## Summary Specification

### KAI-0340 Image Sensor

#### DESCRIPTION

The KAI-0340 image sensor is a 640 (H) x 480 (V) resolution, 1/3" optical format, progressive scan interline CCD. This image sensor is offered in 2 versions: the KAI-0340-Dual supports 210 full resolution frame-per-second readout while the KAI-0340-Single supports 110 frame-per-second readout. Frame rates as high as 2,000 Hz (KAI-0340-Single) and 3,400 Hz (KAI-0340-Dual) can be achieved by combining the Fast Horizontal Line Dump with custom clocking modes. Designed for demanding imaging applications, the KAI-0340 provides electronic shuttering, peak QE (quantum efficiency) of 55%, extremely low noise and low dark current. These features give this sensor exceptional sensitivity and make it ideal for machine vision, scientific, surveillance, and other computer input applications.

#### FEATURES

- High sensitivity
- High dynamic range
- Low noise architecture
- High frame rate
- Electronic shutter

#### APPLICATIONS

- Intelligent Transportation Systems
- Machine Vision
- Scientific

Parameter	Value
Architecture	Interline CCD; Progressive Scan
Total Number of Pixels	696 (H) x 492 (V)
Number of Effective Pixels	648 (H) x 484 (V)
Number of Active Pixels	640 (H) x 480 (V)
Pixel Size	7.4 μm (H) x 7.4 μm (V)
Active Image Size	4.736mm (H) x 3.552mm (V) 5.920mm (diagonal) 1/3" optical format
Aspect Ratio	4:3
Number of Outputs	1 or 2
Charge Capacity	40 MHz – 20,000 electrons 20 MHz – 40,000 electrons
Output Sensitivity	30 μV/e
Photometric Sensitivity KAI-0340-ABB	3.61 V/lux-sec
Photometric Sensitivity KAI-0340-CBA	1.17(B), 1.54(G), 0.65(R) V/lux-sec
Readout Noise	40 MHz – 16 electrons 20 MHz – 14 electrons
Dynamic Range	40 MHz – 62 dB 20 MHz – 69 dB
Dark Current	Photodiode < 200 eps VCCD < 1000 eps
Maximum Pixel Clock Speed	40MHz
Maximum Frame Rate	KAI-0340-Dual – 210 fps KAI-0340-Single – 110 fps
Package Type	CerDIP
Package Size	0.500" [12.70mm] width 0.625" [15.87mm] length
Package Pins	22
Package Pin Spacing	0.050"

All parameters above are specified at T = 40 °C

## Ordering Information

Catalog Number	Product Name	Description	Marking Code
4H0655	KAI-0340-AAA-CP-AA-Single	Monochrome, No Microlens, CERDIP Package (sidebrazed), Taped Clear Cover Glass, no coatings, Standard Grade, Single Output	KAI-0340S
4H0656	KAI-0340-AAA-CP-AE-Single	Monochrome, No Microlens, CERDIP Package (sidebrazed), Taped Clear Cover Glass, no coatings, Engineering Grade, Single Output	
4H0657	KAI-0340-AAA-CP-AA-Dual	Monochrome, No Microlens, CERDIP Package (sidebrazed), Taped Clear Cover Glass, no coatings, Standard Grade, Dual Output	KAI-0340D
4H0658	KAI-0340-AAA-CP-AE-Dual	Monochrome, No Microlens, CERDIP Package (sidebrazed), Taped Clear Cover Glass, no coatings, Engineering Grade, Dual Output

## Device Description

### ARCHITECTURE

Figure 1: Sensor Architecture

There are 4 light-shielded rows followed by 488 photoactive rows. The first 4 and the last 4 photoactive rows are buffer rows giving a total of 480 lines of image data.

In the single output mode all pixels are clocked out of the Video L output in the lower left corner of the sensor. The first 12 empty pixels of each line do not receive charge from the vertical shift register. The next 24 pixels receive charge from the left light-shielded edge followed by 648 photosensitive pixels and finally 24 more light-shielded pixels from the right edge of the sensor. The first and last 4 photosensitive pixels are buffer pixels giving a total of 640 pixels of image data.

In the dual output mode the clocking of the right half of the horizontal CCD is reversed. The left half of the image is clocked out Video L and the right half of the image is clocked out Video R. Each row consists of 12 empty pixels followed by 24 light-shielded pixels followed by 324 photosensitive pixels. When reconstructing the image, data from Video R will have to be reversed in a line buffer and appended to the Video L data.

There are no dark reference rows at the top and 4 dark rows at the bottom of the image sensor. The 4 dark rows are not entirely dark and so should not be used for a dark reference level. Use the 24 dark columns on the left or right side of the image sensor as a dark reference.

Of the 24 dark columns, the first and last dark columns should not be used for determining the zero signal level. Some light does leak into the first and last dark columns. Only use the center 22 columns of the 24 column dark reference.

**ESD PROTECTION**

Figure 2: ESD Protection

The ESD protection on the KAI-0340 is implemented using bipolar transistors. The substrate (SUB) forms the common collector of all the ESD protection transistors. The ESD pin is the common base of all the ESD protection transistors. Each protected pin is connected to a separate emitter as shown in Figure 2.

