

## Ultra-Small, Quad-Channel, 12-Bit Buffered Output DAC with Internal Reference and I<sup>2</sup>C Interface

### ABSOLUTE MAXIMUM RATINGS

V <sub>DD</sub> to GND.....	-0.3V to +6V	Maximum Continuous Current into Any Pin .....	±50mA
OUT <sub>-</sub> , REF to GND....	0.3V to the lower of (V <sub>DD</sub> + 0.3V) and +6V	Operating Temperature.....	-40°C to +125°C
SCL, SDA to GND .....	-0.3V to +6V	Storage Temperature .....	-65°C to +150°C
ADDR to GND .....	-0.3V to the lower of (V <sub>DD</sub> + 0.3V) and +6V	Lead Temperature (soldering, 10s) .....	+300°C
Continuous Power Dissipation (T <sub>A</sub> = +70°C)		Soldering Temperature (reflow) .....	+260°C
TDFN (derate at 24.4mW/°C above 70°C).....	1951.2mW		

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### PACKAGE THERMAL CHARACTERISTICS (Note 1)

TDFN

Junction-to-Ambient Thermal Resistance (θ <sub>JA</sub> ) .....	41°C/W
Junction-to-Case Thermal Resistance (θ <sub>JC</sub> ).....	9°C/W

**Note 1:** Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to [www.maxim-ic.com/thermal-tutorial](http://www.maxim-ic.com/thermal-tutorial).

### ELECTRICAL CHARACTERISTICS

(V<sub>DD</sub> = 2.7V to 5.5V, V<sub>GND</sub> = 0V, C<sub>L</sub> = 200pF, R<sub>L</sub> = 2kΩ, T<sub>A</sub> = -40°C to +125°C, unless otherwise noted. Typical values are at T<sub>A</sub> = +25°C.) (Note 2)

**Note 2:** Limits are 100% production tested at T<sub>A</sub> = +25°C and/or T<sub>A</sub> = +125°C. Limits over the operating temperature range and relevant supply voltage range are guaranteed by design and characterization. Typical values are at T<sub>A</sub> = +25°C and are not guaranteed.

**Note 3:** DC Performance is tested without load.

**Note 4:** Linearity is tested with unloaded outputs to within 20mV of GND and V<sub>DD</sub>.

**Note 5:** Gain and offset tested at code 4065 and 30, respectively with V<sub>REF</sub> = V<sub>DD</sub>.

**Note 6:** Subject to zero and full-scale error limits and V<sub>REF</sub> settings.

**Note 7:** Measured with all other DAC outputs at midscale with one channel transitioning 0 to full scale.

**Note 8:** On power-up, the device initiates an internal 200μs (typ) calibration sequence. All commands issued during this time will be ignored.

**Note 9:** All channels active at V<sub>FS</sub>, unloaded. Static logic inputs with V<sub>IL</sub> = V<sub>GND</sub> and V<sub>IH</sub> = V<sub>DD</sub>.

**Note 10:** Guaranteed by design.

**Note 11:** An unconnected condition on the ADDR pin is sensed via a resistive pullup and pulldown operation; for proper operation, the ADDR pin should be tied to V<sub>DD</sub>, GND, or left unconnected with minimal capacitance.

—	EP	Exposed Pad. Connect the exposed pad to ground.

# Ultra-Small, Quad-Channel, 12-Bit Buffered Output DAC with Internal Reference and I<sup>2</sup>C Interface

## Detailed Description

The MAX5816 is a 4-channel, low-power, 12-bit buffered voltage-output DAC. The 2.7V to 5.5V wide supply voltage range and low-power consumption accommodates most low-power and low-voltage applications. The device presents a 100k $\Omega$  load to the external reference. The internal output buffers allow rail-to-rail operation. An internal voltage reference is available with software selectable options of 2.048V, 2.5V, or 4.096V. The device features a fast 400kHz I<sup>2</sup>C-compatible interface. The MAX5816 includes a serial-in/parallel-out shift register, internal CODE and DAC registers, a power-on-reset (POR) circuit to initialize the DAC outputs to code zero, and control logic.

