

# CobraNet™

## Programmer's Reference

Version 2.5

## Features

### Digital Audio Networking Processor

#### CobraNet

- Real-time Digital Audio Distribution via Ethernet
- No Overall Limit on Network Channel Capacity
- Supports Switched and Repeater Fast Ethernet Networks
- Fully IEEE 802.3 Ethernet Standards Compliant
- Fiber Optic and Gigabit Ethernet Variants Supported
- Ethernet infrastructure can be used simultaneously for audio and data communications.
- Free *CobraCAD™* Audio Network Design Tool
- High-quality Audio Sample Clock Delivery Over Ethernet
- Uncompressed 16-, 20-, and 24-bit Audio Transport
- Professional 48 kHz and 96 kHz Sample Rate
- Low (1-1/3 ms) Latency
- Flexible Many-to-many Network Audio Routing Capabilities
- Available in a family of modules and low-cost devices, most without licensing fees or royalties.

#### CobraNet Interface

- Auto-negotiating, 100-Mbit, Full-duplex Ethernet Connections
- Up to 64 Audio Channel I/O Capability
- Implements CobraNet protocol for real-time transport of audio over ethernet.
- Local Management via 8-bit Parallel Host Port
- UDP/IP Network Stack with Dynamic IP Address Assignment via BOOTP or RARP
- Remote Management via Simple Network Management Protocol (SNMP)
- Available module form factor allows for flexible integration into audio products.
- 120-MIPS Digital Signal Processor
- Non-volatile Storage of Configuration Parameters
- Safely Upgrade Firmware over Ethernet Connection
- LED Indicators for Ethernet Link Activity, Conductor Status, and Fault Annunciation
- Watchdog Output for System Integrity Assurance
- Comprehensive Power-on Self Test (POST)
- Error and Fault Reporting and Logging Mechanisms

#### Host Interface

- 8-bit Data, 3- or 4-bit Address
- Virtual 24- or 32-bit Data and Addressing
- Polled, Interrupt, and DMA Modes of Operation
- Configure and Monitor CobraNet Interface
- Transmit and Receive Ethernet Packets at 100-Mbit Wire Speed

#### Asynchronous serial interface

- Full-duplex Capable
- 8- and 9-bit Data Formats
- Standard Baud Rates up to 115.2 kbps
- Transmitter Tri-state Control for Multi-drop Networking

#### Synchronous Serial audio Interface

- 4 Bi-directional Interfaces Supporting Up to 64 Channels of Audio I/O
- 48 kHz and 96 kHz Sample Rates
- 64FS, 128FS, and 256FS Bit Rates Supported
- Supports numerous synchronous serial formats including I<sup>2</sup>S
- Up to 32-bit Data Resolution

#### Audio clock interface

- 4 Host Audio Clocking Modes for Maximum Flexibility in Digital Audio Interface Design
- Low-jitter, 512FS (24.576 MHz) Master Clock Oscillator
- Synchronize to Supplied Master and/or Sample Clock
- Sophisticated jitter attenuation assures network perturbations do not affect audio performance.

#### Audio routing and processing

- Single-channel Granularity in Routing from Synchronous Serial Audio Interface to CobraNet Network
- Two levels of audio routing indirection absorbs any quirks in audio I/O interface design in host system.
- Local Audio Loopback and Output Duplication Capability
- Peak-reading Audio Metering with Ballistics

## General Description

CobraNet is a combination of hardware (the CobraNet interface), network protocol, and firmware. CobraNet operates on a switched Ethernet network or on a dedicated Ethernet repeater network. CobraNet provides the following additional communications services for an Ethernet network.

- *Isynchronous Audio Data Transport*
- *Sample Clock Distribution*
- *Control and Monitoring Data Transport*

The CobraNet interface performs synchronous-to-isochronous and isochronous-to-synchronous

### **Digital Audio Networking Processor**

conversions as well as the data formatting required for transporting real-time digital audio over the network.

The CobraNet interface utilizes standard Ethernet. It has the added capability to carry and utilize other Ethernet and IP compatible protocols for control and monitoring such as Simple Network Management Protocol (SNMP) and User Datagram Protocol (UDP) through the same network connection. This capability is shown below as unregulated traffic. Data communications and CobraNet applications can coexist on the same physical network in most cases.

Figure 1. Digital Audio Distribution via Ethernet

# 1. Overview

## 1.1 CobraNet Terminology

CobraNet is a technology that combines state of the art audio and communications technologies. While each have their own terminology, the following terms are used to refer to elements specific to CobraNet.

**Audio Channel**—A CobraNet digital audio channel operates with a sample rate 48 kHz or 96 kHz and a sample size of 16, 20, or 24 bits.

**Bundle**—A Bundle\* is the basic CobraNet audio routing element and can carry 0 to 8 audio channels. Bundles are assigned a number which determines both which interface the Bundle is routed to and in what manner. The range within which the Bundle number falls determines whether it is routed as a *multicast*, *unicast*, or *private* type. Bundles are numbered 1 through 65535. CobraNet interfaces are capable of sending and receiving multiple bundles simultaneously. Bundle numbers are described in more detail in [Table 2., "Bundle Numbering"](#) .

\*Bundles were formerly referred to as channels or network channels and may be seen represented as such in some SNMP variable names and older documentation.

**CobraNet Device**—A CobraNet device is any equipment containing one or more CobraNet interfaces.

**CobraNet Interface**—The CobraNet interface is the hardware (or hardware design) and software supplied by Cirrus Logic to manufacturers of CobraNet enabled equipment. Several generations of the CobraNet interface exist and will interoperate with each other:

**CS4961xx and CS1810xx** - A family of CobraNet chips containing one or more 32-bit, 120-MIPS DSP cores, RAM and audio I/O circuitry.

**CM-2** - A modular CobraNet interface based on a CS4961xx device.

**CM-1** - A modular CobraNet interface based on a 24-bit, 100 MIPS DSP.

**Silicon Series Reference Design** - A CobraNet design based on the CS1810xx or CS4961xx. This is essentially a CM-2 without the modular circuit board and host interface connector.

**24-bit Platform** - CobraNet interfaces based on 24-bit DSPs: Reference design, CM-1.

**32-bit Platform** - CobraNet interfaces based on 32-bit DSPs: CS4961xx and CS1810xx, CM-2.

**Reference Design** - A CobraNet interface design based on a 24-bit, 40 MIPS DSP.

**Conductor**—The conductor is the CobraNet interface elected to provide master clock and transmission arbitration for the network. The role of the conductor and the means for selecting a conductor are described elsewhere in this document. All CobraNet devices other than the conductor operate in a **performer** role.

**Isochronous cycle** - One or more CobraNet bundles are transmitted each isochronous cycle. The period of an isochronous cycle is 750 Hz or 1-1/3 mS

---

**Host Management Interface (HMI)** - The hardware (8-bit bi-directional parallel interface) and protocol for accessing MI variables locally. The HMI is described in detail in the CS4961xx/CS1810xx Hardware Manual and CM-1 Hardware Manual.

**Management Interface (MI)** - The set of variables used to control and monitor the CobraNet interface. MI variables are accessible both locally through the *Host Management Interface (HMI)* and over the network using *Simple Network Management Protocol (SNMP)*. MI variables are described in detail in [Section 6. "Management Interface Variable Reference" on page 28](#).

**Packet Bridge** - A function provided by the CobraNet protocol which allows a CobraNet interface to send and receive raw Ethernet packets over the same Ethernet media used for audio transmission.

**Performer** - A CobraNet interface which receives its transmission permissions and master clock from a conductor. In the event a conductor fails, the CobraNet protocol will automatically promote a performer to become the new conductor.

**Receiver** - A logical entity within the CobraNet interface capable of receiving one Bundle.

**Serial Bridge** - A function provided by the CobraNet protocol which allows a CobraNet interface to send and receive asynchronous (i.e. RS-232) data over the same Ethernet media used for audio transmission.

**Transmitter** - A logical entity within the CobraNet interface capable of transmitting one Bundle.

## 1.2 Protocol

The CobraNet protocol operates at the Data Link Layer also referred to as OSI Layer 2 or MAC layer. CobraNet uses four basic packet types described below. All CobraNet packets are identified with a unique Ethernet protocol identifier (0x8819) assigned to Cirrus Logic. As CobraNet is a Local Area Network (LAN) technology and not a Wide Area Network (WAN) technology, CobraNet does not utilize Internet Protocol (IP) to transport audio. Packet Bridge packets are generic packets and are not identified as CobraNet packets. Packet bridging is discussed in more detail in [Section 2.2 "Packet Bridge" on page 13](#).

### 1.2.1 Beat Packet

A multicast packet with an address of 01:60:2B:FF:FF:00 and which contains network operating parameters, clock and transmission permissions. The beat packet is transmitted 750 times per second from a single CobraNet device on the network (the conductor) and indicates the start of the main isochronous cycle. Since the beat packet carries the clock for the network, it is sensitive to delay variation. If the delay variation specification shown in [Table 1 on page 10](#) is not met, CobraNet devices may not be able to lock their local sample clocks to the network clock. The beat packet is typically small (on the order of 100 bytes) but can be large on a network with numerous active bundles.

### 1.2.2 Isochronous Data Packet (or Bundle)

A multicast or unicast packet. A stream of isochronous data packets carries an audio bundle. Though the size of the packet is dependent on the number and format of the audio channels contained in the bundle, isochronous data packets are typically large. A bundle carrying 8 channels of 20-bit audio at 48kHz sample rate in the standard latency mode is approximately 1300 octets.

Isochronous data packets are transmitted in response to receipt of the beat packet. However when low-latency modes are utilized, isochronous data packets are transmitted twice or four times per isochronous cycle. The first transmission is in response to beat packet receipt, the other transmissions are made at evenly timed intervals thereafter.

Because CobraNet devices buffer isochronous data packets, out-of-order delivery of data packets is acceptable as long as the packet forwarding delay specifications in [Table 1 on page 10](#) are not exceeded.

### 1.2.3 Reservation Packet

A multicast packet with an address of 01:60:2B:FF:FF:01 used by the CobraNet protocol to allocate bandwidth and establish connections between CobraNet interfaces. CobraNet devices transmit reservation packets as needed or typically once per second at minimum.

### 1.2.4 Serial Bridge Packet

A multicast or unicast packet used to bridge asynchronous serial data between CobraNet interfaces. Serial bridging is discussed in more detail in [Section 2.1 "Serial Bridge" on page 12](#).

## 1.3 Timing and Performance

CobraNet provides real-time audio delivery and requires real-time performance from the network on which it is deployed. The best means of insuring a network will deliver the performance required by CobraNet is to verify the design using Cirrus Logic's CobraCAD CobraNet modeling software (available for download at [www.cirrus.com](http://www.cirrus.com)). The design check feature in CobraCAD assures that the performance requirements shown in Table 1 are met and that the network is capable of delivering the bandwidth required to support the modeled application.

**Table 1. Network Performance Requirements**

Parameter	Maximum	Comments
Beat Packet Delay Variation	250µs	If delivery of beat packets periodically varies from the nominal delay by more than this value, then the Receivers may loose sample lock or fail to meet clock delivery specifications.
Forwarding Delay, 5-1/3ms latency	500µs	Forwarding delay is the sum of store forward, queuing and propagation delays. Forwarding delay includes delay variation - i.e. 150µs forwarding delay + 250µs delay variation = 400µs. Thus tolerance of forwarding delay is reduced in the presence of delay variation. When forwarding specification is exceeded, audio is delivered reliably with additional latency. rxDelay and rxMinDelay can be used to observe and control this adaptation to forwarding delay.
Forwarding Delay, 2-2/3ms latency	250µs	
Forwarding Delay, 1-1/3ms latency <sup>a</sup>	125µs	
Maximum Forwarding Delay	5000µs	Audio cannot be delivered at any latency with extreme forwarding delays.
Maximum Forwarding Delay Variation, 5-1/3ms latency	1000µs	Delay variation exceeding these specifications will result in unreliable audio transport due unstable rxDelay determination. In some cases this may be addressed through manual rxMinDelay setting.
Maximum Forwarding Delay Variation, 2-2/3ms latency	500µs	
Maximum Forwarding Delay Variation, 1-1/3ms latency	250µs	

- a. Store-forward delay on a 100Mbit Ethernet connection is 121us (assuming maximum length packets). This forwarding delay specification is only achievable on an audio-only dedicated network. The lowest latency achievable with CobraNet on a non-dedicated network is 1-2/3ms (using the 1-1/3ms latency mode with an rxMinDelay setting of 0x40 to make receivers tolerant to queuing delays introduced by non-audio traffic).

## 1.4 Bundle Addressing types

**Multicast bundles** represent a least common denominator for audio interoperability in CobraNet networks. Bundles sent with multicast destination addresses are delivered indiscriminately to all CobraNet interfaces and thus have the potential of overloading a network. Care should be taken to insure that an excessive number of multicast bundles are not used. See *Bundle Assignments in CobraNet Systems* (available for download at [www.cirrus.com](http://www.cirrus.com)) for a discussion of issues associated with multicast bundles.

**Unicast bundles** are sent to only one destination on a network. However, in the event that more than one CobraNet interface is set to receive the same bundle number, the CobraNet protocol may, according to rules governed by the *txUniCastMode* and *txMaxUnicast* variables, cause unicast bundles to be sent as multicast or multi-unicast when necessary. Multi-unicast will use unicast addressing to send up to four copies of the same bundle to different CobraNet interfaces. The default configuration for *txUniCastMode* insures that unicast bundles are never multicast.

**Private bundles** are a special case of unicast or multicast bundles. The transmitter's MAC address, in addition to the bundle number, is required to fully qualify a private channel at the receiver. Like unicast bundles, these may be either unicast or multicast based on *txUniCastMode*.

Note: Transmitted bundles must have a unique bundle number assigned to them. More than one transmitting interface cannot use the same bundle number. Multiple receiving interfaces can receive the same bundles.

**Table 2. Bundle Numbering**

Hexadecimal Bundle Number	Decimal Bundle Number	Designation	Usage	Transmission Addressing	Transmission Mode
0	0	Null	Unused bundle. Disables transmission/reception when selected.	Never transmitted.	Never transmitted.
1-0xFF	1-255	Multicast	Transmitted by a single CobraNet interface and received by any number of interfaces.	Always multicast	Always transmitted.
0x100-0xFEFF	256-65279	Unicast	Transmitted by a single CobraNet interface. Dependent on <i>txUniCastMode</i> and <i>txMaxUnicast</i> settings may be received at a single (default case), a few (multiple unicast case) or a large number (multicast case) of interfaces.	Generally unicast but may multicast if <i>txUniCastMode</i> variable is adjusted.	Only transmitted when at least one receiver is identified via reverse reservation.
0xFF00-0xFFFF	65280-65535	Private	Individual transmitters locally allocate private channels. The bundle number is conditioned on the transmitter's MAC address. There are 256 of these bundles per transmitter thus the total number of private bundles is virtually unlimited as the bundle numbers are unique to a particular MAC address.	Generally unicast but may multicast if <i>txUniCastMode</i> variable is adjusted.	Only transmitted when at least one receiver is identified via reverse reservation.

## 2. Control Communications

### 2.1 Serial Bridge

Asynchronous serial data may be bridged across the network using the serial bridge hardware and software. The CobraNet interface has a two wire logic-level asynchronous interface. Characters received on the interface are buffered and placed in the payload of a special serial bridge Ethernet packet. The packet is then transmitted onto the network with unicast or multicast addressing as configured. It is received at the destination CobraNet interface where the data in the packet is re-serialized and presented on the serial interface. Many standard asynchronous serial formats are supported. With proper physical interface circuitry, this port can be made to support RS-232, RS-422 or RS-485 standards. Multi-drop two-wire interfaces are also supported.

The bridging feature can be useful in a CobraNet product as either an internal or external control interface. Used externally, the appropriate transceiver, such as an RS-232 driver chip, is connected to the logic-level pins and in turn connected to a standard connector, such as a DB-9 or DB-25, on the back panel. This allows control of external serial interfaced devices remotely over Ethernet.

Figure 2. Serial Bridging, External Application

Internal application of the serial bridge allows serial communications over the network between host processors which are incorporated into CobraNet devices. Using this communication scheme reduces engineering effort in integrating CobraNet into audio products that already accomplish control communications via serial link.

Figure 3. Serial Bridging, Internal Application

Although the serial bridging feature strives to transmit data at wire speed, delays are introduced by the process of serializing, de-serializing, and prioritizing the serial bridge packets. These delays are typically on the order of 10ms or less.

See [Table 6.4.8 on page 86](#) for details on the MI variables used to control serial bridging.

## 2.2 Packet Bridge

The packet bridge provides a means for using the CobraNet interface as if it were an Ethernet controller by providing a basic capability to send and receive raw Ethernet packets. A CobraNet device utilizing a host processor with network stack can use this feature to transmit and receive both control and audio data over the same network connection.

In the simplest implementation, the host sees the packet bridge as several control variables, a receive buffer, and a transmit buffer which are accessed via the HMI interface. Ethernet data packets are transferred in both directions over the host port using the same HMI semantics used to read and write other MI variables.

More advanced implementations can take advantage of interrupt and DMA modes of HMI operation as well as some HMI operations specifically tailored to packet bridge functions.

Refer to [Table 6.4.7 on page 81](#) for details on the MI variables used to control packet bridging.

### 2.2.1 Packet Bridge Buffer Data Format

Packets are transmitted by writing raw packet data to *bridgeTxPktBuffer*. Packets are received by reading *bridgeRxPktBuffer*. Data in both buffers shares the same format. The first word of the buffer specifies the byte length of the data that follows. Byte length includes the 14-byte Ethernet header. The Frame Check Sequence (FCS) is automatically appended to transmitted packets and automatically checked and stripped from received packets. The FCS is not included in the packet data or byte length specification. Byte length should be in the range 14 to 1514.

#### 2.2.1.1 Processor-dependent Layout of Packet Bridge Buffers

Refer to [Table 3](#) and [Table 4 on page 14](#) for organization of data within bridge buffers for 24- and 32-bit platforms. All data marked as *unused/0* will be received as 0 and must be set to 0 when writing the buffer prior to transmission.

For both platforms, requested transmissions shorter than the 60-byte Ethernet packet minimum will be padded to 60 bytes with indeterminate data.

**Table 3. Packet Bridge Buffer Layout, 24-bit Platforms**

	<b>MS</b>	<b>Middle</b>	<b>LS</b>
<b>Word 1</b>	Packet byte length MS	Packet byte length LS	unused/0
<b>Word 2</b>	Destination MAC byte 2	Destination MAC byte 3	unused/0
<b>Word 2</b>	Destination MAC byte 4	Destination MAC byte 3	unused/0
<b>Word 3</b>	Destination MAC byte 6	Destination MAC byte 5	unused/0
<b>Word 4</b>	Source MAC byte 2	Source MAC byte 1	unused/0
<b>Word 5</b>	Source MAC byte 4	Source MAC byte 3	unused/0
<b>Word 6</b>	Source MAC byte 6	Source MAC byte 5	unused/0
<b>Word 7</b>	Protocol identifier LS	Protocol identifier MS	unused/0
<b>Word 8</b>	Payload byte 2	Payload byte 1	unused/0
...	...	...	unused/0
<b>Word n</b>	Payload byte n	Payload byte n-1	unused/0

**2.2.1.2. 24-bit HMI Packet Bridge Buffer Data Format**

Packet byte length is specified in the two MS bytes of the first word. The LS bytes will read 0 on receipt and must be set to 0 for transmit. Transmit byte length is rounded up to the nearest even multiple of 4. Receive byte length indicates the actual number of bytes received.

**2.2.1.3. 32-bit HMI Packet Bridge Buffer Data Format**

Packet data begins with the second word. Transmission order of each word is MH, MS, LS, ML.

**Table 4. Packet Bridge Buffer Layout, 32-bit Platforms**

	<b>MS</b>	<b>MH</b>	<b>ML</b>	<b>LS</b>
<b>Word 1</b>	Byte length MS	Byte length LS	unused/0	unused/0
<b>Word 2</b>	Destination MAC byte 2	Destination MAC byte 1	Destination MAC byte 4	Destination MAC byte 3
<b>Word 3</b>	Destination MAC byte 6	Destination MAC byte 5	Source MAC byte 1	Source MAC byte 2
<b>Word 4</b>	Source MAC byte 4	Source MAC byte 3	Source MAC byte 6	Source MAC byte 5
<b>Word 5</b>	Protocol identifier LS	Protocol identifier MS	Payload byte 2	Payload byte 1
<b>Word 6</b>	Payload byte 4	Payload byte 3	Payload byte 6	Payload byte 5
...	...	...	...	...
<b>Word n</b>	Payload byte n-2	Payload byte n-3	Payload byte n	Payload byte n-1

## 2.2.2 Packet Bridge Receive Filtering

The packet bridge can allow *only selected* packets to be passed to the bridge buffer or allow *copies* of packets to be sent to the bridge buffer. The value of the *bridgeRxFilter* variable controls the filter mode. With *bridgeRxFilter* = 0x10 or 0x01 the packet bridge sends selected packets of unknown protocol to the HMI interface via the packet bridge buffer. With *bridgeRxFilter* = 0x02 or 0x08, copies of selected packets are passed both to the packet bridge *and* are processed by the CobraNet interface. The packet bridge never passes audio data packets or beat packets to the host. The operation of packet bridge filtering is shown in Figure 4 below.

**Figure 4. Packet Bridge Receive Filtering**

The default value of *BridgeRxFilter* is 0x01. When *BridgeRxFilter* is set to 0x08 and/or 0x02, the CobraNet interface and the host processor can independently process the same packets. The Host processor can use 0x08 in order to respond to packets with IP addresses other than the address assigned to the CobraNet interface. Care must be taken in the host processor software when using these modes to ensure that the CobraNet interface and Host Processor do not both respond to the same packets.

### 3. Network Stack

Figure 5. CobraNet Network Stack

#### 3.1 CobraNet Audio

This includes transmission and reception of audio data packets and reservation requests, implementation of conductor arbitration, and the ability to serve in either conductor or performer roles. CobraNet audio is a self-contained service that spans from Logical Link (2) to Application (7) layers.

#### 3.2 Serial Bridge

This service provides bridging of asynchronous serial streams over the Ethernet network. This self-contained service spans from the logical link to the Application layer. The serial bridge service is discussed in [Section 2.1 "Serial Bridge" on page 12](#).

#### 3.3 Packet Bridge

This service simply allows the CobraNet interface to operate as an Ethernet controller for a connected host. This service works at the logical link layer and provides access to the network without providing any actual network services. The packet bridge feature is discussed in [Section 2.2 "Packet Bridge" on page 13](#).

#### 3.4 BOOTP

The boot protocol (BOOTP) is supported as specified in RFCs 951 and 1542. Network clients use BOOTP to receive an IP address from a BOOTP server.

Clients needing an IP address will broadcast a BOOTP request packet. A BOOTP server on the network will respond with a BOOTP response containing the preferred IP address for the client to use. Use of BOOTP simplifies the error-prone task of assigning unique IP addresses to devices on a large network. BOOTP is carried via UDP/IP and, as such, is able to pass through properly configured routers.

BOOTP requests are transmitted by the CobraNet interface on a randomized schedule as recommended in the RFCs. Requests are sent out frequently at startup and then taper

down to an approximate 2-per-minute minimum rate. Two conditions must be met before a CobraNet device will send out BOOTP requests:

- The device must not already have an IP address. Apart from BOOTP, there are two other means for a CobraNet interface to obtain an IP address - RARP and the *ipMonitor* variables.
- The device must be attached to a switched network. In order to avoid producing unregulated traffic, BOOTP requests are not transmitted on a repeater network.

Upon receipt of a valid BOOTP response, a CobraNet device will change its IP address to the IP address indicated by the BOOTP response. It is not necessary for a response to be paired with a specific request to be considered valid.

