

MAX96708

14-Bit GMSL Deserializer with Coax or STP Cable Input

General Description

The MAX96708 is a compact deserializer especially suited for automotive camera applications. Features include adaptive equalization and an output crosspoint switch. An embedded control channel operates at 9.6kbps to 1Mbps in UART, I²C, and mixed UART/I²C modes, allowing programming of serializer, deserializer (SerDes), and camera registers, independent of video timing.

The deserializer can track data from a spread-spectrum serial input. The serial input meets ISO 10605 and IEC 61000-4-2 ESD standards. The core supply range is 1.7V to 1.9V and the I/O supply range is 1.7V to 3.6V. The device is available in a 32-pin (5mm x 5mm) TQFN package with 0.5mm lead pitch and operates over -40°C to +115°C temperature range.

Applications

- Automotive Camera Applications

Simplified Block Diagram

[Ordering Information](#) appears at end of data sheet.

Benefits and Features

- Ideal for Safety Camera Applications
 - Works with Low-Cost 50Ω Coax (100Ω STP) Cable
 - Error Detection of Video/Control Data
 - High-Immunity Mode for Robust Control-Channel EMC Tolerance
 - Best-in-Class Supply Current: 185mA (max)
 - Adaptive Equalization for 15m Cable at Full Speed
 - 32-Pin (5mm x 5mm) TQFN Package
 - Horizontal- and Vertical-Sync Encoding and Tracking
- High-Speed Deserialization for Megapixel Cameras
 - Up to 1.74Gbps Serial-Bit Rate
 - 6.25MHz to 87MHz x 12-Bit + H/V Data
 - 36.66MHz to 116MHz x 11-Bit + H/V Data
- Multiple Modes for System Flexibility
 - 9.6kbps to 1Mbps Control Channel in UART, I²C (with Clock Stretch), or UART-to-I²C Modes
 - 2:1 Input Mux for Camera Selection
 - 15 Hardware-Selectable I²C-Device Addresses
 - Pairs with Any Maxim GMSL Serializer
 - Crosspoint Switch Maps Data to any Output
- Reduces EMI and Shielding Requirements
 - Spread-Spectrum Serial-Input Tracking and Transfer to the Parallel Output
 - 1.7V to 1.9V Core and 1.7V to 3.6V I/O Supply
- Peripheral Features for System Verification
 - Built-In PRBS Receiver for BER Testing
 - Dedicated “Up/Down” GPI for Camera Frame Sync Trigger and Other Uses
- Meets AEC-Q100 Automotive Specification
 - -40°C to +115°C Operating Temperature Range
 - ±8kV Contact and ±15kV Air IEC 61000-4-2 and ISO 10605 ESD Protection

Absolute Maximum Ratings

AVDD to EP*	-0.5V to +1.9V	Operating Temperature Range	-40°C to +115°C
DVDD to EP*	-0.5V to +1.9V	Junction Temperature	+150°C
IOVDD to EP*	-0.5V to +3.9V	Storage Temperature Range	-40°C to +150°C
LMN_ to EP* (15mA current limit)	-0.5V to +3.9V	Soldering Temperature (reflow)	+260°C
IN_+, IN_- to EP*	-0.5V to +1.9V	Continuous Power Dissipation $T_A = +70^\circ\text{C}$, 32-pin TQFN (derate 34.5 mW/°C above +70°C.)	2758.6mW
All Other Pins to EP*	-0.5V to (IOVDD + 0.5V)V	<i>*EP connected to IC ground.</i>	
IN_+, IN_- Short Circuit to Ground or Supply	Continuous		

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Package Thermal Characteristics

For the latest package outline information and land patterns (footprints), go to www.maximintegrated.com/packages. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

32-Pin TQFN-EP

PACKAGE CODE	T3255+8
Outline Number	21-0140
Land Pattern Number	90-0013
Thermal Resistance, Single Layer Board:	
Junction-to-Ambient (θ_{JA})	47
Junction-to-Case Thermal Resistance (θ_{JC})	1.7
Thermal Resistance, Four Layer Board:	
Junction-to-Ambient (θ_{JA})	29
Junction-to-Case Thermal Resistance (θ_{JC})	1.7

Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

DC Electrical Characteristics

($V_{DVDD} = V_{AVDD} = 1.7$ to $1.9V$, $V_{IOVDD} = 1.7V$ to $3.6V$, $R_L = 100\Omega \pm 1\%$ (differential), EP connected to PCB ground, $T_A = -40^\circ C$ to $+115^\circ C$, Typical values are at, $V_{DVDD} = V_{AVDD} = V_{IOVDD} = 1.8V$, $T_A = +25^\circ C$, unless otherwise noted.) (Note 1)

Pin Configuration

Pin Description

PIN	NAME	FUNCTION	REF SUPPLY	TYPE
POWER				
5	AVDD	1.8V Analog Power Supply. Bypass AVDD to EP with 0.1 μ F and 0.001 μ F capacitors placed as close as possible to the device, with the smaller-value capacitor closest to AVDD.		Power
13	DVDD	1.8V Digital Power Supply. Bypass DVDD to EP with 0.1 μ F and 0.001 μ F capacitors placed as close as possible to the device, with the smaller-value capacitor closest to DVDD.		Power
22	IOVDD	I/O Supply Voltage. 1.8V to 3.3V logic I/O power supply. Bypass IOVDD to EP with 0.1 μ F and 0.001 μ F capacitors placed as close as possible to the device, with the smaller-value capacitor closest to IOVDD.		Power
EP	—	Exposed Pad. EP is internally connected to device ground. Must connect EP to the PCB ground plane through a via array for proper thermal and electrical performance.		Power
HIGH-SPEED DIGITAL				
High-Speed Digital / Multifunction				
14	DOUT13/VS	Parallel-Data/Vertical-Sync Output. Defaults to parallel-data output on power-up. Vertical-sync output when HS/VS encoding is enabled.	IOVDD	Digital
15	DOUT12/HS	Parallel-Data/Horizontal-Sync Output. Defaults to parallel-data output on power-up. Horizontal-sync output when HS/VS encoding is enabled.	IOVDD	Digital
16	DOUT11/ CXTP/DE	Parallel-Data Output/Cable-Type Input/Data-Enable Output with internal pulldown to EP. CX/TP is latched at power-up, or when resuming from power-down mode (PWDNB = low), and switches to parallel/data-enable output after power-up. Connect CXTP to IOVDD with a 30k Ω resistor to set high (coax mode), or leave open to set low (twisted-pair mode).	IOVDD	Digital
17	DOUT10/ I2CSEL	Parallel-Data Output/I ² C-Select Input with Internal Pulldown to EP. I2CSEL is latched at power-up, or when resuming from power-down mode (PWDNB = low), and switches to parallel-data output after power-up. Connect I2CSEL to IOVDD with a 30k Ω resistor to set high (I ² C interface), or leave open to set low (UART interface).	IOVDD	Digital
18	DOUT9/ ADD3	Parallel-Data Output/Address Input with Internal Pulldown to EP. ADD3 is latched at power-up, or when resuming from power-down mode (PWDNB = low), and switches to parallel-data output after power-up. Connect ADD3 to IOVDD with a 30k Ω resistor to set high, or leave open to set low.	IOVDD	Digital
19	DOUT8/ ADD2	Parallel-Data Output/Address Input with Internal Pulldown to EP. ADD2 is latched at power-up, or when resuming from power-down mode (PWDNB = low), and switches to parallel-data output after power-up. Connect ADD2 to IOVDD with a 30k Ω resistor to set high, or leave open to set low.	IOVDD	Digital

Pin Description (continued)

