

# 8-bit I<sup>2</sup>C and SMBus I/O Port with Interrupt

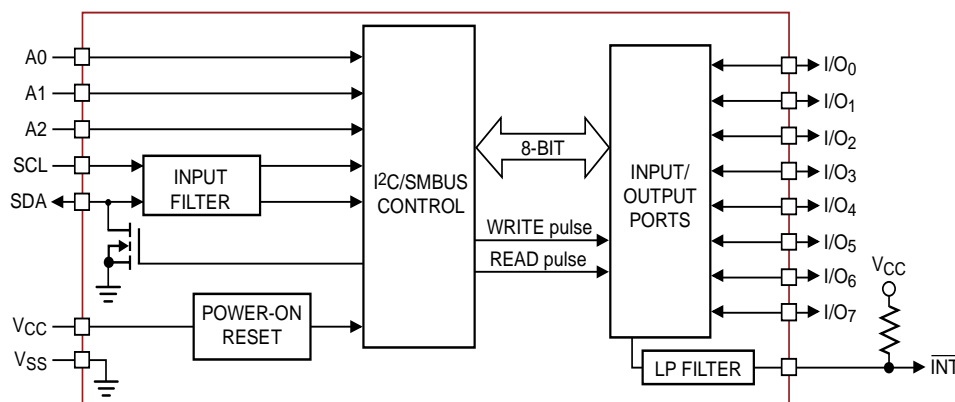

## FEATURES

- 400kHz I<sup>2</sup>C bus compatible <sup>(1)</sup>
- 2.3V to 5.5V operation
- Low stand-by current
- 5V tolerant I/Os
- 8 I/O pins that default to inputs at power-up
- High drive capability
- Individual I/O configuration
- Polarity inversion register
- Active low interrupt output
- Internal power-on reset
- No glitch on power-up
- Noise filter on SDA/SCL inputs
- Cascadable up to 8 devices
- Industrial temperature range
- RoHS-compliant 16-lead SOIC and TSSOP, and 16-pad TQFN (4 x 4mm) packages

## APPLICATIONS

- White goods (dishwashers, washing machines)
- Handheld devices (cell phones, PDAs, digital cameras)
- Data Communications (routers, hubs and servers)

## BLOCK DIAGRAM <sup>(1)</sup>

## DESCRIPTION

The CAT9554 and CAT9554A are CMOS devices that provide 8-bit parallel input/output port expansion for I<sup>2</sup>C and SMBus compatible applications. These I/O expanders provide a simple solution in applications where additional I/Os are needed: sensors, power switches, LEDs, pushbuttons, and fans.

The CAT9554/9554A consist of an input port register, an output port register, a configuration register, a polarity inversion register and an I<sup>2</sup>C/SMBus-compatible serial interface.

Any of the eight I/Os can be configured as an input or output by writing to the configuration register. The system master can invert the CAT9554/9554A input data by writing to the active-high polarity inversion register.

The CAT9554/9554A features an active low interrupt output which indicates to the system master that an input state has changed.

The device's extended addressing capability allows up to 8 devices to share the same bus. The CAT9554A is identical to the CAT9554 except the fixed part of the I<sup>2</sup>C slave address is different. This allows up to 16 of devices (eight CAT9554 and eight CAT9554A) to be connected on the same bus.

**For Ordering Information details, see page 15.**

**Notes:**

(1) All I/Os are set to inputs at RESET.

**PIN CONFIGURATION**

**PIN DESCRIPTION**

SOIC / TSSOP	TQFN	Pin Name	Function
1	15	A0	Address Input 0
2	16	A1	Address Input 1
3	1	A2	Address Input 2
4-7	2-5	I/O <sub>0-3</sub>	Input/Output Port 0 to Input/Output Port 3
8	6	V <sub>SS</sub>	Ground
9-12	7-10	I/O <sub>4-7</sub>	Input/Output Port 4 to Input/Output Port 7
13	11	INT	Interrupt Output (open drain)
14	12	SCL	Serial Clock
15	13	SDA	Serial Data
16	14	V <sub>CC</sub>	Power Supply

**ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>**

Parameters	Ratings	Units
V <sub>CC</sub> with Respect to Ground	-0.5 to +6.5	V
Voltage on Any Pin with Respect to Ground	-0.5 to +5.5	V
DC Current on I/O <sub>0</sub> to I/O <sub>7</sub>	±50	mA
DC Input Current	±20	mA
V <sub>CC</sub> Supply Current	85	mA
V <sub>SS</sub> Supply Current	100	mA
Package Power Dissipation Capability (T <sub>A</sub> = 25°C)	1.0	W
Junction Temperature	+150	°C
Storage Temperature	-65 to +150	°C

**RELIABILITY CHARACTERISTICS**

Symbol	Parameter	Reference Test Method	Min	Units
V <sub>ZAP</sub> <sup>(2)</sup>	ESD Susceptibility	JEDEC Standard JESD 22	2000	Volts
I <sub>LTH</sub> <sup>(2)(3)</sup>	Latch-up	JEDEC Standard 17	100	mA

**Notes:**

- (1) Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions outside of those listed in the operational sections of this specification is not implied. Exposure to any absolute maximum rating for extended periods may affect device performance and reliability.
- (2) This parameter is tested initially and after a design or process change that affects the parameter.
- (3) Latch-up protection is provided for stresses up to 100mA on address and data pins from -1V to V<sub>CC</sub> +1V.

**D.C. OPERATING CHARACTERISTICS**

$V_{CC} = 2.3$  to  $5.5V$ ;  $T_A = -40^\circ C$  to  $+85^\circ C$ , unless otherwise specified.

**Figure 1. I<sup>2</sup>C Serial Interface Timing**

## PIN DESCRIPTION

### SCL: Serial Clock

The serial clock input clocks all data transferred into or out of the device. The SCL line requires a pull-up resistor if it is driven by an open drain output.

### SDA: Serial Data/Address

The bidirectional serial data/address pin is used to transfer all data into and out of the device. The SDA pin is an open drain output and can be wire-ORed with other open drain or open collector outputs. A pull-up resistor must be connected from SDA line to  $V_{CC}$ . The value of the pull-up resistor,  $R_P$ , can be calculated based on minimum and maximum values from Figure 2 and Figure 3 (see Note).

### A0, A1, A2: Device Address Inputs

These inputs are used for extended addressing capability. The A0, A1, A2 pins should be hardwired to  $V_{CC}$  or  $V_{SS}$ . When hardwired, up to eight CAT9554/9554As may be addressed on a single bus system. The levels on these inputs are compared with corresponding bits, A2, A1, A0, from the slave address byte.

### I/O<sub>0</sub> to I/O<sub>7</sub>: Input / Output Ports

Any of these pins may be configured as input or output. The simplified schematic of I/O<sub>0</sub> to I/O<sub>7</sub> is shown in Figure 4. When an I/O is configured as an input, the Q1 and Q2 output transistors are off creating a high impedance input with a weak pull-up resistor (typical 100kΩ). If the I/O pin is configured as an output, the push-pull output stage is enabled. Care should be taken if an external voltage is applied to an I/O pin configured as an output due to the low impedance paths that exist between the pin and either  $V_{CC}$  or  $V_{SS}$ .

Figure 2. Minimum  $R_P$  Value versus Supply Voltage

Figure 3. Maximum  $R_P$  Value versus Bus Capacitance

**Note:** According to the Fast Mode I<sup>2</sup>C bus specification, for bus capacitance up to 200pF, the pull up device can be a resistor. For bus loads between 200pF and 400pF, the pull-up device can be a current source ( $I_{max} = 3mA$ ) or a switched resistor circuit.

**INT: Interrupt Output**

The open-drain interrupt output is activated when one of the port pins configured as an input changes state (differs from the corresponding input port register bit state). The interrupt is deactivated when the input

returns to its previous state or the input port register is read. Changing an I/O from an output to an input may cause a false interrupt if the state of the pin does not match the contents of the input port register.

**Figure 4. Simplified Schematic of  $I/O_0$  to  $I/O_7$**

## FUNCTIONAL DESCRIPTION

The CAT9554 and CAT9554A general purpose input/output (GPIO) peripherals provide up to eight I/O ports, controlled through an I<sup>2</sup>C compatible serial interface

The CAT9554/54A support the I<sup>2</sup>C Bus data transmission protocol. This I<sup>2</sup>C Bus protocol defines any device that sends data to the bus to be a transmitter and any device receiving data to be a receiver. The transfer is controlled by the Master device which generates the serial clock and all START and STOP conditions for bus access. The CAT9554/9554A operate as a Slave device. Both the Master device and Slave device can operate as either transmitter or receiver, but the Master device controls which mode is activated.

