

# **BCM® Bus Converter BCM6123xD1E5117yzz**

# Isolated Fixed-Ratio DC-DC Converter

### **Features & Benefits**

- Up to 16.9A continuous secondary current
- Up to 1250W/in<sup>3</sup> power density
- 97.7% peak efficiency
- 4,242 $V_{DC}$  isolation
- Parallel operation for multi-kW arrays
- OV, OC, UV, short circuit and thermal protection
- BCM6123 through-hole ChiP package
	- $\blacksquare$  2.494 x 0.898 x 0.284in [63.34 x 22.80 x 7.21mm]
- PMBus™ management interface [a]

## **Typical Applications**

- 380 $V_{DC}$  Power Distribution
- High-End Computing Systems
- Automated Test Equipment
- Industrial Systems
- High-Density Power Supplies
- Communications Systems
- **Transportation**

### **Product Description**

The BCM6123xD1E5117yzz is a high-efficiency Bus Converter, operating from a 260 to 410 $V_{DC}$  primary bus to deliver an isolated, ratiometric secondary voltage from 32.5 to 51.3 $V_{DC}$ .

The BCM6123xD1E5117yzz offers low noise, fast transient response, and industry leading efficiency and power density. In addition, it provides an AC impedance beyond the bandwidth of most downstream regulators, allowing input capacitance normally located at the input of a PoL regulator to be located at the primary side of the BCM. With a primary to secondary K factor of 1/8, that capacitance value can be reduced by a factor of 64x, resulting in savings of board area, material and total system cost.

Leveraging the thermal and density benefits of Vicor ChiP packaging technology, the BCM offers flexible thermal management options with very low top and bottom side thermal impedances. Thermally-adept ChiP-based power components enable customers to achieve low cost power system solutions with previously unattainable system size, weight and efficiency attributes quickly and predictably.

This product can operate in the reverse direction, at full rated current, after being previously started in the forward direction.

# **Typical Applications**

*BCM6123xD1E5117y00 at point-of-load*

*BCM6123xD1E5117y01 at point-of-load*

# **Typical Applications (Cont.)**

*BCM6123xD1E5117yzz + PRM + VTM, Remote-Sense configuration*

*3-phase AC to point-of-load (3-phase AIM™ + BCM6123xD1E5117yzz)*

# **Pin Configuration**

## **Pin Descriptions**

## **Part Ordering Information**

All products shipped in JEDEC standard high profile (0.400" thick) trays (JEDEC Publication 95, Design Guide 4.10).

## **Standard Models**

## **Absolute Maximum Ratings**

The absolute maximum ratings below are stress ratings only. Operation at or beyond these maximum ratings can cause permanent damage to the device.

## **Electrical Specifications**

### **Operating Area**

*Figure 1 — Specified thermal operating area*

**Figure 2** — *Specified electrical operating area using rated R<sub>SEC HOT</sub>* 

*Figure 3 — Specified primary start up into load current and external capacitance*

### **Analog Control Signal Characteristics**

Specifications apply over all line and load conditions, unless otherwise noted; **boldface** specifications apply over the temperature range of  $-40^{\circ}$ C ≤ T<sub>INTERNAL</sub> ≤ 125°C (T-Grade); All other specifications are at T<sub>INTERNAL</sub> = 25°C unless otherwise noted.

#### **Temperature Monitor**

- The TM pin is a standard analog I/O configured as an output from an internal µC.
- The TM pin monitors the internal temperature of the controller IC within an accuracy of ±5°C.
- µC 250kHz PWM output internally pulled high to 3.3V.

#### **Enable / Disable Control**

• The EN pin is a standard analog I/O configured as an input to an internal µC.

• It is internally pulled high to 3.3V.

• When held low, the BCM internal bias will be disabled and the powertrain will be inactive.

• In an array of BCMs, EN pins should be interconnected to synchronize start up.

## **Analog Control Signal Characteristics (Cont.)**

Specifications apply over all line and load conditions, unless otherwise noted; **boldface** specifications apply over the temperature range of  $-40^{\circ}$ C ≤ T<sub>INTERNAL</sub> ≤ 125°C (T-Grade); All other specifications are at T<sub>INTERNAL</sub> = 25°C unless otherwise noted.