### DAC Outputs (OUT<sub>n</sub>)

The MAX5816 includes internal buffers on all DAC outputs. The internal output buffers provide improved load regulation for the DAC outputs. The output buffers slew at 1V/ $\mu$ s (typ) and drive up to 2k $\Omega$  in parallel with 500pF. Under no-load conditions, the output buffers drive from GND to V<sub>DD</sub>, subject to offset and gain errors. With a 2k $\Omega$  load to GND, the output buffers drive from GND to within 200mV of V<sub>DD</sub>. With a 2k $\Omega$  load to V<sub>DD</sub>, the output buffers drive to within 200mV of GND and V<sub>DD</sub>.

The DAC ideal output voltage is defined by:

$$V_{OUT} = V_{REF} \times \frac{D}{2^N}$$

where D = code loaded into the DAC register, V<sub>REF</sub> = reference voltage, N = resolution.

### Internal Register Structure

The user interface is separated from the DAC logic to minimize digital feedthrough. Within the serial interface is an input shift register, the contents of which can be routed to control registers, individual, or multiple DACs as determined by the user command.

Within each DAC channel there is a CODE register followed by a DAC latch register (see the *Detailed Functional Diagram*). The contents of the CODE register hold pending DAC output settings which can later be loaded into the DAC registers. The CODE register can be updated using both CODE and CODE\_LOAD user commands. The contents of the DAC register hold the current DAC output settings. The DAC register can be updated directly from the serial interface using the CODE\_LOAD

commands or can upload the current contents of the CODE register using LOAD commands.

The contents of both CODE and DAC registers are maintained during power-down states, so that when the DACs are powered on, they return to their previously stored output settings. Any CODE or LOAD commands issued during power-down states continue to update the register contents. SW\_CLEAR and SW\_RESET commands (both clear and reset modes) reset the contents of all CODE and DAC registers to their zero-scale defaults.

### Internal Reference

The MAX5816 includes an internal precision voltage reference that is software selectable to be 2.048V, 2.500V, or 4.096V. When an internal reference is selected, that voltage is available on the REF pin for other external circuitry (see [Figure 9](#)) and can drive a 25k $\Omega$  load.

### External Reference

The external reference input has a typical input impedance of 100k $\Omega$  and accepts an input voltage from +1.24V to V<sub>DD</sub>. Connect an external voltage supply between REF and GND to apply an external reference. The MAX5816 powers up and resets to external reference mode. Visit [www.maxim-ic.com/products/references](http://www.maxim-ic.com/products/references) for a list of available external voltage-reference devices.

### I<sup>2</sup>C Serial Interface

The MAX5816 features an I<sup>2</sup>C-/SMBus™-compatible, 2-wire serial interface consisting of a serial data line (SDA) and a serial clock line (SCL). SDA and SCL enable communication between the MAX5816 and the master at clock rates up to 400kHz. [Figure 1](#) shows the 2-wire interface timing diagram. The master generates SCL and initiates data transfer on the bus. The master device writes data to the MAX5816 by transmitting the proper slave address followed by the command byte and then the data word. Each transmit sequence is framed by a START (S) or Repeated START (Sr) condition and a STOP (P) condition. Each word transmitted to the MAX5816 is 8 bits long and is followed by an acknowledge clock pulse. A master reading data from the MAX5816 must transmit the proper slave address followed by a series of nine SCL pulses for each byte of data requested. The MAX5816 transmits data on SDA in sync with the master-generated SCL pulses. The master acknowledges receipt of each byte of data. Each read sequence is framed by a START or Repeated START condition, a not acknowledge, and a STOP condition. SDA operates as both an input and

## Ultra-Small, Quad-Channel, 12-Bit Buffered Output DAC with Internal Reference and I<sup>2</sup>C Interface

an open-drain output. A pullup resistor, typically 4.7kΩ is required on SDA. SCL operates only as an input. A pullup resistor, typically 4.7kΩ, is required on SCL if there are multiple masters on the bus, or if the single master has an open-drain SCL output.

