMC	SDMMC ground	SDMMC pins are common to VDDSDMMC pins.  GNDSMMC pins should be connected as shortly as possible to the system ground plane.
	GNDANA	Analog ground	GNDANA pins are common to VDDANA pins.  GNDANA pins should be connected as shortly as possible to the system ground plane.
	GNDFUSE	Fuse box ground	GNDFUSE pins are common to VDDFUSE pins.  GNDFUSE pins should be connected as shortly as possible to the system ground plane.
	GNDAUDIOPLL GNDDPLL	Audio PLL ground	GNDAUDIOPLL and GNDDPLL pins are common to VDDAUDIOPLL.  GNDAUDIOPLL and GNDDPLL pins should be connected as shortly as possible to the system ground plane.

### Note:

1. These values are given only as typical examples.
2. Decoupling capacitors must be connected as close as possible to the microprocessor and on each relevant pin

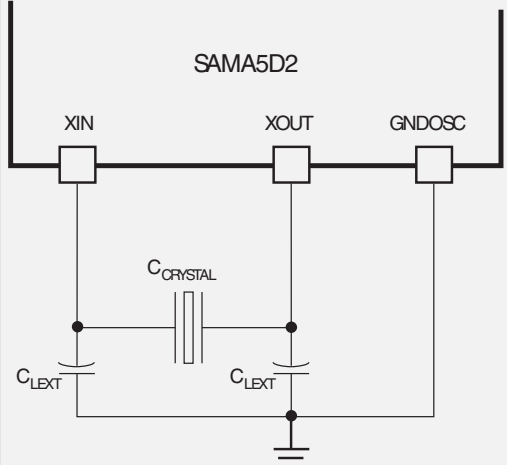

For more information, see the table "VDDCORE Power-On Reset Characteristics" in the section "Electrical Characteristics".

### 68.2 Power-On Reset

The SAMA5D2 embeds several Power-On Resets (PORs) to ensure the power supply is established when the reset is released. These PORs are dedicated to VDDBU, VDDANA and VDDCORE respectively.

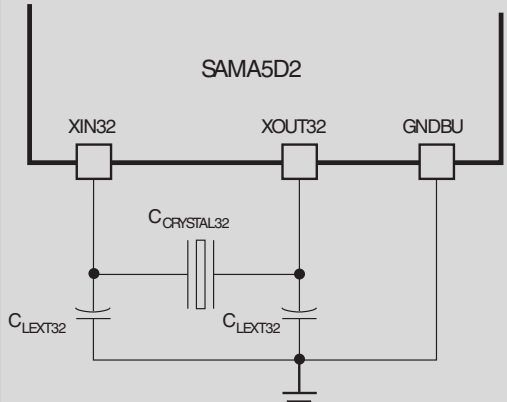

### 68.3 Clock, Oscillator and PLL

**Table 68-2. Clock, Oscillator and PLL Connections**

☑	Signal Name	Recommended Pin Connection	Description
	XIN XOUT Main Oscillator in Normal Mode	Crystals between 8 and 24 MHz  USB High Speed (not Full Speed) Host and Device peripherals need a 12 MHz clock.  Capacitors on XIN and XOUT (Crystal Load Capacitance dependent)	Crystal Load Capacitance to check ( $C_{CRYSTAL}$ )   Refer to the section <a href="#">Electrical Characteristics</a> .
	XIN XOUT Main Oscillator in Bypass Mode	XIN: external clock source XOUT: can be left unconnected  USB High speed (not Full Speed) Host and Device peripherals need a 12 MHz clock.	Square wave signal, high level = VDDOSC  External clock source up to 50 MHz  Duty Cycle: 40 to 60%  Refer to the section <a href="#">Electrical Characteristics</a> .

# SAMA5D2 Series

## Schematic Checklist

.....continued			
☑	Signal Name	Recommended Pin Connection	Description
	XIN XOUT Main Oscillator Disabled	XIN: can be left unconnected  XOUT: can be left unconnected  USB High Speed (not Full Speed)  Host and Device peripherals need a 12 MHz clock.	Typical nominal frequency 12 MHz (Internal 12 MHz RC Oscillator)  Duty Cycle: 45 to 55%  Refer to the section <a href="#">Electrical Characteristics</a> .
	XIN32 XOUT32 Slow Clock Oscillator	32.768 kHz Crystal  Capacitors on XIN32 and XOUT32  (Crystal Load Capacitance dependent)	Crystal load capacitance to check ( $C_{CRYSTAL32}$ )    Refer to the section <a href="#">Electrical Characteristics</a> .
	XIN32 XOUT32 Slow Clock Oscillator Disabled	XIN32: can be left unconnected  XOUT32: can be left unconnected	Typical nominal frequency 32 kHz (internal 64 kHz RC oscillator)  Duty Cycle: 45 to 55%  Refer to the section <a href="#">Electrical Characteristics</a> .

	VBG	0.9–1.1V <sup>(2)</sup>	<p>Bias Voltage Reference for USB</p> <p>To reduce as much as possible the noise on VBG pin, check the layout considerations below:</p> <ul style="list-style-type: none"> <li>- VBG path as short as possible</li> <li>- Ground connection to GNDUTMII</li> </ul> <div style="text-align: center;"> </div> <p>VBG can be left unconnected if USB is not used.</p> <p>Refer to the section <a href="#">Signal Description</a>.</p>

### 68.4 ICE and JTAG

**Note:** It is recommended to establish accessibility to a JTAG connector for debug in any case.

**Note:** The boundary scan is only available on JTAG IO Set 1 signals.

**Table 68-3. ICE and JTAG Connections**

☑	Signal Name	Recommended Pin Connection	Description
	TCK	Pull-up (100 kΩ) <sup>(1)</sup> If Debug mode is not required, this pin can be used as GPIO.	This pin is a Schmitt trigger input. Internal pull-up resistor to V <sub>DDIOP</sub> (100 kΩ).
	TMS	Pull-up (100 kΩ) <sup>(1)</sup> If Debug mode is not required, this pin can be used as GPIO.	This pin is a Schmitt trigger input. Internal pull-up resistor to V <sub>DDIOP</sub> (100 kΩ).
	TDI	Pull-up (100 kΩ) <sup>(1)</sup> If Debug mode is not required, this pin can be used as GPIO.	This pin is a Schmitt trigger input. Internal pull-up resistor to V <sub>DDIOP</sub> (100 kΩ).

# SAMA5D2 Series

## Schematic Checklist

.....continued			
<input checked="" type="checkbox"/>	Signal Name	Recommended Pin Connection	Description
	TDO	Floating  If Debug mode is not required, this pin can be used as GPIO.	Output driven at up to $V_{DDIOP}$ .
	NTRST	Refer to the section Pin Description.  If Debug mode is not required, this pin can be used as GPIO.	This pin is a Schmitt trigger input.  Internal pull-up resistor to $V_{DDIOP}$ (100 k $\Omega$ ).
	JTAGSEL	In harsh environments <sup>(2)</sup> , it is strongly recommended to tie this pin to GNDBU if not used or to add an external low-value resistor (such as 1 k $\Omega$ ).	Internal pull-down resistor to GNDBU (15 k $\Omega$ ).  Must be tied to $V_{DDBU}$ to enter JTAG Boundary Scan.

**Note:**

1. These values are given only as typical examples.
2. In a well-shielded environment subject to low magnetic and electric field interference, the pin may be left unconnected. In noisy environments, a connection to ground is recommended.

### 68.5 Reset and Test

**Table 68-4. Reset and Test Connections**

☑	Signal Name	Recommended Pin Connection	Description
	NRST	<p>Application-dependent</p> <p>Can be connected to a push button for hardware reset.</p> <p>In applications with a storage element on VDDBU (battery, supercapacitor, etc.), NRST must be tied to a non-permanent supply (satisfying VIH conditions on NRST) and not to VDDBU. Typically, this may be the application's primary 3.3V supply (VDDIOP0, VDDIOP1 or any other). The recommended pull-up value is 10 kOhms minimum. Doing so, the NRST level is 'L' when the non-permanent supply is removed. On the contrary, if this pin is tied to VDDBU:</p> <ul style="list-style-type: none"> <li>• the circuit driving this pin low may not be operational when the input power of the application is removed. Therefore the processor may not be properly reset during power-up or power-down phases,</li> <li>• a leakage path from VDDBU to the application's input power may be created when this input power is removed. (This may be for example through a clamping diode that may be present on an external integrated circuit driving NRST.)</li> </ul>	<p>NRST pin is a Schmitt trigger input.</p> <p>No internal pull-up resistor.</p>
	TST	<p>In harsh environments<sup>(1)</sup>, it is strongly recommended to tie this pin to GNDBU to add an external low-value resistor (such as 10 kΩ).</p>	<p>This pin is a Schmitt trigger input.</p> <p>Internal pull-down resistor to GNDBU (15 kΩ).</p>

**Note:**

1. In a well-shielded environment subject to low magnetic and electric field interference, the pin may be left unconnected. In noisy environments, a connection to ground is recommended.

### 68.6 Shutdown/Wake-up Logic

**Table 68-5. Shutdown/Wake-up Logic Connections**

☑	Signal Name	Recommended Pin Connection	Description
	SHDN	Application-dependent  A typical application connects pin SHDN to the shutdown input of the DC/DC Converter providing the main power supplies.	Push-pull output.
	WKUP	0V to V <sub>DDBU</sub>	Input only. WKUP behavior can be configured through the Shutdown Controller (SHDWC).

### 68.7 Parallel Input/Output (PIO)

**Table 68-6. PIO Connections**

☑	Signal Name	Recommended Pin Connection	Description
	PAx PBx PCx PDx	Application-dependent	<p>All PIOs are pulled up inputs (100 kΩ) at reset except those which are multiplexed with the Address Bus signals that require to be enabled as peripherals:</p> <p>In the section <a href="#">Package and Pinout</a>, refer to the column 'Reset State' of the Pin Description table.</p> <p>Schmitt trigger on all inputs.</p> <p>To reduce power consumption if not used, the relevant PIO can be configured as an output, driven at '0' with internal pull-up disabled.</p>

### 68.8 Analog-to-Digital Converter (ADC)

**Table 68-7. ADC Connections**

☑	Signal Name	Recommended Pin Connection	Description
	ADVREF	3.3 V to VDDANA  Decoupling/filtering capacitors Application-dependent	<p>ADVREF is a pure analog input.</p> <p>To reduce power consumption if the ADC is not used, connect ADVREF to GNDANA.</p>

### 68.9 External Bus Interface (EBI)

**Table 68-8. EBI Connections**

☑	Signal Name	Recommended Pin Connection	Description
	D0–D15	Application-dependent	Data Bus (D0 to D15) All data lines are pulled up inputs at reset.
	A0–A25	Application-dependent	Address Bus (A0 to A25) All address lines are pulled up inputs at reset.

The tables below detail the connections to be applied between the EBI pins and the external devices for each memory controller.

**Table 68-9. EBI Pins and External Static Devices Connections**

Signals:	Pins of the Interfaced Device		
EBI_	8-bit Static Devices	2 x 8-bit Static Devices	16-bit Static Devices
Controller	SMC (Static Memory Controller)		
D0–D7	D0–D7	D0–D7	D0–D7
D8–D15	–	D8–D15	D8–D15
A0/NBS0	A0	–	NLB
A1	A1	A0	A0
A2–A22	A[2:22]	A[1:21]	A[1:21]
A23–A25	A[23:25]	A[22:24]	A[22:24]
NCS0	CS	CS	CS
NCS1	CS	CS	CS
NCS2	CS	CS	CS
NCS3/NANDCS	CS	CS	CS
NRD/NANDOE	OE	OE	OE
NWE/NWR0/NANDWE	WE	WE <sup>(1)</sup>	WE
NWR1/NBS1	–	WE <sup>(1)</sup>	NUB

**Note:**

1. NWR0 enables lower byte writes. NWR1 enables upper byte writes.

**Table 68-10. EBI Pins and NAND Flash Device Connections**

Signals: EBI_	Pins of the Interfaced Device	
	8-bit NAND Flash	16-bit NAND Flash
Controller	NFC (NAND Flash Controller)	
D0–D7	NFD0–NFD7	NFD0–NFD7
D8–D15	–	NFD8–NFD15
A21/NANDALE	ALE	ALE
A22/NANDCLE	CLE	CLE
NRD/NANDOE	RE	RE
NWE/NWR0/NANDWE	WE	WE
NCS3/NANDCS	CE	CE
NANDRDY	R/B	R/B

NCS1	–	–
NCS2	–	–
NWAIT	–	–

## 68.10 USB High-Speed Host Port (UHPHS) / USB High-Speed Device Port (UDPHS)

**Table 68-11. UHPHS/UDPHS Connections**

	Signal Name	Recommended Pin Connection	Description
UHPHS	HHSDPA/DHSDPB <sup>(1)</sup> HHSDMA/ DHSDMB <sup>(1)</sup>	Application-dependent <sup>(2)(3)</sup>	Pull-down output at reset
UDPHS	HHSDP/HHSDM	Application-dependent <sup>(2)</sup>	Pull-down output at reset
HSIC	HHSTROBE/ HHDATA	Application-dependent <sup>(2)</sup>	Pull-down output at reset

**Note:**

1. UDPHS shares Port A with UHPHS.

2. Example of a USB High Speed Host connection, refer to the section [USB Host High Speed Port \(UHPHS\)](#).

3. Typical USB High Speed Device connection, refer to the section [USB Host High Speed Port \(UHPHS\)](#).

**Note:** The values shown on the 22 kΩ and 15 kΩ resistors are only valid with 3.3V supplied PIOs.

### 68.11 Boot Program Hardware Constraints

Refer to the section [Standard Boot Strategies](#) for more details on the boot program.

### 68.12 Layout and Design Constraints

**Note:** All PIOs shared, multiplexed, connected to various components and connectors must be connected through serial resistors 22R and 39R for clock signals. The resistors must be populated as close as possible to the SAMA5D2.

### 68.12.1 General Considerations

This chapter provides routing guidelines for layout and design of a printed circuit board using high-speed interfaces, Serial, Ethernet and USB 2.0. The signal integrity rules for high-speed interfaces need to be considered. In fact, it is highly recommended that the board design be simulated to determine optimum layout for signal integrity and quality. Keep in mind that this document can only highlight the most important issues that should be considered when designing the SAMA5D2 board. The designer has to take into account the corresponding information (specification, design guidelines, etc.) contained in the documentation of all other devices that are to be implemented on board.

### 68.12.2 Considerations for High-Speed Differential Interfaces

The following recommendations for designing with high-speed differential signals are useful to maintain maximum SAMA5D2 board performance when implementing these interfaces.

