MAX16150

nanoPower Pushbutton On/Off Controller and Battery Freshness Seal

General Description

The MAX16150A/MAX16150B are extremely low-power, pushbutton, on/off controllers with a switch debouncer and built-in latch. These devices accept a noisy input from a mechanical switch and produce a clean, latched output, as well as a one-shot interrupt output, in response to a switch closure exceeding the debounce period at $\overline{PB_IN}$. The MAX16150A de-asserts the latched output when the switch closure period exceeds the shutdown period, while the MAX16150B does not de-assert the latched output in response to switch closure. For the MAX16150B, a longer switch closure results in a longer interrupt signal.

The MAX16150A/MAX16150B operate from a supply range of +1.3V to +5.5V and consume less than 20nA of supply current to ensure minimal battery drain in low-power applications, as well as to allow use as a battery "freshness seal". The robust switch input ($\overline{PB_IN}$) accepts up to ±60V levels and is ±15kV ESD-protected for use in harsh environments. The latched output can serve as a logic signal to control a regulator, or it can serve as a switch to connect the load directly to the power supply when load current is low, providing 20mA of output current with less than 100mV voltage drop. A separate $\overline{INT}$ output provides a system interrupt whenever a valid pushbutton signal is detected. An asynchronous $\overline{CLR}$ input allows an external signal to force the latched output to the off state.

The MAX16150A and MAX16150B operate over the -40°C to +125°C temperature range are available in a 1mm x 1.5mm, 6-bump wafer-level package (WLP) and a 6-pin thin SOT-23 package.

Applications

- Portable Instruments
- Handheld Consumer Electronics
- Industrial Equipment
- Disposable Low-Power Electronics

Benefits and Features

- Low Power
  - 20nA (Max) Standby Current
- Debounces Noisy Switches
  - 50ms and 2s Debounce Timing Options
  - 8s and 16s Shutdown Timing Periods
- Latched Output Supplies 20mA Load Current With Less Than 100mV Drop
- One-Shot $\overline{INT}$ Output on Each Switch Closure
- 32ms $\overline{INT}$ Duration
- Pushbutton Input Handles Up to ±60V
- ±15kV HBM ESD Protection
- SOT23-6 and 1mm x 1.5mm, 6-bump WLPs

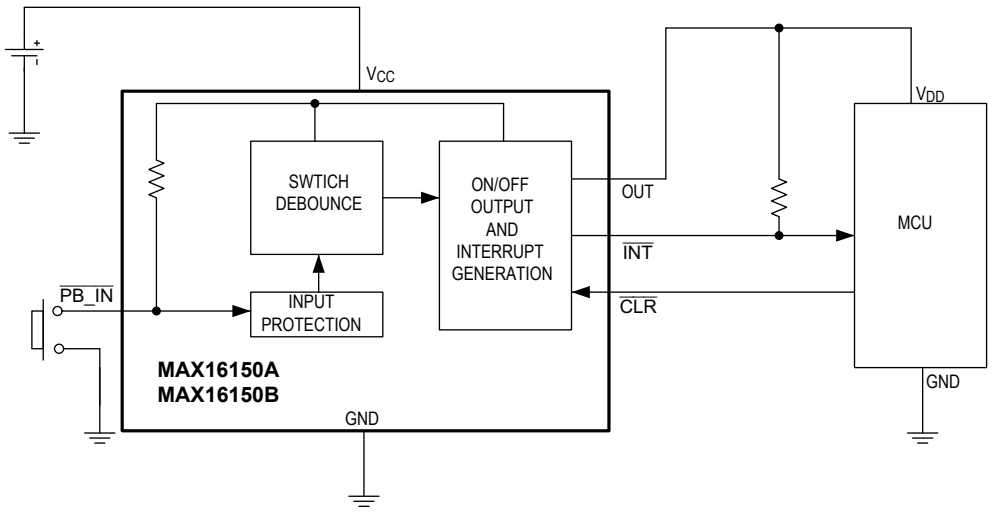
Typical Application Circuit



SWITCH DEBOUNCER/FRESHNESS SEAL PROVIDING POWER DIRECTLY TO LOW-CURRENT LOAD

Absolute Maximum Ratings

V_{CC} to GND ..... -0.3V to +6V
PB_IN to GND ..... -60V to +60V
CLR, INT, OUT to GND ..... -0.3V to +6V
Continuous Power Dissipation (Multilayer Board) SOT23-6 (T_A = +70°C, derate 8.70mW/°C above +70°C.) 696mW
Continuous Power Dissipation (Multilayer Board) WLP (T_A = +70°C, derate 10.50mW/°C above +70°C.) 840mW
Operating Temperature Range ..... -40°C to +125°C
Junction Temperature ..... +150°C
Storage Temperature Range ..... -40°C to +150°C
Soldering Temperature (reflow) ..... +260°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Package Information

