## Ultra-Low Power, AT Command Controlled, Sigfox<sup>®</sup> Compliant Transceiver IC for Up-Link and Down-Link

ON Semiconductor<sup>®</sup>

[www.onsemi.com](http://www.onsemi.com)

### OVERVIEW

#### Circuit Description

AX-Sigfox is an ultra-low power single chip solution for a node on the Sigfox network with both up- and down-link functionality. The AX-Sigfox chip is delivered fully ready for operation and contains all the necessary firmware to transmit and receive data from the Sigfox network in Europe. It connects to the customer product using a logic level RS232 UART. AT commands are used to send frames and configure radio parameters.

#### Features

Functionality and Ecosystem

- Sigfox up-link and down-link functionality controlled by AT commands
- The AX-Sigfox IC is part of a whole development and product ecosystem available from ON Semiconductor for any Sigfox requirement. Other parts of the ecosystem include
  - ◆ Ready to go AX-Sigfox development kit with fully functional AX-Sigfox module including Sigfox subscription
  - ◆ Sigfox Ready<sup>®</sup> certified reference design for the AX-Sigfox IC
  - ◆ MiniStamp by ON Semiconductor Sigfox modules with SMA connector or chip antenna
  - ◆ AX-Sigfox-API IC for customers wishing to write their own application software based on the AXSEM Sigfox Library

General Features

- QFN40 5 mm x 7 mm package
- Supply range 1.8 V – 3.6 V
- –40°C to 85°C
- Temperature sensor
- Supply voltage measurements
- 10 GPIO pins
  - ◆ 4 GPIO pins with selectable voltage measure functionality, differential (1 V or 10 V range) or single ended (1 V range) with 10 bit resolution

- ◆ 2 GPIO pins with selectable sigma delta DAC output functionality
- ◆ 2 GPIO pins with selectable output clock
- ◆ 3 GPIO pins selectable as SPI master interface
- ◆ Integrated RX/TX switching with differential antenna pins

Power Consumption

- Ultra-low Power Consumption:
  - ◆ Charge required to send a Sigfox OOB packet at 14 dBm output power: 0.28 C
  - ◆ Deepsleep mode current: 100 nA
  - ◆ Sleep mode current: 1.3  $\mu$ A
  - ◆ Standby mode current: 0.5 mA
  - ◆ Continuous radio RX-mode at 869.525 MHz : 10 mA
  - ◆ Continuous radio TX-mode at 868.130 MHz 19 mA @ 0 dBm 49 mA @ 14 dBm

High Performance Narrow-band Sigfox RF Transceiver

- Receiver
  - ◆ Carrier frequency 869.525 MHz
  - ◆ Data-rate 600 bps FSK
  - ◆ Sensitivity –126 dBm @ 600 bps, 869.525 MHz, GFSK
  - ◆ 0 dBm maximum input power
- Transmitter
  - ◆ Carrier frequency 868.13 MHz
  - ◆ Data-rate 100 bps PSK
  - ◆ High efficiency, high linearity integrated power amplifier
  - ◆ Maximum output power 14 dBm
  - ◆ Power level programmable in 1 dBm steps

Applications

Sigfox networks up-link and down-link.

**Table 1. PIN FUNCTION DESCRIPTIONS**

Symbol	Pin(s)	Type	Description
CLKP	40	A	TCXO interface
GND	Center pad	P	Ground on center pad of QFN, must be connected

A = analog input  
 I = digital input signal  
 O = digital output signal  
 PU = pull-up  
 I/O = digital input/output signal  
 N = not to be connected  
 P = power or ground  
 PD = pull-down

All digital inputs are Schmitt trigger inputs, digital input and output levels are LVCMOS/LVTTL compatible. Pins GPIO[3:0] must not be driven above VDD\_IO, all other digital inputs are 5 V tolerant. All GPIO pins and UARTRX start up as input with pull-up. For explanations on how to use the GPIO pins, see chapter “AT Commands”.

