## H-Bridge and Dual Half Bridge Driver IC

## **TLE7181EM**

## 1 Overview

#### Features

- PWM/DIR-interface drives 4 N-Channel Power MOSFETs
- Unlimited D.C. switch on time of Low and Highside MOSFETs
- 0 ...95% at 20kHz & 100% Duty cycle of High Side MOSFETs
- 0 ... 100 % Duty cycle of Low Side MOSFETs
- · Additional output to drive a reverse polarity protection N-MOSFET
- Current sense OPAMP
- Low quiescent current mode
- Internal shoot through protection
- Adjustable dead time
- 1 bit diagnosis / ERR
- Over current warning based on current sense OPAMP with fixed warning level
- · Analog adjustable Short Circuit Protection levels via SCDL pin with open pin detection
- Over temperature warning
- Over voltage warning
- Under voltage warning and shutdown
- Green Product (RoHS compliant)
- AEC Qualified

#### Description

The TLE7181EM is a H-bridge driver IC dedicated to control 4 N-channel MOSFETs typically forming the converter for a high current DC motor drives in the automotive sector. It incorporates several protection features such as over current and short circuit detection as well as under-, over voltage and over temperature diagnosis.

Typical applications are fans, pumps and electric power steering. The TLE7181EM is designed for a 12V power net.

#### Table 1 Product Summary

Specified operating voltage	V <sub>SOP</sub>	7.0 V 34 V	
Junction temperature	Tj	-40 °C 150°C	
Maximum output source resistance	R <sub>Sou</sub>	13.5 Ω	
Maximum output sink resistance	R <sub>Sink</sub>	9 Ω	
maximum quiescent current <sup>1)</sup>	I <sub>QVS</sub>	8 μΑ

## 3.2 Pin Definitions and Functions

# of	Symbol	Function
Pins		
1	BH2	Pin for + terminal of the bootstrap capacitor of phase 2
2	GH2	Output pin for gate of high side MOSFET 2
3	SH2	Pin for source connection of high side MOSFET 2
4	GL2	Output pin for gate of low side MOSFET 2
5	VDH	Voltage input common drain high side for short circuit detection
6	RPP	charge pump output for reverse polarity protection of the motor bridge
7	VS	Pin for supply voltage
8	VREG	Output of supply for driver output stage - connect to a capacitor
9	ENA	Input pin for reset of ERR registers, active switch off of external MOSFETs and low quiescent current mode, set HIGH to enable operation
10	ISN	Input for OPAMP + terminal
11	ISP	Input for OPAMP - terminal
12	ISO	Output of OPAMP
13	DT	Input for adjustable dead time function, connect to GND via resistor
14	DRVDIS	Disable DIR/PWM interface & all output stages switched off
15	PWM	control input for PWM frequency and duty cycle
16	DIR	control input for spinning direction of the motor

4.1.24	Storage temperature	$T_{stg}$	-55	150	°C	-	
4.1.25	Lead soldering temperature (1/16" from body)	T <sub>sol</sub>	-	260	°C	_	
4.1.26	Peak reflow soldering temperature <sup>2)</sup>	T <sub>ref</sub>	-	260	°C	-	
Power I	Dissipation						
4.1.27	Power Dissipation (DC)	P <sub>tot</sub>	-	2	W	-	

#### **General Product Characteristics**

#### Absolute Maximum Ratings (cont'd)<sup>1)</sup>

40 °C  $\leq$   $T_i \leq$  150 °C; all voltages with respect to ground, positive current flowing into pin (unless otherwise specified)

Pos.	Parameter	Symbol	Limit Values		Unit	Conditions
			Min.	Max.		
ESD Su	sceptibility				k	
4.1.28	ESD Resistivity <sup>3)</sup>	V <sub>ESD</sub>	-	2	kV	
4.1.29	CDM	V <sub>CDM</sub>	_	1	kV	

1) Not subject to production test, specified by design.