SOT23-6

Package Code	U6+1
Outline Number	21-0058
Land Pattern Number	90-0175
Thermal Resistance, Single Layer Board:	
Junction-to-Ambient (θ_{JA})	N/A
Junction-to-Case Thermal Resistance (θ_{JC})	80°C/W
Thermal Resistance, Four Layer Board:	
Junction-to-Ambient (θ_{JA})	115°C/W
Junction-to-Case Thermal Resistance (θ_{JC})	80°C/W

WLP-6

Package Code	W60C1+2
Outline Number	21-100258
Land Pattern Number	Refer to *Application Note 1891*
Thermal Resistance, Four-Layer Board:	
Junction-to-Ambient (θ_{JA})	95.15°C/W
Junction-to-Case Thermal Resistance (θ_{JC})	N/A

For the latest package outline information and land patterns (footprints), go to *www.maximintegrated.com/packages*. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to *www.maximintegrated.com/thermal-tutorial*.

Electrical Characteristics

(V_{CC} = V_{MIN} to V_{MAX}, T_A = -40°C to +125°C, Limits over the operating temperature range and relevant supply voltage range are guaranteed by production and/or characterization. Typical values are at T_A = +25°C and V_{CC} = +3.3V)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Operating Voltage Range	V_{CC}		1.3		5.5	V

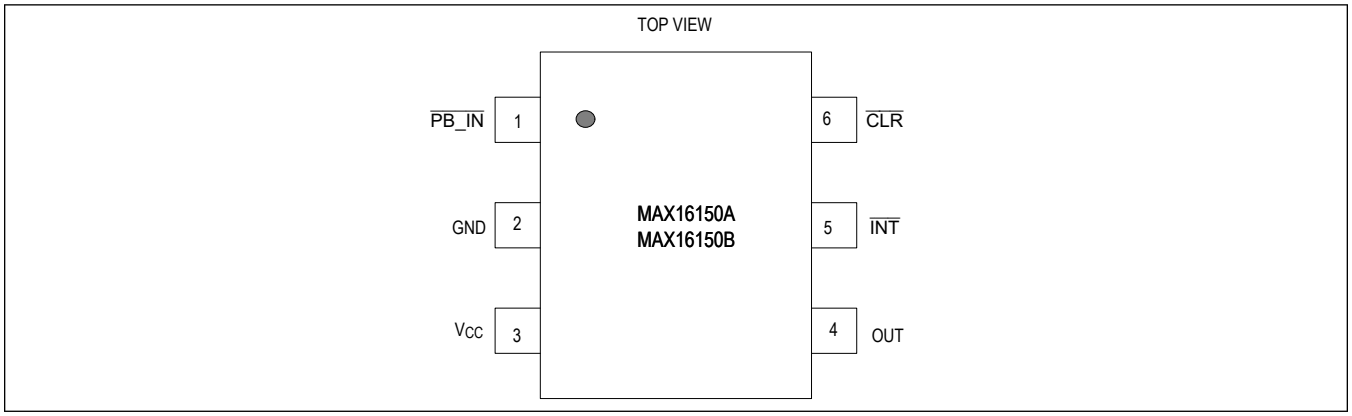
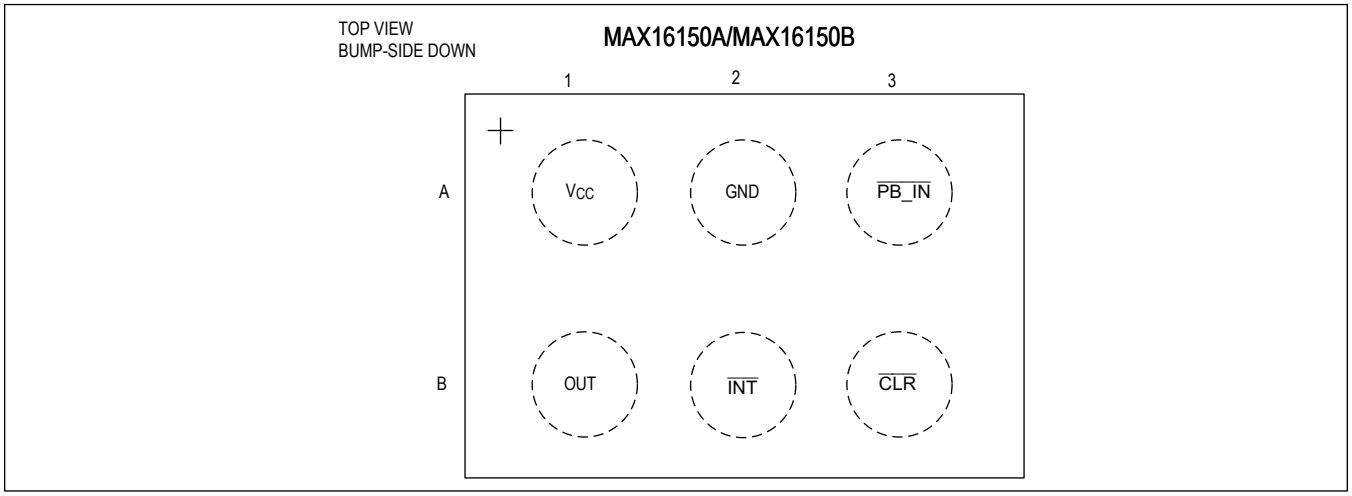
Pin Configurations