PIN	NAME	FUNCTION	REF SUPPLY	TYPE
20	DOUT7/ ADD1	Parallel-Data Output/Address Input with Internal Pulldown to EP. ADD1 is latched at power-up, or when resuming from power-down mode (PWDNB = low), and switches to parallel-data output after power-up. Connect ADD1 to IOVDD with a 30kΩ resistor to set high, or leave open to set low.	IOVDD	Digital
23	DOUT6/ ADD0	Parallel-Data Output/Address Input with Internal Pulldown to EP. ADD0 is latched at power-up, or when resuming from power-down mode (PWDNB = low), and switches to parallel-data output after power-up. Connect ADD0 to IOVDD with a 30kΩ resistor to set high, or leave open to set low.	IOVDD	Digital
24	DOUT5/HIM	Parallel-Data Output/High-Immunity Mode Input with Internal Pulldown to EP. HIM input latched at power-up, or when resuming from power-down mode (PWDNB = low), and switches to parallel-data output after power-up. Connect HIM to IOVDD with a 30kΩ resistor to set high, or leave open to set low. HIGHIMM in the serializer must be set to the same value.	IOVDD	Digital
High-Speed Digital / Single Function				
21	PCLKOUT	Parallel-Clock Output. Provides timing signal to latch parallel-data outputs to the input of another device.	IOVDD	Digital
25	DOUT4	Parallel-Data Output	IOVDD	Digital
26	DOUT3	Parallel-Data Output	IOVDD	Digital
29	DOUT2	Parallel-Data Output	IOVDD	Digital
30	DOUT1	Parallel-Data Output	IOVDD	Digital
31	DOUT0	Parallel-Data Output	IOVDD	Digital
LINE FAULT				
2	LMN1	Line-Fault Monitor Input 1 (see Figure 4)		Analog
8	LMN0	Line-Fault Monitor Input 0 (see Figure 4)		Analog
28	LFLT B	Line-Fault Output. LFLT B is active low, and has a 60kΩ internal pullup to IOVDD. LFLT B low indicates a line-fault condition at LMN0, or LMN1. LFLT B is output high when PWDNB is low.	IOVDD	Digital
OTHER PINS				
1	GPI	General-Purpose Input with Internal Pulldown to EP. Serializer GPO (or INT) output follows the state of the GPI.	IOVDD	Digital
3	IN1+	Noninverting CML Serial-Data Input 1. Coax input when CXTP is high.		
4	IN1-	Inverting CML Serial-Data Input 1		
6	IN0+	Noninverting CML Serial-Data Input 0. Coax input when CXTP is high.		
7	IN0-	Inverting CML Serial-Data Input 0		
9	RX/SDA	Receive/Serial Data. Input/output with internal 30kΩ pullup to IOVDD. In UART mode, RX/SDA is the Rx input of the serializer's UART. In I ² C mode, RX/SDA is the SDA input/output of the serializer's I ² C master/slave. RX/SDA has an open-drain driver and requires a pullup resistor.	IOVDD	Digital

Pin Description (continued)

PIN	NAME	FUNCTION	REF SUPPLY	TYPE
10	TX/SCL	Transmit/Serial Clock. Input/output with internal 30kΩ pullup to IOVDD. In UART mode, TX/SCL is the Tx output of the serializer's UART. In I ² C mode, TX/SCL is the SCL input/output of the serializer's I ² C master/slave. TX/SCL has an open-drain driver and requires a pullup resistor.	IOVDD	Digital
11	ERRB	Error Output. Active-low, open-drain video data error output with internal pullup to IOVDD. ERRB goes low when decoding errors during normal operation exceed a programmed threshold, or when at least one PRBS error is detected during a PRBS test. ERRB is output high when PWDNB is low.	IOVDD	Digital
12	LOCK	Lock Output. Open-drain output with internal pullup to IOVDD. LOCK high indicates PLLs are locked with correct serial-word boundary alignment. LOCK low indicates PLLs are not locked, or incorrect serial-word boundary alignment. LOCK is low when the configuration link is active. LOCK is output high when PWDNB is low.	IOVDD	Digital
27	PWDNB	Active-Low, Power-Down Input with Internal Pulldown to EP. Set PWDNB low to enter power-down mode to reduce power consumption.	IOVDD	Digital
32	MS	Mode-Select Input with Internal Pulldown to EP. Set MS low to select base mode. Set MS high to select bypass mode.	IOVDD	Digital

Detailed Description

The MAX96708 deserializer is a compact device with features especially suited for automotive camera applications. The device operates at a variety of output widths and word rates up to a total serial-data rate up to 1.75Gbps. Two modes offer a 116MHz parallel clock rate with 11 bits of video data or 87MHz parallel clock rate with 14 bits of video data. An embedded 9.6kbps to 1Mbps control channel programs the serializer, deserializer, and any attached UART or I²C peripherals.

To promote safety applications, the device features CRC protection of video data. In addition, high-immunity mode reduces the effects of bit errors corrupting communication. Automatic equalization, along with a PRBS tester, allow for in-system optimization of the link.

This device operates over the -40°C to +115°C automotive temperature range.

Serial Link Signaling and Data Format

The serializer scrambles the input parallel data and combines this with the forward control data. The data is then encoded for transmission and output as a single bitstream at several times the input word rate (depending on bus width). The deserializer receives the serial data and recovers the clock signal. The data is then deserialized, decoded, and descrambled into parallel output data and forward control data.

Operating Modes

The GMSL devices are configurable to operate in many modes, depending on the application. These modes allow for a more efficient use of serial bandwidth. Most of these settings are set during system design and are configured using the external configuration pins, or through register bits.

Video/Configuration Link

In normal operation, the serializer runs in video-link mode (SEREN = 1) with video data and control data sent across the serial link. Set SEREN = 0 in the serializer to turn off serialization. The serializer powers up in video-link mode, and requires a valid PCLK for operation.

The configuration link is available to set up the serializer, deserializer, and peripherals when PCLK is not available.

Set SEREN = 0 and CLINK = 1 in the serializer to enable the configuration link (SEREN = 1 forces the serializer into video-link mode). Once PCLK has been established, turn on the video link (SEREN = 1).

By default, video-link mode requires a valid PCLK for operation. Set AUTO_CLINK bit = 1 (if supported), and SEREN = 1 in the serializer to automatically switch between the video link and configuration link whenever PCLK is not present.

Single and Double Modes of Operation

Single-/double-mode operation configures the available 1.74Gbps bandwidth into a variety of widths and word rates. Single-mode operation is compatible with all GMSL devices, and serializes one parallel word for each serial word. Double mode serializes two half-width parallel words for each serial word, and results in a 2x increase in parallel word-rate range (compared to single mode). Set DBL = 0 for single-mode operation and DBL = 1 for double-mode operation.

HS/VS Encoding

By default, GMSL assigns a video bit slot to HSYNC, VSYNC, and DE (if used). With HS/VS encoding, the device instead encodes special packets to sync signals to free up additional video bit slots. Set HVEN = 1 to turn on HS/VS encoding (DE, if enabled uses up a video bit). HS/VS encoding requires that HSYNC, VSYNC, and DE (if used) remain high during the active video, and low during the blanking period. Use HS/VS inversion when using reverse-polarity sync signals.

Error Detection

The serial link's 8b/10b encoding/decoding, and 1-bit parity detect bit errors that occur on the serial link. An optional 6-bit CRC check is available at the expense of 6 video bits. To activate 6-bit CRC mode, set PXL_CRC = 1 in the remote-side device first, and then in the local-side device. When using 6-bit CRC mode, the available internal bus width is reduced by 6 bits in single-input mode (DBL = 0) and 3 bits in double-input mode (DBL = 1). Note that the input bus width may already have been reduced due to pin availability of the serializer or deserializer; thus, the reduction of bandwidth from CRC may not be visible (see [Table 3](#)).

Bus Widths

The serial link has multiple bus-width settings that determine the parallel bus width and the resulting parallel word rate. The serial link operates to a maximum serial bit rate of 1.74Gbps. The BWS bit determines if each serial packet is 30 or 40 bits long, which translates to a maximum serial packet rate; thus, a maximum parallel word rate of 58MHz or 43.5MHz when BWS = 0 or 1, respectively. Decoding translates the 30- or 40-bit serial packets into 24, or 32 parallel bits. One bit is used for parity, while a second is reserved for the control channel. An additional 6 bits is used during optional 6-bit CRC. In addition, double mode splits the remaining word size in

half if used. The remaining bits can be used for video bits minus any sync bits if HV encoding is not used.

Note: The following modes list the internal bus widths. The number of available input and output pins may limit the actual bus width available.

24-Bit Mode (Figure 14)

When BWS = 0, the 30-bit serial packet corresponds with three 8b/10b symbols, representing 24 bits (24-bit mode). After parity and control channel, this leaves 16/22 bits of video data if CRC is/is not used (single mode), or 8/11 bits of video data if CRC is/is not used (double mode).

