MAX2769C

Universal GNSS Receiver

General Description

The MAX2769C is a next-generation Global Navigation Satellite System (GNSS) receiver covering L1/E1, B1, G1 bands for GPS, Galileo, BeiDou, and GLONASS satellite systems on a single chip. This single-conversion GNSS receiver is designed to provide high performance for industrial and wide range of consumer applications, including mobile handsets.

Designed on Maxim's advanced, low-power SiGe BiCMOS process technology, the MAX2769C offers the highest performance and integration at a low cost. Incorporated on the chip is the complete receiver chain, including a dual-input LNA and mixer, followed by the image-rejection filter, Programmable Gain Amplifier (PGA) and a multibit ADC. The total cascaded noise figure of this receiver is as low as 1.4dB. In addition, the device includes an integrated VCO, a crystal oscillator, a fractional-N frequency synthesizer to program the LO frequency using different reference frequencies.

The MAX2769C has the option to select one of the two LNAs for seperate Active and Passive Antenna inputs. LNA1 can be used with Passive Antenna input and LNA2 can be used for Active antenna input. Also, the MAX2769C completely eliminates the need for external IF filters by implementing on-chip monolithic filters and requires only a few external components to form a complete low-cost GPS RF receiver solution. Moreover, the device has the flexibility to configure the IF filter for various center frequencies and bandwidths using the SPI Interface.

The device is the most flexible receiver on the market. The integrated delta-sigma fractional-N frequency synthesizer allows programming of the IF frequency within a ±30Hz (When $f_{XTAL} \leq 32MHz$) accuracy while operating with any reference or crystal frequencies that are available in the host system.

The ADC outputs CMOS logic levels with 1 or 2 quantized bits for both I and Q channels, or up to 3 quantized bits for the I channel. I and Q analog outputs are also available which will bypass the on-chip ADCs.

The MAX2769C is packaged in a 5mm x 5mm, 28-pin thin QFN package with an exposed paddle.

***Ordering Information* appears at end of data sheet.**

Benefits and Features

- GPS/GLONASS/Galileo/BeiDou Systems
- Dual-Input Selectable LNA for Separate Passive and Active Antenna Inputs
- 1.4dB Cascaded Noise Figure and 110dB of Cascaded Gain with Gain Control Range of 59dB From PGA
- Integrated Active Antenna Sensor
- Fractional-N Synthesizer with Integrated VCO
- No External IF SAW or Discrete Filters Required
- Programmable IF Frequency
- Programmable 2.5MHz, 4.2MHz, 9.66MHz IF Bandwidth and 9MHz ZIF LPF BW
- 8 Preconfigured Device States When No SPI Available
- 40pF Output Clock Drive Capability
- 28-Pin Thin QFN Package (5mm x 5mm)
- Available in AEC-Q100 Automotive-Qualified Version (**MAX2769B**)

Applications

- Navigation Systems, Marine/Avionics Navigation
- Location-Enabled Mobile Handsets
- PNDs (Personal Navigation Devices)
- Telematics (Asset Tracking, Inventory Management)
- Software GPS
- Laptops and Netbooks
- In-Vehicle Navigation Systems
- Digital Still Cameras and Camcorders

Absolute Maximum Ratings

$V_{CC\_}$ to Ground.....-0.3V to +4.2V
Other Pins Except LNA_, MIXIN, XTAL, and LNAOUT to Ground..... -0.3V to +(Operating $V_{CC\_}$ + 0.3V)
Maximum RF Input Power.....+15dBm
Continuous Power Dissipation (T_A = +70°C)
TQFN (derates 27mW/°C above +70°C).....2500mW
Operating Temperature Range..... -40°C to +85°C
Junction Temperature.....+150°C
Storage Temperature Range..... -65°C to +150°C
Lead Temperature (soldering, 10s) .....+300°C
Soldering Temperature (reflow).....+260°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

CAUTION! ESD SENSITIVE DEVICE

DC Electrical Characteristics

(MAX2769C EV kit, $V_{CC\_}$ = 2.7V to 3.3V, T_A = -40°C to +85°C, PGM = Ground. Registers are set to the default power-up states. Typical values are at $V_{CC\_}$ = 2.85V and T_A = +25°C, unless otherwise noted.) (Note 1)

Note 1: MAX2769C is production tested at T_A = +25°C and +85°C. All min/max specifications are guaranteed by design and characterization from -40°C to +85°C, unless otherwise noted. Default register settings are not production tested or guaranteed. User must program the registers upon power-up.

Note 2: Default, low-NF mode of the IC. LNA choice is gated by the ANT_FLAG signal. In the normal mode of operation without an active antenna, LNA1 is active. If an active antenna is connected and ANT_FLAG switches to 1, LNA1 is automatically disabled and LNA2 becomes active. PLL is in an integer-N mode with $f_{COMP} = f_{TCXO}/16$ = 1.023MHz and ICP = 0.5mA. The IF filter is configured as a 5th-order Butterworth filter with a center frequency of 4MHz and bandwidth of 2.5MHz. Output data is in a 2-bit sign/magnitude format at CMOS logic levels in the I channel only.

