

## High-side current sense amplifier plus signal conditioning amplifier

Datasheet - production data

- Output amplifier for tailor-made signal conditioning
- -40 °C to 125 °C operating temperature range
- 4 kV ESD protection

### Applications

- Battery chargers
- Automotive current monitoring
- Notebook computers
- DC motor control
- Photo-voltaic systems
- Precision current sources
- Uninterruptible power supplies
- High-end power supplies

### Description

The TSC102 measures a small differential voltage on a high-side shunt resistor and translates it into a ground-referenced output voltage.

The device's wide input common-mode voltage range, low quiescent current and tiny TSSOP8 packaging enable use in a wide variety of applications (also available in SO8 package).

The input common-mode and power supply voltages are independent. The common-mode voltage can range from 2.8 to 30 V in operating conditions.

The TSC102 is rugged against abnormal conditions on the input pins: Vp and Vm can withstand up to 60 V in case of voltage spikes, as little as -16 V in case of reversed battery, and up to 4 kV in case of electrostatic discharge.

In addition to the current sensing amplifier, the TSC102 offers a fully accessible amplifier for output signal conditioning. The device's overall current consumption is lower than 420  $\mu$ A.

### Features

- Independent supply and input common-mode voltages
- Wide common-mode operating range: 2.8 to 30 V
- Wide common-mode surviving range: -16 to 60 V (reversed battery and load-dump conditions)
- Low current consumption:  $I_{CC}$  max = 420  $\mu$ A

# 1 Application schematic and pin description

The TSC102 high-side current sense amplifier features a 2.8 V to 30 V input common-mode range that is independent of the supply voltage. The main advantage of this feature is that it allows high-side current sensing at voltages much greater than the supply voltage ( $V_{CC}$ ).

**Figure 1. Application schematics**

Table 1 describes the function of each pin. Their position is shown in the illustration on the cover page and in Figure 1 above.

**Table 1. Pin description**

| Symbol   | Type          | Function  |
|----------|---------------|---|
| Out      | Analog output | Out voltage is proportional to the magnitude of the sense voltage $V_p - V_m$                       |
| Gnd      | Power supply  | Ground line   |
| $V_{CC}$ |               | Positive power supply line  |
| $V_p$    | Analog input  | Connection for the external sense resistor. The measured current enters the shunt on the $V_p$ side |
| $V_m$    |               | Connection for the external sense resistor. The measured current exits the shunt on the $V_m$ side  |
| A1       |               | Connection to current sensing amplifier output  |
| A2       |               | Connection to signal conditioning amplifier non-inverting input                                     |
| A3       |               | Connection to signal conditioning amplifier inverting input   |

## 2 Absolute maximum ratings and operating conditions

**Table 2. Absolute maximum ratings**

| Symbol     | Parameter   | Value      | Unit |
|------------|---|------------|------|
| $V_{id}$   | Input pins differential voltage ( $V_p-V_m$ )                         | $\pm 20$   | V    |
| $V_i$      | Current sensing input pin voltages ( $V_p$ and $V_m$ ) <sup>(1)</sup> | -16 to 60  |      |
| $V_1$      | Voltage for pins A1, A2, A3, Out, $V_{cc}$ <sup>(1)</sup>             | -0.3 to 7  |      |
| $T_{stg}$  | Storage temperature   | -55 to 150 | °C   |
| $T_j$      | Maximum junction temperature  | 150        |      |
| $R_{thja}$ | TSSOP8 thermal resistance junction to ambient                         | 120        | °C/W |
|            | SO8 thermal resistance junction to ambient                            | 125        |      |
| ESD        | HBM: human body model for $V_m$ and $V_p$ pins <sup>(2)</sup>         | 4          | kV   |
|            | HBM: human body model <sup>(3)</sup>                                  | 2.5        |      |
|            | MM: machine model <sup>(4)</sup>                                      | 200        | V    |
|            | CDM: charged device model <sup>(5)</sup>                              | 1.5        | kV   |

1. These voltage values are measured with respect to the GND pin.
2. Human body model for  $V_m$  and  $V_p$ : a 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 kΩ resistor between the  $V_p$  or  $V_m$  pin and Gnd while the other pins are floating.
3. Human body model: a 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 kΩ resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.
4. Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω). This is done for all couples of connected pin combinations while the other pins are floating.
5. Charged device model: all pins plus package are charged together to the specified voltage and then discharged directly to ground.