### I<sup>2</sup>C BUS PROTOCOL

The features of the I<sup>2</sup>C bus protocol are defined as follows:

- (1) Data transfer may be initiated only when the bus is not busy.
- (2) During a data transfer, the data line must remain stable whenever the clock line is high. Any changes in the data line while the clock line is high will be interpreted as a START or STOP condition (Figure 5).

### START AND STOP CONDITIONS

The START Condition precedes all commands to the device, and is defined as a HIGH to LOW transition of

SDA when SCL is HIGH. The CAT9554/9554A monitors the SDA and SCL lines and will not respond until this condition is met.

A LOW to HIGH transition of SDA when SCL is HIGH determines the STOP condition. All operations must end with a STOP condition.

### DEVICE ADDRESSING

After the bus Master sends a START condition, a slave address byte is required to enable the CAT9554/9554A for a read or write operation. The four most significant bits of the slave address are fixed as binary 0100 for the CAT9554 (Figure 6) and as 0111 for the CAT9554A (Figure 7). The CAT9554/9554A uses the next three bits as address bits.

The address bits A2, A1 and A0 are used to select which device is accessed from maximum eight devices on the same bus. These bits must compare to their hardwired input pins. The 8th bit following the 7-bit slave address is the R/W bit that specifies whether a read or write operation is to be performed. When this bit is set to "1", a read operation is initiated, and when set to "0", a write operation is selected.

Following the START condition and the slave address byte, the CAT9554/9554A monitors the bus and responds with an acknowledge (on the SDA line) when its address matches the transmitted slave address. The CAT9554/9554A then performs a read or a write operation depending on the state of the R/W bit.

Figure 5. START/STOP Condition

Figure 6. CAT9554 Slave Address

Figure 7. CAT9554A Slave Address

**ACKNOWLEDGE**

After a successful data transfer, each receiving device is required to generate an acknowledge. The acknowledging device pulls down the SDA line during the ninth clock cycle, signaling that it received the 8 bits of data. The SDA line remains stable LOW during the HIGH period of the acknowledge related clock pulse (Figure 5).

The CAT9554/9554A respond with an acknowledge after receiving a START condition and its slave address. If the device has been selected along with a write operation, it responds with an acknowledge after receiving each 8-bit byte.

When the CAT9554/9554A begins a READ mode it transmits 8 bits of data, releases the SDA line, and monitors the line for an acknowledge. Once it receives this acknowledge, the CAT9554/9554A will continue to transmit data. If no acknowledge is sent by the Master, the device terminates data transmission and waits for a STOP condition. The master must then issue a STOP condition to return the CAT9554/9554A to the standby power mode and place the device in a known state.

**REGISTERS AND BUS TRANSACTIONS**

The CAT9554/9554A consist of an input port register, an output port register, a polarity inversion register and a configuration register. Table 1 shows the register address table. Tables 2 to 5 list Register 0 through Register 3 information.

**Table 1. Register Command Byte**

Command (hex)	Protocol	Function
0x00	Read byte	Input port register
0x01	Read/write byte	Output port register
0x02	Read/write byte	Polarity inversion register
0x03	Read/write byte	Configuration register

The command byte is the first byte to follow the device address byte during a write/read bus transaction. The register command byte acts as a pointer to determine which register will be written or read.

The input port register is a read only port. It reflects the incoming logic levels of the I/O pins, regardless of whether the pin is defined as an input or an output by the configuration register. Writes to the input port register are ignored.

