## DESCRIPTION:

The FCT543T is a non-inverting octal transceiver built using an advanced dual metal CMOS technology. This device contains two sets of eight D-type latches with separate input and output controls for each set. For data flow from A to B, for example, the A-to-B Enable ( $\overline{\text{CEAB}}$ ) input must be low in order to enter data from A0–A7 or to take data from B0–B7, as indicated in the Function Table. With  $\overline{\text{CEAB}}$  low, a low signal on the A-to-B Latch Enable ( $\overline{\text{LEAB}}$ ) input makes the A-to-B latches transparent; a subsequent low-to-high transition of the  $\overline{\text{LEAB}}$  signal puts the A latches in the storage mode and their outputs no longer change with the A inputs. With  $\overline{\text{CEAB}}$  and  $\overline{\text{OEAB}}$  both low, the 3-state B output buffers are active and reflect the data present at the output of the A latches. Control of data from B to A is similar, but uses the  $\overline{\text{CEBA}}$ ,  $\overline{\text{LEBA}}$  and  $\overline{\text{OEBA}}$  inputs.

### NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability. No terminal voltage may exceed VCC by +0.5V unless otherwise noted.
- Inputs and VCC terminals only.
- Output and I/O terminals only.
