

## Description

The ICS858S0111 is a high-speed 1-to-2 Differential-to-CML Fanout Buffer. The device is optimized for high-speed and very low output skew, making it suitable for use in demanding applications such as SONET, 1 Gigabit and 10 Gigabit Ethernet, and Fibre Channel. The internally terminated differential input and  $V_{REF\_AC}$  pin allow other differential signal families such as LVDS, LVPECL, SSTL, and CML to be easily interfaced to the input with minimal use of external components.

The ICS858S0111 is packaged in a small 3mm x 3mm 16-pin VFQFN package which makes it ideal for use in space-constrained applications.

## Features

- Two differential CML outputs
- IN/nIN pair can accept the following differential input levels: LVPECL, LVDS, CML, SSTL
- Maximum output frequency: 2GHz
- Output skew: 25ps (maximum)
- Part-to-part skew: 250ps (maximum)
- Additive phase jitter, RMS: 0.042ps (typical)
- Propagation delay: 525ps (maximum)
- Operating voltage supply range:  
 $V_{CC} = 2.375V$  to  $3.63V$ ,  $V_{EE} = 0V$
- $-40^{\circ}C$  to  $85^{\circ}C$  ambient operating temperature
- Available in lead-free (RoHS 6) package

**Table 1. Pin Descriptions**

| Number       | Name          | Type   | Description                                     |
|--------------|---------------|--------|---|
| 1            | IN            | Input  | Non-inverting differential LVPECL clock input.  |
| 2            | $V_T$         | Input  | Termination input.                              |
| 3            | $V_{REF\_AC}$ | Output | Reference voltage for AC-coupled applications.  |
| 4            | nIN           | Input  | Inverting differential LVPECL clock input.      |
| 5, 8, 13, 16 | $V_{CC}$      | Power  | Power supply pins.                              |
| 6, 7, 14, 15 | $V_{EE}$      | Power  | Negative supply pins.                           |
| 9, 10        | Q1, nQ1       | Output | Differential output pair. CML interface levels. |
| 11, 12       | nQ0, Q0       | Output | Differential output pair. CML interface levels. |

## Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

| Item   | Rating                          |
|--|---------------------------------|
| Supply Voltage, $V_{CC}$                                       | 4.6V (CML mode, $V_{EE} = 0V$ ) |
| Inputs, $V_I$  | -0.5V to $V_{CC} + 0.5V$        |
| Outputs, $I_O$<br>Continuous Current<br>Surge Current          | 20mA<br>40mA                    |
| Input Current, IN/nIN  | +50mA                           |
| $V_T$ Current, $I_{VT}$  | +100mA                          |
| Input Sink/Source, $I_{REF\_AC}$                               | $\pm 2mA$                       |
| Operating Temperature Range, $T_A$                             | -40°C to 85°C                   |
| Storage Temperature, $T_{STG}$                                 | -65°C to 150°C                  |
| Package Thermal Impedance, $\theta_{JA}$ (Junction-to-Ambient) | 74.7°C/W (0 mps)                |

## DC Electrical Characteristics

**Table 2A. Power Supply DC Characteristics,  $V_{CC} = 2.375V$  to  $3.63V$ ,  $V_{EE} = 0V$ ,  $T_A = -40^\circ C$  to  $85^\circ C$** 

| Symbol   | Parameter               | Test Conditions | Minimum | Typical | Maximum | Units |

NOTE: Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when device is mounted in a test socket with maintained transverse airflow greater than 500 lfm. Device will meet specifications after thermal equilibrium has been reached under these conditions.

All parameters characterized at  $\leq 1.2GHz$  unless otherwise noted.

NOTE 1: Measured from the differential input crossing point to the differential output crossing point.

NOTE 2: Defined as skew between outputs at the same supply voltage, same temperature, same frequency and with equal load conditions. Measured at the output differential cross points.