SOT23-6



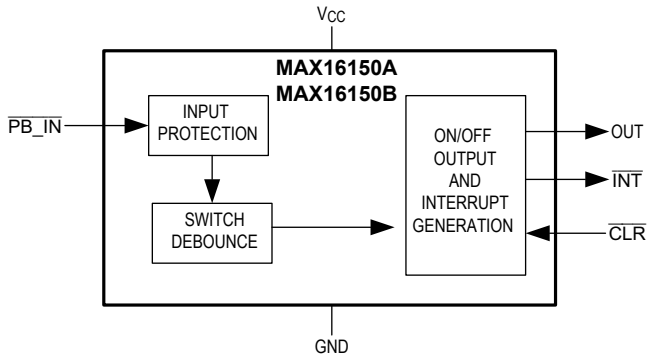
WLP-6



Pin Description

PIN		NAME	FUNCTION
SOT23-6	WLP-6		
1	A3	$\overline{PB_IN}$	Pushbutton Input. $\overline{PB_IN}$ is internally pulled up to V_{CC}. Holding $\overline{PB_IN}$ low for a period greater than the debounce time (t_{DB}) forces OUT to latch high and generates a one-shot pulse at $\overline{INT}$. For the MAX16150A, holding $\overline{PB_IN}$ low for a period greater than the shutdown period (t_{SO}) de-asserts OUT. For the MAX16150B, holding $\overline{PB_IN}$ low for a period greater than shutdown period (t_{SO}) generates an extended interrupt pulse but does not de-assert OUT.
2	A2	GND	Ground
3	A1	V_{CC}	Power Supply Input. Bypass with a 0.1µF capacitor to ground.
4	B1	OUT	Active-High, Push-Pull Latched Output. OUT is connected to V_{CC} when high.
5	B2	$\overline{INT}$	Active-Low, Open-Drain Interrupt/Reset Output. $\overline{INT}$ is a one-shot output pulse. $\overline{INT}$ asserts for the interrupt timeout period when $\overline{PB_IN}$ is held low for a period greater than the debounce time (t_{DB}). $\overline{INT}$ is high-impedance when de-asserted, even when pulled above V_{CC}.
6	B3	$\overline{CLR}$	Clear Input. Pulling $\overline{CLR}$ low de-asserts the latched OUT signal. If OUT is already de-asserted when $\overline{CLR}$ is pulled low, the state of OUT is unchanged.

