

CMPA801B025

25 W, 8.5 - 11.0 GHz, GaN MMIC, Power Amplifier

Cree's CMPA801B025 is a gallium nitride (GaN) High Electron Mobility Transistor (HEMT) based monolithic microwave integrated circuit (MMIC). GaN has superior properties compared to silicon or gallium arsenide, including higher breakdown voltage, higher saturated electron drift velocity and higher thermal conductivity. GaN HEMTs also offer greater power density and wider bandwidths compared to Si and GaAs transistors. This MMIC is available in a 10-lead metal/ceramic flanged package (CMPA801B025F) or small form-factor pill package (CMPA801B025P) for optimal electrical and thermal performance.

To configure the CMPA801B025F test fixture to enable independent V_{G1} / V_{G2} control of the device, a cut must be made to the microstrip line just above the R1 resistor as shown. Pin 9 will then supply V_{G1} and Pin 8 will supply V_{G2} .
