

## FEATURES

- 16-element FIFO for event recording**
- 10 configurable I/Os allowing functions such as**
  - Key pad decoding for a matrix of up to 5 × 5**
  - 11 GPIOs (5 × 6) with ADP5585ACxZ-01-R7 models**
- Key press/release interrupts**
- GPIO functions**
- GPI with selectable interrupt level**
- 100 kΩ or 300 kΩ pull-up resistors**
- 300 kΩ pull-down resistors**
- GPO with push-pull or open-drain**
- Programmable logic block**
- PWM generator**
  - Internal PWM generation**
  - External PWM with internal PWM AND function**
- Reset generators**
- I<sup>2</sup>C interface with fast mode plus (Fm+) support of up to 1 MHz**
- Open-drain interrupt output**
- 16-ball WLCSP, 1.59 mm × 1.59 mm**
- 16-lead LFCSP, 3 mm × 3 mm**

## APPLICATIONS

- Keypad entries and input/output expansion capabilities**
- Smart phones, remote controls, and cameras**
- Healthcare, industrial, and instrumentation**

## GENERAL DESCRIPTION

The ADP5585 is a 10 input/output port expander with a built in keypad matrix decoder, programmable logic, reset generator, and PWM generator. Input/output expander ICs are used in portable devices (phones, remote controls, and cameras) and nonportable applications (healthcare, industrial, and instrumentation). I/O expanders can be used to increase the number of I/Os available to a processor or to reduce the number of I/Os required through interface connectors for front panel designs.

The ADP5585 handles all key scanning and decoding and can flag the main processor via an interrupt line that new key events have occurred. GPI changes and logic changes can also be tracked

Figure 1.

09844-001

as events via the FIFO, eliminating the need to monitor different registers for event changes. The ADP5585 is equipped with a FIFO to store up to 16 events. Events can be read back by the processor via an I<sup>2</sup>C-compatible interface.

The ADP5585 frees up the main processor from having to monitor the keypad, thereby reducing power consumption and/or increasing processor bandwidth for performing other functions.

The programmable logic functions allow common logic requirements to be integrated as part of the GPIO expander, thus saving board area and cost.

<sup>1</sup> All limits at temperature extremes are guaranteed via correlation using standard statistical quality control (SQC). Typical values are at T<sub>A</sub> = 25°C, VDD = 1.8 V.  
<sup>2</sup> Guaranteed by design.  
<sup>3</sup> All timers are referenced from the base oscillator and have the same ±10% accuracy.  
<sup>4</sup> C<sub>B</sub> is the total capacitance of one bus line in picofarads.

## ABSOLUTE MAXIMUM RATINGS

Table 2.

| Parameter   | Rating                      |
|---|-----------------------------|
| VDD to GND  | −0.3 V to +4 V              |
| SCL, SDA, $\overline{\text{RST}}$ , $\overline{\text{INT}}$ , R0, R1, R2, R3, R4, C0, C1, C2, C3, C4 to GND | −0.3 V to (VDD + 0.3 V)     |
| Temperature Range   |                             |
| Operating (Ambient)   | −40°C to +85°C <sup>1</sup> |
| Operating (Junction)  | −40°C to +125°C             |
| Storage   | −65°C to +150°C             |

<sup>1</sup> In applications where high power dissipation and poor thermal resistance are present, the maximum ambient temperature may need to be derated. Maximum ambient temperature ( $T_{A(MAX)}$ ) is dependent on the maximum operating junction temperature ( $T_{J(MAXOP)} = 125^{\circ}\text{C}$ ), the maximum power dissipation of the device ( $P_{D(MAX)}$ ), and the junction-to-ambient thermal resistance of the device/package in the application ( $\theta_{JA}$ ), using the following equation:  $T_{A(MAX)} = T_{J(MAXOP)} - (\theta_{JA} \times P_{D(MAX)})$ .

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Absolute maximum ratings apply individually only, not in combination. Unless otherwise specified, all other voltages are referenced to GND.

### THERMAL RESISTANCE

$\theta_{JA}$  is specified for the worst-case conditions, that is, a device soldered in a printed circuit board (PCB) for surface-mount packages.

Table 3.

| Thermal Resistance        | $\theta_{JA}$ | Unit |
|---------------------------|---------------|------|
| 16-Ball WLCSP             | 62            | °C/W |
| Maximum Power Dissipation | 70            | mW   |
| 16-Lead LFCSP             | 67.154        | °C/W |
| Maximum Power Dissipation | 70            | mW   |

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

Figure 3. WLCSP Pin Configuration

NOTES  
1. THE EXPOSED PAD IS NOT CONNECTED. IT IS RECOMMENDED TO CONNECT THE EXPOSED PAD TO GROUND FOR THERMAL DISSIPATION.

Figure 4. LFCSP Pin Configuration

Table 4. Pin Function Descriptions

| Pin No. |       | Mnemonic | Description   |
|---------|-------|----------|---|
| WLCSP   | LFCSP |          |   |
| D1      | 1     | R4       | GPIO 5 (GPIO Alternate Function: RESET1). This pin functions as Row 4 when used as a keypad.  |
| D2      | 2     | R3       | GPIO 4 (GPIO Alternate Function: Logic Block Input LC, PWM_OUT). This pin functions as Row 3 when used as a keypad.   |
| C1      | 3     | R2       | GPIO 3 (GPIO Alternate Function: Logic Block Input LB). This pin functions as Row 2 when used as a keypad.  |

# THEORY OF OPERATION

Figure 5. Internal Block Diagram

09841-004

## DEVICE ENABLE

When sufficient voltage is applied to VDD and the  $\overline{\text{RST}}$  pin is driven with a logic high level, the ADP5585 starts up in standby mode with all settings at default. The user can configure the device via the I<sup>2</sup>C interface. When the  $\overline{\text{RST}}$  pin is low, the ADP5585 enters a reset state and all settings return to default. The  $\overline{\text{RST}}$  pin features a debounce filter.

If using the ADP5585ACBZ-01-R7 or ADP5585ACPZ-01-R7 device model, the  $\overline{\text{RST}}$  pin acts as an extra row pin. Without a reset pin, the only method to reset the device is by bringing VDD below the UVLO threshold.

## DEVICE OVERVIEW

The ADP5585 contains 10 multiconfigurably input/output pins. Each pin can be programmed to enable the device to carry out its various functions, as follows:

- Keypad matrix decoding (five-column by five-row matrix maximum).
- General-purpose I/O expansion (up to 10 inputs/outputs).
- PWM generation.
- Logic function building blocks (up to three inputs and one output).
- Two reset generators.

All 10 input/output pins have an I/O structure as shown in Figure 6.

Figure 6. I/O Structure

Each I/O can be pulled up with a 100 kΩ or 300 kΩ resistor or pulled down with a 300 kΩ resistor. For logic output drive, each I/O has a 5 mA PMOS source and a 10 mA NMOS sink for a push-pull type output. For open-drain output situations, the 5 mA PMOS source is not enabled. For logic input applications, each I/O can be sampled directly or, alternatively, sampled through a debounce filter.

The I/O structure shown in Figure 6 allows for all GPI and GPO functions, as well as PWM and clock divide functions. For key matrix scan and decode, the scanning circuit uses the 100 kΩ or 300 kΩ resistor for pulling up keypad row pins and the 10 mA NMOS sinks for grounding keypad column pins (see the Key Scan Control section for details about key decoding).

Configuration of the device is carried out by programming an array of internal registers via the I<sup>2</sup>C interface. Feedback of device status and pending interrupts can be flagged to an external processor by using the INT pin.

The ADP5585 is offered with three feature sets. Table 5 lists the options that are available for each model of the ADP5585.

