

FEATURES

Rail-to-rail input/output
Low power: 625 μ A typical
Gain bandwidth product: 15.9 MHz at $A_v = 100$ typical
Unity-gain crossover: 9.9 MHz typical
–3 dB closed-loop bandwidth: 13.9 MHz typical at ± 15 V
Low offset voltage: 100 μ V maximum (SOIC)
Unity-gain stable
High slew rate: 4.6 V/ μ s typical
Low noise: 3.9 nV/ $\sqrt{\text{Hz}}$ typical at 1 kHz

APPLICATIONS

Battery-powered instrumentation
Power supply control and protection
Telecommunications
DAC output amplifier
ADC input buffer

GENERAL DESCRIPTION

The [ADA4084-2](#) is a dual, single-supply, 10 MHz bandwidth amplifier featuring rail-to-rail inputs and outputs. It is guaranteed to operate from 3 V to 30 V (or ± 1.5 V to ± 15 V).

These amplifiers are well suited for single-supply applications requiring both ac and precision dc performance. The combination of wide bandwidth, low noise, and precision makes the [ADA4084-2](#) useful in a wide variety of applications, including filters and instrumentation.

Other applications for these amplifiers include portable telecommunications equipment, power supply control and protection, and use as amplifiers or buffers for transducers with wide output ranges. Sensors requiring a rail-to-rail input amplifier include Hall effect, piezoelectric, and resistive transducers.

The ability to swing rail-to-rail at both the input and output enables designers to build multistage filters in single-supply systems and to maintain high signal-to-noise ratios.

The [ADA4084-2](#) is specified over the industrial temperature range of -40°C to $+125^\circ\text{C}$. The dual [ADA4084-2](#) is available in the 8-lead SOIC, MSOP, and LFCSP surface-mount packages.

PIN CONFIGURATION

NOTES

1. FOR THE LFCSP PACKAGE THE EXPOSED PAD MUST BE CONNECTED TO V-.

Figure 1. 8-Lead MSOP (RM)

08237-001

The [ADA4084-2](#) is a member of a growing series of high voltage, low noise op amps offered by Analog Devices, Inc., (see Table 1).

For a more complete selection table of low input voltage noise amplifiers, see the [AN-940](#) Application Note, *Low Noise Amplifier Selection Guide for Optimal Noise Performance*, available at www.analog.com.

Table 1. Low Noise Op Amps

Voltage Noise	Single	Dual	Quad
1.1 nV/Hz	AD8597	AD8599	
1.8 nV/Hz	ADA4004-1	ADA4004-2	ADA4004-4
2.8 nV/Hz RRO ¹	AD8675	AD8676

ABSOLUTE MAXIMUM RATINGS

Table 5.

Parameter	Rating
Supply Voltage	±18 V
Input Voltage	$V- \leq V_{IN} \leq V+$
Differential Input Voltage ¹	±0.6 V
Output Short-Circuit Duration to GND	Indefinite
Storage Temperature Range	–65°C to +150°C
Operating Temperature Range	–40°C to +125°C
Junction Temperature Range	–65°C to +150°C
Lead Temperature (Soldering 60 sec)	300°C

¹ For input differential voltages greater than 0.6 V, the input current should be limited to less than 5 mA to prevent degradation or destruction of the input devices.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL RESISTANCE

θ_{JA} is specified for the device soldered on a 4-layer JEDEC standard printed circuit board (PCB) with zero airflow.

Table 6. Thermal Resistance

Package Type	θ_{JA}	θ_{JC}	Unit
8-Lead SOIC	121	43	°C/W
8-Lead MSOP	142	45	°C/W
8-Lead LFCSP ¹	55	6	°C/W

¹ Numbers are based on 4-layer JEDEC thermal boards with the exposed pad soldered to the PCB.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

APPLICATIONS INFORMATION

FUNCTIONAL DESCRIPTION

The [ADA4084-2](#) is a precision single-supply, rail-to-rail operational amplifier. Intended for portable instrumentation, the [ADA4084-2](#) combines the attributes of precision, wide bandwidth, and low noise to make it an ideal choice in single-supply applications that require both ac and precision dc performance. Other low supply voltage applications for which the [ADA4084-2](#) is well suited are active filters, audio microphone preamplifiers, power supply control, and telecommunications. To combine all of these attributes with rail-to-rail input/output operation, novel circuit design techniques are used.

