

NCP565, NCV565

1.5 A Low Dropout Linear Regulator

The NCP565/NCV565 low dropout linear regulator will provide 1.5 A at a fixed output voltage or an adjustable voltage down to 0.9 V. The fast loop response and low dropout voltage make this regulator ideal for applications where low voltage and good load transient response are important. Device protection includes current limit, short circuit protection, and thermal shutdown.

Features

- Ultra Fast Transient Response ($< 1.0 \mu\text{s}$)
- Low Ground Current (1.5 mA at $I_{\text{load}} = 1.5 \text{ A}$)
- Low Dropout Voltage (0.9 V at $I_{\text{load}} = 1.5 \text{ A}$)
- Low Noise (28 μV_{rms})
- 0.9 V Reference Voltage
- Adjustable Output Voltage from 7.7 V down to 0.9 V
- 1.2 V, 1.5 V, 2.8 V, 3.0 V, 3.3 V Fixed Output Versions. Other Fixed Voltages Available on Request
- Current Limit Protection (3.3 A Typ)
- Thermal Shutdown Protection (160°C)
- NCV Prefix for Automotive and Other Applications Requiring Site and Change Controls
- Pb-Free Packages are Available

Typical Applications

- Servers
- ASIC Power Supplies
- Post Regulation for Power Supplies
- Constant Current Source

- Performance guaranteed over specified operating conditions by design, guard banded test limits, and/or characterization, production tested at $T_J = T_A = 25^\circ\text{C}$. Low duty cycle pulse techniques are used during testing to maintain the junction temperature as close to ambient as possible.
- Typical values are based on design and/or characterization.
- Dropout voltage is a measurement of the minimum input/output differential at full load.

APPLICATION INFORMATION

The NCP565 low dropout linear regulator provides adjustable voltages at currents up to 1.5 A. It features ultra fast transient response and low dropout voltage. These devices contain output current limiting, short circuit protection and thermal shutdown protection.

Input, Output Capacitor and Stability

An input bypass capacitor is recommended to improve transient response or if the regulator is located more than a few inches from the power source. This will reduce the circuit's sensitivity to the input line impedance at high frequencies and significantly enhance the output transient response. Different types and different sizes of input capacitors can be chosen dependent on the quality of power supply. A 150 µF OSCON 16SA150M type from Sanyo should be adequate for most applications. The bypass capacitor should be mounted with shortest possible lead or track length directly across the regulator's input terminals.

The output capacitor is required for stability. The NCP565 remains stable with ceramic, tantalum, and aluminum-electrolytic capacitors with a minimum value of 1.0 µF with ESR between 50 mΩ and 2.5 Ω. The NCP565 is optimized for use with a 150 µF OSCON 16SA150M type in parallel with a 10 µF OSCON 10SL10M type from Sanyo. The 10 µF capacitor is used for best AC stability while 150 µF capacitor is used for achieving excellent output transient response. The output capacitors should be placed as close as possible to the output pin of the device. If not, the excellent load transient response of NCP565 will be degraded.

Adjustable Operation

The typical application circuit for the adjustable output regulators is shown in Figure 2. The adjustable device develops and maintains the nominal 0.9 V reference voltage between Adj and ground pins. A resistor divider network R1 and R2 causes a fixed current to flow to ground. This current creates a voltage across R1 that adds to the 0.9 V across R2 and sets the overall output voltage.

The output voltage is set according to the formula:

$$V_{out} = V_{ref} \times \left(\frac{R1 + R2}{R2} \right) - I_{Adj} \times R2$$

The adjust pin current, I_{Adj} , is typically 30 nA and normally much lower than the current flowing through R1 and R2, thus it generates a small output voltage error that can usually be ignored.

Load Transient Measurement

Large load current changes are always presented in microprocessor applications. Therefore good load transient performance is required for the power stage. NCP565 has the feature of ultra fast transient response. Its load transient responses in Figures 13 through 16 are tested on evaluation board shown in Figure 19. On the evaluation board, it consists of NCP565 regulator circuit with decoupling and filter capacitors and the pulse controlled current sink to obtain load current transitions. The load current transitions are measured by current probe. Because the signal from current probe has some time delay, it causes un-synchronization between the load current transition and output voltage response, which is shown in Figures 13 through 16.

Figure 19. Schematic for Transient Response Measurement

NCP565, NCV565

PCB Layout Considerations

Good PCB layout plays an important role in achieving good load transient performance. Because it is very sensitive to its PCB layout, particular care has to be taken when tackling Printed Circuit Board (PCB) layout. The figures below give an example of a layout where parasitic elements are minimized. For microprocessor applications it is customary to use an output capacitor network consisting of

several capacitors in parallel. This reduces the overall ESR and reduces the instantaneous output voltage drop under transient load conditions. The output capacitor network should be as close as possible to the load for the best results. The schematic of NCP565 typical application circuit, which this PCB layout is based on, is shown in Figure 20. The output voltage is set to 3.3 V for this demonstration board according to the feedback resistors in the Table 1.

Protection Diodes

When large external capacitors are used with a linear regulator it is sometimes necessary to add protection diodes. If the input voltage of the regulator gets shorted, the output capacitor will discharge into the output of the regulator. The discharge current depends on the value of the capacitor, the output voltage and the rate at which V_{in} drops. In the NCP565 linear regulator, the discharge path is through a large junction and protection diodes are not usually needed. If the regulator is used with large values of output capacitance and the input voltage is instantaneously shorted to ground, damage can occur. In this case, a diode connected as shown in Figure 24 is recommended.

Figure 24. Protection Diode for Large Output Capacitors

Thermal Considerations

This series contains an internal thermal limiting circuit that is designed to protect the regulator in the event that the maximum junction temperature is exceeded. This feature provides protection from a catastrophic device failure due to accidental overheating. It is not intended to be used as a substitute for proper heat sinking. The maximum device power dissipation can be calculated by:

$$P_D = \frac{T_{J(max)} - T_A}{R_{\theta JA}}$$

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