Table 5. Matrix Options by Device Model

| Model             | Description   |
|-------------------|---|
| ADP5585ACBZ-00-R7 | GPIO pull up (default option)<br>5-row × 5-column matrix                              |
| ADP5585ACBZ-01-R7 | Row 5 added to GPIOs<br>6-row × 5-column matrix                                       |
| ADP5585ACBZ-02-R7 | No pull-up resistors to special function pins <sup>1</sup><br>5-row × 5-column matrix |
| ADP5585ACBZ-04-R7 | Pull-down resistors to all GPIO pins on start-up<br>5-row × 5-column matrix           |
| ADP5585ACPZ-00-R7 | GPIO pull up (default option)<br>5-row × 5-column matrix                              |
| ADP5585ACPZ-01-R7 | Row 5 added to GPIOs<br>6-row × 5-column matrix                                       |
| ADP5585ACPZ-03-R7 | Alternate I <sup>2</sup> C address (0x30)<br>5-row × 5-column matrix                  |

<sup>1</sup> Special function pins are defined as R0, R3, R4, and C4. See Table 4 for details.

# FUNCTIONAL DESCRIPTION

## EVENT FIFO

Before going into detail on the various ADP5585 blocks, it is important to understand the function of the event FIFO. The ADP5585 features an event FIFO that can record as many as 16 events. By default, the FIFO primarily records key events, such as key press and key release. However, it is possible to configure the general-purpose input (GPI) and logic activity to generate event information on the FIFO as well. An event count, EC[4:0], is composed of five bits and works in tandem with the FIFO so that the user knows how much of the FIFO must be read back at any given time.

The FIFO is composed of 16 eight-bit sections that the user accesses by reading the FIFO\_x registers. The actual FIFO is not in user accessible registers until a read occurs. The FIFO can be thought of as a “first in first out” buffer that is used to fill Register 0x03 to Register 0x12.

The event FIFO is made up of 16 eight-bit registers. In each register, Bits[6:0] hold the event identifier, and Bit 7 holds the event state. With seven bits, 127 different events can be identified. See Table 11 for event decoding.

Figure 7. Breakdown of Eventx[7:0] Bits

When events are available on the FIFO, the user should first read back the event count, EC[4:0], to determine how many events must be read back. Events can be read from the top of the FIFO only. When an event is read back, all remaining events in the FIFO are shifted up one location, and the EC[4:0] count is decremented.

Figure 8. FIFO Operation

The FIFO registers (0x03 to 0x12) always point to the top of the FIFO (that is, the location of EVENT1[7:0]). If the user tries to read back from any location in a FIFO, data is always obtained from the top of that FIFO. This ensures that events can only be read back in the order in which they occurred, thus ensuring the integrity of the FIFO system.

As stated above, some of the onboard functions of ADP5585 can be programmed to generate events on the FIFO. A FIFO update control block manages updates to the FIFO. If an I<sup>2</sup>C transaction is accessing any of the FIFO address locations, updates are paused until the I<sup>2</sup>C transaction has completed.

A FIFO overflow event occurs when more than 16 events are generated prior to an external processor reading a FIFO and clearing it.

If an overflow condition occurs, the overflow status bit is set. An interrupt is generated if overflow interrupt is enabled, signaling to the processor that more than 16 events have occurred.

## KEY SCAN CONTROL

### General

The 10 input/output pins can be configured to decode a keypad matrix up to a maximum size of 25 switches (5 × 5 matrix). Smaller matrices can also be configured, freeing up the unused row and column pins for other I/O functions.

The R0 through R4 I/O pins comprise the rows of the keypad matrix. The C0 through C4 I/O pins comprise the columns of the keypad matrix. Pins used as rows are pulled up via the internal 300 kΩ (or 100 kΩ) resistors. Pins used as columns are driven low via the internal NMOS current sink.

Figure 9. Simplified Key Scan Block

Figure 9 shows a simplified representation of the key scan block using three row and three column pins connected to a small 3 × 3, nine-switch keypad matrix. When the key scanner is idle, the row pins are pulled high and the column pins are driven low. The key scanner operates by checking the row pins to see if they are low.

If Switch 6 in the matrix is pressed, R1 connects to C2. The key scan circuit senses that one of the row pins has been pulled low, and a key scan cycle begins. Key scanning involves driving all column pins high, then driving each column pin, one at a time,

low and sensing whether a row pin is low or not. All row/column pairs are scanned; therefore, if multiple keys are pressed, they are detected.

To prevent glitches or narrow press times being registered as a valid key press, the key scanner requires the key be pressed for two scan cycles. The key scanner has a wait time between each scan cycle; therefore, the key must be pressed and held for at least this wait time to register as being pressed. If the key is continuously pressed, the key scanner continues to scan, wait, scan, wait, and so forth.

If Switch 6 is released, the connection between R1 and C2 breaks, and R1 is pulled up high. The key scanner requires that the key be released for two scan cycles because the release of a key is not necessarily in sync with the key scanner, it may take up to two full wait/scan cycles for a key to register as released. When the key is registered as released, and no other keys are pressed, the key scanner returns to idle mode.

For the remainder of this document, the press/release status of a key is represented as simply a logic signal in the figures. A logic high level represents the key status as pressed, and a logic low represents released. This eliminates the need to draw individual row/column signals when describing key events.

Figure 10. Logic Low: Released, Logic High: Pressed

Figure 11 shows a detailed representation of the key scan block and its associated control and status signals. When all row and column pins are used, a matrix of 25 unique keys can be scanned.

Figure 11. Detailed Key Scan Block

Use Registers PIN\_CONFIG\_A[7:0] and PIN\_CONFIG\_B[7:0] to configure I/Os for keypad decoding. The number label on each key switch represents the event identifier that is recorded if that switch was pressed. If all row/column pins are configured, it is possible to observe all 25 key identifiers on the FIFO. A larger 6 × 5 matrix can be configured by using the ADP5585ACBZ-01-R7 or the ADP5585ACPZ-01-R7.

If a smaller 2 × 2 matrix is configured, for example, by using the C2 and C3 column pins and the R1 and R2 row pins, only the four event identifiers (8, 9, 13, and 14) can possibly be observed on the FIFO, as shown in Figure 11.

By default, ADP5585 records key presses and releases on the FIFO. Figure 12 illustrates what happens when a single key is pressed and released. Initially, the key scanner is idle. When Key 3 is pressed, the scanner begins scanning through all configured row/column pairs. After the scan wait time, the scanner again scans through all configured row/column pairs and detects that Key 3 has remained pressed, which sets the EVENT\_INT interrupt. The event counter, EC[4:0], is incremented to 1, EVENT1\_IDENTIFIER[6:0] of the FIFO is updated with its event identifier set to 3, and its EVENT1\_STATE bit is set to 1, indicating a press.

Figure 12. Press and Release Event

The key scanner continues the scan/wait cycles while the key remains pressed. If the scanner detects that the key has been released for two consecutive scan cycles, the event counter, EC[4:0], is incremented to 2, and EVENT2\_IDENTIFIER[6:0] of the FIFO is updated with its event identifier set to 3. Its EVENT2\_STATE bit is set to 0, indicating a release. The key scanner returns to idle mode because no other keys are pressed.

The EVENT\_INT interrupt can be triggered by both press and release key events. As shown in Figure 14, if Key 3 is pressed, EVENT\_INT is asserted, EC[4:0] is updated, and the FIFO is updated. During the time that the key remains pressed, it is possible for the FIFO to be read, the event counter decremented to 0, and EVENT\_INT cleared. When the key is finally released, EVENT\_INT is asserted, the event counter is incremented, and the FIFO is updated with the release event information.