2) Reflow profile IPC/JEDEC J-STD-020C

3) ESD susceptibility HBM according to EIA/JESD 22-A 114B

Note: Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note: Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

#### 4.2 Functional Range

Pos.	Parameter	Symbol	Limit Values		Unit	Conditions	
			Min.	Max.			
4.2.1	Specified supply voltage range	V <sub>VS1</sub>	7.0	34	V	-	
4.2.2	supply voltage range <sup>1)</sup>	V <sub>VS2</sub>	5.5	45	V	V <sub>VS</sub> <7V reduced functionality	
4.2.3	Quiescent current at VS	I <sub>QVS1</sub>	-	8	μA	$V_{VS}, V_{VDH}$ =12V; ENA=Low; $T_j$ =25°C	
4.2.4	Quiescent current at VS	I <sub>QVS2</sub>	-	10	μA	$V_{VS}, V_{VDH} < 15V;$ ENA=Low; $T_j \le 85^{\circ}C$	
4.2.5	Quiescent current at VDH	I <sub>QVDH1</sub>	-	8	μA	$V_{VS}, V_{VDH}$ =12V; ENA=Low; $T_j$ =25°C	
4.2.6	Quiescent current at VDH	I <sub>QVDH2</sub>	-	10	μA	$V_{VS}, V_{VDH} < 15V;$ ENA=Low; $T_j \le 85^{\circ}C$	
4.2.7	Supply current at Vs (device enabled) <sup>2)</sup>	I <sub>Vs(1)</sub>	-	22	mA	no switching	
4.2.8	Supply current at Vs (device enabled)	I <sub>Vs(2)</sub>	-	45	mA	4x <i>Q</i> <sub>GS</sub> x <i>f</i> <sub>PWM</sub> ≤20mA ; <i>V</i> <sub>VS</sub> =7.034V	
4.2.9	D.C. switch on time of output stages	D <sub>DC</sub>	-	×	S	-	
4.2.10	Duty cycle Highside output stage <sup>3)</sup>	D <sub>HS</sub>	0	95	%	$f_{PWM}$ =20kHz; continuous operation; $C_{BS} \ge 330$ nF	
4.2.11	Duty cycle Lowside output stage	$D_{LS}$	0	100	%	-	

1) operation above 34V limited by max. allowed power dissipation and max. ratings

2) Current can be higher, if driver output stages are unsupplied

3) max. limit of D.C. will increase, if  $f_{PWM}$  or external gate charge of the MOSFETs is reduced

**General Product Characteristics** 

The PWM frequency is limited by thermal constraints and the maximum duty cycle (minimum charging time of bootstrap capacitor).

Note: Within the functional range the IC operates as described in the circuit description. The electrical characteristics are specified within the conditions given in the related electrical characteristics table.

## 4.3 Thermal Resistance

Note: This thermal data was generated in accordance with JEDEC JESD51 standards. For more information, go to **www.jedec.org**.

Pos.	Parameter	Symbol	Limit Values			Unit	Conditions
			Min.	Тур.	Max.		
4.3.1	Junction to Case <sup>1)</sup>	R <sub>thJC</sub>	-	-	5	K/W	-
4.3.2	Junction to Ambient <sup>1)</sup>	R <sub>thJA</sub>	-	35	-	K/W	2)

1) Not subject to production test, specified by design.

2) Exposed Heatslug Package use this sentence: Specified R<sub>thJA</sub> value is according to Jedec JESD51-2,-5,-7 at natural convection on FR4 2s2p board; The Product (Chip+Package) was simulated on a 76.2 x 114.3 x 1.5 mm board with 2 inner copper layers (2 x 70µm Cu, 2 x 35µm Cu). Where applicable a thermal via array under the exposed pad contacted the first inner copper layer.

#### 4.4 Default State of Inputs

#### Table 2 Default State of Inputs (if left open)

Characteristic	State	Remark			
Default state of PWM and DIR	Low	Low side MOSFETs off and Highside MOSFETs on			
Default state of DT	OPEN	maximum deadtime			
Default state of ENA	Low	Output stages disabled device in sleep mode			
Default state of SCDL	OPEN	Short circuit detection deactivation & warning			
Default state of DRVDIS	High	All output stages off & no error will be reported			

## 5 Description and Electrical Characteristics

## 5.1 MOSFET Driver

## 5.1.1 Driving MOSFET Output Stages

The TLE7181EM incorporates 2 high side and low side output stages for 4 external MOSFETs.

The 4 MOSFET output stages will be driven by the PWM/DIR interface. With the PWM/DIR interface only 2 inputs pins are necessary to drive a typical H-bridge topology for a DC-brush motor. The rotation direction of the motor can be chosen with the input pin DIR. The speed of the motor can is controlled by applying a PWM-signal at pin PWM.

The DRVDIS pin allows to switch off all 4 MOSFETs. **Table 3** provides an overview of the different states with this interface.