### 3.5 RARP (partial support)

RFC 903 defines reverse address resolution protocol (RARP). Network clients use RARP to receive an IP address from a central server. RARP differs from BOOTP in that it is carried at the logical link layer (Layer 2) and thus cannot pass through IP routers.

RARP is comprised of request and response packet types. Upon receipt of a valid RARP response packet, a CobraNet device will change its IP address to the IP address indicated by the RARP response. The CobraNet network stack does not transmit RARP request packets.

RARP is the means used by the CobraNet Discovery application (Disco) and CNDisco object for IP address assignment.

### 3.6 ICMP (partial support)

Internet control message protocol (ICMP) is an administrative protocol defined in RFC 972.

CobraNet devices which have been assigned an IP address will respond to ICMP echo (commonly referred to as 'ping') requests. No other ICMP support is implemented in the CobraNet network stack.

### 3.7 ARP

Address resolution protocol (ARP) is used by the IP protocol to translate IP addresses to MAC addresses according to RFC 826.

A host seeking a MAC address associated with an IP address broadcasts an ARP request. The device using the specified IP address replies with an ARP response packet. In this way the requesting host obtains the MAC address for the target device.

The CobraNet interface responds to ARP requests when appropriate. CobraNet will not generate ARP requests. For this reason the CobraNet can only respond to IP messages and cannot initiate IP communications.

### 3.8 IP

The internet protocol (IP) is defined in RFC 791. IP is a network protocol (layer 3 of the OSI 7-layer networking model) responsible for routing of packets and segmentation and reassembly of packets.

---

The CobraNet implementation of IP has the following limitations:

- Segmentation and reassembly is not supported. Segmentation is primarily utilized by stream based TCP protocols that can generate large data packets. Reassembly capability can be necessary on heterogeneous networks (those comprising multiple network technologies such as Ethernet, FDDI, and ISDN).
- Cannot initiate IP communications; can only respond to incoming messages. The CobraNet implementation does not support net mask and default gateway concepts required to initiate communications to other subnets. Furthermore, CobraNet's implementation of ARP does not support generation of ARP requests.

## 3.9 UDP

User datagram protocol (UDP) is defined in RFC 768. UDP is a transport protocol (layer 4 of the OSI 7-layer networking model) responsible for maintaining the integrity of data. UDP is an extremely simple protocol which, by design, defers the data integrity problem to application protocols in higher network layers.

CobraNet fully supports UDP.

## 3.10 TFTP

Trivial file transfer protocol (TFTP) is defined in RFC 783. TFTP supports file read and write via a UDP/IP transport. The CobraNet implementation of TFTP supports only binary reads and writes to a specific set of files. This is the mechanism used to update firmware in a CobraNet interface. The TFTP file names correspond to the different sectors of the FLASH memory and can differ in name and size for different revisions of CobraNet interface hardware.

Firmware update is a complex process best accomplished by use of an encapsulated software module, such as the PACNFirm object library, or by use of the CobraNet Discovery program which are aware of the data structures and protocol utilized.

## 3.11 SNMP

Version 1 of the simple network management protocol (SNMP) is defined in RFC 1157. The CobraNet SNMP interface is version 1 compliant.

A management information base (MIB) is associated with any SNMP implementation. CobraNet supports the standard MIB for network devices as defined in RFC 1213 "MIB-II" in addition to its own MIB for CobraNet-specific objects.

The CobraNet MIB file is available for public download in order to facilitate full use of the CobraNet SNMP interface via SNMPv1 compliant applications.

## 4. Audio Paths

NOTES: 1. Do not alter audioMap, use txSubMap and rxSubMap to control routing to/from Bundles and SSI.  
 2. The number of transmitters and receivers may vary depending on the implementation.

**Figure 6. CobraNet Interface Audio Model**

### 4.1 Audio Routing Channels

There are 65 audio routing channels within a CobraNet interface numbered from 0 to 64. Channels 1 through 32 are used to route audio from the Synchronous Serial Interface (SSI) to the network transmitters. Channels 33 through 64 are used to route audio from

the network receivers to the SSI outputs. Routing channel 0 is a special logical channel used to supply silence to a transmitted channel or serve as a “bit bucket” when receiving from the network.

Audio arrives and leaves the interface through the SSI receivers and transmitters. As each sample arrives it is buffered. The mapping of audio input and output channels to audio I/O buffer offsets is fixed (and non-intuitive). To accommodate channel numbering differences of different CobraNet devices, the *audioMap* variables allow a mapping from audio I/O buffer offsets to routing channel numbers. This mapping is preset by the manufacturer and should never need to be altered.

## 4.2 Bundle Transmitters

A Transmitter is a logical entity within the CobraNet interface capable of transmitting one bundle of up to 8 audio channels. Input audio routing channels (0, 1 through 32) are mapped into Bundles associated with a particular transmitter via the *txSubMap* variables associated with that transmitter. There are 8 *txSubmap* variables associated with each transmitter, each of which can be set to a particular routing channel number. The first *txSubMap* variable sets the routing channel that will be transmitted in the first audio channel in the bundle. The second *txSubmap* variable selects the source for the second audio channel to be transmitted in the bundle...and so on.

Audio resolution (sample size) and sample rate (48 kHz or 96 kHz) are determined by other transmitter parameters discussed in this document.

## 4.3 Bundle Receivers

A Receiver is a logical entity within the CobraNet interface capable of receiving one bundle of up to 8 audio channels. Output audio routing channels (0, 33 through 64) are mapped from the receiver via the *rxSubMap* variables. There are 8 *rxSubMap* variables associated with each receiver, each of which can be set to a particular routing channel number. The first *rxSubMap* variable selects the routing channel that will receive the first audio channel in the bundle. The second *rxSubMap* variable specifies mapping the second audio channel in the bundle...and so on.

## 4.4 Loopback

The loopback object provides a means for the interface to transfer audio channels internally. Loopback overcomes the limitation that a device cannot receive its own transmission and also allows the audio I/O system to be tested locally.

The *audioLoopSource* and *audioLoopDest* variables control this feature.

## 4.5 Output Channel Duplication

The audio routing channel mapping facilities allow a single routing channel to be mapped to any number of audio channels in any number of network transmitters (Bundles). It is, however, not possible to direct an audio channel in a network receiver to multiple audio routing channels for output through multiple SSI channels or ports.

Output channel duplication allows output routing channels to be copied to other output routing channels. This feature is implemented as a separate set of “dup” paths controlled

by *audioDupSource* and *audioDupDest* variables. An output can be specified as the source for a duplication by multiple “dup” paths. Output duplication is accomplished without incurring additional audio latency. See [Section 6.4.10 "Audio" on page 92](#) for more information.

## 4.6 Meters

Metering is provided for all 64 audio routing channels. The first 32 meters can be mapped to the 32 input routing channels. The second 32 meters are used to meter the output routing channels. Mapping is controlled by the *audioMeterMap* variable.

Metering is disabled by default to conserve processing cycles. Meters are peak detecting with simple first-order decay ballistics. Ballistics are comprised of an instantaneous attack and exponential decay time programmable via *audioMeterDecay* variable. Ballistics are adjusted globally for all meters. All level measurements are peak level (as opposed to RMS, for instance). Level is indicated in 24-or 32-bit positive signed values. A cumulative peak hold element on each meter allows accurate detection of any clipping condition. See [Section 6.4.10 "Audio" on page 92](#) for more information.

## 4.7 Low-latency Audio Support

Low-latency modes are supported on CobraNet interfaces without need for hardware changes to the CobraNet interface or CobraNet Device. The default mode of operation is 5-1/3 mS latency at 48 kHz sample rate.

Running in low-latency mode requires more processing power, implying a trade-off between the number of channels supported and reduction of latency. Some reference-design-based products need to operate at reduced channel count to support lower latency. Depending on selected sample size, sample rate, and latency, newer CobraNet interfaces may be subject to some limitation in channel capacity, number of transmitters and receivers, and multiple unicast transmission count.

The following table shows CM-1 channel capacity for several latency and sample rate operating modes. Eight-channel bundles with 20-bit resolution, unicast to a single destination or multicast is assumed.

Low-latency modes also place additional demands on network performance. Specifically, in order to achieve the desired latency, forwarding delay across the network needs to be reduced by approximately the same factor that audio latency is reduced. These requirements bring into play new network design rules.

Lower latency is achieved by transmitting smaller audio packets at a higher rate. A restriction on the number of audio channels allowed in a bundle is due to a restriction on

the maximum size of an Ethernet packet. Therefore Lower-latency modes have relaxed restrictions in this area. Audio channel count restrictions are summarized below.

**Table 5. Bundle Capacity Limits as a Function of Ethernet Packet Size**

Latency	Channels per Bundle					
	16 bit, 48 kHz	20 bit, 48 kHz	24 bit, 48 kHz	16 bit, 96 kHz	20 bit, 96 kHz	24 bit, 96 kHz
5-1/3 ms	8	8	7	5	4	3
2-2/3 ms	8	8	8	8	8	7
1-1/3 ms	8	8	8	8	8	8

Bundle capacity or maximum channel count may be limited in some cases by both the allowable Ethernet packet size and by the processor bandwidth required to handle lower latency and/or higher sample rate modes. Limitations imposed by packet size are illustrated in [Table 5](#). Limitations imposed by additional bandwidth requirements are discussed in the Hardware Reference Manual applicable to the particular CobraNet Interface.

A CobraNet interface operates at a single latency and sample rate mode as specified by the *modeRateControl* variable. This latency mode applies to all incoming and outgoing audio at the interface.

**Table 6. *txSubFormat* and *rxSubFormat*<sup>1</sup> Values<sup>2</sup>**

<b>txSubFormat Value</b>	<b>Resolution</b>	<b>Sample Rate</b>	<b>Latency</b>
0	No Signal		
0x044000	16 bit	48 kHz	5-1/3 ms
0x054000	20 bit	48 kHz	5-1/3 ms
0x064000	24 bit	48 kHz	5-1/3 ms
0x148000	16 bit	96 kHz	5-1/3 ms
0x158000	20 bit	96 kHz	5-1/3 ms
0x168000	24 bit	96 kHz	5-1/3 ms
0x042000	16 bit	48 kHz	2-2/3 ms
0x052000	20 bit	48 kHz	2-2/3 ms
0x062000	24 bit	48 kHz	2-2/3 ms
0x144000	16 bit	96 kHz	2-2/3 ms
0x154000	20 bit	96 kHz	2-2/3 ms
0x164000	24 bit	96 kHz	2-2/3 ms
0x041000	16 bit	48 kHz	1-1/3 ms
0x051000	20 bit	48 kHz	1-1/3 ms
0x061000	24 bit	48 kHz	1-1/3 ms
0x142000	16 bit	96 kHz	1-1/3 ms
0x152000	20 bit	96 kHz	1-1/3 ms
0x162000	24 bit	96 kHz	1-1/3 ms

<sup>1</sup>*rxSubFormat* is a read only variable indicating the format of the audio data being received and decoded. It will have the same value as *txSubFormat* with the exception of the least-significant bit. i.e. 16-bit, 48 kHz sample rate, 5 1/3-mS latency = 0x44001 when the data is being successfully decoded.

<sup>2</sup>*modeRateControl* must also be set to the correct value necessary to support the mode selected by *txSubFormat*.

## 4.8 96 kHz Sample Rate Support

A CobraNet interface may operate at either 48 kHz or 96 kHz but not both rates simultaneously. A device operating at 48 kHz cannot receive audio from a device operating at 96 kHz and vice versa. However, CobraNet interfaces operating at 96 kHz and 48 kHz audio may co-exist on the same network.

CS4961xx, CS1810xx, CM-2, and CM-1 based interfaces are required for 96 kHz sample rate operation. No hardware changes are required to support the increased sample rate on these platforms. 96 kHz is not supported in the legacy CobraNet Reference Design.

Sample rate is selected by the *modeRateControl* variable. *modeRateControl* selects both sample rate and audio latency. 96 kHz sample rate and low-latency modes can be used together.

*rxSubFormat* indicates the type and status of audio data being received. The LS bit of this variable indicates whether data in the sub channel is being decoded. A value of 0 indicates inability of the interface to decode the received data. An interface operating at 48 kHz cannot decode 96 kHz audio. An interface operating at 96 kHz cannot decode 48 kHz audio.

Processing 96 kHz audio requires twice the bandwidth. At 5-1/3 ms latency, all of the data is transmitted in one packet and thus the number of channels that can be transferred per bundle may be reduced. Lower latency modes can support more channels at 96 kHz, as the data is distributed across 4 packets at 1-1/3 mS and 2 packets at 2-2/3 ms latency. See [Table 5., "Bundle Capacity Limits as a Function of Ethernet Packet Size"](#) for more detail on this topic.

When operating in 96 kHz mode, the Master Clock remains at the standard 24.576 MHz. However, in 96 kHz mode, the Sample Clock Output (FS1) will change to support a 96 kHz signal. If a sample clock cascade and/or reference clock input is supplied, this signal may be either 48 kHz or 96 kHz in 96 kHz mode but must be 48 kHz in 48 kHz mode.

**Table 7. Bit Clock Rates**

<b>Synchronous Serial Port Operating Mode</b>	<b>48 kHz SCK Rate</b>	<b>96 kHz SCK Rate</b>
64Fs (2 channels x 4 interfaces)	3.072 MHz	6.144 MHz
128Fs (4 channels x 4 interfaces)	6.144 MHz	12.288 MHz
256Fs (8 channels x 4 interfaces)	12.288 MHz	24.576 MHz

## 5. Management Interface

The Management Interface (MI) is the means by which the CobraNet interface is controlled and monitored. Integral to the management interface are the MI variables. The MI variables are read and written via the Host Management Interface (HMI) or remotely over the audio network via SNMP. Both methods operate on the same common set of MI variables. The CobraNet device is configured in real time as the variables are changed.

Variables may have read-only, read/write, or read/write-persistent attributes. All variables are given an initial value at startup. The value of all variables can be read. Read/write and Read/write-persistent variable types can be both read and written. The value of persistent variables is saved in flash memory and the variable is restored at startup to the last value written. See [Section 5.2 "Persistence" on page 26](#) for more detail on persistent variables. All MI variables are documented in the [Section 6. "Management Interface Variable Reference" on page 28](#).

MI variables fall into three classes. CobraNet-specific variables allow for configuration and monitoring of CobraNet functionality such as audio transmission and reception. A second class of variables known as SNMP MIB-II variables provides a uniform means of monitoring a network device. These variables are primarily concerned with performance and configuration of the network interface and associated protocols. A third class of product-specific variables may exist when a manufacturer makes use of SNMP extension agent capabilities. This third class of variables is used for controlling and monitoring product-specific features and functions.

### 5.1 Flash

Flash memory may be updated via TFTP or through HMI. The HMI flash memory access mechanism allows flash contents to be read and written via the host port. This provides functionality for the HMI similar to that which TFTP provides via the network.

The mechanism cannot allow direct access to the flash memory. Instead a request to read or write flash is performed by supplying the flash address (*flashTAddress*), byte length (*flashTLength*), transfer direction (*flashTDirection*), and data (*bridgeTxPktBuffer*). The request is then initiated by writing to *flashTRequest*.

The flash memory is a byte-wide device. On 24-bit CobraNet platforms, the transmit buffer is comprised of 3-byte words. The mapping between the byte-wide flash data and the wider buffer memory is as follows.

**Table 8. Flash Layout, 24-bit Platforms**

	<b>MS</b>	<b>Middle</b>	<b>LS</b>
<b>First Word</b>	Byte 3	Byte 2	Byte 1
<b>Second Word</b>	Byte 6	Byte 5	Byte 4

On 32-bit CobraNet platforms, the transmit buffer is comprised of 4-byte words. The mapping between the byte-wide flash data and the wider buffer memory is as follows.

Table 9. Flash Layout, 32-bit Platforms

	MS	MH	ML	LS
First Word	Byte 4	Byte 3	Byte 2	Byte 1
Second Word	Byte 8	Byte 7	Byte 6	Byte 5

## 5.2 Persistence

The persistence feature causes values written to Read/write-persistent type variables to be written to flash and for these stored values to be restored during startup. With the persistence feature disabled, Read/write and Read/write-persistent variables behave identically. Persistence is enabled by setting the *flashPersistEnable* variable.

With persistence enabled, values written to Read/write-persistent variables are written to flash by a background task according to a schedule designed to prevent excessive write cycles on the memory and to avoid interference with other critical functions. In extreme cases it can take up to 1 minute to store changed values. However, the persistence feature is implemented such that it is safe to remove power at any time with the caveat that the values recalled may not include changes made immediately prior to removal of power. Variable values will never become corrupted due to unexpected loss of power or network connection.

*flashPersistAck* can be used to ensure that variables have been stored to non-volatile memory prior to removal of power.

## 5.3 Watch Dog

The watch dog is a digital signal from the CobraNet interface provided to allow fault detection. The watch dog signal is toggled periodically by firmware to indicate normal operation. The toggle rate may drop to as low as 5 Hz on occasion, depending on processor load. Actual minimum, maximum, and nominal toggle rates can be found in the Hardware Reference Manual applicable to the particular CobraNet interface. The watch dog signal will stop toggling following detection and reporting of a fatal error condition. The interface should be reset and re-initialized when absence of the watchdog signal is detected.

Use of the watchdog requires external hardware and/or software. A hardware solution may be implemented with a "microprocessor manager" chip such as the DS1236 from Dallas/Maxim. A software solution could involve wiring the watch dog signal to an I/O port, timer, or interrupt on the host processor and then wiring the CobraNet reset signal to a general purpose output. Software on the host processor would monitor the interval between watch dog transitions and assert the reset signal if the interval exceeds the maximum period.

Implementation of the watch dog feature is not mandatory but is recommended. ESD, EMI, and power fluctuation events are not uncommon in audio installations and the ability to survive and recover from such conditions is a prerequisite for passing many electrical certification programs.

---

## 5.4 SNMP Extension Agent

CobraNet's SNMP agent feature allows the CobraNet interface to be monitored and configured over the Ethernet network by an SNMP manager (or managers). An enhancement of this capability is the SNMP extension agent which allows these monitoring and control capabilities to be extended to product-specific features and functionality.

SNMP extensions require use of a host processor attached to the CobraNet interface. The extension agent appears to the processor as additional product-specific variables in the HMI memory space. For status reporting, the host microcontroller writes updated values to the associated HMI locations. SNMP requests can then be used to read these values at any time. Extension values can also be written via SNMP and monitored by the host processor in order to provide a control path to the host processor via SNMP.

Extensions implemented along with the appropriate hardware and host software can be used to control and monitor many useful functions. For example, extension variables can be used to remotely monitor metrics such as gain, clipping and temperature. They can also be used to control functions such as gain, noise gates, and compression. The system will also benefit from the persistence feature, allowing settings for the entire product, not just the CobraNet interface, to be retained through a power-cycle.

By using the extension agent, the entire product may be made SNMP manageable without need for the host processor to be burdened with the complexity of running a network stack and SNMP agent.

## 6. Management Interface Variable Reference

CobraNet interfaces are configured and monitored by reading and writing Management Interface variables. MI variables may be accessed directly via a processor attached to the Host Management Interface or via the network using SNMP. The method of using the HMI is similar for all CobraNet interfaces but may require specific semantics and may have different word sizes depending on the actual implementation. The HMI interface is described in more detail in the Hardware Reference Manual applicable to the particular CobraNet Interface. Following are detailed descriptions of the size, contents, and effects of the MI variables as well as their HMI addresses and SNMP Object Identifier numbers. All MI variables can be accessed via the HMI but some variable properties render them inappropriate for accessing via SNMP. These exceptions are noted in the variable descriptions where applicable.

### 6.1 Legend

**Name** - Name of variable as seen in CobraNet MIB and cobrami.h header file.

**Description** - Description of the variable including allowed values and usage discussion.

**Host Address** - HMI addresses are used to access variables via the host port. HMI addresses have a 24-bit range on both 24- and 32-bit platforms.

**SNMP Object ID (OID)**- The Object Identifier is the numeric name assigned to a variable according to the SNMP protocol.

**Size** - Size is indicated for varying-length data types such as *DisplayString* and *OID*. Size is not indicated for fixed types whose size is implied by their data type. Note that for fixed types, the word size may differ depending on the processor type.

**Count** - Number of entries for array or buffer-type variables. Absence of a *Count* specification implies a single instance variable, and thus a *Count* of 1.

**Type** - Data type of the variable. The options and format of data types are described below in detail.

**Attributes** - **Read-only** variables can only be read and can not be modified. **Read/Write** variables can be read and written. **Read/Write - Persistent** variables can be read and written. If the persistence feature is enabled, values of these variables will automatically be written to flash for recall at startup.

**Default** - Value assigned to the variable at startup when persistence is disabled. The values of some Read-only variables reflect system conditions and thus may not have a default value.

**Version** - Firmware version in which the variable was first introduced. Unless otherwise noted in this field, one can assume variables will be available in the version indicated and all subsequent versions.

## 6.2 Data Types

### 6.2.1 DisplayString

A *DisplayString* is an ASCII string comprised entirely of printable characters.

**24-bit HMI:** The first word indicates the length of the string in characters. Data is stored three characters per 24-bit word. Character order is MS, Middle, LS. For *DisplayString* variables, documented *Size* indicates the largest possible word size of the variable. *Size* includes the length field. The maximum allowable characters for a *DisplayString* variable is  $(Size-1) \times 3$ .

**32-bit HMI:** The first word indicates the length of the string in characters. Data is stored four characters per 32-bit word. Character order is MS, MH, ML, LS. For *DisplayString* variables, documented *Size* indicates the largest possible word size of the variable. *Size* includes the length field. The maximum allowable characters for a *DisplayString* variable is  $(Size-1) \times 4$ .

### 6.2.2 OID

An SNMP object identifier is the numeric name of an SNMP variable. OIDs are also used for other purposes including system-unique identifiers.

**24-bit HMI:** OIDs are presented in their native BER encoding. The first word indicates the length of the encoding in bytes. Data is stored three octets per 24-bit word. Character order is MS, Middle, LS. For *OID* variables documented *Size* indicates the largest possible word size for the variable. *Size* includes the length field. The maximum number of octets for the *OID* variable encoding is  $(Size-1) \times 3$ .

**32-bit HMI:** OIDs are presented in their native BER encoding. The first word indicates the length of the encoding in bytes. Data is stored four octets per 32-bit word. Character order is MS, MH, ML, LS. For *OID* variables documented *Size* indicates the largest possible word size for the variable. *Size* includes the length field. The maximum number of octets for the *OID* variable encoding is  $(Size-1) \times 4$ .

### 6.2.3 IpAddress

An *IpAddress* is a 32-bit internet protocol (IP) address.

**24-bit HMI:** Data is stored in the most-significant 16 bits of 2 consecutive 24-bit words as shown in [Table 10](#). The least-significant 8 bits of each location are read as zero and *must* be written as zero.

**Table 10. IP address Layout, 24-bit Platforms**

	<b>MS</b>	<b>Middle</b>	<b>LS</b>
<b>Word 1</b>	IP address byte 2	IP address byte 1	0
<b>Word 2</b>	IP address byte 4	IP address byte 3	0

**32-bit HMI:** Data is stored in a single 32-bit word as illustrated below.

**Table 11. IP address Layout, 32-bit Platforms**

<b>MS</b>	<b>MH</b>	<b>ML</b>	<b>LS</b>
IP address byte 2	IP address byte 1	IP address byte 4	IP address byte 3

### 6.2.4 PhysAddress

A 48-bit Ethernet media access control (MAC) address.

**24-bit HMI:** Data is stored in the most-significant 16 bits of 3 consecutive memory locations as illustrated below. The least-significant 8 bits of each location are read as zero and *must* be written as zero.

