

# KLI-2113

## Linear CCD Image Sensor

### Description

The KLI-2113 Image Sensor is a high dynamic range, multispectral, linear CCD image sensor ideally suited for demanding color scanner applications.

The imager consists of three parallel 2098-element photodiode arrays – one for each primary color. The KLI-2113 sensor offers high sensitivity, a high data rate, low noise, and negligible lag. Independent exposure control for each channel allows color balancing at the front end. CMOS-compatible 5 V clocks, and single 12 V DC supply are all that are required to drive the KLI-2113 sensor, simplifying the design of interface electronics.

**Table 1. GENERAL SPECIFICATIONS**

Parameter	Typical Value
Architecture	3 Channel, RGB Tri-linear CCD
Pixels Count	2098 × 3
Pixel Size	14 $\mu\text{m}$ (H) × 14 $\mu\text{m}$ (V)
Pixel Pitch	14 $\mu\text{m}$
Inter-Array Spacing	112 $\mu\text{m}$ (8 Lines Effective)
Active Image Size	29.37 mm (H) × 0.24 mm (V) 29.4 mm (Diagonal)
Saturation Signal	170,000 $e^-$
Dynamic Range	76 dB
Responsivity (Wavelength)	
460 nm	25 $\text{V}/\mu\text{J}/\text{cm}^2$
540 nm	32 $\text{V}/\mu\text{J}/\text{cm}^2$
650 nm	50 $\text{V}/\mu\text{J}/\text{cm}^2$
Output Sensitivity	11.5 $\mu\text{V}/e^-$
Dark Current	0.02 pA/Pixel
Dark Current Doubling Rate	9°C
Charge Transfer Efficiency	0.99999/Transfer
Photoresponse Non-Uniformity	5% Peak-Peak
Lag (First Field)	0.6%
Maximum Data Rate	20 MHz/Channel
Package	CERDIP (Sidebrazed, CuW)
Cover Glass	AR Coated, 2 Sides

NOTE: Parameters above are specified at T = 25°C and 2 MHz clock rates unless otherwise noted.

**ON Semiconductor®**

**Figure 1. KLI-2113 Linear CCD Image Sensor**

### Features

- High Resolution
- Wide Dynamic Range
- High Sensitivity
- High Operating Speed
- High Charge Transfer Efficiency
- No Image Lag
- Electronic Exposure Control
- Pixel Summing Capability
- Up to 2.0 V Peak-Peak Output
- 5.0 V Clock Inputs
- Two-Phase Register Clocking
- On-Chip Dark Reference

### Applications

- Digitization
- Machine Vision
- Mapping/Aerial
- Photography

### ORDERING INFORMATION

See detailed ordering and shipping information on page 2 of this data sheet.

## KLI-2113

See the ON Semiconductor *Device Nomenclature* document (TND310/D) for a full description of the naming convention used for image sensors. For reference documentation, including information on evaluation kits, please visit our web site at [www.onsemi.com](http://www.onsemi.com).

## DEVICE DESCRIPTION

Figure 2. Single Channel Schematic

### Exposure Control

Exposure control is implemented by selectively clocking the LOG gates during portions of the scanning line time. By applying a large enough positive bias to the LOG gate, the channel potential is increased to a level beyond the 'pinning level' of the photodiode. (The 'pinning' level is the maximum channel potential that the photodiode can achieve and is fixed by the doping levels of the structure.) With TG1 in an 'off' state and LOG strongly biased, all of the photocurrent will be drawn off to the LS drain. Referring to Figure 9, one notes that the exposure can be controlled by pulsing the LOG gate to a 'high' level while TG1 is turning 'off' and then returning the LOG gate to a 'low' bias level sometime during the line scan. The effective exposure ( $t_{EXP}$ ) is the net time between the falling edge of the LOG gate and the falling edge of the TG1 gate (end of the line). Separate LOG connections for each channel are provided, enabling on-chip light source and image spectral color balancing. As a cautionary note, the switching transients of the LOG gates during line readout may inject an artifact at the sensor output. Rising edge artifacts can be avoided by switching LOG during the photodiode-to-CCD transfer period, preferably, during the TG1 falling edge. Depending on clocking speeds, the falling edge of the LOG should be synchronous with the  $\phi 1/\phi 2$  shift register readout clocks. For very fast applications, the falling edge of the LOG gate may be limited by on-chip RC delays across the array. In this case, artifacts may extend across one or more pixels. Correlated double sampling (CDS) processing of the output waveform can remove the first order magnitude of such artifacts. In high dynamic range applications, it may be advisable to limit the LOG fall times to minimize the current transients in the device substrate and limit the magnitude of the artifact to an acceptable level.

