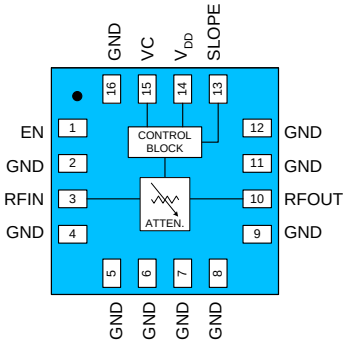
RFSA2113

Wide Bandwidth Voltage Controlled Attenuator

Product Description

The RFSA2113 is a fully monolithic analog voltage controlled attenuator (VCA) featuring exceptional linearity over a typical temperature compensated 30 dB gain control range. The RFSA2113 features a wide bandwidth up to 18 GHz. This VCA incorporates a revolutionary new circuit architecture to solve a long standing industry problem: high IP3, high attenuation range, low DC current, broad bandwidth and temperature compensated linear in dB control voltage characteristic.

The RFSA2113 attenuation level is set by a single positive control voltage with on chip DC conditioning circuitry. The slope polarity of the control voltage versus gain is selectable. The RFSA2113 draws a very low 2 mA current. This attenuator is matched to 50 Ω over its rated control range and frequency with no external matching components required.



Functional Block Diagram

Typical VCA's in this performance range are based on compound semiconductor GaAs FET MMICs that require 1 to 2 negative voltages for control. This game changing product incorporates the complete solution in a small 3.2 mm x 3.2 mm multi-chip laminate module that reduces the footprint in area and simplifies the control aspects over conventional compound semiconductor attenuator approaches.