- Use controlled impedance PCB traces that match the specified differential impedance.
- Keep the trace lengths of the differential signal pairs as short as possible.
- The differential signal pair traces should be trace-length matched.
- Maintain parallelism and symmetry between differential signals with the trace spacing needed to achieve the specified differential impedance.
- Maintain maximum possible separation between the differential pairs and any high-speed clocks/periodic signals (CMOS/TTL) and any connector leaving the PCB (such as I/O connectors, control and signal headers, or power connectors).
- Route differential signals on the signal layer nearest to the ground plane using a minimum of vias and corners. This will reduce signal reflections and impedance changes. Use GND stitching vias when changing layers.
- It is best to put CMOS/TTL and differential signals on different layers which should be isolated by the power and ground planes.
- Avoid tight bends. When it becomes necessary to turn 90°, use two 45° turns or an arc instead of making a single 90° turn.
- Do not route traces under crystals, crystal oscillators, clock synthesizers, magnetic devices or ICs that use, and/or generate, clocks.
- Stubs on differential signals should be avoided due to the fact that stubs cause signal reflections and affect signal quality.
- Keep the length of high-speed clock and periodic signal traces that run parallel to high-speed signal lines at a minimum to avoid crosstalk. Based on EMI testing experience, the minimum suggested spacing to clock signals is 50 mil.
- Use a minimum of 20 mil spacing between the differential signal pairs and other signal traces for optimal signal quality. This helps to prevent crosstalk.
- Route all traces over continuous planes (VCC or GND) with no interruptions.
- Avoid crossing over anti-etch if at all possible. Crossing over anti-etch (split planes) increases inductance and radiation levels by forcing a greater loop area.

### 68.12.3 DDR Layout and Design Considerations

Refer to the document “SAMA5D2 Layout Recommendations”, document no. 44041.

### 68.12.4 e.MMC Routing

Refer to the Micron Technical Note TN-FC-35: *e.MMC PCB Design Guide*. This document is intended as guide for PCB designers using Micron e.MMC devices and discusses the primary issues affecting design and layout.

### 68.12.5 USB Trace Routing Guidelines

- Maintain parallelism between USB differential signals with the trace spacing needed to achieve 90-ohm differential impedance. Deviations will normally occur due to package breakout and routing to connector pins. Just ensure the amount and lengths of the deviations are kept to the minimum possible.
- Use an impedance calculator to determine the trace width and spacing required for the specific board stack-up being used. Example: Layer Stacking, 7.5-mil traces with 7.5-mil spacing results in approximately 90-ohm differential trace impedance.
- Minimize the length of high-speed clock and periodic signal traces that run parallel to high-speed USB signal lines, to minimize crosstalk.
- Based on EMI testing experience, the minimum suggested spacing to clock signals is 50 mils. Based on simulation data, use 20-mil minimum spacing between high-speed USB signal pairs and other signal traces for optimal signal quality. This helps to prevent crosstalk.

**Table 68-12. USB Trace Routing Guidelines**

Parameter	Trace Routing
Signal length allowance for the SAMA5D2	14.0 inches  Valid for a damping value of the PCB trace of 0.11 dB/inch @ 0.4 GHz (common value for FR-4 based material)
Differential impedance	90 ohms $\pm$ 15%
Single-ended impedance	45 ohms $\pm$ 10%
Trace width (W)	5 mils (microstrip routing)
Spacing between differential pairs (intra-pair)	6 mils (microstrip routing)
Spacing between pairs (inter-pair)	Min. 20 mils
Spacing between differential pairs and high-speed periodic signals	Min. 50 mils
Spacing between differential pairs and low-speed non-periodic signals	Min. 20 mils
Length matching between differential pairs (intra-pair)	150 mils
Reference plane	GND referenced preferred
Spacing from edge of plane	Min. 40 mils
Vias usage	Try to minimize the number of vias

### 68.12.6 QSPI Pull-up Resistors

The ROM code **removes** the internal pull-up resistors when it configures PIO controller to mux the QSPI controller I/O lines. Therefore the probing step may fail if the Quad I/O mode of the memory has not been enabled yet and if this memory does not embed internal pull-up resistor on #HOLD or #RESET pin.

For this reason, it is recommended to add external pull-up resistors if needed on the four I/O data lines MOSI/IO0, MISO/IO1, #WP/IO2 and #HOLD/IO3.

Another solution is to update the Quad Enable non-volatile bit in the relevant register to reassign #WP and #HOLD/#RESET pins to functions IO2 and IO3.

### 68.12.7 Considerations for PTC Interface

Particular care must be taken during the layout of the PTC interface for the signals PTC\_Xm and PTC\_Yn. The PTC Debug Port (PTC\_PORT\_x) can be routed normally.

#### X-Lines (PTC\_Xm)

- Must be routed on TOP and BOTTOM side as often as possible.
- Can be routed in inner layer when necessary.
- A maximum of 4 vias per line is allowed.
- Is possible to cross the lines if necessary.
- X-lines must be as short as possible with a maximum intrinsic capacitance of 15pF.

#### Y-Lines (PTC\_Yn)

- Must be routed on TOP side only.
- Only one via per line is allowed.
- Never cross the Y-lines.
- Y-lines must be as short as possible with a maximum intrinsic capacitance of 15pF.

Respect an absolute clearance in PTC routing area. No ground path or plane, no power path or plane, and no signals except other PTC lines respecting the recommendations above should overlay the PTC signals in another PCB layer.

**69. Marking**

Top marking follows the scheme below:

with possible values:

Line	Description	Values
1	Company Logo	Atmel
2	Device Name	ATSAMA5D21 ATSAMA5D22 ATSAMA5D23 ATSAMA5D24 ATSAMA5D26 ATSAMA5D27 ATSAMA5D28
3	Device Information	CN CU
4	Date Code, Design Revision	YYWW C YYWW B YYWW A
5	Lot Traceability, ARM logo	YYWWNNN ARM

### 70. Ordering Information

Ordering Code	MRL	Package	Carrier Type	Operating Temperature Range
ATSAMA5D21C-CU	C	TFBGA196	Tray	-40°C to 85°C
ATSAMA5D21C-CUR	C		Tape and reel	
ATSAMA5D22C-CN	C		Tray	-40°C to 105°C

ATSAMA5D28C-CUR	C	Tape and reel		

**Note:**

- The Boot Configuration Word reset value for ATSAMA5D24C-CUF01 is 0x00000C00, meaning that the boot on SDMMC1 and SDMMC0 are disabled. Refer to [Boot Configuration Word](#).

## 71. Revision History

### 71.1 Revision DS60001476C

Changes
<p><b>Global format change</b> In peripheral sections:</p> <ul style="list-style-type: none"> <li>- User Interface table is now called Register Summary and features new information.</li> <li>- Details for registers have changed. The details are now Name, Offset, Reset and Property <b>(Note)</b>.</li> <li>- Each bitfield now displays its Access and Reset value.</li> </ul> <p><b>Note:</b> Absolute register addresses are available in <a href="#">Memories</a>.</p>
Updated <a href="#">Block Diagram</a> .
Updated <a href="#">Signal Description List</a> for PTC signals.
Table <a href="#">Pin Description (all packages)</a> : added note on JTAG boundary scan.
<p><b>Memory Mapping</b></p> <p>In <a href="#">Figure 8-1</a>, updated SYSCWP, PMC, RTC and RSTC.</p>
<p><b>Debug and Test Features</b></p> <p>Updated <a href="#">Figure 15-2</a>.</p> <p>Deleted section <i>Chip Access Using JTAG Connection</i>.</p> <p>Updated Product part number and JTAG ID Code value in <a href="#">Boundary JTAG ID Register</a>.</p> <p>Updated Product Version Number and Debug Port JTAG IDCODE in <a href="#">JTAG-DP Device ID Code Register</a>.</p>
<p><b>Standard Boot Strategies</b></p> <p>Updated <a href="#">Boot Configuration</a>.</p>
<p><b>Matrix (H64MX/H32MX)</b></p> <p>Updated table <a href="#">Peripheral Identifiers</a>.</p> <p><a href="#">Master to Slave Access on H32MX</a>: connection between ICM and H32MX removed.</p> <p>Added note on AESB after table <a href="#">Master to Slave Access on H64MX</a>.</p> <p>Section "TrustZone Extension to AHB and APB" renamed to <a href="#">18.12 TrustZone Technology</a> and reorganized content.</p> <p>In <a href="#">Principles</a>, renamed 'Always Non-secure' to 'Never Secure'</p>
<p><b>Special Function Registers (SFR)</b></p> <p>Section <a href="#">19.3.2 SFR_OHCIICR</a>: updated SUSPEND_A, SUSPEND_B and SUSPEND_C definitions</p>
<p><b>Advanced Interrupt Controller (AIC)</b></p> <p>Updated <a href="#">Figure 21-8</a>.</p> <p>Updated Figure in Section <a href="#">21.3 Block Diagram</a>; updated Section <a href="#">21.7.3 Interrupt Sources</a>.</p>
<p><b>Shutdown Controller (SHDWC)</b></p> <p>Added information on Write Protection.</p>
<p><b>Periodic Interval Timer (PIT)</b></p> <p>Added information on Write Protection.</p>

.....continued

### Changes

#### Real-time Clock (RTC)

Updated content of section [Waveform Generation](#).

Added information about how to clear bits/fields.

#### System Controller Write Protection

Section [27.1.2 Register Write Protection](#): updated list of write-protected registers.

#### Slow Clock Controller (SCKC)

Updated:

- Section [28.1 Description](#)
- Section [28.3 Block Diagram](#)
- Section [28.4 Functional Description](#)
- Section [28.4.1 Switching from Embedded 64 kHz RC Oscillator to 32.768 kHz Crystal Oscillator](#)
- Section [28.4.2 Switching from 32.768 kHz Crystal Oscillator to Embedded 64 kHz RC Oscillator](#)
- Section [28.5.1 SCKC\\_CR](#)

#### Power Management Controller (PMC)

[Clock Assignments](#): removed LCDC row.

Removed content related to the CKGR\_UCKR.BIASEN bit in Section [32.19 Programming Sequence](#) and Section [32.22.7 CKGR\\_UCKR](#)

Updated Section [32.9 Peripheral and Generic Clock Controller](#).

#### Parallel Input/Output Controller (PIO)

Updated [Figure 33-2](#).

#### External Memories

[Table 34-2](#): Added note on connecting DDR\_DQSN.

#### AHB Multiport DDR-SDRAM Controller (MPDDRC)

[Embedded Characteristics](#): added “Write Leveling not supported” and added “Low-cost LPDDR1with 2 internal banks” and “Arbitration policies” characteristics

Updated [Block Diagram](#).

[DDR2-SDRAM Initialization](#): added Step 2.

[Low-power DDR2-SDRAM Initialization](#): added Step 2.

[DDR3-SDRAM/DDR3L-SDRAM Initialization](#): added Step 2.

Restored title of [Refresh \(Autorefresh Command\)](#).

[Scrambling/Unscrambling Function](#): MPDDRC\_KEY1/2 replaced with KEY1/2.

Added [Monitor](#).

Updated [Sequential Mapping DDR-SDRAM Configuration Mapping: 8K Rows, 512/1024 Columns, 8 banks](#) and [Interleaved Mapping DDR-SDRAM Configuration Mapping: 8K Rows, 512/1024 Columns, 8 banks](#).

[MPDDRC Mode Register](#): updated DAI bit description.

[MPDDRC Configuration Register](#): updated UNAL bit description.

[MPDDRC Memory Device Register](#): updated WL, RL3, MANU\_ID, REV\_ID, TYPE, DENSITY and IO\_WIDTH bit descriptions.

[MPDDRC Low-power DDR2 Low-power DDR3 and DDR3 Timing Calibration Register](#): updated RZQI bit description.

[MPDDRC I/O Calibration Register](#): updated CALCODEP and CALCODEN field descriptions.

[MPDDRC Read Data Path Register](#): updated SHIFT\_SAMPLING field description.

.....continued
<b>Changes</b>
<a href="#">MPDDRC Monitor Configuration Register</a> : updated REFR_CALIB bit description.
<b>DMA Controller (XDMAC)</b>
Section <a href="#">37.5.1 Basic Definitions</a> : added "Stride" definition; added <a href="#">37.5.2 Data Striding Diagram</a> .
Updated Section <a href="#">37.8 XDMAC Software Requirements</a> ;Section <a href="#">37.9.28 XDMAC_CC</a> : updated PROT bit description.
<b>Ethernet MAC (GMAC)</b>
<a href="#">MAC Transmit Block</a> : removed reference to non-existing bit HDFC.
<a href="#">GMAC Network Status Register</a> : updated reset value for GMAC_NSR.
<b>USB High Speed Device Port (UDPHS)</b>
Updated <a href="#">Endpoint Configuration</a> and <a href="#">DPRAM Management</a> .
Removed figure Example of DPRAM Allocation and Reorganization.
<b>USB Host High Speed Port (UHPHS)</b>
Updated Section <a href="#">41.3 Block Diagram</a> , Section <a href="#">41.5.1 I/O Lines</a> , Section <a href="#">41.6.2 EHCI</a> , and Section <a href="#">41.6.3 OHCI</a> .
<a href="#">Power Management</a> : removed reference to bit BIASEN (UTMI BIAS Enable).
Updated <a href="#">Figure 41-2</a> .
Added Section <a href="#">41.6.1 UTMI Transceivers Sharing</a> .
Section <a href="#">41.7.4 UHPHS_USBCMD</a> : USBCMD reset value set to 0x00080B00 (instead of "0x00080000 or 0x00080B00").
Section <a href="#">41.7.11 UHPHS_PORTSCx</a> : UHPHS_PORTSCx reset value set to 0x00002000 (instead of "0x00002000 or 0x00003000").
Deleted registers UHPHS_INSNREG00 to UHPHS_INSNREG05.
<b>Two-wire Interface (TWIHS)</b>
<a href="#">Table 45-1</a> : START byte support now available. Updated Note 2.
Replaced sections "Master Mode FIFOs" and "Slave Mode FIFOs" by a single Section "FIFOs".
Section FIFOs, sub-section <a href="#">Overview</a> , the description for FIFO disable/enable has been changed.
<b>Flexible Serial Communication Controller (FLEXCOM)</b>
Section <a href="#">46.10.7 FLEX_US_MR (SPI_MODE)</a> : restored CHMODE field and updated CHMODE description.
Section <a href="#">46.7.3.1 Transmitter Operations</a> : updated Figure <a href="#">Transmitter Status</a>
Section <a href="#">46.10.55 FLEX_SPI_FMR</a> : updated RXRDYM field description
Updated <a href="#">46.7.4.1 ISO7816 Mode Overview</a>
Section <a href="#">46.7.6 RS485 Mode</a> : updated Figure <a href="#">Example of RTS Drive with Timeguard</a>
<a href="#">TWI Clock Waveform Generator Register</a> : deleted CKSRC description.
<b>Universal Asynchronous Receiver Transmitter (UART)</b>
Section <a href="#">47.3 Block Diagram</a> : RXD/TXD pins were renamed to URXD/UTXD.
Section <a href="#">47.5.7 Register Write Protection</a> : added UART Receiver Time-out Register to the list.
<b>Quad Serial Peripheral Interface (QSPI)</b>
<a href="#">QSPI Bus Clock Modes</a> : updated column "Capture QSCK Edge".
<b>Secure Digital MultiMedia Card Controller (SDMMC)</b>
<a href="#">SDMMC Preset Value Register</a> : deleted Note from SDMMC_PVRx register description.