### Pixel Summing

The effective resolution of this sensor can be varied by enabling the pixel summing feature. A separate pin is provided for the last shift register gate labeled  $\phi 2s$ . This gate, when clocked appropriately, stores the summation of signal from adjacent pixels. This combined charge packet is then transferred onto the sense node. As an example, the sensor can be operated in 2-pixel summing mode (1,049 pixels), by supplying a  $\phi 2s$  clock which is a 75% duty cycle signal at 1/2 the frequency of the  $\phi 2$  signal, and modifying the  $\phi R$  clock as depicted in Figure 10. Applications that require full resolution mode (2,098 pixels), must tie the  $\phi 2s$  pin to the  $\phi 2$  pin. Refer to Figure 9 and Figure 10 for additional details.

### Image Acquisition

During the integration period, an image is obtained by gathering electrons generated by photons incident upon the photodiodes. The charge collected in the photodiode array is a linear function of the local exposure. The charge is stored in the photodiode itself and is isolated from the CCD shift registers during the integration period by the transfer gates TG1 and TG2, which are held at barrier potentials. At the end of the integration period, the CCD register clocking is stopped with the  $\phi 1$  and  $\phi 2$  gates being held in a 'high' and 'low' state respectively. Next, the TG gates are turned 'on' causing the charge to drain from the photo-diode into the TG1 storage region. As TG1 is turned back 'off', charge is transferred through TG2 and into the  $\phi 1$  storage region. The TG2 gate is then turned 'off', isolating the shift registers from the accumulation region once again. Complementary clocking of the  $\phi 1$  and  $\phi 2$  phases now resumes for readout of the current line of data while the next line of data is integrated.

**Charge Transport**

Readout of the signal charge is accomplished by two-phase, complementary clocking of the Phase 1 and Phase 2 gates ( $\phi 1$  and  $\phi 2$ ) in the horizontal (output) shift register. The register architecture has been designed for high speed clocking with minimal transport and output signal degradation, while still maintaining low ( $4.75 \text{ V}_{\text{P-P min}}$ ) clock swings for reduced power dissipation, lower clock noise and simpler driver design. The data in all registers is clocked simultaneously toward the output structures. The signal is then transferred to the output structures in

a parallel format at the falling edge of the  $\phi 2\text{s}$  clock. Resettable floating diffusions are used for the charge to voltage conversion while source followers provide buffering to external connections. The potential change on the floating diffusion is dependent on the amount of signal charge and is given by  $\Delta V_{\text{FD}} = \Delta Q / C_{\text{FD}}$ , where  $\Delta V_{\text{FD}}$  is the change in potential on the floating diffusion,  $\Delta Q$  is the amount of charge, and  $C_{\text{FD}}$  is the capacitance of the floating diffusion node. Prior to each pixel output, the floating diffusion is returned to the RD level by the reset clock,  $\phi \text{R}$ .

## Physical Description

### Pin Description and Device Orientation

Figure 3. KLI-2113 Pinout

Table 4. PACKAGE PIN DESCRIPTION

Pin	Name	Description
1	VIDR	Red Output Video
2	SUB	Substrate
3	RD	Reset Drain
4	$\phi R$	Reset Clock
5	LOGR	Red Overflow Gate
6	LOGG	Green Overflow Gate
7	SUB	Substrate
8	N/C	No Connection
9	LS	Light Shield/Exposure Drain
10	IG	Input Gate/LOG Test Pin
11	TG2	Outer Transfer Gate
12	N/C	No Connection
13	$\phi 2s$	Phase2 Shift Register Summing Gate Clock
14	$\phi 2$	Phase2 Shift Register Clock

Pin	Name	Description
15	$\phi 1$	Phase1 Shift Register Clock
16	N/C	No Connection
17	N/C	No Connection
18	TG1	Inner Transfer Gate
19	ID	Input Diode Test Pin
20	N/C	No Connection
21	N/C	No Connection
22	LOGB	Blue Overflow Gate
23	N/C	No Connection
24	SUB	Substrate
25	VIDB	Blue Output Video
26	VDD	Amplifier Supply
27	SUB	Substrate
28	VIDG	Green Output Video

## IMAGING PERFORMANCE

## Typical Operational Conditions

Specifications given under nominal operating conditions @25°C ambient,  $f_{CLK} = 2$  MHz and nominal external VIDn load resistors unless otherwise specified.

Table 5. SPECIFICATIONS

Description	Symbol	Min.	Nom.	Max.	Units	Notes	Verification Plan
Saturation Output Voltage	$V_{SAT}$	–	2.0	–	$V_{P-P}$	1, 7	Die <sup>8</sup>
Output Sensitivity	$\Delta V_O / \Delta N_e$	–	11.5	–	$\mu V / e^-$	7	Design <sup>9</sup>
Saturation Signal Charge	$N_{e,SAT}$	–	170k	–	$e^-$		Design <sup>9</sup>
Responsivity @ 650 nm @ 540 nm @ 460 nm	R	– – –	50 32 25	– – –	$V / \mu J / cm^2$	2, 7	Design <sup>9</sup>
Output Buffer Bandwidth	$f_{-3dB}$	–	75	–	MHz	@ $C_{LOAD} = 10$ pF	Design <sup>9</sup>
Dynamic Range	DR	–	76	–	dB	3	Design <sup>9</sup>
Dark Current	$I_{DARK}$	–	0.02	–	pA/Pixel	4	Die <sup>8</sup>
Charge Transfer Efficiency	CTE	–	0.99999	–	–	5	Design <sup>9</sup>
Lag	L	–	0.6	1	%	1 <sup>st</sup> Field	Design <sup>9</sup>
DC Output Offset	$V_{ODC}$	6	7	9	V	7	Design <sup>9</sup>
Photoresponse Uniformity	PRNU	–	5	10	% p-p	6	Die <sup>8</sup>
Register Clock Capacitance	$C_\phi$	–	500	–	pF	per Phase	Design <sup>9</sup>
Transfer Gate Capacitance	$C_{TG}$	–	400	–	pF		Design <sup>9</sup>

