

FIN1049 LVDS Dual Line Driver with Dual Line Receiver

General Description

This dual Driver-Receiver is designed for high speed interconnects utilizing Low Voltage Differential Signaling (LVDS) technology. The Driver accepts LVTTTL inputs and translates them to LVDS outputs. The Receiver accepts LVDS inputs and translates them to LVTTTL outputs. The LVDS levels have a typical differential output swing of 350mV which provide for low EMI at ultra low power dissipation even at high frequencies. The FIN1049 can accept LVPECL inputs for translating from LVPECL to LVDS. The En and Enb inputs are ANDed together to enable/disable the outputs. The enables are common to all four outputs. A single line driver and single line receiver function is also available in the FIN1019.
