

UltraCMOS® SPDT RF Switch 100 – 6000 MHz

Product Description

The PE42420 is a HaRP™ technology-enhanced absorptive 50Ω SPDT RF switch developed on the UltraCMOS® process technology.

This general purpose switch is comprised of two RF ports and has very high isolation performance. It is ideal for RF and IF transceiver signal switching (signal amplitude adjust), discrete DSA stages, and filter bank switching applications. No blocking capacitors are required if DC voltage is not present on the RF ports.

Peregrine's HaRP™ technology enhancements deliver high linearity and excellent harmonics performance with the economy and integration of conventional CMOS.

Exceeding absolute maximum ratings may cause permanent damage. Operation should be restricted to the limits in the Operating Ranges table. Operation between operating range maximum and absolute maximum for extended periods may reduce reliability.

Electrostatic Discharge (ESD) Precautions

When handling this UltraCMOS[®] device, observe the same precautions that you would use with other ESD-sensitive devices. Although this device contains circuitry to protect it from damage due to ESD, precautions should be taken to avoid exceeding the specified rating.

Latch-Up Avoidance

Unlike conventional CMOS devices, UltraCMOS[®] devices are immune to latch-up.

Switching Frequency

The PE42420 has a maximum 25 kHz switching frequency.

Switching frequency describes the time duration between switching events. Switching time is the time duration between the point the control signal reaches 50% of the final value and the point the output signal reaches within 10% or 90% of its target value. Switching time is provided in *Table 1*.

Evaluation Kit

The SPDT switch evaluation board was designed to ease customer evaluation of Peregrine's PE42420. The RF common port is connected through a 50 Ω transmission line via the top SMA connector, J2. RF1 and RF2 ports are connected through 50 Ω transmission lines via SMA connectors J1 and J3, respectively. A 50 Ω through transmission line is available via SMA connectors J4 and J5, which can be used to calculate the loss of the PCB. J6 provides DC and digital inputs to the device.

The board is constructed of a four metal layer material with a total thickness of 36 mils. To achieve high isolation, the 50 Ω transmission lines are designed in layer 2 using a stripline waveguide design. The board stack up for 50 Ω transmission lines has 10 mil thickness of Rogers 4350 between layer 1 and layer 2, and 10 mil thickness of Rogers 4350 between layer 2 and layer 3.

For the true performance of the PE42420 to be realized, the PCB should be designed in such a way that RF transmission lines and sensitive DC I/O traces are heavily isolated from one another.