**Table 12. MAC address Layout, 24-bit Platforms**

	<b>MS</b>	<b>Middle</b>	<b>LS</b>
<b>Word 1</b>	MAC byte 2	MAC byte 1	0
<b>Word 2</b>	MAC byte 4	MAC byte 3	0
<b>Word 3</b>	MAC byte 6	MAC byte 5	0

**32-bit HMI:** Data is stored in two consecutive words as shown below. A third word is unused and reserved for addressing compatibility with 24-bit platforms.

**Table 13. MAC address Layout, 32-bit Platforms**

	<b>MS</b>	<b>MH</b>	<b>ML</b>	<b>LS</b>
<b>Word 1</b>	MAC byte 2	MAC byte 1	MAC byte 4	MAC byte 3
<b>Word 2</b>	MAC byte 6	MAC byte 5	unused	unused
<b>Word 3</b>	unused	unused	unused	unused

### 6.2.5 TimeTicks

*TimeTicks* is an integer encoding for time durations in units of 100ths of a second.

**24-bit HMI:** An unsigned timer value is available in two successive 24-bit words. A 32-bit timer value and 15-bit fractional extension are available as shown below. The fractional extension may be used to gain additional accuracy. It may be safely ignored for most applications.

**Table 14. TimeTicks Layout, 24-bit Platforms**

	<b>MS</b>	<b>Middle</b>	<b>LS</b>
<b>Word 1</b>	Timer MS	Timer MH	Timer ML
<b>Word 2</b>	Timer LS	Fractional LS	Fractional MS

**32-bit HMI:** *TimeTicks* value is available as two successive 32-bit words. A 32-bit timer value, a 16-bit rollover, and 16-bit fractional extension are available as shown below. The fractional extension may be used to gain additional accuracy. The rollover extension may

be used to extend the useful range of the timer. Both may be safely ignored for most applications.

**Table 15. TimeTicks Layout, 32-bit Platforms**

	<b>MS</b>	<b>MH</b>	<b>ML</b>	<b>LS</b>
<b>Word 1</b>	Rollover MS	Rollover LS	Timer MS	Timer MH
<b>Word 2</b>	Timer ML	Timer LS	Fractional LS	Fractional MS

**SNMP:** *TimeTicks* is reported as a 32-bit integer in units of 100ths of a second. For example, a reported value of *1000* indicates a 10-second timer reading. As seen through SNMP, *TimeTicks* variables roll over after  $2^{32}$  100ths of a second (42,949,672.96 seconds - over one year).

### 6.2.6 Counter

Counters are never writable and cannot be reset. They indicate the count value since the interface was last restarted (*sysUpTime* = 0). Counters roll over to zero after reaching their maximum value of  $2^{24}$  (16,777,216) on 24-bit platforms and  $2^{32}$  (4,294,967,296) on 32-bit platforms.

**24-bit HMI:** Counter value is represented as a single 24-bit word.

**32-bit HMI:** Counter value is represented as a single 32-bit word.

### 6.2.7 Counter2

*Counter2* is specific to 24-bit platforms and is a 48-bit unsigned event counter. *Counter2* rolls over after  $2^{48}$  counts. Counters are never writable. **On 32-bit platforms *Counter2* is identical to the *Counter* type.**

**24-bit HMI:** The counter value is stored in two successive memory locations. The most-significant word appears first. It is suggested that one read the MS word followed by LS word followed by a second read of the MS word and verify that the MS word has not changed during the LS read (if so, start over).

**32-bit HMI:** Counter value is represented in the same single 32-bit word used for the *Counter* type.

**SNMP:** Only the least-significant 32-bits of the counter value are reported. The counter appears to wrap at  $2^{32}$  and conforms to the expected behavior for the standard SNMP *Counter* data type.

### 6.2.8 Integer

A single-precision, signed integer. Valid range is  $-2^{23}$  (-8,388,608) to  $2^{23}-1$  (8,388,607) on 24-bit platforms and  $-2^{31}$  (-2,147,483,648) to  $2^{31}-1$  (2,147,483,647) on 32-bit platforms.

**HMI:** Signed data is represented in a single word in 2's complement form.

**SNMP:** On 24-bit platforms, *Bad Value* error may be reported if the value magnitude exceeds the 24-bit signed integer range on a set operation.

### 6.2.9 Integer16

A signed, 16-bit integer. Valid range is  $-2^{15}$  (-32,768) to  $2^{15}-1$  (32,767).

**24-bit HMI:** Signed data is represented in 2's complement form. *The most significant 16 bits of the 24-bit host data contain the significant bits.* The LS 8 bits are read as zero and must be written as zero.

**32-bit HMI:** Same as 32-bit *Integer* type with useful values less than  $2^{16}$  (65,536).

**SNMP:** *Bad Value* may be reported if value magnitude exceeds  $2^{16}$  on a set operation.

### 6.2.10 Integer48

*Integer48* is specific to 24-bit platforms. This type is a signed, 48-bit integer. **On 32-bit platforms *Integer48* is identical to the *Integer* type.**

**24-bit HMI:** Data is stored in 2 consecutive memory locations. The most significant word appears first. Signed data is represented in 2's complement form.

**32-bit HMI:** Signed data is represented as the single word in 2's complement form used for the *Integer* type.

**SNMP:** Only the least-significant 32-bits of the value is reported.

## 6.3 MIB-II Variables

These variables are common to all SNMP implementations. This common set of management variables is defined in the Internet Engineering Task Force (IETF) standards document RFC 1213.

### 6.3.1 System

<b>Name</b>	sysDescr
<b>Description</b>	<p>Describes type of interface as ASCII text.</p> <p><b>Format for 24-bit platforms:</b>          &lt;product specific description&gt; CobraNet version &lt;protocol version&gt;.&lt;major version&gt;.&lt;minor version&gt;[.&lt;manufacturer version&gt;] &lt;hardware platform&gt; rev &lt;hardware rev&gt;          where &lt;hardware platform&gt; is {Referlo, Referhi, CM-1(a), CM-1(m), CS18100, CS18101, CS18102, CS18110, CS18111, CS18112}</p> <p><b>Format for 32-bit platforms:</b>          &lt;product specific description&gt; CobraNet version &lt;protocol version&gt;.&lt;major version&gt;.&lt;minor version&gt;[.&lt;manufacturer version&gt;] &lt;hardware platform&gt;&lt;hardware rev&gt;          where &lt;hardware platform&gt; is {Referlo, Referhi, CM-1(a), CM-1(m), CS18100, CS18101, CS18102, CS18110, CS18111, CS18112} and &lt;hardware rev&gt; is the single digit revision number that is part of the Cirrus part number. Example: Cirrus Logic EV-2/CM-2 (CM18101) CobraNet version 2.10.4 CS181012</p> <p><b>Format for RAVE platforms:</b>          &lt;product specific description&gt; CobraNet version &lt;protocol version&gt;.&lt;major version&gt;.&lt;minor version&gt;[.&lt;manufacturer version&gt;]</p> <p>NOTE: [.&lt;manufacturer version&gt;] is an additional manufacturer-specific string that can be optionally added to the firmware by Cirrus Logic for 24-bit platforms or added by the OEM using the <i>CNCustom</i> program for 32-bit platforms.          Example for CS18101: Cirrus Logic EV-2/CM-2 (CM18101) CobraNet version 2.10.5 CS181012</p>
<b>Host Address</b>	0x100000
<b>SNMP Object ID</b>	1.3.6.1.2.1.1.1
<b>Size</b>	84 characters (28 * 3 bytes) for 24-bit platforms. Length was 21 words in 2.9.10. It is now 27 words. 84 characters (21 * 4 bytes) for CS4961xx- and CS1810xx-based platforms.
<b>Type</b>	DisplayString
<b>Attributes</b>	Read-only
<b>Default Value</b>	"[manufacturer name] [product name] CobraNet firmware [protocol version].[major version].[minor version].[manufacturer's version (optional, see note above)]"
<b>Implemented Version</b>	2.6.3

<b>Name</b>	sysObjectID
<b>Description</b>	The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprise sub-tree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining `what kind of box' is being managed. For example, if vendor `Cirrus Logic' was assigned the sub-tree 1.3.6.1.4.1.2680, the identifier `CM-2' could be assigned to 1.3.6.1.4.1.2680.1.2.1.1
<b>Host Address</b>	0x100100
<b>SNMP Object ID</b>	1.3.6.1.2.1.1.2
<b>Size</b>	60 characters
<b>Type</b>	OID
<b>Attributes</b>	Read-only
<b>Default Value</b>	1.3.6.1.4.1.2680.1.2.(CobraNet manufacturer ID).(manufacturer product ID)
<b>Implemented Version</b>	2.6.3

<b>Name</b>	sysContact
<b>Description</b>	The identification of the contact person for this managed node, together with information on how to contact this person.
<b>Host Address</b>	0x100200
<b>SNMP Object ID</b>	1.3.6.1.2.1.1.4
<b>Size</b>	60 characters
<b>Type</b>	DisplayString
<b>Attributes</b>	Read/write - Persistent
<b>Default Value</b>	Zero length string
<b>Implemented Version</b>	2.6.3

<b>Name</b>	sysName
<b>Description</b>	A name assigned to this managed node. By convention, this is the node's fully qualified domain name.
<b>Host Address</b>	0x100300
<b>SNMP Object ID</b>	1.3.6.1.2.1.1.5
<b>Size</b>	60 characters
<b>Type</b>	DisplayString
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	Product specific
<b>Implemented Version</b>	2.6.3

<b>Name</b>	sysLocation
<b>Description</b>	The physical location of this node (e.g., "telephone closet, 3rd floor")
<b>Host Address</b>	0x100400
<b>SNMP Object ID</b>	1.3.6.1.2.1.1.6
<b>Size</b>	60 characters
<b>Type</b>	DisplayString
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	Zero length string
<b>Implemented Version</b>	2.6.3

<b>Name</b>	sysUpTime
<b>Description</b>	Time in 100ths of a second since the network management portion of the system was last re-initialized.
<b>Host Address</b>	0x100500
<b>SNMP Object ID</b>	1.3.6.1.2.1.1.3
<b>Type</b>	TimeTicks
<b>Attributes</b>	<a href="#">Read-only</a>
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.3

<b>Name</b>	sysServices
<b>Description</b>	A value which indicates the set of services supported by this entity. The value is a sum. This sum initially takes the value zero, For each layer, L, in the range 1 through 7, that this node performs transactions for, 2 raised to (L - 1) is added. For example, a node which performs primarily routing functions would have a value of 4 which is equal to $(2^{(3-1)})$ . A node which is a host offering application services would have a value of 72 or $(2^{(4-1)} + 2^{(7-1)})$ . In the context of the Internet suite of protocols, the following service layers are commonly supported: 1 physical (e.g., repeaters), 2 datalink/subnetwork (e.g., bridges), 3 internet (e.g., IP gateways), 4 end-to-end (e.g., IP hosts), 7 applications (e.g., mail relays). For systems including OSI protocols, layers 5 and 6 may also be counted.
<b>Host Address</b>	0x100502
<b>SNMP Object ID</b>	1.3.6.1.2.1.1.7
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	72
<b>Implemented Version</b>	2.6.3

### 6.3.2 Interface

<b>Name</b>	ifNumber
<b>Description</b>	The number of network interfaces (regardless of their current state) present on this system.
<b>Host Address</b>	0x110000
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.1
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	1
<b>Implemented Version</b>	2.1.0

<b>Name</b>	ifDescr
<b>Description</b>	A string containing information about the interface. This string should include the name of the manufacturer, the product name and the version of the hardware interface.
<b>Host Address</b>	0x110001
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.2
<b>Size</b>	Up to 60 characters.
<b>Type</b>	DisplayString
<b>Attributes</b>	Read-only
<b>Default Value</b>	"CobraNet"
<b>Implemented Version</b>	2.1.0

<b>Name</b>	ifType
<b>Description</b>	The type of interface, distinguished according to the physical/link protocol(s) immediately 'below' the network layer in the protocol stack. Reference RFC 1213 for all type identifiers
<b>Host Address</b>	0x11000A
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.3
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	7
<b>Implemented Version</b>	2.1.0

<b>Name</b>	ifMtu
<b>Description</b>	The size of the largest datagram or 'packet' that can be sent/received by the interface, specified in octets. For interfaces that are used for transmitting network datagrams, this is the size of the largest network datagram that can be sent on the interface.
<b>Host Address</b>	0x11000B
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.4
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	1500
<b>Implemented Version</b>	2.1.0

<b>Name</b>	ifSpeed
<b>Description</b>	An estimate of the interface's current bandwidth in bits per second or Mbits per second (see Notes below). For interfaces which do not vary in bandwidth or for those where no accurate estimation can be made, this object should contain the nominal bandwidth.
<b>Host Address</b>	0x11000C
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.5
<b>Type</b>	Gauge32
<b>Attributes</b>	Read-only
<b>Default Value</b>	100
<b>Implemented Version</b>	2.1.0, corrected is 2.6.5 (see Notes below)
<b>Notes</b>	Prior to CobraNet firmware version 2.6.5, <i>ifSpeed</i> was incorrectly reported via SNNP in Mbit/second units (100Mbit interface <i>ifSpeed</i> reported as "100"). 2.6.5 correctly reports <i>ifSpeed</i> in bits per second units via SNMP but due to space constraints, <i>ifSpeed</i> is still reported in Mbit per second units via HMI on 24-bit platforms. <i>ifSpeed</i> is reported consistently in bits per second units on 32-bit platforms.

<b>Name</b>	ifPhysAddress
<b>Description</b>	The interface's address at the protocol layer immediately 'below' the network layer in the protocol stack.
<b>Host Address</b>	0x11000D
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.6
<b>Type</b>	PhysAddress
<b>Attributes</b>	Read-only
<b>Default Value</b>	n.a.
<b>Implemented Version</b>	2.1.0

<b>Name</b>	ifAdminStatus
<b>Description</b>	The desired state of the interface. The testing(3) state indicates that no operational packets can be passed up(1) -- ready to pass packets down(0)
<b>Host Address</b>	0x111000
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.7
<b>Type</b>	Integer
<b>Attributes</b>	Read/Write
<b>Default Value</b>	1
<b>Implemented Version</b>	2.1.0

<b>Name</b>	ifOperStatus
<b>Description</b>	The current operational state of the interface. The testing(3) state indicates that no operational packets can be passed. up(1) - ready to pass packets down(0)
<b>Host Address</b>	0x112000
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.8
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	1
<b>Implemented Version</b>	2.1.0

<b>Name</b>	ifLastChange
<b>Description</b>	The value of <i>sysUpTime</i> at the time the interface entered its current operational state. If the current state was entered prior to the last re- initialization of the local network management subsystem, then this object contains a zero value.
<b>Host Address</b>	0x112001
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.9
<b>Type</b>	TimeTicks
<b>Attributes</b>	Read-only
<b>Default Value</b>	n.a.
<b>Implemented Version</b>	2.1.0

<b>Name</b>	ifInOctets
<b>Description</b>	The total number of octets received on the interface, including framing characters.
<b>Host Address</b>	0x112016
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.10
<b>Type</b>	Counter48
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	ifInUcastPkts
<b>Description</b>	The number of subnetwork-unicast packets delivered to a higher-layer protocol.
<b>Host Address</b>	0x112018
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.11
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	ifInNUcastPkts
<b>Description</b>	The number of non-unicast (i.e., subnetwork- broadcast or subnetwork-multicast) packets delivered to a higher-layer protocol.
<b>Host Address</b>	0x112019
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.12
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	ifInDiscards
<b>Description</b>	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their delivery to a higher-layer protocol. One possible reason for discarding such a packet could be lack of buffer space.
<b>Host Address</b>	0x11201A
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.13
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	ifInErrors
<b>Description</b>	The number of inbound packets that contained errors preventing delivery to a higher-layer protocol.
<b>Host Address</b>	0x11201B
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.14
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	ifInUnknownProtos
<b>Description</b>	The number of packets received which were discarded due to an unknown or unsupported protocol.
<b>Host Address</b>	0x11201C
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.15
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	ifOutOctets
<b>Description</b>	The total number of octets transmitted by the interface, including framing characters.
<b>Host Address</b>	0x11201D - 0x11201E
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.16
<b>Type</b>	Counter48
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	ifOutUcastPkts
<b>Description</b>	The total number of packets that higher-level protocols requested be transmitted to a subnetwork-unicast address, including those that were discarded or not sent.
<b>Host Address</b>	0x11201F
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.17
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	ifOutNUcastPkts
<b>Description</b>	The total number of packets that higher-level protocols requested be transmitted to a non-unicast (i.e., a subnetwork-broadcast or subnetwork-multicast) address, including those that were discarded or not sent.
<b>Host Address</b>	0x112020
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.18
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	ifOutDiscards
<b>Description</b>	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their transmission. One possible reason for discarding such a packet could be to free up buffer space.
<b>Host Address</b>	0x112021
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.19
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	ifOutErrors
<b>Description</b>	The number of outbound packets that could not be transmitted due to errors.
<b>Host Address</b>	0x112022
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.20
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	ifOutQLen
<b>Description</b>	The length of the output packet queue (in packets)
<b>Host Address</b>	0x112023
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.21
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	n.a.
<b>Implemented Version</b>	2.6.1

<b>Name</b>	ifSpecific
<b>Description</b>	A reference to MIB definitions specific to the particular media being used to implement the interface. For example, if the interface is implemented by Ethernet, then the value of this object refers to a document defining objects specific to Ethernet. If this information is not present, its value should be set to the OBJECT IDENTIFIER { 0 0 }, which is a syntactically valid object identifier, and any conformant implementation of ASN.1 and BER must be able to generate and recognize this value.
<b>Host Address</b>	0x112024
<b>SNMP Object ID</b>	1.3.6.1.2.1.2.2.1.22
<b>Size</b>	2
<b>Type</b>	OID
<b>Attributes</b>	Read-only
<b>Default Value</b>	0.0
<b>Implemented Version</b>	2.6.1

### 6.3.3 Address Translation

The Address Translations are deprecated. These variables are no longer available via SNMP.

<b>Name</b>	atIfIndex
<b>Description</b>	The interface on which this entry's equivalence is effective. The interface identified by a particular value of this index is the same interface as identified by the same value of <i>ifIndex</i> .
<b>Host Address</b>	0x120000
<b>SNMP Object ID</b>	<b>Not available via SNMP</b>
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	1
<b>Implemented Version</b>	2.1.0

<b>Name</b>	atPhysAddress
<b>Description</b>	MAC address of the device. Use of <i>ifPhysAddress</i> is preferred for determining the MAC address.
<b>Host Address</b>	0x120001
<b>SNMP Object ID</b>	<b>Not available via SNMP</b>
<b>Type</b>	PhysAddress
<b>Attributes</b>	Read-only
<b>Default Value</b>	As assigned by manufacturer
<b>Implemented Version</b>	2.1.0

<b>Name</b>	atNetAddress
<b>Description</b>	IP address of the device. Obtaining the IP address via SNMP should not be a necessary operation - you need to know the IP address in order to send the query. Via HMI, the IP address may be monitored and manipulated via the IP Monitor variables.
<b>Host Address</b>	0x120004
<b>SNMP Object ID</b>	<b>Not available via SNMP</b>
<b>Type</b>	IpAddress
<b>Attributes</b>	Read-only
<b>Default Value</b>	As assigned by RARP, BOOTP or IP monitor variables.
<b>Implemented Version</b>	2.1.0

### 6.3.4 IP

<b>Name</b>	ipForwarding
<b>Description</b>	The indication of whether this entity is acting as an IP gateway to forward of datagrams received by, but not addressed to, this entity. IP gateways forward datagrams. IP hosts do not (except those source-routed via the host).
<b>Host Address</b>	0x130000
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.1
<b>Type</b>	Integer
<b>Attributes</b>	Read/Write
<b>Default Value</b>	Always reads 2
<b>Implemented Version</b>	2.6.0

<b>Name</b>	ipDefaultTTL
<b>Description</b>	The default value inserted into the Time-To-Live field of the IP header of datagrams originated at this entity when a TTL value is not supplied by the transport layer protocol.
<b>Host Address</b>	0x130001
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.2
<b>Type</b>	Integer
<b>Attributes</b>	Read/Write
<b>Default Value</b>	128
<b>Implemented Version</b>	2.6.0

<b>Name</b>	ipInReceives
<b>Description</b>	The total number of input datagrams received, including those received in error.
<b>Host Address</b>	0x131000
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.3
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	ipInHdrErrors
<b>Description</b>	The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc.
<b>Host Address</b>	0x131001
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.4
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	ipInAddrErrors
<b>Description</b>	The number of input datagrams discarded because the IP address in the IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported Classes (e.g., Class E). For entities which are not IP Gateways and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.
<b>Host Address</b>	0x131002
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.5
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	ipForwDatagrams
<b>Description</b>	The number of input datagrams for which this entity was not the final IP destination, as a result of which an attempt was made to find a route to forward them to the final destination. In entities which do not act as IP Gateways, this counter will include only those packets which were Source-Routed via this entity, and the Source-Route option processing was successful.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.6
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	ipInUnknownProtos
<b>Description</b>	The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
<b>Host Address</b>	0x131003
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.7
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	ipInDiscards
<b>Description</b>	The number of IP datagrams received successfully but which were discarded (e.g., for lack of buffer space). Note that this counter does not include datagrams discarded while awaiting re-assembly.
<b>Host Address</b>	0x131004
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.8
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	ipInDelivers
<b>Description</b>	The total number of input datagrams successfully delivered to IP user-protocols (including ICMP)
<b>Host Address</b>	0x131005
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.9
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	ipOutRequests
<b>Description</b>	The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. Note that this does not include datagrams counted in <i>ipForwDatagrams</i> .
<b>Host Address</b>	0x131006
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.10
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	ipOutDiscards
<b>Description</b>	The number of IP datagrams for which no problem existed to prevent their transmission, but which were discarded (e.g., for lack of buffer space). Note that this counter would include datagrams counted in <i>ipForwDatagrams</i> if any such packets met this (discretionary) discard criterion.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.11
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	ipOutNoRoutes
<b>Description</b>	The number of IP datagrams discarded because no route could be found to transmit them to their destination. Note that this counter includes packets counted in <i>ipForwDatagrams</i> which meet this 'no-route' criterion. This includes any datagrams which cannot route because all of its default gateways are down.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.12
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	ipReasmTimeout
<b>Description</b>	The maximum number of seconds which received fragments are held while they are awaiting reassembly.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.13
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	ipReasmReqds
<b>Description</b>	The number of IP fragments received which needed to be reassembled.
<b>Host Address</b>	0x131007
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.14
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	ipReasmOKs
<b>Description</b>	The number of IP datagrams successfully re-assembled.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.15
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	ipReasmFails
<b>Description</b>	The number of failures detected by the IP re-assembly algorithm (for whatever reason: timed out, errors, etc). Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received. This value will always increment on receipt of a fragmented packet as CobraNet does not support packet re-assembly
<b>Host Address</b>	0x131007 (same as ipReasmReqs)
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.16
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	ipFragOKs
<b>Description</b>	The number of IP datagrams that have been successfully fragmented at this entity. The CobraNet interface does not support fragmentation. This variable will always read 0.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.17
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	ipFragFails
<b>Description</b>	The number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be, e.g., because their Don't Fragment flag was set. The CobraNet interface does not support fragmentation. This variable will always read 0.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.18
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	ipFragCreates
<b>Description</b>	The number of IP datagram fragments that have been generated as a result of fragmentation at this entity. The CobraNet interface does not support fragmentation. This variable will always read 0.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.19
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	ipRoutingDiscards
<b>Description</b>	The number of routing entries which were chosen to be discarded even though they are valid. One possible reason for discarding such an entry could be to free-up buffer space for other routing entries. The CobraNet interface does not support routing. This variable will always read 0.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.4.23
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