GPIO3	0, 1, Z, U, A
GPIO4	0, 1, Z, U, T
GPIO5	0, 1, Z, U
GPIO6	0, 1, Z, U
GPIO7	0, 1, Z, U
GPIO8	0, 1, Z, U
GPIO9	0, 1, Z, U

0 = pin drives  
 1 = not to be connected  
 Z = pin is high impedance input  
 U = pin is input with pull-up  
 A = pin is analog input  
 T = pin is driven by clock or DAC

I <sub>TXMOD14AVG</sub>	Modulated Transmitter Current, Note 2	Pout=14 dBm; average		49.0		mA

1. If VDD\_IO ramps cannot be guaranteed, an external reset circuit is recommended, see the AX8052 Application Note: Power On Reset
2. The output power of the AX-Sigfox can be programmed in 1 dB steps from 0 dBm – 14 dBm. Current consumption values are given for a matching network that is optimized for 14 dBm output. 0 dBm transmission with typically 10 mA can be achieved with other networks that are optimized for 0 dBm operation.
3. Internal 20 MHz oscillator, voltage conditioning and supervisory circuit running.

## Typical Current Waveform

**Figure 3. Typical Current Waveform for a Maximum Length Frame with Downlink Receive at 14 dBm Output Power**

### Battery Life Examples

Scenario 1:

- CR2032 coin cell battery
- One OOB frame transmitter per day at Pout=0 dBm
- Device in Sleep
- Neglecting battery self discharge

CR2032 capacity	225 mAh * 3600 s/h	810 C
Sleep charge per day	1.3 $\mu$ A * 86400 s	0.11 C/day
OOB frame transmission		0.12 C/day
Total Charge consumption		0.23 C/day
Battery life		9.6 Years

Scenario 2:

- 2 AAA Alkaline batteries in series
- One OOB frame transmitter per day at Pout=14 dBm
- Four maximum length frames with downlink receive per day at Pout=14 dBm
- Device in Sleep
- Neglecting battery self discharge

2 AAA alkaline capacity	1500 mAh * 3600 s/h	5400 C
Sleep charge per day	1.3 $\mu$ A * 86400 s	0.11 C/day
OOB frame transmission		0.28 C/day
Frame transmission with downlink	4 * 0.46 C/day	1.84 C/day
Total Charge consumption		2.26 C/day
Battery life		6.5 Years

## COMMAND INTERFACE

### General Information

The chapter “Command Interface” is a documentation of the AT-Command set for devices which do not have an API-interface. To see whether the device is capable of receiving AT-Commands, please refer to chapter “Part Numbers”. If the device has been shipped with the API-Interface, please refer to the AX-Sigfox SOFTWARE MANUAL for an introduction on how to setup a project and how to use the API-Interface.

### Serial Parameters: 9600, 8, N, 1

The AX-Sigfox uses the UART (pins UARTTX, UARTRX) to communicate with a host and uses a bitrate of **9600 baud**, no parity, 8 data bits and one stop bit.

### Power Modes

### Standby

After Power-Up and after finishing a SIGFOX transmission, AX-Sigfox enters Standby mode. In Standby mode, AX-Sigfox listens on the UART for commands from the host. Also, OOB frames are transmitted whenever the OOB timer fires. To conserve power, the AX-Sigfox can be put into Sleep or turned off (Deep Sleep) completely.

### Sleep

The command **AT\$P=1** is used to put the AX-Sigfox into Sleep mode. In this mode, only the wakeup timer for out-of-band messages is still running. To wake the AX-Sigfox up from Sleep mode toggle the serial UARTRX pin, e.g. by sending a break (break is an RS232 framing violation, i.e. at least 10 bit durations low). When an Out of Band (OOB) message is due, AX-Sigfox automatically wakes up to transmit the message, and then returns to Sleep mode.

### Deep Sleep

In Deep Sleep mode, the AX-Sigfox is completely turned off and only draws negligible leakage current. Deep Sleep mode can be activated with **AT\$P=2**. To wake-up from Deep Sleep mode, GPIO9 is pulled to GND.

When using Deep Sleep mode, keep two things in mind: Everything is turned off, timers are not running at all and all settings will be lost (use **AT\$WR** to save settings to flash before entering Deep Sleep mode). Out-of-band messages will therefore not be sent. The pins states are frozen in Deep Sleep mode. The user must ensure that this will not result in condition which would draw a lot of current.

