

## An Ultra-small, Low-power 23 mΩ/4 A P-Channel Integrated Power Switch with Reverse-Current Blocking

### General Description

The SLG59M1649V is a self-powered, high-performance, 23 mΩ pFET integrated power switch designed for 1.5 to 5 V power rail applications up to 4 A. When enabled, internal reverse-current protection will quickly open the switch in the event of a reverse-voltage condition is detected (a  $V_{OUT} + 50\text{mV} > V_{IN}$  condition opens the switch). Upon the detection of a reverse condition, an open-drain  $\overline{\text{FAULT}}$  output is asserted. In the event the  $V_{IN}$  voltage is too low, the power switch also contains an internal UVLO threshold monitor to keep or to turn the switch OFF.

Designed to operate over a  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$  range, the SLG59M1649V is available in a RoHS-compliant, ultra-small 1.0 x 1.6 mm STDFN package.

### Pin Configuration

### Features

- Steady-state Operating Current: Up to 4 A
- Low Typical  $R_{DS(ON)}$ :
  - 23 mΩ at  $V_{IN} = 5\text{ V}$
  - 31 mΩ at  $V_{IN} = 2.5\text{ V}$
  - 42 mΩ at  $V_{IN} = 1.5\text{ V}$
- Operating Voltage: 1.5 V to 5.5 V
- Reverse-voltage Detection ON or OFF
- Internal Gate Drive and VOUT Discharge
- Open-drain  $\overline{\text{FAULT}}$  Signaling
- Operating temperature range:  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$
- Low  $\theta_{JA}$ , 8-pin 1.0 mm x 1.6 mm STDFN Packaging
  - Pb-Free / Halogen-Free / RoHS compliant packaging

### Applications

- Power-Rail Switching:
  - Notebook/Laptop/Tablet PCs
  - Smartphones/Wireless Handsets
  - High-definition Digital Cameras
  - Set-top Boxes
- Point of Sales Pins
- GPS Navigation Devices

### Pin Description

Pin #	Pin Name	Type	Pin Description
1, 4	VIN	Power/Input	With an internal 1.2V UVLO threshold, VIN supplies the power for the operation of the power switch, the internal control circuitry, and the source terminal of pFET. Bypass the VIN pin to GND with a 2.2 $\mu$ F (or larger), low-ESR capacitor.
2, 3	ON	Input	A low-to-high transition on this pin initiates the operation of the power switch. ON is an asserted-HIGH, level-sensitive CMOS input with $V_{IL} < 0.3$ V and $V_{IH} > 1$ V. As the ON input circuitry does not have an internal pull-down resistor, connect the ON pin directly to a GPIO controller – do not allow this pin to be open circuited.
5, 8	VOUT	Output	Output and drain terminal of MOSFET.
6	$\overline{\text{FAULT}}$	Output	An open drain output, $\overline{\text{FAULT}}$ is asserted within $T_{\text{FAULT\_Low}}$ when a $(V_{\text{OUT}} + V_{\text{REVERSE}} > V_{\text{IN}})$ condition is detected. The $\overline{\text{FAULT}}$ output is deasserted within $T_{\text{FAULT\_High}}$ when the fault condition is removed. Connect an external 10-k $\Omega$ resistor from the $\overline{\text{FAULT}}$ pin to the system's local logic supply.
7	GND	GND	Ground connection. Connect this pin to system analog or power ground plane.

### VIN Inrush Current Details

When the SLG59M1649V is enabled with ON ↑, the power switch closes to charge the VOUT output capacitor to VIN. The charging current drawn from VIN is commonly referred to as “VIN inrush current” and can cause the input power source to collapse if the VIN inrush current is too high.

Since the VOUT rise time of the SLG59M1649V is fixed, VIN inrush current is then a function of the output capacitance at VOUT. The expression relating VIN inrush current, the SLG59M1649V VOUT rise time, and COUT is:

$$\text{VIN Inrush Current} = \text{COUT} \times \frac{\Delta\text{VOUT}}{\text{VOUT Rise Time}}$$

where in this expression ΔVOUT is equivalent to VIN if the initial SLG59M1649V’s output voltages are zero.

In the table below are examples of VIN inrush currents assuming zero initial charge on COUT as a function of VIN.

VIN	VOUT Rise Time	COUT	Inrush Current
1.5 V	66 μs	0.1 μF	2.3 mA
5 V	130 μs	0.1 μF	3.8 mA

Since the relationship is linear and if COUT were increased to 1 μF, then the VIN inrush currents would be 10x higher in either example. If a large COUT capacitor is required in the application and depending upon the strength of the input power source, it may very well be necessary to increase the CIN-to-COUT ratio to minimize VIN droop during turn-on.

For other VOUT rise time options, please contact Silego for additional information.

### Power Dissipation

The junction temperature of the SLG59M1649V depends on factors such as board layout, ambient temperature, external air flow over the package, load current, and the RDS<sub>ON</sub>-generated voltage drop across each power MOSFET. While the primary contributor to the increase in the junction temperature of the SLG59M1649V is the power dissipation of its power MOSFETs, its power dissipation and the junction temperature in nominal operating mode can be calculated using the following equations:

$$\text{PD}_{\text{TOTAL}} = \text{RDS}_{\text{ON}} \times \text{I}_{\text{OUT}}^2$$

where:

PD<sub>TOTAL</sub> = Total package power dissipation, in Watts (W)

RDS<sub>ON</sub> = Power MOSFET ON resistance, in Ohms (Ω)

I<sub>OUT</sub> = Output current, in Amps (A)

and

$$\text{T}_J = \text{PD}_{\text{TOTAL}} \times \Theta_{\text{JA}} + \text{T}_A$$

where:

T<sub>J</sub> = Die junction temperature, in Celsius degrees (°C)

Θ<sub>JA</sub> = Package thermal resistance, in Celsius degrees per Watt (°C/W) – highly dependent on pcb layout

T<sub>A</sub> = Ambient temperature, in Celsius degrees (°C)

### Power Dissipation (continued)

In nominal operating mode, the SLG59M1649V's power dissipation can also be calculated by taking into account the voltage drop across each switch ( $V_{IN}-V_{OUT}$ ) and the magnitude of that channel's output current ( $I_{OUT}$ ):

$$PD_{TOTAL} = (V_{IN}-V_{OUT}) \times I_{OUT} \text{ or}$$
$$PD_{TOTAL} = (V_{IN} - (R_{LOAD} \times I_{OUT})) \times I_{OUT}$$

where:

$PD_{TOTAL}$  = Total package power dissipation, in Watts (W)

$V_{IN}$  = Input Voltage, in Volts (V)

$R_{LOAD}$  = Output Load Resistance, in Ohms ( $\Omega$ )

$I_{OUT}$  = Output current, in Amps (A)

$V_{OUT}$  = Output voltage, or  $R_{LOAD} \times I_{OUT}$

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкуренеспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