The ESD circuit turns on if the base-emitter junction voltage exceeds 17 V. Care must be taken while operating the image sensor, especially during the power on sequence, to not forward bias the base-emitter or base-collector junctions. If it is possible for the camera power up sequence to forward bias these junctions then diodes D1 and D2 should be added to protect the image sensor. Put one diode D1 between the ESD and VSUB pins. Put one diode D2 on each pin that may forward bias the base-emitter junction. The diodes will prevent large currents from flowing through the image sensor. Note that external diodes D1 and D2 are optional and are only needed if it is possible to forward bias any of the junctions.

Note that diodes D1 and D2 are added external to the KAI-0340.

### PIN DESCRIPTION AND PHYSICAL ORIENTATION

Figure 3: Package Pin Designations - Top View

Pin	Name	Description
1	VOUTL	Video Output, Left
2	RL	Reset Gate, Left
3	H2BL	Horizontal Clock, Phase 2, Barrier, Left
4	H1BL	Horizontal Clock, Phase 1, Barrier, Right
5	H1S	Horizontal Clock, Phase 1, Storage
6	GND	Ground
7	H2S	Horizontal Clock, Phase 2, Storage
8	H1BR	Horizontal Clock, Phase 1, Barrier, Right
9	H2BR	Horizontal Clock, Phase 2, Barrier, Right
10	RR	Reset Gate, Right
11	VOUTR	Video Output, Right

Pin	Name	Description
22	VDDL	Vdd, Left
21	FDC	Fast Line Dump Gate, Center Columns
20	ESD	ESD
19	V1C	Vertical Clock, Phase 1, Center Rows
18	V1	Vertical Clock, Phase 1, Top and Bottom Rows
17	V2	Vertical Clock, Phase 2, Top and Bottom Rows
16	V2C	Vertical Clock, Phase 2, Center Rows
15	GND	Ground
14	SUB	Substrate
13	FD	Fast Line Dump Gate, Left and Right Columns
12	VDDR	Vdd, Right

Notes:

1. The pins are on a 0.050" spacing
2. If the vertical windowing option is not to be used, then the V1 and V1C pins should be driven from one clock driver. The V2 and V2C pins should also be driven from one clock driver.
3. If the fast dump windowing option is not to be used, then the FD and FDC pins should be driven from the same clock driver.
4. The VOUTR pin is not enabled in the KAI-0340-Single version.

## Imaging Performance

### IMAGING PERFORMANCE OPERATIONAL CONDITIONS

Unless otherwise noted, Imaging Performance Specifications are measured using the following conditions.

Description	Condition	Notes
Frame Time	53 msec	1
Horizontal Clock Frequency	10 MHz	
Light Source	Continuous red, green and blue illumination centered at 450, 530 and 650 nm	2,3
Operation	Nominal operating voltages and timing	

Notes:

1. Electronic shutter is not used. Integration time equals frame time.
2. LEDs used: Blue: Nichia NLPB500, Green: Nichia NSPG500S and Red: HP HLMP-8115.
3. For monochrome sensor, only green LED used.

### IMAGING PERFORMANCE SPECIFICATIONS

n/a: not applicable

### Notes:

1. Measured at sensor output with constant current load of  $I_{out} = -5$  mA and during the floating diffusion reset interval (R high).
2. Last stage only.  $C_{LOAD} = 10$  pF. Then  $F_{-3dB} = (1 / (2\pi * R_{out} * C_{LOAD}))$ .
3. Per color.
4. Calculated using quantum efficiency, output amplifier sensitivity, 3200K Plankian source and a CM500S IR-cut filter.

## Typical Performance Curves

### QUANTUM EFFICIENCY

#### Monochrome with Microlens

Figure 4: Monochrome with Microlens Quantum Efficiency

#### Monochrome without Microlens

Figure 5: Monochrome without Microlens Quantum Efficiency

### Color (Bayer RGB) with Microlens

Figure 6: Color with Microlens Quantum Efficiency

## ANGULAR QUANTUM EFFICIENCY

### Monochrome with Microlens

For the curves marked "Horizontal", the incident light angle is varied in a plane parallel to the HCCD.

For the curves marked "Vertical", the incident light angle is varied in a plane parallel to the VCCD.

Figure 7: Angular Quantum Efficiency

### POWER - ESTIMATED

### FRAME RATES

Frames rates are for continuous mode operation.