Note 3: The LNA output connects to the mixer input without a SAW filter between them.

Note 4: Two tones are located at 12MHz and 24MHz offset frequencies from the GPS center frequency of 1575.42MHz at -60dBm/tone. Passive pole at the mixer output is programmed to be 13MHz.

Note 5: Measured from the LNA input to the LNA output. Two tones are located at 12MHz and 24MHz offset frequencies from the GPS center frequency of 1575.42MHz at -60dBm per tone.

Typical Operating Characteristics

Pin Description

PIN	NAME	FUNCTION
1	ANTFLAG	Active Antenna Flag Logic Output. A logic-high indicates that an active antenna is connected to the ANTBIAS pin.
2	LNAOUT	LNA Output. The LNA output is internally matched to 50Ω.
3	ANTBIAS	Buffered Supply Voltage Output. Provides a supply voltage bias for an external active antenna.
4	V_{CC_RF}	RF Section Supply Voltage. Bypass to ground with 100nF and 100pF capacitors in parallel as close as possible to the pin.
5	MIXIN	Mixer Input. The mixer input is internally matched to 50Ω.
6	LD	Lock-Detector CMOS Logic Output. A logic-high indicates the PLL is locked.
7	$\overline{SHDN}$	Operation Control Logic Input. A logic-low shuts off the entire device.
8	SDATA	Data Digital Input of 3-Wire Serial Interface
9	SCLK	Clock Digital Input of 3-Wire Serial Interface. Active when $\overline{CS}$ is low. Data is clocked in on the rising edge of the SCLK.

Pin Description (continued)

PIN	NAME	FUNCTION
10	$\overline{CS}$	Chip-Select Logic Input of 3-Wire Serial Interface. Set $\overline{CS}$ low to allow serial data to shift in. Set $\overline{CS}$ high when the loading action is completed.
11	V_{CC_VCO}	VCO Supply Voltage. Bypass to ground with a 100nF capacitor as close as possible to the pin.
12	CPOUT	Charge-Pump Output. Connect a PLL loop filter as a shunt C and a shunt combination of series R and C (see the *Typical Application Circuit*).
13	V_{CC_CP}	PLL Charge-Pump Supply Voltage. Bypass to ground with a 100nF capacitor as close as possible to the pin.
14	V_{CCD}	Digital Circuitry Supply Voltage. Bypass to ground with a 100nF capacitor as close as possible to the pin.
15	XTAL	XTAL or Reference Oscillator Input. Connect to XTAL or a DC-blocking capacitor if TCXO is used.
16	CLKOUT	Reference Clock Output
17	Q1	Q-Channel Voltage Outputs. Bits 0 and 1 of the Q-channel ADC output or analog differential voltage output.
18	Q0	
19	V_{CC_ADC}	ADC Supply Voltage. Bypass to ground with a 100nF capacitor as close as possible to the pin.
20	I0	I-Channel Voltage Outputs. Bits 0 and 1 of the I-channel ADC output or analog differential voltage output.
21	I1	
22	N.C.	No Connection. Leave this pin unconnected.
23	V_{CC_IF}	IF Section Supply Voltage. Bypass to ground with a 100nF capacitor as close as possible to the pin.
24	$\overline{IDLE}$	Operation Control Logic Input. A logic-low enables the idle mode, in which the XTAL oscillator is active, and all other blocks are off.
25	LNA2	LNA Input Port 2. This port is typically used with an active antenna. Internally matched to 50Ω.
26	PGM	Logic Input. Connect to ground to use the serial interface. A logic-high allows programming to 8 hard-coded by device states connecting SDATA, $\overline{CS}$, and SCLK to supply or ground according to Table 19.
27	LNA1	LNA Input Port 1. This port is typically used with a passive antenna. Internally matched to 50Ω (see the *Typical Application Circuit*).
28	N.C.	No Connect.
—	EP	Exposed Pad. Ultra-low-inductance connection to ground. Place several vias to the PCB ground plane.

Detailed Description

Integrated Active Antenna Sensor

MAX2769C can be used either with an active antenna or a Passive antenna. Using the Active Antenna sensor feature, the antenna (either Active/ Passive) can be selcted automatically depending on the current drawn at ANTBIAS pin which enables to have a single design in both Active/Passive antenna applications. If automatic LNA selection is not desired, it can be disabled through the Config1 register <14:13>. The MAX2769C includes a low-dropout switch to bias an external active antenna. To activate the antenna switch output, set ANTEN in the Configuration 1 register to logic 1. This closes the switch that connects the antenna bias pin to V_{CC_RF} to achieve a low 200mV dropout for a 20mA load current. A logic-low in ANTEN disables the antenna bias. The active antenna circuit also features short-circuit protection to prevent the output from being shorted to ground. See Table 2.