Series resistors in line with SDA and SCL are optional. Series resistors protect the digital inputs of the MAX5816 from high voltage spikes on the bus lines and minimize crosstalk and undershoot of the bus signals. The MAX5816 can accommodate bus voltages higher than V<sub>DD</sub> up to a limit of 5.5V; bus voltages lower than V<sub>DD</sub> are not recommended and may result in significantly increased interface currents.

### I<sup>2</sup>C START and STOP Conditions

SDA and SCL idle high when the bus is not in use. A master initiates communication by issuing a START condition. A START condition is a high-to-low transition on SDA with SCL high. A STOP condition is a low-to-high transition on SDA while SCL is high (Figure 2). A START condition from the master signals the beginning of a transmission to the MAX5816. The master terminates transmission and frees the bus, by issuing a STOP condition. The bus remains active if a Repeated START condition is generated instead of a STOP condition.

### I<sup>2</sup>C Early STOP and Repeated START Conditions

The MAX5816 recognizes a STOP condition at any point during data transmission except if the STOP condition occurs in the same high pulse as a START condition. Transmissions ending in an early STOP condition will not impact the internal device settings. If the STOP occurs during a readback byte, the transmission is terminated and a later read mode request will begin transfer of the requested register data from the beginning (this applies to combined format I<sup>2</sup>C read mode transfers only, interface verification mode transfers will be corrupted). See Figure 2.

### I<sup>2</sup>C Slave Address

The slave address is defined as the seven most significant bits (MSBs) followed by the R/W bit. See Figure 4. The five most significant bits are 00011 with the 2 LSBs determined by ADDR as shown in Table 1. Setting the R/W bit to 1 configures the MAX5816 for read mode.

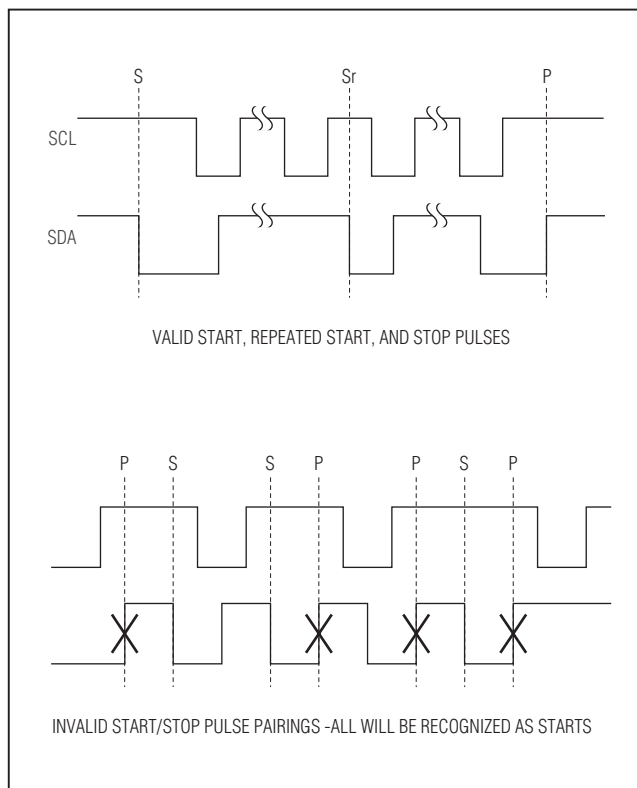

Figure 2. I<sup>2</sup>C START, Repeated START, and STOP Conditions

Setting the R/W bit to 0 configures the MAX5816 for write mode. The slave address is the first byte of information sent to the MAX5816 after the START condition.

The MAX5816 has the ability to detect an unconnected state on the ADDR input for additional address flexibility; if leaving the ADDR input unconnected, be certain to minimize all loading on the pin (i.e. provide a landing for the pin, but do not allow any board traces).

**Table 1. I<sup>2</sup>C Slave Address LSBs for TDFN Package**

ADDR	A1	A0
V <sub>DD</sub>	0	0
N.C.	1	0
GND	1	1

## Ultra-Small, Quad-Channel, 12-Bit Buffered Output DAC with Internal Reference and I<sup>2</sup>C Interface

### I<sup>2</sup>C Broadcast Address

A broadcast address is provided for the purpose of updating or configuring all MAX5816 devices on a given I<sup>2</sup>C bus. All MAX5816 devices acknowledge and respond to the broadcast device address 00010000. The devices will respond to the broadcast address, regardless of the state of the address pins. The broadcast mode is intended for use in write mode only (as indicated by  $R/\overline{W} = 0$  in the address given).