Figure 14. 24-Bit Mode Serial-Data Format

32-Bit Mode (Figure 15)

When BWS = 1 the 40-bit serial packet corresponds with four 8b/10b symbols, representing 32 bits (32-bit mode). After parity and control channel, this leaves 24/30 bits of video data if CRC is/is not used (single mode), or 12/15 bits of video data if CRC is/is not used (double mode).

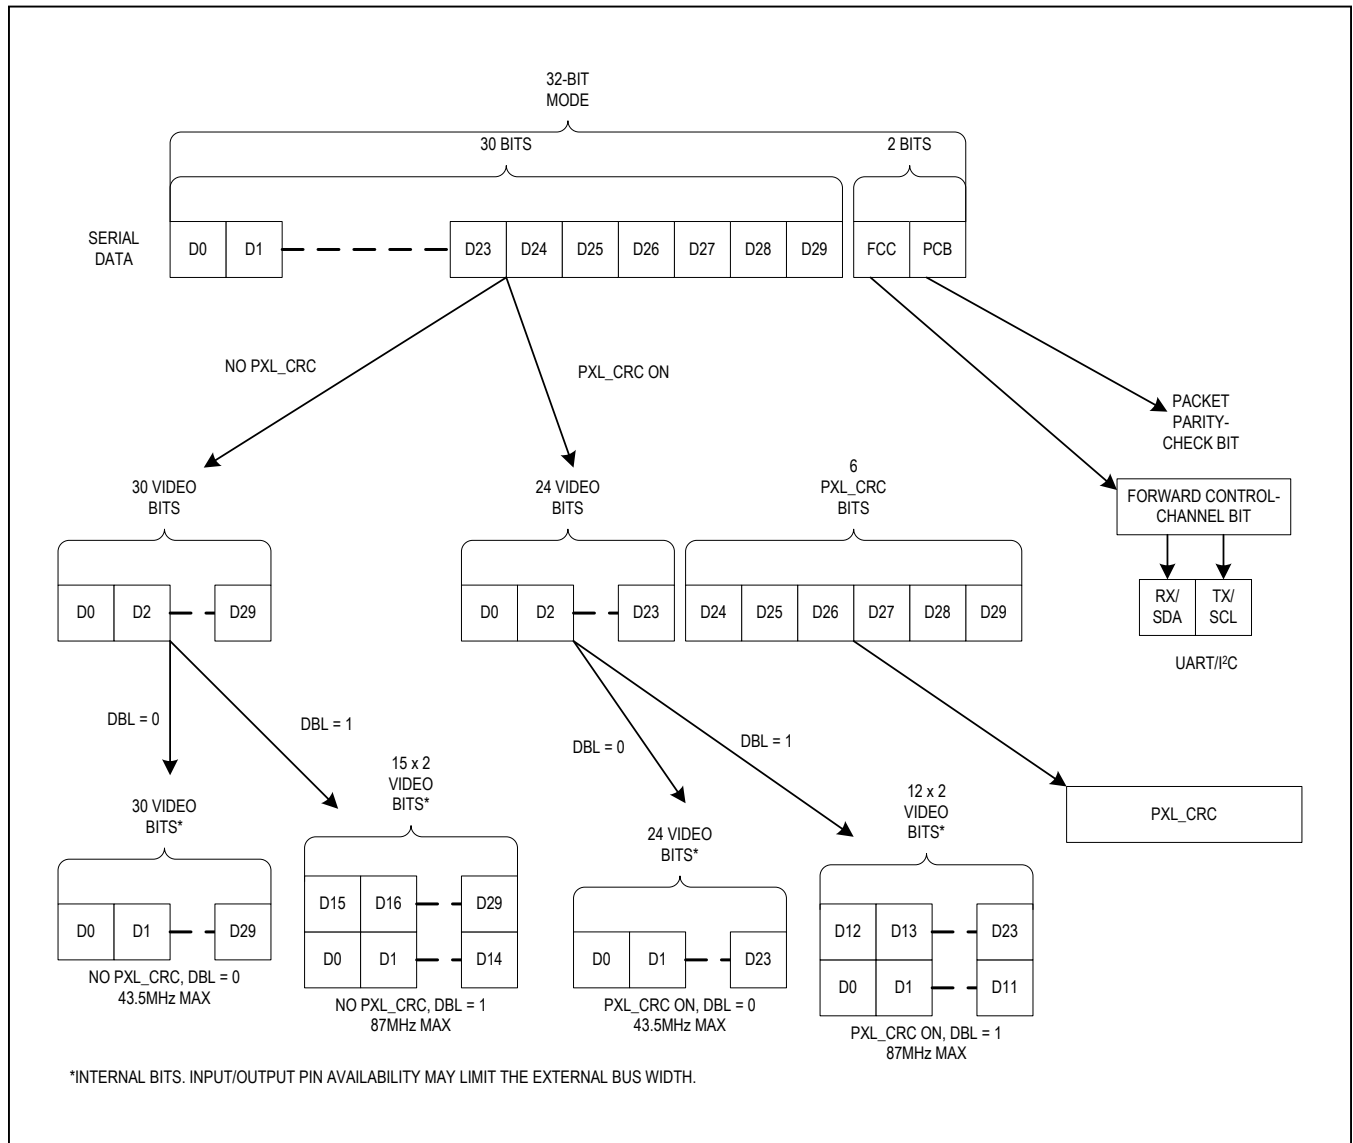

Figure 15. 32-Bit Mode Serial-Data Format

Control Channel and Register Programming

The control channel sends I²C or UART information across the serial link for control of the serializer, deserializer, and any attached peripherals. The control channel is multiplexed onto the serial link and is available with or without the video channel.

Forward Control Channel

Control data sent from the serializer to the deserializer is sent on the forward control channel. The data is encoded as one of the serial bits in the forward high-speed link. After deserialization, the forward control-channel data is extracted from the serial link. The forward control-channel bandwidth exceeds the maximum external control data rate, and all data sent on the forward control channel appears on the remote side after transmission delay of a few bit times.

Reverse Control Channel

Control data sent from the deserializer to the serializer is sent on the reverse control channel. The data is encoded as a series of 1 μ s pulses, with a maximum raw data rate of 1Mbps. High-immunity mode is available to increase the robustness of the reverse control channel at a reduced raw bit rate of 500kbps (Table 1). In high-immunity mode, set HPFTUNE = 00 in the deserializer when the serial bit rate is larger than 1Gbps. Setting the REV_FAST bit = 1 increases this rate back to 1Mbps. In I²C mode, when the input data rate (after encoding) exceeds the reverse data rate, the input clock is held through clock stretching to slow the external clock to match the internal bit rate.

UART Interface

The UART interface, compatible with all GMSL devices, sends commands from device to device through several UART packets. Set I2CSEL = 0 to set the device to use UART protocol.

I²C Interface

The serial link connects the serializer and deserializer I²C interfaces together through the control channel. When an I²C master sends a command to one side of the link (local side) the control channel forwards this information to and from the other side of the link (remote side), allowing a single microcontroller to configure the serializer, deserializer, and peripherals. The microcontroller can be located on the serializer side (display applications) and the deserializer side (camera applications). Dual- μ C operations are supported as long as a software-arbitration method is used. The serial link assumes that only one microcontroller is talking at any given time.

Remote-End Operation

When an I²C master initiates communication on the local slave device (the serializer/deserializer directly connected to the master), the remote-side device acts as a master device that sends data forwarded from the local-side device, and forwards any data received from peripherals attached to the remote-side device. This remote-side master device operates according to the timing settings in the I²C Master setting register. Set the master settings to match the timing settings used by the external microcontroller.

Clock-Stretch Timing

The I²C interface uses clock stretching to allow time for data to be forwarded across the serial link. The master microcontroller, along with any attached peripherals, must accept clock stretching of the GMSL devices.

GPO/GPI Control

GPO on the serializer follows GPI transitions on the deserializer. This GPO/GPI function can be used to transmit signals such as a frame sync in a surround-view camera system (see the [Providing a Frame Sync \(Camera Applications\)](#) section).

