

General Description

The SLG59M1804V is designed for load switching application. The part comes with two 4.5 A rated MOSFETs switched on by two ON control pins. Each MOSFETs turn on time is independently adjusted by an external capacitor.

Features

- UL2367 Certified - File Number E497808
- Two 4.5A independent MOSFETs
- Two Integrated VGS Charge Pumps
- Two internal discharges per channel for gate and source
- Independent Ramp Control
- Protected by thermal shutdown with current limit
- Pb-Free / RoHS Compliant
- Halogen-Free
- STDFN 14L, 1 x 3 x 0.55 mm

Pin Configuration

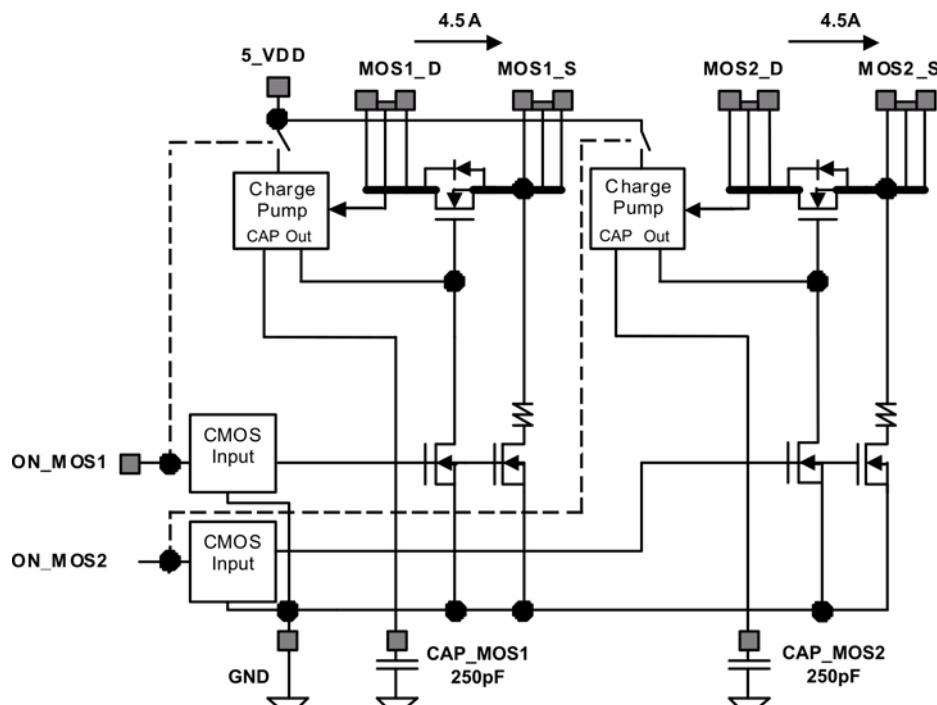

MOS1_D	1	14	MOS1_S
MOS1_D	2	13	MOS1_S
ON_MOS1	3	12	CAP_MOS1
VDD	4	11	GND
ON_MOS2	5	10	CAP_MOS2
MOS2_D	6	9	MOS2_S
MOS2_D	7	8	MOS2_S

**14-pin STDFN

Applications

- Ideal for switching ON and OFF S0 +5.0 and 3.3V power rails with associated support circuitry discharges.
- Ideal for switching ON and OFF power rails 5V or less.
- Can use either channel up to 4.5A with combined maximum current of 8.5A
- Maximum load capacitance of 1000 μ F for each Channel Source terminal.

Application Notes SLG59M1804V Power-Up/Power-Down Sequence Considerations

To ensure glitch-free power-up under all conditions, apply V_{DD} first, followed by V_D after V_{DD} exceeds 1 V. Then allow V_D to reach 90% of its max value before toggling the ON pin from Low-to-High. Likewise, power-down in reverse order.

If V_{DD} and V_D need to be powered up simultaneously, glitching can be minimized by having a suitable load capacitor. A 10 μF C_{LOAD} will prevent glitches for rise times of V_{DD} and V_D less than 2 ms.

If the ON pin is toggled HIGH before V_{DD} and V_D have reached their steady-state values, the IPS timing parameters may differ from datasheet specifications.

The slew rate of output V_S follows a linear ramp set by a capacitor connected to the CAP pin. A larger capacitor value at the CAP pin produces a slower ramp, reducing inrush current from capacitive loads.

SLG59M1804V Current Limiting

The SLG59M1804V has two forms of current limiting.

Standard Current Limiting Mode

Current is measured by mirroring the current through the main MOSFET. The mirrored current is then sent through a resistor creating a voltage $V(i)$ proportional to the MOSFET current. The $V(i)$ is then compared with a Band Gap voltage $V(BG)$. If $V(i)$ exceeds the Band Gap voltage then the voltage $V(g)$ on the gate of the main MOSFET is reduced. The $V(g)$ continues to drop until $V(i) < V(BG)$. This response is a closed loop response and is therefore very fast and current limits in less than a few micro-seconds. There is no difference between peak or constant current limit.

