Logic Control

PS_ON	An active low signal that turns on the 12vdc power rail. When this signal High, or left open, the 12vdc output turn off. The 3.3Vsb output remains on.
POK	Is a power good signal to be pulled low by the power supply to indicate that all the outputs are within regulation limits of the power supply. (turn-on delay 100 - 500mS)
PS FAIL	In the event of a power supply failure (OVP at any output, UV at any output, OTP or other electrical failure), this signal shall go to a High state.
AC OK	High when AC is not OK, Low if AC is OK
PRESENT	Low if PSU is Present, High if not Present; Pull high in system.
FAN FAIL	Low if one or both fans have failed
PS_KILL	This pin shall quickly turn off the power supply and prevent arcing of the DC output contacts.