DRVDIS	DIR	PWM	Highside switch1	Lowside switch1	Highside switch2	Lowside switch2
0	0	0	ON	OFF	ON	OFF
0	0	1	ON	OFF	OFF	ON
0	1	0	ON	OFF	ON	OFF
0	1	1	OFF	ON	ON	OFF
1	х	х	OFF	OFF	OFF	OFF

#### Table 3 PWM/DIR interface normal operation

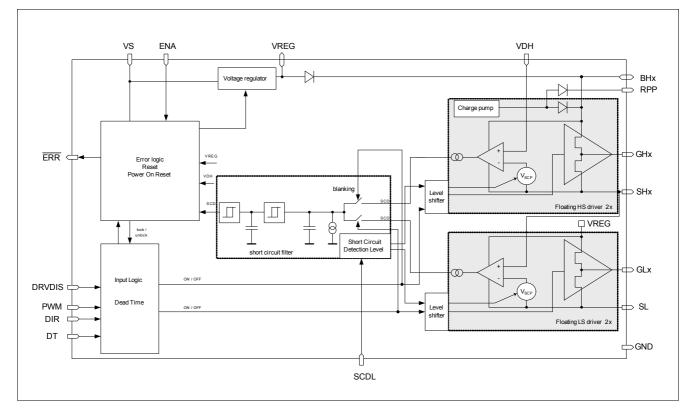

## 5.1.2 MOSFET Output Stages

The six push-pull MOSFET driver stages of the TLE7181EM are realized as separate floating blocks. This means that the output stage is follows the individual MOSFET source voltages and so ensuring stable MOSFET driving even in harsh electrical environment.

All 4 output stages have the same output power and thanks to the used bootstrap principle they can be switched all up to high frequencies.

Each output stage has its own short circuit detection block. For more details about short circuit detection see **Chapter 5.2.2**.

#### Figure 3 Block Diagram of Driver Stages including Short Circuit Detection

## 5.1.3 Dead Time

In bridge applications it has to be assured that the external high side and low side MOSFETs are not "on" at the same time, connecting directly the battery voltage to GND. The dead time generated in the TLE7181EM can be programmed by applying an resistor between the DT pin and GND. Higher external resistor values lead to higher dead time.

A minimum dead time applied, if the DT pin is connected to GND.

The typical dead time can be calculated with the following formula:

$$t_{deadtime}[\mu s] = \frac{0.081}{0.02 + \frac{2.4}{4 + Rdt[k\Omega]}}$$

If an exact dead time of the bridge is needed, the use of the  $\mu$ C PWM generation unit is recommended.

## 5.1.4 Bootstrap Principle

The TLE7181EM provides a bootstrap based supply for its high side output stages.

The bootstrap capacitors are charged by switching on the external low side MOSFETs, connecting the bootstrap capacitor to GND. Under this condition the bootstrap capacitor will be charged from the VREG capacitor via the integrated bootstrap diode. If the low side MOSFET is switched off and the high side MOSFET is switched on, the bootstrap capacitor will float together with the SHx voltage to the supply voltage of the bridge. Under this condition the supply current of the high side output stage will discharge the bootstrap capacitor. This current is specified. The size of the capacitor together with this current will determine how long the high side MOSFET can be kept on without recharging the bootstrap capacitor.

## 5.1.5 100% D.C. charge pumps

100% D.C. charge pumps are implemented for each high side output stage. Therefore the high side output stages can be switch on for an unlimited time. These integrated charge pumps can handle leakage currents which will be caused by external MOSFETs and the TLE7181EM itself. They are not strong enough to drive a 99% duty cycle for a longer time. the charge pumps are running when the driver is not in sleep mode and assure that the bootstrap capacitors are charged as long as the user does not apply critical duty cycle for a longer time.

## 5.1.6 Reverse polarity protection of motor bridge

The TLE7181EM provides an additional RPP pin to protect motor bridge for reverse polarity. This RPP pin can drive an additional external N-channel power MOSFET designed in between battery and the motor bridge. The RPP pin is internally supplied by the two integrated 100% D.C. charge pumps. They are especially designed to handle additional current which is needed to drive a the gate charge of the reverse polarity MOSFET. The guarantied output current of the charge pumps is specified.

## 5.1.7 Sleep mode

If ENA pin is set to low, the ERR flag will be set to low and the output stages will be switched off.