Block Diagram



Detailed Description

The MAX16150A/MAX16150B are pushbutton on/off controllers with a switch debouncer and latched output for controlling system power. A switch closure that pulls $\overline{PB_IN}$ low and is stable for a period greater than or equal to the debounce time (t_{DB}) causes OUT to assert high. Driving $\overline{CLR}$ low causes OUT to de-assert. For the MAX16150A, a switch closure period greater than or equal to the shutdown period (t_{SO}) will cause OUT to de-assert. Each debounced switch closure also initiates a one-shot $\overline{INT}$ output. See Table 1 for details on the values of t_{DB}, t_{SO}, and other timing intervals.

Table 1. MAX16150A vs. MAX16150B INPUT TIMING CHARACTERISTICS

VERSION	DEBOUNCE TIME (t_{DB})	SHUTDOWN PERIOD (t_{SO})	INTERRUPT PERIOD (SWITCH CLOSURE > t_{DB})	INTERRUPT PERIOD (SWITCH CLOSURE > t_{SO})	SWITCH CLOSURE > t_{SO}
MAX16150A	50ms	8s	32ms	128ms	OUT De-asserts
MAX16150B	2s	16s	32ms	128ms	OUT Stays Asserted

Operation

The MAX16150A/MAX16150B operate from supply voltages between +1.3V and +5.5V, consuming less than 20nA of supply current when OUT is in the de-asserted state and $\overline{PB_IN}$ is unconnected. Whenever OUT is de-asserted, the state of $\overline{CLR}$ is ignored. After asserting OUT, $\overline{CLR}$ continues to be ignored for a period of 2x the $\overline{INT}$ period. For low-power applications (up to about 20mA output current), OUT can drive the load directly with minimal voltage drop. Each debounced switch closure causes $\overline{INT}$ to assert. A switch closure longer than t_{SO} results in $\overline{INT}$ asserting for a period that is 4x longer than the nominal $\overline{INT}$ period. This longer $\overline{INT}$ can be used to signal the system to perform a specific function, or to initiate a shutdown process. Closing the switch for a time longer than this extended $\overline{INT}$ period will not cause $\overline{INT}$ to be re-asserted or the $\overline{INT}$ period to be extended.

The MAX16150A de-asserts OUT when $\overline{PB_IN}$ is held low for a period equal to or greater than the shutdown period, t_{SO}. Holding $\overline{PB_IN}$ of the MAX16150B low for a period equal to or greater than the shutdown period (t_{SO}) does not de-assert OUT. Instead the MAX16150B outputs a longer interrupt signal.

Note that, when V_{CC} is first applied (for example, when the battery is initially installed), OUT may initially be in either the asserted or the de-asserted state. To change the state, use either the PB_IN or CLR input as appropriate.

Very brief high periods (less than approximately 600µs) at $\overline{PB_IN}$ are ignored, so that fast switch bounces don't interrupt the debounce logic, while valid short presses and releases cause the debouncer to reset.

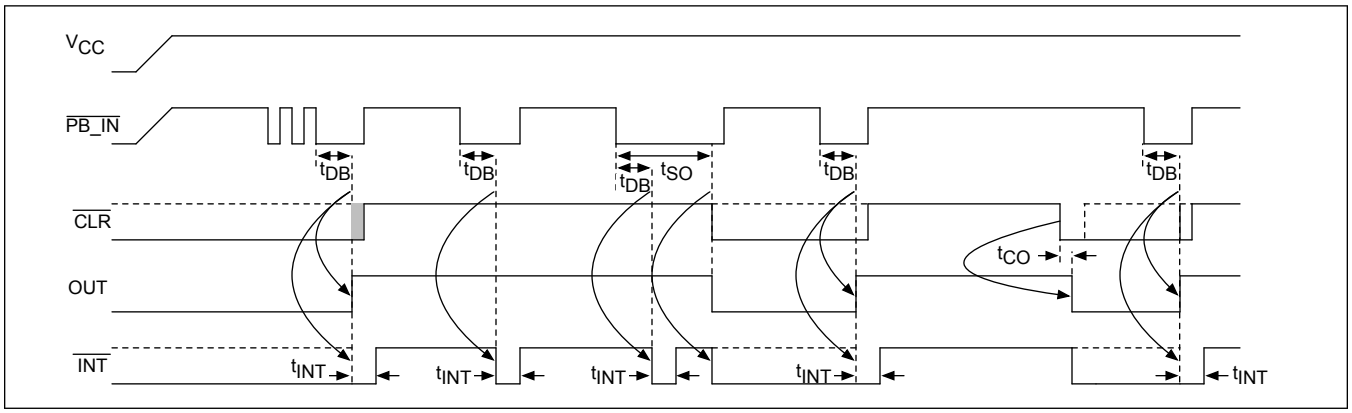


Figure 1. MAX16150A Timing Diagram

Figure 1 shows the timing diagram of the MAX16150A. A switch closure of a duration greater than t_{DB} causes OUT to