Table 1. Reverse Control-Channel Modes

HIM PIN SETTING	REVFASST BIT	REVERSE CONTROL-CHANNEL MODE	MAX UART/I ² C BIT RATE (kbps)
Low	X	Legacy reverse control-channel mode (compatible with all GMSL devices)	1000
High	0	High-immunity mode	500
	1	Fast high-immunity mode (requires serial-data rate > 1.25Gbps)	1000

X = Don't care.

Adaptive Line Equalizer

The deserializer includes an adaptive line equalizer to compensate for higher cable attenuation at higher frequencies. The cable equalizer has 12 levels of compensation to handle up to 30m coax and 15m STP cable lengths. At initial lock, the adaptive equalizer selects the optimum compensation level. The device can be programmed to re-adapt periodically, or manually to compensate for any significant changes in the transmission environment.

Spread-Spectrum Tracking

The deserializer can track a spread input clock, eliminating the need for multiple spread clocks.

Cable-Type Configuration and Input MUX

The driver inputs are programmable for two kinds of cable: 100Ω twisted pair and 50Ω coax (contact the factory for devices compatible with 75Ω cables). In coax mode, connect IN0+ to OUT+ of the serializer. Connect IN1+ to OUT+ of the second serializer. Control-channel data is sent to the serializer selected with the GMSL_IN_SEL bit. Leave all unused IN_ pins unconnected, or connect them to ground through 50Ω and a capacitor for increased power-supply rejection. If OUT- is not used, connect OUT- to V_{DD} through a 50Ω resistor (Figure 16). When there are μCs at the serializer, and at each deserializer, only one μC can communicate at a time. Disable forward and reverse channel links according to the communicating deserializer connection to prevent contention in I²C-to-I²C mode.

Figure 16. Coax Connection

Crosspoint Switch

The crosspoint switch routes data between the parallel input/output and the SerDes (Figure 17). The anything-to-anything routing assures the mapping between the video source and destination.

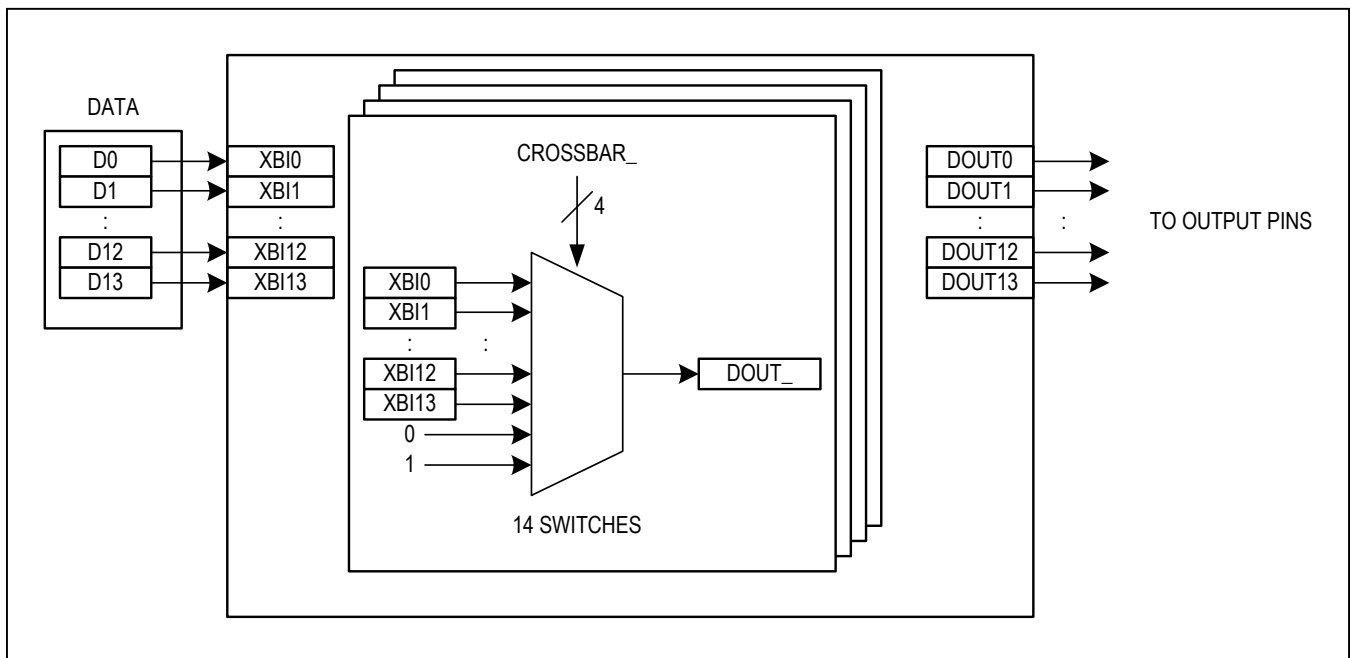

Figure 17. Crosspoint-Switch Dataflow

Shutdown/Sleep Modes

Several sleep and shutdown modes are available when full operation is not needed.

Configuration Link

When the high-speed video link is not needed, or unavailable, a configuration link can be used in its place. In configuration-link mode, the parallel-digital input/output is disabled, the LOCK pin remains low, and the serial link internally generates its own clock, to allow full operation of the control channel (UART/I²C and GPIO).

Serialization Disable

When the serial link is not needed, such as when downstream devices are powered off, the user can disable serialization. In this mode, all forward communication is shut down. The user can reenables serialization either locally or through the reverse channel.

Sleep Mode

To reduce power consumption further, the devices can be put into sleep mode. In this mode, all registers keep their programmed values, and all functions in the device are powered down except for the wake-up detectors on the local I²C/UART interface, and the serial link. Any activity seen by the wake-up detectors temporarily turns on the control-channel interface. During this time, a micro-controller can command the device to exit sleep mode. See the [Entering/Exiting Sleep Mode](#) section.

Power-Down Mode

The lowest power-consumption mode is power-down mode. In this mode, all functions are powered down, and all register values are lost.

Link-Startup Procedure

[Table 2](#) lists the startup procedure for image-sensing applications. The control channel is available after the video link or the configuration link is established. If the deserializer powers up after the serializer, the control channel becomes unavailable until 2ms after power-up.

Table 2. Link-Startup Procedure

NO.	MC	SERIALIZER	DESERIALIZER
—	µC connected to deserializer.	Set all configuration inputs.	Set all configuration inputs.
1	Powers up. Wait t _{PJ} .	Powers up and loads default settings. Establishes video link when valid PCLK available.	Powers up and loads default settings. Locks to video-link signal if available.
1a	(If no PCLK) Programs CLINKEN, SEREN, and/or AUTOCLINK bits. Wait 5ms after each command.	Establishes configuration link.	Locks to config link if available.
1b	(If not locked) Sets any additional configuration bits that are mismatched between serializer and deserializer (e.g BWS, CX/TP). Wait 5ms for lock after each command.	Configuration changed. Reestablishes configuration/video link if needed.	Configuration changed. Locks to configuration/video link.
2	Sets Register 0x07 configuration bits in the serializer (DBL, BWS, PXL_CRC, etc.). Wait 2ms.	Configuration changed. Reestablishes config/video link if needed	Loss of lock may occur.
3	Sets Register 0x07 configuration bits in the deserializer (DBL, BWS, PXL_CRC, etc.). Wait 5ms for lock to re-establish.	—	Configuration changed. Locks to configuration/video link.
4	Writes rest of serializer/deserializer configuration bits.	Configuration changed.	Configuration changed.
5	Writes camera/peripheral configuration bits.	Forwards commands from µC to serializer.	Forwards commands to camera/peripherals.
5a	If in configuration link: When PCLK is available, set SEREN = 1. Wait 5ms for lock.	Enables video link.	Locks to video link.

Applications Information

Parallel Interface

The CMOS parallel-interface data width is programmable and depends on the application. Using a larger width (BWS = 1) results in a lower-pixel clock rate, while a smaller width (BWS = 0) allows a higher-pixel clock rate.

Bus Data Width

The bus data width depends on the selected modes. The available bus width is less when using error detection or when in double mode (DBL = 1). [Table 3](#) shows the available bit widths and default mapping for various modes.

