Chapter 6 Pin Descriptions

This section provides a detailed description of each signal. The signals are arranged in functional groups according to their associated interface. The pin descriptions are applied when using the internal default firmware and can be referenced in Chapter 7, "Pin Configurations," on page 26. Please reference Chapter 2, "Acronyms," on page 7 for a list of the acronyms used.

The “n” symbol in the signal name indicates that the active, or asserted, state occurs when the signal is at a low voltage level. When “n” is not present in the signal name, the signal is asserted at the high voltage level.

The terms assertion and negation are used exclusively. This is done to avoid confusion when working with a mixture of “active low” and “active high” signals. The term assert, or assertion, indicates that a signal is active, independent of whether that level is represented by a high or low voltage. The term negate, or negation, indicates that a signal is inactive.

Chapter 7 Pin Configurations

7.1 Card Reader

The SMSC USB224x is fully compliant with the following flash media card reader specifications:

- Secure Digital 2.0
  - HS-SD and SDHC
  - TransFlash™ and reduced form factor media
- MultiMediaCard 4.2
  - 1/4/8 bit MMC
- Memory Stick 1.43
- Memory Stick Pro Format 1.02
- Memory Stick Pro-HG Duo Format 1.01
  - Memory Stick, MS Duo, HS-MS, MS Pro-HG, MS Pro

7.2 System Configurations

7.2.1 EEPROM

The USB224x can be configured via a 2-wire (I^2C) EEPROM (512x8) flash device containing the options for the USB224x. If an external configuration device does not exist the internal default values will be used. If one of the external devices is used for configuration, the OEM can update the values through the USB interface. The device will then “attach” to the upstream USB host.

The USBDM tool set is available in the USB224x/USB225x Card Reader software release package. To download the software package from SMSC's website, please visit:

BIT	NAME	DESCRIPTION
7:0	USB_BM_ATT	Self- or Bus-Power: Selects between self- and bus-powered operation. The hub is either self-powered (draws less than 2 mA of upstream bus power) or bus-powered (limited to a 100 mA maximum of upstream power prior to being configured by the host controller). When configured as a bus-powered device, the SMSC device consumes less than 100 mA of current prior to being configured. After configuration, the bus-powered SMSC device (along with all associated device circuitry, any embedded devices if part of a compound device, and 100 mA per externally available downstream port) must consume no more than 500 mA of upstream VBUS current. The current consumption is system dependent, and the OEM must ensure that the USB 2.0 Specification is not violated. When configured as a self-powered device, <1 mA of upstream VBUS current is consumed and all ports are available, with each port being capable of sourcing 500 mA of current. **80 = Bus-powered operation (default)** C0 = Self-powered operation A0 = Bus-powered operation with remote wake-up E0 = Self-powered operation with remote wake-up

7.2.3.18 9Bh: USB MaxPower (1 byte)

7.2.4 A0h-A7h: Device Power Configuration

The USB224x has one internal FET which can be utilized for card power. This section describes the default internal configuration. The settings are stored in NVSTORE and provide the following features:

1. A card can be powered by an external FET or by an internal FET.

2. The power limit can be set to 100 mA or 200 mA (Default) for the internal FET.

Each media uses two bytes to store its device power configuration. Bit 3 selects between internal or external card power FET options. For internal FET card power control, bits 0 through 2 are used to set the power limit. The “Device Power Configuration” bits are ignored unless the “Enable Device Power Configuration” bit is set. See Section 7.2.3.19, "9Ch-9Fh: Attribute Byte Descriptions," on page 32.

7.2.4.5 A8h: LED Blink Interval

BYTE	NAME	DESCRIPTION
0	LED_BLK_INT	The blink rate is programmable in 50 ms intervals. The high bit (7) indicates an idle state: ‘0’ - Off ‘1’ - On The remaining bits (6:0) are used to determine the blink interval up to a max of 128 x 50 ms.

7.2.4.6 A9h: LED Blink Duration

BYTE	NAME	DESCRIPTION
1	LED_BLK_DUR	LED Blink After Access. This byte is used to designate the number of seconds that the GPIO1 LED will continue to blink after a drive access. Setting this byte to "05" will cause the GPIO 1 LED to blink for 5 seconds after a drive access.