Description	KAI-0340-Single and KAI-0340-Dual Single Output (fps)	KAI-0340-Dual Only Dual Output (fps)
640 x 480	112	214
228 x 480	306	581
640 x 164	325	618
228 x 164	877	1637
228 x 55	2000	3400

Figure 9: Frame Rates

## Defect Definitions

### MONOCHROME (EXCLUDING KAI-0340-ABB-CB-A2-SINGLE)

Description	Definition	Maximum	Temperature(s) tested at (°C)	Notes
Major dark field defective pixel	Defect $\geq$ 16mV	2	27, 40	
Major bright field defective pixel	Defect $\geq$ 11%	0	27, 40	
Minor dark field defective pixel	Defect $\geq$ 4mV	100	27, 40	
Dead pixel	Defect $\geq$ 80%	0	27, 40	
Saturated pixel	Defect $\geq$ 30mV	0	27, 40	
Cluster defect	A group of 2 to 10 contiguous major defective pixels	0	27, 40	
Column defect	A group of more than 10 contiguous major defective pixels along a single column	0	27, 40	

### MONOCHROME (KAI-0340-ABB-CB-A2-SINGLE ONLY)

Description	Definition	Maximum	Temperature(s) tested at (°C)	Notes
Major dark field defective pixel	Defect $\geq$ 16mV	2	27, 40	
Major bright field defective pixel	Defect $\geq$ 11%	10	27, 40	
Minor dark field defective pixel	Defect $\geq$ 4mV	100	27, 40	
Dead pixel	Defect $\geq$ 80%	0	27, 40	
Saturated pixel	Defect $\geq$ 30mV	0	27, 40	
Cluster defect	A group of 2 to 10 contiguous major defective pixels	0	27, 40	
Column defect	A group of more than 10 contiguous major defective pixels along a single column	0	27, 40	

### COLOR VERSIONS

Description	Definition	Maximum	Temperature(s) tested at (°C)	Notes
Major dark field defective pixel	Defect $\geq$ 16mV	2	27, 40	
Major bright field defective pixel	Defect $\geq$ 11%	2	27, 40	
Minor dark field defective pixel	Defect $\geq$ 4mV	100	27, 40	
Dead pixel	Defect $\geq$ 80%	0	27, 40	
Saturated pixel	Defect $\geq$ 30mV	0	27, 40	
Cluster defect	A group of 2 to 10 contiguous major defective pixels	0	27, 40	
Column defect	A group of more than 10 contiguous major defective pixels along a single column	0	27, 40	

### DEFECT MAP

No defect maps are available for the KAI-0340 image sensor.

## Test Definitions

### TEST REGIONS OF INTEREST

Active Area ROI: Pixel (1, 1) to Pixel (640, 480)

Center 100 by 100 ROI: Pixel (270, 190) to Pixel (369, 289)

Only the active pixels are used for performance and defect tests.

### TEST SUB REGIONS OF INTEREST

Pixel (1,1)	1	2	3	4	5	
	6	7	8	9	10	
	11	12	13	14	15	
	16	17	18	19	20	
	21	22	23	24	25	
						Pixel (640,480)

Figure 10: Test Sub Regions of Interest

### OVERCLOCKING

The test system timing is configured such that the sensor is overlocked in both the vertical and horizontal directions. See Figure 11 for a pictorial representation of the regions.

Figure 11: Overclock Regions of Interest

## TESTS

### Global Non-Uniformity

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 420 mV). Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 600 mV. Global non-uniformity is defined as

$$\text{Global Non - Uniformity} = 100 * \left( \frac{\text{Active Area Standard Deviation}}{\text{Active Area Signal}} \right)$$

Units: %rms. Active Area Signal = Active Area Average – Horizontal Overclock Average

### Global Peak to Peak Non-Uniformity

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 420 mV). Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 600 mV. The sensor is partitioned into 25 sub regions of interest, each of which is 128 by 96 pixels in size. The average signal level of each of the 25 sub regions of interest (ROI) is calculated. The signal level of each of the sub regions of interest is calculated using the following formula:

$$A[i] = (\text{ROI Average} - \text{Horizontal Overclock Average})$$

Where i = 1 to 25. During this calculation on the 25 sub regions of interest, the maximum and minimum average signal levels are found. The global peak to peak non-uniformity is then calculated as:

$$\text{Global Non - Uniformity} = 100 * \frac{A[i] \text{ MaximumSignal} - A[i] \text{ MinimumSignal}}{\text{Active Area Signal}}$$

Units: %pp. Active Area Signal = Active Area Average – Horizontal Overclock Average

## Center Non-Uniformity

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 420 mV). Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 600 mV. Defects are excluded for the calculation of this test. This test is performed on the center 100 by 100 pixels (See Test Regions of Interest) of the sensor. Center non-uniformity is defined as:

$$\text{Center ROI Non - Uniformity} = 100 * \left( \frac{\text{Center ROI Standard Deviation}}{\text{Center ROI Signal}} \right)$$

Units: %rms. Center ROI Signal = Center ROI Average – Horizontal Overclock Average

## Dark Field Defect Test

This test is performed under dark field conditions. The sensor is partitioned into 25 sub regions of interest, each of which is 128 by 96 pixels in size. In each region of interest, the median value of all pixels is found. For each region of interest, a pixel is marked defective if it is greater than or equal to the median value of that region of interest plus the defect threshold specified in “Defect Definitions” section.

## Bright Field Defect Test

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 420 mV). Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 600 mV. The average signal level of all active pixels is found. The bright and dark thresholds are set as:

Dark defect threshold = Active Area Signal \* threshold

Bright defect threshold = Active Area Signal \* threshold

The sensor is then partitioned into 25 sub regions of interest, each of which is 128 by 96 pixels in size. In each region of interest, the average value of all pixels is found. For each region of interest, a pixel is marked defective if it is greater than or equal to the median value of that region of interest plus the bright threshold specified or if it is less than or equal to the median value of that region of interest minus the dark threshold specified.