#### **Auxiliary Voltage Source**

- The VAUX pin is a standard analog I/O configured as an output from an internal µC.
- VAUX is internally connected to μC output and internally pulled high to a 3.3V regulator with 2% tolerance, a 1% resistor of 1.5kΩ.
- VAUX can be used as a "Ready to process full power" flag. This pin transitions VAUX voltage after a 2ms delay from the start of powertrain activating, signaling the end of soft start.

• VAUX can be used as "Fault flag". This pin is pulled low internally when a fault protection is detected.

### **PMBus™ Control Signal Characteristics**

Specifications apply over all line, load conditions, unless otherwise noted; **boldface** specifications apply over the temperature range of  $-40^{\circ}$ C ≤ T<sub>INTERNAL</sub> ≤ 125°C (T-Grade); All other specifications are at T<sub>INTERNAL</sub> = 25°C unless otherwise noted.

#### **UART SER-IN / SER-OUT Pins**

- Universal Asynchronous Receiver/Transmitter (UART) pins.
- The BCM communication version is not intended to be used without a Digital Supervisor.
- Isolated I2C communication and telemetry is available when using Vicor Digital Isolator and Vicor Digital Supervisor. Please see specific product data sheet for more details.
- UART SER-IN pin is internally pulled high using a 1.5kΩ to 3.3V.

#### **Enable / Disable Control**

• The EN pin is a standard analog I/O configured as an input to an internal µC.

• It is internally pulled high to 3.3V.

• When held low, the BCM internal bias will be disabled and the powertrain will be inactive.

• In an array of BCMs, EN pins should be interconnected to synchronize start up.

• PMBus ON/OFF command has no effect if the BCM EN pin is not in the active state. This BCM has active high EN pin logic.

### **PMBus™ Reported Characteristics**

Specifications apply over all line, load conditions, unless otherwise noted; **boldface** specifications apply over the temperature range of –40°C ≤ T<sub>INTERNAL</sub> ≤ 125°C (T-Grade); All other specifications are at T<sub>INTERNAL</sub> = 25°C unless otherwise noted.

#### **Monitored Telemetry**

- The BCM communication version is not intended to be used without a Digital Supervisor.
- The current telemetry is only available in forward operation. The input and output current reported value is not supported in reverse operation.

**[b]** Default READ Output Voltage returned when unit is disabled = –300V.

**[c]** Default READ Temperature returned when unit is disabled = –273°C.

#### **Variable Parameter**

• Factory setting of all below Thresholds and Warning limits are 100% of listed protection values.

• Variables can be written only when module is disabled either EN pulled low or  $V_{IN} < V_{IN\_UVLO-}$ .

• Module must remain in a disabled mode for 3ms after any changes to the below variables allowing ample time to commit changes to EEPROM.

**[d]** Refer to Digital Supervisor datasheet for complete list of supported commands.

## **High-Level Functional State Diagram**

## **Application Characteristics**

Temperature controlled via top-side cold plate, unless otherwise noted. All data presented in this section are collected from units processing power in the forward direction (primary side to secondary side). See associated figures for general trend data.

**Figure 8** — *Efficiency at*  $T_{CASE} = 25^{\circ}C$ 

**Figure 4 —** No-load power dissipation vs. V<sub>PRI\_DC</sub> **Figure 5 —** Full-load efficiency vs. temperature; V<sub>PRI\_DC</sub>

*Figure 18 — Start up from application of EN with pre-applied VPRI\_DC = 380V, 50% ISEC\_OUT\_DC, 100% CSEC\_OUT\_EXT*

## **General Characteristics**

## **General Characteristics (Cont.)**

Specifications apply over all line and load conditions, unless otherwise noted; **boldface** specifications apply over the temperature range of –40°C ≤ T<sub>INTERNAL</sub> ≤ 125°C (T-Grade); All other specifications are at T<sub>INTERNAL</sub> = 25°C unless otherwise noted.

[e] Product is not intended for reflow solder attach.

