

Description

The 5PB11xx is a high-performance LVCMOS clock buffer family of devices. It has an additive phase jitter of 50fs RMS.

There are five different fan-out variations available: 1:2 to 1:10.

The 5PB11xx supports a synchronous glitch-free output enable (OE) function to eliminate any potential intermediate incorrect output clock cycles when enabling or disabling outputs. It can operate from a 1.8V to 3.3V supply.

The 5PB1104 is also available in an Automotive Grade 1, AEC-Q100 qualified version.

³ With rail-to-rail input clock.

⁴ Between any 2 outputs with equal loading.

⁵ Duty cycle on outputs will match incoming clock duty cycle when V_{IH} on CLKIN pin equals V_{DD} power supply voltage. Consult IDT for tight duty cycle clock generators.

Phase Noise Plots

The phase noise plots show the low additive jitter of the 5PB11xx high-performance buffer. With an integration range of 12kHz to 20MHz, the reference input has about 58.9fs of RMS phase jitter while the output of 5PB11xx has about 70.9fs of RMS phase jitter. This results in a low additive phase jitter of only 39fs.

Reference Phase Noise 58.9fs (12kHz to 20MHz)

Output Phase Noise 70.9fs (12kHz to 20MHz)