### I<sup>2</sup>C Acknowledge

In write mode, the acknowledge bit (ACK) is a clocked 9th bit that the MAX5816 uses to handshake receipt of each byte of data as shown in Figure 3. The MAX5816 pulls down SDA during the entire master-generated 9th clock pulse if the previous byte is successfully received. Monitoring ACK allows for detection of unsuccessful data transfers. An unsuccessful data transfer occurs if a receiving device is busy or if a system fault has occurred. In the event of an unsuccessful data transfer, the bus master will retry communication.

In read mode, the master pulls down SDA during the 9th clock cycle to acknowledge receipt of data when the MAX5816 is in read mode. An acknowledge is sent by the master after each read byte to allow data transfer to continue. A not-acknowledge is sent when the master reads the final byte of data from the MAX5816, followed by a STOP condition.

### I<sup>2</sup>C Command Byte and Data Bytes

A command byte follows the slave address. A command byte is typically followed by two data bytes unless it is the last byte in the transmission. If data bytes follow the command byte, the command byte indicates the address of the register that is to receive the following two data bytes. The data bytes are stored in a temporary register and then transferred to the appropriate register during

the ACK periods between bytes. This avoids any glitching or digital feedthrough to the DACs while the interface is active.

### I<sup>2</sup>C Write Operations (Standard Protocol)

A master device communicates with the MAX5816 by transmitting the proper slave address followed by command and data words. Each transmit sequence is framed by a START or Repeated START condition and a STOP condition as described above. Each word is 8 bits long and is always followed by an acknowledge clock (ACK) pulse as shown in the Figure 4 and Figure 5. The first byte contains the address of the MAX5816 with  $R/\overline{W} = 0$  to indicate a write. The second byte contains the command (or register) to be written and the third and fourth bytes contain the data to be written. By repeating the command plus data byte pairs (Byte #2 through Byte #4 in Figure 4 and Figure 5), the user can execute multiple command writes using a single I<sup>2</sup>C write sequence. There is no limit as to how many commands the user can execute with a single write sequence. The MAX5816 supports this capability for all user-accessible write mode commands.

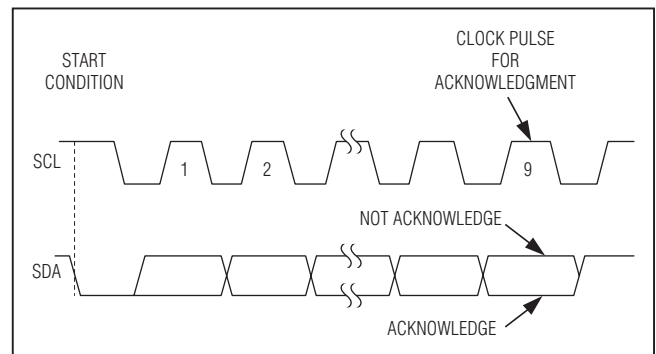

Figure 3. I<sup>2</sup>C Acknowledge

Figure 4. I<sup>2</sup>C Single Register Write Sequence

## Ultra-Small, Quad-Channel, 12-Bit Buffered Output DAC with Internal Reference and I<sup>2</sup>C Interface

### I<sup>2</sup>C Write Operation (Multibyte Operation)

The MAX5816 supports a multibyte transfer protocol for some commands. In multibyte mode, once a command is issued (with multibyte bit = 1), that command is continuously executed based on two byte data blocks for the duration I<sup>2</sup>C operation. Essentially, bytes 1 to 4 are processed normally, but for every two bytes of data provided after byte 4, the originally requested command is executed again with the latest byte pair provided as input data. Multibyte protocol is enforced until a STOP condition (or repeated START) is encountered, this provides a higher speed transfer mode that is useful in servo DAC applications.