**6.3.5 UDP**

<b>Name</b>	udpInDatagrams
<b>Description</b>	The total number of UDP datagrams delivered to UDP users.
<b>Host Address</b>	0x140000
<b>SNMP Object ID</b>	1.3.6.1.2.1.7.1
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	udpNoPorts
<b>Description</b>	The total number of received UDP datagrams for which there was no application at the destination port.
<b>Host Address</b>	0x140001
<b>SNMP Object ID</b>	1.3.6.1.2.1.7.2
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	udpInErrors
<b>Description</b>	The number of received UDP datagrams that could not be delivered for reasons other than lack of an application at the destination port.
<b>Host Address</b>	0x140002
<b>SNMP Object ID</b>	1.3.6.1.2.1.7.3
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	udpOutDatagrams
<b>Description</b>	The total number of UDP datagrams sent from this entity.
<b>Host Address</b>	0x140003
<b>SNMP Object ID</b>	1.3.6.1.2.1.7.4
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	udpLocalAddress
<b>Description</b>	The local IP address for this UDP listener. In the case of a UDP listener which is willing to accept datagrams for any IP interface associated with the node, the value 0.0.0.0 is used.
<b>Host Address</b>	N.A.
<b>SNMP Object ID</b>	N.A.
<b>Type</b>	IpAddress
<b>Attributes</b>	Read-only
<b>Default Value</b>	N.A.
<b>Implemented Version</b>	Not supported

<b>Name</b>	udpLocalPort
<b>Description</b>	The local port number for this UDP listener.
<b>Host Address</b>	N.A.
<b>SNMP Object ID</b>	N.A.
<b>Type</b>	Integer16
<b>Attributes</b>	Read-only
<b>Default Value</b>	N.A.
<b>Implemented Version</b>	Not supported

**6.3.6 SNMP**

<b>Name</b>	snmpInPkts
<b>Description</b>	The total number of SNMP Messages received from the transport service
<b>Host Address</b>	0x150000
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.1
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	snmpOutPkts
<b>Description</b>	The total number of SNMP Messages passed to the transport service.
<b>Host Address</b>	0x150001
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.2
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	snmpInBadVersions
<b>Description</b>	The total number of SNMP Messages received which were for an unsupported SNMP version.
<b>Host Address</b>	0x150002
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.3
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	snmpInBadCommunityNames
<b>Description</b>	The total number of SNMP Messages received which used an unknown community name.
<b>Host Address</b>	0x150003
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.4
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	snmpInBadCommunityUses
<b>Description</b>	The total number of SNMP Messages received for which an operation was not allowed by the SNMP community named in the Message.
<b>Host Address</b>	0x150004
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.5
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	snmpInASNParseErrs
<b>Description</b>	The total number of ASN.1 or BER errors encountered when decoding received SNMP Messages.
<b>Host Address</b>	0x150005
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.6
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	snmpInTooBig
<b>Description</b>	The total number of SNMP PDUs received for which the value of the error-status field was `tooBig`.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.8
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	Always reads 0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	snmpInNoSuchNames
<b>Description</b>	The total number of SNMP PDUs received for which the value of the error-status field was `noSuchName`.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.9
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	Always reads 0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	snmpInBadValues
<b>Description</b>	The total number of SNMP PDUs received for which the value of the error-status field was `badValue`.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.10
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	Always reads 0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	snmplnReadOnlys
<b>Description</b>	The total number of valid SNMP PDUs received for which the value of the error-status field was `readOnly`. Note that it is a protocol error to generate an SNMP PDU which contains the value `readOnly` in the error-status field. This object is provided as a means of detecting incorrect implementations of SNMP.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.11
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	Always reads 0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	snmplnGenErrs
<b>Description</b>	The total number of SNMP PDUs received for which the value of the error-status field was `genErr`.
<b>Host Address</b>	Not Available
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.12
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	Always reads 0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	snmplnTotalReqVars
<b>Description</b>	The total number of MIB objects which have been retrieved successfully as a result of receiving valid SNMP Get-Request and Get-Next PDUs.
<b>Host Address</b>	0x150006
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.13
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	snmplnTotalSetVars
<b>Description</b>	The total number of MIB objects which have been altered successfully as a result of receiving valid SNMP Set-Request PDUs.
<b>Host Address</b>	0x150007
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.14
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	snmplnGetRequests
<b>Description</b>	The total number of SNMP Get-Request PDUs which have been accepted and processed.
<b>Host Address</b>	0x150008
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.15
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.0

<b>Name</b>	snmplnGetNexts
<b>Description</b>	The total number of SNMP Get-Next PDUs which have been accepted and processed.
<b>Host Address</b>	0x150009
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.16
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.3

<b>Name</b>	snmpInSetRequests
<b>Description</b>	The total number of SNMP Set-Request PDUs which have been accepted and processed.
<b>Host Address</b>	0x15000A
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.17
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.3

<b>Name</b>	snmpInGetResponses
<b>Description</b>	The total number of SNMP Get-Response PDUs which have been accepted and processed.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.18
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	Always reads 0
<b>Implemented Version</b>	2.6.3

<b>Name</b>	snmpInTraps
<b>Description</b>	The total number of SNMP Trap PDUs which have been accepted and processed.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.19
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	Always reads 0
<b>Implemented Version</b>	2.6.3

<b>Name</b>	snmpOutTooBig
<b>Description</b>	The total number of SNMP PDUs generated for which the value of the error-status field was 'tooBig.'
<b>Host Address</b>	0x15000B
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.20
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.3

<b>Name</b>	snmpOutNoSuchNames
<b>Description</b>	The total number of SNMP PDUs generated for which the value of the error-status was 'noSuchName'.
<b>Host Address</b>	0x15000C
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.21
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.3

<b>Name</b>	snmpOutBadValues
<b>Description</b>	The total number of SNMP PDUs generated for which the value of the error-status field was 'badValue'.
<b>Host Address</b>	0x15000D
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.22
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.3

<b>Name</b>	snmpOutGenErrs
<b>Description</b>	The total number of SNMP PDUs generated for which the value of the error-status field was 'genErr'.
<b>Host Address</b>	0x15000E
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.24
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.3

<b>Name</b>	snmpOutGetRequests
<b>Description</b>	The total number of SNMP Get-Request PDUs generated.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.25
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	Always reads 0
<b>Implemented Version</b>	2.6.3

<b>Name</b>	snmpOutGetNexts
<b>Description</b>	The total number of SNMP Get-Next PDUs generated.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.26
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	Always reads 0
<b>Implemented Version</b>	2.6.3

<b>Name</b>	snmpOutSetRequests
<b>Description</b>	The total number of SNMP Set-Request PDUs generated.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.27
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	Always reads 0
<b>Implemented Version</b>	2.6.3

<b>Name</b>	snmpOutGetResponses
<b>Description</b>	The total number of SNMP Get-Response PDUs generated.
<b>Host Address</b>	0x150001 (same as <i>snmpOutPackets</i> )
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.28
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.3

<b>Name</b>	snmpOutTraps
<b>Description</b>	The total number of SNMP Trap PDUs generated.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.29
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	Always reads 0
<b>Implemented Version</b>	2.6.3

<b>Name</b>	snmpEnableAuthenTraps
<b>Description</b>	Indicates whether the SNMP agent process is permitted to generate authentication-failure traps. The value of this object overrides any configuration information. It provides a means to disable all authentication-failure traps.
<b>Host Address</b>	0x15000F
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.30
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	Always reads 2
<b>Implemented Version</b>	2.6.0

<b>Name</b>	snmpSilentDrops
<b>Description</b>	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs received which were silently dropped because the size of a reply containing an alternate Response-PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.31
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	Always reads 0
<b>Implemented Version</b>	2.6.3

<b>Name</b>	snmpProxyDrops
<b>Description</b>	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs received which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response-PDU could be returned.
<b>Host Address</b>	Not available
<b>SNMP Object ID</b>	1.3.6.1.2.1.11.32
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	Always reads 0
<b>Implemented Version</b>	2.6.3

## 6.4 CobraNet Variables

### 6.4.1 Firmware

<b>Name</b>	firmwareProtocolVersion
<b>Description</b>	Highest CobraNet protocol version supported by firmware. Current protocol version is 2. A protocol version of 0 indicates an unsupported test version of firmware.
<b>Host Address</b>	0x0
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.1.1
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.1.0

<b>Name</b>	firmwareMajorVersion
<b>Description</b>	CobraNet firmware major revision number.
<b>Host Address</b>	0x1
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.1.2
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.1.0

<b>Name</b>	firmwareMinorVersion
<b>Description</b>	CobraNet firmware minor revision number.
<b>Host Address</b>	0x2
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.1.3
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.1.0

<b>Name</b>	firmwareBootVersion
<b>Description</b>	Configuration record revision number. The configuration record contains the MAC address for the interface and other permanent initialization parameters.
<b>Host Address</b>	0x3
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.1.4
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.1.0

<b>Name</b>	firmwareMfgId
<b>Description</b>	Identifies the manufacturer of the CobraNet device. 0 represents unknown.
<b>Host Address</b>	0x4
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.1.5
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.1.0

<b>Name</b>	firmwareMfgProductId
<b>Description</b>	Identifies product type per manufacturer. Product identifiers are unique per manufacturer identifier. 0 represents unknown product.
<b>Host Address</b>	0x5
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.1.6
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.1.0

<b>Name</b>	firmwareMfgVersion
<b>Description</b>	A manufacturer assigned minor revision number for firmware. A non-zero value indicates manufacturer has made some modification to the standard firmware as released by Cirrus Logic.
<b>Host Address</b>	0x6
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.1.7
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.1.0

<b>Name</b>	firmwareRestart
<b>Description</b>	Reboots the interface when set to a non-zero value. Invoking this function will cause loss of communications. The interface will attempt to send a response to an SNMP set request before restarting. Due to the nature of SNMP, receipt of such a response by the manager is not guaranteed. Invoking this feature via HMI will cause the HMI to become inoperable until the interface has completed re-initialization. A successful restart can be verified by reading the <i>sysUpTime</i> variable. <i>sysUpTime</i> returns to 0 following a restart. A restart via SNMP may adversely affect an HMI connected host processor. Care should be taken to insure that a host processor attempting to communicate via HMI during reset can recover from the HMI's failure to respond and, further, that the host processor will continue to function properly following reinitialization of the MI variables to their default or persistent values.
<b>Host Address</b>	0x100
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.1.8
<b>Type</b>	Integer
<b>Attributes</b>	Read/Write
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.3. Not implemented on 32-bit platforms.

<b>Name</b>	firmwareFreeCycles
<b>Description</b>	Free CPU cycles in thousandths. For example, 475 means 47.5% of CPU cycles are free, i.e., running idle loop.
<b>Host Address</b>	0x9
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.1.11
<b>Type</b>	Integer32 for CS18101-based firmware. Integer24 for Motorola-based firmware.
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.9.12 for Motorola-based firmware; 2.10.5 for CS1810xx-based firmware.

### 6.4.2 Hardware Identification

Different platforms and hardware version have different channel and processing capacities. By recognizing the capabilities of the interface, the host may optimize the configuration to take advantage of the capabilities.

Before the introduction of the variables documented below, the host could use sysDescr, sysObjectID and firmwareVersion\* to determine the capabilities. With the introduction of the CM-1 rev F, these variables no longer fully characterize the interface. CM-1 rev F features a memory speed increase and thus a capacity improvement over CM-1 rev E and previous revisions.

<b>Name</b>	firmwareHardwarePlatform
<b>Description</b>	CobraNet interface hardware platform. 1 - RAVE 2 - Reference design 3 - High capacity reference design 4 - CM-1 with AMD flash memory (alternate supplier) 5 - CM-1 with Micron flash memory (standard supplier) 18100 - CS18100 18101 - CS18101 18102 - CS18102 18110 - CS18110 18111 - CS18111 18112 - CS18112
<b>Host Address</b>	0x7
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.1.9
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.9.10, 2.10.5

<b>Name</b>	firmwareHardwareVersion
<b>Description</b>	Version number specific to platform. 1 - Reported for all RAVE and reference design hardware as these platforms lack hardware version identification feature: CM-1 rev A-C (95Mhz) and CS18101 rev 1 (prototypes). 2 - CM-1 rev C-E (100 MHz-capable), CS18xxx rev 2. 3 - CM-1 rev F (1 WS-capable)
<b>Host Address</b>	0x8
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.1.10
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.9.10 (2.10.5 for CS18101-based firmware)

### 6.4.3 Flash

<b>Name</b>	flashTotalSize
<b>Description</b>	Total flash memory size in bytes.
<b>Host Address</b>	0x1000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.2.1
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.1.0

<b>Name</b>	flashSectorSize
<b>Description</b>	Largest flash sector size in bytes. Sector size is visible via TFTP where each sector is presented as a system file. Some flash memories have sectors that vary in size and it is not safe to use this variable to determine sector size. The safe way to determine sector size is to read each sector via TFTP. The amount of data returned will indicate the sector size.
<b>Host Address</b>	0x1001
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.2.2
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.1.0

<b>Name</b>	flashPersistSequence
<b>Description</b>	Sequence number for persistence storage. This gives an approximate indication of the wear on the flash memory from persistent stores. The sequence number is incremented each time a sector is erased to make room for a persistent store. Typically two sectors are used for persistent storage. The sequence number divided by the number of sectors used for persistence yields the approximate erase cycle count each sector has experienced. Flash memory is typically rated for no less than 100,000 erase cycles.
<b>Host Address</b>	0x1002
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.2.3
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.8.1

<b>Name</b>	flashPersistType
<b>Description</b>	Indicates the type identifier for the persistent store dataset. If firmware is updated to a version that uses a different dataset type (or different size), persistent settings will be lost.
<b>Host Address</b>	0x1003
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.2.4
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.8.1

<b>Name</b>	flashPersistSize
<b>Description</b>	Size in words of the persistent store dataset. If firmware is updated to a version that uses a different dataset size (or different type), persistent settings will be lost.
<b>Host Address</b>	0x1004
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.2.5
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.8.1

<b>Name</b>	flashPersistStores
<b>Description</b>	The number of times variables have been written to flash during <i>sysUpTime</i> . Use of <i>flashPersistAck</i> is preferred to determine completion of a persistent save operation.
<b>Host Address</b>	0x1005
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.2.6
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.8.1

<b>Name</b>	flashTAcknowledge
<b>Description</b>	A semaphore variable updated to the value of <i>flashTRequest</i> on completion of a flash write.
<b>Host Address</b>	0x1006
<b>SNMP Object Identifier</b>	Not available via SNMP
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.8.6

<b>Name</b>	flashPersistEnable
<b>Description</b>	Non-zero value enables variable persistence feature. Read/write - Persistent type variables will be automatically written to non-volatile memory when changed. Values will be restored on power-up.
<b>Host Address</b>	0x1100
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.2.7
<b>Type</b>	Integer
<b>Attributes</b>	Read/write - Persistent
<b>Default Value</b>	0
<b>Implemented Version</b>	2.8.1

<b>Name</b>	flashPersistAck
<b>Description</b>	Forces a write of variables to non-volatile memory when set to a non-zero value. Value returns to zero when write has completed. This value will not change if persistence is disabled. This feature is recommended for use during factory configuration where writing and confirmation of success must be done in a timely manner. In normal use it is best to let the interface schedule writes to non-volatile memory. Over-use of this feature can result in excessive wear on the flash device.
<b>Host Address</b>	0x1200
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.2.8
<b>Type</b>	Integer
<b>Attributes</b>	Read/Write
<b>Default Value</b>	0
<b>Implemented Version</b>	2.8.1

<b>Name</b>	flashTRequest
<b>Description</b>	When changed, causes data transfer to begin between flash memory and <i>bridgeTxPktBuffer</i> . Transfer begins when set to a value different than <i>flashTAcknowledge</i> .
<b>Host Address</b>	0x1201
<b>SNMP Object Identifier</b>	Not available via SNMP
<b>Type</b>	Integer
<b>Attributes</b>	Read/Write
<b>Implemented Version</b>	2.8.6

<b>Name</b>	flashTAddress
<b>Description</b>	Specifies the source (read) or destination (write) address in flash memory. This address is a byte offset into flash memory. For an erase operations this variable can be set to any address within the sector to be erased. Following read and write operations <i>flashTAddress</i> is incremented by <i>flashTLength</i> ( $flashTAddress += flashTLength$ )
<b>Host Address</b>	0x1202
<b>SNMP Object Identifier</b>	Not available via SNMP
<b>Type</b>	Integer
<b>Attributes</b>	Read/Write
<b>Implemented Version</b>	2.8.6

<b>Name</b>	flashTLength
<b>Description</b>	Specifies the number of bytes to be transferred between flash and transmit buffer. This value should never exceed the byte size of <i>bridgeTxPktBuffer</i> . A flash operation is not allowed to straddle a sector boundary. This variable is ignored for erase operations.
<b>Host Address</b>	0x1203
<b>SNMP Object Identifier</b>	Not available via SNMP
<b>Type</b>	Integer
<b>Attributes</b>	Read/Write
<b>Implemented Version</b>	2.8.6

<b>Name</b>	flashTDirection
<b>Description</b>	Specifies whether the transaction is a flash sector read, write or erase. 0 - Read flash to transmit buffer 1 - Write flash from transmit buffer 2 - Erase flash sector
<b>Host Address</b>	0x1204
<b>SNMP Object Identifier</b>	Not available via SNMP
<b>Type</b>	Integer
<b>Attributes</b>	Read/Write
<b>Implemented Version</b>	2.8.6

### 6.4.4 Errors

<b>Name</b>	errorPOSTResults
<b>Description</b>	Power on self-test results. 0 - no errors detected. Currently the CobraNet interface does not recover from a POST failure. This variable will always report 0. A POST failure is reported by the indicator LED's. A self-reset will be attempted following the error report.
<b>Host Address</b>	0x2000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.3.1
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	errorIndicators
<b>Description</b>	This value is a sum of exclusive binary values which can be OR'd to represent multiple errors. 0x01 - Fault 0x04 - Receive error 0x08 - Transmit error 0x10000 - Audio mute (audio output may be corrupt) 0x20000 - BuddyLink output disabled (fault or lost contact with the network) 0x40000 - Unexpected system error (diagnostic information on firmware fault may be available in <i>errorDisplay</i> )
<b>Host Address</b>	0x2001
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.3.2
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.1.0

<b>Name</b>	errorCode
<b>Description</b>	Last error code reported. On 24-bit platforms, error code is a byte in MS byte position of this variable. On 32-bit platforms, error code is a byte in LS byte position of this variable. Some values are warnings and will not affect <i>errorIndicators</i> . See error table. Note: this variable has also been referred to as <i>errorLast</i> in older documentation and MIB files.
<b>Host Address</b>	0x2002
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.3.3
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	errorCount
<b>Description</b>	Number of errors reported during <i>sysUpTime</i> . Some errors are warnings and do not affect <i>errorIndicators</i> .
<b>Host Address</b>	0x2003
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.3.4
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	errorDisplay
<b>Description</b>	Error code to display on a user interface. Error codes are displayed for serious and unexpected error conditions. A value of 0 indicates there is no error code to display.
<b>Host Address</b>	0x2004
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.3.5
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	modeRateStatus
<b>Description</b>	Indicates the latency and sample rate operating mode currently in effect for the interface. <i>modeRateStatus</i> and <i>modeRateControl</i> will differ if an unsupported mode value is written to <i>modeRateControl</i>
<b>Host Address</b>	0x2005
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.3.6.2
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.9.0

<b>Name</b>	modeRateControl
<b>Description</b>	Selects latency and sample rate mode for the interface. The following modes are supported: 0x701 - 5-1/3 ms latency, 96 kHz sample rate 0x600 - 5-1/3 ms latency, 48 kHz sample rate 0x601 - 2-2/3 ms latency, 96 kHz sample rate 0x500 - 2-2/3 ms latency, 48 kHz sample rate 0x501 - 1-1/3 ms latency, 96 kHz sample rate 0x400 - 1-1/3 ms latency, 48 kHz sample rate
<b>Host Address</b>	0x2100
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.3.6.1
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	0x600
<b>Implemented Version</b>	2.9.0

### 6.4.5 Conductor

These variables determine the values transmitted in the header of the Beat Packet when the CobraNet interface is acting as the network conductor.

<b>Name</b>	conductorCycleRate
<b>Description</b>	Number of isochronous cycles per second as a 16.16 fixed point number. This is a legacy variable. It always reports default value and should not be changed.
<b>Host Address</b>	0x10000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.4.1
<b>Type</b>	Integer48
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	750
<b>Implemented Version</b>	2.2.0

<b>Name</b>	conductorPriority
<b>Description</b>	Specifies the conductor priority for a CobraNet device. The device with the highest priority will become the conductor for the network. MS byte must be 0. 0 - Never Conduct 0x1 - Lowest conductor priority 0xFF - highest conductor priority
<b>Host Address</b>	0x10002
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.4.2
<b>Type</b>	Integer16
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	0x20 for reference design, 0x30 for CM-1, CS4961xx, and CS1810xx.
<b>Implemented Version</b>	2.2.0

<b>Name</b>	conductorGaps
<b>Description</b>	These timing specifications are applicable only to repeater networks and therefore do not apply to most CobraNet applications. This variable is changed on the active conductor in order to reduce the probability of collisions. In most cases the default value works well. Useful values other than the default are dependant on the specific network topology used. Channel Gap in LS byte - Larger channel gaps allow greater network diameter. Packet Gap in MS byte - Larger packet gaps increase resilience to unregulated traffic.
<b>Host Address</b>	0x10003
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.4.3
<b>Type</b>	Integer16
<b>Attributes</b>	Read/write - Persistent
<b>Default Value</b>	0x0306
<b>Implemented Version</b>	2.2.0

<b>Name</b>	conductorStatus
<b>Description</b>	Conductor status: 0 - This interface is not the conductor 1 - This interface is the conductor
<b>Host Address</b>	0x11000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.4.4
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.1.0

### 6.4.6 Conductor Information

These conductor variables give a description and status of the current conductor of the CobraNet network.

<b>Name</b>	condInfoPriority
<b>Description</b>	Conductor priority of the current conductor. 1 - Lowest conductor priority 255 - highest conductor priority If the priority of the current conductor is adjusted, <i>condInfoPriority</i> will change to reflect this. Dependent on priority setting of other devices on the network, a change in current conductor priority does not necessarily induce a change in conductor and <i>condInfoMAC</i> .
<b>Host Address</b>	0x11001
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.4.5
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.9.12 (24-bit platforms only.) Not available on 32-bit platforms.

<b>Name</b>	condInfoMAC
<b>Description</b>	Ethernet MAC address of the current conductor. condInfoMAC should read 00:00:00:00:00:00 if there is no conductor on the network. There is no conductor if there is 0 or 1 CobraNet device(s) attached to the network or if all CobraNet devices have a condPriority setting of 0.
<b>Host Address</b>	0x11002
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.4.6
<b>Type</b>	Physical Address
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.9.12 (24-bit platforms only.) Not available on 32-bit platforms.

<b>Name</b>	condInfoLastChange
<b>Description</b>	sysUpTime value at time of last change to condInfoMAC.
<b>Host Address</b>	0x11005
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.4.7
<b>Type</b>	Time Ticks
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.9.12 (24-bit platforms only.) Not available on 32-bit platforms.

<b>Name</b>	condInfoChanges
<b>Description</b>	Count of condInfoMAC changes since boot. A single conductor arbitration event may produce multiple increments.
<b>Host Address</b>	0x11007
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.4.8
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.9.12 (24-bit platforms only.) Not available on 32-bit platforms.