Figure 13. Asserting the EVENT\_INT Interrupt Key Pad Extension

As shown in Figure 11, the keypad can be extended if each row is connected directly to ground by a switch. If the switch placed between R0 and ground is pressed, the entire row is grounded. When the key scanner completes scanning, it normally detects Key 1 to Key 5 as being pressed; however, this unique condition is decoded by the ADP5585, and Key Event 31 is assigned to it. Up to eight more key event assignments are possible, allowing the keypad size to extend up to 30. However, if one of the extended keys is pressed, none of the keys on that row is detectable. Activation of a ground key causes all other keys sharing that row to be undetectable.

**Ghosting**

Ghosting is an occurrence where, given certain key press combinations on a keypad matrix, a false positive reading of an additional key is detected. Ghosting is created when three or more keys are pressed simultaneously on multiple rows or columns (see Figure 14). Key combinations that form a right angle on the keypad matrix can cause ghosting.

The solution to ghosting is to select a keypad matrix layout that takes into account three key combinations that are most likely to be pressed together. Multiple keys pressed across one row or across one column do not cause ghosting. Staggering keys so that they do not share a column also avoids ghosting. The most common practice is to place keys that are likely to be pressed together in the same row or column. Some examples of keys that are likely to be pressed together are as follows:

- The navigation keys in combination with Select.
- The navigation keys in combination with the space bar.
- The reset combination keys, such as CTRL + ALT + DEL.

Figure 14. COL0: ROW3 is a Ghost Key Due to a Short Among ROW0, COL0, COL2, and ROW3 During Key Press

**GPI INPUT**

Each of the 10 input/output lines can be configured as a general-purpose logic input line. Figure 15 shows a detailed representation of the GPI scan and detect block and its associated control and status signals.

Figure 15. GPI Scan and Detect Block

The current input state of each GPI can be read back using the GPI\_STATUS\_x registers. Each GPI can be programmed to generate an interrupt via the GPI\_INTERRUPT\_EN\_x registers. The interrupt status is stored in the GPI\_INT\_STAT\_x registers. GPI interrupts can be programmed to trigger on the positive or negative edge by configuring the GPI\_INT\_LEVEL\_x registers. If any of the GPI interrupts is triggered, the master GPI\_INT interrupt is also triggered. Figure 16 shows a single GPI and how it affects its corresponding status and interrupt status bits.

Figure 16. Single GPI Example

GPIs can be programmed to generate FIFO events via the GPI\_EVENT\_EN\_x registers. GPIs in this mode do not generate GPI\_INT interrupts and instead generate EVENT\_INT interrupts. Figure 17 shows several GPI lines and their effects on the FIFO and event count, EC[4:0].

Figure 17. Multiple GPI Example

The GPI scanner is idle until it detects a level transition. It scans the GPI inputs and updates accordingly. It then returns to idle immediately, it does not scan/wait, like the key scanner. As such, the GPI scanner can detect narrow pulses once they get past the 50 μs input debounce filter.

**GPO OUTPUT**

Each of the 10 input/output lines can be configured as a general-purpose output (GPO) line. Figure 6 shows a detailed diagram of the I/O structure. See the Detailed Register Descriptions section for GPO configuration and usage.

**LOGIC BLOCKS**

Several of the ADP5585 input/output lines can be used as inputs and outputs for implementing some common logic functions.

The R1, R2, and R3 input/output pins can be used as inputs, and the R0 input/output pin can be used as an output for the logic block.

The outputs from the logic blocks can be configured to generate interrupts. They can also be configured to generate events on the FIFO.

Figure 19 shows a detailed diagram of the internal make-up of the logic block, illustrating the possible logic functions that can be implemented.

Figure 18. Logic Block Overview

09841-017

**PWM BLOCK**

The ADP5585 features a PWM generator whose output can be configured to drive out on the R3 I/O pin. PWM on/off times are programmed via four 8-bit registers (see Figure 20). Each bit of the on or off time represents 1  $\mu$ s. The highest frequency obtainable from the PWM is performed by setting the least significant bit of both the on and off time bit patterns, resulting in a 500 kHz signal with a 50% duty cycle.

The PWM block provides support for continuous PWM mode as well as a one-shot mode (see Table 59). Additionally, an external signal can be AND'ed with the internal PWM signal. This option can be selected by writing a 1 to PWM\_IN\_AND (PWM\_CFG[2]). The input to the external AND is the C3 I/O pin. C3 should be set to GPI. Note that the debounce for C3 results in a delay of the AND'ing, and can be turned on or off using Register 0x21.

Newly programmed values are not latched until the final byte, PWM\_ONT\_HIGH\_BYTE (Register 0x32, Bits[7:0]), is written.

Figure 19. Logic Block

09841-018

Figure 20. PWM Block Diagram

09841-019

**RESET BLOCKS**

ADP5585 features two reset blocks that can generate reset conditions if certain events are detected simultaneously. Up to three reset trigger events can be programmed for RESET1. Up to two reset trigger events can be programmed for RESET2. The event scan control blocks monitor whether these events are present for the duration of RESET\_TRIG\_TIME[2:0] (Register 0x2E, Bits[4:2]). If they are, reset-initiate signals are sent to the reset generator blocks. The generated reset signal pulse width is programmable.

Figure 21. Reset Blocks

The Reset 1 signal uses the R4 I/O pin as its output. A pass through mode allows the main RST pin to be output on the R4 pin also. The Reset 2 signal uses the C4 I/O pin as its output.

The reset generation signals are useful in situations where the system processor has locked up and the system is unresponsive to input events. The user can press one of the reset event combinations and initiate a system wide reset. This alleviates the need for removing the battery from the system and doing a hard reset.

It is not recommended to use the immediate trigger time (see Table 54) because this setting may cause false triggering.

**Interrupts**

The  $\overline{\text{INT}}$  pin can be asserted low if any of the internal interrupt sources is active. The user can select which internal interrupts interact with the external interrupt pin in Register 0x3C (refer to Table 68). Register 0x3B allows the user to choose whether the external interrupt pin remains asserted, or deasserts for 50  $\mu\text{s}$ , then reasserts, in the case that there are multiple internal interrupts asserted and one is cleared (refer to Table 67).

Figure 22. Asserting  $\overline{\text{INT}}$  Low

## REGISTER INTERFACE

Register access to the ADP5585 is acquired via its I<sup>2</sup>C-compatible serial interface. The interface can support clock frequencies of up to 1 MHz. If the user is accessing the FIFO or key event counter (KEC), FIFO/KEC updates are paused. If the clock frequency is very low, events may not be recorded in a timely manner. FIFO or KEC updates can happen up to 23 μs after an interrupt is asserted because of the number of I<sup>2</sup>C cycles required to perform an I<sup>2</sup>C read or write. This delay should not present an issue to the user.

Figure 23 shows a typical write sequence for programming an internal register. The cycle begins with a start condition, followed by the hard coded 7-bit device address, which for the ADP5585 is 0x34, followed by the R/W bit set to 0 for a write cycle. The ADP5585 acknowledges the address byte by pulling the data line low. The address of the register to which data is to be written is sent next. The ADP5585 acknowledges the register pointer byte by pulling the data line low. The data byte to be written is sent next. The ADP5585 acknowledges the data byte by pulling the data line low. A stop condition completes the sequence.

Figure 24 shows a typical multibyte write sequence for programming internal registers. The cycle begins with a start condition followed by the 7-bit device address (0x34 for all models except the ADP5585ACPZ-03-R7, 0x30 for the ADP5585ACPZ-03-R7 only), followed by the R/W bit set to 0 for a write cycle. The ADP5585 acknowledges the address byte by pulling the data

line low. The address of the register to which data is to be written is sent next. The ADP5585 acknowledges the register pointer byte by pulling the data line low. The data byte to be written is sent next. The ADP5585 acknowledges the data byte by pulling the data line low. The pointer address is then incremented to write the next data byte, until it finishes writing the n data byte. The ADP5585 pulls the data line low after every byte, and a stop condition completes the sequence.