7.2.5 Device ID Strings

These bytes are used to specify the LUN descriptor returned by the device. These bytes are used in combination with the device to LUN mapping bytes in applications where the OEM wishes to reorder and rename the LUNs. If multiple devices are mapped to the same LUN (a COMBO LUN), then the CLUN#_ID_STR will be used to name the COMBO LUN instead of the individual device strings. When applicable, the "SM" value will be overridden with xD once an xD-Picture Card has been identified.

7.2.5.1 AAh-B0h: Device 0 Identifier String

BYTE	NAME	DESCRIPTION
6:0	DEV0_ID_STR	Not applicable.

7.2.5.2 B1h-B7h: Device 1 Identifier String

BYTE	NAME	DESCRIPTION
6:0	DEV1_ID_STR	This ID string is associated with the Memory Stick device.

7.2.5.3 B8h-BEh: Device 2 Identifier String

BYTE	NAME	DESCRIPTION
6:0	DEV2_ID_STR	This ID string is associated with the xD-Picture Card device.

7.2.5.4 BFh-C5h: Device 3 Identifier String

BYTE	NAME	DESCRIPTION
6:0	DEV3_ID_STR	This ID string is associated with the Secure Digital / MultiMediaCard device.

7.2.5.5 C6h-CDh: Inquiry Vendor String

BYTE	NAME	DESCRIPTION
7:0	INQ_VEN_STR	If bit 4 of the 1st attribute byte is set, the device will use these strings in response to a USB inquiry command, instead of the USB descriptor manufacturer and product ID strings.

7.2.5.6 CEh-D2h: Inquiry Product String

BYTE	NAME	DESCRIPTION
4:0	INQ_PRD_STR	If bit 4 of the 1st attribute byte is set, the device will use these strings in response to a USB inquiry command, instead of the USB descriptor manufacturer and product ID strings.

7.2.5.7 D3h: Dynamic Number of LUNs

BIT	NAME	DESCRIPTION
7:0	DYN_NUM_LUN	These bytes are used to specify the number of LUNs the device exposes to the host. These bytes are also used for icon sharing by assigning more than one LUN to a single icon. This is used in applications where the device utilizes a combo socket and the OEM wishes to have only a single icon displayed for one or more interfaces. If this field is set to "FF", the program assumes that you are using the default value and icons will be configured per the default configuration.

7.2.5.8 D4h-D7h: Device to LUN Mapping

BYTE	NAME	DESCRIPTION
3:0	DEV_LUN_MAP	These registers map a device controller (SD/MMC, SM, and MS) to a Logical Unit Number (LUN). The device reports the mapped LUNs to the USB host in the USB descriptor during enumeration. The icon installer associates custom icons with the LUNs specified in these fields. Setting a register to "FF" indicates that the device is not mapped. Setting all of the DEV_LUN_MAP registers for all devices to "FF" forces the use of the default mapping configuration. Not all configurations are valid. Valid configurations depend on the hardware, packaging, and OEM board layout. The number of unique LUNs mapped must match the value in the Section 7.2.5.7, "D3h: Dynamic Number of LUNs," on page 35.

7.2.5.9 D8h-FBh: Not Applicable

BYTE	NAME	DESCRIPTION
35:0	Not Applicable	Not Applicable.

7.2.5.10 FCh-FFh: Non-Volatile Storage Signature

BYTE	NAME	DESCRIPTION
3:0	NVSTORE_SIG	This signature is used to verify the validity of the data in the first 256 bytes of the configuration area. The signature must be set to 'ATA2' for USB224x.

7.3 Default Configuration Option

The SMSC device can be configured via its internal default configuration. Please see Section 7.2.2, "EEPROM Data Descriptor" for specific details on how to enable default configuration. Please refer to Table 7.1 for the internal default values that are loaded when this option is selected.

7.3.1 External Hardware RESET_N

A valid hardware reset is defined as assertion of RESET_N for a minimum of 1 µs after all power supplies are within operating range. While reset is asserted, the device (and its associated external circuitry) consumes less than 500 µA of current from the upstream USB power source.

Assertion of RESET_N (external pin) causes the following:

1. The PHY is disabled and the differential pair will be in a high-impedance state.
2. All transactions immediately terminate; no states are saved.
3. All internal registers return to the default state.
4. The external crystal oscillator is halted.
5. The PLL is halted.
6. The processor is reset.
7. All media interfaces are reset.

