**PIN FUNCTION DESCRIPTION**

Pin No.	Function	Description
1	Compensation	This pin is the Error Amplifier output and is made available for loop compensation
2	Voltage Feedback	This is the inverting input of the Error Amplifier. It is normally connected to the switching power supply output through a resistor divider.
3	Current Sense	A voltage proportional to inductor current is connected to this input. The PWM uses this information to terminate the output switch conduction
4	RT/CT	The Oscillator frequency and maximum Output duty cycle are programmed by connecting resistor $R_T$ to $V_{REF}$ and capacitor $C_T$ to ground. Operation to 500kHz is possible.
5	GND	This pin is the combined control circuitry and power ground
6	Output	This output directly drives the gate of a power MOSFET. Peak currents up to 1,0A are sourced and sunk by this pin.
7	Vcc	This pin is the positive supply of the control IC.
8	$V_{REF}$	This is the reference output. It provides charging current for capacitor $C_T$ through resistor $R_T$