#### **PMBus™ System Diagram**

The PMBus communication enabled bus converter provides accurate telemetry monitoring and reporting, threshold and warning limits adjustment, in addition to corresponding status flags.

The BCM internal µC is referenced to primary ground. The Digital Isolator allows UART communication interface with the host Digital Supervisor at typical speed of 750kHz across the isolation barrier. One of the advantages of the Digital Isolator is its low power consumption. Each transmission channel is able to draw its internal bias circuitry directly from the input signal being transmitted to the output with minimal to no signal distortion.

The Digital Supervisor provides the host system µC with access to an array of up to four BCMs. This array is constantly polled for status by the Digital Supervisor. Direct communication to individual BCM is enabled by a page command. For example, the page (0x00) prior to a telemetry inquiry points to the Digital Supervisor data and pages (0x01 – 0x04) prior to a telemetry inquiry points to the array of BCMs connected data. The Digital Supervisor constantly polls the BCM data through the UART interface.

The Digital Supervisor enables the PMBus compatible host interface with an operating bus speed of up to 400kHz. The Digital Supervisor follows the PMBus command structure and specification.

Please refer to the Digital Supervisor data sheet for more details.

#### **BCM in a ChiP™**

*Figure 19 — BCM AC model*

The BCM uses a high-frequency resonant tank to move energy from primary to secondary and vice versa. The resonant LC tank, operated at high frequency, is amplitude modulated as a function of the primary voltage and the secondary current. A small amount of capacitance embedded in the primary and secondary stages of the module is sufficient for full functionality and is key to achieving high power density.

The BCM6123xD1E5117yzz can be simplified into the model shown in Figure 19.

At no load:

$$
V_{SEC} = V_{PRI} \bullet K \tag{1}
$$

K represents the "turns ratio" of the BCM. Rearranging Equation 1:

$$
K = \frac{V_{SEC}}{V_{PRI}}\tag{2}
$$

In the presence of a load,  $V_{SEC}$  is represented by:

$$
V_{SEC} = V_{PRI} \bullet K - I_{SEC} \bullet R_{SEC} \tag{3}
$$

and  $I_{\text{SEC}}$  is represented by:

$$
I_{SEC} = \frac{I_{PRI} - I_{PRI\_Q}}{K} \tag{4}
$$

R<sub>SEC</sub> represents the impedance of the BCM, and is a function of the  $R_{DS}$  <sub>ON</sub> of the primary and secondary MOSFETs and the winding resistance of the power transformer.  $I_{PRI\_Q}$  represents the quiescent current of the BCM controller, gate drive circuitry and core losses.

The effective DC voltage transformer action provides additional interesting attributes. Assuming that  $R_{SEC} = 0\Omega$  and  $I_{PRI-O} = 0$ A, Equation 3 now becomes Equation 1 and is essentially  $\log$  independent, resistor R is now placed in series with  $V_{\text{PRI}}$ .

*Figure 20 — K = 1/8 BCM with series primary resistor*

The relationship between  $V_{PRI}$  and  $V_{SFC}$  becomes:

$$
V_{SEC} = (V_{PRI} - I_{PRI} \bullet R) \bullet K \tag{5}
$$

Substituting the simplified version of Equation 4  $(I_{PRI O}$  is assumed = 0A) into Equation 5 yields:

$$
V_{SEC} = V_{PRI} \bullet K - I_{SEC} \bullet R \bullet K^2
$$
 (6)

This is similar in form to Equation 3, where  $R_{SFC}$  is used to represent the characteristic impedance of the BCM. However, in this case a real resistor, R on the primary side of the BCM is effectively scaled by  $K^2$  with respect to the secondary.

Assuming that  $R = 1\Omega$ , the effective R as seen from the secondary side is 16mΩ, with  $K = 1/8$ .

A similar exercise can be performed with the additon of a capacitor or shunt impedance at the primary of the BCM. A switch in series with  $V_{PRI}$  is added to the circuit. This is depicted in Figure 21.