Figure 25 shows a typical byte read sequence for reading internal registers. The cycle begins with a start condition followed by the 7-bit device address (0x34 for all models except the ADP5585ACPZ-03-R7, 0x30 for the ADP5585ACPZ-03-R7 only), followed by the R/W bit set to 0 for a write cycle. The ADP5585 acknowledges the address byte by pulling the data line low. The address of the register from which data is to be read is sent next. The ADP5585 acknowledges the register pointer byte by pulling the data line low. A start condition is repeated, followed by the 7-bit device address (0x34 for all models except the ADP5585ACPZ-03-R7, 0x30 for the ADP5585ACPZ-03-R7 only), followed by the R/W bit set to 1 for a read cycle. The ADP5585 acknowledges the address byte by pulling the data line low. The 8-bit data is then read. The host pulls the data line high (no acknowledge), and a stop condition completes the sequence.

Figure 23. I<sup>2</sup>C Single Byte Write Sequence

Figure 24. I<sup>2</sup>C Multibyte Write Sequence

Figure 25. I<sup>2</sup>C Single Byte Read Sequence

Figure 26 shows a typical multibyte read sequence for reading internal registers. The cycle begins with a start condition, followed by the 7-bit device address (0x34 for all models except the ADP5585ACPZ-03-R7, 0x30 for the ADP5585ACPZ-03-R7 only), followed by the R/W bit set to 0 for a write cycle. The ADP5585 acknowledges the address byte by pulling the data line low. The address of the register from which data is to be read is sent next. The ADP5585 acknowledges the register pointer byte by pulling the data line low. A start condition is repeated, followed by the 7-bit device address (0x34 for all models except the

ADP5585ACPZ-03-R7, 0x30 for the ADP5585ACPZ-03-R7 only), followed by the R/W bit set to 1 for a read cycle. The ADP5585 acknowledges the address byte by pulling the data line low. The 8-bit data is then read. The address pointer is then incremented to read the next data byte, and the host continues to pull the data line low for each byte (master acknowledge) until the n data byte is read. The host pulls the data line high (no acknowledge) after the last byte is read, and a stop condition completes the sequence.

Figure 26. I2C Multibyte Read Sequence

## REGISTER MAP

Table 6.

| Reg Add | Reg Name           | R/W <sup>1</sup> | Bit 7         | Bit 6                   | Bit 5           | Bit 4            | Bit 3            | Bit 2           | Bit 1           | Bit 0           |
|---------|--------------------|------------------|---------------|-------------------------|-----------------|------------------|------------------|-----------------|-----------------|-----------------|

<sup>1</sup> R means read, W means write, and R/W means read/write.

**DETAILED REGISTER DESCRIPTIONS**

Note that N/A throughout this section means not applicable.

Note: All register default to 0000 0000 unless otherwise specified.

**ID Register 0x00**

Table 7. ID Bit Descriptions

| Bit(s) | Bit Name | Access    | Description                     |
|--------|----------|-----------|---------------------------------|
| 7 to 4 | MAN_ID   | Read only | Manufacturer ID, default = 0010 |
| 3 to 0 | REV_ID   | Read only | Rev ID                          |

**INT\_STATUS Register 0x01**

Table 8. INT\_STATUS Bit Descriptions

| Bit(s) | Bit Name     | Access     | Description <sup>1</sup>   |
|--------|--------------|------------|--|
| 7 to 5 | N/A          |            | Reserved.  |
| 4      | LOGIC_INT    | Read/write | 0 = no interrupt.<br>1 = interrupt due to a general logic condition.   |
| 3      | N/A          |            | Reserved.  |
| 2      | OVERFLOW_INT | Read/write | 0 = no interrupt.<br>1 = interrupt due to an overflow condition.   |
| 1      | GPI_INT      | Read/write | This bit is not set by a GPI that has been configured to update the FIFO and event count. This bit cannot be cleared until all GPI_x_INT bits are cleared.<br>0 = no interrupt.<br>1 = interrupt due to a general GPI condition. |
| 0      | EVENT_INT    | Read/write | 0 = no interrupt.<br>1 = interrupt due to key event (press/release), GPI event (GPI programmed for FIFO updates), or logic event (programmed for FIFO updates).  |

<sup>1</sup> Interrupt bits are cleared by writing a 1 to the flag; writing a 0 or reading the flag has no effect.

**Status Register 0x02**

Table 9. Status Bit Descriptions

| Bit(s) | Bit Name   | Access    | Description   |
|--------|------------|-----------|---|
| 7      | N/A        |           | Reserved.   |
| 6      | LOGIC_STAT | Read only | 0 = output from logic block (LY) is low.<br>1 = output from logic block (LY) is high. |
| 5      | N/A        |           | Reserved.   |
| 4 to 0 | EC[4:0]    | Read only | Event count value. Indicates how many events are currently stored on the FIFO.        |

**FIFO\_1 Register 0x03**

Table 10. FIFO\_1 Bit Descriptions

| Bit(s) | Bit Name               | Access    | Description  |
|--------|------------------------|-----------|--|
| 7      | EVENT1_STATE           | Read only | This bit represents the state of the event that is recorded in the EVENT1_IDENTIFIER[6:0] bit. For key events from Event 1 to Event 36, use the following settings:<br>1 = key is pressed.<br>0 = key is released.<br>For GPI and logic events from Event 37 to Event 48, use the following settings:<br>1 = GPI/logic is active.<br>0 = GPI/logic is inactive.<br>Active and inactive states for Event 37 to Event 48 are programmable. |
| 6 to 0 | EVENT1_IDENTIFIER[6:0] | Read only | Contains the event identifier for the pin. Refer to Table 11.  |

Table 11. Event Decoding

| Event No. | Meaning          | Event No. | Meaning          | Event No. | Meaning | Event No. | Meaning |
|-----------|------------------|-----------|------------------|-----------|---------|-----------|---------|
| 0         | No event         | 32        | Key 32 (R1, GND) | 64        | Unused  | 96        | Unused  |
| 1         | Key 1 (R0, C0)   | 33        | Key 33 (R2, GND) | 65        | Unused  | 97        | Unused  |
| 2         | Key 2 (R0, C1)   | 34        | Key 34 (R3, GND) | 66        | Unused  | 98        | Unused  |
| 3         | Key 3 (R0, C2)   | 35        | Key 35 (R4, GND) | 67        | Unused  | 99        | Unused  |
| 4         | Key 4 (R0, C3)   | 36        | Key 36 (R5, GND) | 68        | Unused  | 100       | Unused  |
| 5         | Key 5 (R0, C4)   | 37        | GPI 1 (R0)       | 69        | Unused  | 101       | Unused  |
| 6         | Key 6 (R1, C0)   | 38        | GPI 2 (R1)       | 70        | Unused  | 102       | Unused  |
| 7         | Key 7 (R1, C1)   | 39        | GPI 3 (R2)       | 71        | Unused  | 103       | Unused  |
| 8         | Key 8 (R1, C2)   | 40        | GPI 4 (R3)       | 72        | Unused  | 104       | Unused  |
| 9         | Key 9 (R1, C3)   | 41        | GPI 5 (R4)       | 73        | Unused  | 105       | Unused  |
| 10        | Key 10 (R1, C4)  | 42        | GPI 6 (R5)       | 74        | Unused  | 106       | Unused  |
| 11        | Key 11 (R2, C0)  | 43        | GPI 7 (C0)       | 75        | Unused  | 107       | Unused  |
| 12        | Key 12 (R2, C1)  | 44        | GPI 8 (C1)       | 76        | Unused  | 108       | Unused  |
| 13        | Key 13 (R2, C2)  | 45        | GPI 9 (C2)       | 77        | Unused  | 109       | Unused  |
| 14        | Key 14 (R2, C3)  | 46        | GPI 10 (C3)      | 78        | Unused  | 110       | Unused  |
| 15        | Key 15 (R2, C4)  | 47        | GPI 11 (C4)      | 79        | Unused  | 111       | Unused  |
| 16        | Key 16 (R3, C0)  | 48        | Logic            | 80        | Unused  | 112       | Unused  |
| 17        | Key 17 (R3, C1)  | 49        | Unused           | 81        | Unused  | 113       | Unused  |
| 18        | Key 18 (R3, C2)  | 50        | Unused           | 82        | Unused  | 114       | Unused  |

| 31        | Key 31 (R0, GND) | 63        | Unused           | 95        | Unused  | 127       | Unused  |