Table 3. Output-Data Width Selection

REGISTER BIT SETTINGS				OUTPUT MAPPING
DBL	BWS	PXL_CRC	HVEN	
1	1	1	1	DOUT11:0, HS, VS
1	1	1	0	DOUT11:0
1	1	0	1	DOUT11:0*, HS, VS
1	1	0	0	DOUT13:0*
1	0	1	1	DOUT7:0, HS, VS
1	0	1	0	DOUT7:0
1	0	0	1	DOUT10:0, HS, VS
1	0	0	0	DOUT10:0
0	1	1	1	DOUT11:0*, HS, VS
0	1	1	0	DOUT13:0*
0	1	0	1	DOUT11:0*, HS, VS
0	1	0	0	DOUT13:0*
0	0	1	1	DOUT11:0*, HS, VS
0	0	1	0	DOUT13:0*
0	0	0	1	DOUT11:0*, HS, VS
0	0	0	0	DOUT13:0*

*The bit width is limited by the number of available outputs.

Bus Data Rates

The bus data rate depends on the settings BWS and DBL. [Table 4](#) lists the available PCLK rates available for different bus-width settings. For lower PCLK rates, set DBL = 0 (if DBL = 1 in both the serializer and deserializer).

Crossbar Switch

By default, the crossbar switch connects the serializer input pins DIN_ and HS/VS (when HV encoding is used) to the corresponding deserializer output pins DOUT_ and HS/VS when DBL of the serializer and deserializer match. When there is a DBL mismatch use [Table 5](#), [Table 66](#), and [Table 7](#) to map the serial bits to the crossbar inputs. Reprogram the crossbar switch when changing the output pin assignments.

Crossbar Switch Programming

Each output pin can be assigned any of the 14 DOUT signals. Multiple outputs can share the same input. To force an output low, and ignore the input, set CROSSBAR_bit = 1110. To force an output high set CROSSBAR_bit = 1111.

Recommended Crossbar Switch Programming Procedure

The following procedure programs the crossbar switch to reassign input/output pin locations:

- 1) For the crossbar output equivalent of DOUT0 (XBO0) select which pin to map (e.g., DOUT4 → XBI4).
- 2) Set the crossbar bits (CROSSBAR0) to the desired selected mapped input (e.g., CROSSBAR0 = 0100).
- 3) Repeat for the other crossbar outputs.

Table 4. Data-Rate Selection Table

DRS	DBL	BWS	PCLK RANGE (MHZ)
0	1	1	25 to 87
0	1	0	33.3 to 116
0	0	1	12.5 to 43.5
0	0	0	16.7 to 58
1*	0	1	6.25 to 12.5
1*	0	0	8.33 to 16.7

*Use DRS = 1 with legacy devices only (MAX92XX).

	Output on first word	Z	Zero
	Output on second word		
	Zero		

*HV_SRC is automatically set by default. MAX96705 mode automatically sets HV_SRC to 0, 1, or 3 according to the other bit settings above. MAX96707 mode automatically sets HV_SRC to 0, 2, or 3 according to the other bit settings above.

Control-Channel Interfaces

I²C

Set I2CSEL = 1 to configure the control channel for I²C-to-I²C mode. In this mode, the control channel forwards I²C commands from the microcontroller side to the other side of the GMSL link. The remote device acts as an I²C master to the other peripherals connected to the remote side device. I²C-to-I²C mode uses clock stretching to hold the microcontroller until the data and the acknowledge/no-acknowledge have been sent across the link.

I²C Bit Rate

The I²C interface accepts bit rates from 9.6kbps to 1Mbps. The local I²C rate is set by the microcontroller. The remote I²C rate is set by the remote device. By default the control channel is set up for a 400kbps-to-I²C bit rate. Program the I2C_MSTBT and SLV_SH bits (register 0x0D) to match the desired microcontroller I²C rate.

Software Programming of the Device Addresses

The serializer and deserializer have programmable device addresses. This allows multiple GMSL devices, along with I²C peripherals, to coexist on the same control channel. The serializer device address is in register 0x00 of each device, while the deserializer device address is in register 0x01 of each device. To change a device address, first write to the device whose address changes (register 0x00 of the serializer for serializer device address change, or register 0x01 of the deserializer for deserializer device address change). Then write the same address into the corresponding register on the other device (register 0x00 of the deserializer for serializer device address change, or register 0x01 of the serializer for deserializer device address change).

I²C Address Translation

The device supports I²C address translation for up to two device addresses. Use address translation to assign unique device addresses to peripherals with limited I²C addresses. Source addresses (address to translate from) are stored in registers 0x09 and 0x0B. Destination addresses (address to translate to) are stored in registers 0x0A and 0x0C.

Configuration Blocking

The device can block changes to its registers. Set CFGBLOCK to make all registers read only. Once set, the registers remain blocked until the supplies are removed or until PWDNB is low.

Cascaded/Parallel Devices

GMSL supports cascaded and parallel devices connected through I²C. When cascading or using parallel links, all I²C commands are forwarded to all links. Each link attempts to hold the control channel until it receives an acknowledge/non-acknowledge from the remote side device. It is important to keep the control channel active between links in order to prevent timeout. If a link is unused, keep the control channel clear by turning on the configuration link, disconnecting the I²C lines, or powering down the unused device.

Dual μ C Control

Most systems use a single microcontroller; however, μ Cs can reside on each side simultaneously and trade off running the control channel. Contention occurs if both μ Cs attempt to use the control channel at the same time. It is up to the user to prevent this contention by implementing a higher-level protocol. In addition, the control channel does not provide arbitration between I²C masters on both sides of the link. An acknowledge frame is not generated when communication fails due to contention. If communication across the serial link is not required, the μ Cs can disable the forward and reverse control channel using the FWCCEN and REVCCEN bits (0x04, D[1:0]) in the serializer/deserializer. Communication across the serial link is stopped and contention between μ Cs cannot occur.

UART

Set I2CSEL = 0 to configure the control channel for UART or UART to I²C. In this mode, the control channel forwards UART commands from the microcontroller side to the other side of the GMSL link. When INTTYPE = 00, the remote device acts as an I²C master to the other peripherals connected to the remote side device. UART-to-I²C mode does not support devices that use clock stretching.

Base Mode

In base mode, UART packets control the serializer, deserializer and attached peripherals.

UART Timing

In base mode, the UART idles high (through a pullup resistor). Each GMSL-UART byte consists of a START bit, 8 data bits, an even-parity bit and a stop bit (Figure 19). Keep the idle time between bytes of the same UART packet to less than 4 bit times. The GMSL-UART protocol is listed in Figure 20. A write packet consists of a SYNC byte (Figure 21). Device address byte, Starting register address byte, number of bytes to write, and the data bytes. The slave device responds with an acknowledge byte (Figure 22) if the write was successful. A Read packet consists of a SYNC byte, Device address byte, Starting register address byte, and number of bytes to read. The slave device responds with an acknowledge byte and the read data bytes.