Temperature Cutoff

However, as the $V(g)$ drops the $R_{ds(ON)}$ of the main MOSFET will increase, thus limiting the current, but also increasing the power dissipation of the IC. The IC is very small and cannot dissipate much power. Therefore, if a current limit condition is sustained the IC will heat up. If the temperature exceeds approximately 120°C, then $V(g)$ will be brought low completely shutting off the main MOSFET. As the die cools the MOSFET will be turned back on at 100°C.

If the current limiting condition has not been mitigated then the die will again heat up to 120°C and the process will repeat.

Short Circuit Current Limiting Mode

When $V(V_S) < 250$ mV, which is the case if there is a solder bridge during the manufacturing process or a hard short on the power rail, then the current is limited to approximately 500 mA. This current limit is accomplished in the same manner as the Standard Current Limiting Mode with the exception that the current mirror is 12x greater. Because the current mirror is so much larger, a 15x smaller main MOSFET current is required to generate the same $V(i)$. If $V(V_S)$ rises above approximately 250 mV, then this mode is automatically switched out.

Slew Rate Control

V_S slew rate control, or inrush current control for each channel, is set by an external capacitor on pin 10 and pin 12. The charging current drawn from V_D is commonly referred to as “ V_D Inrush Current” and can cause the input power source to collapse if the V_D inrush current is too high. The expression relating V_D inrush current, V_S slew rate and C_{OUT} is:

$$V_D \text{ Inrush Current, } A = C_{OUT}, \mu F \times \text{Slew Rate, } V/ms$$

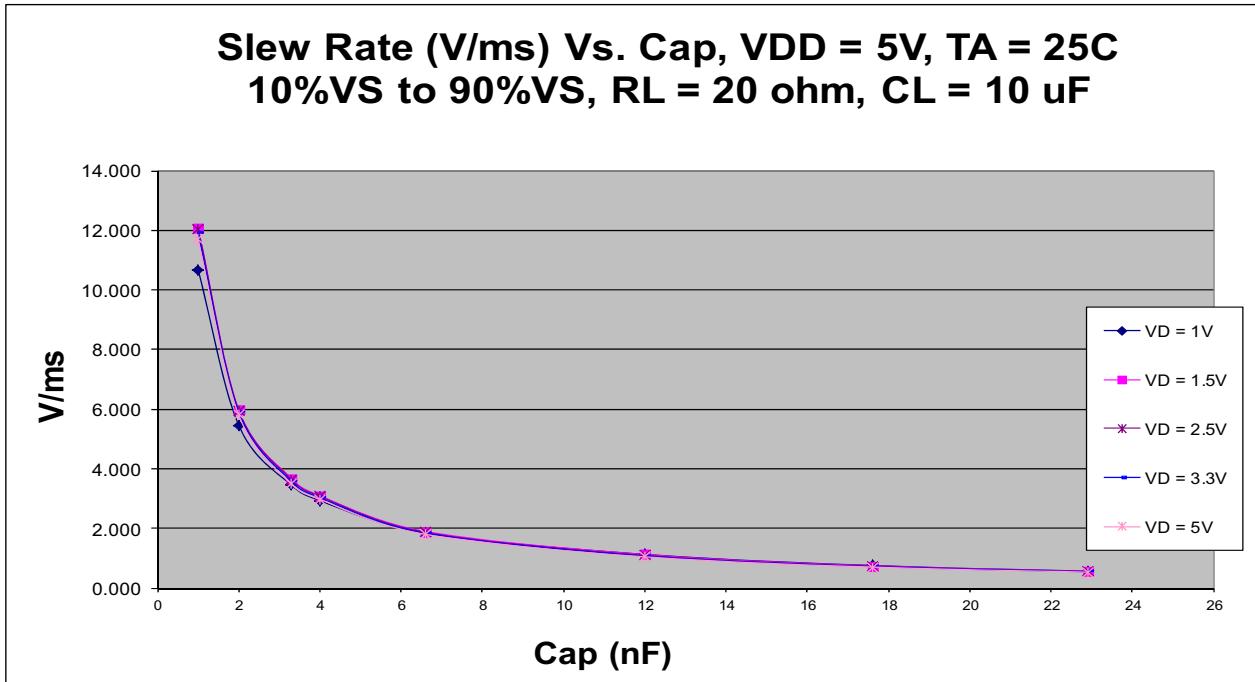

Dependence of Slew Rate from Cap on Pin 10 and pin 12 is illustrated on page 6. Since the IPS has some Ton Delay time before V_S starts rising, the dependence of Total ON time vs Cap on pin 10 and pin 12 can be estimated and is illustrated on page 6.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибуторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибуторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помочь разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