**Table 3. Operating conditions**

| Symbol     | Parameter  | Value      | Unit |
|------------|--|------------|------|
| $V_{CC}$   | DC supply voltage from $T_{min}$ to $T_{max}$            | 3.5 to 5.5 | V    |
| $T_{oper}$ | Operational temperature range ( $T_{min}$ to $T_{max}$ ) | -40 to 125 | °C   |
| $V_{icm}$  | Common-mode voltage range ( $V_m$ pin voltage)           | 2.8 to 30  | V    |

### 3 Electrical characteristics

Unless otherwise specified, the electrical characteristics given in the following tables have been measured under the following test conditions.

- $T_{amb} = 25\text{ °C}$ ,  $V_{CC} = 5\text{ V}$ ,  $V_{sense} = V_p - V_m = 50\text{ mV}$ ,  $V_m = 12\text{ V}$ .
- No load on Out pin.
- Signal conditioning amplifier used as a buffer (pin A3 connected to pin Out and pin A1 connected to pin A2).

**Table 4. Supply**

| Symbol    | Parameter            | Test conditions  | Min. | Typ. | Max. | Unit          |
|-----------|----------------------|--|------|------|------|---------------|
| $I_{CC}$  | Total supply current | $V_{sense} = 0\text{ V}$ , pin A1 open, pin A2 shorted to Gnd<br>$T_{min} < T_{amb} < T_{max}$ | -    | 240  | 420  | $\mu\text{A}$ |
| $I_{CC1}$ |                      | $V_{sense} = 50\text{ mV}$ , pin A1 connected to pin A2<br>$T_{min} < T_{amb} < T_{max}$       |      | 420  | 700  |               |

**Table 5. Current sensing amplifier input stage**

| Symbol       | Parameter   | Test conditions   | Min. | Typ.    | Max.                   | Unit                    |
|--------------|---|---|------|---------|------------------------|-------------------------|
| DC CMR1      | DC common-mode rejection<br>Variation of $V_{a1}$ versus $V_{icm}$ referred to input <sup>(1)</sup>                   | $2.8\text{ V} < V_m < 30\text{ V}$<br>$-40\text{ °C} < T_{amb} < 150\text{ °C}$     | 90   | 100     |                        | dB                      |

## 4 Electrical characteristics curves: current sense amplifier

Unless otherwise specified, the test conditions for the following curves are:

- $T_{amb} = 25\text{ }^{\circ}\text{C}$ ,  $V_{CC} = 5\text{ V}$ ,  $V_{sense} = V_p - V_m = 50\text{ mV}$ ,  $V_m = 12\text{ V}$ .
- no load on Out pin.
- signal conditioning amplifier used as a buffer (pin A3 connected to pin Out and pin A1 connected to pin A2).

## 5 Electrical characteristics curves: signal conditioning amplifier

Unless otherwise specified, the test conditions for the following curves are:

- $T_{amb} = 25\text{ }^{\circ}\text{C}$ ,  $V_{CC} = 5\text{ V}$
- no load on Out.
- signal conditioning amplifier tested as standalone amplifier.