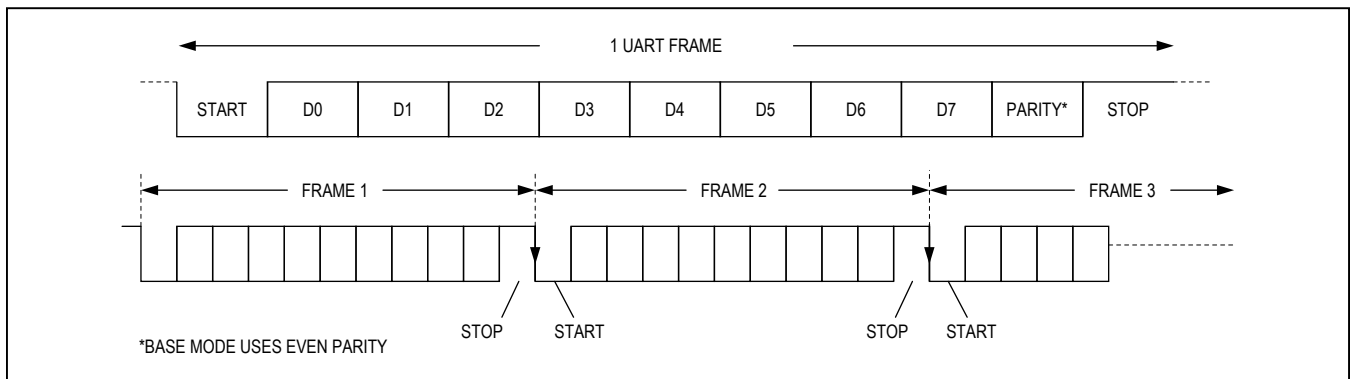

Figure 19. GMSL-UART Data Format for Base Mode

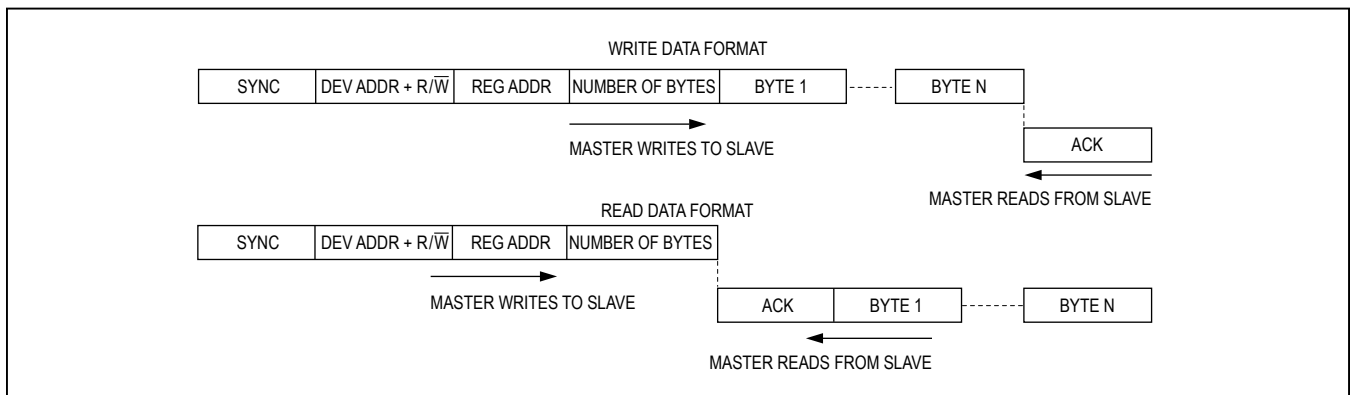

Figure 20. GMSL-UART Protocol for Base Mode

Figure 21. SYNC Byte (0x79)

Figure 22. ACK Byte (0xC3)

UART-to-I²C Conversion

When using the UART control channel, the remote-side device can communicate to I²C peripherals through UART-to-I²C conversion. Set the INTTYPE bits in the remote side device to "00" to activate UART-to-I²C conversion. The converted I²C bit rate is the same as the incoming UART bit rate. I²C peripherals must not use clock stretching in order to be compatible with UART-to-I²C conversion.

There are two possible methods the devices use to convert UART to I²C. In the first method, I²CMETHOD = 0. The register address is sent with the I²C communication (*Figure 23*). For devices that do not use a register address (such as the MAX7324) set I²CMETHOD = 1 and send a dummy byte in place of the register address (*Figure 24*). In this method, the remote device omits sending the register address.

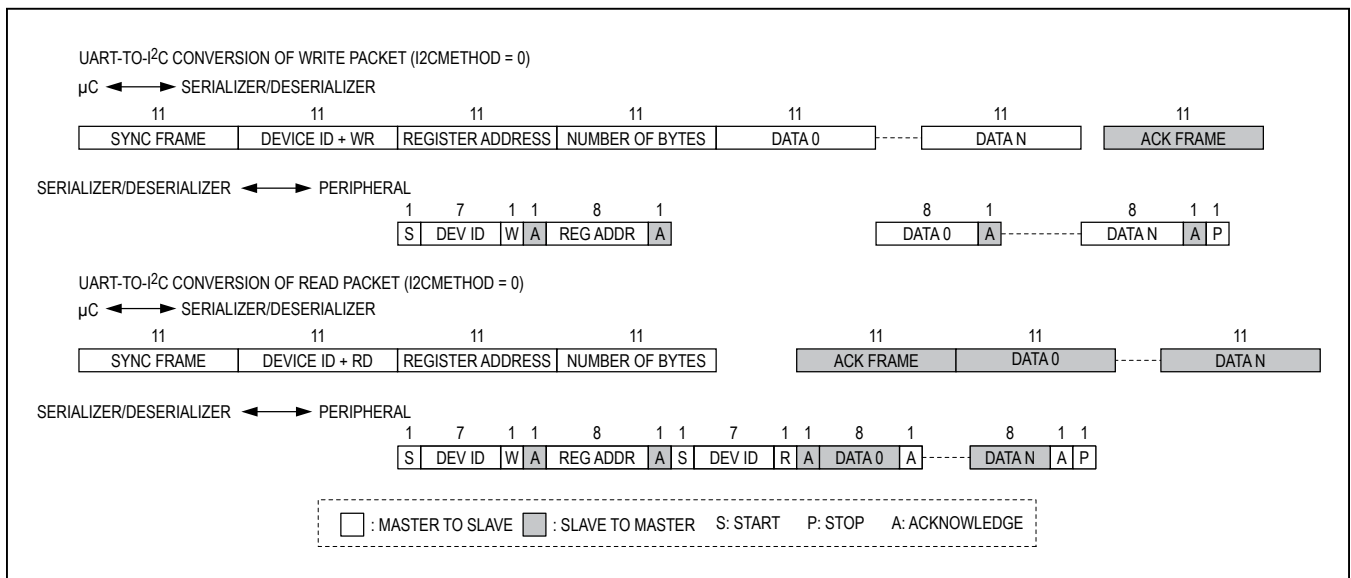

Figure 23. Format Conversion Between GMSL UART and I²C with Register Address (I²CMETHOD = 0)

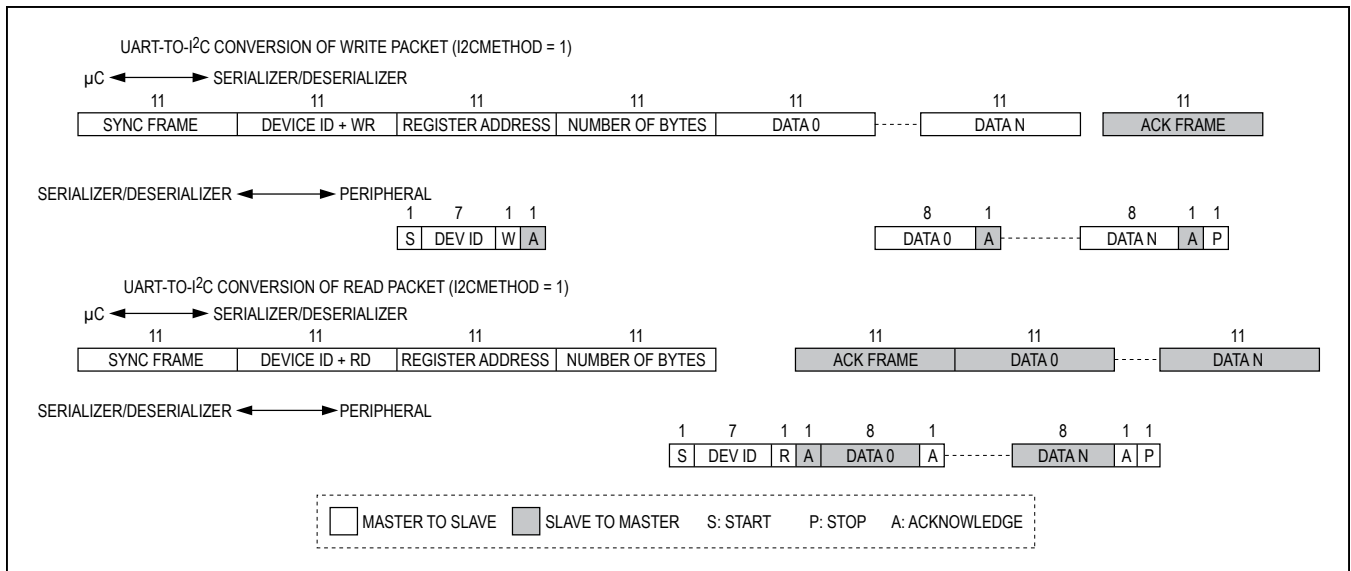

Figure 24. Format Conversion Between GMSL UART and I²C without Register Address (I²CMETHOD = 1)

Table 8. Default-Device Address

D7	D6	D5	D4	D3	D2	D1	D0
1	ADD3	ADD2	1	ADD1	ADD0	0	R/W

Note: ADD[3:0] pin settings latched at power-up.