.....continued

### Changes

[SDMMC Maximum Current Capabilities Register](#): corrected access to Read/Write. Added note on CAPWREN below register table.

[SDMMC Capabilities Control Register](#): updated CAPWREN bit description.

### Image Sensor Controller (ISC)

Section [51.6.1 ISC\\_CTRLLEN](#): added bit FUPPRO at index 9 and bit description.

Section [51.6.30 ISC\\_GAM\\_CTRL](#): added bit BIPART at index 4 and bit description.

### Controller Area Network (MCAN)

[Description](#), Section [52.2 Embedded Characteristics](#): added information on ISO non-compliance

### Pulse Width Modulation Controller (PWM)

[PWM Clock Generator](#): updated figure.

### Secure Fuse Controller (SFC)

Number of maskable Data Registers modified to 8. Number of Data Registers modified to 17.

Modified ACE bit name in Section [56.5.3 SFC\\_IER](#), Section [56.5.4 SFC\\_IDR](#), Section [56.5.5 SFC\\_IMR](#) and Section [56.5.6 SFC\\_SR](#).

### Integrity Check Monitor (ICM)

Updated Section [57.5.4.2 Processing Period](#).

### Advanced Encryption Standard (AES)

Section [59.1 Description](#): added XTS to supported modes.

Section [59.4.2 Operating Modes](#): added bullet for XTS mode; added bullet for CBC-MAC.

[Last Output Data Mode](#): Added (CBC-MAC) to section title. Added details on CMAC algorithm.

Section [59.4.7.1 Manual Mode](#): table "Authorized Input Data Registers": updated for XTS algorithm.

Section [59.4.7.3 DMA Mode](#): table "DMA Data Transfer Type for the Different Operating Modes": updated for XTS algorithm.

[IPSEC Padding](#): added detail on padding length.

[SSL Padding](#): added detail on incremental integer values.

Updated [DMA Mode](#).

Updated [If AES\\_MR.LOD = 1](#).

### Triple Data Encryption Standard (TDES)

[Last Output Data Mode \(CBC-MAC\)](#): added "CBC-MAC" in section title and added second paragraph.

Updated Section [61.4.2.3 DMA Mode](#) and Section [61.4.3.2.2 TDES\\_MR.LOD = 1](#).

### Analog-to-Digital Controller (ADC)

[ADC Channel Status Register](#): updated CHx bit description

Updated USCHx field description in [ADC Channel Sequence 1 Register](#) and [ADC Channel Sequence 2 Register](#)

### Electrical Characteristics

In [DC Characteristics](#) updated:

- Vhyst parameter

- VDDIODDR

- conditions for VOL and VOH

Updated Section [66.5.2 Backup Mode with DDR in Self-Refresh](#).

[Master Clock Waveform Parameters](#): changed VDDIODDR range.

.....continued

### Changes

Corrected references to CKGR\_MOR bits and added VIL\_XIN and VIH\_XIN parameters in [XIN Clock Electrical Characteristics](#).

Updated [12 MHz RC Oscillator Characteristics](#).

Updated [PLLA Characteristics](#).

Added [ADC Bias Current](#).

Added [Pen Detect Characteristics](#).

Updated [Analog Comparator Characteristics](#).

[Two Wire Serial Bus Requirements](#): corrected definition of TWCK high and low periods.

[DDR2-SDRAM System Clock Waveform Parameters](#): VDDIODDR range changed.

[LPDDR1-SDRAM System Clock Waveform Parameters](#): VDDIODDR range changed.

Section [66.21 SSC Timings](#): added SSC14 and SSC15 timings

### Schematic Checklist

[ICE and JTAG](#): added note on JTAG boundary scan.

### Errata

Removed from data sheet to create separate document, *SAMA5D2 Family Silicon Errata and Data Sheet Clarification*, document number DS80000803.

## 71.2 Revision DS60001476B

### Changes

#### Section 6. “Package and Pinout”

Table 6-2 Pin Description: added notes (2) and (3).

Table 6-3 Pin Description (SAMA5D23 pins different from those in Table 6-2 “Pin Description”): added note (2).

Table 6-4 Pin Description (SAMA5D28B/C pins different from those in Table 6-2 “Pin Description”): added note (2).

#### Section 7. “Power Considerations”

Updated Figure 7-1 “Recommended Powerup Sequence” and Table 7-2 “Powerup Timing Specification”.

#### Section 16. “Standard Boot Strategies”

Updated Section 16.4.7.3 “SDCard / e.MMC Boot”.

Reworked Section 16.4.7.6 “QSPI NOR Flash Boot for MRL C”.

#### Section 29. “Peripheral Touch Controller (PTC)”

- Replaced “Peripheral Touch Controller” with “Peripheral Touch Controller Subsystem”.

- Changed “PTC\_IRQ\_EVT” to “PTC\_IRQ”.

- Replaced “PIO” and “IO” with “GPIO”.

Updated:

- Figure 29-1. “PTC Block Diagram”

- Section 29.2 “Embedded Characteristics”

- Section 29.5.2 “I/O Lines”

- Section 29.5.3 “Interrupt Sources”

.....continued

### Changes

- Section 29.6.2.3 “Firmware in SRAM Code Area”

Section 29.5.1 “Power Management”: updated description of “SLCK”.

Section 29.6.3.1 “PTC Digital Controller Operations”: modified Sensing mode description.

Renamed and reworked Section 29.7.1 “PTC Command Register” and Section 29.7.2 “PTC Interrupt Status Register”.

Section 29.7.3 “PTC Enable Register”: removed field CLR\_IRQEN, and replaced field SET\_IRQEN with bits IER0, IER1, IER2, IER3.

Renamed the following registers:

- “Mode 1: Write Access” to “PTC Command Register”

- “Host Flags” to “PTC Interrupt Status Register”

- “Host Flags Control” to “PTC Enable Register”

Section 39. “LCD Controller (LCDC)”

Corrected Figure 39-1. Block Diagram (added “PP Layer” block).

### Section 66. “Electrical Characteristics”

Added Section 66.10 “PTC Characteristics”.

Section 66.5.3.1 “ULP0 Mode”: updated steps (5) and (6).

Table 66-9 “Typical Peripheral Power Consumption by Peripheral in Active Mode”: corrected UPHPS consumption value from “12 \*MCK + 4900\*DR” to “12 \*MCK + 490\*DR” and UDPHS consumption value from “10 \*MCK + 2060\*DR” to “10 \*MCK + 206\*DR”

Table 66-13 “VDDCORE Power Consumption in Ultra Low-power Mode: AMP2”: removed ULP0 512 Hz row.

### Section 68. “Schematic Checklist”

Removed Section 68.3 “Shutdown Considerations” and Section 68.4 “Wakeup Considerations” (redundant with content in Section 7. “Power Considerations”).

Table 68-1 “Power Supply Connections”: updated VDDCORE recommended pin connection from “1.08V to 1.32V” to “1.1V to 1.32V”.

Table 68-2 “Clock, Oscillator and PLL Connections”: updated main oscillator recommended pin connection from “Crystals between 8 and 16 MHz” to “Crystals between 8 and 24 MHz”.

Table 68-6 “Reset and Test Connections”: updated NRST recommended pin connection.

### Section 69. “Marking”

Updated marking information.

### Section 71. “Errata”

Added the following issues in Section 71.1 “Errata - SAMA5D2 MRL C Parts”:

Section 71.1.9 “Master CAN-FD Controller (MCAN)” to Section 71.1.18 “MCAN High Priority Message (HPM)” and Section 71.1.19 “ROM Code: Using JTAG IOSET 4”.

Added the following issues in Section 71.2 “Errata - SAMA5D2 MRL B Parts”:

Section 71.2.10 “Master CAN-FD Controller (MCAN)” to Section 71.2.19 “MCAN High Priority Message (HPM)” and Section 71.2.20 “ROM Code: Using JTAG IOSET 4”.

Added the following issues in Section 71.3 “Errata - SAMA5D2 MRL A Parts”:

Section 71.3.26 “Master CAN-FD Controller (MCAN)” to Section 71.3.35 “MCAN High Priority Message (HPM)” and Section 71.3.36 “ROM Code: Using JTAG IOSET 4”.

### 71.3 Revision DS60001476A

Changes
<b>General</b>
- Template update: Moved from Atmel to Microchip template.
- The datasheet is assigned a new document number (DS60001476) and revision letter is reset to A.
--- Document number DS60001476 revision A corresponds to what would have been 11267 revision F.
- ISBN number assigned.
<b>“Features”</b> : added PTC.
<b>Table 2. “Configuration Summary”</b> : added PTC. Corrected number of Timers.
<b>Section 3. “Block Diagram”</b>
Figure 3-1 “SAMA5D2 Series Block Diagram”: corrected SDMMC signals. Updated peripheral bridge naming. Added PTC. Removed signal names.
<b>Section 4. “Signal Description”</b>
Table 4-1 “Signal Description List”: renamed SDMMCx_VDDSEL to SDMMCx_1V8SEL. Added PTC pins on PD0 to PD18.
Added <b>Section 5. “Safety and Security Features”</b> .
<b>Section 6. “Package and Pinout”</b>
Added Note on IO sets.
Table 6-2 “Pin Description”: for P15/R14 renamed SDMMC0_VDDSEL to SDMMC0_1V8SEL.
<b>Section 7. “Power Considerations”</b>
Table 7-1 “SAMA5D2 Power Supplies”: in VDDBU row, corrected RC Oscillator frequency to 64 kHz.
<b>Section 8. “Memories”</b>
Figure 8-1 “Memory Mapping”: renamed MATRIXx blocks. Added PTC. Renamed TC blocks. Added SYSCWP block.
<b>Section 11. “Peripherals”</b>
Table 11-1 “Peripheral Identifiers”: corrected reference to SDMMC. Assigned ID 58 to Peripheral Touch Controller (PTC).
Section 11.4 “Peripheral Clock Types”: removed clock type HCLOCK and PCLOCK from table.
<b>Section 12. “Chip Identifier (CHIPID)”</b>
Table 12-1 “SAMA5D2 Chip ID Registers”: added chip ids for MRL C revision.
<b>Section 13. “ARM Cortex-A5”</b>
Section 13.4.7.3 “Debug”: updated Note.
<b>Section 16. “Standard Boot Strategies”</b>
Replaced all occurrences of “Spansion” by “Cypress”.
Updated Section 16.3 “Chip Setup”.
Updated Section 16.4.1 “Boot Configuration Word”.
Section 16.4.2 “Boot Sequence Controller Configuration Register”: updated BUREG_VALID bit description.
Added Note to descriptions of SDMMC_0 and SDMMC_1 in Section 16.4.4 “Boot Configuration Word”.
Updated Section 16.4.5 “NVM Boot Sequence” and figures.
Renamed Section 16.4.7.5 “QSPI Flash Boot for MRL A and MRL B”.

.....continued

### Changes

Added Section 16.4.7.6 “QSPI Flash Boot for MRL C”.

Updated Section 16.4.8 “Hardware and Software Constraints”:

-- added Table 16-5 “Clock Frequencies during External Memory Boot Sequence”.

-- Table 16-6 “PIO Driven during Boot Program Execution”: renamed SDMMC\_VDDSEL to SDMMC0\_1V8SEL. Added column “Drive Strength (MRL C only)”.

Section 16.5 “SAM-BA Monitor”: deleted sentence on Main Clock; updated 3rd paragraph.

Updated Section 16.6.1 “Fuse Bit Mapping”.

### Section 18. “Matrix (H64MX/H32MX)”

Table 18-5 “List of H32MX Slaves”: added Peripheral Touch Controller (PTC) at Slave 6.

Table 18-6 “Master to Slave Access on H32MX”: added Peripheral Touch Controller (PTC) at Slave 6.

Table 18-9 “Peripheral Identifiers”: added PTC at ID 58.

### Section 19. “Special Function Registers (SFR)”

Section 19.3.5 “UTMI Clock Trimming Register”: VBG now 2 bits wide at index [17:16] (was [19:16]).

### Section 20. “Special Function Registers Backup (SFRBU)”

Section 20.3.3 “SFRBU DDR BU Mode Control Register” changed occurrences of VCCCORE to VDDCORE.

### Section 26. “Real-time Clock (RTC)”

Table 26-1 “Register Mapping”: updated offsets as of 0xCC. Deleted RTC\_WPMR at offset 0xE4.

Deleted “Section 25.6.23 RTC Write Protection Mode Register”.

Added **Section 27. “System Controller Write Protection (SYSCWP)”**.

Added **Section 29. “Peripheral Touch Controller (PTC)”**.

### Section 33. “Power Management Controller (PMC)”

Reorganized order of sub-sections within the chapter.

Updated Figure 33-2 “H32MX 32-bit Matrix Clock Configuration”.

Figure 33-1 “General Clock Block Diagram”: updated PMC\_PCR block.

Added Section 33.8 “Core and Bus Independent Clocks for Peripherals”.

Added Section 33.9 “Peripheral and Generic Clock Controller”.

Deleted section “Peripheral Clock Controller”.

Deleted section “Generic Clock Controller”.

Figure 33-10 “Clock Failure Detection (Example)”: corrected CDFEV to CFDEV and CDFS to CFDS.

Section 33.19 “Programming Sequence”: deleted paragraph on DIVA from Step 6.

Section 33.22.10 “PMC Clock Generator PLLA Register”: changed DIVA description for value ‘0’.

### Section 35. “External Memories”

Updated Figure 35-2 “MPDDRC Block Diagram”.

Table 35-1 “DDR/LPDDR I/O Lines Description”: DDR\_DQS[3:0] and DDR\_DQSN[3:0] now type I/O.

Aligned signal names in schematics of Section 35.1 “Multiport DDR-SDRAM Controller (MPDDRC)” with signal names in Table 35-2 “I/O Lines Usage vs Operating Modes”.

### Section 36. “Multiport DDR-SDRAM Controller (MPDDRC)”

.....continued

### Changes

Section 36.1 “Description”: corrected supported CAS latency.

Section 36.4.1 “Low-power DDR1-SDRAM Initialization”: updated Step 12.

Section 36.4.2 “DDR2-SDRAM Initialization”: updated Step 22.

Section 36.4.3 “Low-power DDR2-SDRAM Initialization”: updated Step 22.

Section 36.4.4 “DDR3-SDRAM/DDR3L-SDRAM Initialization”: updated Step 13.

Section 36.4.5 “Low-power DDR3-SDRAM Initialization”: updated Step 22.

Table 36-1 “CAS Write Latency”: added row for Low-power DDR3-SDRAM. Corrected typo in note.

Table 36-2 “CAS Read Latency”: added row for Low-power DDR3-SDRAM. Corrected typo in note.

Section 36.7.2 “MPDDRC Refresh Timer Register”: updated the method to compute COUNT.

Section 36.7.3 “MPDDRC Configuration Register”: updated NC field description table.