Example for major bright field defective pixels:

- Average value of all active pixels is found to be 420 mV.
- Dark defect threshold:           420mV \* 11% = 46 mV
- Bright defect threshold:        420mV \* 11% = 46 mV
- Region of interest #1 selected. This region of interest is pixels 1,1 to pixels 128,96.
  - Median of this region of interest is found to be 420 mV.
  - Any pixel in this region of interest that is  $\geq (420+46 \text{ mV})$  466 mV in intensity will be marked defective.
  - Any pixel in this region of interest that is  $\leq (420-46 \text{ mV})$  374 mV in intensity will be marked defective.
- All remaining 24 sub-regions of interest are analyzed for defective pixels in the same manner.

For the color sensor, the threshold for each color channel is determined independently.

## Operation

### MAXIMUM RATINGS

Absolute maximum rating is defined as a level or condition that should not be exceeded at any time per the description. If the level or the condition is exceeded, the device will be degraded and may be damaged.

Description	Symbol	Minimum	Maximum	Units	Notes
Operating Temperature	T	-50	70	°C	1
Humidity	RH	5	90	%	2
Output Bias Current	I <sub>out</sub>	0.0	10	mA	3
Off-chip Load	C <sub>L</sub>	n/a	10	pF	4

Notes:

- Noise performance will degrade at higher temperatures.
- T=25 °C. Excessive humidity will degrade MTTF.
- Each output. See Figure 12. Note that the current bias affects the amplifier bandwidth.
- With total output load capacitance of C<sub>L</sub> = 10 pF between the outputs and AC ground.
- Absolute maximum rating is defined as a level or condition that should not be exceeded at any time per the description. If the level or the condition is exceeded, the device will be degraded and may be damaged.

### MAXIMUM VOLTAGE RATINGS BETWEEN PINS

Description	Minimum	Maximum	Units	Notes
RL, RR, H1S, H2S, H1BL, H2BL, H1BR, H2BR to ESD	0	17	V	
Pin to Pin with ESD Protection	-17	17	V	1
VDDL, VDDR to GND	0	25	V	

Notes:

- Pins with ESD protection are: RL, RR, H1S, H2S, H1BL, H2BL, H1BR, and H2BR.

### DC BIAS OPERATING CONDITIONS

Description	Symbol	Minimum	Nominal	Maximum	Units	Maximum DC Current (mA)	Notes
Output Amplifier Supply	VDD	14.75	15.0	15.25	V	2.5 mA	1, 4
Ground	GND	0.0	0.0	0.0	V		
Substrate	SUB	8.0	VAB	15.0	V		2, 6
ESD Protection	ESD	-9.25	-9.0	-8.75	V	2.0 mA	3
Output Bias Current	Iout	0.0	5.0	10.0	mA		5

Notes:

1. The maximum DC current is for one output unloaded and is shown as  $I_{rd} + I_{ss}$  in Figure 12. This is the maximum current that the first two stages of one output amplifier plus the reset drain bias circuit will draw. This value is with  $V_{out}$  disconnected.
2. The operating value of the substrate voltage,  $V_{AB}$ , will be marked on the shipping container for each device. The shipping container will be marked with two  $V_{AB}$  voltages. One  $V_{AB}$  will be for a 600mV charge capacity and the other  $V_{AB}$  will be for a 1200mV charge capacity. The 600mV charge capacity is for operation of the horizontal clock at frequencies greater than 20 MHz. The 1200mV charge capacity  $V_{AB}$  value may be used for horizontal clock frequencies at or below 20MHz.
3.  $V_{ESD}$  must be more negative than H1L, H2L and RL during sensors operation AND during camera power turn on.
4. **Both VDDL and VDDR must both be supplied.**
5. One output.
6. Refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions*.

