## General Purpose, Form A, Solid State Relay (Photo MOSFET)

(400V/0.12A/25Ω)

## Data Sheet

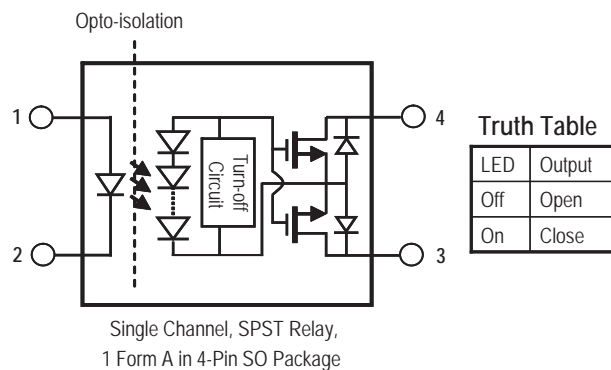

### Description

The ASSR-41xx Series consists of an AlGaAs infrared light-emitting diode (LED) input stage optically coupled to a high-voltage output detector circuit. The detector consists of a high-speed photovoltaic diode array and driver circuitry to switch on/off two discrete high voltage MOSFETs. The relay turns on (contact closes) with a minimum input current of 3mA through the input LED. The relay turns off (contact opens) with an input voltage of 0.8V or less.

The single channel configurations, ASSR-4110 and ASSR-4111, are equivalent to 1 Form A Electromechanical Relays (EMR), and the dual channel configuration, ASSR-4120, are equivalent to 2 Form A EMR. They are available in 4-pin SO, 6-pin DIP, 8-pin DIP and Gull Wing Surface Mount for DIP packages. Their electrical and switching characteristics are specified over the temperature range of -40°C to +85°C. They are used for general purpose switching of signals and low power AC/DC loads.

ASSR-4111 enables AC/DC and DC-only output connections. For DC-only connection, the output current,  $I_o$ , increases to 0.24A and the on-resistance,  $R_{(ON)}$  reduces to 8.5Ω.

### Notes:

- For derating, refer to Figure 1, 2, 3 and 4.
- The voltage across the output terminals of the relay should not exceed this rated withstand voltage. Over-voltage protection circuits should be added in some applications to protect against over-voltage transients.
- Threshold to switch device is  $I_F \geq 0.5\text{ mA}$ , however, for qualified device performance over temperature range, it is recommended to operate at  $I_F = 5\text{ mA}$ .
- Device is considered as a two terminal device:
  - ASSR-4110 - pin 1, 2 shorted and pin 3, 4 shorted.
  - ASSR-4111 - pin 1, 2, 3 shorted and pin 4, 5, 6 shorted.
  - ASSR-4120 - pin 1, 2, 3, 4 shorted and pin 5, 6, 7, 8 shorted.
- The Input-Output Momentary Withstand Voltage is a dielectric voltage rating that should not be interpreted as an input-output continuous voltage rating. For the continuous voltage rating refer to the IEC/EN/DIN EN 60747-5-2 Insulation Characteristics Table (if applicable), your equipment level safety specification, or Avago Technologies Application Note 1074, "Optocoupler Input-Output Endurance Voltage."
- During the pulsed  $R_{(ON)}$  measurement ( $I_O$  duration  $\leq 30\text{ ms}$ ), ambient ( $T_A$ ) and case temperature ( $T_C$ ) are equal.

## Applications Information

### On-Resistance and Derating Curves

The Output On-Resistance,  $R_{(ON)}$ , specified in this data sheet, is the resistance measured across the output contact when a pulsed current signal ( $I_o = 120 \text{ mA}$ ) is applied to the output pins. The use of a pulsed signal ( $\leq 30 \text{ ms}$ ) implies that each junction temperature is equal to the ambient and case temperatures. The steady-state resistance,  $R_{ss}$ , on the other hand, is the value of the resistance measured across the output contact when a DC current signal is applied to the output pins for a duration sufficient to reach thermal equilibrium.  $R_{ss}$  includes the effects of the temperature rise in the device.

Figure 1. Maximum Output Current Rating vs Ambient Temperature (ASSR-4110-003E)

Figure 1, 2, 3 and 4 specify the maximum average output current allowable for a given ambient temperature. The maximum allowable output current and power dissipation are related by the expression  $R_{ss} = P_o(\max)/(I_o(\max))^2$  from which  $R_{ss}$  can be calculated. Staying within the safe area assures that the steady state MOSFET junction temperature remains less than  $125^\circ\text{C}$ .

### Turn On Time and Turn Off Time Variation

The ASSR-41xx Series exhibits a very fast turn on and turn off time. Both the turn on and turn off time can be adjusted by choosing proper forward current as depicted in Figures 11 and 13. The changes of the turn on and turn off time with ambient temperature are also shown in Figures 12 and 14.