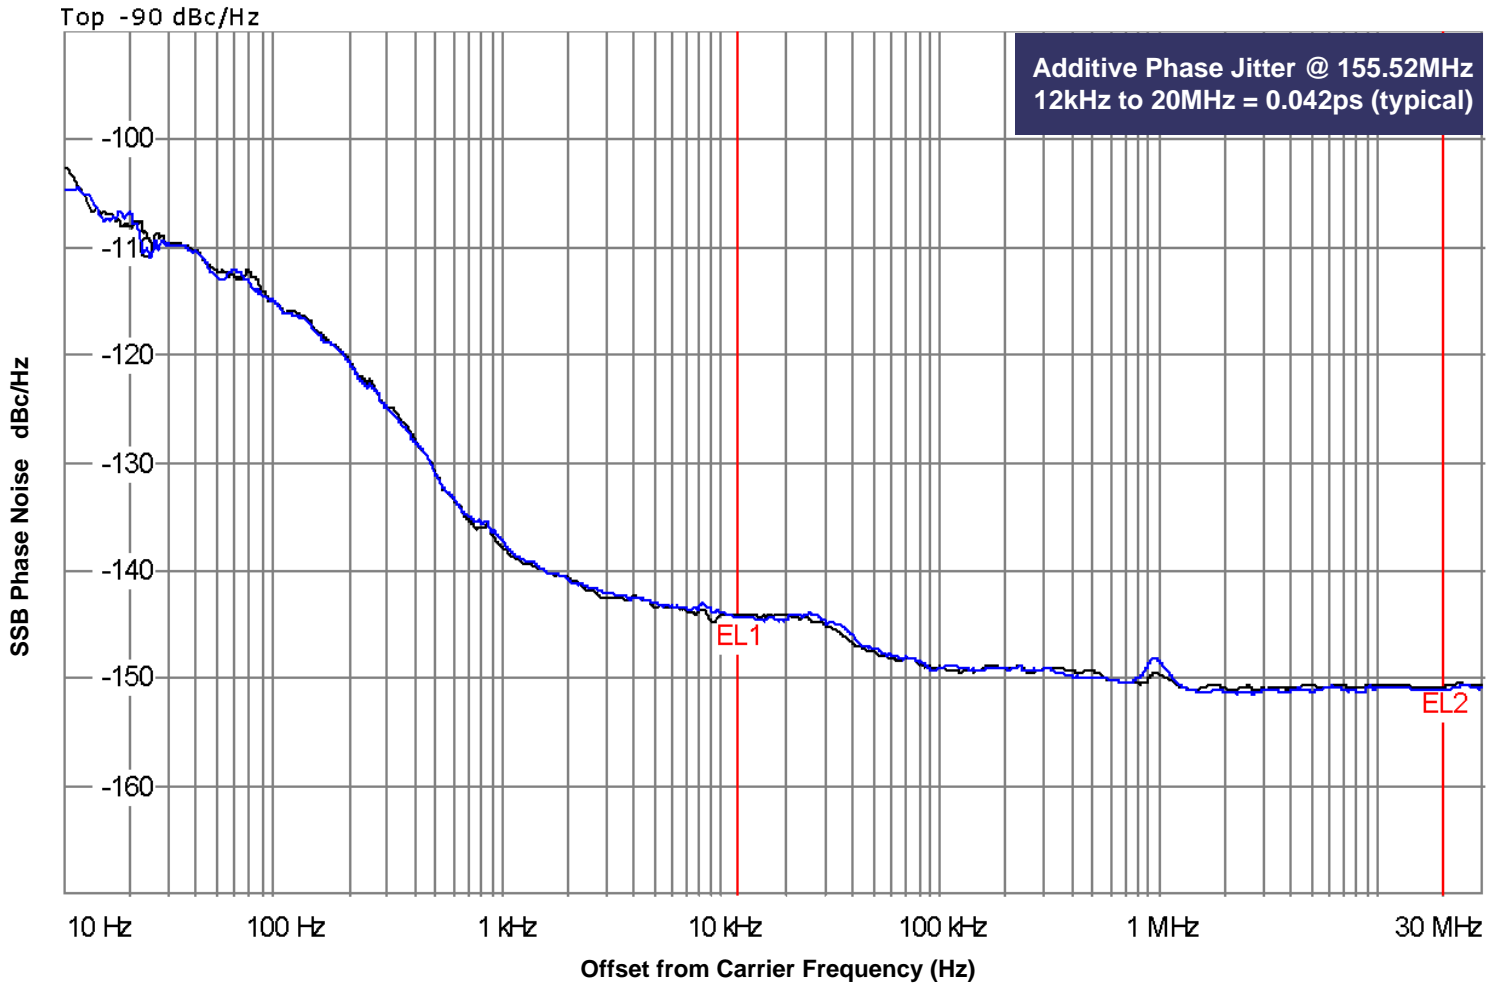

NOTE 3: Defined as skew between outputs on different devices operating at the same supply voltages and with equal load conditions. Using the same type of inputs on each device, the outputs are measured at the differential cross points.

NOTE 4: This parameter is defined in accordance with JEDEC Standard 65.

## Additive Phase Jitter

The spectral purity in a band at a specific offset from the fundamental compared to the power of the fundamental is called the ***dBc Phase Noise***. This value is normally expressed using a Phase noise plot and is most often the specified plot in many applications. Phase noise is defined as the ratio of the noise power present in a 1Hz band at a specified offset from the fundamental frequency to the power value of the fundamental. This ratio is expressed in decibels (dBm) or a ratio

of the power in the 1Hz band to the power in the fundamental. When the required offset is specified, the phase noise is called a ***dBc*** value, which simply means dBm at a specified offset from the fundamental. By investigating jitter in the frequency domain, we get a better understanding of its effects on the desired application over the entire time record of the signal. It is mathematically possible to calculate an expected bit error rate given a phase noise plot.

As with most timing specifications, phase noise measurements has issues relating to the limitations of the equipment. Often the noise floor of the equipment is higher than the noise floor of the device. This is illustrated above. The device meets the noise floor of what is shown, but can actually be lower. The phase noise is dependent on the input source and measurement equipment.

The source generator "Rohde & Schwarz SMA100A Low Noise Signal Generator as external input to an Agilent 8133A 3GHz Pulse Generator".