**FIFO\_2 Register 0x04**

Table 12. FIFO\_2 Bit Descriptions

| Bit(s) | Bit Name               | Access    | Description        |
|--------|------------------------|-----------|--------------------|
| 7      | EVENT2_STATE           | Read only | Refer to Table 10. |
| 6 to 0 | EVENT2_IDENTIFIER[6:0] | Read only | Refer to Table 10. |

**FIFO\_3 Register 0x05**

Table 13. FIFO\_3 Bit Descriptions

| Bit(s) | Bit Name               | Access    | Description        |
|--------|------------------------|-----------|--------------------|
| 7      | EVENT3_STATE           | Read only | Refer to Table 10. |
| 6 to 0 | EVENT3_IDENTIFIER[6:0] | Read only | Refer to Table 10. |

**FIFO\_4 Register 0x06**

Table 14. FIFO\_4 Bit Descriptions

| Bit(s) | Bit Name               | Access    | Description        |
|--------|------------------------|-----------|--------------------|
| 7      | EVENT4_STATE           | Read only | Refer to Table 10. |
| 6 to 0 | EVENT4_IDENTIFIER[6:0] | Read only | Refer to Table 10. |

**FIFO\_5 Register 0x07**

Table 15. FIFO\_5 Bit Descriptions

| Bit(s) | Bit Name               | Access    | Description        |
|--------|------------------------|-----------|--------------------|
| 7      | EVENT5_STATE           | Read only | Refer to Table 10. |
| 6 to 0 | EVENT5_IDENTIFIER[6:0] | Read only | Refer to Table 10. |

**FIFO\_6 Register 0x08**

Table 16. FIFO\_6 Bit Descriptions

| Bit(s) | Bit Name               | Access    | Description        |
|--------|------------------------|-----------|--------------------|
| 7      | EVENT6_STATE           | Read only | Refer to Table 10. |
| 6 to 0 | EVENT6_IDENTIFIER[6:0] | Read only | Refer to Table 10. |

**FIFO\_7 Register 0x09**

Table 17. FIFO\_7 Bit Descriptions

| Bit(s) | Bit Name               | Access    | Description        |
|--------|------------------------|-----------|--------------------|
| 7      | EVENT7_STATE           | Read only | Refer to Table 10. |
| 6 to 0 | EVENT7_IDENTIFIER[6:0] | Read only | Refer to Table 10. |

**FIFO\_8 Register 0x0A**

Table 18. FIFO\_8 Bit Descriptions

| Bit(s) | Bit Name               | Access    | Description        |
|--------|------------------------|-----------|--------------------|
| 7      | EVENT8_STATE           | Read only | Refer to Table 10. |
| 6 to 0 | EVENT8_IDENTIFIER[6:0] | Read only | Refer to Table 10. |

**FIFO\_9 Register 0x0B**

Table 19. FIFO\_9 Bit Descriptions

| Bit(s) | Bit Name               | Access    | Description        |
|--------|------------------------|-----------|--------------------|
| 7      | EVENT9_STATE           | Read only | Refer to Table 10. |
| 6 to 0 | EVENT9_IDENTIFIER[6:0] | Read only | Refer to Table 10. |

**FIFO\_10 Register 0x0C**

Table 20. FIFO\_10 Bit Descriptions

| Bit(s) | Bit Name                | Access    | Description        |
|--------|-------------------------|-----------|--------------------|
| 7      | EVENT10_STATE           | Read only | Refer to Table 10. |
| 6 to 0 | EVENT10_IDENTIFIER[6:0] | Read only | Refer to Table 10. |

**FIFO\_11 Register 0x0D**

Table 21. FIFO\_11 Bit Descriptions

| Bit(s) | Bit Name                | Access    | Description        |
|--------|-------------------------|-----------|--------------------|
| 7      | EVENT11_STATE           | Read only | Refer to Table 10. |
| 6 to 0 | EVENT11_IDENTIFIER[6:0] | Read only | Refer to Table 10. |

**FIFO\_12 Register 0x0E**

Table 22. FIFO\_12 Bit Descriptions

| Bit(s) | Bit Name                | Access    | Description        |
|--------|-------------------------|-----------|--------------------|
| 7      | EVENT12_STATE           | Read only | Refer to Table 10. |
| 6 to 0 | EVENT12_IDENTIFIER[6:0] | Read only | Refer to Table 10. |

**FIFO\_13 Register 0x0F**

Table 23. FIFO\_13 Bit Descriptions

| Bit(s) | Bit Name                | Access    | Description        |
|--------|-------------------------|-----------|--------------------|
| 7      | EVENT13_STATE           | Read only | Refer to Table 10. |
| 6 to 0 | EVENT13_IDENTIFIER[6:0] | Read only | Refer to Table 10. |

**FIFO\_14 Register 0x10**

Table 24. FIFO\_14 Bit Descriptions

| Bit(s) | Bit Name                | Access    | Description        |
|--------|-------------------------|-----------|--------------------|
| 7      | EVENT14_STATE           | Read only | Refer to Table 10. |
| 6 to 0 | EVENT14_IDENTIFIER[6:0] | Read only | Refer to Table 10. |

**FIFO\_15 Register 0x11**

Table 25. FIFO\_15 Bit Descriptions

| Bit(s) | Bit Name                | Access    | Description        |
|--------|-------------------------|-----------|--------------------|
| 7      | EVENT15_STATE           | Read only | Refer to Table 10. |
| 6 to 0 | EVENT15_IDENTIFIER[6:0] | Read only | Refer to Table 10. |

**FIFO\_16 Register 0x12**

Table 26. FIFO\_16 Bit Descriptions

| Bit(s) | Bit Name                | Access    | Description        |
|--------|-------------------------|-----------|--------------------|
| 7      | EVENT16_STATE           | Read only | Refer to Table 10. |
| 6 to 0 | EVENT16_IDENTIFIER[6:0] | Read only | Refer to Table 10. |

**GPI\_INT\_STAT\_A Register 0x13**

Table 27. GPI\_INT\_STAT\_A Bit Descriptions

| Bit(s) | Bit Name  | Access    | Description   |
|--------|-----------|-----------|---|
| 7 to 6 | N/A       |           | Reserved.   |
| 5      | GPI_6_INT | Read only | 0 = no interrupt<br>1 = interrupt due to GPI_6 (R5 pin). Cleared on read. |
| 4      | GPI_5_INT | Read only | 0 = no interrupt<br>1 = interrupt due to GPI_5 (R4 pin). Cleared on read. |
| 3      | GPI_4_INT | Read only | 0 = no interrupt<br>1 = interrupt due to GPI_4 (R3 pin). Cleared on read. |
| 2      | GPI_3_INT | Read only | 0 = no interrupt<br>1 = interrupt due to GPI_3 (R2 pin). Cleared on read. |
| 1      | GPI_2_INT | Read only | 0 = no interrupt<br>1 = interrupt due to GPI_2 (R1 pin). Cleared on read. |
| 0      | GPI_1_INT | Read only | 0 = no interrupt<br>1 = interrupt due to GPI_1 (R0 pin). Cleared on read. |