Figure 78. [ADA4084-2](#) Equivalent Input Circuit

For example, Figure 78 illustrates a simplified equivalent circuit for the input stage of the [ADA4084-2](#). It comprises a PNP differential pair, Q1 and Q2, and an NPN differential pair, Q3 and Q4, operating concurrently. Diode D100 and Diode D101 serve to clamp the applied differential input voltage to the [ADA4084-2](#), thereby protecting the input transistors against Zener breakdown of the emitter-base junctions. Input stage voltage gains are kept low for input rail-to-rail operation. The two pairs of differential output voltages are connected to the second stage of the [ADA4084-2](#), which is a modified compound folded cascade gain stage. It is also in the second gain stage, where the two pairs of differential output voltages are combined into a single-ended output signal voltage used to drive the output stage.

A key issue in the input stage is the behavior of the input bias currents over the input common-mode voltage range. Input bias currents in the [ADA4084-2](#) are the arithmetic sum of the base currents in Q1 and Q4 and in Q2 and Q3. As a result of this design approach, the input bias currents in the [ADA4084-2](#) not only exhibit different amplitudes; they also exhibit different polarities. This effect is best illustrated by Figure 9, Figure 10, Figure 34, Figure 35, Figure 59, and Figure 60. It is therefore important that the effective source impedances connected to the [ADA4084-2](#) inputs be balanced for optimum dc and ac performance.

To achieve rail-to-rail output, the [ADA4084-2](#) output stage design employs a unique topology for both sourcing and sinking current. This circuit topology is illustrated in Figure 79. The output stage is voltage-driven from the second gain stage. The signal path through the output stage is inverting; that is, for positive input signals, Q13 provides the base current drive to Q19 so that it conducts (sinks) current. For negative input signals, the signal path via Q18 → mirror → Q24 provides the base current drive for Q23 to conduct (source) current. Both transistors provide output current until they are forced into saturation.

Figure 79. [ADA4084-2](#) Equivalent Output Circuit

Thus, the saturation voltage of the output transistors sets the limit on the [ADA4084-2](#) maximum output voltage swing. Output short-circuit current limiting is determined by the maximum signal current into the base of Q13 from the second gain stage. The output stage also exhibits voltage gain. This is accomplished by the use of common-emitter amplifiers, and, as a result, the voltage gain of the output stage (thus, the open-loop gain of the device) exhibits a dependence on the total load resistance at the output of the [ADA4084-2](#).

STARTUP CHARACTERISTICS

The ADA4084-2 is specified to operate from 3 V to 30 V (± 1.5 V to ± 15 V) under nominal power supplies. During power up as the supply voltage increases from 0 V to the nominal power supply voltage, the supply current (I_{SY}) increases as well to the point at which it stabilizes and the amplifier is ready to operate. The stabilization varies with temperature, as shown in Figure 80, below such that at -40°C it takes a higher voltage and stabilizes at a lower supply current than at hot temperatures where it takes a lower voltage but stabilizes at a higher current. In all cases, the ADA4084-2 is specified to start up and operate at a minimum of 3 V under all temperature conditions.

Figure 80. Supply Current vs. Supply Voltage

INPUT PROTECTION

As with any semiconductor device, if conditions exist where the applied input voltages to the device exceed either supply voltage, the input overvoltage I-to-V characteristic of the device must be considered. When an overvoltage occurs, the amplifier may be damaged, depending on the magnitude of the applied voltage and the magnitude of the fault current.

The D1, D2, D4, and D5 diodes conduct when the input common-mode voltage exceeds either supply pin by a diode drop. This varies with temperature and is in the range of 0.3 V to 0.8 V. As illustrated in the simplified equivalent circuit shown in Figure 78, the ADA4084-2 does not have any internal current limiting resistors; thus, fault currents can quickly rise to damaging levels.

This input current is not inherently damaging to the device, provided that it is limited to 5 mA or less. If a fault condition causes more than 5 mA to flow, an external series resistor should be added at the expense of additional thermal noise. Figure 81 illustrates a typical noninverting configuration for an overvoltage-protected amplifier where the series resistance, R_S , is chosen, such that

$$R_S = \frac{V_{IN(MAX)} - V_{SUPPLY}}{5 \text{ mA}}$$

For example, a 1 k Ω resistor protects the ADA4084-2 against input signals up to 5 V above and below the supplies. Note that the thermal noise of a 1 k Ω resistor at room temperature is 4 nV/ $\sqrt{\text{Hz}}$, which exceeds the voltage noise of the ADA4084-2. For other configurations where both inputs are used, each input should be protected against abuse with a series resistor. Again, to ensure optimum dc and ac performance, it is recommended that source impedance levels be balanced.