assert. A switch closure of a duration greater than t_{SO} causes OUT to de-assert. Typically, $\overline{INT}$ and $\overline{CLR}$ are pulled up either to OUT or to a regulated voltage controlled by OUT as depicted in Figure 1. As such, $\overline{INT}$ and $\overline{CLR}$ are pulled low while OUT is de-asserted. If pulled up to a constant supply voltage, $\overline{INT}$ and $\overline{CLR}$ will behave as shown by the horizontal dashed lines while OUT is de-asserted.

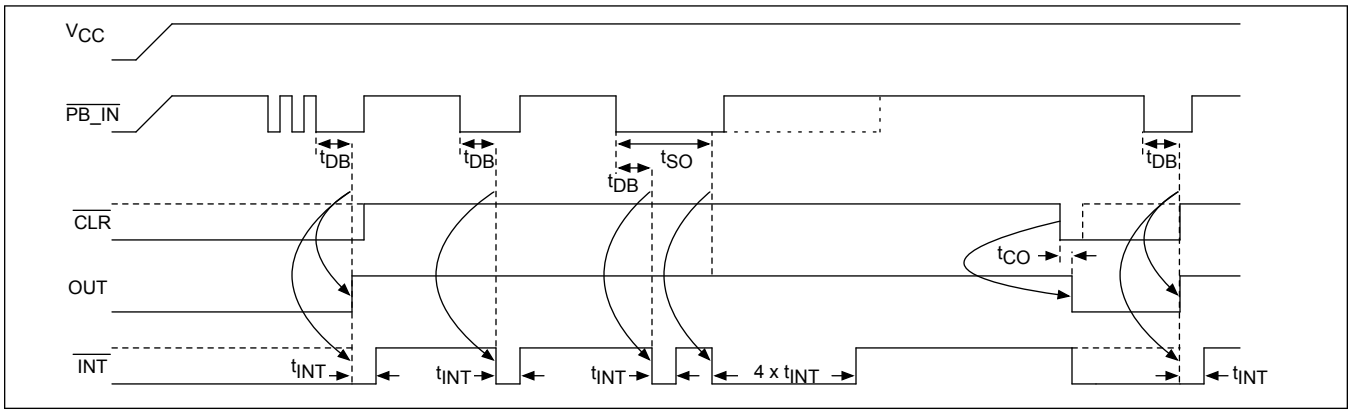

Figure 2. MAX16150B Timing Diagram

Figure 2 shows the timing diagram for the MAX16150B. A switch closure of a duration greater than t_{DB} causes OUT to assert. A switch closure of a duration greater than t_{SO} does not cause OUT to de-assert. Instead, it causes an extended interrupt. Typically, $\overline{INT}$ and $\overline{CLR}$ are pulled up either to OUT or to a regulated voltage controlled by OUT as depicted in the figure above. As such, $\overline{INT}$ and $\overline{CLR}$ are pulled low while OUT is de-asserted. If pulled up to a constant supply voltage, $\overline{INT}$ and $\overline{CLR}$ will behave as shown by the horizontal dashed lines while OUT is de-asserted.

Robust Switch Input

The switch input ($\overline{PB_IN}$) has overvoltage clamping diodes to protect against damaging fault conditions. Switch input voltages can safely swing ±60V relative to ground.

±15kV ESD Protection

ESD-protection structures are incorporated on all pins to protect against electrostatic discharges encountered during handling and assembly. The MAX16150A/MAX16150B have extra protection against static electricity to protect against ESD of ±15kV at the switch input without damage. The ESD structures withstand high ESD in all states: normal operation, shutdown, and powered down. A design advantage of these devices is that they continue working without latchup after an ESD event, which eliminates the need to power-cycle the device. ESD protection can be tested in various ways; this product is characterized for protection to ±15kV using the Human Body Model.