**GPI\_INT\_STAT\_B Register 0x14**

Table 28. GPI\_INT\_STAT\_B Bit Descriptions

| Bit(s) | Bit Name   | Access    | Description   |
|--------|------------|-----------|---|
| 7 to 5 | N/A        |           | Reserved.   |
| 4      | GPI_11_INT | Read only | 0 = no interrupt.<br>1 = interrupt due to GPI_11 (C4 pin). Cleared on read. |

**GPO\_OUT\_MODE\_B Register 0x26****Table 46. Register 0x26, GPO\_OUT\_MODE\_B Bit Descriptions**

| Bit(s) | Bit Name        | Access     | Description                       |
|--------|-----------------|------------|-----------------------------------|
| 7 to 5 | N/A             |            | Reserved.                         |
| 4      | GPO_11_OUT_MODE | Read/write | 0 = push/pull.<br>1 = open drain. |
| 3      | GPO_10_OUT_MODE | Read/write | 0 = push/pull.<br>1 = open drain. |
| 2      | GPO_9_OUT_MODE  | Read/write | 0 = push/pull.<br>1 = open drain. |
| 1      | GPO_8_OUT_MODE  | Read/write | 0 = push/pull.<br>1 = open drain. |
| 0      | GPO_7_OUT_MODE  | Read/write | 0 = push/pull.<br>1 = open drain. |

**GPIO\_DIRECTION\_A Register 0x27**

Table 47. GPIO\_DIRECTION\_A Bit Descriptions

| Bit(s) | Bit Name   | Access     | Description  |
|--------|------------|------------|--|
| 7 to 6 | N/A        |            | Reserved.  |
| 5      | GPIO_6_DIR | Read/write | (Reserved except for ADP5585AC_Z-01-R7 options)<br>0 = GPIO 6 is an input.<br>1 = GPIO 6 is an output. |
| 4      | GPIO_5_DIR | Read/write | 0 = GPIO 5 is an input.<br>1 = GPIO 5 is an output.  |
| 3      | GPIO_4_DIR | Read/write | 0 = GPIO 4 is an input.<br>1 = GPIO 4 is an output.  |
| 2      | GPIO_3_DIR | Read/write | 0 = GPIO 3 is an input.<br>1 = GPIO 3 is an output.  |
| 1      | GPIO_2_DIR | Read/write | 0 = GPIO 2 is an input.<br>1 = GPIO 2 is an output.  |
| 0      | GPIO_1_DIR | Read/write | 0 = GPIO 1 is an input.<br>1 = GPIO 1 is an output.  |

**GPIO\_DIRECTION\_B Register 0x28**

Table 48. Register 0x28, GPIO\_DIRECTION\_B Bit Descriptions

| Bit(s) | Bit Name    | Access     | Description   |
|--------|-------------|------------|---|
| 7 to 5 | N/A         |            | Reserved.   |
| 4      | GPIO_11_DIR | Read/write | 0 = GPIO 11 is an input.<br>1 = GPIO 11 is an output. |
| 3      | GPIO_10_DIR | Read/write | 0 = GPIO 10 is an input.<br>1 = GPIO 10 is an output. |
| 2      | GPIO_9_DIR  | Read/write | 0 = GPIO 9 is an input.<br>1 = GPIO 9 is an output.   |
| 1      | GPIO_8_DIR  | Read/write | 0 = GPIO 8 is an input.<br>1 = GPIO 8 is an output.   |
| 0      | GPIO_7_DIR  | Read/write | 0 = GPIO 7 is an input.<br>1 = GPIO 7 is an output.   |

**RESET1\_EVENT\_A Register 0x29**

Table 49. RESET1\_EVENT\_A Bit Descriptions

| Bit(s) | Bit Name             | Access     | Description   |
|--------|----------------------|------------|---|
| 7      | RESET1_EVENT_A_LEVEL | Read/write | Defines which level the first reset event should be to generate the RESET1 signal.<br>For key events, use the following settings:<br>0 = not applicable; releases not used for reset generation.<br>1 = press is used as reset event.<br>For GPIOs and logic outputs configured for FIFO updates, use the following settings:<br>0 = inactive event used as reset condition.<br>1 = active event used as reset condition. |
| 6 to 0 | RESET1_EVENT_A[6:0]  | Read/write | Defines an event that can be used to generate the RESET1 signal. Up to three events can be defined for generating the RESET1 signal, using RESET1_EVENT_A[6:0], RESET1_EVENT_B[6:0], and RESET1_EVENT_C[6:0]. If one of the registers is 0, that register is not used for reset generation. All reset events must be detected at the same time to trigger the reset.  |

**RESET1\_EVENT\_B Register 0x2A**

Table 50. RESET1\_EVENT\_B Bit Descriptions

| Bit(s) | Bit Name             | Access     | Description  |
|--------|----------------------|------------|--|
| 7      | RESET1_EVENT_B_LEVEL | Read/write | Defines which level the second reset event should be to generate the RESET1 signal. Refer to Table 49. |
| 6 to 0 | RESET1_EVENT_B[6:0]  | Read/write | Defines an event that can be used to generate the RESET1 signal. Refer to Table 11.                    |

**RESET1\_EVENT\_C Register 0x2B**

Table 51. RESET1\_EVENT\_C Bit Descriptions

| Bit(s) | Bit Name             | Access     | Description  |
|--------|----------------------|------------|--|
| 7      | RESET1_EVENT_C_LEVEL | Read/write | Defines which level the second reset event should be to generate the RESET1 signal. Refer to Table 49. |
| 6 to 0 | RESET1_EVENT_C[6:0]  | Read/write | Defines an event that can be used to generate the RESET1 signal. Refer to Table 11.                    |

**RESET2\_EVENT\_A Register 0x2C**

Table 52. RESET2\_EVENT\_A Bit Descriptions

| Bit(s) | Bit Name             | Access     | Description   |
|--------|----------------------|------------|---|
| 7      | RESET2_EVENT_A_LEVEL | Read/write | Defines which level the first reset event should be to generate the RESET2 signal.<br>For key events, use the following settings:<br>0 = not applicable; releases not used for reset generation.<br>1 = press is used as reset event.<br>For GPIOs and logic outputs configured for FIFO updates, use the following settings:<br>0 = inactive event used as reset condition.<br>1 = active event used as reset condition. |
| 6 to 0 | RESET2_EVENT_A[6:0]  | Read/write | Defines an event that can be used to generate the RESET2 signal. Up to two events can be defined for generating the RESET2 signal, using RESET2_EVENT_A[6:0], and RESET2_EVENT_B[6:0]. If one of the registers is 0, that register is not used for reset generation. All reset events must be detected at the same time to trigger the reset.   |

**RESET2\_EVENT\_B Register 0x2D**

Table 53. RESET2\_EVENT\_B Bit Descriptions

| Bit(s) | Bit Name             | Access     | Description  |
|--------|----------------------|------------|--|
| 7      | RESET2_EVENT_B_LEVEL | Read/write | Defines which level the second reset event should be to generate the RESET2 signal. Refer to Table 52. |
| 6 to 0 | RESET2_EVENT_B[6:0]  | Read/write | Defines an event that can be used to generate the RESET2 signal. Refer to Table 11.                    |