*Figure 21 — BCM with primary capacitor*

A change in  $V_{PRI}$  with the switch closed would result in a change in capacitor current according to the following equation:

$$
I_c(t) = C \frac{dV_{PRI}}{dt}
$$
 (7)

Assume that with the capacitor charged to  $V_{PRI}$ , the switch is opened and the capacitor is discharged through the idealized BCM. In this case,

$$
I_C = I_{SEC} \bullet K \tag{8}
$$

substituting Equation 1 and 8 into Equation 7 reveals:

$$
I_{SEC}(t) = \frac{C}{K^2} \cdot \frac{dV_{SEC}}{dt}
$$
 (9)

The equation in terms of the secondary has yielded a  $K^2$  scaling factor for C, specified in the denominator of the equation.

A K factor less than unity results in an effectively larger capacitance on the secondary when expressed in terms of the primary. With  $K = 1/8$  as shown in Figure 21,  $C = 1\mu F$  would appear as  $C = 64\mu$ F when viewed from the secondary.

Low impedance is a key requirement for powering a high-current, low-voltage load efficiently. A switching regulation stage should have minimal impedance while simultaneously providing appropriate filtering for any switched current. The use of a BCM between the regulation stage and the point of load provides a dual benefit of scaling down series impedance leading back to the source and scaling up shunt capacitance or energy storage as a function of its K factor squared. However, these benefits are not achieved if the series impedance of the BCM is too high. The impedance of the BCM must be low, i.e., well beyond the crossover frequency of the system.

A solution for keeping the impedance of the BCM low involves switching at a high frequency. This enables the use of small magnetic components because magnetizing currents remain low. Small magnetics mean small path lengths for turns. Use of low-loss core material at high frequencies also reduces core losses.

The two main terms of power loss in the BCM are:

- $\blacksquare$  No load power dissipation (P<sub>PRI\_NI</sub>): defined as the power used to power up the module with an enabled powertrain at no load.
- Resistive loss ( $P_{R<sub>SFC</sub>}$ ): refers to the power loss across the BCM modeled as pure resistive impedance.

$$
P_{DISSIPATED} = P_{PRI\_NL} + P_{R_{SEC}} \tag{10}
$$

Therefore,

$$
P_{SEC\_OUT} = P_{PRI\_IN} - P_{DISSIPATED} = P_{PRI\_IN} - P_{PRI\_NL} - P_{RSEC} (11)
$$

The above relations can be combined to calculate the overall module efficiency:

$$
\eta = \frac{P_{SEC\_OUT}}{P_{PRI\_IN}} = \frac{P_{PRI\_IN} - P_{PRI\_NL} - P_{R_{SEC}}}{P_{PRI\_IN}}
$$
(12)

$$
= \frac{V_{PRI} \bullet I_{PRI} - P_{PRI\_NL} - (I_{SEC})^2 \bullet R_{SEC}}{V_{PRI} \bullet I_{PRI}}
$$

$$
= 1 - \left(\frac{P_{PRLNL} + (I_{SEC})^2 \cdot R_{SEC}}{V_{PRI} \cdot I_{PRI}}\right)
$$

#### **Input and Output Filter Design**

A major advantage of BCM systems versus conventional PWM converters is that the transformer based BCM does not require external filtering to function properly. The resonant LC tank, operated at extreme high frequency, is amplitude modulated as a function of primary voltage and secondary current and efficiently transfers charge through the isolation transformer. A small amount of capacitance embedded in the primary and secondary stages of the module is sufficient for full functionality and is key to achieving power density.

This paradigm shift requires system design to carefully evaluate external filters in order to:

#### ■ *Guarantee low source impedance:*

To take full advantage of the BCM's dynamic response, the impedance presented to its primary terminals must be low from DC to approximately 5MHz. The connection of the bus converter module to its power source should be implemented with minimal distribution inductance. If the interconnect inductance exceeds 100nH, the input should be bypassed with a RC damper to retain low source impedance and stable operation. With an interconnect inductance of 200nH, the RC damper may be as high as 1µF in series with 0.3Ω. A single electrolytic or equivalent low-Q capacitor may be used in place of the series RC bypass.

#### ■ *Further reduce primary and/or secondary voltage ripple without sacrificing dynamic response:*

Given the wide bandwidth of the module, the source response is generally the limiting factor in the overall system response. Anomalies in the response of the primary source will appear at the secondary of the module multiplied by its K factor.