UART Bypass Mode

In UART bypass mode, the control channel acts as a full-duplex 9.6kbps to 1Mbps link that forwards UART commands across the serial link without responding to the packets themselves. Set MS high to enter bypass mode (wait 1ms after setting bypass mode if the μC is connected on the deserializer side). Bypass uses bit rates from 9.6kbps to 1Mbps. Do not send a logic-low value longer than 100μs when using the GPI/GPO functionality.

Device Address

The SerDes have a 7-bit-long slave address stored in registers 0x00 and 0x01. The bit following a 7-bit slave address is the R/W bit, which is low for a write command and high for a read command. External inputs determine the default slave address as shown in Table 8. After startup, a μC can reprogram the slave address as needed.

Cable Equalizer

By default, the cable equalizer is enabled and set to Adaptive mode. Set AEQ_EN = 0 to switch to manual EQ mode. EQTUNE determines the boost level in manual EQ mode (see Table 9). Set EN_EQ = 0 to disable all equalization (manual or automatic).

The auto-equalization level is determined during serial-link locking. Set AEQ_MAN_TRG_REQ = 1 to re-trigger auto equalization. Set AEQ_PER_MODE = 1 to set up periodic AEQ.

ERRB Output

The deserializer has an open-drain ERRB output. This output asserts low whenever any of the following conditions occur:

- The number of detected errors exceeds the error thresholds during normal operation. Read DET_ERR, set auto-error reset, or re-lock the link to clear.

Table 9. Cable-Equalizer Boost Levels

BOOST SETTING (MANUAL AND ADAPTIVE EQ)	TYPICAL BOOST GAIN AT 750MHZ (DB)
0000	1.6
0001	2.1
0010	2.8
0011	3.5
0100	4.3
0101	5.2
0110	6.3
0111	7.3
1000	8.5
1001	9.7 Power-up default for Manual EQ*
1010	11.0
1011	12.2

*Automatic EQ is enabled by default.

Additional conditions that set ERRB (disabled by default) include:

- Insufficient boost at maximum boost setting (set UNDERBST_DET_EN = 1). Retrigger the equalization calibration to clear.

Auto-Error Reset

The default method to reset errors is to read the respective error counter registers in the deserializer. Auto-error reset clears the error counters DET_ERR ~1μs after ERR goes low. Auto-error reset is disabled on power-up. Enable auto-error reset through ERR_RST. Auto-error reset does not run when the device is in PRBS test mode.

Board Layout

Power-Supply Circuits and Bypassing

The deserializer uses an AVDD and DVDD of 1.7V to 1.9V. All inputs and outputs, except for the serial input, derive power from an IOVDD of 1.7V to 3.6V that scales with IOVDD. Proper voltage-supply bypassing is essential for high-frequency circuit stability.

High-Frequency Signals

Separate the LVCMOS logic signals and CML/coax high-speed signals to prevent crosstalk. Use a four-layer PCB with separate layers for power, ground, CML/coax, and LVCMOS logic signals. Layout STP PCB traces close to each other for a 100Ω differential characteristic impedance. The trace dimensions depend on the type of trace used (microstrip or stripline). Note that two 50Ω PCB traces do not have 100Ω differential impedance when brought close together—the impedance goes down when the traces are brought closer. Use a 50Ω trace for the single-ended output when driving coax. Route the PCB traces for differential CML in parallel to maintain the differential characteristic impedance. Avoid vias. Keep PCB traces that make up a differential pair equal in length to avoid skew within the differential pair.

ESD Protection

ESD tolerance is rated for Human Body Model, IEC 61000-4-2, and ISO 10605. The ISO 10605 and IEC 61000-4-2 standards specify ESD tolerance for electronic systems. The serial outputs are rated for ISO 10605 ESD protection and IEC 61000-4-2 ESD protection. All pins are tested for the Human Body Model. The Human Body Model discharge components are CS = 100pF and RD = 1.5kΩ (Figure 25). The IEC 61000-4-2 discharge components are CS = 150pF and RD = 330Ω (Figure 26). The ISO 10605 discharge components are CS = 330pF and RD = 2kΩ (Figure 27).

Figure 25. Human Body Model ESD Test Circuit

Figure 26. IEC 61000-4-2 Contact Discharge ESD Test Circuit

Figure 27. ISO 10605 Contact Discharge ESD Test Circuit

Table 10. Feature Compatibility

DESERIALIZER FEATURE	GMSL SERIALIZER
HSYNC/VSYNC encoding	If feature not supported in the serializer, turn off in the deserializer.
I ² C-to-I ² C	If feature not supported in the serializer, use UART-to-I ² C or UART-to-UART.
CRC error detection	If feature not supported in the serializer, turn off in the deserializer.
Double input	If feature not supported in the serializer, data is output as a single word at half the input frequency. Use Crossbar switch to correct input mapping.
Coax	If feature not supported in the serializer, connect unused serial input through 200nF and 50Ω in series to AVDD, and set the reverse control-channel amplitude to 100mV.
I ² S encoding	If supported in the serializer, disable I ² S in the serializer
High-immunity mode	If feature not supported in the serializer, turn off in the deserializer.

Compatibility with Other GMSL Devices

The MAX96708 is designed to pair with the MAX96705–MAX96711 family of SerDes devices, but interoperates with any GMSL device. See [Table 10](#) for operating limitations.

Device Configuration and Component Selection

Internal Input Pulldowns

The control and configuration inputs include a pulldown resistor to GND. External pulldown resistors are not needed.

Multifunction Inputs

The device has several inputs/outputs that function both as a parallel input/output and as a configuration pin. On power-up, or when reverting from a power-down state, the pins act as configuration inputs. After latching the input state, the configuration inputs become parallel digital input/outputs. Connect a configuration input through a 30kΩ resistor to IOVDD to set a high level. Leave the configuration input open to set a low level.

I²C/UART Pullup Resistors

The I²C and UART open-drain lines require a pullup resistor to provide a logic-high level. There are tradeoffs between power dissipation and speed, and a compromise may be required when choosing pullup resistor values. Every device connected to the bus introduces some capacitance even when the device is not in operation. I²C specifies 300ns rise times (30% to 70%) for fast mode, which is defined for data rates up to 400kbps. See the I²C specifications in the I²C/UART Port Timing section in the [AC Electrical Characteristics](#) table for details. To meet the fast-mode rise-time requirement, choose the pullup resistors so that rise time $t_R = 0.85 \times R_{PULLUP} \times C_{BUS} <$

300ns. The waveforms are not recognized if the transition time becomes too slow. GMSL supports I²C/UART rates up to 1Mbps (UART-to-I²C mode) and 400kbps (I²C-to-I²C mode).

AC-Coupling Capacitors

Voltage droop and the digital sum variation (DSV) of transmitted symbols cause signal transitions to start from different voltage levels. Because the transition time is fixed, starting the signal transition from different voltage levels causes timing jitter. The time constant for an AC-coupled link needs to be chosen to reduce droop and jitter to an acceptable level. The RC network for an AC-coupled link consists of the CML/coax receiver termination resistor (R_{TR}), the CML/coax driver termination resistor (R_{TD}), and the series AC-coupling capacitors (C). The RC time constant for four equal-value series capacitors is $(C \times (R_{TD} + R_{TR}))/4$. R_{TD} and R_{TR} are required to match the transmission line impedance (usually 100Ω differential, 50Ω single-ended). This leaves the capacitor selection to change the system time constant. Use 0.22μF or larger high-frequency surface-mount ceramic capacitors, with sufficient voltage rating to withstand a short to battery, to pass the lower-speed reverse control-channel signal. Use capacitors with a case size less than 3.2mm x 1.6mm to have lower parasitic effects to the high-speed signal.

