

**FEATURES**

- On-chip clock ÷4 and ÷8
- Extended 100E VEE range of -4.2V to -5.5V
- 1.6Gb/s typical data rate capability
- Differential clock and serial inputs
- VBB output for single-ended use
- Asynchronous data synchronization
- Mode select to expand to 8 bits
- Internal 75KΩ input pulldown resistors
- Fully compatible with Motorola MC10E/100E446
- Available in 28-pin PLCC package

**PIN NAMES**

Pin	Function
SIN, $\overline{\text{SIN}}$	Differential Serial Data Input
D <sub>0</sub> – D <sub>3</sub>	Parallel Data Input
SOUT, $\overline{\text{SOUT}}$	Differential Serial Data Output
CLK, $\overline{\text{CLK}}$	Differential Clock Input
CL/4, $\overline{\text{CL/4}}$	Differential 4 Clock Output
CL/8, $\overline{\text{CL/8}}$	Differential 8 Clock Output
MODE	Conversion Mode, 4-bit/8-bit
SYNC	Conversion Synchronizing Input
Vcco	Vcc to Output

**DESCRIPTION**

The SY10/100E446 are integrated 4-bit parallel-to-serial data converters. These devices are designed to operate for NRZ data rates of up to a minimum of 1.3Gb/s. The chips generate a divide-by-4 and a divide-by-8 clock for both 4-bit conversion and a two-chip 8-bit conversion function. The conversion sequence was chosen to convert the parallel data into a serial stream from bit D<sub>0</sub> to D<sub>3</sub>. A serial input is provided to cascade two E446 devices for 8-bit conversion applications.

The SYNC input will asynchronously reset the internal clock circuitry. This pin allows the user to reset the internal clock conversion unit and, thus, select the start of the conversion process.

The MODE input is used to select the conversion mode of the device. With the MODE input LOW (or open) the device will function as a 4-bit converter. When the mode input is driven HIGH, the internal load clock will change on every eighth clock cycle, thus allowing for an 8-bit conversion scheme using two E446s. When cascaded in an 8-bit conversion scheme, the devices will not operate at the 1.3Gb/s data rate of a single device. Refer to the applications section of this data sheet for more information on cascading the E446.

For lower data rate applications, a VBB reference voltage is supplied for single-ended inputs. When operating at clock rates above 500MHz, differential input signals are recommended. For single-ended inputs, the VBB pin is tied to the inverting differential input and bypassed via a 0.01μF capacitor. The VBB provides the switching reference for the input differential amplifier. The VBB can also be used to AC couple an input signal.

# TIMING DIAGRAMS

Timing Diagram A. 4:1 Parallel-to-Serial Conversion

**TIMING DIAGRAMS (CONTINUED)**

**Timing Diagram B. 8:1 Parallel-to-Serial Conversion**

**APPLICATIONS INFORMATION**

The SY10E/100E446 are integrated 4:1 parallel-to-serial converters. The chips are designed to work with the E445 device to provide both transmission and receiving of a high-speed serial data path. The E446 can convert 4 bits of data into a 1.3Gb/s NRZ data stream. The device features a SYNC input which allows the user to reset the internal clock circuitry and restart the conversion sequence (see Timing Diagram A). Note that SOUT is triggered by negative clock edges.

The E446 features a differential serial input and internal divide-by-eight circuitry to facilitate the cascading of two devices to build an 8:1 multiplexer. Figure 1 illustrates the architecture for an 8:1 multiplexer using two E446s (see Timing Diagram B). Notice the serial outputs (SOUT) of the lower order converter feed the serial inputs (SIN) of the higher order device. This feed through of the serial inputs bounds the upper end of the frequency of operation. The clock-to-serial output propagation delay, plus the set-up time of the

serial input pins, must fit into a single clock period for the cascade architecture to function properly. Using the worst case values for these two parameters from the data sheet,  $t_{PD} \text{ CLK to SOUT} = 1600\text{ps}$  and  $t_s \text{ for SIN} = -200\text{ps}$ , yields a minimum period of 1400ps or a clock frequency of 700MHz.

The clock frequency is somewhat lower than that of a single converter. In order to increase this frequency, it is recommended that the clock edge feeding the E446A be delayed with respect to the E446B, as shown in Figure 2.

Perhaps the easiest way to delay the second clock relative to the first is to take advantage of the differential clock inputs of the E446. By connecting the clock for E446A to the complimentary clock input pin, the device will clock a half a clock period after E446B (Figure 2). Utilizing this simple technique will raise the potential conversion frequency up to the maximum 1.3GHz of a stand-alone E446.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