### AT Commands

#### Numerical Syntax

```

hexdigit ::= [0-9A-Fa-f]
hexnum  ::= "0x" hexdigit+
decnum   ::= "0" | [1-9] [0-9]*
octnum   ::= "0" [0-7]+
binnum   ::= "0b" [01]+
bit      ::= [01]
optnum   ::= "-1"
frame    ::= (hexdigit hexdigit)+
uint     ::= hexnum | decnum | octnum | binnum
uint_opt ::= uint | optnum
    
```

#### Command Syntax

A command starts with ‘AT’ (everything is case sensitive!), continues with the actual command followed by parameters (if any) and ends with any kind of whitespace (space, tab, newline etc.)

If incorrect syntax is detected (“parsing error”) all input is ignored up until the next whitespace character.

Also note that any number can be entered in any format (Hexadecimal, Decimal, Octal and binary) by adding the corresponding prefix (‘0x’, ‘0’, ‘0b’). The only exception is the ‘Send Frame’ command (**AT\$SF**) which expects a list of hexadecimal digits without any prefix.

#### Return Codes

A successful command execution is indicated by sending ‘OK’. If a command returns a value (e.g. by querying a register) only the value is returned.

#### Examples

Bold text is sent to AX-Sigfox.

**AT\$I=0**

AXSEM AT Command Interface

Here, we execute command ‘I’ to query some general information.

**AT\$SF=aabb1234**

OK

This sends a Sigfox frame containing { 0x00 : 0x11 : 0x22 : 0x33 : 0x44 }, then waits for a downlink response telegram, which in this example contains { 0xAA : 0xBB : 0xCC : 0xDD }.

**AT\$CB=0011223344,1**

OK

RX=AA BB CC DD

## AX-SIGFOX

This sends a Sigfox frame containing { 0xAA : 0xBB : 0x12 : 0x34 } without waiting for a response telegram.

**AT\$CB=0xAA,1**  
OK

The 'CB' command sends out a continuous pattern of bits, in this case 0xAA = 0b10101010.

**AT\$P=1**  
OK

This transitions the device into sleep mode. Out-of-band transmissions will still be triggered. The UART is powered down. The device can be woken up by a low level on the UART signal, i.e. by sending break.

**Table 10. COMMANDS**

Command	Name	Description												
AT	Dummy Command	Just returns 'OK' and does nothing else. Can be used to check communication.												
AT\$SB=bit[,bit]	Send Bit	Send a bit status (0 or 1). Optional bit flag indicates if AX-Sigfox should receive a downlink frame.												
AT\$SF=frame[,bit]	Send Frame	Send payload data, 1 to 12 bytes. Optional bit flag indicates if AX-Sigfox should receive a downlink frame.												
AT\$SO	Manually send out of band message	Send the out-of-band message.												
AT\$uint?	Get Register	Query a specific configuration register's value. See chapter "Registers" for a list of registers.												
AT\$uint=uint	Set Register	Change a configuration register.												
AT\$IF=uint	Set TX Frequency	Set the output carrier macro channel for Sigfox frames.												
AT\$IF?	Get TX Frequency	Get the currently chosen TX frequency.												
AT\$DR=uint	Set RX Frequency	Set the reception carrier macro channel for Sigfox frames.												
AT\$DR?	Get RX Frequency	Get the currently chosen RX frequency.												
AT\$CW=uint,bit[,uint_opt]	Continuous Wave	<p>To run emission tests for Sigfox certification it is necessary to send a continuous wave, i.e. just the base frequency without any modulation. **Table 10. COMMANDS**