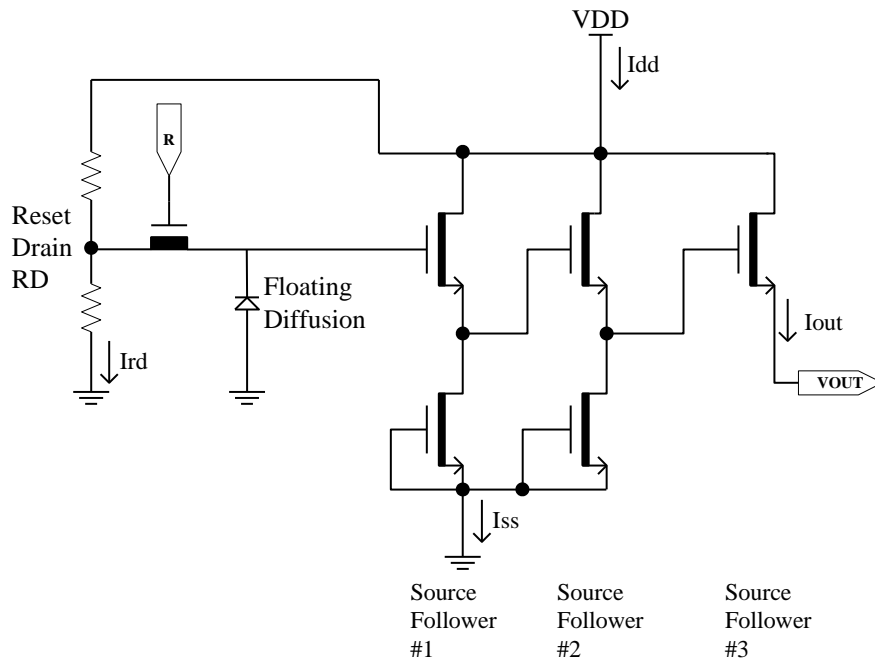

Figure 12: Output Amplifier

## AC OPERATING CONDITIONS

### Clock Levels

Description	Symbol	Minimum	Nominal	Maximum	Units	Notes
Vertical CCD Clock High	V2H	9.5	+10.0	10.5	V	
Vertical CCD Clocks Midlevel	V1M, V2M	-0.2	+0.0	+0.2	V	
Vertical CCD Clocks Low	V1L, V2L	-9.5	-9.0	-8.5	V	
Horizontal CCD Clocks High	H1H, H2H	-0.5	+0.0	+0.5	V	1
Horizontal CCD Clocks Low	H1L, H2L	-5.5	-5.0	-4.5	V	1
Reset Clock High	RH	+1.5	+2.0	+2.5	V	2
Reset Clock Low	RL	-3.5	-3.0	-2.5	V	2
Electronic Shutter Voltage	VES	44	48	52	V	3
Fast Dump High	FDH	+4.0	+5.0	+5.5	V	
Fast Dump Low	FDL	-9.5	-9.0	-8.5	V	

Notes:

1. The amplitude of the horizontal clock must be at least 4.5 volts.
2. The amplitude of the reset clock must be at least 4.5 volts.
3. Refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions*.

The figure below shows the DC bias (SUB) and AC clock (VES) applied to the SUB pin. Both the DC bias and AC clock are referenced to ground.

### Clock Line Capacitances

PIN	Approximate Capacitance	Units
V1C	3	nF
V1	5	nF
V2	5	nF
V2C	2	nF
H2BL	25	pF
H1BL	25	pF
H1S	40	pF
H2S	40	pF
H1BR	25	pF
H2BR	25	pF
RL	20	pF
RR	20	pF
FD	30	pF
FDC	25	pF

### TIMING REQUIREMENTS

Description	Symbol	Minimum	Units	Notes
HCCD Delay	$T_{HD}$	200	ns	
VCCD Transfer Time	$T_{VCCD}$	200	ns	
Photodiode Transfer Time	$T_{V3rd}$	300	ns	
VCCD Pedestal Time	$T_{3P}$	15	$\mu$ s	
VCCD Delay	$T_{3D}$	5	$\mu$ s	
VCCD Frame Delay	$T_{3L}$	15	$\mu$ s	
VCCD Line End Delay	$T_{EL}$	25	ns	
HCCD Clock Period	$T_H$	25	ns	1
Reset Pulse Time	$T_R$	2.5	ns	
Shutter Pulse Time	$T_S$	1.0	$\mu$ s	
Shutter Pulse Delay	$T_{SD}$	1.0	$\mu$ s	
Fast Line Dump Delay	$T_{FD}$	75	ns	

Description	Symbol	Minimum	Units	Notes
VCCD Clock Overlap	$T_{OV}$	50	%	

Notes:

- For operation at the minimum HCCD clock period (40MHz), the substrate voltage must be set to limit the signal at the output to 600 mV.
- Each clock pulse width is defined for  $t_{wh}$  or  $t_{wl}$ .

### TIMING SEQUENCES

#### Timing Sequence A: Photodiode to VCCD transfer, Entire Image

Figure 13: Timing Sequence A

**Timing Sequence B: Vertical CCD Line Shift and Horizontal CCD Readout of One Line**

Figure 14: Timing Sequence B

Timing Sequence C: Photodiode to VCCD Transfer, Center 164 Rows

Timing Sequence D: No Vertical CCD Line Transfer, Readout of One Horizontal CCD Line

Figure 16: Timing Sequence D

## TIMING MODES

### Sensor Architecture

When the sensor is operated in single output mode using the left output, the horizontal CCD is 708 pixels long. This assumes no horizontal over clocking is done.

When the sensor is operated in dual output mode, the horizontal CCD is divided into left and right registers. Each half of the register is 360 pixels long. This assumes no horizontal over clocking is done.