## Applications Information

### Recommendations for Unused Output Pins

#### Outputs:

##### CML Outputs

All unused CML outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

### 3.3V LVPECL Input with Built-In 50Ω Termination Interface

The IN/nIN with built-in 50Ω terminations accept LVDS, LVPECL, CML, SSTL and other differential signals. Both differential inputs must meet the  $V_{PP}$  and  $V_{CMR}$  input requirements. Figures 1A to 1E show interface examples for the IN/nIN input with built-in 50Ω terminations driven by the most common driver types. The input

interfaces suggested here are examples only. If the driver is from another vendor, use their termination recommendation. Please consult with the vendor of the driver component to confirm the driver termination requirements.

### Schematic Example

Figure 3 shows a schematic example of the ICS858S011I. This schematic provides examples of input and output handling. The ICS858S011I input has built-in 50Ω termination resistors. The input can directly accept various types of differential signal without AC couple. If AC couple termination is used, the ICS858S011I also provides VREF\_AC pin for proper offset level after AC couple. This

example shows the ICS858S011I input driven by a 3.3V LVPECL driver. The ICS858S011I outputs are CML driver with built-in 50Ω pullup resistors. In this example, we assume the traces are long transmission line and the receiver is high input impedance without built-in matched load. An external 100Ω resistor across the receiver input is required.

Figure 3. ICS858S011I Application Schematic Example

### VFQFN EPAD Thermal Release Path

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in *Figure 4*. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as “heat pipes”. The number of vias (i.e. “heat pipes”) are application specific

and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, please refer to the Application Note on the Surface Mount Assembly of Amkor’s Thermally/Electrically Enhance Leadframe Base Package, Amkor Technology.

**Figure 4. P.C. Assembly for Exposed Pad Thermal Release Path – Side View (drawing not to scale)**

## Power Considerations

This section provides information on power dissipation and junction temperature for the ICS858S011I. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the ICS858S011I is the sum of the core power plus the power dissipation in the load(s). The following is the power dissipation for  $V_{DD} = 3.3V + 10\% = 3.63V$ , which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipation in the load.

- Power (core)<sub>MAX</sub> =  $V_{DD\_MAX} * I_{DD} = 3.63V * 57mA = 206.9mW$
- Power Dissipation for internal termination  $R_T$   
Power (R<sub>T</sub>)<sub>MAX</sub> =  $4 * (V_{IN\_MAX})^2 / R_{T\_MIN} = (1.2V)^2 / 80\Omega = 72mW$

**Total Power<sub>-MAX</sub> = 206.9mW + 72mW = 278.9mW**

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad, and directly affects the reliability of the device. The maximum recommended junction temperature is 125°C. Limiting the internal transistor junction temperature,  $T_j$ , to 125°C ensures that the bond wire and bond pad temperature remains below 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd\_total + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd\_total$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming no air flow and a multi-layer board, the appropriate value is 74.7°C/W per Table 4 below.

Therefore,  $T_j$  for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ C + 0.279W * 74.7^\circ C/W = 105.8^\circ C. \text{ This is well below the limit of } 125^\circ C.$$

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

**Table 4. Thermal Resistance  $\theta_{JA}$  for 16 Lead VFQFN, Forced Convection**

| $\theta_{JA}$ by Velocity                   |          |          |          |
|---|----------|----------|----------|
| Meters per Second                           | 0        | 1        | 2.5      |
| Multi-Layer PCB, JEDEC Standard Test Boards | 74.7°C/W | 65.3°C/W | 58.5°C/W |

## Reliability Information

**Table 5.  $\theta_{JA}$  vs. Air Flow Table for a 16 Lead VFQFN**

| $\theta_{JA}$ vs. Air Flow                  |          |          |          |
|---|----------|----------|----------|
| Meters per Second                           | 0        | 1        | 2.5      |
| Multi-Layer PCB, JEDEC Standard Test Boards | 74.7°C/W | 65.3°C/W | 58.5°C/W |

## Transistor Count

The transistor count for ICS858S011I is: 216

Pin Compatible with 858011

## Package Outline Drawings

The package outline drawings are located in the last section of this document. The package information is the most current data available and is subject to change without notice or revision of this document.

## Ordering Information

**Table 7. Ordering Information**

| Part/Order Number | Marking | Package                   | Shipping Packaging | Temperature   |
|-------------------|---------|---------------------------|--------------------|---------------|
| 858S011AKILF      | 011A    | "Lead-Free" 16 Lead VFQFN | Tube               | -40°C to 85°C |
| 858S011AKILFT     | 011A    | "Lead-Free" 16 Lead VFQFN | 2500 Tape & Reel   | -40°C to 85°C |

NOTE: Parts that are ordered with an "LF" suffix to the part number are the Pb-Free configuration and are RoHS compliant.

## Revision History

| Revision Date      | Description of Change  |
|--------------------|--|
| September 19, 2017 | Updated the package outline drawings; however, no mechanical changes<br>Completed other minor improvements |
| October 12, 2010   | Initial release.   |

1. ALL DIMENSIONS ARE IN mm. ANGLES IN DEGREES

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