### Combined Format I<sup>2</sup>C Readback Operations

Each readback sequence is framed by a START or Repeated START condition and a STOP condition. Each word is 8 bits long and is followed by an acknowledge clock pulse as shown in Figure 6. The first byte contains the address of the MAX5816 with R/W = 0 to indicate a write. The second byte contains the register that is to be read back. There is a Repeated START condition, followed by the device address with R/W = 1 to indicate a read and an acknowledge clock. The master has control of the SCL line but the MAX5816 takes over the SDA line. The final two bytes in the frame contain the register data readback followed by a STOP condition. If additional bytes beyond those required to readback the requested data are provided, the MAX5816 will continue to read-back ones.

Readback of individual CODE registers is supported for all the user CODE commands. For these commands, which support a DAC address, the requested channel CODE register content will be returned; if all DACs are selected, CODE A content will be returned.

Readback of individual DAC registers is supported for all user LOAD and CODE\_LOAD commands. For these commands, which support a DAC address, the requested DAC register content will be returned. If all DACs are selected, DACA content will be returned.

Modified readback of the POWER register is supported for the POWER command. The power status of each DAC is reported in locations B[3:0], with a 1 indicating the DAC is powered down and a zero indicating the DAC is operational (see Table 2).

Readback of all other registers is not directly supported. All requests to read unsupported registers reads back the device's reference status device ID and revision information in the format is shown in Table 2.

### Interface Verification I<sup>2</sup>C Readback Operations

While the MAX5816 supports standard I<sup>2</sup>C readback of selected registers, it is also capable of functioning in an interface verification mode. This mode is accessed any time a readback operation follows an executed write mode command. In this mode, the last executed three-byte command is read back in its entirety. This behavior allows verification of the interface.

Sample command sequences are shown in Figure 7. The first command transfer is given in write mode with R/W = 0 and must be run to completion to qualify for interface verification readback. There is now a STOP/START pair or Repeated START condition required, followed by the readback transfer with R/W = 1 to indicate a read and an acknowledge clock from the MAX5816. The master still has control of the SCL line but the MAX5816 takes over the SDA line. The final three bytes in the frame contain the command and register data written in the first transfer presented for readback, followed by a STOP condition. If additional bytes beyond those required to read back the requested data are provided, the MAX5816 will continue to read back ones.

Figure 8. Interface Verification I<sup>2</sup>C Register Read Sequences

## Ultra-Small, Quad-Channel, 12-Bit Buffered Output DAC with Internal Reference and I<sup>2</sup>C Interface

It is not necessary for the write and read mode transfers to occur immediately in sequence. I<sup>2</sup>C transfers involving other devices do not impact the MAX5816 readback mode. Toggling between readback modes is based on the length of the preceding write mode transfer. Combined format I<sup>2</sup>C readback operation is resumed if a write command greater than two bytes but less than four bytes is supplied. For commands written using multiple register write sequences, only the last command executed is read back. For each command written, the readback sequence can only be completed one time; partial and/or multiple attempts to readback executed in succession will not yield usable data.

### I<sup>2</sup>C Compatibility

The MAX5816 is fully compatible with existing I<sup>2</sup>C systems. SCL and SDA are high-impedance inputs; SDA has an open drain which pulls the data line low to transmit data or ACK pulses. [Figure 9](#) shows a typical I<sup>2</sup>C application.

### I<sup>2</sup>C User-Command Register Map

This section lists the user accessible commands and registers for the MAX5816.

[Table 3](#) provides detailed information about the Command Registers.

0	0	1	DAC B
0	1	0	DAC C
0	1	1	DAC D
1	X	X	ALL DACs

### **CODEn Command**

The CODEn command updates the CODE register contents for the selected DAC(s). Changes to the CODE register content based on this command will not affect DAC outputs directly unless the latch has been configured to be transparent (see the CONFIG command). In order to update CODE register content of all DACs, use the CODEn command with DAC selection = 1XX = all DACs. The CODEn command supports the multibyte protocol. See [Table 3](#) and [Table 5](#).

