Applications Information

Wiring the differential input to accept single ended levels

Figure 1 shows how the differential input can be wired to accept single-ended levels. The reference voltage $V_{REF} = VCC/2$ is generated by the bias resistors R1, R2 and C1. This bias circuit should be placed as close as possible to the input pin. The ratio of R1 and R2 should be adjusted to position the V_{REF} at the center of the input voltage swing. For example, if the input clock swing is 2.5V and $VCC = 3.3V$, V_{REF} should be 1.25V and $R1/R2 = 0.609$.