After ENA pin is kept low for  $t_{LQM}$  the sleep mode of the Driver IC will be activated.

In Sleep mode the complete chip is deactivated. This means the internal supply structure of the TLE7181EM will be switched off. This mode is designed for lowest current consumption from the power net of the car. The passive clamping is active. For details see the description of passive clamping, see **Chapter 5.2.9**.

The TLE7181EM will wake up, if ENA is set to high. The ENA pin is 45V compatible, so ENA can be directly be connected to the ignition key signal KL15.

## 5.1.8 Wake up

A special start up procedure is implemented into the TLE7181EM to guarantee charged bootstrap capacitors.

This start up procedure is automatically performed before normal H-bridge motor control with PWM/DIR is possible.

If the ENA pin is set to high, the VREG voltage starts to increase. As soon as the under voltage threshold VREG\_UV is reached, both low side output stages will be switched on for a short period of time for fast charging of the bootstrap capacitors. When the bootstrap capacitor voltage is high enough the auto start up procedure is completed and the low side MOSFETs will be driven accoring the input pattern.

During wake up procedure the ERR signal is set to low. It will be set to high, if no error occurs at the TLE7181EM and auto start procedure is completed.

To assure that the driver is finally in the normal operation mode, it is recommended to set the DRVDIS pin to high for minimum 1us. After that procedure the output stages can be driven by PWM/DIR interface.

## 5.1.9 Electrical Characteristics

#### **Electrical Characteristics MOSFET Drivers**

 $V_{\rm S}$  = 7.0 to 34V,  $T_{\rm j}$  = -40 to +150°C all voltages with respect to ground, positive current flowing into pin (unless otherwise specified)

5.1.55	wake up time	t <sub>wake</sub>	-	50	100	μs	$C_{\rm REG}$ =2.2 $\mu$ F; $C_{\rm BS}$ =330nF

1) Not subject to production test, specified by design.

2)  $V_{\rm diode}$  is the bulk diode of the external low side MOSFET

3) normally no error flag; Error flag might by triggered by under voltage VREG caused by very high load current

## 5.2 Protection and Diagnostic Functions

## 5.2.1 State diagram of different operation modes

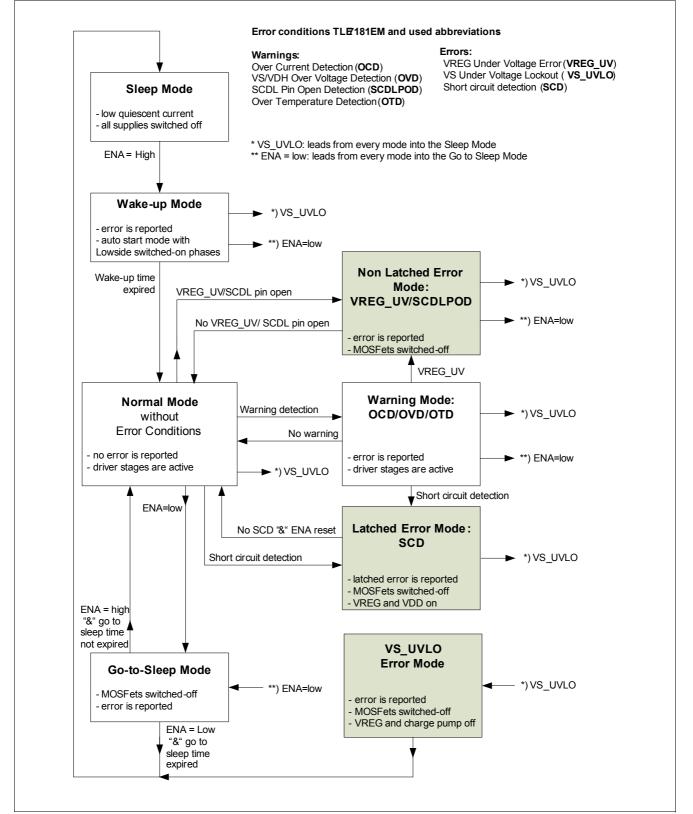

Figure 4 State diagramTLE7181EM

## 5.2.2 Short Circuit Protection

The TLE7181EM provides a short circuit protection for the external MOSFETs by monitoring the drain-source voltage of the external MOSFETs.

This monitoring of the short circuit detection for a certain external MOSFET is active as soon as the corresponding driver output stage is set to "on" and the dead time and the blanking time are expired.

