

### FEATURES

#### Low Power

- 1.7 mA/Amplifier Supply Current
- Fully Specified for  $\pm 5$  V and +5 V Supplies

#### High Output Current, 125 mA

#### High Speed

- 350 MHz, -3 dB Bandwidth ( $G = +1$ )
- 150 MHz, -3 dB Bandwidth ( $G = +2$ )
- 2,250 V/ $\mu$ s Slew Rate
- 20 ns Settling Time to 0.1%

#### Low Distortion

- 72 dBc Worst Harmonic @ 500 kHz,  $R_L = 100 \Omega$
- 66 dBc Worst Harmonic @ 5 MHz,  $R_L = 1 \text{ k}\Omega$

#### Good Video Specifications ( $R_L = 1 \text{ k}\Omega$ , $G = +2$ )

- 0.02% Differential Gain Error
- 0.06° Differential Phase Error
- Gain Flatness 0.1 dB to 40 MHz
- 60 ns Overdrive Recovery

#### Low Offset Voltage, 1.5 mV

#### Low Voltage Noise, 2.5 nV/ $\sqrt{\text{Hz}}$

#### Available in 8-Lead SOIC and 8-Lead MSOP

### APPLICATIONS

- XDSL, HDSL Line Drivers
- ADC Buffers
- Professional Cameras
- CCD Imaging Systems
- Ultrasound Equipment
- Digital Cameras

### PRODUCT DESCRIPTION

The AD8012 is a dual, low power, current feedback amplifier capable of providing 350 MHz bandwidth while using only 1.7 mA per amplifier. It is intended for use in high frequency, wide dynamic range systems where low distortion and high speed are essential and low power is critical.

With only 1.7 mA of supply current, the AD8012 also offers exceptional ac specifications such as 20 ns settling time and 2,250 V/ $\mu$ s slew rate. The video specifications are 0.02% differential gain and 0.06 degree differential phase, excellent for such a low power amplifier. In addition, the AD8012 has a low offset of 1.5 mV.

The AD8012 is well suited for any application that requires high performance with minimal power.

The product is available in standard 8-lead SOIC or MSOP packages and operates over the industrial temperature range -40°C to +85°C.

\*Protected under U.S. Patent Number 5,537,079.

# AD8012

## MAXIMUM POWER DISSIPATION

The maximum power that can be safely dissipated by the AD8012 is limited by the associated rise in junction temperature. The maximum safe junction temperature for plastic encapsulated devices is determined by the glass transition temperature of the plastic, approximately +150°C. Temporarily exceeding this limit may cause a shift in parametric performance due to a change in the stresses exerted on the die by the package. Exceeding a junction temperature of +175°C for an extended period can result in device failure.

The output stage of the AD8012 is designed for maximum load current capability. As a result, shorting the output to common can cause the AD8012 to source or sink 500 mA. To ensure proper operation, it is necessary to observe the maximum power derating curves. Direct connection of the output to either power supply rail can destroy the device.

Figure 3. Plot of Maximum Power Dissipation vs. Temperature for AD8012

## Test Circuits

Test Circuit 1. Gain = +2

Test Circuit 2. Gain = -1

## ABSOLUTE MAXIMUM RATINGS<sup>1</sup>

Supply Voltage	12.6 V
Internal Power Dissipation <sup>2</sup>	
SOIC Package (R)	0.8 W
MSOP Package (RM)	0.6 W
Input Voltage (Common Mode)	$\pm V_S$
Differential Input Voltage	$\pm 2.5$ V
Output Short-Circuit Duration	Observe Power Derating Curves
Storage Temperature Range RM, R	-65°C to +125°C
Operating Temperature Range (A Grade)	-40°C to +85°C
Lead Temperature Range (Soldering 10 sec)	300°C

## NOTES

<sup>1</sup>Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

<sup>2</sup>Specification is for device in free air at +25°C.

8-Lead SOIC Package:  $\theta_{JA} = 155^\circ\text{C}/\text{W}$

8-Lead MSOP Package:  $\theta_{JA} = 200^\circ\text{C}/\text{W}$

## CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the AD8012 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## APPLICATIONS

### Line Driving for HDSL

High bitrate digital subscriber line (HDSL) is becoming popular as a means of providing full duplex data communication at rates up to 1.544 MBPS or 2.048 MBPS over moderate distances via conventional telephone twisted pair wires. Traditional T1 (E1 in Europe) requires repeaters every 3,000 feet to 6,000 feet to boost the signal strength and allow transmission over distances of up to 12,000 feet. In order to achieve repeaterless transmission over this distance, an HDSL modem requires a transmitted power level of 13.5 dBm (assuming a line impedance of 135  $\Omega$ ).