### 6.4.7 Packet Bridge

<b>Name</b>	bridgeTxPkt
<b>Description</b>	Variable is used in conjunction with <i>bridgeTxDone</i> . If <i>bridgeTxPkt</i> and <i>bridgeTxDone</i> are equal, then it is permitted to write new packet data to <i>bridgeTxPktBuffer</i> . Setting <i>bridgeTxPkt</i> different than <i>bridgeTxDone</i> will cause the contents of the packet buffer to be transmitted. Upon transmit completion, <i>bridgeTxDone</i> will be updated to match <i>bridgeTxPkt</i> . Packet transmission can also be initiated by issuing a Packet Transmit command via HMI.
<b>Host Address</b>	0x20000
<b>SNMP Object ID</b>	Not available via SNMP
<b>Type</b>	Integer
<b>Attributes</b>	Read/Write
<b>Default Value</b>	0
<b>Implemented Version</b>	2.2.0

<b>Name</b>	bridgeRxPkt
<b>Description</b>	This variable is used in conjunction with <i>bridgeRxReady</i> . If values of <i>bridgeRxPkt</i> and <i>bridgeRxReady</i> differ, then <i>bridgeRxPktBuffer</i> contains received data and may be read by the host. Setting <i>bridgeRxPkt</i> equal to <i>bridgeRxReady</i> will release the buffer to the CobraNet interface so that the next packet can be received.
<b>Host Address</b>	0x20001
<b>SNMP Object ID</b>	Not available via SNMP
<b>Type</b>	Integer
<b>Attributes</b>	Read/Write
<b>Default Value</b>	0
<b>Implemented Version</b>	2.2.0

<b>Name</b>	bridgeMMAC
<b>Description</b>	Specifies the source multicast MAC address of packets to be received via the packet bridge. To receive multicast addressed packets, it is necessary to compute and load a multicast hash filter table into <i>bridgeHashBuffer</i> .
<b>Host Address</b>	0x20002 - 0x20004
<b>SNMP Object ID</b>	Not available via SNMP
<b>Type</b>	PhysAddress
<b>Attributes</b>	Read/Write
<b>Default Value</b>	00:00:00:00:00:00
<b>Implemented Version</b>	2.2.0

<b>Name</b>	bridgeCalcMMACHash
<b>Description</b>	This variable is used to calculate a hash value based on the address in <i>bridgeMMAC</i> . Writing a value different than <i>bridgeMMACHashDone</i> to this variable causes the calculation to begin. When complete, <i>bridgeMMACHashDone</i> will be updated with the value written here and <i>bridgeMACHashBuf</i> will contain the new hash value. Folding <i>bridgeMACHashBuf</i> results into <i>bridgeHashBuf</i> will then allow receipt of packets from the multicast address specified in <i>bridgeMMAC</i> .
<b>Host Address</b>	0x20005
<b>SNMP Object ID</b>	Not available via SNMP
<b>Type</b>	Integer
<b>Attributes</b>	Read/Write
<b>Default Value</b>	0
<b>Implemented Version</b>	2.2.0

<b>Name</b>	bridgeMMACHashBuffer
<b>Description</b>	This is the calculated hash value for the MAC address entered in <i>bridgeMMAC</i> .
<b>Host Address</b>	0x20006 - 0x20009
<b>SNMP Object ID</b>	Not available via SNMP
<b>Size</b>	4 words
<b>Type</b>	Octet String
<b>Attributes</b>	Read/Write
<b>Default Value</b>	0
<b>Implemented Version</b>	2.2.0

<b>Name</b>	bridgeHashBuffer
<b>Description</b>	This is the value loaded to the hash table of the Ethernet controller which determines the range of multicast addresses the host will receive.
<b>Host Address</b>	0x2000A - 0x2000D
<b>SNMP Object ID</b>	Not available via SNMP
<b>Size</b>	4 words
<b>Type</b>	Octet String
<b>Attributes</b>	Read/Write
<b>Default Value</b>	0
<b>Implemented Version</b>	2.2.0

<b>Name</b>	bridgeRxFilter
<b>Description</b>	<p>Selects which types of received packets will be passed to the host via the packet bridge. The following values may be ORed together. See <a href="#">Figure 4 on page 15</a>.</p> <p>0x1 - bridge unprocessed CobraNet packets  0x2<sup>1</sup> - bridge all CobraNet reservation packets  0x8<sup>1</sup> - bridge all IP packets (IP, ARP and RARP)  0x10 - bridge all packets with unknown protocol identifier</p> <p><sup>1</sup>Copies of packets are passed to the packet bridge and the originals are still processed by the CobraNet interface. Care must be taken that redundant replies are not generated.</p>
<b>Host Address</b>	0x2000E
<b>SNMP Object ID</b>	Not available via SNMP
<b>Type</b>	Integer
<b>Attributes</b>	Read/Write
<b>Default Value</b>	1
<b>Implemented Version</b>	2.6.9

<b>Name</b>	bridgeTxPktBuffer
<b>Description</b>	<p>Buffer for bridge packet transmission. The first word contains the length of the packet in bytes exclusive of the length field itself. Ethernet packet data, including complete header and payload, follows the length. The FCS field is computed and appended by the Ethernet controller and is not included as part of the packet data or length.</p> <p>See <a href="#">Section 2.2 "Packet Bridge" on page 13</a> for more information on the format and use of this buffer</p>
<b>Host Address</b>	0x21000
<b>SNMP Object ID</b>	Not available via SNMP
<b>Count</b>	758 on 24-bit platforms, 380 on 32-bit platforms.
<b>Type</b>	Integer16
<b>Attributes</b>	Read/Write
<b>Implemented Version</b>	2.2.0

<b>Name</b>	bridgeRxPktBuffer
<b>Description</b>	Buffer to read received packet. The data format for packet data is the same as used in <i>bridgeTxPktBuffer</i> .
<b>Host Address</b>	0x22000
<b>SNMP Object ID</b>	Not available via SNMP
<b>Count</b>	1 + actual packet size in words.
<b>Type</b>	Integer16
<b>Attributes</b>	Read/Write
<b>Implemented Version</b>	2.2.0

<b>Name</b>	bridgeTxDone
<b>Description</b>	Please refer to <i>bridgeTxPkt</i> documentation. This variable is used in conjunction with <i>bridgeTxPkt</i> .
<b>Host Address</b>	0x23000
<b>SNMP Object ID</b>	Not available via SNMP
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.2.0

<b>Name</b>	bridgeRxReady
<b>Description</b>	Please refer to <i>bridgeRxPkt</i> documentation. This variable is used in conjunction with <i>bridgeRxPkt</i> .
<b>Host Address</b>	0x23001
<b>SNMP Object ID</b>	Not available via SNMP
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.2.0

<b>Name</b>	bridgeMMACHashDone
<b>Description</b>	Refer to <i>bridgeCalcMMACHash</i> documentation. This variable is used in conjunction with <i>bridgeCalcMMACHash</i> .
<b>Host Address</b>	0x23002
<b>SNMP Object ID</b>	Not available via SNMP
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.2.0

<b>Name</b>	bridgeRxDropped
<b>Description</b>	Counts the number of received packet bridge packets dropped due to the receive buffer being unavailable. Packets which could be received via the packet bridge will be dropped if the host has ownership of the receive buffer ( <i>bridgeRxPktBuffer</i> ).
<b>Host Address</b>	0x23003
<b>SNMP Object ID</b>	Not available via SNMP
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.5.7

### 6.4.8 Serial Bridge

<b>Name</b>	serialFormat
<b>Description</b>	<p>This variable is used to enable or disable the Serial Communications Interface (a.k.a SCI or Serial Bridge) and to set the data format for both transmit and receive directions. Format may only be changed while the SCI is disabled (LS bit = 0). It is recommended to set <i>serialFormat</i> to 0, wait at least 100ms then set <i>serialFormat</i> to the desired value with the enable bit set. The SCI can take up to 100ms to recognize a change. This procedure insures that the change is recognized and the port is properly configured. The following values may be OR'd together:</p> <p><b>0x01</b> - Enable serial bridging. TXD pin is tri-stated when disabled.</p> <p><b>0x02</b> - Use nine-bit data format. The 9th data bit is bridged over the Ethernet along with the standard 8 data bits. 9 bit format is appropriate for the following standard serial data formats: N,9,1 E,8,1 O,8,1 M,8,1 S,8,1 N,7,2. The 8 bit data format supports the following standard serial data formats: N,8,1 E,7,1 O,7,1 M,7,1 S,7,1. If the 8th or 9th bit is used as a parity bit, it is simply bridged across the network and must be generated and/or checked by the device connected to the bridge interface. <i>CS4961xx- and CS1810xx-based hardware does not support 9-bit format: this bit is ignored.</i></p> <p><b>0x04</b> - Use SCI_SCLK to control transmit enable for multi-drop (RS485) operation. SCI_SCLK is an active high signal; transmitter should be enabled when SCI_SCLK is high. <i>CS4961xx and CS1810xx firmware does not currently support tri-state control format: this bit is ignored.</i></p> <p><b>0x08</b> - Enable local loopback. This feature is intended primarily for factory test. SCI bridging must also be enabled for loopback to operate. When loopback is enabled, received characters are directed to the SCI transmitter instead of to the network. <i>serialRxMAC</i> should be set to 00:00:00:00:00:00 to avoid transmitter contention when loopback is enabled.</p> <p><b>0x10</b> - Accept properly unicast addressed data in addition to data addressed in accordance to serialRxMAC setting.</p>
<b>Host Address</b>	0x24000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.10.1.1
<b>Type</b>	Integer
<b>Attributes</b>	Read/write - Persistent
<b>Default Value</b>	0
<b>Implemented Version</b>	2.4.7. Available via SNMP in 2.6.4. Accept unicast (0x10 bit) implemented in 2.8.8.

<b>Name</b>	serialBaud
<b>Description</b>	<p>Baud rate for transmission and reception. The baud rate is specified in bits per second. The minimum baud rate is 600 baud. Maximum baud rate is 57,600. CS4961xx- and CS1810xx-based interfaces will support baud rates up to 115,200</p>
<b>Host Address</b>	0x24001
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.10.1.2
<b>Type</b>	Integer
<b>Attributes</b>	Read/write - Persistent
<b>Default Value</b>	19200
<b>Implemented Version</b>	2.4.7 (available via SNMP in 2.6.4)

<b>Name</b>	serialPPeriod
<b>Description</b>	<p>Time in 256ths of a millisecond before a character received at the SCI port is placed in a packet and transmitted. Shorter periods to achieve lower latency are appropriate for real time connections such as MIDI. With higher settings more characters can be packed into a packet before it is transmitted resulting in increased efficiency. Higher settings are recommended for bulk data transfer applications.</p> <p>The isochronous cycle period (1-1/3 mS) determines the minimum <i>serialPPeriod</i>. Setting <i>serialPPeriod</i> below the isochronous cycle rate does not further improve responsiveness. The upper limit of responsiveness can also be affected by control channel accessibility and pipeline delays. The depth of the receive SCI character queue in combination with the baud rate determines the maximum allowed setting. The character buffer can accommodate 100 characters. This allows for operation at the default 10ms period at a baud rate of 57,600. At this baud rate, larger settings will result in buffer overflow and loss of data.</p>
<b>Host Address</b>	0x24002
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.10.1.3
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	2560 (10ms)
<b>Implemented Version</b>	2.4.7 (available via SNMP in 2.6.4)

<b>Name</b>	serialRxMAC
<b>Description</b>	<p>MAC address of the CobraNet Interface from which SCI data will be accepted. This may be any multicast address though 01:60:2B:FD:00:00 through 01:60:2B:FD:FF:FF have been reserved by Cirrus Logic for use as "asynchronous global channels." <i>ifPhysAddress</i> is the only usable unicast address (CobraNet does not support Ethernet promiscuous mode).</p>
<b>Host Address</b>	0x24003
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.10.1.4
<b>Type</b>	PhysAddress
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	01:60:2B:FD:00:00
<b>Implemented Version</b>	2.4.7 (available via SNMP in 2.6.4)

<b>Name</b>	serialTxPriority
<b>Description</b>	<p>Serial bridging bundle priority in MS byte. Higher priority bundles are transmitted earlier in the isochronous cycle and are thus less susceptible to dropouts in the event network bandwidth is exhausted. Request priority in LS byte. Contention for transmission on a bundle is resolved via request priority.</p> <p>This variable has no effect when <i>serialTxBundle</i> is 0.</p> <p><i>The reference design, CM-1, CM-2, CS4961xx, and CS1810xx-based designs do not support isochronous transmission of serial data and ignore settings for serialTXBundle and serialTxPriority.</i></p>
<b>Host Address</b>	0x24006
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.10.1.5
<b>Type</b>	Integer16
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	0x0110
<b>Implemented Version</b>	2.4.7 (available via SNMP in 2.6.4)

<b>Name</b>	serialTxBundle
<b>Description</b>	<p>On legacy repeater Ethernet networks and CobraNet interface hardware, serialTXBundle is used to specify a bundle number for use in transmitting serial data reliably over CobraNet's isochronous audio transport service. Specifying bundle 0 causes serial data to be delivered normally via the asynchronous transport. This is the default and recommended setting.</p> <p><i>The reference design, CM-1, CM-2, CS4961xx- and CS1810xx-based designs do not support isochronous transmission of serial data and ignore settings for serialTXBundle and serialTxPriority.</i></p>
<b>Host Address</b>	0x24007
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.10.1.6
<b>Type</b>	Integer16
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	0
<b>Implemented Version</b>	2.4.7 (available via SNMP in 2.6.4)

<b>Name</b>	serialTxMAC
<b>Description</b>	MAC address of the CobraNet interface to which serial data is sent. May be any multicast or unicast address.
<b>Host Address</b>	0x24100
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.10.1.7
<b>Type</b>	PhysAddress
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	01:60:2B:FD:00:00
<b>Implemented Version</b>	2.4.7 (available via SNMP in 2.6.4)

### 6.4.9 Interrupt Control

<b>Name</b>	hackEnable
<b>Description</b>	Enable conditions for asserting HACK. HACK is de-asserted by issuing an Interrupt Acknowledge HMI command. The following values may be OR'ed together <b>0x4</b> - Activate HACK on bridge packet receipt (change in <i>bridgeRxReady</i> ). <b>0x8</b> - Activate HACK on bridge packet transmission complete (change in <i>bridgeTxDone</i> ). <b>0x10</b> - Activate HACK on HMI address translation completion (change in <i>hackTranslations</i> ). <b>0x20</b> - Activate HACK on MI variable change via SNMP (change in <i>miMonSNMPDirty</i> or <i>hackSNMPModify</i> ). <b>0x40</b> - Enable HACK Timer.
<b>Host Address</b>	0x25000
<b>SNMP Object ID</b>	Not available via SNMP
<b>Type</b>	Integer
<b>Attributes</b>	Read/Write
<b>Default Value</b>	0
<b>Implemented Version</b>	2.10.4 for CS18101-based firmware only.

<b>Name</b>	hackTimerInterval
<b>Description</b>	A mask defining which bits of the network time should be locked to generate a HACK timer interrupt. The hackTimerInterval variable will be limited to powers of 2, in units of isochronous cycle intervals. The isochronous cycle interval is 1-1/3 ms. The correct mask value will be a power of 2 minus one. For example, a value of 0xffff will generate an interrupt every $256 * 1 - 1/3 = 341.33$ ms.
<b>Host Address</b>	0x25001
<b>SNMP Object ID</b>	Not available via SNMP
<b>Type</b>	Integer32
<b>Attributes</b>	Read/Write
<b>Default Value</b>	0xffffffff
<b>Implemented Version</b>	2.10.4 for CS18101-based firmware only.

<b>Name</b>	hackStatus
<b>Description</b>	Indicates the source of a HACK assertion requiring acknowledge. The following values may be OR'd together. Undocumented bits should be ignored: <b>0x01</b> - A new receive packet is available in the receive buffer. Host should read packet data from receive buffer and then acknowledge receipt. <b>0x02</b> - No transmission in progress. Host may write transmit packet data into the transmit buffer. On 32-bit platforms, these bits may also be read in the HMI status register <i>Received packet available</i> and <i>Packet transmission complete</i> .
<b>Host Address</b>	0x25100
<b>SNMP Object ID</b>	Not available via SNMP
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.8.5

<b>Name</b>	hackTranslations
<b>Description</b>	Incremented when a translate address command completes. On 32-bit platforms, this information is also available through the <i>Translation Complete</i> bit in the HMI status register.
<b>Host Address</b>	0x25101
<b>SNMP Object ID</b>	Not available via SNMP
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.8.5

<b>Name</b>	hackSNMPModify
<b>Description</b>	Copy of <i>miMonSNMPDirty</i> .
<b>Host Address</b>	0x25102
<b>SNMP Object ID</b>	Not available via SNMP
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.8.5

<b>Name</b>	hackReadLength
<b>Description</b>	Size of readable area in words for the last address traslation. 0 if read permission is denied (invalid address). This variable is updated upon completion of a translate address operation. On 32-bit platforms, this information is also available through the <i>Region length</i> field in the status register.
<b>Host Address</b>	0x25103
<b>SNMP Object ID</b>	Not available via SNMP
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.8.5

<b>Name</b>	hackWriteLength
<b>Description</b>	Size of writable area in words for the last address traslation. 0 if write permission is denied (invalid address or read only region). This variable is updated upon completion of a translate address operation. On 32-bit platforms, this information is also available through the <i>Region length</i> field in the status register.
<b>Host Address</b>	0x25104
<b>SNMP Object ID</b>	Not available via SNMP
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.8.5

<b>Name</b>	hackNTime
<b>Description</b>	CobraNet network time - a copy of <i>syncNTime</i> . CS4961xx and CS1810xx only.
<b>Host Address</b>	0x25105
<b>SNMP Object ID</b>	Not available via SNMP
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.9.9 (2.10.4 for CS18101-based firmware)

### 6.4.10 Audio

<b>Name</b>	audioMeterDropouts
<b>Description</b>	This counter is incremented each isochronous cycle that metering is not performed. Metering may be skipped when processor cycles are in high demand on the interface.
<b>Host Address</b>	0x30000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.5.1
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.2.0

<b>Name</b>	audioAllowedChannels
<b>Description</b>	Number of audio channels this CobraNet interface is licensed to handle. <i>AudioAllowedChannels</i> < <i>audioRxChannels</i> + <i>audioTxChannels</i> indicates a licensing violation. <u>There are <b>NO</b> license fees on CS4961xx- and CS1810xx-based interfaces. Channel accounting is not implemented. On CS4961xx and CS1810xx, audioAllowedChannels, audioRxChannels and audioTxChannels always read 0.</u>
<b>Host Address</b>	0x30001
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.5.6
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	Read from flash configuration record.
<b>Implemented Version</b>	2.8.3.

<b>Name</b>	audioRxChannels
<b>Description</b>	Number of unique audio channels currently being received from the network. <u>On CS4961xx- and CS1810xx-based interfaces this variable always reads 0.</u>
<b>Host Address</b>	0x30002
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.5.7
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.8.3.

<b>Name</b>	audioTxChannels
<b>Description</b>	Number of unique audio channels currently being transmitted to the network. <i>On CS4961xx and CS1810xx this variable always reads 0.</i>
<b>Host Address</b>	0x30003
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.5.8
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.8.3.

<b>Name</b>	audioMeterDecay
<b>Description</b>	Decay time constant for <i>audioMeters</i> . Meters have an instantaneous attack time that cannot be adjusted. This constant can be computed from the desired decay time (t) as: <b>24-bit platforms:</b> $0x800000 \times ((1 - \tan(1/(1500 \times t))) / (1 + \tan(1/(1500 \times t))))$ <b>32-bit platforms:</b> $0x80000000 \times ((1 - \tan(1/(1500 \times t))) / (1 + \tan(1/(1500 \times t))))$ For reasonably large decay times (>50ms) this can be approximated as: <b>24-bit platforms:</b> $0x800000 \times (((1500 \times t) - 1) / ((1500 \times t) + 1))$ <b>32-bit platforms:</b> $0x80000000 \times (((1500 \times t) - 1) / ((1500 \times t) + 1))$ Example decay settings: 0 - Instantaneous 8170671 (0x7CACAF) 24-bit, 2091691776 (0x7CACAF00) 32-bit - 50ms 8333053 (0x7F26FD) 24-bit, 2133261568 (0x7F26FD00) 32-bit - 200ms 8377430 (0x7FD456) 24-bit, 2144622080 (0x7FD45600) 32-bit - 1 second 8388235 (0x7FFE86) 24-bit, 2147388160 (0x7FFE8600) 32-bit - 30 seconds
<b>Host Address</b>	0x30100
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.5.5
<b>Type</b>	Integer
<b>Attributes</b>	Read/write - Persistent
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.9

<b>Name</b>	audioMeterMap
<b>Description</b>	Maps audio routing channels to audio metering. Meters 0-31 are designated for metering audio inputs. Meters 32-63 are designated for metering outputs. The first unassigned (null or unconnected routing channel) in each section terminates meter processing. It is not possible to activate meter 3 without first activating meter 2, for instance.
<b>Host Address</b>	0x31000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.5.2.1.2
<b>Count</b>	64
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	0
<b>Implemented Version</b>	2.2.0

<b>Name</b>	audioMeterPeaks
<b>Description</b>	The peak level is the highest level recorded since the last time the meters were reset. Level is represented as a 24- of 32-bit positive value. 0 indicating the absence of signal and 0x7FFFFF or 0x7FFFFFFF indicating a full-scale signal. Reset is accomplished by writing 0 to the peak level. It is not possible to determined if a peak level is missed between the time the variable is read and when it is cleared. Also it should be recognised that it is possible for another manager to clear this variable. There is no way of determining when this has happened.
<b>Host Address</b>	0x32000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.5.2.1.3
<b>Count</b>	64
<b>Type</b>	Integer
<b>Attributes</b>	Read/write
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	audioMeters
<b>Description</b>	Allows reading current audio levels. Ballistics for metering comprise an instantaneous attack and exponential decay time programmable via <i>audioMeterDecay</i> . All level measurements are peak level (as opposed to RMS). Level is reported as a 24- or 32-bit positive value. 0 indicates the complete absence of signal and 0x7FFFFF or 0x7FFFFFFF indicates a full-scale signal.
<b>Host Address</b>	0x33000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.5.2.1.4
<b>Count</b>	64
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.1.0

<b>Name</b>	audioMeterPeakRaw
<b>Description</b>	Efficiently retrieves all audioMeterPeaks values in a single Get operation. On 24-bit platforms, audioMeterPeakRaw and audioMeterRaw values are packed in 3 octet words. On CS4961xx- and CS1810xx-based platforms the values are packed in 4 octet words. Byte ordering for 24-bit platforms is MS, Middle, LS. Byte ordering for 32-bit platforms is MS, Middle High, Middle Low, LS.
<b>Host Address</b>	0x32000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.5.2.1.5
<b>Count</b>	64
<b>Type</b>	Integer
<b>Attributes</b>	Read/write
<b>Default Value</b>	0
<b>Implemented Version</b>	2.9.3 (24-bit platforms), 2.10.4 (32-bit paltforms)

<b>Name</b>	audioMeterRaw
<b>Description</b>	Efficiently retrieves all audioMeters values in a single Get operation. On 24-bit platforms, audioMeterPeakRaw and audioMeterRaw values are packed in 3 octet words. On CS4961xx- and CS1810xx-based platforms the values are packed in 4 octet words. Byte ordering for 24-bit is MS, Middle, LS. Byte ordering for 32-bit platforms is MS, Middle High, Middle Low, LS.
<b>Host Address</b>	0x32000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.5.2.1.6
<b>Count</b>	64
<b>Type</b>	Integer
<b>Attributes</b>	Read/write
<b>Default Value</b>	0
<b>Implemented Version</b>	2.9.3 (24-bit platforms), 2.10.4 (32-bit paltforms)