1. Defined as the maximum output level achievable before linearity or PRNU performance is degraded.
2. With color filter. Values specified at filter peaks. 50% bandwidth =  $\pm 30$  nm.
3. This device utilizes 2-phase clocking for cancellation of driver displacement currents. Symmetry between  $\phi 1$  and  $\phi 2$  phases must be maintained to minimize clock noise.
4. Dark current doubles approximately every 9°C.
5. Measured per transfer. For total line  $h < (0.99999)^{4256} = 0.96$
6. Low frequency response across array with color filter array.
7. Decreasing external VIDn load resistors to improve signal bandwidth will decrease these parameters.
8. A parameter that is measured on every sensor during production testing.
9. A parameter that is quantified during the design verification activity.

## DEFECT DEFINITIONS

**Table 6. OPERATING CONDITION SPECIFICATIONS**(Test Conditions:  $T = 25^{\circ}\text{C}$ ,  $f_{\text{CLK}} = 2 \text{ MHz}$ ,  $t_{\text{INT}} = 1.066 \text{ ms}$ )

Field	Defect Type	Threshold	Units	Notes	Number
Dark	Bright	8.0	mV	1, 2	0
Bright	Bright/Dark	10	%	1, 3	0
Bright	Exposure Control	4.0	mV	1, 4, 5	$\leq 16$

1. Defective pixels will be separated by at least one non-defective pixel within and across channels.
2. Pixels whose response is greater than the average response by the specified threshold. See Figure 6 below.
3. Pixels whose response is greater or less than the average response by the specified threshold. See Figure 6 below.
4. Pixels whose response deviates from the average pixel response by the specified threshold when operating in exposure control mode. See Figure 6 below.
5. Defect coordinates are available upon request.

**Figure 6. Illustration of Defect Classifications**

## OPERATION

Table 7. ABSOLUTE MAXIMUM RATINGS

Description	Symbol	Minimum	Maximum	Unit	Notes
Gate Pin Voltage	$V_{GATE}$	-0.5	16	V	1, 2
Pin-to-Pin Voltage	$V_{PIN-PIN}$	-	16	V	1, 3
Diode Pin Voltage	$V_{DIODE}$	-0.5	16	V	1, 4
Output Bias Current	$I_{DD}$	-	-10	mA	5
Output Load Capacitance	$C_{VID,LOAD}$	-	15	pF	
CCD Clocking Frequency	$f_C$	-	20	MHz	6

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Referenced to substrate voltage.
2. Includes pins:  $\phi 1$ ,  $\phi 2$ ,  $\phi 2s$ , TG1, TG2,  $\phi R$ , IG, and LOGn.
3. Voltage difference (either polarity) between any two pins.
4. Includes pins: VIDn, RD, VDD, LS and ID.
5. Care must be taken not to short output pins to ground during operation as this may cause serious damage to the output structures.
6. Charge transfer efficiency will degrade at frequencies higher than the nominal (2 MHz) clocking frequency. VIDn load resistor values may need to be decreased as well to achieve required output bandwidths.

## Device Input ESD Protection Circuit (Schematic)

**CAUTION:** To allow for maximum performance, this device contains limited I/O protection and may be sensitive to electrostatic induced damage. Devices should be installed in accordance with strict ESD handling procedures!

Figure 7. ESD Protection Circuit

## DC Bias Operating Conditions

Table 8. DC BIAS OPERATING CONDITIONS

Description	Symbol	Minimum	Nominal	Maximum	Units	Notes
Substrate	$V_{SUB}$	–	0	–	V	
Reset Drain Bias	$V_{RD}$	11.5	12.0	12.5	V	
Output Buffer Supply	$V_{DD}$	11.5	12.0	12.5	V	
Light Shield/Drain Bias	$V_{LS}$	11.5	12.0	12.5	V	
Output Bias Current/Channel	$I_{DDn}$	–4.0	–6.0	–8.0	mA	1
Test Pin – Input Gate/LOG	$V_{IG}$	–	12.0	–	V	
Test Pin – Input Diode	$V_{ID}$	–	12.0	–	V	

1. A current sink must be supplied for each output. Load capacitance should be minimized so as not to limit bandwidth. See Figure 8. Choose values optimized for specific operating frequency, but R2 should not be less than 75  $\Omega$ .

*Typical Output Bias/Buffer Circuit*

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