**RESET\_CFG Register 0x2E**

Table 54. RESET\_CFG Bit Descriptions

| Bit(s) | Bit Name        | Access     | Description   |
|--------|-----------------|------------|---|
| 7      | RESET2_POL      | Read/write | Sets the polarity of RESET2.<br>0 = RESET2 is active low.<br>1 = RESET2 is active high.             |
| 6      | RESET1_POL      | Read/write | Sets the polarity of RESET1.<br>0 = RESET1 is active low.<br>1 = RESET1 is active high.             |
| 5      | RST_PASSTHRU_EN | Read/write | Allows the RST pin to override (OR with) the RESET1 signal. This function not applicable to RESET2. |

| Bit(s) | Bit Name               | Access     | Description   |
|--------|------------------------|------------|---|
| 4 to 2 | RESET_TRIG_TIME[2:0]   | Read/write | Defines the length of time that the reset events must be active before a reset signal is generated. All events must be active at the same time for the same duration. RESET_TRIG_TIME[2:0] is common to both RESET1 and RESET2.<br>000 = immediate.<br>001 = 1.0 sec.<br>010 = 1.5 sec.<br>011 = 2.0 sec.<br>100 = 2.5 sec.<br>101 = 3.0 sec.<br>110 = 3.5 sec.<br>111 = 4.0 sec. |
| 1 to 0 | RESET_PULSE_WIDTH[1:0] | Read/write | Defines the pulse width of the reset signals. RESET_PULSE_WIDTH[1:0] is common to both RESET1 and RESET2.<br>00 = 500 $\mu$ s.<br>01 = 1 ms.<br>10 = 2 ms.<br>11 = 10 ms.   |

**PWM\_OFFT\_LOW Register 0x2F**

Table 55. Register 0x2F, PWM\_OFFT\_LOW Bit Descriptions

| Bit(s) | Bit Name               | Access     | Description                       |
|--------|------------------------|------------|-----------------------------------|
| 7 to 0 | PWM_OFFT_LOW_BYTE[7:0] | Read/write | Lower eight bits of PWM off time. |

**PWM\_OFFT\_HIGH Register 0x30**

Table 56. PWM\_OFFT\_HIGH Bit Descriptions

| Bit(s) | Bit Name                | Access     | Description                       |
|--------|-------------------------|------------|-----------------------------------|
| 7 to 0 | PWM_OFFT_HIGH_BYTE[7:0] | Read/write | Upper eight bits of PWM off time. |

**PWM\_ONT\_LOW Register 0x31**

Table 57. PWM\_ONT\_LOW Bit Descriptions

| Bit(s) | Bit Name              | Access     | Description                      |
|--------|-----------------------|------------|----------------------------------|
| 7 to 0 | PWM_ONT_LOW_BYTE[7:0] | Read/write | Lower eight bits of PWM on time. |

**PWM\_ONT\_HIGH Register 0x32**

Table 58. PWM\_ONT\_HIGH Bit Descriptions

| Bit(s) | Bit Name               | Access     | Description  |
|--------|------------------------|------------|--|
| 7 to 0 | PWM_ONT_HIGH_BYTE[7:0] | Read/write | Upper eight bits of PWM on time. Note that updated PWM times are not latched until this byte is written to. PWM count times are referenced from the internal oscillator. The fastest oscillator setting is 500 kHz (2 $\mu$ s increments). Therefore, the maximum period is<br>$2 \mu\text{s} \times 2^{16} = 131 \text{ ms}$<br>This gives PWM frequencies from 500 kHz down to 7.6 Hz. |

**PWM\_CFG Register 0x33**

Table 59. PWM\_CFG Bit Descriptions

| Bit(s) | Bit Name   | Access     | Description  |
|--------|------------|------------|--|
| 7 to 3 | N/A        |            | Reserved.  |
| 2      | PWM_IN_AND |            | 0 = no external AND'ing.<br>1 = PWM signal AND'ed with an externally supplied PWM signal (C3). |
| 1      | PWM_MODE   | Read/write | Defines PWM mode.<br>0 = continuous.<br>1 = executes one PWM period, then sets PWM_EN to 0.    |
| 0      | PWM_EN     | Read/write | Enable PWM generator.  |

**LOGIC\_CFG Register 0x34**

Table 60. LOGIC\_CFG Bit Descriptions

| Bit(s) | Bit Name       | Access     | Description   |
|--------|----------------|------------|---|
| 7      | N/A            |            | Reserved.   |
| 6      | LY_INV         | Read/write | 0 = LY output not inverted before passing into logic block.<br>1 = inverts output LY from the logic block.  |
| 5      | LC_INV         | Read/write | 0 = LC input not inverted before passing into the logic block.<br>1 = inverts input LC before passing it into the logic block.  |
| 4      | LB_INV         | R/W        | 0 = LB input not inverted before passing into the logic block.<br>1 = inverts input LB before passing it into the logic block.  |
| 3      | LA_INV         | R/W        | 0 = LA input not inverted before passing into the logic block.<br>1 = inverts input LA before passing it into the logic block.  |
| 2 to 0 | LOGIC_SEL[2:0] | R/W        | Configures the digital mux for the logic block. Refer to Figure 19.<br>000 = off/disable.<br>001 = AND.<br>010 = OR.<br>011 = XOR.<br>100 = FF.<br>101 = IN_LA.<br>110 = IN_LB.<br>111 = IN_LC. |

**LOGIC\_FF\_CFG Register 0x35**

Table 61. LOGIC\_FF\_CFG Bit Descriptions

| Bit(s) | Bit Name | Access     | Description  |
|--------|----------|------------|--|
| 7 to 2 | N/A      | Read/write | Reserved.  |
| 1      | FF_SET   | Read/write | 0 = FF not set in the logic block. Refer to Figure 19.<br>1 = set FF in the logic block.       |
| 0      | FF_CLR   | Read/write | 0 = FF not cleared in the logic block. Refer to Figure 19.<br>1 = clear FF in the logic block. |

**LOGIC\_INT\_EVENT\_EN Register 0x36**

Table 62. LOGIC\_INT\_EVENT\_EN Bit Descriptions

| Bit(s) | Bit Name        | Access     | Description   |
|--------|-----------------|------------|---|
| 7 to 3 | N/A             |            | Reserved.   |
| 2      | LY_DBNC_DIS     | Read/write | 0 = output of the logic block is debounced before entering the event/interrupt block.<br>1 = output of the logic block is not debounced before entering the event/interrupt block. Use with caution because glitches may generate interrupts prematurely. |
| 1      | LOGIC_EVENT_EN  | Read/write | 0 = LY cannot generate interrupt.<br>1 = allow LY activity to generate events on the FIFO.  |
| 0      | LOGIC_INT_LEVEL | Read/write | Configure the logic level of LY that generates an interrupt.<br>0 = LY is active low.<br>1 = LY is active high.   |

**POLL\_TIME\_CFG Register 0x37**

Table 63. Register 0x37, POLL\_TIME\_CFG Bit Descriptions

| Bit(s) | Bit Name           | Access     | Description   |
|--------|--------------------|------------|---|
| 7 to 2 | N/A                |            | Reserved.   |
| 1 to 0 | KEY_POLL_TIME[1:0] | Read/write | Configure time between consecutive scan cycles.<br>00 = 10 ms.<br>01 = 20 ms.<br>10 = 30 ms.<br>11 = 40 ms. |

