

# CAT93C66, CAT93W66

## 4 kb Microwire Serial CMOS EEPROM

### Description

The CAT93C66 is a 4 kb CMOS Serial EEPROM device which is organized as either 256 registers of 16 bits (ORG pin at  $V_{CC}$ ) or 512 registers of 8 bits (ORG pin at GND). The CAT93W66 features x16 memory organization only. Each register can be written (or read) serially by using the DI (or DO) pin. The device features sequential read and self-timed internal write with auto-clear. On-chip Power-On Reset circuitry protects the internal logic against powering up in the wrong state.

### Features

- High Speed Operation: 4 MHz (5 V), 2 MHz (1.8 V)
- 1.8 V to 5.5 V Supply Voltage Range
- Selectable x8 or x16 Memory Organization: CAT93C66
- Self-timed Write Cycle with Auto-clear
- Sequential Read
- Software Write Protection
- Power-up Inadvertent Write Protection
- Low Power CMOS Technology
- 1,000,000 Program/Erase Cycles
- 100 Year Data Retention
- Industrial and Extended Temperature Ranges
- 8-lead PDIP, SOIC, TSSOP, 6-lead SOT-23, 8-pad TDFN and UDFN Packages
- These Devices are Pb-Free, Halogen Free/BFR Free, and RoHS Compliant

Figure 1. Functional Symbols

### CAT93C66 Selectable Organization:

When the ORG pin is connected to  $V_{CC}$ , the x16 organization is selected. When it is connected to ground, the x8 organization is selected. If the ORG pin is left unconnected, then an internal pull-up device will select the x16 organization.

### CAT93W66:

The device works in x16 mode only.

\* Not recommended for new designs

\*\* CAT93C66 available in SOT-23 6-pin for x8 Organization. Contact factory for availability.

### ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 16 of this data sheet.

# CAT93C66, CAT93W66

**Table 1. PIN FUNCTION**

| Pin Name | Function           | Pin Name        | Function            |
|----------|--------------------|-----------------|---------------------|
| CS       | Chip Select        | V <sub>CC</sub> | Power Supply        |
| SK       | Clock Input        | GND             | Ground              |
| DI       | Serial Data Input  | ORG (Note 1)    | Memory Organization |
| DO       | Serial Data Output | NC              | No Connection       |

1. ORG Pin available for the CAT93C66 only.

**Table 2. ABSOLUTE MAXIMUM RATINGS**

| Parameters                                         | Ratings      | Units |
|----------------------------------------------------|--------------|-------|
| Storage Temperature                                | -65 to +150  | °C    |
| Voltage on Any Pin with Respect to Ground (Note 2) | -0.5 to +6.5 | V     |

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

2. The DC input voltage on any pin should not be lower than -0.5 V or higher than V<sub>CC</sub> + 0.5 V. During transitions, the voltage on any pin may undershoot to no less than -1.5 V or overshoot to no more than V<sub>CC</sub> + 1.5 V, for periods of less than 20 ns.

**Table 3. RELIABILITY CHARACTERISTICS** (Note 3)

| Symbol                    | Parameter      | Min       | Units                  |
|---------------------------|----------------|-----------|------------------------|
| N <sub>END</sub> (Note 4) | Endurance      | 1,000,000 | Program / Erase Cycles |
| T <sub>DR</sub>           | Data Retention | 100       | Years                  |

3. These parameters are tested initially and after a design or process change that affects the parameter according to appropriate AEC-Q100 and JEDEC test methods.

4. Block Mode, V<sub>CC</sub> = 5 V, 25°C.

**Table 4. D.C. OPERATING CHARACTERISTICS – MATURE PRODUCT**

(V<sub>CC</sub> = +1.8 V to +5.5 V, T<sub>A</sub> = -40°C to +125°C unless otherwise specified.)

10. This parameter is tested initially and after a design or process change that affects the parameter.

### Device Operation

The CAT93C66 is a 4096-bit nonvolatile memory intended for use with industry standard microprocessors. The CAT93C66 can be organized as either registers of 16 bits or 8 bits. When organized as X16, seven 11-bit instructions control the reading, writing and erase operations of the device. When organized as X8, seven 12-bit instructions control the reading, writing and erase operations of the device. The CAT93W66 works in x16 mode only. The device operates on a single power supply and will generate on chip, the high voltage required during any write operation.

Instructions, addresses, and write data are clocked into the DI pin on the rising edge of the clock (SK). The DO pin is normally in a high impedance state except when reading data from the device, or when checking the ready/busy status after a write operation. The serial communication protocol follows the timing shown in Figure 2.

The ready/busy status can be determined after the start of internal write cycle by selecting the device (CS high) and polling the DO pin; DO low indicates that the write operation is not completed, while DO high indicates that the device is ready for the next instruction. If necessary, the DO pin may be placed back into a high impedance state during chip select by shifting a dummy "1" into the DI pin. The DO pin will enter the high impedance state on the rising edge of the clock (SK). Placing the DO pin into the high impedance state is recommended in applications where the DI pin and the DO pin are to be tied together to form a common DI/O pin.

The format for all instructions sent to the device is a logical "1" start bit, a 2-bit (or 4-bit) opcode, 8-bit address (an additional bit when organized X8) and for write operations a 16-bit data field (8-bit for X8 organizations). The instruction format is shown in Instruction Set table.