**Table 5. CODEn (000) Command Format**

B23	B22	B21	B20	B19	B18	B17	B16	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0

		Data Default Value →							0	0	0	0	0	0	0	0	0	0	0	0	0	X	X
Command Byte								Data High Byte								Data Low Byte							

### **LOADn Command**

The LOADn command (B[23:20] = 0001) updates the DAC register content for the selected DAC(s) by uploading the current contents of the CODE register. The LOADn command can be used with DAC SELECTION = 1XX = ALL DACs to issue a software load for all DACs, which does not alter the existing content of any CODE register (unlike CODEn\_LOAD\_ALL command). See [Table 3](#) and [Table 6](#). The LOADn command supports the multibyte protocol.

**Table 6. LOADn (001) Command Format**

B23	B22	B21	B20	B19	B18	B17	B16	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0

		Command Byte								Data High Byte								Data Low Byte					

## Ultra-Small, Quad-Channel, 12-Bit Buffered Output DAC with Internal Reference and I<sup>2</sup>C Interface

### **CODEn\_LOAD\_ALL Command**

The CODEn\_LOAD\_ALL command updates the CODE register contents for the selected DAC(s) as well as the DAC register content of all DACs. Channels for which the CODE register content has not been modified since the last load to DAC register will not be updated to reduce digital crosstalk. The CODEn\_LOAD\_ALL command by definition will modify at least one CODE register. To avoid this, use the LOADn command with DAC SELECTION = ALL DACs. The CODEn\_LOAD\_ALL command supports the multibyte protocol. See [Table 3](#) and [Table 7](#).

**Table 7. CODEn\_LOAD\_ALL (010) Command Format**

B23	B22	B21	B20	B19	B18	B17	B16	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0		
0	M	0	1	0	A2	A1	A0	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	X	X	X	X

Command Byte								Data High Byte							Data Low Byte										

### **CODEn\_LOADn Command**

The CODEn\_LOADn command updates the CODE register contents for the selected DAC(s) as well as the DAC register content of the selected DAC(s). Channels for which the CODE register content have not been modified since the last load to DAC register will not be updated to reduce digital crosstalk. See [Table 3](#) and [Table 8](#).

**Table 8. CODEn\_LOADn (011) Command Format**

B23	B22	B21	B20	B19	B18	B17	B16	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0

Command Byte								Data High Byte							Data Low Byte										

## Ultra-Small, Quad-Channel, 12-Bit Buffered Output DAC with Internal Reference and I<sup>2</sup>C Interface

### POWER Command

The MAX5816 features a software-controlled power-mode (POWER) command. The POWER command updates the power-mode settings of the selected DACs while the power settings of the remaining of the DACs remain unchanged. The new power setting is determined by bits B[5:4] while the affected DAC(s) are selected by bits B[3:0]. If all DACs are powered down, the device enters a STANDBY mode.

In power-down, the output is disconnected from the buffer and is grounded when one of the two selectable

internal resistors or set to high impedance. See [Table 9](#) for the selectable internal resistor values in power-down mode. In STANDBY mode, the DAC register retains its value so that the output is restored when the device powers up. The serial interface remains active in power-down mode.

In powered down mode, the internal reference can be powered down or it can be set to remain powered-on for external use in STANDBY mode, parts using external reference do not load the REF. See [Table 9](#).

**Table 9. POWER (100) Command Format**

B23	B22	B21	B20	B19	B18	B17	B16	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0

Command Byte								Data High Byte								Data Low Byte											

### SW\_RESET and SW\_CLEAR Command

The SW\_RESET and SW\_CLEAR commands provide a means of issuing a software reset or software clear operation. Set B0 = 0 to issue a software clear operation

to return all CODE and DAC registers to the zero-scale value. Set B0 = 1 to reset all CODE, DAC, and configuration registers to their default values. See [Table 10](#).

**Table 10. SW\_RESET (101) Command Format**

B23	B22	B21	B20	B19	B18	B17	B16	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0			
0	X	1	0	1	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	R0

Command Byte								Data High Byte								Data Low Byte										

## Ultra-Small, Quad-Channel, 12-Bit Buffered Output DAC with Internal Reference and I<sup>2</sup>C Interface

### CONFIG Command

The CONFIG command allows independent configurations of the DAC. In normal mode (0), the DAC latch is operational and responds to LOAD commands. In transparent mode (1), the DAC latch is transparent and CODE register contents are supplied directly to the DAC outputs. See [Table 11](#).