**PIN\_CONFIG\_A Register 0x38**

Table 64. PIN\_CONFIG\_A Bit Descriptions

| Bit(s) | Bit Name  | Access     | Description   |
|--------|-----------|------------|---|
| 7 to 6 | N/A       |            | Reserved.   |
| 5      | R5_CONFIG | Read/write | Reserved except for ADP5585AC_Z-01-R7 options)<br>0 = GPIO 6.<br>1 = Row 5.                           |
| 4      | R4_CONFIG | Read/write | 0 = GPIO 5 (see R4_EXTEND_CFG in Table 66 for alternate configuration, RESET1).<br>1 = Row 4          |
| 3      | R3_CONFIG | Read/write | 0 = GPIO 4 (see R3_EXTEND_CFG[1:0] in Table 66 for alternate configuration, LC/PWM_OUT).<br>1 = Row 3 |
| 2      | R2_CONFIG | Read/write | 0 = GPIO 3<br>1 = Row 2   |
| 1      | R1_CONFIG | Read/write | 0 = GPIO 2<br>1 = Row 1   |
| 0      | R0_CONFIG | Read/write | 0 = GPIO 1/LY (see R0_EXTEND_CFG in Table 66 for alternate configuration, LY).<br>1 = Row 0           |

**PIN\_CONFIG\_B Register 0x39**

Table 65. PIN\_CONFIG\_B Bit Descriptions

| Bit(s) | Bit Name  | Access     | Description   |
|--------|-----------|------------|---|
| 7 to 5 | N/A       |            | Reserved.   |
| 4      | C4_CONFIG | Read/write | 0 = GPIO 11 (see C4_EXTEND_CFG in Table 66 for alternate configuration, RESET2).<br>1 = Column 4. |
| 3      | C3_CONFIG | Read/write | 0 = GPIO 10.<br>1 = Column 3.   |
| 2      | C2_CONFIG | Read/write | 0 = GPIO 9.<br>1 = Column 2.  |
| 1      | C1_CONFIG | Read/write | 0 = GPIO 8.<br>1 = Column 1.  |
| 0      | C0_CONFIG | Read/write | 0 = GPIO 7.<br>1 = Column 0.  |

**PIN\_CONFIG\_C Register 0x3A**

Table 66. PIN\_CONFIG\_D Bit Descriptions

| Bit(s) | Bit Name      | Access     | Description  |
|--------|---------------|------------|--|
| 7      | PULL_SELECT   | Read/write | 0 = 300 kΩ resistor used for row pull-up during key scanning.<br>1 = 100 kΩ resistor used for row pull-up during key scanning. |
| 6      | C4_EXTEND_CFG | Read/write | 0 = C4 remains configured as GPIO 11.<br>1 = C4 reconfigured as RESET2 output.   |

| Bit(s) | Bit Name           | Access     | Description  |
|--------|--------------------|------------|--|
| 5      | R4_EXTEND_CFG      | Read/write | 0 = R4 remains configured as GPIO 5.<br>1 = R4 reconfigured as RESET1 output.  |
| 4      | N/A                |            | Reserved.  |
| 3 to 2 | R3_EXTEND_CFG[1:0] | Read/write | 00 = R3 remains configured as GPIO 4.<br>01 = R3 reconfigured as LC input for the logic block.<br>10 = R3 reconfigured as PWM_OUT output from PWM block.<br>11 = unused. |
| 1      | N/A                |            | Reserved.  |
| 0      | R0_EXTEND_CFG      | Read/write | 0 = R0 remains configured as GPIO 1.<br>1 = R0 reconfigured as LY output from the logic block.   |

**GENERAL\_CFG Register 0x3B**

Table 67. GENERAL\_CFG Bit Descriptions

| Bit(s) | Bit Name                     | Access     | Description  |
|--------|------------------------------|------------|--|
| 7      | OSC_EN                       | Read/write | 0 = disable internal 1 MHz oscillator.<br>1 = enable internal 1 MHz oscillator.  |
| 6 to 5 | OSC_FREQ[1:0]                | Read/write | Sets the input clock frequency fed from the base 1 MHz oscillator to the digital core. Slower frequencies result in less quiescent current, but key and GPI scan times increase.<br>00 = 50 kHz.<br>01 = 100 kHz.<br>10 = 200 kHz.<br>11 = 500 kHz.  |
| 4 to 2 | N/A                          |            | Reserved.  |
| 1      | $\overline{\text{INT}}\_CFG$ | Read/write | Configure the behavior of the $\overline{\text{INT}}$ pin if the user tries to clear it while an interrupt is pending.<br>0 = $\overline{\text{INT}}$ pin remains asserted if an interrupt is pending.<br>1 = $\overline{\text{INT}}$ pin deasserts for 50 $\mu\text{s}$ and reasserts if an interrupt is pending. |
| 0      | $\overline{\text{RST}}\_CFG$ | R/W        | Configure the response ADP5585 has to the $\overline{\text{RST}}$ pin.<br>0 = ADP5585 resets if $\overline{\text{RST}}$ is low.<br>1 = ADP5585 does not reset if $\overline{\text{RST}}$ is low.   |

**INT\_EN Register 0x3C**

Table 68. INT\_EN Bit Descriptions

| Bit(s) | Bit Name    | Access     | Description  |
|--------|-------------|------------|--|
| 7 to 5 | N/A         |            | Reserved.  |
| 4      | LOGIC_IEN   | Read/write | 0 = Logic 1 interrupt is disabled.<br>1 = assert the $\overline{\text{INT}}$ pin if LOGIC_INT is set.    |
| 3      | N/A         |            | Reserved.  |
| 2      | OVRFLOW_IEN | Read/write | 0 = overflow interrupt is disabled.<br>1 = assert the $\overline{\text{INT}}$ pin if OVRFLOW_INT is set. |
| 1      | GPI_IEN     | Read/write | 0 = GPI interrupt is disabled.<br>1 = assert the $\overline{\text{INT}}$ pin if GPI_INT is set.          |
| 0      | EVENT_IEN   | Read/write | 0 = event interrupt is disabled.<br>1 = assert the $\overline{\text{INT}}$ pin if EVENT_INT is set.      |

## ORDERING GUIDE

| Model <sup>1</sup> | Temperature Range | Package Description                              | Package Option | Branding |
|--------------------|-------------------|--|----------------|----------|
| ADP5585ACBZ-00-R7  | -40°C to +85°C    | 16-Ball Wafer Level Chip Scale Package [WLCSP]   | CB-16-10       |          |
| ADP5585ACBZ-01-R7  | -40°C to +85°C    | 16-Ball Wafer Level Chip Scale Package [WLCSP]   | CB-16-10       |          |
| ADP5585ACBZ-02-R7  | -40°C to +85°C    | 16-Ball Wafer Level Chip Scale Package [WLCSP]   | CB-16-10       |          |
| ADP5585ACBZ-04-R7  | -40°C to +85°C    | 16-Ball Wafer Level Chip Scale Package [WLCSP]   | CB-16-10       |          |
| ADP5585ACPZ-00-R7  | -40°C to +85°C    | 16-Lead Lead Frame Chip Scale Package [LFCSP_WQ] | CP-16-22       | LJM      |
| ADP5585ACPZ-01-R7  | -40°C to +85°C    | 16-Lead Lead Frame Chip Scale Package [LFCSP_WQ] | CP-16-22       | LJN      |
| ADP5585ACPZ-03-R7  | -40°C to +85°C    | 16-Lead Lead Frame Chip Scale Package [LFCSP_WQ] | CP-16-22       | LJP      |
| ADP5585CP-EVALZ    |                   | LFCSP Evaluation Board                           | CP-16-22       |          |

<sup>1</sup> Z = RoHS Compliant Part.

**NOTES**

**NOTES**

I<sup>2</sup>C refers to a communications protocol originally developed by Philips Semiconductors (now NXP Semiconductors).

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