Figure 81. Resistance in Series with Input Limits Overvoltage Currents to Safe Values

To protect Q1-Q2 and Q3-Q4 from large differential voltages that may result in Zener breakdown of the emitter-base junction, D100 and D101 are connected between the two inputs. This precludes operation as a comparator. For a more complete description, see the MT-035 Tutorial, *Op Amp Inputs, Outputs, Single-Supply, and Rail-to-Rail Issues*; the MT-083 Tutorial, *Comparators*, the MT-084 Tutorial, *Using Op Amps As Comparators*; and the AN-849 Application Note, *Using Op Amps as Comparators*, at www.analog.com.

OUTPUT PHASE REVERSAL

Some operational amplifiers designed for single-supply operation exhibit an output voltage phase reversal when their inputs are driven beyond their useful common-mode range. Typically, for single-supply bipolar op amps, the negative supply determines the lower limit of their common-mode range. With these devices, external clamping diodes, with the anode connected to ground and the cathode to the inputs, prevent input signal excursions from exceeding the negative supply of the device (that is, GND), preventing a condition that causes the output voltage to change phase. JFET input amplifiers can also exhibit phase reversal, and, if so, a series input resistor is usually required to prevent it.

The ADA4084-2 is free from reasonable input voltage range restrictions, provided that input voltages no greater than the supply voltages are applied (see Figure 27, Figure 52, and Figure 77).

Although device output does not change phase, large currents can flow through the input protection diodes. Therefore, the technique recommended in the Input Protection section should be applied to those applications where the likelihood of input voltages exceeding the supply voltages is high.

DESIGNING LOW NOISE CIRCUITS IN SINGLE-SUPPLY APPLICATIONS

In single-supply applications, devices like the [ADA4084-2](#) extend the dynamic range of the application through the use of rail-to-rail operation. Referring to the op amp noise model circuit configuration illustrated in Figure 82, the expression for an amplifier's total equivalent input noise voltage for a source resistance level, R_S , is given by

$$e_{nT} = \sqrt{2[(e_{nR})^2 + (i_{nOA} \times R_S)^2] + (e_{nOA})^2}, \text{ units in } \frac{V}{\sqrt{\text{Hz}}}$$

where:

$R_S = 2R$, the effective, or equivalent, circuit source resistance.

$(e_{nR})^2$ is the source resistance thermal noise voltage power ($4kTR$).

k is the Boltzmann's constant, 1.38×10^{-23} J/K.

T is the ambient temperature in Kelvin of the circuit, $273.15 + T_A$ (°C).

$(i_{nOA})^2$ is the op amp equivalent input noise current spectral power (1 Hz bandwidth).

$(e_{nOA})^2$ is the op amp equivalent input noise voltage spectral power (1 Hz bandwidth).

Figure 82. Op Amp Noise Circuit Model Used to Determine Total Circuit Equivalent Input Noise Voltage and Noise Figure

As a design aid, Figure 83 shows the total equivalent input noise of the [ADA4084-2](#) and the total thermal noise of a resistor for comparison. Note that for source resistance less than 1 kΩ, the equivalent input noise voltage of the [ADA4084-2](#) is dominant.

Figure 83. [ADA4084-2](#) Equivalent Thermal Noise vs. Total Source Resistance

Because circuit SNR is the critical parameter in the final analysis, the noise behavior of a circuit is sometimes expressed in terms of its noise figure, NF. The noise figure is defined as the ratio of a circuit's output signal-to-noise to its input signal-to-noise.

Noise figure is generally used for RF and microwave circuit analysis in a 50 Ω system. This is not very useful for op amp circuits where the input and output impedances can vary greatly. For a more complete description of noise figure, see the [MT-052 Tutorial, Op Amp Noise Figure: Don't be Mislead](#), available at www.analog.com.

Signal levels in the application invariably increase to maximize circuit SNR, which is not an option in low voltage, single-supply applications.

Therefore, to achieve optimum circuit SNR in single-supply applications, it is recommended that an operational amplifier with the lowest equivalent input noise voltage be chosen, along with source resistance levels that are consistent with maintaining low total circuit noise.

COMPARATOR OPERATION

Although op amps are quite different from comparators, occasionally an unused section of a dual or a quad op amp can be used as a comparator; however, this is not recommended for any rail-to-rail output op amps. For rail-to-rail output op amps, the output stage is generally a ratioed current mirror with bipolar or MOSFET transistors. With the part operating open loop, the second stage increases the current drive to the ratioed mirror to close the loop. However, it cannot, which results in an increase in supply current. With the op amp configured as a comparator, the supply current can be significantly higher (see Figure 84). An unused section should be configured as a voltage follower with the noninverting input connected to a voltage within the input voltage range. The [ADA4084-2](#) has unique second stage and output stage designs that greatly reduce the excess supply current when the op amp is operating open loop.

NOTES

NOTES

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