One Output Full Field

708 HCCD clock cycles per line  
492 VCCD clock cycles

VCCD overclocking: allowed  
HCCD overclocking: allowed

H1 timing: connect to H1S, H1BL, H2BR  
H2 timing: connect to H2S, H2BL, H1BR

FDH = Active  
FDL = Inactive

Two Outputs Full Field

360 HCCD clock cycles per line  
492 VCCD clock cycles

VCCD overclocking: allowed  
HCCD overclocking: allowed

H1 timing: connect to H1S, H1BL, H1BR  
H2 timing: connect to H2S, H2BL, H2BR

FDH = Active  
FDL = Inactive

### One Output Center Columns

246 HCCD clock cycles per line  
492 VCCD clock cycles

VCCD overclocking: allowed  
HCCD overclocking: **not** allowed

H1 timing: connect to H1S, H1BL, H2BR  
H2 timing: connect to H2S, H2BL, H1BR

FDH = Active  
FDL = Inactive

### Two Outputs Center Columns

120 HCCD clock cycles per line  
492 VCCD clock cycles

VCCD overclocking: allowed  
HCCD overclocking: **not** allowed

H1 timing: connect to H1S, H1BL, H1BR  
H2 timing: connect to H2S, H2BL, H2BR

FDH = Active  
FDL = Inactive

One Output Center Rows

708 HCCD clock cycles per line  
163 VCCD clock cycles

VCCD overclocking: **not** allowed  
HCCD overclocking: allowed

H1 timing: connect to H1S, H1BL, H2BR  
H2 timing: connect to H2S, H2BL, H1BR

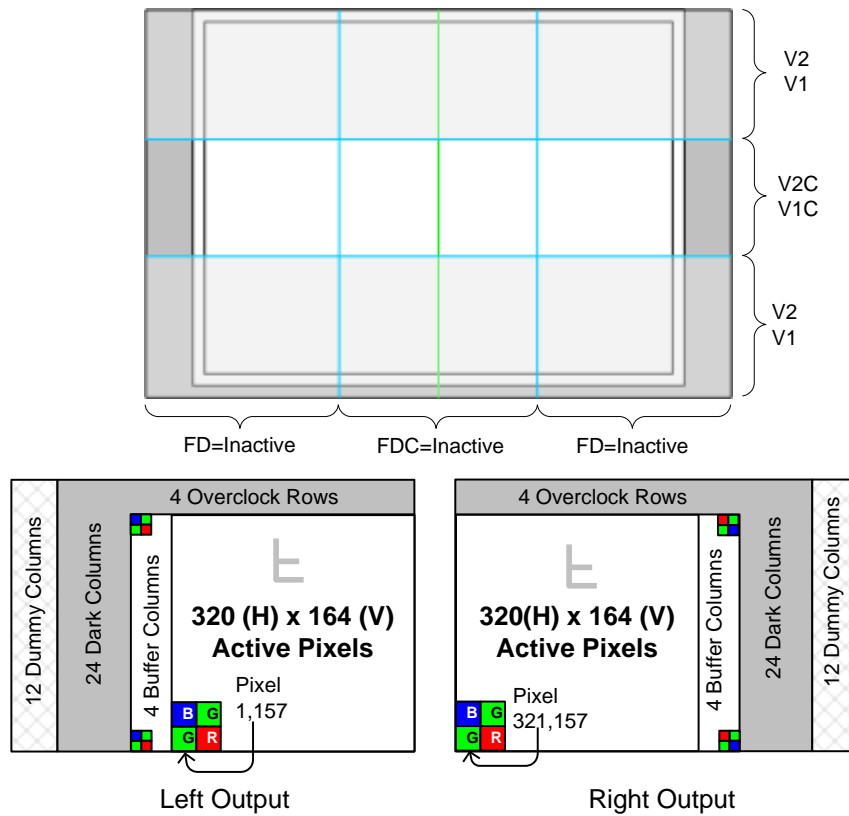

FDH = Active  
FDL = Inactive

Omit this step if the 4  
overclock rows are  
not needed

### Two Outputs Center Rows

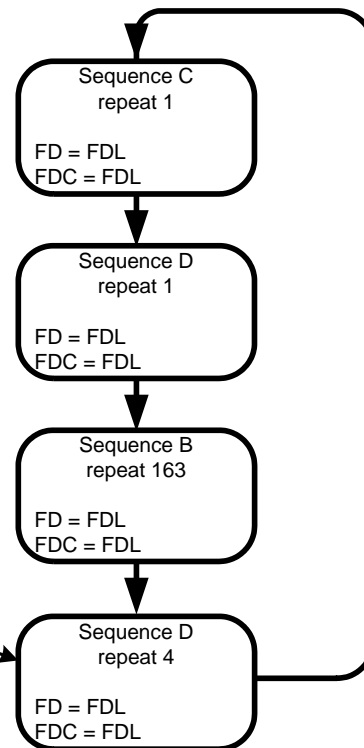

360 HCCD clock cycles per line  
163 VCCD clock cycles

VCCD overlocking: **not** allowed  
HCCD overlocking: allowed

H1 timing: connect to H1S, H1BL, H1BR  
H2 timing: connect to H2S, H2BL, H2BR

FDH = Active  
FDL = Inactive

Omit this step if the 4  
overclock rows are  
not needed

### One Output Center Rows and Columns

246 HCCD clock cycles per line  
163 VCCD clock cycles

VCCD overclocking: **not** allowed  
HCCD overclocking: **not** allowed

H1 timing: connect to H1S, H1BL, H2BR  
H2 timing: connect to H2S, H2BL, H1BR

FDH = Active  
FDL = Inactive

Omit this step if the 4  
overclock rows are  
not needed

### Two Outputs Center Rows and Columns

120 HCCD clock cycles per line  
163 VCCD clock cycles

VCCD overclocking: **not** allowed  
HCCD overclocking: **not** allowed

H1 timing: connect to H1S, H1BL, H1BR  
H2 timing: connect to H2S, H2BL, H2BR

FDH = Active  
FDL = Inactive

Omit this step if the 4 over clock rows are not needed

### TIMING DETAILS

#### Pixel Timing

Figure 17: Pixel Timing Detail

### Vertical Clock Phase 1 – Line Timing Detail

The following timing detail applies if any of the center row timing modes are selected. If the center row timing modes are not to be used, then the V1 and V1C pins should be tied together and driven from one clock driver.