Section 36.7.6 “MPDDRC Timing Parameter 2 Register”: in TRPA description, added “In the case of LPDDR2-SDRAM, this field is equivalent to tRPAB.”

Section 36.7.10 “MPDDRC Low-power DDR2 Low-power DDR3 and DDR3 Calibration and MR4 Register”: in COUNT\_CAL field description, added ‘One ZQCS command can effectively correct at least 1.5% of output impedance errors within Tzqcs.’ and ‘TSens and VSens are given by the manufacturer (Output Driver Sensitivity definition). Tdriftrate and Vdriftrate are defined by the end user.’

### Section 38. “DMA Controller (XDMAC)”

Added information regarding XDMAC\_CC.INITD in Section 38.8 “XDMAC Software Requirements” and Section 38.9.28 “XDMAC Channel x [x = 0..15] Configuration Register”.

Section 38.9.3 “XDMAC Global Weighted Arbiter Configuration Register”: replaced “XDMAC scheduler” with “DMAC scheduler” throughout.

### Section 39. “LCD Controller (LCDC)”

Standardized signal names from ‘LCD\_XXX’ to ‘LCDXXX’ (‘underscore’ character removed)

Section 39.2 “Embedded Characteristics”: removed “(at synthesis time)” from characteristic “Asynchronous Output Mode Supported”.

### Section 40. “Ethernet MAC (GMAC)”

Section 40.2 “Embedded Characteristics”: deleted queue sizes (now found in Table 40-6 “Queue Size”).

Table 40.6.3.9 “Priority Queueing in the DMA”: added Table 40-6 “Queue Size” and updated queue sizes.

Section 40.6.15 “Timestamp Unit”: changed pin reference from “TIOB11/PD22” to “TIOA11/PD21”.

Added Section 40.6.18 “Energy-efficient Ethernet Support”

Updated Section 40.6.19 “802.1Qav Support - Credit-based Shaping”: added definitions of portTransmitRate and IdleSlope; updated content on queue priority management.

Added Section 40.6.20 “LPI Operation in the GMAC”.

Table 40-18 “Register Mapping”: added registers at offsets 0x270 to 0x27C.

Section 40.8.1 “GMAC Network Control Register”: added bit 19: TXLPIEN: Enable LPI Transmission (was ‘reserved’). Added bit description. Changed description of SRTSM bit.

Section 40.8.3 “GMAC Network Status Register”: added bit 7: RXLPIS: LPI Indication (was ‘reserved’). Added bit description.

Added bit 27: RXLPISBC: Receive LPI indication Status Bit Change and bit description and added bit 29: TSUTIMCOMP: TSU timer comparison interrupt and bit description in:

- Section 40.8.10 “GMAC Interrupt Status Register”

- Section 40.8.11 “GMAC Interrupt Enable Register”

- Section 40.8.12 “GMAC Interrupt Disable Register”

.....continued

### Changes

- Section 40.8.13 “GMAC Interrupt Mask Register”

Section 40.8.13 “GMAC Interrupt Mask Register”: added bit 26, SRI, and bit 28, WOL, and bit descriptions.

Added following sections:

- Section 40.8.106 “GMAC Received LPI Transitions”

- Section 40.8.107 “GMAC Received LPI Time”

- Section 40.8.108 “GMAC Transmit LPI Transitions”

- Section 40.8.109 “GMAC Transmit LPI Time”

Section 40.8.115 “GMAC Credit-Based Shaping IdleSlope Register for Queue A” and Section 40.8.116 “GMAC Credit-Based Shaping IdleSlope Register for Queue B”: updated example for calculation of IdleSlope.

### Section 41. “USB High Speed Device Port (UDPHS)”

Table 41-6 “Register Mapping”: offsets 0xD0 to 0xDC now ‘reserved’.

Deleted internal registers:

- UDPHS Test SOF Counter Register

- UDPHS Test A Counter Register

- UDPHS Test B Counter Register

- UDPHS Test Mode Register

### Section 43. “Audio Class D Amplifier (CLASSD)”

Section 43.6.6 “Application Schematics For Use Case Examples”: for Use Case 1, added information on external MOSFET selection.

### Section 44. “Inter-IC Sound Controller (I2SC)”

In text, tables and figures, pin names changed to:

- I2SC\_MCK

- I2SC\_CK

- I2SC\_WS

- I2SC\_DI

- I2SC\_DO

Updated Figure 44-1 “I2SC Block Diagram”.

Section 44.6.1 “Initialization”: added detail on configuring SFR\_I2SCLKSEL.

Section 44.6.5 “Serial Clock and Word Select Generation”: updated paragraph on I2SC input clock selection in Master mode.

Updated Figure 44-3 “I2SC Clock Generation”.

Updated figures in Section 44.7 “I2SC Application Examples”.

Section 44.8.2 “I2SC Mode Register”: updated MODE bit description for value ‘1’. Updated IMCKDIV and IMCKMODE field descriptions.

### Section 46. “Two-wire Interface (TWIHS)”

Added Section 46.7.2 “TWIHS Control Register (FIFO\_ENABLED)”.

Added Section 46.7.8 “TWIHS Status Register (FIFO\_ENABLED)”.

### Section 47. “Flexible Serial Communication Controller (FLEXCOM)”

Corrected Figure 47-27 “RTS Line Software Control when FLEX\_US\_MR.USART\_MODE = 2”.

Reworked Section 47.7.11 “USART FIFOs”.

.....continued

### Changes

Updated Section 47.8.3.5 “Peripheral Selection”.

Reworked Section 47.8.7 “SPI FIFOs”.

Section 47.9.3.9 “SMBus Mode”: corrected typo in SMBEN bit name (was ‘SMEN’).

Created Section 47.9.6 “TWI FIFOs” by merging Section 10.3.15 “TWI Master Mode FIFOs” and Section 10.5.9 “TWI Slave Mode FIFOs”

Section 47.10.43 “SPI Control Register”: updated TXFCLR and RXFCLR bit descriptions.

Section 47.10.50 “SPI Status Register”: updated RDRF and TDRE bit descriptions.

Section 47.10.55 “SPI FIFO Mode Register”: updated TXRDYM description for value ‘1’. Deleted row for value ‘2’. Updated RXRDYM description for value ‘1’ and for value ‘2’.

Added Section 47.10.61 “TWI Control Register (FIFO\_ENABLED)”.

Added Section 47.10.67 “TWI Status Register (FIFO\_ENABLED)”.

### Section 49. “Serial Peripheral Interface (SPI)”

Section 49.7.3.5 “Peripheral Selection”: modified sub-section “Variable Peripheral Select Mode”.

Section 49.7.5 “SPI Comparison Function on Received Character”: replace ‘When the CMPMODE bit is cleared in SPI\_CMPR’ with ‘When SPI\_MR.CMPMODE is cleared’

In Section 49.7.7 “FIFOs” updated:

- Section 49.7.7.1 “Overview”

- Section 49.7.7.2 “Sending Data with FIFO Enabled”

- Section 49.7.7.3 “Receiving Data with FIFO Enabled”

- Section 49.7.7.5 “TXEMPTY, TDRE and RDRF Behavior”

- Section 49.7.7.6 “Single Data Mode”

- Section 49.7.7.7 “Multiple Data Mode”

- “TDRE and RDRF Configuration”

Section 49.8.1 “SPI Control Register”: updated TXFCLR and RXFCLR bit descriptions.

Section 49.8.8 “SPI Status Register”: updated RDRF and TDRE bit descriptions.

Section 49.8.13 “SPI FIFO Mode Register”: updated TXRDYM description for value ‘1’. Deleted row for value ‘2’. Updated RXRDYM description for value ‘1’ and for value ‘2’.

Updated “DMAC” in Section 49.7.7.7 “Multiple Data Mode”.

### Section 50. “Quad Serial Peripheral Interface (QSPI)”

Section 50.1 “Description”: added Note on device support.

Removed references to Double Data Rate (DDR) in Section 50.2 “Embedded Characteristics” and Section 50.6.5.2 “Instruction Frame Transmission”.

Section 50.6.5 “QSPI Serial Memory Mode”: updated text on data transfer constraint.

Updated Figure 50-8 “Instruction Frame”.

Figure 50-9 “Instruction Transmission Flow Diagram”:

- Corrected typos:

--- “Wait for flag QSPI\_SR.INSTRE ... “ (was “QSPI\_CR“)

--- “Wait for flag QSPI\_SR.CSR ... “ (was “QSPI\_CR“)

- Added new instruction: “Read QSPI\_SR (dummy read) to clear QSPI\_SR.INSTRE and QSPI\_SR.CSR“

.....continued

### Changes

Updated Figure 50-10 “Continuous Read Mode”, Figure 50-16 “Instruction Transmission Waveform 6”, Figure 50-17 “Instruction Transmission Waveform 7” and Figure 50-18 “Instruction Transmission Waveform 8”.

#### Section 51. “Secure Digital MultiMedia Card Controller (SDMMC)”

Section 51.2 “Embedded Characteristics”: updated bullets on support for MMC at default speed and at high speed.

Section 51.3 “Embedded Features for SDMMC0 and SDMMC1”: updated information on SDMMC1.

Section 51.10.1.3 “Boot Procedure, ADMA Mode”: removed note after step j.

Section 51.13.2 “SDMMC Block Size Register” updated BLKSIZE field description.

Section 51.13.9 “SDMMC Present State Register”: updated BUFWREN field description.

Section 51.13.16 “SDMMC Clock Control Register”: updated SDCLKFSEL field description.

Section 51.13.17 “SDMMC Timeout Control Register”: updated equation in DTCVAL field description.

Section 51.13.18 “SDMMC Software Reset Register”: in SWRSTALL field description, updated list of registers cleared to 0 .

Section 51.13.21 “SDMMC Error Interrupt Status Register (SD\_SDIO)”: in CURLIM bit description, corrected reference to SDMMC\_PCR (was SDMMC\_PSR).

Section 51.13.22 “SDMMC Error Interrupt Status Register (e.MMC)”: updated ACMD bit description.

Section 51.13.31 “SDMMC Auto CMD Error Status Register”: changed register access to Read-only.

Section 51.13.32 “SDMMC Host Control 2 Register (SD\_SDIO)”: corrected typo in bit 7 name (is SCLKSEL; was SLCKSEL). Updated VS18EN bit description.

Section 51.13.33 “SDMMC Host Control 2 Register (e.MMC)”: corrected typo in bit 7 name (is SCLKSEL; was SLCKSEL).

Section 51.13.41 “SDMMC Preset Value Register”: in Table 51-8 “Preset Value Register Select Condition”: corrected HSEN value in row for High Speed.

Section 51.13.45 “SDMMC e.MMC Control 1 Register”: in DDR bit description Note, replaced ‘HSEN’ with ‘DDR’.

Section 51.13.51 “SDMMC Retuning Counter Value Register”: updated description for TCVAL.

#### Section 53. “Controller Area Network (MCAN)”

Section 53.1 “Description”: updated information on compliance.

Section 53.4.4 “Address Configuration”: added cross-reference for clarity.

Section 53.5.1.4 “Transmitter Delay Compensation”: changed NTSEG1 to TSEG1.

#### Section 54. “Timer Counter (TC)”

Table 54-1 “Timer Counter Clock Assignment”: added Note below table.

Section 54.6.16.2 “Input Preprocessing”: removed unit following equation in 3rd paragraph. Added limitation on maximum pulse duration.

Section 54.6.16.4 “Position and Rotation Measurement”: in 3rd paragraph, added “The process must be started by configuring TC\_CCR.CLKEN and TC\_CCR.SWTRG.”

Section 54.6.16.6 “Detecting a Missing Index Pulse”: corrected value of TC\_RC0.RC in example in 2nd paragraph.

Added Section 54.6.16.7 “Detecting Contamination/Dust at Rotary Encoder Low Speed”.

Section 54.7.16 “TC Block Mode Register”: updated MAXFILT field description.

In Section 54.7.17 “TC QDEC Interrupt Enable Register”, Section 54.7.18 “TC QDEC Interrupt Disable Register” and Section 54.7.19 “TC QDEC Interrupt Mask Register”: at index 3, added bit MPE and bit description.

Corrected occurrences of ‘MAXMP’ to ‘MAXCMP’ in Section 54.7.19 “TC QDEC Interrupt Mask Register” and in Section 54.7.20 “TC QDEC Interrupt Status Register”

#### Section 56. “Pulse Width Modulation Controller (PWM)”

.....continued

### Changes

Section 56.6.2.2 “Comparator”: corrected ‘CRPD’ to ‘CPRD’ in formulae.

Table 56-8 “Register Mapping”: modified offsets for “PWM External Trigger Register 1”, “PWM Leading-Edge Blanking Register 1”, “PWM External Trigger Register 2” and “PWM Leading-Edge Blanking Register 2”.

Section 56.7.43 “PWM Channel Period Register”: corrected ‘CRPD’ to ‘CPRD’ in CPRD description.

Section 56.7.44 “PWM Channel Period Update Register”: corrected ‘CRPDUPD’ to ‘CPRDUPD’ in CPRDUPD description.

### Section 57. “Secure Fuse Controller (SFC)”

Removed all occurrences of ‘Atmel reserved area’ ( now just ‘reserved area’).

Modified bit names for APLE and ACE in:

- Section 57.5.3 “SFC Interrupt Enable Register”

- Section 57.5.4 “SFC Interrupt Disable Register”

- Section 57.5.5 “SFC Interrupt Mask Register”

- Section 57.5.6 “SFC Status Register”

### Section 58. “Integrity Check Monitor (ICM)”

Updated Section 58.5.5 “ICM Automatic Monitoring Mode”.

Section 58.6.1 “ICM Configuration Register”: updated ASCD description.

### Section 59. “Advanced Encryption Standard Bridge (AESB)”

Section 59.1 “Embedded Characteristics”: replaced “12 clock cycles encryption/decryption processing time with a 128-bit cryptographic key” with “10 clock cycles encryption/decryption inherent processing time”.

In Section 59.3.6 “Automatic Bridge Mode”, updated Section 59.3.6.1 “Description”.

### Section 60. “Advanced Encryption Standard (AES)”

Replaced references to “keys” and to “AES\_KEYWRx registers” with “AES Key Registers”.

Section 60.1 “Description”: corrected index of AES\_KEYWR0 registers from 3 to 7.

Section 60.2 “Embedded Characteristics” replaced “12/14/16 Clock Cycles Encryption/Decryption Processing Time” with “10/12/14 Clock Cycles Encryption/Decryption Inherent Processing Time”

### Section 61. “Secure Hash Algorithm (SHA)”

Corrected typos in some figures.

Section 61.4.9.1 “Manual Mode”: updated Step 2.

Section 61.5.2 “SHA Mode Register”: updated SMOD bit description.

### Section 62. “Triple Data Encryption Standard (TDES)”

Replaced references to “TDES\_KEYxWRx registers” with “Key Registers”.

### Section 63. “True Random Number Generator (TRNG)”

Section 63.6.1 “TRNG Control Register”: changed field name to WAKEY (was KEY).