**Table 2. Register 0 – Input Port Register**

bit	I <sub>7</sub>	I <sub>6</sub>	I <sub>5</sub>	I <sub>4</sub>	I <sub>3</sub>	I <sub>2</sub>	I <sub>1</sub>	I <sub>0</sub>
default	1	1	1	1	1	1	1	1

**Table 3. Register 1 – Output Port Register**

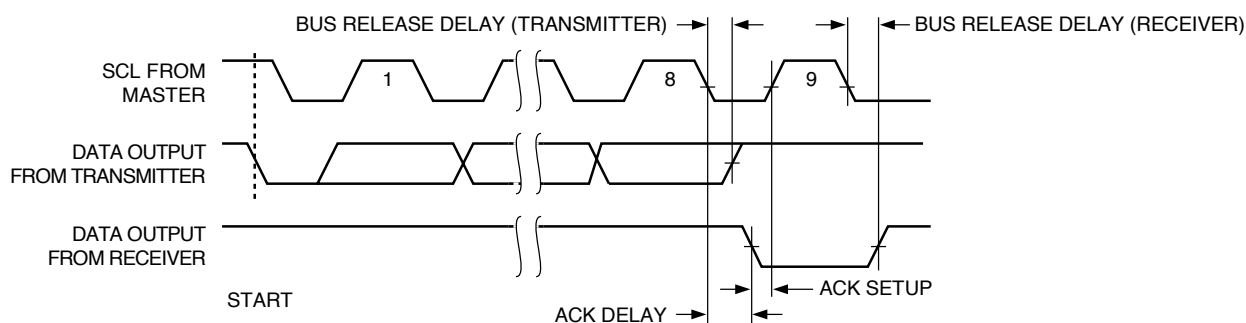

bit	O <sub>7</sub>	O <sub>6</sub>	O <sub>5</sub>	O <sub>4</sub>	O <sub>3</sub>	O <sub>2</sub>	O <sub>1</sub>	O <sub>0</sub>
default	1	1	1	1	1	1	1	1

**Table 4. Register 2 – Polarity Inversion Register**

bit	N <sub>7</sub>	N <sub>6</sub>	N <sub>5</sub>	N <sub>4</sub>	N <sub>3</sub>	N <sub>2</sub>	N <sub>1</sub>	N <sub>0</sub>
default	0	0	0	0	0	0	0	0

**Table 5. Register 3 – Configuration Register**

bit	C <sub>7</sub>	C <sub>6</sub>	C <sub>5</sub>	C <sub>4</sub>	C <sub>3</sub>	C <sub>2</sub>	C <sub>1</sub>	C <sub>0</sub>
default	1	1	1	1	1	1	1	1

**Figure 8. Acknowledge Timing**

The output port register sets the outgoing logic levels of the I/O ports, defined as outputs by the configuration register. Bit values in this register have no effect on I/O pins defined as inputs. Reads from the output port register reflect the value that is in the flip-flop controlling the output, not the actual I/O pin value.

The polarity inversion register allows the user to invert the polarity of the input port register data. If a bit in this register is set ("1") the corresponding input port data is inverted. If a bit in the polarity inversion register is cleared ("0"), the original input port polarity is retained.

The configuration register sets the directions of the ports. Set the bit in the configuration register to enable

the corresponding port pin as an input with a high impedance output driver. If a bit in this register is cleared, the corresponding port pin is enabled as an output. At power-up, the I/Os are configured as inputs with a weak pull-up resistor to  $V_{CC}$ .

Data is transmitted to the CAT9554/9554A registers using the write mode shown in Figure 9 and Figure 10.

The CAT9554/9554A registers are read according to the timing diagrams shown in Figure 11 and Figure 12. Once a command byte has been sent, the register which was addressed will continue to be accessed by reads until a new command byte will be sent.