Human Body Model

Figure 3 shows the Human Body Model, while Figure 4 shows the current waveform it generates when discharged into a low-impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the test device through a 1.5kΩ resistor.

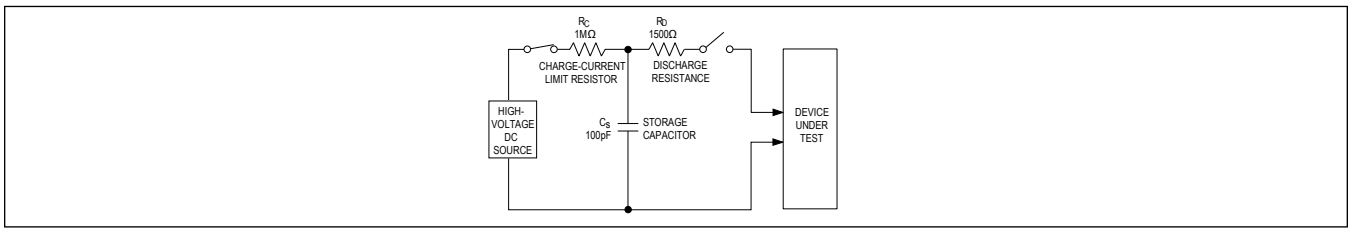

Figure 3. Human Body ESD Test Model

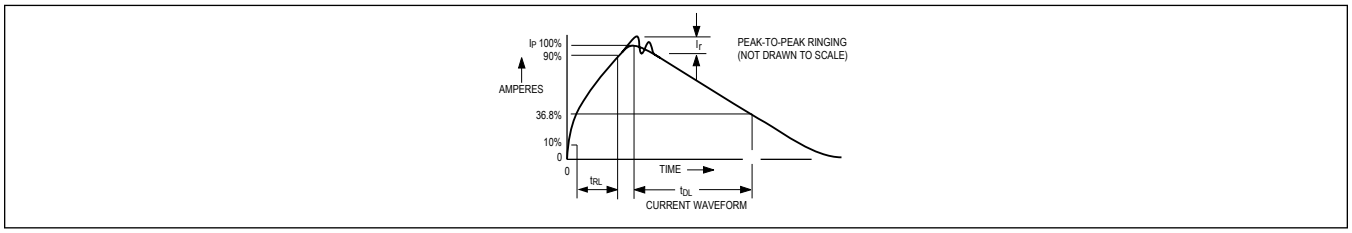

Figure 4. Human Body Current Waveform

Applications Information

Powering the Load

OUT is capable of driving light loads. When the supply current of circuitry is less than about 20mA, the voltage drop from V_{CC} to OUT is less than 100mV. The *Typical Application Circuit*, located at the beginning of this document, shows OUT providing power directly to the load.

Some systems require higher power supply current than the output of the MAX16150 can provide. For those cases, OUT can be used as an enable signal for the voltage regulator powering the system. This *Typical Application Circuit* shows an LDO providing power to the load. The LDO's enable input is driven by OUT. A debounced pushbutton at $\overline{PB_IN}$ of the MAX16150 causes OUT to assert high, thereby enabling the LDO.

Typical Application Circuit

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- *Конкурентоспособные цены и скидки постоянным клиентам.*
- *Специальные условия для постоянных клиентов.*
- *Подбор аналогов.*
- *Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.*

- *Приемлемые сроки поставки, возможна ускоренная поставка.*
- *Доставку товара в любую точку России и стран СНГ.*
- *Комплексную поставку.*
- *Работу по проектам и поставку образцов.*
- *Формирование склада под заказчика.*

- *Сертификаты соответствия на поставляемую продукцию (по желанию клиента).*
- *Тестирование поставляемой продукции.*
- *Поставку компонентов, требующих военную и космическую приемку.*
- *Входной контроль качества.*
- *Наличие сертификата ISO.*

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- *Регистрацию проекта у производителя компонентов.*
- *Техническую поддержку проекта.*
- *Защиту от снятия компонента с производства.*
- *Оценку стоимости проекта по компонентам.*
- *Изготовление тестовой платы монтаж и пусконаладочные работы.*