### Added Section 64. “Security Module (SECUMOD)”.

### Section 65. “Analog-to-Digital Converter (ADC)”

Section 65.5.3 “I/O Lines”: “ADC\_ADTRG” corrected to “ADTRG”.

Section 65.6.14 “Automatic Error Correction”: added information about ADCMODE field.

Table 65-7 “ADC Running Modes”: updated Offset Error row.

.....continued

### Changes

Section 65.6.18 “Fault Event”: reworked and renamed section (was previously “Fault Output”).

Section 65.7.2 “ADC Mode Register”: at index 30, added bit MAXSPEED and bit description

Section 65.7.12 “ADC Interrupt Status Register”: updated LCCHG bit description.

Section 65.7.20 “ADC Analog Control Register”: added Note (1).

### Section 66. “Electrical Characteristics”

Table 66-3 “DC Characteristics”: updated min and max valued for low-level and high-level input currents (all pads). Changed ISI\_MCK to ISC\_MCK.

Updated Table 66-8 “Typical Peripheral Power Consumption by Peripheral in Active Mode” with new column “Clock”.

Table 66-10 “Power Consumption in Active Mode: AMP2”: Removed columns DMIPS and CoreMark.

In Section 66.14 “FLEXCOM Timings”, added Section 66.14.1 “FLEXCOM USART in Asynchronous Modes” and Section 66.14.3 “FLEXCOM TWI Timings”.

In Section 66.14.2 “FLEXCOM SPI Timings”, removed note below all tables from Table 66-52 “FLEXCOM0 in SPI Mode IOSET1 Timings” to Table 66-61 “FLEXCOM4 in SPI Mode IOSET3 Timings”.

Added Section 66.15 “USART in Asynchronous Modes”.

Section 66.16 “SPI Timings”: updated limitation on fSPCK in “Master Read Mode” and “Slave Write Mode”. Removed note below Table 66-63 “SPI0 IOSET1 Timings”, Table 66-64 “SPI0 IOSET2 Timings”, Table 66-65 “SPI1 IOSET1 Timings”, Table 66-66 “SPI1 IOSET2 Timings” and Table 66-67 “SPI1 IOSET3 Timings”.

Section 66.18 “QSPI Timings”: updated limitation on fQSCK in “Master Read Mode”.

Section 66.19.3 “LPDDR1-SDRAM”, Table 66-76 “System Clock Waveform Parameters”: updated min value of tDDRCK for VDDCORE[1.2V, 1.32V].

Section 66.19.4 “LPDDR2/LPDDR3-SDRAM”, Table 66-77 “System Clock Waveform Parameters”: updated min value of tDDRCK for VDDCORE[1.2V, 1.32V].

Section 66.19.5 “DDR3/DDR3L-SDRAM”: updated min values in Table 66-78 “System Clock Waveform Parameters”.

Section 66.23 “ISC Timings”: updated Figure 66-40 “ISC Timing Diagram” and Timings tables.

### Section 68. “Schematic Checklist”

Table 68-1 “Power Supply Connections”: removed reference to VCCCORE.

Added Section 68.14.7 “Considerations for PTC Interface”.

### Section 70. “Ordering Information”

Updated Table 70-1 “SAMA5D2 Ordering Information” with MRL C ordering codes.

### Section 71. “Errata”

Added Section 71.1 “Errata - SAMA5D2 MRL C Parts”.

Section 71.2 “Errata - SAMA5D2 MRL B Parts”: added Section 71.1.1 “GMAC Timestamps and PTP packets”.

Section 71.3 “Errata - SAMA5D2 MRL A Parts”: added

- Section 71.1.1 “GMAC Timestamps and PTP packets”

- Section 71.3.4 “ROM Code: SPI Bootup Frequency”.

### 71.4 Revision 11267E

#### Changes

Deleted Section 61. "Security Module".

### 71.5 Revision 11267D

#### Changes

Minor formatting and editorial changes throughout

#### "Introduction"

Updated listed DDR memories

#### "Features"

Frequency of digital fractional PLL for audio "11.289 MHz" corrected to "11.2896 MHz"

"Two 64-bit, 16-channel DMA controllers" changed to "51 DMA Channels including two 16-channel 64-bit Central DMA Controllers"

#### Section 1. "Description"

Updated description of Low-power modes

#### Section 2. "Configuration Summary"

"Class D amplifier" changed to "stereo Class D amplifier"

Updated text at end of section

#### Section 3. "Block Diagram"

Figure 3-1 "SAMA5D2 Series Block Diagram": added ISC\_MSK input; updated description of crystal oscillators; "PWMEXTRIG0-1" renumbered to "PWMEXTRG1-2"

Added note "See Section 35. "DMA Controller (XDMAC)" for peripheral connections to DMA."

#### Section 4. "Signal Description"

Table 4-1 "Signal Description List": NRST signal function "Microcontroller Reset" changed to "Microprocessor Reset"; "PWMEXTRG0-1" renumbered to "PWMEXTRG1-2"; "Self-refresh mode" changed to "Backup Self-refresh mode" in DDR\_CKE comments

#### Section 5. "Package and Pinout"

Separated content into Section 5.1 "Packages" and Section 5.2 "Pinouts"

Table 5-2 "Pin Description (SAMA5D21, SAMA5D22, SAMA5D24, SAMA5D26, SAMA5D27, SAMA5D28A)": "ADVREFF" corrected to "ADVREF"; "PWMEXTRG0" and "PWMEXTRG1" renumbered to "PWMEXTRG1" and "PWMEXTRG2"; removed empty function cells for primary signals PA30, PA31, and PB0-PB7; removed "SEC, FILTER" from "Reset State" column header; added footnote on reset states

Added Table 5-3 "Pin Description (SAMA5D23 pins different from those in SAMA5D21/SAMA5D2)" and Table 5-4 "Pin Description (SAMA5D28B pins different from those in SAMA5D28A)"

#### Section 6. "Power Considerations"

Table 6-1 "SAMA5D2 Power Supplies": updated rows VDDUTMIC, VDDHSIC and VDDOSC

Section 6.4.1 "VDDBU Power Architecture": reworded second paragraph and deleted "typically less than 2  $\mu$ A"

#### Section 7. "Memories"

Section 7.2.1 "External Bus Interface": "The slew rates are determined by programming the SFR\_EBICFG bit in SFR registers" changed to "The drive levels are configured with the DRIVEx field in the EBI Configuration Register (SFR\_EBICFG)"

#### Section 8. "Event System"

Section 8-1 "Real-time Event Mapping List": instance of "ADC\_ADTRG" corrected to "ADTRG"

.....continued

### Changes

#### Section 9. “System Controller”

Section 9.1 “Power-On Reset”: “dedicated to VDDBU, VDDIOP and VDDCORE” changed to “dedicated to monitoring VDDBU, VDDIOP and VDDCORE”

#### Section 10. “Peripherals”

Table 10-1 “Peripheral identifiers”: in ‘Instance Name’ column, renamed CAN0 and CAN1 to MCAN0 and MCAN1

Section 10.4 “Peripheral Clock Types”: in SLOW\_CLOCK description, “32768-Hz crystal oscillator or by the on-chip 32-kHz RC oscillator” changed to “32.768 kHz crystal oscillator or by the on-chip 64 kHz RC oscillator”

#### Section 11. “Chip Identifier (CHIPID)”

Updated Table 11-1 “SAMA5D2 Chip ID Registers”

#### Section 13. “L2 Cache Controller (L2CC)”

Table 13-2 “Register Mapping”: reset value 0x0000\_0000 changed to 0x0000\_0111 for L2CC\_TRCR and L2CC\_DRRCR

#### Section 14. “Debug and Test Features”

Table 14-1 “Debug and Test Pin List”: NRST pin function “Microcontroller Reset” changed to “Microprocessor Reset”

#### Section 15. “Standard Boot Strategies”

“Boot Sequence Control Register (BSCR)” renamed to “Boot Sequence Controller Configuration Register”

Section 15.1 “Description”: “This microcontroller can be configured” changed to “This microprocessor can be configured”

Figure 15-10 “Galois Field Table Mapping”: modified Galois field table offsets

Section 15.4.2 “Boot Sequence Controller Configuration Register”: added address

Section 15.4.3 “Boot Configuration Word”: added reference to “Customer Fuse Matrix”

Added Section 15.4.6.5 “QSPI Flash Boot”

Table 15-3 “PIO Driven during Boot Program Execution”: NAND Flash PIO line PIOC17 changed to PIOB0

#### Section 18. “Special Function Registers (SFR)”

Table 18-1 “Register Mapping”: removed EBI Configuration Register / SFR\_EBICFG (offset 0x40 now reserved)

Section 18.3.1 “DDR Configuration Register”: added note

Removed section “EBI Configuration Register”

#### Section 21. “Watchdog Timer (WDT)”

Section 21.4 “Functional Description”: in eighth paragraph, “To prevent a software deadlock that continuously triggers the watchdog, the reload of the watchdog must occur...” changed to “The reload of the watchdog must occur...”

#### Section 25. “Real-time Clock (RTC)”

Reworked Section 25.5.6 “Updating Time/Calendar”

Reworked Figure 25-7 “Calibration Circuitry Waveforms”

AD index ‘7’ replaced with generic ‘n’ in Section 25.5.8 “Waveform Generation”

Updated Figure 25-8 “Waveform Generation for ADC Trigger Event”

Section 25.6.2 “RTC Mode Register”:

- updated descriptions of fields OUT0 and OUT1

- added fields TPERIOD and THIGH

#### Section 27. “Low Power Asynchronous Receiver (RXLP)”

.....continued

### Changes

Pin/signal name “LPRXD” changed to “RXD”

#### Section 29. “Clock Generator”

Section 29.2 “Embedded Characteristics”: AUDIOPLLCK changed to AUDIOPLLCLK

Figure 29-1 “Clock Generator Block Diagram”: lines changed to arrows for OSCSEL to multiplexer, for MOSCSEL to multiplexer, and for PLLADIV2 to “PLLA and Divider” block

Figure 29-5 “Divider and PLLA Block Diagram”: added PLLADIV2 divider

Updated Section 29.8 “Audio PLL”

#### Section 30. “Power Management Controller (PMC)”

AUDIOPLLCK changed to AUDIOPLLCLK in Section 30.15 “Programmable Clock Controller” and Section 30.16 “Generic Clock Controller”

Figure 30-1 “General Clock Block Diagram”: added PLLA block; repositioned PLLACK signal; at bottom of diagram “PCKx” changed to “PCKx (to pads)”

Table 30-3 “Register Mapping”: PMC\_AUDIO\_PLL0 reset value ‘0x0000\_0000’ changed to ‘0x0000\_00D0’

Section 30.22.11 “PMC Master Clock Register”: updated CSS field description

Section 30.22.13 “PMC Programmable Clock Register”: added addresses 0xF0014044 and 0xF0014048; updated CSS field description

Section 30.22.39 “PMC Audio PLL Control Register 0”: added fields DCO\_FILTER (bits 29:28), DCO\_GAIN (bits 27:24) and PLLFLT (bits 7:4)

Section 30.22.40 “PMC Audio PLL Control Register 1”: updated DIV field description

#### Section 31. “Parallel Input/Output Controller (PIO)”

Section 31.4.2 “External Interrupt Lines”: “are generally multiplexed” changed to “are multiplexed”

Section 31.5 “Functional Description”: removed entire section “Peripheral Muxing Example”

Table 31-4 “Register Mapping”:

- added reset value for PIO\_CFGR, PIO\_ODSR, PIO\_IMR, S\_PIO\_CFGR, S\_PIO\_ODSR and S\_PIO\_IMR

- “PIO I/O Freeze Register” corrected to “PIO I/O Freeze Configuration Register”

- defined offset range 0x400–0x4FC as reserved

- reserved offset range 0x5E8–0x5F8 changed to 0x5E8–0x5FC

- “Secure PIO I/O Freeze Register” corrected to “Secure PIO I/O Freeze Configuration Register”

Removed duplicated or invalid addresses in Section 31.7.1 “PIO Mask Register”, Section 31.7.2 “PIO Configuration Register”, Section 31.7.3 “PIO Pin Data Status Register”, Section 31.7.4 “PIO Lock Status Register”, Section 31.7.5 “PIO Set Output Data Register”, and Section 31.7.6 “PIO Clear Output Data Register”

Section 31.7.7 “PIO Output Data Status Register”: removed duplicated or invalid addresses; access “Read-only or Read/Write” corrected to “Read/Write”

Removed duplicated or invalid addresses in Section 31.7.8 “PIO Interrupt Enable Register”, Section 31.7.9 “PIO Interrupt Disable Register”, Section 31.7.10 “PIO Interrupt Mask Register”, and Section 31.7.11 “PIO Interrupt Status Register”

Section 31.7.12 “PIO I/O Freeze Configuration Register”: corrected title (was “PIO Freeze Configuration Register”); removed duplicated or invalid addresses; access “Read/Write” corrected to “Write-only”

Removed duplicated or invalid addresses in Section 31.7.15 “Secure PIO Mask Register”, Section 31.7.16 “Secure PIO Configuration Register”, Section 31.7.17 “Secure PIO Pin Data Status Register”, Section 31.7.18 “Secure PIO Lock Status Register”, Section 31.7.19 “Secure PIO Set Output Data Register” and Section 31.7.20 “Secure PIO Clear Output Data Register”

Section 31.7.21 “Secure PIO Output Data Status Register”: removed duplicated or invalid addresses; access “Read-only or Read/Write” corrected to “Read/Write”