The blanking time starts when the dead time has expired and assures that the switch on process of the MOSFET is not taken into account. It is recommended to keep the switching times of the MOSFETs below the blanking time.

The short circuit detection level is adjustable in an analog way by the voltage setting at the SCDL pin. There is a 1:1 translation between the voltage applied to the SCDL pin and the drain-source voltage limit. E.g. to trigger the SCD circuit at 1 V drain-source voltage, the SCDL pin must be set to 1 V. The drain-source voltage limit can be chosen between 0.2 ... 2 V.

If after the expiration of the blanking time the drain source voltage of the observed MOSFET is still higher then the SCDL level, the SCD filter time  $t_{SCP}$  starts to run. A capacitor is charged with a current. If the capacitor voltage reaches a specific level (filter time  $t_{SCP}$ ), the error signal is set and the IC goes into SCDL Error Mode. If the SCD condition is removed before the SC is detected, the capacitor is discharged with the same current. The discharging of the capacitor happens as well when the MOSFET is switched off. It has to be considered that the high side and the low side output of one phase are working with the same capacitor.

## 5.2.3 SCDL Pin Open Detection

An integrated structure at the SCDL pin assures that in case of an open pin the SCDL voltage is pulled to a medium voltage level. The external MOSFETs are actively switched off and an ERR flag is set. This error is self-clearing.

## 5.2.4 Vs and VDH Over Voltage Warning

The TLE7181EM has an integrated over voltage warning to minimize risk of destruction of the IC at high supply voltages caused by violation of the maximum ratings. For the over voltage warning the voltage is observed at the pin VS and VDH. If the voltage level has reached, the fixed over voltage threshold  $V_{\text{OVW}}$  for the filter time  $t_{\text{OV}}$ , a warning at ERR pin is set and TLE7181EM will go in normal operation with warning.

The over voltage warning is self clearing. If the voltage at pin VS and VDH returns into the specified voltage range, the Error register will be cleared and TLE7181EM returns to normal operation mode.

It is the decision of the user, if and how to react on the over voltage warning.

## 5.2.5 VS Under Voltage Shutdown

The TLE7181EM has an integrated VS Under Voltage Shutdown, to assure that the behavior of the complete IC is predictable in all supply voltage ranges. As soon as the under voltage threshold  $V_{\text{UVVR}}$  is reached for a specified filter time the TLE7181EM is in VS\_UVLO error mode. The error signal will be set and output stages, voltage regulator and charge pump will be switched off so the IC will go into sleep mode. An enable is necessary to restart the TLE7181EM.

## 5.2.6 VREG Under Voltage Warning

The TLE7181EM has an integrated under voltage warning detection at VREG. If the supply voltage at VREG reaches the VREG under voltage threshold  $V_{\rm UVVR}$ , a warning at ERR pin is set and the TLE7181EM will go into VREG error mode. In case of VREG error mode all output stages will actively switched off to prevent low gate source voltages at the power MOSFETs causing high RDSon. If supply voltage at the VREG pin recovers; the error flag will be cleared and the TLE7181EM will return in normal operation mode.

## 5.2.7 Over Temperature Warning

The TLE7181EM provides an integrated digital over temperature warning to minimize risk of destruction of the IC at high temperature. The temperature will be detected by a embedded sensor. During over temperature warning the ERR signal is set and the TLE7181EM is in normal operation mode with warning.

The over temperature warning is self clearing. So if temperature is below  $T_{j(PW)}$ - $dT_{j(OW)}$ , the warning will be cleared and TLE7181EM returns to normal operation mode.

It is the decision of the user to react on the over temperature warning.

## 5.2.8 Over Current Warning

The TLE7181EM offers an integrated over current detection. The output signal of the current sense OpAmp will be monitored. If the output signal reaches the specified voltage threshold  $V_{\text{OCTH}}$  for a certain time, over current will be detected. After the comparator the filter time  $t_{\text{OC}}$  is implemented to avoid false triggering caused by overswing of the current sense signal. The ERR pin will be set to low and the TLE7181EM will go into normal operation mode with warning.

The error signal disappears as soon as the current decreases below the over current threshold  $V_{\text{OCTH}}$ . The error signal disappears as well when the current commutates from the low side MOSFET to the associated high side MOSFET and is no longer flowing over the shunt resistor.

It is the decision of the user to react on the over current signal by modifying input patterns.