Command	Name	Description															
AT:ADC Pn[-Pn[(1V 10V)]]?	Get GPIO Pin Analog Voltage	Measure the voltage applied to a GPIO pin. The command also allows measurement of the voltage difference across two GPIO pins. In differential mode, the full scale range may also be specified as 1 V or 10 V. Note however that the pin input voltages must not exceed the range 0..VDD <sub>IO</sub> . The command returns the result as fraction of the full scale range (1 V if none is specified). The GPIO pins referenced should be initialized to analog mode before issuing this command.															
AT:SPI[(A B C D)]=bytes	SPI Transaction	<p>This command clocks out <i>bytes</i> on the SPI port. The clock frequency is 312.5 kHz. The command returns the bytes read on MISO during output. Optionally the clocking mode may be specified (default is A):</p> <table border="1"> <thead> <tr> <th>Mode</th> <th>Clock Inversion</th> <th>Clock Phase</th> </tr> </thead> <tbody> <tr> <td>A</td> <td>normal</td> <td>normal</td> </tr> <tr> <td>B</td> <td>normal</td> <td>alternate</td> </tr> <tr> <td>C</td> <td>inverted</td> <td>normal</td> </tr> <tr> <td>D</td> <td>inverted</td> <td>alternate</td> </tr> </tbody> </table> <p>Note that SEL, if needed, is not generated by this command, and must instead be driven using standard GPIO commands (AT:Pn=0 1).</p>	Mode	Clock Inversion	Clock Phase	A	normal	normal	B	normal	alternate	C	inverted	normal	D	inverted	alternate
Mode	Clock Inversion	Clock Phase															
A	normal	normal															
B	normal	alternate															
C	inverted	normal															
D	inverted	alternate															
AT:CLK=freq,reffreq	Set Clock Generator	Output a square wave on the pin(s) set to T mode. The frequency of the square wave is $(\text{freq} / 2^{16}) \times \text{reffreq}$ . Possible values for reffreq are 20000000, 10000000, 5000000, 2500000, 1250000, 625000, 312500, 156250. Possible values if freq are 0...65535.															
AT:CLK=OFF	Turn off Clock Generator	Switch off the clock generator															
AT:CLK?	Get Clock Generator	Return the settings of the clock generator. Two numbers are returned, freq and reffreq.															
AT:DAC=value	Set $\Sigma\Delta$ DAC	Output a $\Sigma\Delta$ DAC value on the pin(s) set to T mode. Parameter value may be in the range -32768...32767. The average output voltage is $(1/2 + \text{value} / 2^{17}) \times VDD$ . An external low pass filter is needed to get smooth output voltages. The modulation frequency is 20 MHz. A possible low pass filter choice is a simple RC low pass filter with R = 10 k $\Omega$ and C = 1 $\mu$ F.															
AT:DAC=OFF	Turn off $\Sigma\Delta$ DAC	Switch off the DAC															
AT:DAC?	Get $\Sigma\Delta$ DAC	Return the DAC value

## QFN40 Recommended Pad Layout

1. PCB land and solder masking recommendations are shown in Figure 7.

- A = Clearance from PCB thermal pad to solder mask opening, 0.0635 mm minimum
- B = Clearance from edge of PCB thermal pad to PCB land, 0.2 mm minimum
- C = Clearance from PCB land edge to solder mask opening to be as tight as possible to ensure that some solder mask remains between PCB pads.
- D = PCB land length = QFN solder pad length + 0.1 mm
- E = PCB land width = QFN solder pad width + 0.1 mm

**Figure 7. PCB Land and Solder Mask Recommendations**

2. Thermal vias should be used on the PCB thermal pad (middle ground pad) to improve thermal conductivity from the device to a copper ground plane area on the reverse side of the printed circuit board. The number of vias depends on the package thermal requirements, as determined by thermal simulation or actual testing.
3. Increasing the number of vias through the printed circuit board will improve the thermal conductivity to the reverse side ground plane and external heat sink. In general, adding more metal through the PCB under the IC will improve operational heat transfer, but will require careful attention to uniform heating of the board during assembly.

### Assembly Process

#### Stencil Design & Solder Paste Application

1. Stainless steel stencils are recommended for solder paste application.
2. A stencil thickness of 0.125 – 0.150 mm (5 – 6 mils) is recommended for screening.

3. For the PCB thermal pad, solder paste should be printed on the PCB by designing a stencil with an array of smaller openings that sum to 50% of the QFN exposed pad area. Solder paste should be applied through an array of squares (or circles) as shown in Figure 8.
4. The aperture opening for the signal pads should be between 50–80% of the QFN pad area as shown in Figure 9.
5. Optionally, for better solder paste release, the aperture walls should be trapezoidal and the corners rounded.
6. The fine pitch of the IC leads requires accurate alignment of the stencil and the printed circuit board. The stencil and printed circuit assembly should be aligned to within + 1 mil prior to application of the solder paste.
7. No-clean flux is recommended since flux from underneath the thermal pad will be difficult to clean if water-soluble flux is used.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкуренеспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