**Table 11. CONFIG Command Format**

B23	B22	B21	B20	B19	B18	B17	B16	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0		
0	X	1	1	0	X	X	X	X	X	X	X	D	C	B	A	X	X	X	X	D	C	B	A		
Reserved	Don't Care	CONFIG Command				Don't Care			Don't Care							Don't Care				DAC Latch Mode 0 = Operational 1 = Transparent					
Data Default Value →								X	X	X	X	X	X	X	X	X	X	X	X	X	X	0	0	0	0
Command Byte								Data High Byte								Data Low Byte									

### REF Command

The REF command updates the global reference setting used for all DAC channels. Set B[1:0] = 00 to use an external reference for the DACs or set B[1:0] to 01, 10, or 11 to select either the 2.500V, 2.048V, or 4.096V internal reference, respectively.

If RF2 (B2 = 0) is set to zero (default) in the REF command, the reference will be powered down any time all DAC channels are powered down (in STANDBY mode). If RF2 is set to one, the reference will remain powered even if all DAC channels are powered down, allowing continued operation of external circuitry. In this mode the 1 $\mu$ A shutdown state is not available. See [Table 12](#).

**Table 12. REF Command Format**

B23	B22	B21	B20	B19	B18	B17	B16	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0

## Applications Information

---

### Power-On Reset (POR)

When power is applied to V<sub>DD</sub>, the DAC output is set to zero scale. To optimize DAC linearity, wait until the supplies have settled and the internal setup and calibration sequence completes (200μs, typ). Note all commands issued during the period will be ignored.

### Power Supplies and Bypassing Considerations

Bypass V<sub>DD</sub> with high-quality ceramic capacitors to a low-impedance ground as close as possible to the device. Minimize lead lengths to reduce lead inductance. Connect the GND to the analog ground plane.

### Layout Considerations

Digital and AC transient signals on GND can create noise at the output. Connect GND to form the star ground for the DAC system. Refer remote DAC loads to this system ground for the best possible performance. Use proper grounding techniques, such as a multilayer board with a low-inductance ground plane, or star connect all ground return paths back to the MAX5816 GND. Carefully layout the traces between channels to reduce AC cross-coupling. Do not use wire-wrapped boards and sockets. Use shielding to minimize noise immunity. Do not run analog and digital signals parallel to one another, especially clock signals. Avoid routing digital lines underneath the MAX5816 package.

## Definitions

---

### Integral Nonlinearity (INL)

INL is the deviation of the measured transfer function from a straight line drawn between two codes once offset and gain errors have been nullified.

### Differential Nonlinearity (DNL)

DNL is the difference between an actual step height and the ideal value of 1 LSB. If the magnitude of the  $DNL \leq 1$  LSB, the DAC guarantees no missing codes and is monotonic. If the magnitude of the  $DNL \geq 1$  LSB, the DAC output may still be monotonic.

### Offset Error

Offset error indicates how well the actual transfer function matches the ideal transfer function at a single point. Typically, the point at which the offset error is specified is at or near the zero-scale point of the transfer function.

### Gain Error

Gain error is the difference between the ideal and the actual full-scale output voltage on the transfer curve, after nullifying the offset error. This error alters the slope of the transfer function and corresponds to the same percentage error in each step.

### Settling Time

The settling time is the amount of time required from the start of a transition, until the DAC output settles to the new output value within the converter's specified accuracy.

### Digital Feedthrough

Digital feedthrough is the amount of noise that appears on the DAC output when the DAC digital control lines are toggled.

### Digital-to-Analog Glitch Impulse

A major carry transition occurs at the midscale point where the MSB changes from low to high and all other bits change from high to low, or where the MSB changes from high to low and all other bits change from low to high. The duration of the magnitude of the switching glitch during a major carry transition is referred to as the digital-to-analog glitch impulse.

The digital-to-analog power-up glitch is the duration of the magnitude of the switching glitch that occurs as the device exits power-down mode.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