## 5.2.9 Passive Gxx Clamping

If VS Under Voltage shutdown is detected or the device is in Sleep Mode, a passive clamping is active as long as the voltage at VS or VDH is higher than 3V. Even below 3V it is assured that the MOSFET driver stage will not switch on the MOSFET actively.

The passive clamping means that the BHx and the VREG pin are pulled to GND with specified pull down resistors. Together with the intrinsic diode of the push stage of the output stages which connect the gate output to BHx respectively VREG, this assures that the gate of the external MOSFETs are not floating undefined.

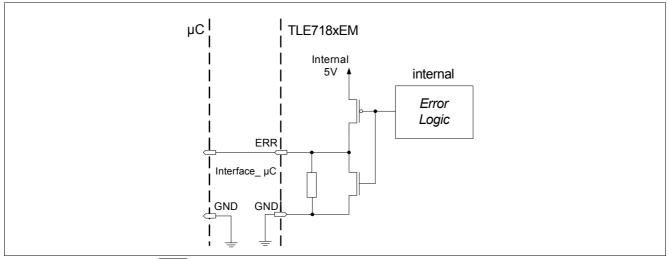

## 5.2.10 ERR Pin

The TLE7181EM has a status pin to provide diagnostic feedback to the  $\mu$ C. The logical output of this pin is a push pull output stage with an integrated pull-down resistor to GND (see **Figure 5**).

#### Reset of error registers and Disable

The TLE7181EM can be reset by the enable pin ENA. If the ENA pin is pulled to low for a specified minimum time, the error registers are cleared. ERR output is still set to low. After the next rising edge at ENA pin ERR pin will be set to high and no error condition is applied.

#### Figure 5 Structure of ERR output

#### Table 4Overview of error condition

ERR	Driver conditions	Driver action	Restart
High no errors		Fully functional	-
Low	Over temperature	Warning only	Self clearing
Low	Over voltage VS/VDH	Warning only	Self clearing
Low	Over current OPAMP	Warning only	Self clearing
Low	Under voltage error VREG	All MOSFETs actively switched off	Self clearing
Low	Under voltage shutdown based on VS	MOSFET, charge pump, Vreg switched off	Self clearing restart when enable high <sup>1)</sup>
Low	SCDL open pin	All MOSFETs actively switched off	Self clearing
Low	Short circuit detection	All MOSFETs actively switched off	Reset at ENA needed
Low	Go to sleep mode	All MOSFETs actively switched off	immediate restart when ENA goes high
Low	Wake up mode	start up	-

1) When SC detected, reset with ENA necessary

#### Table 5Prioritization of Errors

Priority	Errors and Warnings
0	Under voltage lockout at Vs (VS_UVLO)
1	Short circuit detection error (SCD) SCDL pin open warning (SCDLPOD)
2	Under voltage detection VREG (UV_VREG) Over voltage detection warning (OVD) Over temperature warning (OTD) Over current warning (OCD)

## 5.2.11 Electrical Characteristics

#### **Electrical Characteristics - Protection and diagnostic functions**

 $V_{\rm S}$  = 7.0 to 34V,  $T_{\rm j}$  = -40 to +150°C, all voltages with respect to ground, positive current flowing into pin (unless otherwise specified)

5.2.25	Internal pull-down resistor ERR to GND	$R_{\rm f(ERR)}$	60	100	170	kΩ	-

1) Not subject to production test, specified by design.

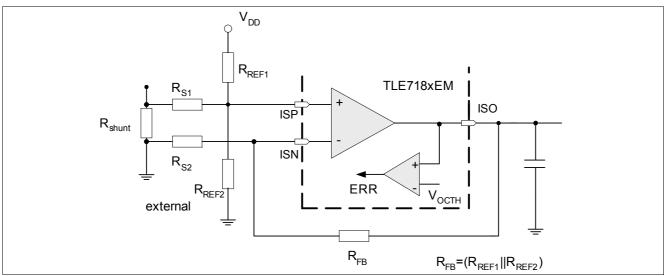

2) ERR pin and Reset & Enable functional between  $V_{\rm VS}$ =6 ... 7V, but characteristics might be out of specified range

## 5.3 Shunt Signal Conditioning

The TLE7181EM incorporates a fast and precise operational amplifier for conditioning and amplification of the current sense shunt signal. The gain of the OpAmp is adjustable by external resistors within a range higher than 5. The usage of higher gains in the application might be limited by required settling time and band width.