#### **Protect the module from overvoltage transients imposed** *by the system that would exceed maximum ratings and induce stresses:*

The module primary/secondary voltage ranges shall not be exceeded. An internal overvoltage lockout function prevents operation outside of the normal operating primary range. Even when disabled, the powertrain is exposed to the applied voltage and the power MOSFETs must withstand it.

Total load capacitance at the secondary of the BCM shall not exceed the specified maximum. Owing to the wide bandwidth and low secondary impedance of the module, low-frequency bypass capacitance and significant energy storage may be more densely and efficiently provided by adding capacitance at the primary of the module. At frequencies <500kHz the module appears as an impedance of  $R_{SEC}$  between the source and load.

Within this frequency range, capacitance at the primary appears as effective capacitance on the secondary per the relationship defined in Equation 13.

$$
C_{SEC\_EXT} = \frac{C_{PRI\_EXT}}{K^2} \tag{13}
$$

This enables a reduction in the size and number of capacitors used in a typical system.

#### **Thermal Considerations**

The ChiP™ module provides a high degree of flexibility in that it presents three pathways to remove heat from the internal power-dissipating components. Heat may be removed from the top surface, the bottom surface and the leads. The extent to which these three surfaces are cooled is a key component in determining the maximum current that is available from a ChiP, as can be seen from Figure 1.

Since the ChiP has a maximum internal temperature rating, it is necessary to estimate this internal temperature based on a system-level thermal solution. Given that there are three pathways to remove heat from the ChiP, it is helpful to simplify the thermal solution into a roughly equivalent circuit where power dissipation is modeled as a current source, isothermal surface temperatures are represented as voltage sources and the thermal resistances are represented as resistors. Figure 22 shows the "thermal circuit" for a BCM6123 ChiP in an application where the top, bottom, and leads are cooled. In this case, the BCM power dissipation is  $PD_{\text{TOTAL}}$  and the three surface temperatures are represented as  $T_{CAGE\_TOP}$ ,  $T_{CASE\ BOTTOM}$ , and  $T_{LEADS}$ . This thermal system can now be very easily analyzed using a SPICE simulator with simple resistors, voltage sources, and a current source. The results of the simulation provide an estimate of heat flow through the various dissipation pathways as well as internal temperature.

*Figure 22 — Top case, bottom case and leads thermal model*

Alternatively, equations can be written around this circuit and analyzed algebraically:

$$
T_{INT} - PD_i \bullet \theta_{INT-TOP} = T_{CASE\_TOP}
$$
  
\n
$$
T_{INT} - PD_2 \bullet \theta_{INT-BOTTOM} = T_{CASE\_BOTTOM}
$$
  
\n
$$
T_{INT} - PD_3 \bullet \theta_{INTLEADS} = T_{LEADS}
$$
  
\n
$$
PD_{TOTAL} = PD_i + PD_2 + PD_3
$$

Where  $T_{INT}$  represents the internal temperature and PD<sub>1</sub>, PD<sub>2</sub>, and PD<sub>3</sub> represent the heat flow through the top side, bottom side, and leads, respectively.

*Figure 23 — Top case and leads thermal model*

Figure 23 shows a scenario where there is no bottom side cooling. In this case, the heat flow path to the bottom is left open and the equations now simplify to:

$$
T_{INT} - PD_{I} \bullet \theta_{INT-TOP} = T_{CASE\_TOP}
$$
  

$$
T_{INT} - PD_{3} \bullet \theta_{INT-LEADS} = T_{LEADS}
$$
  

$$
PD_{TOTAL} = PD_{I} + PD_{3}
$$

*Figure 24 — Top case thermal model*

Figure 24 shows a scenario where there is no bottom side and leads cooling. In this case, the heat flow paths to the bottom and leads are left open and the equations now simplify to:

$$
\begin{aligned} T_{\text{INT}}-PD_{\text{I}}\bullet\theta_{\text{INT-TOP}} &= T_{\text{CASE\_TOP}} \\ PD_{\text{TOTAL}} &= PD_{\text{I}} \end{aligned}
$$

Please note that Vicor has a suite of online tools, including a simulator and thermal estimator that greatly simplify the task of determining whether or not a BCM thermal configuration is valid for a given condition. These tools can be found at: [http://www.vicorpower.com/powerbench.](http://www.vicorpower.com/powerbench)

## **Current Sharing**

The performance of the BCM topology is based on efficient transfer of energy through a transformer without the need of closed loop control. For this reason, the transfer characteristic can be approximated by an ideal transformer with a positive temperature coefficient series resistance.