**Figure 17. Bode diagram ( $V_{out} = V_{CC}/2$ ,  $R_L = 10\text{ k}\Omega$ ,  $C_{load} = 100\text{ pF}$ )**

## 6 Parameter definitions

### 6.1 Common-mode rejection ratio (CMR)

The common-mode rejection ratio (CMR) measures the ability of the current sensing amplifier to reject any DC voltage applied on both inputs  $V_p$  and  $V_m$ . The CMR is referred back to the input so that its effect can be compared with the applied differential signal. The CMR is defined by the formula:

$$\text{CMR} = -20 \cdot \log \frac{\Delta V_{a1}}{\Delta V_{icm} \cdot A_v}$$

### 6.2 Supply voltage rejection ratio (SVR)

The supply voltage rejection ratio (SVR) measures the ability of the current sensing amplifier to reject any variation of the supply voltage  $V_{CC}$ . The SVR is referred back to the input so that its effect can be compared with the applied differential signal. The SVR is defined by the formula:

$$\text{SVR} = -20 \cdot \log \frac{\Delta V_{a1}}{\Delta V_{cc} \cdot A_v}$$

### 6.3 Gain ( $A_v$ ) and input offset voltage ( $V_{os}$ )

The input offset voltage is defined as the intersection between the linear regression of the  $V_{a1}$  versus  $V_{sense}$  curve with the X-axis (see [Figure 18](#)). If  $V_{a11}$  is the output voltage with  $V_{sense} = V_{sense1} = 50$  mV and  $V_{a12}$  is the output voltage with  $V_{sense} = V_{sense2} = 5$  mV, then  $V_{os}$  can be calculated with the formula:

$$V_{os} = V_{sense1} - \left( \frac{V_{sense1} - V_{sense2}}{V_{a11} - V_{a12}} \cdot V_{out1} \right)$$

The amplification gain  $A_v$  is defined as the ratio between the output voltage and the input differential voltage.

$$A_v = \frac{V_{out}}{V_{sense}}$$

Figure 18.  $V_{a1}$  versus  $V_{sense}$  characteristics: detail for low  $V_{sense}$  values

## 6.4 Output voltage drift versus temperature

The output voltage drift versus temperature is defined as the maximum variation of  $V_{a1}$  with respect to its value at 25 °C, over the temperature range. It is calculated as follows:

$$\frac{\Delta V_{a1}}{\Delta T} = \max \frac{V_{a1}(T_{amb}) - V_{a1}(25^\circ \text{C})}{T_{amb} - 25^\circ \text{C}}$$

with  $T_{min} < T_{amb} < T_{max}$ .

[Figure 19](#) provides a graphical definition of the output voltage drift versus temperature. On this chart,  $V_{a1}$  is always within the area defined by the maximum and minimum variation of  $V_{a1}$  versus  $T$ , and  $T = 25^\circ \text{C}$  is considered to be the reference.

Figure 19. Output voltage drift versus temperature

## 6.5 Output voltage accuracy

The output voltage accuracy is the difference between the actual output voltage and the theoretical output voltage. Ideally, the current sensing output voltage should be equal to the input differential voltage multiplied by the theoretical gain, as in the following formula.

$$V_{a1-th} = Av \cdot V_{sense}$$

The actual value is very slightly different, mainly due to the effects of the input offset voltage  $V_{OS}$  and the non-linearity.

**Figure 20.  $V_{a1}$  vs.  $V_{sense}$  theoretical and actual characteristics**

The output voltage accuracy, expressed as a percentage, can be calculated with the following formula:

$$\Delta V_{a1} = \frac{\text{abs}(V_{a1} - (Av \cdot V_{sense}))}{Av \cdot V_{sense}}$$

with  $Av = 20 \text{ V/V}$ .

# 7 Application information

The TSC102 can be used to measure current and feed back the information to a microcontroller, as shown in [Figure 21](#).

**Figure 21. Typical application schematic**

This fully-accessible output amplifier offers wide schematic possibilities, as shown in the following examples.

## 8 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK<sup>®</sup> packages, depending on their level of environmental compliance. ECOPACK<sup>®</sup> specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK<sup>®</sup> is an ST trademark.

[www.st.com](http://www.st.com)

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