<b>Name</b>	audioLoopSrc
<b>Description</b>	Describes source audio routing channels for performing a local audio loopback function. The first unassigned (null or unconnected routing channel) loopback entry terminates loopback processing. It is not possible to activate loopback element 3 without first activating loopback 2, for instance.
<b>Host Address</b>	0x34000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.5.3.1.2
<b>Count</b>	8 in standard firmware build.
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	audioLoopDst
<b>Description</b>	Describes destination audio routing channels for performing a local audio loopback function. See <i>audioLoopSrc</i> for a complete description.
<b>Host Address</b>	0x35000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.5.3.1.3
<b>Count</b>	8 in standard firmware build
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	audioOutputs
<b>Description</b>	List of audio output routing channels. Audio output data must be cleared to silence if data is not received over the network for the channels. By default 33 - 64 are used as outputs but these variables may be configured by the manufacturer according to the audio I/O configuration of the hardware. <b>The user should not change these values.</b>
<b>Host Address</b>	0x36000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.5.4.1.2
<b>Count</b>	32
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	{33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64}
<b>Implemented Version</b>	2.1.0

<b>Name</b>	audioMap
<b>Description</b>	Audio routing channel to synchronous serial audio channel mapping. Each entry specifies an SSI audio buffer offset corresponding to a routing channel. The first <i>audioMap</i> entry corresponds to routing channel 1. These variables are configured by the manufacturer according to the audio I/O configuration of the hardware. Cirrus Logic can assist manufacturers in determining proper configuration of these variables to match audio I/O hardware. <b>The user should not change these values.</b>
<b>Host Address</b>	0x37000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.5.2.1.5
<b>Count</b>	64
<b>Type</b>	Integer
<b>Attributes</b>	Read/write - Persistent
<b>Default Value</b>	Product specific
<b>Implemented Version</b>	2.1.0

<b>Name</b>	audioDupSrc
<b>Description</b>	A vector used to specify the source audio routing channels used in audio channel duplication. Each audioDupSrc vector member will have a corresponding audioDupDst member corresponding to each available duplication channel. AudioDupSrc will contain the source audio routing channel number and audioDupDst will contain the corresponding destination audio routing channel. The audio routing channel chosen as either a source or destination must be an output channel (i.e. appear in audioOutputs which, by default, consists of audio routing channels 33-64). The first unassigned entry (null or unconnected routing channel for either source or destination) terminates dup processing. For instance, it is not possible to specify dup channel 3 without first specifying dup channel 2.
<b>Host Address</b>	0x38000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.5.9.1.2
<b>Count</b>	0 in standard CM-1 firmware, 8 in CS4961xx and CS1810xx firmware.
<b>Type</b>	Integer
<b>Attributes</b>	Read/Write
<b>Implemented Version</b>	2.8.5

<b>Name</b>	audioDupDst
<b>Description</b>	A vector used to specify the source audio routing channels used in audio channel duplication. See audioDupSrc.
<b>Host Address</b>	0x39000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.5.9.1.3
<b>Count</b>	0 in standard CM-1 firmware, 8 in CS4961xx and CS1810xx firmware.
<b>Type</b>	Integer
<b>Attributes</b>	Read/Write
<b>Implemented Version</b>	2.8.5

<b>Name</b>	audioMeterPeaksRaw
<b>Description</b>	Efficiently retrieve all <i>audioMeterPeaks</i> values in a single Get operation. <b>24-bit platforms:</b> values are packed in 3 octet words. Byte ordering is Most Significant, Middle, Least Significant. <b>32-bit platforms:</b> values are packed in 4 octet words. Byte ordering is Most Significant, Middle High, Middle Low, Least Significant.
<b>Host Address</b>	Not available via HMI
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.5.10
<b>Type</b>	Octet string
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.9.3, 2.10.5

<b>Name</b>	audioMetersRaw
<b>Description</b>	Efficiently retrieve all <i>audioMeters</i> values in a single Get operation. <b>24-bit platforms:</b> values are packed in 3 octet words. Byte ordering is Most Significant, Middle, Least Significant. <b>32-bit platforms:</b> values are packed in 4 octet words. Byte ordering is Most Significant, Middle High, Middle Low, Least Significant.
<b>Host Address</b>	Not available via HMI
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.5.11
<b>Type</b>	Octet string
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.9.3, 2.10.5

<b>Name</b>	audioSSIFormat
<b>Description</b>	Format of SSI channel data. 0 - Normal Mode 1 - I2S Mode 2 - Standard Mode Default is Normal Mode  See Hardware User's Manual for SSI mode descriptions.
<b>Host Address</b>	0x30004
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.5.12
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.9.10, 2.10.5

### 6.4.11 Receivers

<b>Name</b>	rxStatus
<b>Description</b>	Indicates bundle reception. Bundle reception does not necessarily indicate audio reception. Consult <i>rxSubFormat</i> variables for audio reception status. <b>0</b> - Bundle is not being received <b>1</b> - Bundle is being received
<b>Host Address</b>	0x4n000 (n is 0 based receiver number)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.6.1.1.6.n (n is 1 based receiver number)
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.1.0

<b>Name</b>	rxDropouts
<b>Description</b>	Counts number of times bundle reception has been interrupted. Interruptions can be caused by transmitter failure or by reconfiguring the receiver. This variable is implemented by counting transitions to 0 of <i>rxStatus</i> .
<b>Host Address</b>	0x4n001 (n is 0 based receiver number)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.6.1.1.7.n (n is 1 based receiver number)
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	rxDelay
<b>Description</b>	Indicates additional group delay imposed on the received audio due to network forwarding delays. Delay is expressed in units of audio transmission cycles (1-1/3ms for standard 5-1/3ms latency mode, 2/3ms for 2-2/3ms latency mode and 1/3ms for 1-1/3ms latency mode). Forwarding delay is continuously monitored by the receiver. If forwarding delay changes due to a network reconfiguration or change in <i>rxBundle</i> , the receiver delay will adapt to the new conditions. A discontinuity in the audio stream will be experienced whenever the receiver delay is adjusted in this manner. Normal propagation delay is 4 isochronous cycle periods. This normal condition is indicated by a 0 reading in <i>rxDelay</i> . A reading of 1 indicates an additional isochronous cycle period delay (for a total of 5 cycles) has been inserted due to network forwarding delay.
<b>Host Address</b>	0x4n002 (n is 0 based receiver number)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.6.1.1.8.n (n is 1 based receiver number)
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.6.3

<b>Name</b>	rxMinDelay
<b>Description</b>	Selects a minimum additional delay imposed on the received audio. Delay is expressed in units of isochronous cycles (1-1/3ms for standard 5-1/3ms latency mode, 2/3ms for 2-2/3ms latency mode and 1/3ms for 1-1/3ms latency mode). This variable is designed to allow configuration of a deterministic common delay for all CobraNet interfaces in larger network installations. <i>rxDelay</i> will never be reduced below this setting. This variable is <u>not</u> designed for actively delaying audio for architectural applications. The maximum setting for <i>rxMinDelay</i> is determined by the amount of Ethernet packet buffering available on the interface. Excessive settings will result in ERROR_RXBUFFER_OVERFLOW errors and accompanying audio dropouts.
<b>Host Address</b>	0x4n106 (n is 0 based receiver number)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.6.1.1.9.n (n is 1 based receiver number)
<b>Type</b>	Integer
<b>Attributes</b>	Read/write - Persistent
<b>Default Value</b>	0
<b>Implemented Version</b>	2.8.3

<b>Name</b>	rxSubFormat
<b>Description</b>	Vector of received audio format for each sub-channel. See <a href="#">Table 6 on page 23</a> for a complete listing of valid format values. The least significant bit of these variables is set when the received format is supported for reception by the CobraNet interface. A test of this least significant bit can be used to determine correct reception on a per audio channel basis. All entries in this vector will be 0 if <i>rxStatus</i> is zero.
<b>Host Address</b>	0x4n30m (n is 0 based receiver number, m is 0 based audio channel number)
<b>Count</b>	8
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.6.2.1.3.n.m (n is 1 based receiver number, m is the 1 based sub-channel number)
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.2.0

<b>Name</b>	rxBundle
<b>Description</b>	Receive bundle assignment.
<b>Host Address</b>	0x4n100 (n is 0 based receiver number)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.6.1.1.2.n (n is 1 based receiver number)
<b>Type</b>	Integer16
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	rxSourceMAC
<b>Description</b>	Source MAC address for private channel reception. Must be set to 00:00:00:00:00:00 for public and broadcast channel reception.
<b>Host Address</b>	0x4n101 - 0x4n103 (n is 0 based receiver number)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.6.1.1.3.n (n is 1 based receiver number)
<b>Type</b>	PhysAddress
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	00:00:00:00:00:00
<b>Implemented Version</b>	2.1.0

<b>Name</b>	rxPriority
<b>Description</b>	Suggested channel priority in MS byte. Transmitter may use this suggestion when submitting forward reservations. Request priority in LS byte. If a transmitter is able to service a limited number of receivers due to <i>txUnicastMode</i> selection, the request priority determines which receivers are serviced.
<b>Host Address</b>	0x4n104 (n is 0 based receiver number)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.6.1.1.4.n (n is 1 based receiver number)
<b>Type</b>	Integer16
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	0x1010
<b>Implemented Version</b>	2.4.8

<b>Name</b>	rxBuddyExclude
<b>Description</b>	Controls BuddyLink operation for this receiver: <b>0</b> - Reverse reservations for this receiver are suspended when BuddyLink signal is detected. i.e. the interface will not be able to receive audio bundles when BuddyLink signal is detected. <b>1</b> - Reverse reservations are never suspended. Also see <i>syncBuddyLinkControl</i> .
<b>Host Address</b>	0x4n105 (n is 0 based receiver number)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.6.1.1.5.n (n is 1 based receiver number)
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	0
<b>Implemented Version</b>	2.5.0

<b>Name</b>	rxSubMap
<b>Description</b>	Audio routing channel destinations for each audio channel in a received bundle.
<b>Host Address</b>	0x4n20m (n is 0 based receiver number, m is 0 based audio channel number)
<b>Count</b>	8
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.6.2.1.2.n.m (n is 1 based receiver number, m is the 1 based audio channel number)
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	First receiver {33, 34, 35, 36, 37, 38, 39, 40} Second receiver {41, 42, 43, 44, 45, 46, 47, 48} Third receiver {49, 50, 51, 52, 53, 54, 55, 56} Fourth receiver {57, 58, 59, 60, 61, 62, 63, 64}
<b>Implemented Version</b>	2.1.0

### 6.4.12 Transmitters

<b>Name</b>	txDropouts
<b>Description</b>	Count of times channel transmission has been interrupted. Interruptions can be caused by loss of transmit permission from conductor or by changes to <i>txBundle</i> . Implemented by counting transitions to 0 of <i>txPosition</i> .
<b>Host Address</b>	0x5n000 (n is 0 based transmitter number)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.7.1.1.7.n (n is 1 based transmitter number)
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	txPosition
<b>Description</b>	Transmission permission position. 0 indicates no transmission either because the conductor has not granted permission (due to bandwidth constraints or bundle conflict) or <i>txBundle</i> is set to 0. Valid values are 0 through the number of bundles active on the network. A value of 1 indicates the transmitter has the highest priority on the network and will be the last to be dropped if bandwidth is exhausted.
<b>Host Address</b>	0x5n001 (n is 0 based transmitter number)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.7.1.1.8.n (n is 1 based transmitter number)
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	txReceivers
<b>Description</b>	Number of receivers requesting this bundle. This may not be valid for multicast bundles as receivers of multicast bundles are not required to issue a reverse reservation although all receivers currently do. A transmitter will track no more than 4 receivers. <i>txReceivers</i> will never exceed 4.
<b>Host Address</b>	0x5n002 (n is 0 based transmitter number)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.7.1.1.9.n (n is 1 based transmitter number)
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.5.7

<b>Name</b>	txBundle
<b>Description</b>	Transmit bundle assignment.
<b>Host Address</b>	0x5n100 (n is 0 based transmitter number)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.7.1.1.2.n (n is 1 based transmitter number)
<b>Type</b>	Integer16
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	0
<b>Implemented Version</b>	2.1.0

<b>Name</b>	txDestinationMAC
<b>Description</b>	<b>This variable is unused and should not be changed from its default value.</b>
<b>Host Address</b>	0x5n101 (n is 0 based transmitter number)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.7.1.1.3.n (n is 1 based transmitter number)
<b>Type</b>	PhysAddress
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	00:00:00:00:00:00
<b>Implemented Version</b>	2.2.0

<b>Name</b>	txPriority
<b>Description</b>	<p>This is a two part variable used to set the preferred time within an isochronous cycle that a bundle is sent and also the priority this bundle should be given in the event that more than one interface is attempting to transmit using the same bundle number.</p> <p><b>MS byte: Bundle priority.</b> Higher priority bundles are transmitted earlier in the cycle. This can be reflected in <i>txPosition</i>. On a repeater network, and to some extent on a switched network, bundles transmitted earlier may be less susceptible to dropouts in the event network bandwidth is exhausted.</p> <p><b>LS byte: Request priority.</b> Only one transmitter is permitted per bundle. If two transmitters attempt to transmit using the same bundle number, request priority is used to resolve the contention. If request priority is the same for both transmitters, contention resolution is first-come-first-serve.</p>
<b>Host Address</b>	0x5n104 (n is 0 based transmitter number)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.7.1.1.4.n (n is 1 based transmitter number)
<b>Type</b>	Integer16
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	0x1010
<b>Implemented Version</b>	2.2.0

<b>Name</b>	txSubCount
<b>Description</b>	Number of audio channels to transmit in a bundle. Valid values are 0 through 8. Reducing <i>txSubCount</i> is the preferred means for transmitting bundles with less than the maximum 8 audio channels. Short bundles may also be transmitted by setting <i>txSubFormat</i> or <i>txSubMap</i> entries to 0.
<b>Host Address</b>	0x5n105 (n is 0 based transmitter number)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.7.1.1.5.n (n is 1 based transmitter number)
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	8
<b>Implemented Version</b>	2.1.0

<b>Name</b>	txBuddyExclude
<b>Description</b>	Control BuddyLink operation on this channel: <b>0</b> - Transmission suspended when BuddyLink signal is detected. <b>1</b> - Transmission is never suspended. Also see <i>syncBuddyLinkControl</i>
<b>Host Address</b>	0x5n106 (n is 0 based transmitter number)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.7.1.1.6.n (n is 1 based transmitter number)
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	0
<b>Implemented Version</b>	2.5.0

<b>Name</b>	txUnicastMode
<b>Description</b>	<p>Specifies the number of unicast destinations served before automatically switching to multicast bundle transmission. Multicast transmission is useful for efficient point to multipoint routing. However, multicast addressing consumes bandwidth on all ports on a switched network. This variable allows control of multicast traffic from transmitters.</p> <p><b>0</b> - Multicast addressing used at all times. Note: multicast bundles do not transmit data until a receiver is assigned to the same bundle number.</p> <p><b>1</b> - Unicast addressing used to single receiver. Multicast addressing used for multiple receivers.</p> <p><b>0x7FFFFFFF</b> - Multicast addressing is never used. Maximum number of unicast destinations is set by <i>txMaxUnicast</i>. Receiver request priority is used to determine which receivers are serviced if multiple receivers are assigned to this bundle.</p>
<b>Host Address</b>	0x5n107 (n is 0 based transmitter number)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.7.1.1.10.n (n is 1 based transmitter number)
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	0x7FFFFFFF
<b>Implemented Version</b>	2.6.3

<b>Name</b>	txMaxUnicast
<b>Description</b>	<p>Specifies maximum number of unicast destinations supported simultaneously by the transmitter. Receivers in excess of this setting will not receive the bundle.</p> <p>A transmitter can service up to 4 receivers. The number of unicast destinations transmitted to will never exceed this internal capacity limitation.</p> <p>If <i>txUnicastMode</i> is set lower than <i>txMaxUnicast</i>, the bundle will switch to multicast before the limitation on unicast destinations is reached.</p> <p>If <i>txUnicastMode</i> is set equal to <i>txMaxUnicast</i>, the bundle will switch to multicast when the limitation on unicast destinations is exceeded.</p>
<b>Host Address</b>	0x5n108 (n is 0 based transmitter number)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.7.1.1.11.n (n is 1 based transmitter number)
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	1
<b>Implemented Version</b>	2.8.3

<b>Name</b>	txSubMap
<b>Description</b>	Transmit audio channel (channel within bundle) to audio routing channel (channel of SSI) mapping. This vector contains the routing channel source specifiers per audio channel in the transmitted bundle.
<b>Host Address</b>	0x5n20m (n is 0 based transmitter number, m is 0 based sub-channel number)
<b>Count</b>	8
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.7.2.1.2.n .m (n is 1 based transmitter number, m is 1 based audio channel)
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	First transmitter {1, 2, 3, 4, 5, 6, 7, 8} Second transmitter {9, 10, 11, 12, 13, 14, 15, 16} Third transmitter {17, 18, 19, 20, 21, 22, 23, 24} Fourth transmitter {25, 26, 27, 28, 29, 30, 31, 32}
<b>Implemented Version</b>	2.1.0

<b>Name</b>	txSubFormat
<b>Description</b>	Specifies data format for each sub-channel in the transmitted bundle. Please see <a href="#">Table 6 on page 23</a> for a complete list of valid format values. <i>modeRateControl</i> must also be set correctly to support the configured format.
<b>Host Address</b>	0x5n30m - 0x5n30m (n is 0 based transmitter number, m is 0 based sub-channel number)
<b>Count</b>	8
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.7.2.1.3.n .m (n is 1 based transmitter number, m is 1 based sub-channel number)
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	0x54000
<b>Implemented Version</b>	2.2.0

### 6.4.13 Synchronization

<b>Name</b>	syncConductorClock
<b>Description</b>	Selects sample clock source when acting as network conductor. <b>0x0</b> - Internal mode. <b>0x1</b> - External Word Clock mode. <b>0x10</b> - Not supported on CobraNetSilicon Series devices. ( <i>Internal with External Sample Synchronization mode.</i> ) <b>0x14</b> - Not supported on CobraNet Silicon Series devices. ( <i>External Master Clock with External Sample Synchronization mode.</i> )
<b>Host Address</b>	0x60000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.8.1
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	0
<b>Implemented Version</b>	2.2.1

<b>Name</b>	syncPerformerClock
<b>Description</b>	Selects sample clock source when acting as a performer. Values are the same as documented above for <i>syncConductorClock</i> . External clocks applied must be externally synchronized to the conductor.
<b>Host Address</b>	0x60001
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.8.2
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	0
<b>Implemented Version</b>	2.2.1

<b>Name</b>	syncClockTrim
<b>Description</b>	<p>Allows fine control of clock rate when acting as a network conductor in internal synchronization mode (syncConductorClock = 0x00). Range of control is on the order +/-37PPM  A trim value of 0xFFFFFFFF is sufficient for most applications.</p> <p><b>0xFFFFFFFF</b> - normal  <b>0x800000</b> - minimum frequency  <b>0x7FFFFFFF</b> - maximum frequency</p> <p>For RAVE only:  <b>0x500000</b> - normal  <b>0x7FFFFFFF</b> - minimum frequency  <b>0</b> - maximum frequency</p>
<b>Host Address</b>	0x60002
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.8.3
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	Read from flash configuration record.
<b>Implemented Version</b>	2.2.1

<b>Name</b>	syncBuddyLinkControl
<b>Description</b>	<p>BuddyLink allows two CobraNet interfaces to operate as a redundant pair with fail-over capability. The BuddyLink signal must be synthesized in hardware by ANDing together the FS1 clock and MUTE signals from the primary interface. Presence of this gated clock signal at the REFCLK_IN input of the Secondary unit indicates proper operation of the Primary unit. Mute is asserted (dropped) when a fault is detected by the primary, which then gates off the clock signal to the secondary. As long as the BuddyLink signal is detected by the secondary unit, it will send empty reservation requests preventing the unit from transmitting and, in most cases, receiving audio. When absence of the clock is detected, the secondary will begin transmitting valid reservation packets, thus allowing it to process bundles. An idle secondary unit may still receive multicast bundles. The following values may be OR'd together:</p> <p><b>0x2</b> - Disable reference clock input. This master disable feature should be invoked on designs where the reference clock input is not connected. Disabling the reference clock input prevents noise from interfering with operation of the interface.</p> <p><b>0x4</b> - Enable BuddyLink. Presence of a clock at REFCLK_IN will disable network transmitters and receivers.</p> <p><b>0x8</b> - Force Buddy Link presence. Applicable in secondary BuddyLink interfaces to simulate failure of a primary BuddyLink partner. Enable BuddyLink bit is overridden.</p>
<b>Host Address</b>	0x60003
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.8.4
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	2
<b>Implemented Version</b>	2.4.7

<b>Name</b>	syncStatus
<b>Description</b>	Indicates current audio clock synchronization status. The following values may be ORed together: Unspecified bits should be ignored. <b>0x01</b> - Locked to external or network clock reference. <b>0x02</b> - Valid clock present at REFCLK_IN. <b>0x04</b> - MUTE is not asserted. Indicates proper operation of CobraNet interface as MUTE is asserted on detection of a fault condition or loss of connection to the network.
<b>Host Address</b>	0x61000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.8.5
<b>Type</b>	Integer
<b>Attributes</b>	Read-only
<b>Default Value</b>	n.a.
<b>Implemented Version</b>	Variable implemented 2.5.9. EXTWRDCLKOUT presence indication added 2.6.4.

<b>Name</b>	syncCounter
<b>Description</b>	Incremented each time network sync is lost.
<b>Host Address</b>	0x61001
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.8.6
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.5

<b>Name</b>	syncNTime
<b>Description</b>	CobraNet network time. Advances 256 every 1-1/3ms. Network time rolls over after reaching 0xFFFF00 (16,776,960) on 24- and 32-bit platforms.
<b>Host Address</b>	0x61002
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.8.7
<b>Type</b>	Integer (Only lower 24 bits are valid. Upper byte is always zero.)
<b>Attributes</b>	Read-only
<b>Implemented Version</b>	2.9.9 (2.10.4 for CS18101-based firmware)

#### 6.4.14 SNMP Monitor

<b>Name</b>	snmpWriteEnable
<b>Description</b>	This variable enables write access to all read-write SNMP variables. <b>0</b> - all SNMP variables read-only; write disabled <b>non-zero</b> - writes enabled for read-write SNMP variables
<b>Host Address</b>	0x70000
<b>SNMP Object ID</b>	Not available via SNMP
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	1
<b>Implemented Version</b>	2.6.3

<b>Name</b>	snmpROCommunity
<b>Description</b>	The community name the SNMP agent requires for reading variables (get and get-next SNMP requests).
<b>Host Address</b>	0x70001
<b>SNMP Object ID</b>	Not available via SNMP
<b>Size</b>	60 characters
<b>Type</b>	DisplayString
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	"public"
<b>Implemented Version</b>	2.6.3

<b>Name</b>	snmpRWCommunity
<b>Description</b>	The community name the SNMP agent requires for writing variables (set SNMP requests). Reading of variables is also allowed using this community name.
<b>Host Address</b>	0x70017
<b>SNMP Object ID</b>	Not available via SNMP
<b>Size</b>	60 characters
<b>Type</b>	DisplayString
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Default Value</b>	"private"
<b>Implemented Version</b>	2.6.3

### 6.4.15 MI Monitor

<b>Name</b>	miMonDirty
<b>Description</b>	Incremented when a management interface variable is modified either via SNMP or HMI. Multiple modifications may result in a single increment of this counter. The act of writing a variable, even if written with its current value, is considered a modification for the purposes of this counter.
<b>Host Address</b>	0x71000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.9.1.1
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.3 (available via SNMP in 2.6.4)

<b>Name</b>	miMonSNMPDirty
<b>Description</b>	Incremented if a management interface variable is modified through SNMP. The counter is intended to allow detection of variable modification by any SNMP manager. Multiple modifications may result in a single increment of this variable. The act of setting a variable, even if set to its current value, is considered a modification for the purposes of this counter.
<b>Host Address</b>	0x71001
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.9.1.2
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.5

<b>Name</b>	miMonHMIDirty
<b>Description</b>	Incremented if a management interface variable is modified through HMI. The counter is intended to allow detection of variable modification by a local manager. Multiple modifications may result in a single increment of this variable. The act of writing a variable, even if written with its current value, is considered a modification for the purposes of this counter.
<b>Host Address</b>	0x71002
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.9.1.3
<b>Type</b>	Counter
<b>Attributes</b>	Read-only
<b>Default Value</b>	0
<b>Implemented Version</b>	2.6.5

<b>Name</b>	miMonHMIMode
<b>Description</b>	Host interface mode. 0 - Motorola mode 1 - Intel mode -1 - default mode (Motorola mode, otherwise undefined)
<b>Host Address</b>	0x71003
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.9.1.4
<b>Type</b>	Integer32
<b>Attributes</b>	Read-only
<b>Default Value</b>	-1
<b>Implemented Version</b>	2.10.5 (32-bit platforms only). Not available on 24-bit platforms.