7.3.1.1 RESET_N for EEPROM Configuration

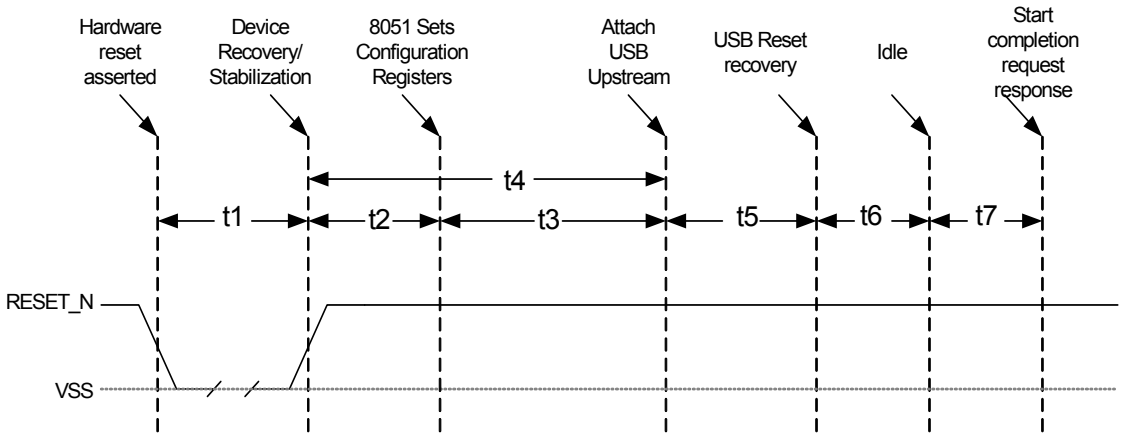

Figure 7.1 RESET_N Timing for EEPROM Mode

Table 7.2 RESET_N Timing for EEPROM Mode

NAME	DESCRIPTION	MIN	TYP	MAX	UNITS
t1	RESET_N asserted	1			µsec
t2	Device recovery/stabilization			500	µsec

t4	USB attach			100	msec
t5	Host acknowledges attach and signals USB reset	100			msec
t6	USB idle		Undefined		msec
t7	Ready to handle requests (with or without data)			5	msec

Note: All power supplies must have reached the operating levels mandated in Chapter 9, DC Parameters, prior to (or coincident with) the assertion of RESET_N.

7.3.2 USB Bus Reset

In response to the upstream port signaling a reset to the device, the device does the following:

1. Sets default address to ‘0’.
2. Sets configuration to: Unconfigured.
3. All transactions are stopped.
4. Processor reinitializes and restarts.
5. All media interfaces are disabled.

Chapter 9 DC Parameters

9.1 Maximum Guaranteed Ratings

PARAMETER	SYMBOL	MIN	MAX	UNITS	COMMENTS
Storage Temperature	T_A	-55	150	°C	
Lead Temperature				°C	Please refer to JEDEC specification J-STD-020D.
3.3 V supply voltage	V_{DD33}	-0.5	4.0	V	
Voltage on USB+ and USB- pins		-0.5	(3.3 V supply voltage + 2) ≤ 6	V	
Voltage on GPIO10		-0.5	V_{DD33} + 0.3	V	When internal power FET operation of this pin is enabled, this pin may be simultaneously shorted to ground or any voltage up to 3.63 V indefinitely, without damage to the device as long as V_{DD33} and V_{DDA33} are less than 3.63 V and T_A is less than 70°C.
Voltage on any signal pin		-0.5	V_{DD33} + 0.3	V	
Voltage on XTAL1		-0.5	3.6	V	
Voltage on XTAL2		-0.5	V_{DD18} + 0.3	V	

Note 9.1 Stresses above the specified parameters may cause permanent damage to the device. This is a stress rating only and functional operation of the device at any condition above those indicated in the operation sections of this specification is not implied.

Note 9.2 When powering this device from laboratory or system power supplies, it is important that the absolute maximum ratings not be exceeded or device failure can result. Some power supplies exhibit voltage spikes on their outputs when the AC power is switched on or off. In addition, voltage transients on the AC power line may appear on the DC output. When this possibility exists, it is suggested that a clamp circuit be used.