This type of characteristic is close to the impedance characteristic of a DC power distribution system both in dynamic (AC) behavior and for steady state (DC) operation.

When multiple BCMs of a given part number are connected in an array, they will inherently share the load current according to the equivalent impedance divider that the system implements from the power source to the point of load. Ensuring equal current sharing among modules requires that BCM array impedances be matched.

Some general recommendations to achieve matched array impedances include:

- $\blacksquare$  Dedicate common copper planes within the PCB to deliver and return the current to the modules.
- Provide as symmetric a PCB layout as possible among modules
- A dedicated input filter for each BCM in an array is required to prevent circulating currents.

For further details see: [AN:016 Using BCM Bus Converters in High Power Arrays.](http://www.vicorpower.com/documents/application_notes/vichip_appnote16.pdf)

*Figure 25 — BCM parallel array*

## **Fuse Selection**

In order to provide flexibility in configuring power systems, ChiP™ modules are not internally fused. Input line fusing of ChiP products is recommended at the system level to provide thermal protection in case of catastrophic failure.

The fuse shall be selected by closely matching system requirements with the following characteristics:

- $\blacksquare$  Current rating (usually greater than maximum current of BCM)
- $\blacksquare$  Maximum voltage rating (usually greater than the maximum possible input voltage)
- $\blacksquare$  Ambient temperature
- Nominal melting  $I<sup>2</sup>t$
- Recommend fuse: See safety agency approvals.

### **Reverse Operation**

BCMs are capable of reverse power operation. Once the unit is started, energy will be transferred from the secondary back to the primary whenever the secondary voltage exceeds  $V_{PRI} \bullet K$ . The module will continue operation in this fashion for as long as no faults occur.

Transient operation in reverse is expected in cases where there is significant energy storage on the output and transient voltages appear on the input.

The BCM6123xD1E5117y0R and BCM6123xD1E5117y0P are both qualified for continuous operation in reverse power condition. A primary voltage of  $V_{PRI\_DC} > V_{PRI\_UVLO+\_R}$  must be applied first to allow the primary reference controller and power train to start. Continuous operation in reverse is then possible after a successful start up.

#### **ООО "ЛайфЭлектроникс" "LifeElectronics" LLC**

*ИНН 7805602321 КПП 780501001 Р/С 40702810122510004610 ФАКБ "АБСОЛЮТ БАНК" (ЗАО) в г.Санкт-Петербурге К/С 30101810900000000703 БИК 044030703* 

 *Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.*

*С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров*

 *Мы предлагаем:*

- *Конкурентоспособные цены и скидки постоянным клиентам.*
- *Специальные условия для постоянных клиентов.*
- *Подбор аналогов.*
- *Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.*
- *Приемлемые сроки поставки, возможна ускоренная поставка.*
- *Доставку товара в любую точку России и стран СНГ.*
- *Комплексную поставку.*
- *Работу по проектам и поставку образцов.*
- *Формирование склада под заказчика.*
- *Сертификаты соответствия на поставляемую продукцию (по желанию клиента).*
- *Тестирование поставляемой продукции.*
- *Поставку компонентов, требующих военную и космическую приемку.*
- *Входной контроль качества.*
- *Наличие сертификата ISO.*

 *В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.*

*Конструкторский отдел помогает осуществить:*

- *Регистрацию проекта у производителя компонентов.*
- *Техническую поддержку проекта.*
- *Защиту от снятия компонента с производства.*
- *Оценку стоимости проекта по компонентам.*
- *Изготовление тестовой платы монтаж и пусконаладочные работы.*
