Application Information

Power Supplies

A common V_{CC} power supply should be used for all pins requiring DC power. All supply pins should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade noise figure and fast transients can trigger ESD clamps and cause them to fail. Supply voltage change or transients should have a slew rate smaller than $1V / 20\mu s$. In addition, all control pins should remain at $0V (+/-0.3V)$ while the supply voltage ramps up or while it returns to zero.

Control Pin Interface

If control signal integrity is a concern and clean signals cannot be guaranteed due to overshoot, undershoot, ringing, etc., the following circuit at the input of each control pin is recommended. This applies to control pins 7 and 8 as shown below.

Evaluation Kit (EVKit) Operation

External Supply Setup

Set up a V_{CC} power supply in the voltage range of 2.5V to 5.25V with the power supply output disabled.

For the 75 Ω EVKit, connect the disabled V_{CC} supply connection to J6 pin 2 and GND to J6 pins 1 or 5.

For the 50 Ω EVKit, connect the disabled V_{CC} supply connection to J6 pin 3 and GND to J6 pin 1, 2, 4, 6, 8, 9, or 10.

Logic Control Setup

With the logic control lines disabled set the HIGH and LOW logic levels to satisfy the levels stated in the electrical specifications table.

For the 75 Ω EVKit, connect the disabled logic control lines to J6 EN (pin 3) and V_{CTL} (pin 4).

For the 50 Ω EVKit, connect the disabled logic control lines to J6 EN / LS (pin 5) and V_{CTL} (pin 7).

See Table 9 for the logic truth table.

Turn On Procedure

Setup the supplies and EVKit as noted in the External Supply Setup and Logic Control Setup sections above.

Enable the V_{CC} supply.

Enable the logic control signals.

Set the logic settings to achieve the desired Table 9 configuration. Note that external control logic should not be applied without V_{CC} being present.

Turn Off Procedure

Set the logic control pins to a logic LOW.

Disable the V_{CC} supply.