HDSL uses the two binary/one quaternary line code (2B1Q). A sample 2B1Q waveform is shown in Figure 5. The digital bit stream is broken up into groups of two bits. Four analog voltages (called quaternary symbols) are used to represent the four possible combinations of two bits. These symbols are assigned the arbitrary names +3, +1, -1, and -3. The corresponding voltage levels are produced by a DAC that is usually part of an analog front end circuit (AFEC). Before being applied to the line, the DAC output is low-pass filtered and acquires the sinusoidal form shown in Figure 5. Finally, the filtered signal is applied to the line driver. The line voltages that correspond to the quaternary symbols +3, +1, -1, and -3 are 2.64 V, 0.88 V, -0.88 V, and -2.64 V. This gives a peak-to-peak line voltage of 5.28 V.

Figure 5. Time Domain Representation of an HDSL Signal

Many of the elements of a classic differential line driver are shown in the HDSL line driver in Figure 6. A 6 V peak-to-peak differential signal is applied to the input. The differential gain of the amplifier ( $1 + 2 R_F/R_G$ ) is set to +2, so the resulting differential output signal is 12 V p-p.

As is normal in telephony applications, a transformer galvanically isolates the differential amplifier from the line. In this case, a 1:1 turns ratio is used. In order to correctly terminate the line, it is necessary to set the output impedance of the amplifier to be equal to the impedance of the line being driven (135  $\Omega$  in this case). Because the transformer has a turns ratio of 1:1, the impedance reflected from the line is equal to the line impedance of 135  $\Omega$  ( $R_{REFL} = R_{LINE}/\text{Turns Ratio}^2$ ). As a result, two 66.5  $\Omega$  resistors correctly terminate the line.

Figure 6. Differential for HDSL Applications

The immediate effect of back-termination is that the signal from the amplifier is halved before being applied to the line. This doubles the power the amplifier must deliver. However, the back-termination resistors also play an important second role.

Full-duplex data transmission systems like HDSL simultaneously transmit data in both directions. As a result, the signal on the line and across the back termination resistors is the composite of the transmitted and received signal. The termination resistors are used to tap off this signal and feed it to the receive circuitry. Because the receive circuitry “knows” what is being transmitted, the transmitted data can be subtracted from the digitized composite signal to reveal the received data.

Driving a line with a differential signal offers a number of advantages compared to a single-ended drive. Because the two outputs are always 180 degrees out of phase relative to one another, the differential signal output is double the output amplitude of either of the op amps. As a result, the differential amplifier can have a peak-to-peak swing of 16 V (each op amp can swing to  $\pm 4$  V), even though the power supply is  $\pm 5$  V.

In addition, even-order harmonics (second, fourth, sixth, and so on.) of the two single-ended outputs tend to cancel out one another, so the total harmonic distortion (quadratic sum of all harmonics) decreases compared to the single-ended case, even as the signal amplitude is doubled. This is particularly advantageous in the case of the second harmonic. Because it is very close to the fundamental, filtering becomes difficult. In this application, the THD is dominated by the third harmonic, which is 65 dB below the carrier (i.e., spurious-free dynamic range = -65 dBc).

Differential line driving also helps to preserve the integrity of the transmitted signal in the presence of electromagnetic interference (EMI). EMI tends to induce itself equally onto both the positive and negative signal lines. As a result, a receiver with good common-mode rejection will amplify the original signal while rejecting induced (common-mode) EMI.

# AD8012

## Choosing the Appropriate Turns Ratio for the Transformer

Increasing the peak-to-peak output signal of the amplifier in the previous example and adding a variation in the turns ratio of the transformer can yield further enhancements to the circuit. The output signal swing of the AD8012 can be increased to about  $\pm 3.9$  V before clipping occurs. This increases the peak-to-peak output of the differential amplifier to 15.6 V. Because the signal applied to the primary winding is now bigger, the transformer turns ratio of 1:1 can be replaced with a (step-down) turns ratio of about 1.3:1 (from amplifier to line). This steps the 7.8 V peak-to-peak primary voltage down to 6 V. This is the same secondary voltage of the earlier examples, so the resulting power delivered to the line is the same.

The received signal, which is small relative to the transmitted signal, will, however, be stepped *up* by a factor of 1.3. Amplifying the received signal in this manner enhances its signal-to-noise ratio and is useful when the received signal is small compared to the to-be-transmitted signal.