.....continued
<b>Changes</b>
Removed duplicated or invalid addresses in Section 31.7.22 “Secure PIO Interrupt Enable Register”, Section 31.7.23 “Secure PIO Interrupt Disable Register”, Section 31.7.24 “Secure PIO Interrupt Mask Register”, and Section 31.7.25 “Secure PIO Interrupt Status Register”
Section 31.7.29 “Secure PIO I/O Freeze Configuration Register”: corrected title (was “Secure PIO Freeze Configuration Register”); removed duplicated or invalid addresses; access “Read/Write” corrected to “Write-only”
Section 31.7.30 “Secure PIO Slow Clock Divider Debouncing Register”: added sentence about register write protection
<b>Section 32. “External Memories”</b>
Table 32-1 “DDR/LPDDR I/O Lines Description”: updated DDR_VREF function description
<b>Section 33. “Multiport DDR-SDRAM Controller (MPDDRC)”</b>
Section 33.4.1 “Low-power DDR1-SDRAM Initialization”: in first paragraph, removed content about configuring register SFR_DDRCFG
Section 33.6 “Software Interface/SDRAM Organization, Address Mapping”: modified description of Interleaved mode (“at each SDRAM end page” corrected to “at each DDRSDRAM end of page”)
Harmonized register naming throughout Section 33.7 “AHB Multiport DDR-SDRAM Controller (MPDDRC) User Interface”
Removed all MPDDRC DLL registers (offset range 0x100–0x158 now reserved)
Section 33.7.3 “MPDDRC Configuration Register”: modified description of DECOD bit value ‘1’ (“at each SDRAM end page” corrected to “at each DDR-SDRAM end of page”)
Section 33.7.12 “MPDDRC I/O Calibration Register”: updated RZQ values in RDIV field description
<b>Section 34. “Static Memory Controller (SMC)”</b>
Section 34.17.3 “NFC Initialization”: instances of “rbn” changed to “Ready/Busy”
Section 34.20.3 “NFC Status Register”: bit RB_EDGE3 (bit 27) replaced by RB_EDGE0 (bit 24); updated RB_RISE and RB_FALL bit descriptions
Bit RB_EDGE3 (bit 27) replaced by RB_EDGE0 (bit 24) in Section 34.20.4 “NFC Interrupt Enable Register”, Section 34.20.5 “NFC Interrupt Disable Register” and Section 34.20.6 “NFC Interrupt Mask Register”
Deleted invalid addresses in Section 34.20.30 “PMECC Error Location SIGMA0 Register” and Section 34.20.31 “PMECC Error Location SIGMAx Register”
Section 34.20.32 “PMECC Error Location x Register”: register index “x=0..23” corrected to “x=0..31”
Section 34.20.36 “Timings Register”: removed RBNSEL field
<b>Section 35. “DMA Controller (XDMAC)”</b>
Added XDMAC_CCx.CSIZE configuration to Table 35-2 “DMA Channels Definition (XDMAC0)” and Table 35-3 “DMA Channels Definition (XDMAC1)”
Table 35-5 “Register Mapping”:
- XDMAC_GCFG access Read-only corrected to Read/Write
- XDMAC_GWAC access Read-only corrected to Read/Write
Section 35.9.2 “XDMAC Global Configuration Register”: access Read-only corrected to Read/Write
Section 35.9.3 “XDMAC Global Weighted Arbiter Configuration Register”: access Read-only corrected to Read/Write
<b>Section 36. “LCD Controller (LCDC)”</b>
Updated “Section 36.2 “Embedded Characteristics”
Updated Section 36.6.1.1 “Pixel Clock Period Configuration”
<b>Section 37. “Ethernet MAC (GMAC)”</b>
Table 37-1 “GMAC Connections in Different Modes”: added table Note on GTXCK

.....continued

### Changes

Updated Section 37.5.3 “Interrupt Sources”

Section 37.7.1.2 “Receive Buffer List” and Section 37.7.1.3 “Transmit Buffer List”: added note at end of sections on queue pointer initialization

Section 37.8.107 “GMAC Transmit Buffer Queue Base Address Register Priority Queue x” and Section 37.8.108 “GMAC Receive Buffer Queue Base Address Register Priority Queue x”: changed sentence on register initialization

### Section 39. “USB Host High Speed Port (UHPHS)”

Section 39.2 “Embedded Characteristics”: “X Hosts (A and B) High Speed (EHCI)” corrected to “2 Hosts (A and B) High Speed (EHCI)”

Table 39-2 “Register Mapping”: inserted reserved offset 0x0C

Section 39.7.19 “EHCI: REG06 - AHB Error Status”: instances of “INSNREG[8:4]” changed to “INSNREG06[8:4]”

### Section 40. “Audio Class D Amplifier (CLASSD)”

Section 40.2 “Embedded Characteristics”: DSP clock frequency “11.289 MHz” corrected to “11.2896 MHz”

Section 40.5.2 “Power Management”: field name “NOVRLAP” corrected to “NOVRVAL”

Figure 40-21 “Use Case 4B: Stereo Audio DAC With Passive Low Pass Filter and Single-ended Outputs”: changed title (was “Use Case 4B: Stereo Audio DAC With Passive Low Pass Filter and Differential Outputs”)

### Section 42. “Synchronous Serial Controller (SSC)”

Figure 42-19 “Interrupt Block Diagram”: “RXSYNC” renamed to “RXSYN”; “TXSYNC” renamed to “TXSYN”

Section 42.8.10 “Register Write Protection”: in first sentence, “AIC behavior” corrected to “SSC behavior”

### Section 43. “Two-wire Interface (TWIHS)”

Section 43.6.3.10 “SMBus Mode”: Deleted “A dedicated bus line, SMBALERT, allows a slave to get a master attention” from listed exceptions

Section 43.6.5.6 “SMBus Mode”: Deleted “A dedicated bus line, SMBALERT, allows a slave to get a master attention” from listed exceptions

Deleted note about debugger read access in Section 43.7.6 “TWIHS Status Register”, Section 43.7.13 “TWIHS Receive Holding Register” and Section 43.7.25 “TWIHS Write Protection Status Register”

### Section 44. “Flexible Serial Communication Controller (FLEXCOM)”

Section 44.7.1.2 “Fractional Baud Rate in Asynchronous Mode”: in first paragraph, deleted sentence “This feature is only available when using USART Normal mode.”

Figure 44-8 “Preamble Patterns, Default Polarity Assumed”: instances of “8 bit width” changed to “8-bit”

Figure 44-11 “Asynchronous Start Detection”: added missing arrowheads

Section 44.7.3.11 “Receiver Timeout”: removed redundant paragraphs on STTTO and RETTO; rewrote two bullets

Section 44.7.4 “ISO7816 Mode”: at end of second paragraph, “value 0x5 for protocol T = 1” changed to “value 0x6 for protocol T = 1”

Section 44.7.4.2 “Protocol T = 0”: rewrote content under “Receive NACK Inhibit”

Section 44.7.7 “USART Comparison Function on Received Character”: modified information about the CMPMODE bit

Table 44-18 “Register Mapping”: added TWI SleepWalking Matching Register (FLEX\_TWI\_SWMR)

Section 44.10.41 “USART Write Protection Mode Register”: rephrased WPEN bit description

Corrected order of all sections from Section 44.10.66 “TWI Interrupt Enable Register” to Section 44.10.76 “TWI SleepWalking Matching Register”

Section 44.10.76 “TWI SleepWalking Matching Register”: added addresses

### Section 46. “Serial Peripheral Interface (SPI)”

Figure 46-1 “Block Diagram”: added GCLK output from PMC to SPI

Modified transmission condition description in Section 46.7.3 “Master Mode Operations”

.....continued

### Changes

Section 46.7.4 “SPI Slave Mode”: added sentence about NSS rising between characters

Section 46.7.5 “SPI Comparison Function on Received Character”: in seventh paragraph, added “if SleepWalking mode is disabled” to sentence “The comparison trigger event is...”

Updated Section 46.7.8 “Register Write Protection”

Section 46.8.2 “SPI Mode Register”: added bits BRSRCCLK (Bit Rate Source Clock) and LSBHALF (LSB Timing Selection); updated description of field DLYBCS

Section 46.8.12 “SPI Chip Select Register”: updated description of fields CSNAAT, SCBR, DLYBS and DLYBCT

### Section 47. “Quad Serial Peripheral Interface (QSPI)”

Section 47.2 “Embedded Characteristics”: added bullet “Interface to Serial Flash Memories Operating in Single Data Rate or Double Data Rate Modes”

### Section 47. “Quad Serial Peripheral Interface (QSPI)” (cont’d)

NSS renamed to QCS in Figure 47-2 “QSPI Transfer Format (QSPI\_SCR.CPHA = 0, 8 bits per transfer)” and Figure 47-3 “QSPI Transfer Format (QSPI\_SCR.CPHA = 1, 8 bits per transfer)”

Section 47.7.2 “QSPI Mode Register”: added note “This field is forced to LASTXFER when SMM is written to ‘1’ to CSMODE field description; modified equation in description of fields DLYBCT and DLYCS

Section 47.7.5 “QSPI Status Register”: updated descriptions of bits CSR and INSTRE

Section 47.7.9 “QSPI Serial Clock Register”: modified equation in description of fields SCBR and DLYBS

### Section 48. “Secure Digital Multimedia Card Controller (SDMMC)”

Added Section 48.3 “Embedded Features for SDMMC0 and SDMMC1”

Figure 48-1 “Block Diagram”: added two notes

Table 48-3 “Register Mapping”: updated SDMMC\_APSR reset value (SDMMC0 different from SDMMC1)

Section 48.13.18 “SDMMC Software Reset Register”: updated SWRSTCMD bit description

Section 48.13.58 “SDMMC Calibration Control Register”: in CNTVAL field description, “tSTARTUP = ...” corrected to “tSTARTUP = 2 μs”

### Section 49. “Image Sensor Controller (ISC)”

Added Section 49.4 “Product Dependencies”

Table 49-18 “Register Mapping”: defined offset range 0x404–0x40C as reserved

### Section 50. “Controller Area Network (MCAN)”

“GCLK3” changed to “GCLK” in Section 50.3 “Block Diagram” and Section 50.4.2 “Power Management”

Added Table 50-2 “Peripheral IDs”

Updated Section 50.5.1.3 “CAN FD Operation”

Section 50.5.1.4 “Transmitter Delay Compensation”: modified title (was “Transceiver Delay Compensation”); revised content

Section 50.5.1.5 “Restricted Operation Mode”: added ‘Note’

Section 50.5.3 “Timeout Counter”: “baud rate” changed to “bit rate” in ‘Note’

Section 50.5.4.1 “Acceptance Filtering”: “described in Section” corrected to “described in “Rx FIFO Overwrite Mode”

Updated Figure 50-5 “Standard Message ID Filter Path” and Figure 50-6 “Extended Message ID Filter Path”

Updated register names in Figure 50-7 “Rx FIFO Status” and Figure 50-8 “Rx FIFO Overflow Handling”

Section 50.5.7.2 “Rx Buffer and FIFO Element”: “R1 Bit 21 FDF: Extended Data Length” renamed to “R1 Bit 21 FDF: FD Format”

Section 50.5.7.4 “Tx Event FIFO Element”: “E1 Bit 21 FDF: Extended Data Length” renamed to “E1 Bit 21 FDF: FD Format”

.....continued

### Changes

Table 50-14 “Register Mapping”:

- deleted row “0x00–0x04 / Reserved”

- “Fast Bit Timing and Prescaler Register” renamed to “Data Bit Timing and Prescaler Register”

#NAME?

Section 50.6.4 “MCAN Data Bit Timing and Prescaler Register”: changed name (was “MCAN Fast Bit Timing and Prescaler Register”); field FBRP replaced by field DBRP

Section 50.6.7 “MCAN CC Control Register”: updated descriptions of fields FDOE, BRSE, PXHD and EFB; removed NISO bit

Section 50.6.8 “MCAN Nominal Bit Timing and Prescaler Register”: “NBRP: Nominal Baud Rate Prescaler” changed to “NBRP: Nominal Bit Rate Prescaler”

Section 50.6.9 “MCAN Timestamp Counter Configuration Register”: updated TSS field description

Section 50.6.10 “MCAN Timestamp Counter Value Register”: updated TSC field description

Section 50. “Controller Area Network (MCAN)” (cont’d)

Section 50.6.20 “MCAN Global Filter Configuration”: added details on register description; updated ANFE and ANFS field descriptions.

Added details on register description in Section 50.6.21 “MCAN Standard ID Filter Configuration” and Section 50.6.22 “MCAN Extended ID Filter Configuration”

Section 50.6.24 “MCAN High Priority Message Status”: updated description of MSI field value ‘1’

### Section 51. “Timer Counter (TC)”

Replaced TIOA, TIOB, TCLK with TIOAx, TIOBx, TCLKx

Table 51-1 “Timer Counter Clock Assignment”: updated definitions

Section 51.6.3 “Clock Selection”: updated bullet “Internal clock signals”, updated notes 1 and 2

Section 51.6.9 “Transfer with DMAC in Capture Mode”: updated title (added “in Capture Mode”)

Updated Figure 51-5 “Example of Transfer with DMAC in Capture Mode”

Section 51.6.16.4 “Position and Rotation Measurement”: updated text in first paragraph

Added Section 51.6.16.6 “Detecting a Missing Index Pulse”

Updated TCCLKS field description in Section 51.7.2 “TC Channel Mode Register: Capture Mode” and Section 51.7.3 “TC Channel Mode Register: Waveform Mode”

### Section 53. “Pulse Width Modulation Controller (PWM)”

Throughout, “PWMTRG” and “EXTTRG” renamed to “PWMEXTRG”

Table 53-2 “I/O Lines”: “PWMEXTRG0” and “PWMEXTRG1” renumbered to “PWMEXTRG1” and “PWMEXTRG2”

Updated Section “Recoverable Fault”

Updated Figure 53-1 “Pulse Width Modulation Controller Block Diagram” and added note below figure

Updated Figure 53-16 “Fault Protection”

### Section 54. “Secure Fuse Controller (SFC)”

Table 54-1 “Register Mapping”: removed reset value from SFC\_IER and SFC\_IDR (both registers are write-only)

### Section 55. “Integrity Check Monitor (ICM)”

Table 55-8 “Register Mapping”: ICM\_SR access “Write-only” corrected to “Read-only”

### Section 57. “Advanced Encryption Standard (AES)”

Table 57-5 “Register Mapping”: AES\_ALPHAR[0..3] access “Write” corrected to “Write-only”

.....continued

### Changes

Section 57.5.20 “AES Alpha Word Register x”: access “Write” corrected to “Write-only”

### Section 59. “Triple Data Encryption Standard (TDES)”

Section 59.4.1 “Operating Modes”: deleted sentence “The OFB and CFB modes of operation are only available if 2-key mode is selected (KEYMOD = 1 in TDES\_MR).”

Section 59.4.3 “Last Output Data Mode”: deleted sentence “No more Output Data Register reads are necessary between consecutive encryptions/decryptions (see Section 59.4.3 “Last Output Data Mode”).”

Section 59.5.2 “TDES Mode Register”: in OPMOD field description, deleted sentence “The OFB and CFB modes of operation are only available if 2-key mode is selected (KEYMOD = 1).”

### Section 61. “Security Module”

Updated Figure 61-2 “Security Module Internal Memory Map”

### Section 62. “Analog-to-Digital Converter (ADC)”

Section 62.1 “Description”:

- deleted sentence “A digital error correction circuit based on the multi-bit redundant signed digit (RSD) algorithm is implemented to reduce INL and DNL errors.”

- deleted sentence “Finally, the user can configure ADC timings, such as startup time and tracking time.”