Cables and Connectors

Interconnect for CML typically has a differential impedance of 100Ω. Use cables and connectors that have matched differential impedance to minimize impedance discontinuities. Coax cables typically have a characteristic impedance of 50Ω (contact the factory for 75Ω operation). [Table 11](#) lists the suggested cables and connectors used in the GMSL link.

Table 11. Suggested Connectors and Cables for GMSL

VENDOR	CONNECTOR	CABLE	TYPE
Rosenberger	59S2AX-400A5-Y	Dacar 302	Coax
Rosenberger	D4S10A-40ML5-Z	Dacar 535-2	STP
Nissei	GT11L-2S	F-2WME AWG28	STP
JAE	MX38-FF	A-BW-Lxxxxx	STP

PRBS

The serializer includes a PRBS pattern generator that works with bit-error verification in the deserializer. To run the PRBS test, set PRBSEN = 1 (0x04, D5) in the deserializer, then in the serializer. To exit the PRBS test, set PRBSEN = 0 (0x04, D5) in the serializer. The deserializer automatically ends PRBS checking and sets the PRBS_OK bit high. Note that during PRBS mode, the remote control channel is not available except to exit PRBS mode if I2C_LOC_ACK = 1; otherwise, the remote control channel is not available at all.

To run the PRBS with a 3Gbps SerDes, first set the PRBS_TYPE bit = 0 in the MAX967XX. Then set PRBSEN = 1 (0x04, D5) in the serializer, then in the deserializer. To exit the PRBS test, set PRBSEN = 0 (0x04, D5) in the deserializer, then in the serializer.

During PRBS test, ERRB function changes to reflect PRBS errors only. ERRB goes low when any PRBS errors occur. ERRB goes high when the PRBS error counter is reset when PRBS_ERR is read. Normal ERRB function resumes when exiting the PRBS test.

GPI/GPO

GPO on the serializer follows GPI transitions on the deserializer. By default, the GPI-to-GPO delay is 0.35ms (max). Keep the time between GPI transitions to a minimum 0.35ms. GPI_IN the deserializer stores the GPI input state. GPO is low after power-up. The μ C can set GPO by writing to the SET_GPO register bit. Do not send a logic-low value on the deserializer RX/SDA input (UART mode) longer than 100 μ s in either base or bypass mode to ensure proper GPO/GPI functionality.

Fast Detection of Loss-of-Lock

A measure of link quality is the recovery time from loss of synchronization. The host can be quickly notified of loss-of-lock by connecting the deserializer's LOCK output to the GPI input. If other sources use the GPI input, such as a touch-screen controller, the μ C can implement a routine to distinguish between interrupts from loss-of-sync and

normal interrupts. Reverse control-channel communication does not require an active forward link to operate and accurately tracks the LOCK status of the GMSL link. LOCK asserts for video link only and not for the configuration link.

Providing a Frame Sync (Camera Applications)

The GPI and GPO provide a simple solution for camera applications that require a frame sync signal from the ECU (e.g., surround-view systems). Connect the ECU frame sync signal to the GPI input and connect the GPO output to the camera-frame sync input. GPI/GPO have a typical delay of 275 μ s. Skew between multiple GPI/GPO channels is 115 μ s (max). If a lower-skew signal is required, connect the camera's frame-sync input to one of the serializer's GPIOs and use an I²C broadcast write command to change the GPIO output state. This has a maximum skew of 1.5 μ s, independent from the used I²C bit rate.

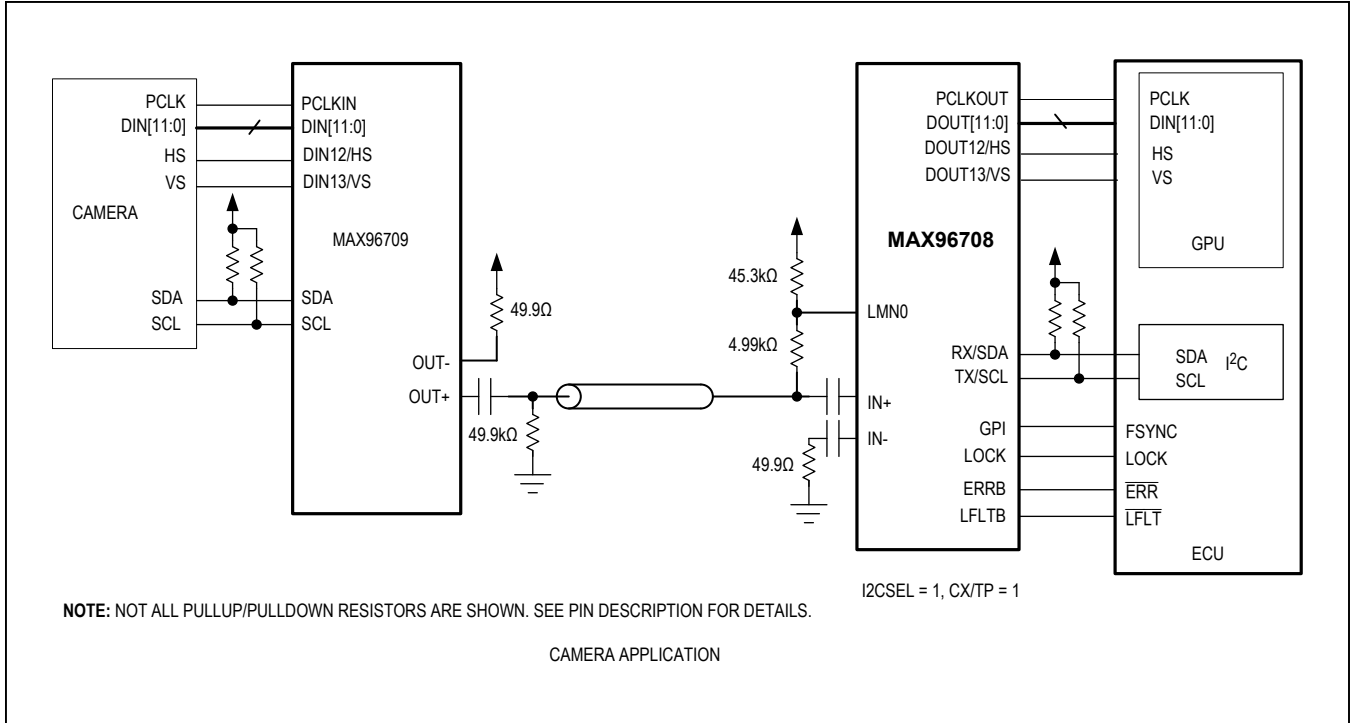

Entering/Exiting Sleep Mode

The procedure for entering and exiting sleep mode depends on the location of the microcontroller, and the type of control-channel interface used. If wake-up from a remote-side (serializer-side) microcontroller is not needed or desired, set the DIS_RWAKE bit = 1 to shut down remote wake-up for further power savings.

When the microcontroller is on the deserializer side, first put the serializer to sleep, or disable serialization. Next, set SLEEP = 1 in deserializer. The device sleeps after 8ms. To wake up the device, send an arbitrary control-channel command to the deserializer (the device will not send an acknowledge), wait for 5ms for the chip to power up and then set SLEEP = 0 to make the wake-up permanent.

When μ C is on the serializer side, set SLEEP = 1 in deserializer. Next, disable serialization. The device sleeps after 8ms. To wake up the deserializer, reenables serialization. The deserializer wakes up and clears its SLEEP bit when it locks to the serializer.

Typical Application Circuit

Ordering Information

PART NUMBER	TEMP RANGE	PIN-PACKAGE
MAX96708GTJ+	-40°C to +115°C	32 TQFN-EP*

REVISION NUMBER	REVISION DATE	DESCRIPTION	PAGES CHANGED
0	3/16	Initial release	—
1	3/17	Various updates, beginning with <i>Absolute Maximum Ratings</i>	7, 29, 33, 38, 40, 62, 63, 65, 66

For pricing, delivery, and ordering information, please contact Maxim Direct at 1-888-629-4642, or visit Maxim Integrated's website at www.maximintegrated.com.

Maxim Integrated cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim Integrated product. No circuit patent licenses are implied. Maxim Integrated reserves the right to change the circuitry and specifications without notice at any time. The parametric values (min and max limits) shown in the Electrical Characteristics table are guaranteed. Other parametric values quoted in this data sheet are provided for guidance.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
