Connections

■ Connection Examples

AC Model G3J-T□BL-C

DC Model G3J-T□BL-C (NPN transistor input)

(PNP transistor input)

Note: Harmonized protection for motor overload is ensured by using a thermal relay. Be sure, however, to install protective devices on the power supply side, such as fuses and non-fuse breakers, as protection against accidents due to short-circuiting.

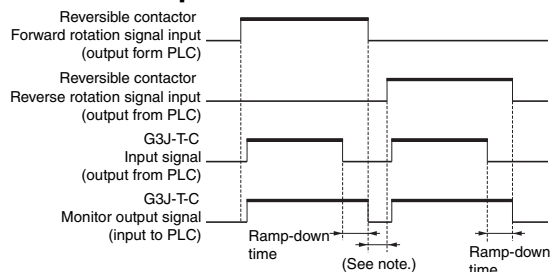

Example of Forward/Reverse Rotation Using Monitor Output

G3J-T-C

Note: Be sure to use a fuse or non-fuse breaker to protect the G3J.

Time Chart Example

Note: Switch between forward and reverse rotation only after the motor rotation has come to a complete stop.

Monitor Output Usage Example (Motor Stop Hold)

DC Model G3J-T□BL-C

Monitor Output Applications

- The monitor output will be ON while current is flowing to the main circuit. Use the monitor output, e.g., to switch the operation indicator, or to switch control signals during forward/reverse rotation or when a mechanical brake is used.
- Be sure to use a surge absorber when connecting an inductive load to the monitor output.

Do not use two G3J-T or G3J-C Contactors together for reversible operation.

Switching Frequency Conditions (AC3/AC4/AC53-a)

AC3 Class (Immediate Start)

I_e : Rated carry current
 U_e : Rated load voltage (200/400 V)
 Testing for the soft-start model was performed at the following conditions:

Ramp-up time = 1 s
 Starting torque = 450% I_n
 Testing for the soft start/stop model was performed at the following conditions:
 Ramp-up time = 1 s
 Ramp-down time = 1 s
 Starting torque = 450% I_n

AC4 Class (Inching)

I_e : Rated carry current
 U_e : Rated load voltage (200/400 V)
 Testing for the soft-start model was performed at the following conditions:

Ramp-up time = 1 s
 Starting torque = 450% I_n
 Testing for the soft start/stop model was performed at the following conditions:
 Ramp-up time = 1 s
 Ramp-down time = 1 s
 Starting torque = 450% I_n

AC53-2: 6-6: 25-15, Actual Load Service Life Test

I_e : Rated carry current
 U_e : Rated load voltage (200/400 V)
 Testing for the soft-start model was performed at the following conditions:

Ramp-up time = 1 s
 Starting torque = 450% I_n
 Testing for the soft start/stop model was performed at the following conditions:
 Ramp-up time = 1 s
 Ramp-down time = 1 s
 Starting torque = 450% I_n

Time Chart

- Note:**
1. The soft-start time and soft-stop time depend on the load characteristics (e.g., inertia and friction factor) in addition to the starting torque, ramp-up time, and ramp-down time. Therefore, the soft-start time or soft-stop time will not increase beyond a certain point if the ramp-up time and ramp-down time are increased.
 2. Due to the soft-stop control characteristics, the load current continues flowing even after the motor stops. Set to the optimum value according to the application.
 3. The operation indicator will light synchronized with the monitor output.