Industrial Part	T_A	-40	85	°C	Ambient temperature in still air.
3.3 V supply voltage	V_{DD33}	3.0	3.6	V	(Note 9.3)
3.3 V supply rise time	t_{RT}	0	400	µs	
Voltage on USB+ and USB- pins		-0.3	5.5	V	If any 3.3 V supply voltage drops below 3.0 V, then the MAX becomes: (3.3 V supply voltage) + 0.5 ≤ 5.5
Voltage on any signal pin		-0.3	V_{DD33}	V	
Voltage on XTAL1		-0.3	V_{DD33}	V	
Voltage on XTAL2		-0.3	V_{DD18}	V	

Note 9.3 A 3.3 V regulator with an output tolerance of 1% must be used if the output of the internal power FETs must support a 5% tolerance.

Note 9.6 RBIAS is a 3.3 V tolerant analog pin.

Note 9.7 Output current range is controlled by program software, software disables FET during short circuit condition.

Note 9.8 The assignment of each Integrated Card Power FET to a designated Card Connector is controlled by both firmware and the specific board implementation. Firmware will default to the settings listed in Table 11.1, “USB2240/40i and USB2241/41i GPIO Usage,” on page 49.

Note 9.9 The 3.3 V supply should be at least at 75% of its operating condition before the 1.8 V supply is allowed to ramp up.

Chapter 10 AC Specifications

10.1 Oscillator/Crystal

Parallel Resonant, Fundamental Mode, 24 MHz ± 350 ppm.

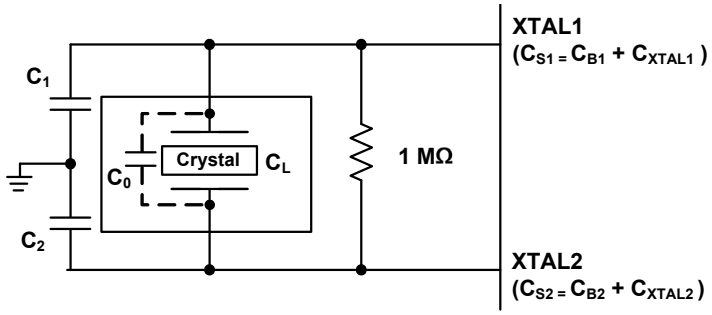

Figure 10.1 Typical Crystal Circuit

Table 10.1 Crystal Circuit Legend

SYMBOL	DESCRIPTION	IN ACCORDANCE WITH
C_0	Crystal shunt capacitance	Crystal manufacturer's specification (See Note 10.1)
C_L	Crystal load capacitance	
C_B	Total board or trace capacitance	OEM board design
C_S	Stray capacitance	SMSC IC and OEM board design
C_{XTAL}	XTAL pin input capacitance	SMSC IC
C_1	Load capacitors installed on OEM board	Calculated values based on Figure 10.2, "Capacitance Formulas" (See Note 10.2)
C_2		

$$C_1 = 2 \times (C_L - C_0) - C_{S1}$$

$$C_2 = 2 \times (C_L - C_0) - C_{S2}$$

Figure 10.2 Capacitance Formulas

Note 10.1 C_0 is usually included (subtracted by the crystal manufacturer) in the specification for C_L and should be set to '0' for use in the calculation of the capacitance formulas in Figure 10.2, "Capacitance Formulas". However, the OEM PCB itself may present a parasitic capacitance between XTAL1 and XTAL2. For an accurate calculation of C_1 and C_2, take the parasitic capacitance between traces XTAL1 and XTAL2 into account.

Note 10.2 Each of these capacitance values is typically approximately 18 pF.

10.2 Ceramic Resonator

24 MHz ± 350 ppm

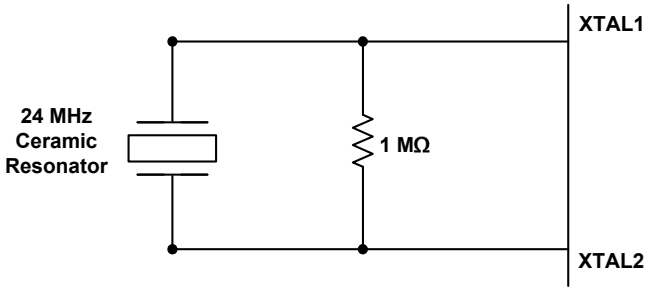

Figure 10.3 Ceramic Resonator Usage with SMSC IC

10.3 External Clock

50% Duty cycle ± 10%, 24 MHz ± 350 ppm, Jitter < 100 ps rms.

The external clock is recommended to conform to the signaling level designated in the JESD76-2 specification on 1.8 V CMOS Logic. XTAL2 should be treated as a no connect or drive only a CMOS-like buffer.