It is recommended to apply a small offset to the OpAmp, to avoid operation in the lower rail at low currents. The output of the OpAmp ISO is not short-circuit proof.

Over current warning see Chapter 5.2.8.

## 5.3.1 Electrical Characteristics

#### Electrical Characteristics - Current sense signal conditioning

 $V_{\rm S}$  = 7.0 to 36V,  $T_{\rm j}$  = -40 to +150°C, gain = 5 to 75, all voltages with respect to ground, positive current flowing into pin (unless otherwise specified)

Pos.	Parameter	Symbol	Limit Values			Unit	Conditions	
			Min.	Тур.	Max.			
5.3.1	Series resistors	R <sub>S</sub>	100	500	1000	Ω	-

1) Not subjected to production test; specified by design

2) Without considering any offsets such as input offset voltage, internal mismatch and assuming no tolerance error in external resistors.

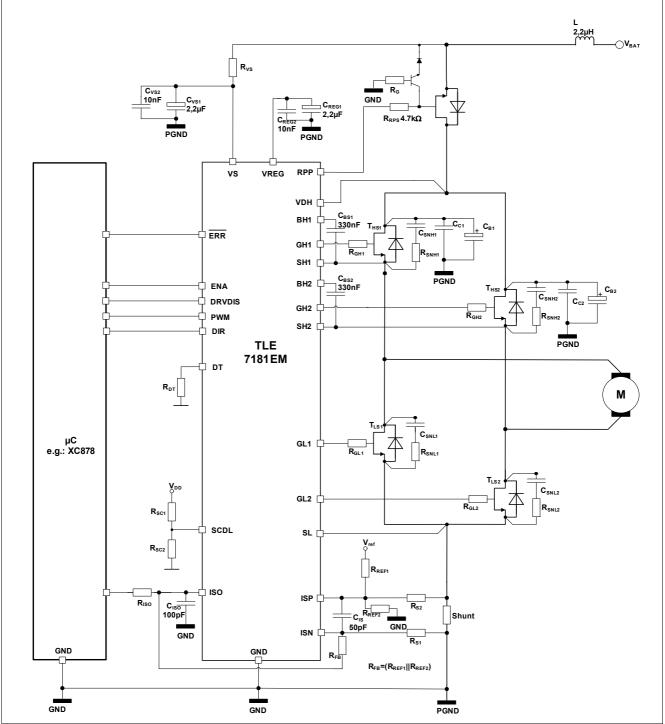

Application Information

## 6 Application Information

Note: The following information is given as a hint for the implementation of the device only and shall not be regarded as a description or warranty of a certain functionality, condition or quality of the device.

This is the description how the IC is used in its environment...

Note: This are very simplified examples of an application circuit. The function must be verified in the real application.

#### **Application Information**

## 6.1 Layout Guide Lines

Please refer also to the simplified application example.

- Two separated bulk capacitors C<sub>B</sub> should be used one per half bridge
- Two separated ceramic capacitors C<sub>C</sub> should be used one per half bridge
- Each of the two bulk capacitors C<sub>B</sub> and each of the two ceramic capacitors C<sub>C</sub> should be assigned to one of the half bridges and should be placed very close to it
- The components within one half bridge should be placed close to each other: high side MOSFET, low side MOSFET, bulk capacitor C<sub>B</sub> and ceramic capacitor C<sub>C</sub> (C<sub>B</sub> and C<sub>C</sub> are in parallel) and the shunt resistor form a loop that should be as small and tight as possible. The traces should be short and wide
- The connection between the source of the high side MOSFET and the drain of the low side MOSFET should be as low inductive and as low resistive as possible.
- VDH is the sense pin used for short circuit detection; VDH should be routed (via Rvdh) to the common point of the drains of the high side MOSFETs to sense the voltage present on drain high side
- SL is the sense pin used for short circuit detection; SL should be routed o the common point of the source of the low side MOSFETs to sense the voltage present on source low side
- Additional R-C snubber circuits (R and C in series) can be placed to attenuate/suppress oscillations during switching of the MOSFETs, there may be one or two snubber circuits per half bridge, R (several Ohm) and C (several nF) must be low inductive in terms of routing and packaging (ceramic capacitors)
- if available the exposed pad on the backside of the package should be connected to GND

## 6.2 Further Application Information

#### **Green Product (RoHS compliant)**

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).

For further information on alternative packages, please visit our website: http://www.infineon.com/packages.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