### 6.4.16 IP Monitor

<b>Name</b>	ipMonCurrentIP
<b>Description</b>	The current IP address for the CobraNet interface. Changing the current IP address has an immediate effect on IP communications. A value of 0.0.0.0 indicates no IP address assignment for the interface. An IP address can be assigned (or reassigned) to the interface by any of the following means: A value loaded from <i>ipMonStaticIP</i> during power-up. A host processor writing to <i>pMonCurrentIP</i> via the HMI. Receipt of a BOOTP response packet (typically in response to a transmitted BOOTP request) Receipt of a RARP response packet (RARP requests are not transmitted)
<b>Host Address</b>	0x72000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.9.2.2
<b>Type</b>	IpAddress
<b>Attributes</b>	Read/Write
<b>Default Value</b>	ipMonStaticIP
<b>Implemented Version</b>	2.6.3

<b>Name</b>	ipMonStaticIP
<b>Description</b>	A power-up static IP address assignment for the interface. A value of 0.0.0.0 indicates no power-up IP address assignment.
<b>Host Address</b>	0x72002
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.9.2.1
<b>Type</b>	IpAddress
<b>Attributes</b>	Read/write - Persistent
<b>Default Value</b>	0.0.0.0
<b>Implemented Version</b>	2.8.2

### 6.4.17 IF Monitor

MI interface for monitoring redundant Ethernet connection (Dual Link) feature. These variables are only available on the CM-1, CM-2, and CS4961xx/CS1810xx-based hardware.

<b>Name</b>	ifmCurrentIf
<b>Description</b>	Index of the current, active Ethernet connection. <b>1</b> - Primary <b>2</b> - Secondary On platforms with only one interface, this value will always be one.
<b>Host Address</b>	0x73000
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.9.3.1
<b>Type</b>	Integer
<b>Attributes</b>	Read Only
<b>Implemented Version</b>	2.9.9 (24-bit platforms), 2.10.3 (32-bit platforms)

<b>Name</b>	ifmLastChange
<b>Description</b>	The value of <i>sysUpTime</i> at the time the <i>ifmCurrentIf</i> was established. If the current state was entered prior to or concurrent with the last re-initialization of the local network management subsystem, then this value will be zero. On platforms with only one interface, this value will always be zero.
<b>Host Address</b>	0x73001
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.9.3.2
<b>Type</b>	Time Ticks
<b>Attributes</b>	Read Only
<b>Implemented Version</b>	2.9.9 (24-bit platforms), 2.10.3 (32-bit platforms)

<b>Name</b>	ifmSwitchMode
<b>Description</b>	Controls DualLink behavior. This variable applies only to interfaces which support two Ethernet ports. <b>0</b> - (default) Automatic switchover to secondary on failure of primary. <b>1</b> - Always use primary port. <b>2</b> - Always use secondary port. <b>3</b> - If one port is working properly and the other has failed, switch to the port that is working properly. If both are working properly or both have failed, do not change ports. On boot, start with the primary port. On platforms with only one interface, a value of "3" is ignored.
<b>Host Address</b>	0x73100
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.9.3.4
<b>Type</b>	Integer
<b>Attributes</b>	Read/Write
<b>Implemented Version</b>	2.9.9 (24-bit platforms), 2.10.3 (32-bit platforms)

<b>Name</b>	ifmtStatus
<b>Description</b>	Status of Ethernet connection. The following values may be OR'd together: <b>1</b> - Ethernet link established <b>2</b> - Connection is full-duplex <b>4</b> - Ethernet packets being received at a rate of at least 1 packet every two seconds.
<b>Host Address</b>	0x74n00 where: n = <b>0</b> = primary Ethernet interface n = <b>1</b> = secondary Ethernet interface
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.9.3.3.1.2.n
<b>Count</b>	2
<b>Type</b>	Integer
<b>Attributes</b>	Read Only
<b>Implemented Version</b>	2.9.9 (24-bit platforms), 2.10.3 (32-bit platforms)

<b>Name</b>	ifmtLastChange
<b>Description</b>	The value of <i>sysUpTime</i> at the time <i>ifmtStatus</i> was established. If the current state was entered prior to or concurrent with the last re-initialization of the local network management subsystem, then this object contains a zero value.
<b>Host Address</b>	0x74n01 where: n = <b>0</b> = primary Ethernet interface n = <b>1</b> = secondary Ethernet interface
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.1.9.3.3.1.3.n
<b>Count</b>	2
<b>Type</b>	Time Ticks
<b>Attributes</b>	Read Only
<b>Implemented Version</b>	2.9.9 (24-bit platforms), 2.10.3 (32-bit platforms)

## 6.5 DSP Extensions

The CS4961xx family of CobraNet interface chips features a MIB extension for control and monitoring of the digital signal processing capabilities.

### 6.5.1 Processor

The *proc* variables provide general control and monitoring of the digital signal processing.

<b>Name</b>	procMode
<b>Description</b>	Signal processing mode: <b>0</b> - Silent (default) <b>1</b> - Audio pass-thru <b>2</b> - Run User Configuration
<b>Host Address</b>	0x75100
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.4.1.1
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read/write - Persistent</a>
<b>Implemented Version</b>	2.11.0

<b>Name</b>	procStatus
<b>Description</b>	Processor status, the following values may be OR'ed together: <b>0x1</b> - Pass-thru <b>0x2</b> - Running user configuration <b>0x4</b> - Firmware mismatches the chip <b>0x8</b> - Firmware channel number mismatches the user's configuration <b>0x10</b> - Firmware version mismatches the DSP Conductor kernel version <b>0x20</b> - Invalid user configuration  Bits 2 to 31 are only valid when bit 1 is set.
<b>Host Address</b>	0x75200
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.4.1.2
<b>Type</b>	Integer
<b>Attributes</b>	<a href="#">Read Only</a>
<b>Implemented Version</b>	2.11.1

<b>Name</b>	procFreeCycles
<b>Description</b>	Free CPU cycles in thousandths (1000=100.0%, 256=25.6%). Negative values indicate inadequate free cycles. This condition is normally accompanied by errors (advancing errorCount).
<b>Host Address</b>	0x75201
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.4.1.3
<b>Type</b>	Integer
<b>Attributes</b>	Read Only
<b>Implemented Version</b>	2.11.1

### 6.5.2 Control

The *control* variables are for control and monitoring of DSP parameters. The organization of parameters is specific to the DSP Conductor configuration currently in force. See the application note AN279, “Controlling and Monitoring DSP Conductor Configurations” for details.

<b>Name</b>	controlRWLength
<b>Description</b>	Length of read-write control variable set instantiated in controlRWValue.
<b>Host Address</b>	0x75300
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.4.2.1
<b>Type</b>	Integer
<b>Attributes</b>	Read Only
<b>Implemented Version</b>	2.11.1

<b>Name</b>	controlRWValue
<b>Description</b>	Writable DSP parameters.
<b>Host Address</b>	0x76000+n (n is the 0-based parameter offset)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.4.2.2.1.2.n (n is the 1-based parameter offset)
<b>Type</b>	Integer
<b>Attributes</b>	Read/Write
<b>Default Value</b>	DSP Conductor configuration specific.
<b>Implemented Version</b>	2.11.1

<b>Name</b>	controlROLength
<b>Description</b>	Length of read-write control variable set instantiated in controlROValue.
<b>Host Address</b>	0x75301
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.4.2.3
<b>Type</b>	Integer
<b>Attributes</b>	Read Only
<b>Implemented Version</b>	2.11.1

<b>Name</b>	controlROValue
<b>Description</b>	Read-only DSP parameters.
<b>Host Address</b>	0x7A000+n ( <i>n</i> is the 0-based parameter offset)
<b>SNMP Object ID</b>	1.3.6.1.4.1.2680.1.4.2.4.1.2.n ( <i>n</i> is the 1-based parameter offset)
<b>Type</b>	Integer
<b>Attributes</b>	Read Only
<b>Default Value</b>	DSP Conductor configuration specific
<b>Implemented Version</b>	2.11.1

## 7. Recommended User Interface Practices

### 7.1 Channel Assignments and Labeling

There are at least five layers where audio channels are numbered:

- User labels on the back panel of a device.
- As synchronous serial time slot and interface assignments. This is determined by how the audio I/O is physically connected and multiplexed.
- As audio buffer offsets within the CobraNet interface. There is a fixed mapping between the time slot and interface assignments and the audio buffer offsets for each basic CobraNet I/O configuration supported.
- As audio routing channels within the CobraNet interface. Valid routing channels are in the range 1-64. Channel 0 is reserved to indicate an unused channel. The mapping between I/O indices and audio buffer offsets is determined by the *audioMap* MI variable.
- As bundle and audio channel assignments. Valid bundle numbers are 1-65535. Bundle 0 indicates an unused transmitter or receiver. A bundle may carry up to 8 audio channels. Routing channels are assigned to bundles through the *txSubMap* and *rxSubMap* MI variables.

#### 7.1.1 Audio I/O Map

The *audioMap* variables may need to be set up by the manufacturer. Audio inputs starting from the channel labeled 1 should be assigned starting at routing channel 1. Audio outputs starting from the channel labeled 1 should be assigned starting at routing channel 33. The *audioMap* values may be initialized through firmware customization or the HMI.

#### 7.1.2 Bundle Assignments

It is recommended that all front panel interfaces allow selection of multicast bundles in the range 1-255 and unicast bundles in the range 256-65279. We recommend against allowing private bundle assignments from a front panel user interface since these are conditioned on a 48-bit MAC address. Private bundle assignments are best left to a central graphical user interface operating via SNMP.

**Transmitters**—Audio channels are transmitted in groups of up to 8 onto the network via a bundle. It is an advisable policy to pack as many audio channels into a bundle as possible as this improves network efficiency. This does strategy does not necessarily limit routing flexibility as complex routing functionality can be readily accomplished at the receiver side. At a minimum, user control of bundle assignments per network transmitter should be provided. Optional user interface control of transmitter functionality may include any combination of the following:

- Audio Resolution on a per-audio-channel Basis
- Audio Source Channel Mapping per Transmitter Audio Channel
- Number of Audio Channels to Include in Bundle Transmission
- Bundle and Request Priority

**Receivers**—The receiver can extract up to 8 audio channels from a bundle. The receiver decodes the data according to the tags attached to the bundle by the transmitter. At a minimum, user control of the bundle assignment per network receivers should be

provided. Optional user interface control of receiver functionality may include any combination of the following:

- Audio destination channel mapping per receiver audio channel
- Bundle and request priority

## 7.2 Conductor Priority

It is not necessary to give users the ability to change conductor priority via a front panel interface. If manipulation of conductor priority is desired, allowing three options with regard to conductor priority selection is recommended:

- Never - conductorPriority = 0
- Normal - conductorPriority = 32
- High - conductorPriority = 128

## 7.3 Name

Users should be able to either select and display or simply display a network name for the device. This network name is stored in the *sysName* management variable as an ASCII string that is 4 to 16 characters in length. a-z, A-Z, 0-9 and - [hyphen] are allowed characters. Names are not case sensitive. A name may be as simple as 4 numeric characters. A set of thumb wheel switches can be used to provide a unique numerical name. Names containing only 0's (zeros) and "NONAME" are reserved names indicating that no name has been assigned to the unit.

## 8. Error Reporting

### 8.1 Recoverable Errors

Recoverable errors are indicated by an increment of *errorCount*, update of *errorCode*, *errorIndicators* and illumination of the TX error, RX error and/or Fault indicators, if available. Note that some CobraNet devices do not present all indicators to the user. For example, the CM-1 provides only the Fault indicator. There are numerous recoverable error conditions that can cause an error indication. It is possible to determine the exact cause of the most recently reported error conditions by reading the *errorCode* variable through the management interface.

#### 8.1.1 Receive and Transmit Errors

Receive and transmit errors illuminate the RX Error and/or TX Error indicators. These errors are reported with respect to the Ethernet interface. An RX error indicates trouble receiving audio or control data from the network. A TX error indicates trouble transmitting audio or control data onto the network. These errors may originate at peripherals attached to the CobraNet interface. A framing error detected at the asynchronous serial port is reported as a TX error because an inability to correctly receive asynchronous serial data means that it can't be properly *transmitted* onto the Ethernet. Difficulty locking to the conductor clock is reported by simultaneous illumination of the RX error and TX error indicators as a failure to lock affects both transmission and reception.

#### 8.1.2 Faults

Illumination of the Fault indicator indicates detection of an unexpected condition. Some fault conditions will also light the RX error and/or TX error indicators to give more specific indication if the unexpected condition is in the receive or transmit processes.

### 8.2 Unrecoverable Errors

#### 8.2.1 Fatal Faults

A fatal fault halts the CobraNet interface. Audio and control data delivery is suspended while an error code is displayed as a flashing pattern on the Fault indicator. Once the code has been displayed several times, the interface will automatically attempt to reset itself.

The fatal fault code is displayed as a repeating set of three flash sequences. These three flash sequences represent three digits of an octal error code. A single flash represents a 0 digit and 8 flashes represent a 7 digit. The three digits are delivered least significant first. Convert from octal to decimal and divide by two to get the error code. Or the flash sequences may be looked up directly in the Error Codes section of this document

As an example, a repeating pattern of 5 flashes then 2 flashes followed by 3 flashes represents an octal code of 214. Converting to decimal and dividing by 2 yields error code 70.

### 8.2.2 POST Failure

Power on self-tests are performed during the boot process. If one of these tests fails, an error code is displayed as a flashing pattern on the Fault indicator. Once the code has been displayed, the interface will automatically attempt to reset itself. Typically the same test will fail again resulting in repeated display of the failing error code.

**Table 16. POST Failure Error Codes**

<b>Number of Fault Indicator Flashes</b>	<b>Failed Test</b>
1	Runtime code checksum error
2	Boot code checksum error
3	Xilinx configuration load failure
4	Error in MAC register access
5	Data error in PHY register access
6	Timeout error in PHY register access
8	SRAM error: bank 0 LS byte
9	SRAM error: bank 0 middle byte
10	SRAM error: bank 0 MS byte
11	SRAM error: bank 1 LS byte
12	SRAM error: bank 1 middle byte
13	SRAM error: bank 1 MS byte
14	Address or data bus data dependent failure
15	Ethernet loopback test failure
19	Unexpected interrupt occurred
20	Unexpected Xilinx configuration identification
21	Unexpected Xilinx configuration version
22	Sample clock range test failure
23	Sample clock not running

## 9. Error Code Reference

### 9.1 Legend

**Byte Code** - Numeric error code. Error codes reported through SNMP or HMI are of varying form must be converted to this common byte code representation as per instructions give in section 9.2 below.

**Flash Code** - Code as reported in a fatal fault situation. Flash codes are typically only displayed for fatal errors.

**Type** - Classification and behavior of the error condition.

Table 17. Error Types

Type	Description
TX	Recoverable and expected transmit error
TXQUIET	Informative transmit incident
TXFAULT	Unexpected but recoverable transmit error
RX	Recoverable and expected receive error
RXQUIET	Informative receive incident
RXFAULT	Unexpected but recoverable receive error
TXRX	Recoverable and expected error simultaneously affecting transmit and receive
FAULT	Unexpected but recoverable error
FATAL	Unrecoverable error condition. Reported as a flash code on the fault indicator.

**Name** - Name assigned to the error by the firmware programmer.

**Description** - Description of the error condition.

**Expected Conditions** - Foreseeable conditions under which the error condition would occur on normally functioning and properly connected hardware.

**Unexpected Conditions** - Conditions indicating a hardware or firmware fault.

---

## 9.2 Error Code Interpretation

Errors are listed and described in section 9.3 below. Errors are keyed by Byte Code and Flash Code. Flash codes are used when a fatal fault is reported (see section 9.1 above). Byte codes are used for all other runtime error reporting.

A conversion between raw error codes reported via the `errorCode` MI variable and the byte code key values is required to correctly interpret error conditions. Error codes are represented differently on 24-bit and 32-bit platforms. The conversion between error code and byte code for each platform is described in section 9.2.1 and section 9.2.2 below.

### 9.2.1 24-bit Error Code Interpretation

On 24-bit platforms (reference design and CM-1), the byte code is presented in the most-significant 8 bits of the 24-bit error code reported. To derive a byte code from an error code, divide the error code by 65,535. Alternatively when the error code is expressed as a hexadecimal value, the byte code (in hexadecimal form) is in the 5th and 6th digits. Convert this value to decimal representation and look up the byte code in the table below.

### 9.2.2 32-bit Error Code Interpretation

For 32-bit platforms (CM-2, CS4961xx, and CS1810xx), the byte code is presented in the least-significant 8 bits of the 32-bit error code. To retrieve the byte code, strip off the most-significant 24 bits by taking the error code modulo 256. Alternatively, when the error code is expressed as a hexadecimal value, the byte code (in hexadecimal form) appears in the first and second digits. Convert this value to decimal representation and look up the byte code in the table below.

## 9.3 Error Codes Listing

Byte Code	Flash Code	Type	Name	Description	Expected Conditions	Unexpected Conditions
0	1,1,1	NONE	NO_ERROR	No error has been reported.	-	-
1	3,1,1	FATAL	NO_CODE	No valid runtime code to load from flash memory.	No code has ever been loaded in the flash.	Corrupted flash contents. Hardware failure in flash memory or address/data bus.
2	5,1,1	FATAL	BOOT_CSUM	Bad boot sector checksum.	-	Corrupted flash contents. Hardware failure in flash memory or address/data bus.
3	7,1,1	FATAL	XILINX_CONFIG	Xilinx configuration load failure.	-	Hardware problem with Xilinx PLD or configuration interface. Corrupted Xilinx configuration file in flash.
4	1,2,1	FATAL	POST_MAC	Ethernet media access controller (MAC) register access failure.	-	Problem with Ethernet MAC or MAC <-> DSP interface.
5	3,2,1	FATAL	POST_PHY_DATA	Ethernet physical interface (PHY) register access failure. Data read does not match data written.	-	Problem with PHY, Ethernet MAC or MAC <-> PHY interface (MII).
6	5,2,1	FATAL	POST_PHY_TIMEOUT	PHY register access failure. PHY did not respond to read or write request.	-	Problem with PHY, MAC or MAC <-> PHY interface (MII).
7	7,2,1	FATAL	POST_BONDID	CobraNet processor unrecognized.	Attempt to run firmware on a non-CobraNet Cirrus processor. Attempt to run down-rev firmware on a more recently introduced CobraNet processor.	-
8	1,3,1	FATAL	POST_B0L	Main memory failure; low byte, main bank.	-	Memory chip problem. Data bus problem. Address bus problem.

Byte Code	Flash Code	Type	Name	Description	Expected Conditions	Unexpected Conditions
9	3,3,1	FATAL	POST_B0M	Memory failure; middle byte, main bank.	-	Memory chip problem. Data bus problem. Address bus problem.
10	5,3,1	FATAL	POST_B0H	Memory failure; high byte, main bank.	-	Memory chip problem. Data bus problem. Address bus problem.
11	7,3,1	FATAL	POST_B1L	Memory failure; low byte, high bank.	-	Memory chip problem. Data bus problem. Address bus problem.
12	1,4,1	FATAL	POST_B1M	Memory failure; middle byte, high bank.	-	Memory chip problem. Data bus problem. Address bus problem.
13	3,4,1	FATAL	POST_B1H	Memory failure; high byte, high bank.	-	Memory chip problem. Data bus problem. Address bus problem.
14	5,4,1	FATAL	POST_BUS	Address/data bus test failure during bus stress test.	-	Address and/or data bus performance is marginal.
15	7,4,1	FATAL	POST_LOOPBACK	Ethernet physical interface (PHY) loopback test failure. Cannot transmit and receive packet correctly.	-	Problem with Ethernet controller (MAC or PHY). Problem with Ethernet DMA (Xilinx).
16	1,5,1	FAULT	FLASH_FAILURE	Failure during flash erase or write operation.	Flash device has fatigued due to excessive write/erase operations.	Problem with flash device or flash <-> DSP interface.
17	3,5,1	FAULT	FLASH_WRITE	Attempt to program flash location before erase.	-	Flash erase failure.
18	5,5,1	FATAL	BAD_CONFIG	Bad configuration record in flash	No configuration parameters specified during boot bank programming and an existing configuration record could not be found.	The configuration record does not match the main code. Either the flash is improperly programmed or there is a problem with the flash bank selection logic or other address decode logic.
19	7,5,1	FAULT	INT_UNEXPECTED	Interrupt occurred while interrupts were disabled.	-	-

Byte Code	Flash Code	Type	Name	Description	Expected Conditions	Unexpected Conditions
20	1,6,1	FATAL	XILINX_ID	Xilinx does not report expected identification.	-	Problem with Xilinx. Problem with Xilinx configuration file in flash.
21	3,6,1	FATAL	XILINX_VERSION	Reported Xilinx version not supported by boot code.	-	Mismatched files used during code build.
22	5,6,1	FATAL	POST_CLOCK_RANGE	Sample clock pull range test failure. The voltage controlled sample clock crystal oscillator (VCXO) pull range does not meet minimum requirements.	-	The VCXO device does not meet specification. Problem with VCXO control voltage circuitry.
23	7,6,1	FATAL	POST_CLOCK_STOPPED	Sample clock not running. Timeout waiting for measurement edge.	-	VCXO is not oscillating. Problem with FS1 circuitry or Xilinx.
24	1,7,1	FAULT	XILINX_CHECKSUM	Checksum failure reloading Xilinx configuration during runtime.	-	flash contents corrupted
25	3,7,1	FATAL	UNUSED	-	-	-
27	7,7,1	FATAL	UNUSED	-	-	-
29	3,8,1	FATAL	UNUSED	-	-	-
31	7,8,1	FATAL	UNUSED	-	-	-
32	1,1,2	TXRX	CYCLES	DSP processing cycles exhausted.	Broadcast storm in progress on network.	Processor running slow. Sample clock running fast. DMA controller malfunctioning. Unable to acknowledge an interrupt.
33	3,1,2	RX	RX_STORM	Broadcast storm detected.	Loop in network producing overwhelming amount of broadcast or multicast network traffic.	-

Byte Code	Flash Code	Type	Name	Description	Expected Conditions	Unexpected Conditions
34	5,1,2	RX	BEAT_FLOODED	Beat packet received while previous beat packet still being processed.	Occurs normally while synchronizing to the network. Late collisions on an oversized (>200 meter) repeater network are occurring profusely. multiple units may be conducting in this scenario.	Conductor is misbehaving.
35	7,1,2	TX	BAD_HANDLE	Out of range permission handle received in beat packet.	-	Conductor is misbehaving.
36	1,2,2	TX	TX_TOOBIG	Attempt to generate an oversize outgoing packet.	Too many 24 bit audio channels specified for transmitter.	-
37	3,2,2	FATAL	INTREENTERED	Unexpected interrupt service routine reentry.	-	Processor running slow. Sample clock running fast.
38	5,2,2	TX	ETXUNEXPECTED	Unexpected Ethernet transmit complete interrupt; no transmit in progress.	Collisions occurring on repeater network.	-
39	7,2,2	TXRX	LOST_LOCK	Lost lock to network clock.	Initial synchronization to the network. Change of conductor. Conductor is attempting to synchronize to bad external reference clock.	Sample clock crystal of either this unit or the conductor does not meet specification.
40	1,3,2	RX	EARLY_PACKET	Received an audio packet with eager timestamp.	Excessive delay variation through the network.	-
41	3,3,2	FAULT	FRAME_ASSERTFAIL	Programmer assertion failed in frame.asm	-	-
42	5,3,2	TXFAULT	QUEUEPUT_BEATDISCARDS	Packet queue overflow discarding untransmitted packets.	-	-
43	7,3,2	TX	QUEUEGET_TXFREE	Free transmit buffers exhausted.	A unit is kept from transmitting because network bandwidth is exhausted.	-

