

FEATURES

- 10-Bit Resolution
- Two Monolithic Complete 10-Bit ADCs
- 40 MSPS Conversion Rate
- On-Chip Track-and-Hold
- On-Chip Voltage Reference
- Low 5 pF Input Capacitance
- TTL/CMOS Outputs
- Tri-State Output Buffers
- Single +3.0V Power Supply Operation
- Low Power Dissipation: 200mW-typ @ 2.7V
- Power Down Mode Less Than 5mW
- 75dB Crosstalk (fin=1.0MHz)
- -40°C to +85°C Operation Temperature Range

APPLICATIONS

- Medical Imaging
- Instrumentation
- Data Acquisition Systems
- Digital Communications

BENEFITS

- Reduction of Components
- Reduction of System Cost
- High Performance @ Low Power Dissipation
- Long Term Time and Temperature Stability

GENERAL DESCRIPTION

The XRD64L43 is two 10-bit, monolithic, 40 MSPS ADCs. Manufactured using a standard CMOS process, the XRD64L43 offers low power, low cost and excellent performance. The on-chip track-and-hold amplifier(T/H) and voltage reference (VREF) eliminate the need for external active components, requiring only an external ADC conversion clock for the application. The XRD64L43 analog input can be driven with ease due to the high input impedance.

The design architecture uses 17 time-interleaved 10-bit SAR ADCs in each converter to achieve high conversion rate of 40 MSPS minimum. In order to insure and maintain accurate 10-bit operation with respect to time and temperature, XRD64L43 incorporates an auto-calibration circuit which continuously adjusts and matches the offset and linearity of each ADC. This auto-calibration circuit is transparent to the

user after the initial 4.2ms calibration (168,000 initial clock cycles).

The power dissipation is only 200mW at 40MSPS with +2.7V power supply.

The digital output data is straight binary format, and the tri-state disable function is provided for common bus interface.

The XRD64L43 internal reference provides cost savings and simplifies the design/development. The output voltage of the internal reference is set by two external resistors. The internal reference can be disabled if an external reference is used for a power savings of 50mW.

ORDERING INFORMATION

Part Number	Package Type	Temperature Range
XRD64L43AIV	64-Lead LQFP	-40°C to +85°C

ABSOLUTE MAXIMUM RATINGS ($T_A = +25^\circ\text{C}$ unless otherwise noted)^{1, 2, 3}

V_{DD} to GND	+7.0V	Lead Temperature (Soldering 10 seconds)	300°C
V_{RT} & V_{RB}	$V_{DD} + 0.5$ to GND - 0.5V	Maximum Junction Temperature	150°C
V_{IN}	$V_{DD} + 0.5$ to GND - 0.5V	Package Power Dissipation Ratings ($T_A = +70^\circ\text{C}$)	
All Inputs	$V_{DD} + 0.5$ to GND - 0.5V	TQFP	$\theta_{JA} = 89.4^\circ\text{C/W}$
All Outputs	$V_{DD} + 0.5$ to GND - 0.5V	ESD	2000V min
Storage Temperature	-65°C to 150°C		

Notes:

- ¹ Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation at or above this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.
- ² Any input pin which can see a value outside the absolute maximum ratings should be protected by Schottky diode clamps from input pin to the supplies. All inputs have protection diodes which will protect the device from short transients outside the supplies of less than 100mA for less than 100ms.
- ³ V_{DD} refers to AV_{DD} and DV_{DD} . GND refers to AGND and DGND

APPLICATION SECTION

Voltage References

The top ladder voltage for the XRD64L43 can be provided from an internal bandgap reference. The bandgap reference and its feedback path, Pins 1 and 2 respectively, can be used to set the voltage for VRHF. Select R_f and R_i (if gain is necessary) so that $VRHF = VBG(1 + R_f/R_i)$. The internal bandgap voltage is 1.24 volts. The XRD64L43 has a low impedance ladder, therefore, the typical value for R_f and R_i is 10K (R_f and R_i are recommended to be greater than 5K). See Figure 2. for a simplified diagram. Decoupling caps on the sense inputs to AGND should be used to reduce injection of high-frequency noise.

Figure 2. Voltage Reference Generated from the Internal Bandgap Voltage/gain

External voltage references can be forced at VRHF and VRLF. If VRHF and VRLF are driven externally, VFBK should be connected to AVdd, which tri-states the bandgap reference. Direct inputs or inputs driven by external amplifiers can be used to drive the ladder reference voltages of the XRD64L43. See Figure 3. for a simplified diagram. The sense inputs are intended for sensing purposes only and care must be taken to insure that no current flow be present in the sense lines.

Figure 3. Voltage Reference Provided by an External Source as Direct Inputs

Single-Ended Inputs

The XRD64L43 can be used in either single-ended or differential input mode. For differential inputs, see the Differential Inputs Section. Single-ended inputs minimize the amount of external components necessary to interface with the XRD64L43. The common inputs, VINA(-) and VINB(-) should be tied to ground. VINA(+) and VINB(+) can be used to apply direct inputs to the XRD64L43. Figure 4. is a simplified diagram for single-ended inputs. Pin 16, DIFF should be held low to select single-ended inputs.

Figure 4. Single-Ended Inputs for the XRD64L43

Differential Inputs

The XRD64L43 can be used in either differential or single-ended input mode. For single-ended inputs, see the Single-Ended Inputs Section. Differential inputs reduce system noise by removing noise components common at both input pins. Figure 5. is a simplified diagram that is used as a common test circuit with our XRD64L43ES application board. This circuit is used to evaluate the dynamic performance of the XRD64L43 using differential inputs. Pin 16, DIFF should be held high to select differential inputs.

Figure 5. Common Test Circuit for the Differential Input Mode

SYNCO, Data Valid Delay and Latency

SYNCO is an output pin provided by the XRD64L43. Valid data is available on the rising edge of SYNCO, see Figure 6. The Latency for the XRD64L43 is 17 clock cycles.

Figure 6. SYNCO, Data Valid Delay and Latency for the XRD64L43

Auto-Calibration

The XRD64L43 incorporates an auto-calibration circuit which continuously adjusts and matches the offset and linearity of each ADC. This auto-calibration circuit is transparent to the user after the initial 4.2ms calibration (168,000 initial clock cycles).

Note: To avoid auto-calibration after power down, do not disable CKIN. CKIN can be slowed down significantly to save power without losing calibration.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