Updated Section 62.2 “Embedded Characteristics”

Updated Figure 62-1 “Analog-to-Digital Converter Block Diagram”

Revised Section 62.5 “Product Dependencies”

Revised Section 62.6.1 “Analog-to-Digital Conversion”

Updated Section 62.6.3 “ADC Reference Voltage” and Section 62.6.4 “Conversion Resolution”

Updated Section 62.6.7 “Conversion Triggers”

Section 62.6.9 “Comparison Window”: in fourth paragraph, instance of “ADC\_SR” corrected to “ADC\_ISR”

Section 62.6.10 “Differential and Single-ended Input Modes”: changed title (was “Differential Inputs”) and revised content

Updated Section 62.6.11 “ADC Timings”, Section 62.6.12 “Last Channel Specific Measurement Trigger”, Section 62.6.13 “Enhanced Resolution Mode and Digital Averaging Function” and Section 62.6.14 “Automatic Error Correction”

Instances of GND renamed to GNDANA in Figure 62-15 “Touchscreen Switches Implementation”, Figure 62-18 “Touchscreen Switches Implementation” and Figure 62-20 “Touchscreen Pen Detect”

Updated Section 62.6.16 “Asynchronous and Partial Wakeup (SleepWalking)”

Section 62.6.17.1 “Classic ADC Channels Only (Touchscreen Disabled)”: changed title (was “Classical ADC Channels Only”)

Section 62.6.19 “Register Write Protection”: updated list of protectable registers

Table 62-8 “Register Mapping”:

.....continued

### Changes

- defined 0x48 as reserved
- added row 0x4C / Channel Offset Register / ADC\_COR
- added offset 0x7C for ADC\_CDR11
- defined offset range 0x80–0x90 as reserved
- added row 0x94 / Analog Control Register / ADC\_ACR
- defined offset range 0xC4–0xD0 as reserved
- added row 0xD4 / Correction Values Register / ADC\_CVR
- added row 0xD8 / Channel Error Correction Register / ADC\_CECR
- added row 0xDC / Touchscreen Correction Values Register / ADC\_TSCVR
- defined offset 0xE0 as reserved

Section 62.7.2 “ADC Mode Register”: updated TRACKIM field description

Added LCCHG (Last Channel Change) bit in Section 62.7.9 “ADC Interrupt Enable Register”, Section 62.7.10 “ADC Interrupt Disable Register”, Section 62.7.11 “ADC Interrupt Mask Register” and Section 62.7.12 “ADC Interrupt Status Register”

Section 62.7.13 “ADC Last Channel Trigger Mode Register”: updated CMPMOD field description

Section 62.7.16 “ADC Extended Mode Register”: updated CMPMODE field description; added descriptions for fields OSR ASTE

Section 62.7.18 “ADC Channel Offset Register”: added address; removed bits OFF11:OFF0 from bitmap; modified DIFFx field description

Section 62.7.20 “ADC Analog Control Register”: added address; added IBCTL field

Section 62.7.25 “ADC Trigger Register”: added sentence about write protection

Removed Section “Correction Select Register”

Added sentence about write protection in Section 62.7.26 “ADC Correction Values Register” and Section 62.7.27 “ADC Channel Error Correction Register”

Added Section 62.7.28 “ADC Touchscreen Correction Values Register”

### Section 63. “Electrical Characteristics”

“ADVREFP” corrected to “ADVREF”

Section 63.2 “DC Characteristics”: in first sentence, “TA = -40°C to +85°C” changed to “TA = -40°C to +105°C”

Added Table 63-2 “Recommended Thermal Operating Conditions”

Updated Section 63.4 “Active Mode”

Table 63-8 “Low-power Mode Configuration Summary”: updated values for ‘Consumption’ and ‘Wakeup Time’

Updated Section 63.5.6 “Low-power Consumption Versus Modes”

Table 63-9 “Typical Power Consumption in Idle Mode: AMP2”: updated consumption values

Table 63-10 “VDDCORE Power Consumption in Ultra Low-power Mode: AMP2”: updated consumption values; updated wakeup time for ULP1 Fast Wakeup mode

Table 63-11 “Typical Power Consumption for Backup Mode”: updated consumption values

Updated Table 63-12 “Processor Clock Waveform Parameters” and Table 63-13 “Master Clock Waveform Parameters”

Updated Section 63.7.1 “Main Oscillator Characteristics”

Table 63-17 “12 MHz RC Oscillator Characteristics”: updated startup time values

Updated Section 63.7.3 “32.768 kHz Crystal Oscillator Characteristics”

Updated Table 63-23 “Audio PLL Characteristics”

.....continued
<b>Changes</b>
Section 63.10 “ADC Characteristics”: deleted sentence “The VREFN pin must be connected to ground.”
Table 63-25 “Power Supply Characteristics”: updated Analog Current Consumption value for Fast Wakeup mode
Table 63-26 “ADVREF Electrical Characteristics”: “VREFP” corrected to “ADVREF”; updated Current value
Section 63.10.4.1 “Differential Mode (12-bit mode)” and Section 63.10.4.2 “Single-ended Mode (12-bit mode)”: in equation, “VVREFP” corrected to “VADVREF”
Section 63.10.4.4 “Gain and Offset Errors”: “VVREFP” corrected to “VADVREF”
Table 63-27 “ADC Timing Characteristics”: updated footnote
Added Table 63-32 “ADC Analog Input Characteristics”
Table 63-37 “VDDCORE Power-On Reset Characteristics”: updated Hysteresis Voltage values
Section 63.14.1 “Maximum SPI Frequency”: updated values in “Master Read Mode” and “Slave Write Mode”
Revised Section 63.18 “MPDDRC Timings”
Corrected CKI values in Figure 63-33 “SSC Transmitter, TK and TF in Input”, Figure 63-35 “SSC Receiver, RK in Input and RF in Output”, Figure 63-36 “SSC Receiver, RK and RF in Output” and Figure 63-38 “Minimum and Maximum Access Time of Output Signals”
<b>Section 65. “Schematic Checklist”</b>
Figure 65-1 “1.2V, 1.35V/1.5V, 2V, 2.5V, 3.3V Power Supplies Schematics(1)”: GNDHSIC changed to GNDUTMIC
Table 65-1 “Power Supply Connections”: updated GNDUTMIC row; removed GNDHSIC row; in second footnote, “microcontroller” changed to “microprocessor”
Table 65-2 “Clock, Oscillator and PLL Connections”: “(internal 32-kHz RC oscillator) changed to “(internal 64 kHz RC oscillator)”
Section 65.5.1 “How to Define the Oscillator Load Capacitance”: instances of “32-KHz Oscillator” changed to “32.768 kHz Oscillator”
Added Section 65.14.6 “QSPI Pull-up Resistors”
Updated <b>Section 67. “Ordering Information”</b>
<b>Section 68. “Errata”</b>
Updated and reorganized content (errata now collected in Section 68.1 “Errata - SAMA5D2 MRL-B Parts” and Section 68.2 “Errata - SAMA5D2 MRL-A Parts”)

## 71.6 Revision 11267C

<b>Changes</b>
Changed datasheet status from ‘Preliminary’ to ‘Complete’.
Added “Introduction” and transferred Description to Section 1.
<b>Section 2. “Configuration Summary”</b>
Added device compatibility information
<b>Section 4. “Signal Description”</b>
Table 4-1 “Signal Description List”: modified rows PIOBU 0-7 and DDR_RESETN
<b>Section 6. “Power Considerations”</b>
Added Section 6.4.1 “VDDBU Power Architecture”
Updated Section 6.2 “Power-Up Considerations” and Section 6.3 “Power-Down Considerations”
<b>Section 7. “Memories”</b>

.....continued

### Changes

Updated Section 7.1.2 "Internal ROM"

#### Section 10. "Peripherals"

Updated Table 10-1 "Peripheral identifiers" and Section 10.4 "Peripheral Clock Types"

#### Section 16. "AXI Matrix (AXIMX)"

Table 16-1 "Register Mapping": removed 0x00000000 reset value from all rows

#### Section 17. "Matrix (H64MX/H32MX)"

Section 17.2 "Embedded Characteristics": removed "Master number forwarding to slaves" characteristic

Updated Table 17-1 "List of H64MX Masters", Table 17-2 "List of H64MX Slaves", Table 17-4 "List of H32MX Masters", Table 17-5 "List of H32MX Slaves"

Table 17-3 "Master to Slave Access on H64MX": updated 'SDMMC0-SDMMC1' row

Table 17-6 "Master to Slave Access on H32MX": updated 'Slave 5' rows

Section 17.12.2 "Security of APB Slaves": added introduction and bulleted list introduced by "As a general rule"

Added Section 17.12.3 "Security Types of AHB Master Peripherals" and Section 17.12.4 "Security Types of AHB Slave Peripherals"

Section 17-9 "Peripheral Identifiers": corrected some security type names

Section 17.13 "AHB Matrix (MATRIX) User Interface": added introduction and modified reset value of Updated Security Areas Split Slave x Registers in Table 17-10 "Register Mapping"

#### Section 21. "Watchdog Timer (WDT)"

Replaced "Idle mode" with "Sleep mode (Idle mode)" in Section 21.1 "Description" and with "Sleep mode" in Section 21.4 "Functional Description"

#### Section 22. "Reset Controller (RSTC)"

Renamed 'proc\_nreset' to 'Processor Reset', 'periph\_nreset' to 'Peripheral Reset', 'backup\_nreset' to 'Backup Reset', 'rstc\_irq' to 'Reset Controller Interrupt', 'wd\_fault' to 'Watchdog Fault', 'user\_reset' to User Reset.

Updated text and figures to show that Processor Reset and Peripheral Reset signals are merged.

#### Section 23. "Shutdown Controller (SHDWC)"

Updated Figure 23-1 "Shutdown Controller Block Diagram" and Table 23-1 "I/O Lines Description"

Section 23.7.3 "Shutdown Status Register": corrected register table (added WKUPIS9)

Section 23.7.4 "Shutdown Wake-up Inputs Register": corrected register table (added WKUPT9 and WKUPEN9)

#### Section 25. "Real-time Clock (RTC)"

Removed RTC Milliseconds Register (RTC\_MSR) and all related information in Section 25.1 "Description", Section 25.2 "Embedded Characteristics", Section 25.5 "Functional Description" and Section 25.6 "Real-time Clock (RTC) User Interface".

Table 25-1 "Register Mapping": modified RTC\_CALR reset value

Section 25.6.1 "RTC Control Register": updated CALEVSEL field description

Updated Section 25.6.22 "RTC TimeStamp Source Register"

#### Section 29. "Clock Generator"

Section 29.2 "Embedded Characteristics": replaced "400 to 1000 MHz programmable PLL" with "600 to 1200 MHz programmable PLL" and replaced "HCLOCK" with "HCLOCK\_LS/HS" and "PCLOCK" with "PCLOCK\_LS/HS"

Section 29.4 "Slow Clock": removed "This allows the slow clock to be valid in a short time (about 100  $\mu$ s)"

Section 29.8 "Audio PLL": updated all equations and added "in the 700 MHz range" after "The PLL core operates at 700 MHz (AUDIOCORECLOCK)"

.....continued

### Changes

Updated Figure 29-3. Main Clock Block Diagram and Figure 29-4. Main Clock Source Selection

#### Section 30. “Power Management Controller (PMC)”

Updated Section 30.6 “Matrix Clock Controller”

Updated Section 30-1 “General Clock Block Diagram”

Section 30.19 “Programming Sequence”, sub-section “Selecting Master Clock and Processor Clock”: updated sequence following “If a new value for CSS field corresponds to PLL Clock”

Section 30.22.11 “PMC Master Clock Register”: updated H32MXDIV field description

#### Section 33. “Multi-port DDR-SDRAM Controller (MPDDRC)”

Section 33-2 “Single Write Access, Row Closed, DDR-SDRAM Devices” to Section 33-8 “SINGLE Write Access Followed by a Read Access, DDR2-SDRAM Devices”: replaced “D[15:0]” with “DATA”

Updated Section 33.7.9 “MPDDRC Low-power DDR2 Low-power DDR3 Low-power Register”

Section 33.7.10 “MPDDRC Low-power DDR2 Low-power DDR3 and DDR3 Calibration and MR4 Register”: updated MR4\_READ field description

#### Section 34. “Static Memory Controller (SMC)”

Removed NFCCMD field and modified Section 34.17.2.1 “Building NFC Address Command Example” and Section 34.17.2.2 “NFC Address Command” accordingly

Table 34-20 “Register Mapping”: corrected offset values of PMECC Error Location 31 Register and of subsequent reserved range; removed reset value from HSMC\_CTRL (register is write-only)

#### Section 35. “DMA Controller (XDMAC)”

Section 35.5.4.1 “Single Block With Single Microblock Transfer”: added text on memory-to-memory transfer

Section 35.8 “XDMAC Software Requirements”: added bullet on memory-to-memory transfer

Table 35-5 “Register Mapping”: corrected access of XDMAC\_GTYPE, XDMAC\_GWAC, XDMAC\_CIM

Section 35.9.6 “XDMAC Global Interrupt Mask Register”: corrected access to Read-only

Section 35.9.28 “XDMAC Channel x [x = 0..15] Configuration Register”: corrected INITD and PERID field descriptions

#### Section 36. “LCD Controller (LCDC)”

Modified width of fields in Section 36.7.2 “LCD Controller Configuration Register 1” and Section 36.7.3 “LCD Controller Configuration Register 2”

#### Section 40. “Audio Class D Amplifier (CLASSD)”

Replaced ‘audio clock’ with ‘generic clock’ and ‘ACLK’ with ‘GCLK’ throughout the section

#### Section 41. “Inter-IC Sound Controller (I2SC)”

Section 41.6.3 “Master, Controller and Slave Modes”: removed text fragment: ‘in order to avoid unwanted glitches on the I2SWS and I2SCK pins.’

Section 41.8.2 “Inter-IC Sound Controller Mode Register”: removed text fragment: ‘in order to avoid unexpected behavior on the I2SWS, I2SCK and I2SDO outputs.’ and added note (2) below IMCKDIV field description.

#### Section 44. “Flexible Serial Communication Controller (FLEXCOM)”

Restored all references to ISO7816 specification

Updated Figure 44-3 “Fractional Baud Rate Generator”

Added Figure 44-27 “RTS line software control when FLEX\_US\_MR.USART\_MODE = 2”

Section 44.10.6 “USART Mode Register”: updated USART\_MODE field description (SPI\_MASTER item)

.....continued

### Changes

Section 44.10.44 "SPI Mode Register": added LBHPC bit

#### Section 45. "Universal Asynchronous Receiver Transmitter (UART)"

Section 45.6.9 "UART Baud Rate Generator Register": in CD field description, corrected equation after "If BRSRCCK = 1"

#### Section 47. "Quad SPI Interface (QSPI)"

Section 47.7.5 "QSPI Status Register": updated RDRF, TDRE, TXEMPTY, and OVRES field descriptions

#### Section 48. "Secure Digital Multimedia Card (SDMMC)"

Section 48.12.41 "SDMMC Preset Value Register": updated CLKGSEL field description

#### Section 49. "Image Sensor Controller (ISC)"

Section 49.1 "Description": removed "serial csi-2 based CMOS/CCD sensor" (not supported).