During the line timing, the V1 and V1C rise and fall times need to be identical. Since the V1 capacitance is approximately twice the V1C capacitance, the clock driver circuits must be adjusted to ensure equal rise and fall times.

The figure below is an example of unacceptable V1 and V1C clock waveforms.

The figures below are examples of acceptable V1 and V1C clock waveforms.

### Vertical Clock Phase 2 – Line Timing Detail

The following timing detail applies if any of the center row timing modes are selected. If the center row timing modes are not to be used, then the V2 and V2C pins should be tied together and driven from one clock driver.

During the line timing, the V2 and V2C rise and fall times need to be identical. Since the V2 capacitance is approximately twice the V2C capacitance, the clock driver circuits must be adjusted to ensure equal rise and fall times.

The figure below is an example of unacceptable V2 and V2C clock waveforms.

The figures below are examples of acceptable V2 and V2C clock waveforms.

### Vertical Clocks Phases 1 and 2 – Line Timing Detail

The following line timing detail applies to all modes.

The V1 and V1C clocks must be symmetrical to the V2 and V2C clocks. The figure below is an example of unacceptable V1, V1C, V2 and V2C clock waveforms.

The figures below are of acceptable V1, V1C, V2 and V2C clock waveforms.

### Vertical Clock Phase 1 – Frame Timing Detail

The following timing detail applies if any of the center row timing modes are selected. If the center row timing modes are not to be used, then the V1 and V1C pins should be tied together and driven from one clock driver.

During the frame timing, the V1 and V1C rise and fall times need to be identical. Since the V1 capacitance is approximately twice the V1C capacitance, the clock driver circuits must be adjusted to ensure equal rise and fall times.

The figure below is an example of unacceptable V1 and V1C clock waveforms.

The figures below are examples of acceptable V1 and V1C clock waveforms

### Vertical Clock Phase 2 – Frame Timing Detail

The following timing detail applies if any of the center row timing modes are selected. If the center row timing modes are not to be used, then the V2 and V2C pins should be tied together and driven from one clock driver.

During the frame timing, the V2 and V2C rise and fall times need to be identical. Since the V2 capacitance is approximately twice the V2C capacitance, the clock driver circuits must be adjusted to ensure equal rise and fall times.

The figure below is an example of unacceptable V2 and V2C clock waveforms during the frame timing.

The figures below are examples of acceptable V2 and V2C clock waveforms during the frame timing.

### Vertical Clocks Phases 1 and 2 – Frame Timing Detail

The following frame timing detail applies to all modes.

The V1 and V1C clocks must be symmetrical to the V2 and V2C clocks. Also, during the  $T_{V3rd}$  timing, the V1 and V2 waveform edges should be aligned to occur at the same time.

The figure below is an example of unacceptable V1, V1C, V2 and V2C clock waveforms.

The figures below are of acceptable V1, V1C, V2 and V2C clock waveforms.

Electronic Shutter Timing

Figure 18: Electronic Shutter Timing

### Electronic Shutter – Integration Time Definition

Figure 19: Integration Time Definition

### Fast Line Dump Timing

The figure below shows an example of dumping three lines for all rows.

Figure 20: Fast Line Dump Timing

### EXAMPLE HCCD CLOCK DRIVER

The HCCD clock inputs should be driven by buffers capable of driving a capacitance of 40 pF and having a full voltage swing of at least 4.7 Volts. A 74AC04 or equivalent is recommended to drive the HCCD. The HCCD requires a 0.0 to – 5.0 V clock. This clock level can be obtained by capacitive coupling and a diode to clamp the high level to ground. Resistors R2 and R6 are used to dampen the signal to prevent overshoots. The values of resistors R2 and R6 shown in the schematics below are only suggestions. The actual value required should be selected for each camera design.

#### Single Output Only

#### Dual Output Only

#### Selectable Single or Dual Output

The inputs to the above circuits, H1 and H2, are 5V logic from the timing generator (a programmable gate array for example). If the camera is to have selectable single or dual output modes of operation, then the timing logic needs to generate two extra signals for the H1BR and H2BR timing. For single output mode program the timing such that H1BR=H2 and H2BR=H1. For dual output mode program the timing such that H1BR=H1 and H2BR=H2.

## Storage and Handling

### STORAGE CONDITIONS

Description	Symbol	Minimum	Maximum	Units	Notes
Temperature	T <sub>ST</sub>	-55	80	°C	1
Humidity	RH	5	90	%	2

#### Notes:

1. Long-term exposure toward the maximum temperature will accelerate color filter degradation.
2. T=25 °C. Excessive humidity will degrade MTTF.