Byte Code	Flash Code	Type	Name	Description	Expected Conditions	Unexpected Conditions
44	1,4,2	FATAL	FLASHREQ_ASSERTFAIL	Programmer assertion failed in flashreq.asm	-	-
45	3,4,2	RX	QUEUEPUT_RXCONTROL	Too many control packets received.	Excessive broadcast control traffic on network.	-
46	5,4,2	RX	QUEUEPUT_RX	Too much audio data received for a network isochronous channel.	-	Two devices are mistakenly transmitting onto the same bundle.
47	7,4,2	RX	QUEUEPUT_RXPACKETS	Receive packets backlogged.	Excessive broadcast traffic on network.	-
48	1,5,2	TX	QUEUEPUT_TX	Packet queue overflow at bundle transmitter.	A unit is kept from transmitting because network bandwidth is exhausted.	-
49	3,5,2	TXFAULT	QUEUEPUT_TXFREE	Packet queue overflow while freeing a transmit buffer.	-	Freed a buffer twice.
50	5,5,2	TXFAULT	QUEUEPUT_TXPACKETS	Transmit packets backlogged.	-	-
51	7,5,2	FAULT	IPBUF_FREETWICE	Freed the same IP buffer twice.	-	-
52	1,6,2	RX	RXBUFFER_OVERFLOW	Receive buffers exhausted.	Excessive broadcast traffic on network. Setting of rxMinDelay is too high. Excessive delay variation through network.	-
53	3,6,2	TXFAULT	SSIRX_OVERRUN	Synchronous serial (SSI) audio data receive overrun.	-	Excessive interrupt latency.
54	5,6,2	RXFAULT	SSITX_UNDERRUN	Synchronous serial (SSI) audio data transmit underrun.	-	Excessive interrupt latency.
55	7,6,2	FATAL	EXTSTACK_OVER	Processor external stack overflow.	-	-
56	1,7,2	FATAL	EXTSTACK_UNDER	Processor external stack underflow.	-	-
57	3,7,2	TX	TX_CHANCOUNT	Unable to transmit all outbound audio packets within an isochronous cycle period.	Bandwidth is exhausted on a repeater network.	-

Byte Code	Flash Code	Type	Name	Description	Expected Conditions	Unexpected Conditions
58	5,7,2	TXFAULT	QUEUEPUT_ORDER	Queue overflow preparing packets for transmission.	-	-
59	7,7,2	RXQUIET	MISMATCH_CNVERSION	Protocol minor version mismatch.	CobraNet silicon receiver running pre-2.10.4 firmware connected to CM-1 or Refer running pre 2.9.0 firmware.	-
60	1,8,2	TXQUIET	TXAUDIO_DROPOUT	Audio dropout occurred on transmission.	Conductor revoked permission, channel number changed or turned off by user. A beat packet did not arrive either due to a conductor change or a problem on the network.	-
61	3,8,2	RXQUIET	RXAUDIO_DROPOUT	Audio dropout occurred on reception.	Conductor revoked permission, channel number changed or turned off by user. Audio packet was dropped by the network.	-
62	5,8,2	TXFAULT	TXFREE_TWICE	A transmit buffer was freed twice.	-	-
63	7,8,2	RXFAULT	RXPACKET_BOUNDS	DMA reports receiving a packet outside designated receive buffer address range.	-	DMA hardware is misbehaving.
64	1,1,3	TX	QUEUEPUT_SCICRX	Serial bridge can't packetize and transmit characters as fast as they're being received from the serial port.	serialPPeriod setting too high for selected baud rate.	-
65	3,1,3	FATAL	IP_ASSERTFAIL	Programmer assertion failure in ip.asm	-	-
66	5,1,3	FATAL	QUEUEPUT_FLASHREQ	Queue overflow initiating a flash read, write or erase.	-	A request has been resubmitted before it was completed. Flash request queue size needs to be increased due to software expansion.

Byte Code	Flash Code	Type	Name	Description	Expected Conditions	Unexpected Conditions
67	7,1,3	FATAL	PROCSTACK_OVER	Processor internal stack overflow.	-	-
68	1,2,3	FATAL	PROCSTACK_UNDER	Processor internal stack underflow.	-	-
69	3,2,3	TX	DUP_MAC	Duplicate MACs detected on network detected during conductor arbitration. MAC addresses are supposed to be globally unique. The two (or more) units may not be able to resolve this conflict peacefully.	Loop in network resulting in broadcast storm and subsequent receipt of own beat packets.	-
70	5,2,3	FATAL	STACK_CORRUPT	Processor external stack corrupted.	-	-
71	7,2,3	FATAL	UNUSED	-	-	-
72	1,3,3	FATAL	TXFREE_CORRUPT	A transmit buffer was modified after being freed.	-	-
73	3,3,3	RX	QUEUEPUT_SCITXC	Serial bridging received more characters from the network faster than it can transmit them out the serial port. from SCI.	Characters are being received simultaneously over the network from two transmitters. Baud rate at transmitter is set higher than at receiver.	-
74	5,3,3	RXQUIET	RXIDLE	Loss of receive activity detected.	There are no longer any other CobraNet devices on the network.	-
75	7,3,3	FATAL	PROC_LOOPSTACK_OVER	Processor internal loop stack overflow.	-	More concurrent processes or deeper procedure nesting than expected.
76	1,4,3	FATAL	PROC_LOOPSTACK_UNDER	Processor internal loop stack underflow.	-	Memory corruption hardware or software problem.
77	3,4,3	FATAL	ILLEGAL_INST	Illegal instruction encountered.	-	Hardware problem with main memory or address/data busses.
78	5,4,3	FATAL	UNUSED	-	-	-

Byte Code	Flash Code	Type	Name	Description	Expected Conditions	Unexpected Conditions
79	7,4,3	RX	ETHERRX_OVERRUN	Could not keep up with Ethernet receive data transfer requirements.	Ethernet receive data transfers deferred by transmissions.	-
79	7,4,3	RXFAULT	ETHERRX_OVERRUN	Could not keep up with Ethernet receive data transfer requirements.	-	Problem with Ethernet receive DMA.
80	1,5,3	RX	ETHERRX_CRC	Corrupted Ethernet packet received (CRC error).	Late collisions on an oversized (>200 meter) repeater network. Cabling, equipment or electromagnetic interference problem on the network. A cut through switch may convert collision fragments into packets with bad CRC.	Problem with Ethernet controller.
81	3,5,3	RX	ETHERRX_DRIBBLE	Received packet with incomplete last byte.	Cabling, equipment or electromagnetic interference problem on the network. Late collisions on an oversized (>200 meter) repeater network.	Problem with Ethernet controller.
82	5,5,3	RX	ETHERRX_BIGPACKET	Received an illegally large packet.	Equipment problem on the network.	-
83	7,5,3	TX	ETHERTX_UNDER	Could not keep up with Ethernet transmit data requirements.	Late collisions on an oversized (>200 meter) repeater network disrupt transmit in progress leading to this condition	Problem in Ethernet DMA.
83	7,5,3	TXFAULT	ETHERTX_UNDER	Could not keep up with Ethernet transmit data requirements.	-	Problem in Ethernet DMA.
84	1,6,3	TX	ETHERTX_16COLL	16 successive collisions on transmission attempt; transmission aborted.	-	Repeater network is saturated with traffic. problem with collision detection mechanism in the Ethernet controller.

Byte Code	Flash Code	Type	Name	Description	Expected Conditions	Unexpected Conditions
85	3,6,3	TX	ETHERTX_CRS	Ethernet carrier sense did not assert in response to transmission.	May be reported if transmission is in progress when Ethernet is disconnected.	-
86	5,6,3	TXQUIET	ETHERTX_LATECOLL	Late collision occurred during transmission.	Late collisions can occur on a repeater network if network diameter exceeds 200 meters. CobraNet's collision avoidance mechanism for repeaters allows network diameters up to 2 kilometers. On such networks, late collisions are expected in transmission of control data. The collision detection mechanism of a device on the network is inoperative or a device is mistakenly manually configured for full-duplex operation on a repeater network.	-
87	7,6,3	RXQUIET	ETHERRX_SHORTPACKET	Received an illegally short Ethernet packet.	Collisions are occurring on the network.	A transmitter on the network is misbehaving. Problem with Ethernet controller.
88	1,7,3	TX	SCI_RXOVER	Asynchronous serial receive overrun error.	Bad serial baud rate selected.	-
89	3,7,3	TX	ETHERTX_LOSS_CARRIER	Loss of carrier during Ethernet frame transmission.	Transmission in progress when Ethernet was disconnected.	-
90	5,7,3	TX	SCI_RXFRAMING	Asynchronous serial receive framing error.	Wrong serial data format or baud rate selected.	-
91	7,7,3	RX	ETHERRX_LATECOLL	Late collision detected during reception.	Late collisions can occur on a repeater network if network diameter exceeds 200 meters.	-

Byte Code	Flash Code	Type	Name	Description	Expected Conditions	Unexpected Conditions
92	1,8,3	RX	ETHERRX_PHY_LAYER	Physical layer error reported by Ethernet controller.	-	Poor signal integrity in onboard Ethernet circuits.
93	3,8,3	RXFAULT	RXPACKET_TOOLONG	DMA reports receiving an illegally long packet.	-	Ethernet DMA misbehaving or incorrect handling of receive discard or late collision condition.
94	5,8,3	TX	TRANSMITTING	Attempt to transmit while we're already transmitting.	May be reported during synchronization to network conductor.	-
95	7,8,3	TXFAULT	UNPREPARED	Transmitted a packet before it was fully prepared.	-	-
96	1,1,4	TXFAULT	ALREADY_PREPARED	Prepared a packet for transmission that was already previously prepared.	-	-
97	3,1,4	TXFAULT	ALREADY_UNPREPARED	Unprepared a packet for transmission that was already Unprepared.	-	-
98	5,1,4	TXFAULT	QUEUEPUT_TXRECYCLE	Queue overflow discarding or recycling an untransmitted packet.	-	-
99	7,1,4	FATAL	BEAT_ASSERTFAIL	Programmer assertion failed in beat.asm	-	-
100	1,2,4	TX	ETHERTX_COL_PKT	Collision packet transmission error.	-	Problem with collision detection mechanism in the Ethernet controller.
101	3,2,4	RX	ETHERRX_RUNT_FRAME	Illegally short Ethernet packet received.	Runt frames can be generated as the result of collision on a repeater network.	-
102	5,2,4	TX	BEAT_BUSY	Beat packet is still being updated when it is time to transmit it.	Transmission is protracted on loss of link.	A task is not running or processor cycles exhausted.
103	7,2,4	FATAL	SNMP_ASSERTFAIL	Programmer assertion failed in snmp.a	-	-

Byte Code	Flash Code	Type	Name	Description	Expected Conditions	Unexpected Conditions
104	1,3,4	FATAL	MODE_ASSERTFAIL	Programmer assertion failed in mi.a	-	-
105	3,3,4	RX	ETHERRX_WATCHDOG_TIMEOUT	Receive watchdog time-out.	Packet length greater than 2048 bytes detected.	Signal integrity problem in Ethernet receive circuitry.
106	5,3,4	FATAL	UNUSED	-	-	-
108	1,4,4	FATAL	UNUSED	-	-	-
110	5,4,4	FATAL	UNUSED	-	-	-
112	1,5,4	FATAL	UNUSED	-	-	-
114	5,5,4	RX	NO_BEAT_HEADER	Could not find header section in beat packet.	-	Conductor has transmitted an ill formed beat packet.
115	7,5,4	RX	NO_ISO_HEADER	Could not find header section in isochronous data packet.	Device has transmitted an ill formed isochronous data packet	-
116	1,6,4	FATAL	UNUSED	-	-	-
117	3,6,4	TX	BRIDGE_TX_SIZE	Packet bridge transmission is too big (>1514 bytes) or too small (<14 bytes).	Host processor has specified a size out of range.	-
118	5,6,4	TXQUIET	HMI_ADDRESS_INVALID	Invalid host MI address specified.	Host processor lost its mind or assumes a different MI version.	-
119	7,6,4	TXFAULT	QUEUEPUT_TXCONTROL	Queue overflow transmitting control packets.	-	-
120	1,7,4	FAULT	SSIPTR_SLIP	Unexpected audio DMA pointer location.	-	Problem with audio DMA.
121	3,7,4	RX	SCIDATA_MISSING	Serial bridge packet contained no data section.	-	Malformed packet transmitted by another station or packet was truncated on receipt.
122	5,7,4	FAULT	FRAME_FLOODED	Frame advance processing not completed before beginning of next frame.	-	-
123	7,7,4	TX	ORDER_LOCKED	Transmit packets not available at transmission time.	Synchronization to network scenario.	-

Byte Code	Flash Code	Type	Name	Description	Expected Conditions	Unexpected Conditions
124	1,8,4	FATAL	UNUSED	-	-	-
126	5,8,4	RX	SECTIONLENGTH_UNEXPECTED	Unexpected packet structure encountered.	Defective transmitter may spew corrupt packets	-
127	7,8,4	RXFAULT	ETHERRX_ABORT	Unexpected packet receipt aborted; receive abort mechanism unimplemented.	-	-
128	1,1,5	RX	ETHERRX_INTERNAL	Internal receive error reported Ethernet controller (MAC).	Accompanies receiver data overrun in some cases. Ethernet receive data transfers deferred by transmissions.	-
128	1,1,5	RXFAULT	ETHERRX_INTERNAL	Internal receive error reported Ethernet controller (MAC).	Accompanies receiver data overrun in some cases.	Problem in Ethernet receive DMA.
129	3,1,5	RX	IP_DROPPED	IP packet dropped on receive.	IP packets arriving more frequently than they can be processed.	-
130	5,1,5	FATAL	UNUSED	-	-	-
131	7,1,5	RX	SNMP_NOPARSE	Unable to parse SNMP packet.	Ill-formed SNMP packet transmitted by a manager.	-
132	1,2,5	FATAL	INIT_ASSERT	Programmer assertion failed in initialization code.	-	-
133	3,2,5	FATAL	UNUSED	-	-	-
135	7,2,5	FATAL	UNUSED	-	-	-
137	3,3,5	FATAL	UNUSED	-	-	-
139	7,3,5	FATAL	UNUSED	-	-	-
141	3,4,5	FATAL	UNUSED	-	-	-
143	7,4,5	FATAL	UNUSED	-	-	-
144	1,5,5	FATAL	DSPB_PROCSTACK_OVER	DSPB processor call stack overflow.	-	-
145	3,5,5	FATAL	DSPB_PROCSTACK_UNDER	DSPB processor call stack underflow.	-	-

## 10. Glossary of Terms

### 100BASE-T

See [Fast Ethernet](#)

### 1000BASE-T

See [Gigabit Ethernet](#)

### Audio Channel

A single audio signal. Audio channels on CobraNet have a 48 kHz sampling rate and may be 16, 20 or 24 bit resolution. Multiple audio channels may be carried in a [Bundle](#).

### Auto-negotiation

A low bit rate form of communication during which one device tells another device if it is capable of full- or half-duplex operation and whether to connect at 10MB or 100MB bit rates. More information on auto-negotiation is available at <http://www.peakaudio.com/Index.htm>.

### Broadcast Addressing

Broadcasting is a special case of [Multicast Addressing](#). Whereas it is possible, in some cases, to indicate intended recipients of multicast data, broadcast data is unconditionally received by all [DTEs](#) within a network domain.

### Bundle

The basic network transmission unit under CobraNet. Up to 8 [Audio Channels](#) may be carried in a bundle.

### Category 5 Cable (CAT5)

As used on this site, CAT5 is inexpensive unshielded twisted pair (UTP) data grade cable. It is very similar to ubiquitous telephone cable but the pairs are more tightly twisted. CAT5 cable runs are limited to 100 meters due to signal radiation and attenuation considerations. A CAT5 run in excess of 100 meters may be overly sensitive to electromagnetic interference (EMI). It should be noted that not all CAT5 cable is UTP. Shielded CAT5 also exists but is rare due to its greater cost and a much shorter distance limitations than UTP CAT5.

### CobraNet™

CobraNet is a combination of hardware, software and protocol which distributes many channels of digital audio over [Fast Ethernet](#). CobraNet supports switched and repeater Ethernet networks. On a repeater network, CobraNet eliminates collisions and allows full bandwidth utilization of the network. CobraNet uses standard Ethernet packets and network infrastructure.

---

## CobraNet Device

A device in compliance with the CobraNet specification for transmission and/or reception of digital audio and associated sample clock.

## Conductor

[CobraNet Device](#) on the network supplying master clock. A conductor arbitration procedure insures that at any time there is one and only one conductor per network.

## Crossover Cable

A crossover cable can be used to directly connect two network devices.

## DTE

Short for Data Terminal Equipment, a DTE is any network device that produces or consumes data. All CobraNet devices are DTEs.

## Ethernet

A Local Area Network (LAN) protocol that transmits information between computers at speeds of 10 Mbps (megabits per second). It is one of the most widely implemented LAN standards.

## Fast Ethernet

A newer version of Ethernet, also known as 100BASE-T. It supports data transfer rates of 100Mbps. CobraNet operates on a Fast Ethernet network.

## Full Duplex

Data can be transmitted and received simultaneously.

## Gigabit Ethernet

Gigabit Ethernet is a newer version of Ethernet, also known as 1000BASE-T. It supports data transfer rates of 1000 Mbps (1 gigabit).

## Half Duplex

Data can only be transmitted in one direction at a time (i.e., a device cannot transmit and receive data simultaneously).

## Hub

Hub is not a technically concise term. The term can be used to refer to either a [Repeater Hub](#) or a [Switching Hub](#).

## Link Aggregation

A means for making multiple Ethernet links act as a single higher capacity, fault tolerant link. More information on link aggregation is available at <http://www.peakaudio.com/Index.htm>. Link aggregation is also known as trunking.

## Mbps

Short for megabits per second, it is a measure of data transfer speed.

## Media Converter

A Media Converter is typically a two port device that accepts one type of media on one port and a different media on the other. Common Ethernet media types are twisted pair, multimode and single mode fiber. Some hubs and switches include media conversion via plug in module options for various media types.

## Meshing

A fusion of [Spanning Tree Protocol](#) and [Link Aggregation](#). Eliminates loops while creating higher capacity, fault tolerant links among interconnected (meshed) switches. Meshing is only available on [HP ProCurve](#) switches.

## Multicast Addressing

Data which is Multicast is addressed to a group of, or all [DTEs](#) on a network. All DTEs receive multicast addressed data and decide individually whether the data is relevant to them. A Switched Hub is typically not able to determine appropriate destination port or ports for multicast data and thus must send the data out all ports simultaneously just as a [Repeater Hub](#) does. Multicast addressing is to be avoided whenever possible since it uses bandwidth network wide and since all DTEs are burdened with having to decide whether multicast data is relevant to them.

## Multicast Bundle

A multicast bundle supports a one-to-many routing of audio on the network. Ethernet multicast addressing is used to deliver a multicast bundle. Because a multicast bundle consumes bandwidth network-wide, use of this delivery service must be rationed on a switched network.

## Multimode Fiber

A fiber-optic cable commonly used in data communications and short haul telecommunications. A multimode fiber is built of two types of glass arranged in a concentric manner. Two sizes of fiber are available: 62.5/125um is used primarily in data communications, 50/100um is used primarily in telecommunications applications. The standard for transmission of 100Mbit Ethernet over 62.5/125um multimode fiber is called 100BASE-FX. Multimode fiber and its associated transceivers are fairly economical. 100BASE-FX has a 2 kilometer distance limitation.

## Network Diameter

The longest cable distance between any two [DTEs](#) on the network.

## Network Topology

The physical and logical relationship of nodes in a network; networks typically have a star, ring, tree or bus topology, or some combination.

## NIC

A NIC or Network Interface Card is an expansion board inserted into a computer in order to connect the computer to a network. Typically, NICs are designed for a particular type of network and media, although some can serve multiple networks.

## Node

A processing location. A node can be a computer, a switch, a CobraNet device, or any other device that has a unique network address.

## Repeater Hub

An Ethernet multi-port repeater. A data signal arriving in any port is electrically regenerated and reproduced out all other ports on the hub. A repeater hub does not buffer or interpret the data passing through it. An Ethernet network is typically wired in a star configuration and the hub is at the center. Hubs are available with port counts from 4 to 24. There are two grades of Fast Ethernet hubs: Class I and Class II. Class II hubs deliver higher performance than the Class I hubs. Most hubs shipping today are of the Class II variety. The use of hubs require that all devices on the network run in half duplex mode.

## Ring

A network topology in which all nodes are connected in a closed loop.

## Run Length

Each type of media has a limitation in the length of a point-to-point run between two devices. When maximum run length guidelines are exceeded it may not be possible to establish a valid network connection or data may be corrupted. Longer distances can be achieved by upgrading the media or using multiple runs in series.

## Single Mode Fiber

A fiber optic cable built from a single type of glass. Data is carried over single mode fiber in the coherent light produced by a laser. While the single mode fiber cable cost approximately the same as a multimode cable, the cost of the optical transmitters and receivers is significantly more for a single mode installation than multimode. However, single mode fiber systems are able to achieve much greater transmission distance than multimode. There is no official standard for carrying Ethernet over single mode fiber.

Proprietary single mode fiber systems each have their own run length limits; all exceed the 2 kilometer multimode limit. Some systems offer lengths in excess of 100 kilometers.

## Spanning Tree Protocol

An IEEE standard protocol (802.1D) allowing detection and elimination of loops in Ethernet networks. Spanning tree protocol is implemented on most managed switches. More information on spanning tree protocol is available at <http://www.peakaudio.com/Index.htm>.

## Star

A network topology in which all nodes are connected to a central network device such as a hub or switch.

## Switch

See [Switching Hub](#) below.

## Switching Hub

A Switching Hub, or simply "Switch", examines addressing fields on data arriving at each port and attempts to direct the data out the port or ports to which the data is addressed. Data may be buffered within the Switching Hub to avoid the collision condition experienced within a [Repeater Hub](#). A network utilizing Switching Hubs realizes higher overall bandwidth capacity as data may be received through multiple ports simultaneously without conflict. Switches are full-duplex devices. A network utilizing switches to connect network segments is referred to as a switched network.

## Trunking

See [Link Aggregation](#).

## Unicast Addressing

Data which is unicast is addressed to a specific DTE. A switching hub may examine the unicast address field of the data and determine on which port the addressed [DTE](#) resides and direct the data out only that port. Delivery of an e-mail message is an example of unicast data addressing.

---

## Unicast Bundle

A unicast bundle supports a one-to-one routing of audio on the network. Ethernet unicast addressing is used to deliver a unicast bundle. Because unicast addressing is friendly to Ethernet switches, unicast bundles should be used for audio delivery whenever possible.

## Unregulated Traffic

Refers to any data transmitted onto a network by non-CobraNet devices. Unregulated traffic is particularly offensive on a repeater network as it interferes with CobraNet's collision avoidance mechanism and can result in audio dropouts. On a switched network, unregulated traffic is only a problem if it appears in such copious quantity as to overload the network.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкуренспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