Figure 9. Write to Output Port Register

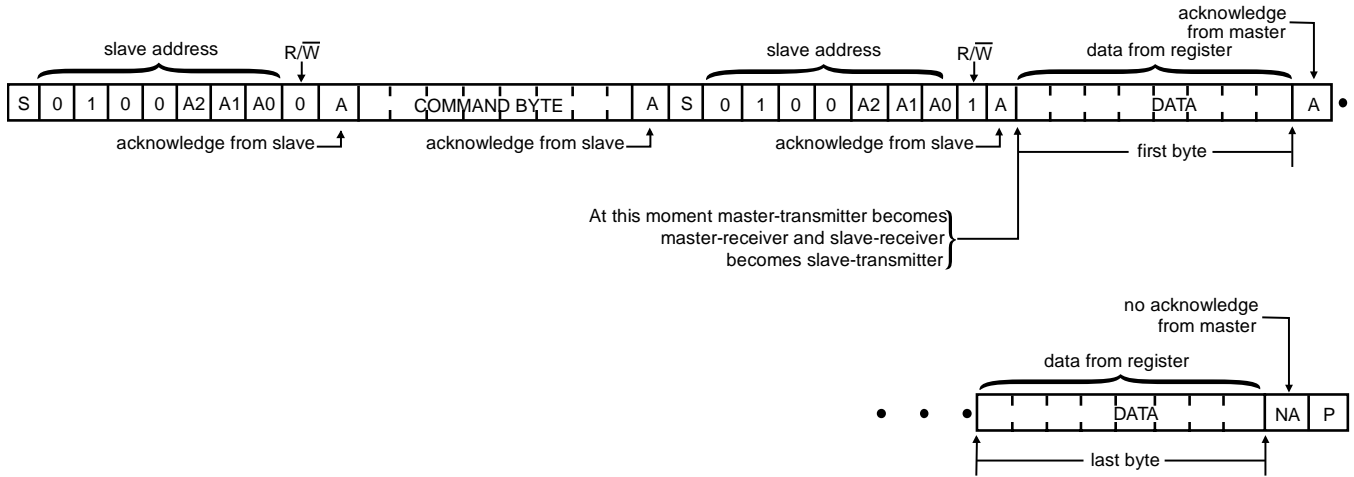

Figure 10. Write to Configuration or Polarity Inversion Register

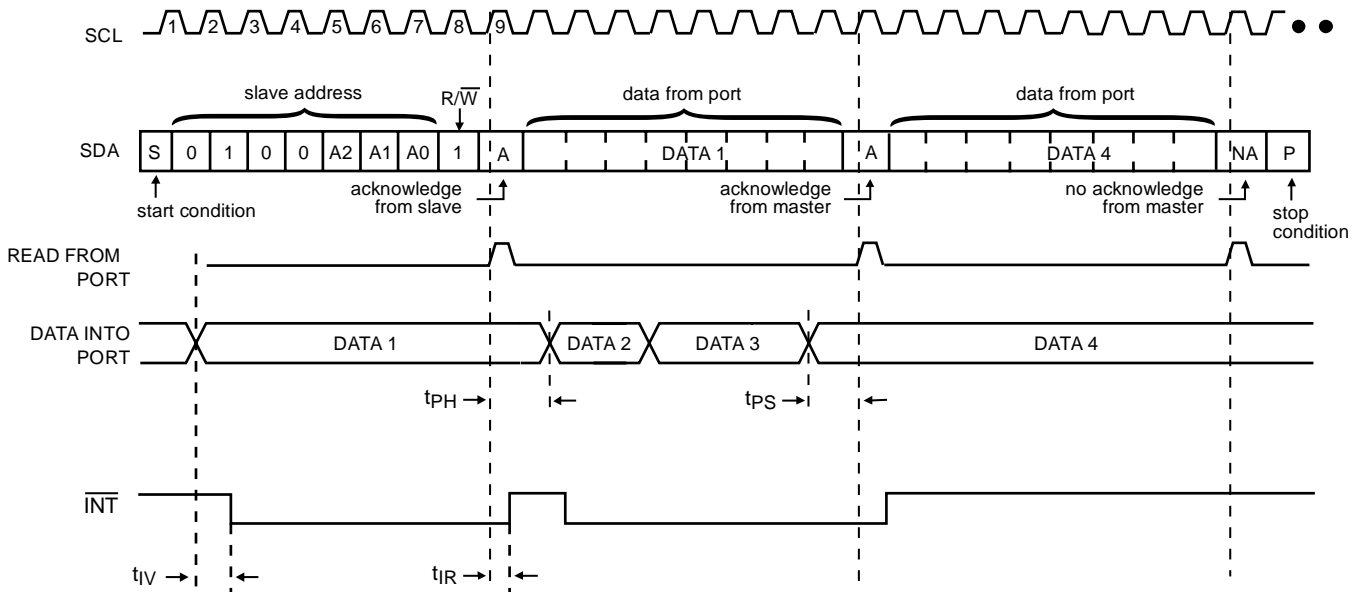

**POWER-ON RESET OPERATION**

When the power supply is applied to  $V_{CC}$  pin, an internal power-on reset pulse holds the CAT9554/9554A in a reset state until  $V_{CC}$  reaches  $V_{POR}$  level. At this point, the reset condition is released

and the internal state machine and the CAT9554/9554A registers are initialized to their default state.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