**Table 11. INSTRUCTION SET**

| Instruction | Start Bit | Opcode | Address      |           | Data         |        | Comments              |
|-------------|-----------|--------|--------------|-----------|--------------|--------|-----------------------|
|             |           |        | x8 (Note 11) | x16       | x8 (Note 11) | x16    |                       |
| READ        | 1         | 10     | A8-A0        | A7-A0     |              |        | Read Address AN – A0  |
| ERASE       | 1         | 11     | A8-A0        | A7-A0     |              |        | Clear Address AN – A0 |
| WRITE       | 1         | 01     | A8-A0        | A7-A0     | D7-D0        | D15-D0 | Write Address AN – A0 |
| EWEN        | 1         | 00     | 11XXXXXXX    | 11XXXXXXX |              |        | Write Enable          |
| EWDS        | 1         | 00     | 00XXXXXXX    | 00XXXXXXX |              |        | Write Disable         |
| ERAL        | 1         | 00     | 10XXXXXXX    | 10XXXXXXX |              |        | Clear All Addresses   |
| WRAL        | 1         | 00     | 01XXXXXXX    | 01XXXXXXX | D7-D0        | D15-D0 | Write All Addresses   |

11. The x8 memory organization is available for the CAT93C66 only.

## Read

Upon receiving a READ command and an address (clocked into the DI pin), the DO pin of the CAT93C66, CAT93W66 will come out of the high impedance state and, after sending an initial dummy zero bit, will begin shifting out the data addressed (MSB first). The output data bits will toggle on the rising edge of the SK clock and are stable after the specified time delay ( $t_{PD0}$  or  $t_{PD1}$ ).

For the CAT93C66, CAT93W66 after the initial data word has been shifted out and CS remains asserted with the SK clock continuing to toggle, the device will automatically increment to the next address and shift out the next data word in a sequential READ mode. As long as CS is continuously asserted and SK continues to toggle, the device will keep incrementing to the next address automatically until it reaches to the end of the address space, then loops back to address 0. In the sequential READ mode, only the initial data word is preceded by a dummy zero bit. All subsequent data

words will follow without a dummy zero bit. The READ instruction timing is illustrated in Figure 3.

## Erase/Write Enable and Disable

The device powers up in the write disable state. Any writing after power-up or after an EWDS (erase/write disable) instruction must first be preceded by the EWEN (erase/write enable) instruction. Once the write instruction is enabled, it will remain enabled until power to the device is removed, or the EWDS instruction is sent. The EWDS instruction can be used to disable all CAT93C66, CAT93W66 write and erase instructions, and will prevent any accidental writing or clearing of the device. Data can be read normally from the device regardless of the write enable/disable status. The EWEN and EWDS instructions timing is shown in Figure 4.

Figure 2. Synchronous Data Timing

Figure 3. READ Instruction Timing

## CAT93C66, CAT93W66

### Write

After receiving a WRITE command (Figure 5), address and the data, the CS (Chip Select) pin must be deselected for a minimum of  $t_{CSMIN}$ . The falling edge of CS will start the self clocking clear and data store cycle of the memory location specified in the instruction. The clocking of the SK pin is not necessary after the device has entered the self clocking mode. The ready/busy status of the CAT93C66, CAT93W66 can be determined by selecting the device and polling the DO pin. Since this device features Auto-Clear before write, it is NOT necessary to erase a memory location before it is written into.

### Erase

Upon receiving an ERASE command and address, the CS (Chip Select) pin must be deasserted for a minimum of  $t_{CSMIN}$  (Figure 6). The falling edge of CS will start the self clocking clear cycle of the selected memory location. The clocking of the SK pin is not necessary after the device has entered the self clocking mode. The ready/busy status of the CAT93C66, CAT93W66 can be determined by selecting the device and polling the DO pin. Once cleared, the content of a cleared location returns to a logical "1" state.

Figure 4. EWEN/EWDS Instruction Timing

Figure 5. Write Instruction Timing

Figure 6. Erase Instruction Timing

## CAT93C66, CAT93W66

### Erase All

Upon receiving an ERAL command (Figure 7), the CS (Chip Select) pin must be deselected for a minimum of  $t_{CSMIN}$ . The falling edge of CS will start the self clocking clear cycle of all memory locations in the device. The clocking of the SK pin is not necessary after the device has entered the self clocking mode. The ready/busy status of the device can be determined by selecting the device and polling the DO pin. Once cleared, the contents of all memory bits return to a logical “1” state.

### Write All

Upon receiving a WRAL command and data, the CS (Chip Select) pin must be deselected for a minimum of  $t_{CSMIN}$  (Figure 8). The falling edge of CS will start the self clocking data write to all memory locations in the device. The clocking of the SK pin is not necessary after the device has entered the self clocking mode. The ready/busy status of the device can be determined by selecting the device and polling the DO pin. It is not necessary for all memory locations to be cleared before the WRAL command is executed.

\* Marking for New Product (Rev H)

12. All packages are RoHS-compliant (Lead-free, Halogen-free).

13. The standard lead finish is NiPdAu.

14. For additional package and temperature options, please contact your nearest ON Semiconductor Sales office.

15. For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specifications Brochure, BRD8011/D.

16. For detailed information and a breakdown of device nomenclature and numbering systems, please see the ON Semiconductor Device Nomenclature document, TND310/D, available at [www.onsemi.com](http://www.onsemi.com)

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