### ESD

1. This device contains limited protection against Electrostatic Discharge (ESD). ESD events may cause irreparable damage to a CCD image sensor either immediately or well after the ESD event occurred. Failure to protect the sensor from electrostatic discharge may affect device performance and reliability.
2. Devices should be handled in accordance with strict ESD procedures for Class 0 (<250V per JESD22 Human Body Model test), or Class A (<200V JESD22 Machine Model test) devices. Devices are shipped in static-safe containers and should only be handled at static-safe workstations.
3. See Application Note *Image Sensor Handling Best Practices* for proper handling and grounding procedures. This application note also contains workplace recommendations to minimize electrostatic discharge.
4. Store devices in containers made of electro-conductive materials.

### COVER GLASS CARE AND CLEANLINESS

1. The cover glass is highly susceptible to particles and other contamination. Perform all assembly operations in a clean environment.
2. Touching the cover glass must be avoided.
3. Improper cleaning of the cover glass may damage these devices. Refer to Application Note *Image Sensor Handling Best Practices*.

### ENVIRONMENTAL EXPOSURE

1. Extremely bright light can potentially harm CCD image sensors. Do not expose to strong sunlight for long periods of time, as the color filters and/or microlenses may become discolored. In addition, long time exposures to a static high contrast scene should be avoided. Localized changes in response may occur from color filter/microlens aging. For Interline devices, refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible lighting Conditions*.
2. Exposure to temperatures exceeding maximum specified levels should be avoided for storage and operation, as device performance and reliability may be affected.
3. Avoid sudden temperature changes.
4. Exposure to excessive humidity may affect device characteristics and may alter device performance and reliability, and therefore should be avoided.
5. Avoid storage of the product in the presence of dust or corrosive agents or gases, as deterioration of lead solderability may occur. It is advised that the solderability of the device leads be assessed after an extended period of storage, over one year.

### SOLDERING RECOMMENDATIONS

1. The soldering iron tip temperature is not to exceed 370 °C. Higher temperatures may alter device performance and reliability.
2. Flow soldering method is not recommended. Solder dipping can cause damage to the glass and harm the imaging capability of the device. Recommended method is by partial heating using a grounded 30 W soldering iron. Heat each pin for less than 2 seconds duration.

## Mechanical Drawings

### COMPLETED ASSEMBLY

SHOWN WITH SEALED COVER GLASS

Figure 21: Completed Assembly

**Notes:**

1. Units: IN [mm]
2. See Available Part Configurations in Ordering Section for a description of the marking code.
3. Lid shall not extend beyond ceramic edge.
4. Light shield shown for reference only. Quartz version is smaller.

### DIE TO PACKAGE ALIGNMENT

Figure 22: Die to Package Alignment

Notes:

1. Units: IN [mm]
2. Center of image area is offset from center of package by (0.00, 0.00) IN nominal.
3. Die is aligned within  $\pm 1$  degree of any package cavity edge.

**GLASS**

**Clear Cover Glass**

Figure 23: Glass Drawing

Notes:

1. Substrate: Schott D-263T eco or equivalent.
2. Units: Inch [mm].
3. Top and Bottom edge chamfers = 0.008 [0.20].
4. Corner chamfers = 0.020 [0.50].
5. Dust, scratch, dig specification: 10 microns max.

Quartz Cover Glass

Figure 24: Quartz Cover Glass

Notes:

1. Substrate: SK1300.
2. Units: Inch [mm].
3. Top and Bottom edge chamfers = 0.008 [0.20].
4. Corner chamfers = 0.020 [0.50].
5. Dust, scratch, dig specification: 10 microns max.

## Quality Assurance and Reliability

### QUALITY AND RELIABILITY

All image sensors conform to the specifications stated in this document. This is accomplished through a combination of statistical process control and visual inspection and electrical testing at key points of the manufacturing process, using industry standard methods. Information concerning the quality assurance and reliability testing procedures and results are available from ON Semiconductor upon request. For further information refer to Application Note *Quality and Reliability*.

### REPLACEMENT

All devices are warranted against failure in accordance with the *Terms of Sale*. Devices that fail due to mechanical and electrical damage caused by the customer will not be replaced.

### LIABILITY OF THE SUPPLIER

A reject is defined as an image sensor that does not meet all of the specifications in this document upon receipt by the customer. Product liability is limited to the cost of the defective item, as defined in the *Terms of Sale*.

### LIABILITY OF THE CUSTOMER

Damage from mishandling (scratches or breakage), electrostatic discharge (ESD), or other electrical misuse of the device beyond the stated operating or storage limits, which occurred after receipt of the sensor by the customer, shall be the responsibility of the customer.

### TEST DATA RETENTION

Image sensors shall have an identifying number traceable to a test data file. Test data shall be kept for a period of 2 years after date of delivery.

### MECHANICAL

The device assembly drawing is provided as a reference.

ON Semiconductor reserves the right to change any information contained herein without notice. All information furnished by ON Semiconductor is believed to be accurate.

## Life Support Applications Policy

ON Semiconductor image sensors are not authorized for and should not be used within Life Support Systems without the specific written consent of ON Semiconductor.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