#### Section 50. "Controller Area Network (MCAN)"

Changed MCAN interrupt line names to MCAN\_INT0 and MCAN\_INT1 throughout the section

Section 50.6.7 "MCAN CC Control Register": added bit NISO

#### Section 51. "Timer Counter (TC)"

Reformatted and renamed Table 51-2 "Channel Signal Description"

Section 51.6.3 "Clock Selection": updated notes (1) and (2)

#### Section 52. "Pulse Density Modulation Interface Controller (PDMIC)"

Replaced all instances of "PCK" with "GCLK"

Section 52.2 "Embedded Characteristics": removed 'Multiplexed PDM Input Support' characteristic

Updated Section 52.5.2 "Power Management" and Section 52.6.2.1 "Description"

Section 52.6.2.6 "Gain and Offset Compensation": updated dgain bullet

Section 52.7.3 "PDMIC Converted Data Register": updated DATA field description

Section 52.7.8 "PDMIC DSP Configuration Register 0": updated OSR field description

#### Section 61. "Security Module"

Section 61.5.5 "SECUMOD Status Clear Register": removed MCKM field description

Section 61.5.18 "SECUMOD Wake Up Register": removed TPML field description

#### Section 62. "Analog-to-Digital Converter (ADC)"

Section 62.7.2 "ADC Mode Register": updated TRACKTIM and TRANSFER field descriptions.

#### Section 63. "Electrical Characteristics"

Updated tables from Table 63-2 "DC Characteristics" to Table 63-33 "Analog Comparator Characteristics"

Updated Figure 63-2 "Main Oscillator Schematics"

Corrected Gain Error formula under Figure 63-5 "Gain and Offset Errors in Single-ended Mode"

Removed Figure 63-4 "Single-ended Mode ADC" and Figure 63-5 "Differential Mode ADC"

Updated wake-up pin numbers in Section 63.5.1 "Backup Mode" and Section 63.5.3.2 "ULP1 Mode"

Updated Section 63.5.4 "Idle Mode" and Section 63.23 "SDMMC Timings"

Section 63.14.3 "Timing Extraction": added introduction and Figure 63-11 "MISO Capture in Master Mode"

#### Section 65. "Schematic Checklist"

.....continued

### Changes

Removed Table 65-12. “EBI Pins and NAND Flash Device Connections” and Table 65-13. “DDR2 I/O Lines Usage vs Operating Modes”

Reorganized **Section 67. “Ordering Information”**

**Updated Section 68. “Errata”**

## 71.7 Revision 11267B

### Changes

“Features”

Updated Security features

#### **Section 2. “Block Diagram”**

Updated Figure 2-1 “SAMA5D2 Series Block Diagram”.

#### **Section 4. “Package and Pinout”**

Updated Table 4-2 “Pin Description”

Removed Section 4.2 “Input/Output Description” and Section 4-3 “SAMA5D2 I/O Type Description”

#### **Section 5. “Power Considerations”**

Updated Table 5-1 “SAMA5D2 Power Supplies”

Updated Figure 5-1 “Recommended Power-Up Sequence”, Figure 5-2 “Recommended Power-Down Sequence”, Figure 5-3 “Recommended Backup Mode Entry”, Figure 5-4 “Recommended Power Supply Sequencing at Wake-Up”

#### **Section 7. “Event System”**

Updated Table 7-1 “Real-time Event Mapping List”

#### **Section 14. “Standard Boot Strategies”**

Replaced all instances of “GPBR” with “BUREG”.

#### **Section 17. “Special Function Registers (SFR)”**

Updated Section 17.3.15 “I2S Register”

#### **Section 19. “Advanced Interrupt Controller (AIC)”**

Removed Sections “Interrupt Vectoring” and “Fast Interrupt Vectoring”

Updated Section 19.8.3.3 “Interrupt Handlers” and Section 19.8.4.3 “Fast Interrupt Handlers”

#### **Section 29. “Power Management Controller (PMC)”**

Replaced “generated clock” with “generic clock”, and “GCK” with “GCLK”

Updated Section 29.22.8 “PMC Clock Generator Main Oscillator Register”

#### **Section 30. “Parallel Input/Output Controller (PIO)”**

Removed all references to programmable I/O delay

Added **Section 31. “External Memories”**

#### **Section 32. “Multi-port DDR-SDRAM Controller (MPDDRC)”**

Section 32.4.3 “Low-power DDR2-SDRAM Initialization”: added Step 14., Step 15. and Step 21.

Section 32.4.5 “Low-power DDR3-SDRAM Initialization”: added Step 14., Step 15. and Step 21.

Section 32.7.8 “MPDDRC Memory Device Register”: updated DBW field description; corrected location of fields RL3 and WL

.....continued

### Changes

#### Section 36. “Ethernet MAC (GMAC)”

Updated Section 36.1 “Description”

Section 36.5.2 “Power Management”: deleted reference to PMC\_PCER

Section 36.5.3 “Interrupt Sources”: deleted reference to ‘Advanced Interrupt Controller’. Replaced by ‘Interrupt Controller’.

Section 36.6.14 “IEEE 1588 Support”: deleted reference to GMAC\_TSSx. Removed reference to ‘output pins’ in 2nd paragraph.

Section 36.6.15 “Time Stamp Unit”: added information on GTSUCOMP signal in last paragraph

#### Section 39. “Audio Class D Amplifier (CLASSD)”

Updated Figure 39-1. CLASSD Block Diagram

#### Section 40. “Inter-IC Sound Controller (I2SC)”

Replaced all instances of “PCKx” with “GCLK”

Removed all references to Time Division Multiplexed (TDM) format (not supported)

Section 40.1 “Description”: replaced “The I2SC can use either a single DMA Controller channel for both audio channels or one DMA Controller channel per audio channel.” with “The I2SC uses a single DMA Controller channel for both audio channels.”, and updated Section 40.2 “Embedded Characteristics” and Section 40.6.8 “DMA Controller Operation” accordingly

Section 40.8.2 “Inter-IC Sound Controller Mode Register”: removed fields RXDMA and TXDMA

#### Section 43. “Flexible Serial Communication Controller (FLEXCOM)”

Added SPI mode in UART/USART

Replaced all instances of ‘PCK’ with ‘GCLK’

Replaced all instances of ‘DMAC/PDC’ with ‘DMAC’

Removed SleepWalking characteristic from UART/USART mode

Removed all references to ISO7816 specification

Section 43.10.6 “USART Mode Register” updated USCLKS field description

Section 43.10.42 “SPI Mode Register”: updated BRSRCCLK and DLYBCS field descriptions

Section 43.10.52 “SPI Chip Select Register”: updated CSNAAT, SCBR, DLYBS and DLYBCT field descriptions

Section 43.10.62 “TWI Clock Waveform Generator Register”: updated BRSRCCLK and CKSRC field descriptions

Updated Figure 43-1 “FLEXCOM Block Diagram” and Figure 43-63 “Master Mode Block Diagram”

#### Section 42. “Two-wire Interface (TWIHS)”

Replaced all instances of “PMC\_PCK” with “GCLK”

#### Section 44. “Universal Asynchronous Receiver Transmitter (UART)”

Replaced “Processor-Independent Source Clock” with “Processor-Independent Generic Source Clock” and “PCK” with “GCLK”

#### Section 47. “Secure Digital Multimedia Card (SDMMC)”

Updated revision of supported e.MMC specification (from V4.41 to V4.51)

#### Section 51. “Pulse Density Modulation Interface Controller (PDMIC)”

Removed all references to PDC

Removed Section 1.6.4 “Buffer Structure”

#### Section 53. “Secure Fuse Controller (SFC)”

Removed all references to lock fuse (not supported)

.....continued

### Changes

Section 53.4.5.3 “Fuse Masking”: corrected data register names

Section 53.5.2 “SFC Mode Register”: updated MSK field description

Table 53-1 “Register Mapping”: modified SFC\_IER and SFC\_IDR access type from “Read/Write” to “Write-only”

### Section 56. “Advanced Encryption Standard (AES)”

Updated Figure 56-12 “Generation of an ESP IPsec Frame without ESN” and Figure 56-13 “Generation of an ESP IPsec Frame with ESN”

### Added Section 60. “Security Module”

### Section 61. “Analog-to-Digital Converter (ADC)”

Updated enhanced resolution value from 12 bits to 14 bits

Renamed “Hold time” to “Transfer time”

Replaced all instances of “PMC PCK” with “GCLK”

Added Section 61.6.6 “Conversion Results Format”, Section 61.7.13 “ADC Last Channel Trigger Mode Register”, Section 61.7.14 “ADC Last Channel Compare Window Register”

Section 61.2 “Embedded Characteristics”: corrected conversion rate

Section 61.6.9 “Comparison Window”: added paragraph about bit SIGNMODE

Section 61.6.14 “Automatic Error Correction”: replaced “GAIN\_ERROR\_SIZE-1” with appropriate value; replaced “Gs-1” with “Gs” in formulas

Section 61.6.14 “Automatic Error Correction”, Section 61.7.27 “Correction Values Register”: replaced “GAIN\_ERROR\_SIZE-1” and “OFFSET\_ERROR\_SIZE-1” with appropriate values

Section 61.7.2 “ADC Mode Register”: updated TRGSEL and TRACKTIM field descriptions

Updated Section 61.7.8 “ADC Last Converted Data Register”

Section 61.7.16 “ADC Extended Mode Register”: added bit SIGNMODE

Updated Section 61.7.18 “ADC Channel Offset Register”

Updated Figure 61-1 “Analog-to-Digital Converter Block Diagram” and Figure 61-7 “Analog Full Scale Ranges in Single-Ended/Differential Applications”

Updated Table 61-5 “Oversampling Digital Output Range Values”

### Section 62. “Electrical Characteristics”

Added:

- Section 62.11 “Analog Comparator Characteristics”

- Section 62.14.1 “Maximum SPI Frequency”

- Section 62.16.1 “Maximum QSPI Frequency”

- Table 62-3 “I/O Switching Frequency”

- Table 62-4 “QSPI I/O Switching Frequency”

- Table 62-21 “PLL UTMI Characteristics”

- Table 62-22 “PLLAUDIO Characteristics”

Updated:

- Table 62-1 “Absolute Maximum Ratings\*\*”

- Table 62-2 “DC Characteristics”

- Table 62-6 “Typical Peripheral Power Consumption by Peripheral in Active Mode” to Table 62-10 “Typical Power Consumption for Backup Mode”

# SAMA5D2 Series

## Revision History

.....continued

### Changes

- Table 62-13 "8 to 24 MHz Crystal Oscillator Characteristics"
  - Table 62-16 "12-MHz RC Oscillator Characteristics" to Table 62-21 "PLL UTMI Characteristics"
  - Table 62-34 "VDDBU Power-On Reset Characteristics" to Table 62-36 "VDDANA Power-On Reset Characteristics"
- Reworked Section 62.9 "USB HS Characteristics"

### Section 64. "Schematic Checklist"

Updated:

- Section 64.16.3 "DDR Layout and Design Considerations"
- Figure 64-1 "1.2V, 1.35V/1.5V, 2V, 2.5V, 3.3V Power Supplies Schematics(1)"
- Table 64-1 "Power Supply Connections"

## 71.8 Revision 11267A

Issue Date	Changes
10-Sep-15	Preliminary Datasheet - First issue
25-Feb-15	Advance Information Datasheet.

## Table of Contents

---

Introduction.....	1
Features.....	1
1. Description.....	5
2. Configuration Summary.....	6
3. Block Diagram.....	7
4. Signal Description.....	8
5. Safety and Security Features.....	15
5.1. Design for Safety and IEC60730 Class B Certification.....	15
5.2. Design for Security.....	15
5.3. Safety and IEC 60730 Features.....	15
5.4. Security Features.....	17
6. Package and Pinout.....	20
6.1. Packages.....	20
6.2. Pinouts.....	20
7. Power Considerations.....	51
7.1. Power Supplies .....	51
7.2. Power-up Considerations.....	51
7.3. Power-down Considerations.....	53

## The Microchip Web Site

---

Microchip provides online support via our web site at <http://www.microchip.com/>. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

## Customer Change Notification Service

---

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at <http://www.microchip.com/>. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

## Customer Support

---

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: <http://www.microchip.com/support>

## Product Identification System

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

Architecture:	ATSAMA5	= Arm Cortex-A5 CPU
Product Group:	D21, D22, D23	= 196-ball general-purpose microprocessors
	D24	= 256-ball general-purpose microprocessors
	D28	= 289-ball general-purpose microprocessors
Mask Revision:	C	
Package:	C	= BGA
Temperature Range:	U	= -40°C to +85°C (Industrial)
	N	= -40°C to +105°C (Extended Industrial)
Carrier Type:	Blank	= Standard packaging (tray)
	R	= Tape and Reel

Examples:

- ATSAMAD21C-CUR = ARM Cortex-A5 general- purpose microprocessor, 196-ball, Industrial temperature, BGA Package.

**Note:** Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package

## Microchip Devices Code Protection Feature

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the

operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.

- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

## Legal Notice

---

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

## Trademarks

---

The Microchip name and logo, the Microchip logo, AnyRate, AVR, AVR logo, AVR Freaks, BitCloud, chipKIT, chipKIT logo, CryptoMemory, CryptoRF, dsPIC, FlashFlex, flexPWR, Heldo, JukeBlox, KeeLoq, Klear, LANCheck, LINK MD, maXStylus, maXTouch, MediaLB, megaAVR, MOST, MOST logo, MPLAB, OptoLyzer, PIC, picoPower, PICSTART, PIC32 logo, Prochip Designer, QTouch, SAM-BA, SpyNIC, SST, SST Logo, SuperFlash, tinyAVR, UNI/O, and XMEGA are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

ClockWorks, The Embedded Control Solutions Company, EtherSynch, Hyper Speed Control, HyperLight Load, IntelliMOS, mTouch, Precision Edge, and Quiet-Wire are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Adjacent Key Suppression, AKS, Analog-for-the-Digital Age, Any Capacitor, AnyIn, AnyOut, BodyCom, CodeGuard, CryptoAuthentication, CryptoAutomotive, CryptoCompanion, CryptoController, dsPICDEM, dsPICDEM.net, Dynamic Average Matching, DAM, ECAN, EtherGREEN, In-Circuit Serial Programming, ICSP, INICnet, Inter-Chip Connectivity, JitterBlocker, KlearNet, KlearNet logo, memBrain, Mindi, MiWi, motorBench, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICKit, PICtail, PowerSmart, PureSilicon, QMatrix, REAL ICE, Ripple Blocker, SAM-ICE, Serial Quad I/O, SMART-I.S., SQI, SuperSwitcher, SuperSwitcher II, Total Endurance, TSHARC, USBCheck, VariSense, ViewSpan, WiperLock, Wireless DNA, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

GestIC is a registered trademark of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.

AMBA, Arm, Arm7, Arm7TDMI, Arm9, Arm11, Artisan, big.LITTLE, Cordio, CoreLink, CoreSight, Cortex, DesignStart, DynamIQ, Jazelle, Keil, Mali, Mbed, Mbed Enabled, NEON, POP, RealView, SecurCore, Socrates, Thumb, TrustZone, ULINK, ULINK2, ULINK-ME, ULINK-PLUS, ULINKpro,  $\mu$ Vision, Versatile are trademarks or registered trademarks of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

## Quality Management System Certified by DNV

---

### ISO/TS 16949

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC<sup>®</sup> MCUs and dsPIC<sup>®</sup> DSCs, KEELOQ<sup>®</sup> code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