The impedance reflected from the 135  $\Omega$  line now becomes 228  $\Omega$  ( $1.3^2 \times 135 \Omega$ ). With a correctly terminated line, the amplifier must now drive a total load of 456  $\Omega$  (114  $\Omega$  + 114  $\Omega$  + 228  $\Omega$ ), considerably more than the original 270  $\Omega$  load. This reduces the drive current from the op amps by about 40%.

More significant, however, is the reduction in dynamic power consumption—that is, the power the amplifier must consume in order to deliver the load power. Increasing the output signal so that it is as close as possible to the power rails minimizes the power consumed in the amplifier.

There is, however, a price to pay in terms of increased signal distortion. Increasing the output signal of each op amp from the original  $\pm 3$  V to  $\pm 3.9$  V reduces the spurious-free dynamic range (SFDR) from  $-65$  dB to  $-50$  dB (measured at 500 kHz), even though the overall load impedance has increased from 270  $\Omega$  to 456  $\Omega$ .

## LAYOUT CONSIDERATIONS

The specified high speed performance of the AD8012 requires careful attention to board layout and component selection. Table I shows recommended component values for the AD8012 and Figures 8–13 show recommended layouts for the 8-lead SOIC and MSOP packages for a positive gain. Proper RF design techniques and low parasitic component selections are mandatory.

The PCB should have a ground plane covering all unused portions of the component side of the board to provide a low impedance ground path. The ground plane should be removed from the area near the input pins to reduce stray capacitance.

Chip capacitors should be used for supply bypassing (see Figure 7). One end should be connected to the ground plane and the other within 1/8 inch of each power pin. An additional (4.7  $\mu$ F to 10  $\mu$ F) tantalum electrolytic capacitor should be connected in parallel.

The feedback resistor should be located close to the inverting input pin in order to keep the stray capacitance at this node to a minimum. Capacitance greater than 1.5 pF at the inverting input will significantly affect high speed performance when operating at low noninverting gains.

Stripline design techniques should be used for long signal traces (greater than about 1 inch). They should be designed with the proper system characteristic impedance and be properly terminated at each end.

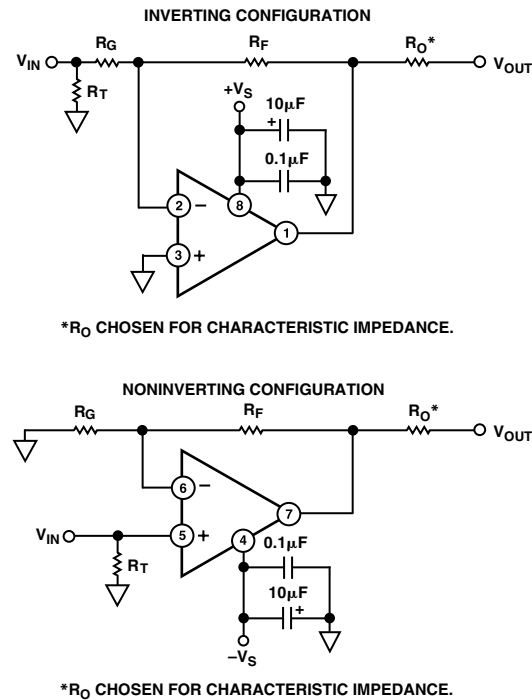

Figure 7. Inverting and Noninverting Configurations

Table I. Typical Bandwidth vs. Gain Setting Resistors

Gain	$R_F$	$R_G$	$R_T$	Small Signal $-3$ dB BW (MHz), $V_S = \pm 5$ V, $R_L = 1$ k $\Omega$

OUTLINE DIMENSIONS

8-Lead Standard Small Outline Package [SOIC]  
Narrow Body  
(R-8)

Dimensions shown in millimeters and (inches)

COMPLIANT TO JEDEC STANDARDS MS-012AA  
CONTROLLING DIMENSIONS ARE IN MILLIMETERS; INCH DIMENSIONS  
(IN PARENTHESES) ARE ROUNDED-OFF MILLIMETER EQUIVALENTS FOR  
REFERENCE ONLY AND ARE NOT APPROPRIATE FOR USE IN DESIGN

8-Lead Mini Small Outline Package [MSOP]  
(RM-8)

Dimensions shown in millimeters

COMPLIANT TO JEDEC STANDARDS MO-187AA

Revision History

Location	Page
12/03—Data Sheet changed from REV. A to REV. B.	
Renumbered figures and TPCs	Universal
Updated ORDERING GUIDE	5
Updated OUTLINE DIMENSIONS	16

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