Low-Noise Amplifier (LNA)

The MAX2769C integrates two low-noise amplifiers. LNA1 is typically used with a passive antenna and requires an AC-coupling capacitor. In the default mode, the bias current is set to 4mA, the typical Gain, noise figure and IIP3 are approximately 19dB, 0.8dB and -1.1dBm, respectively. LNA2 is typically used with an active antenna. The LNA2 is internally matched to 50 and requires a DC-blocking capacitor. The typical Gain, Noise Figure and IIP3 are approximatley 13dB, 1.14dB and 1dBm, respectively. See Table 3. Bits LNAMODE in the Configuration 1 register control the modes of the two LNAs. See Table 4.

Mixer

The MAX2769C includes a quadrature mixer to output low-IF or zero IF I and Q signals. The quadrature mixer is internally matched to 50Ω and requires a low-side LO injection. The output of the LNA and the input of the mixer are brought off-chip to facilitate the use of a SAW filter.

On MAX2769C, the RF signal has been made accessible between the first LNA stage output and mixer input (pins 2 and 5 respectively). If filtering is not desired, these pins can be connected through a coupling capacitor. However, filtering introduced at this point has minimal effect on the excellent sensitivity of the receiver. For example, for typical device parameters, a SAW filter with 1dB insertion loss would degrade cascaded NF (and thus GPS sensitivity) by only about 0.15dB.

While no external filtering is required for stand-alone applications, coexistence with cellular or WiLAN transmissions in close proximity may require additional filtering to prevent overdriving the GPS receiver front-end.

IF Filter

The IF filter of the receiver can be programmed to be a lowpass filter or a bandpass filter by setting the bit FCENX either 0 for Low pass filter mode or 1 for Band pass filter mode. See Table 5.

Table 2. Antenna Enable

ANTEN (CONFIGURATION 1 REGISTER)	ANTENNA BIAS
0	OFF
1	ON

Table 3. LNA Specifications

PARAMETER	LNA1 (PASSIVE ANTENNA)	LNA2 (ACTIVE ANTENNA)

LNAMODE (CONFIGURATION 1 REGISTER)	MODE
00	LNA selection gated by the antenna bias circuit
01	LNA2 is active
10	LNA1 is active
11	Both LNA1 and LNA2 are off

Table 5. IF Filter Mode Selection

FCENX (CONFIGURATION 1 REGISTER)	FILTER MODE
0	Low Pass
1	Band Pass

Also, the IF filter can be configured either as a 3rd-order Butterworth filter for a reduced group delay or a 5th-order Butterworth filter for a steeper out-of-band rejection by setting the bit F3OR5 either 1 or 0, respectively in the Configuration 1 register. See Table 6.

The two-sided 3dB corner bandwidth can be selected to be 2.5 MHz, 4.2 MHz, 9.66 MHz by programming bits FBW in the Configuration 1 register. See Table 7.

When the filter is enabled by changing bit FCENX in the Configuration 1 register to 1, the lowpass filter becomes a bandpass filter and the center frequency can be programmed by bits FCEN and FCENMSB in the Configuration 1 register. See Table 8.

The IF center frequency is adjustable in 127 steps with a 7 bit FCEN word with 6bit FCEN and 1bit FCENMSB.

Refer Applications section of this document to configure the desired IF filter center frequency

Table 6. IF Filter Order Selection

F3OR5 (CONFIGURATION 1 REGISTER)	IF FILTER ORDER

00	001101	3.9
10	001101	7.1
01	111101	10.7

Programmable Gain Amplifier (PGA)

The MAX2769C integrates a baseband programmable gain amplifier that provides 59dB of gain control range. The PGA gain can be programmed through the serial interface by setting bits GAININ in the Configuration 3 register. Set bits 12 and 11 (AGCMODE) in the Configuration 2 register to 10 to control the gain of the PGA directly from the 3-wire interface. See Table 9.

Automatic Gain Control (AGC)

The MAX2769C provides a control loop that automatically programs PGA gain to provide the ADC with an input power that optimally fills the converter and establishes a desired magnitude bit density at its output. An algorithm operates by counting the number of magnitude bits over 512 ADC clock cycles and comparing the magnitude bit count to the reference value provided through a control word (GAINREF) using Configuration 2 register.

The desired magnitude bit density is expressed as a value of GAINREF in a decimal format divided by the counter length of 512. For example, to achieve the magnitude bit density of 33%, which is optimal for a 2-bit converter, program the GAINREF to 170, so that 170/512 = 33%. See Table 10.

Table 9. PGA Gain Settings

GAININ (CONFIGURATION 3 REGISTER)	GAIN (dB)
000000	0
101011	42

Synthesizer

The MAX2769C integrates a 20-bit sigma-delta fractional-N synthesizer allowing the device to tune to a required VCO frequency with an accuracy of approximately Q30Hz. The synthesizer includes a 10-bit reference divider with a divisor range programmable from 1 to 1023, a 15-bit integer portion main divider with a divisor range programmable from 36 to 32767, and also a 20-bit fractional portion main divider. The reference divider is programmable by bits RDIV in the PLL integer division ratio register, and can accommodate reference frequencies from 8MHz to 32MHz. The reference divider needs to be set so the comparison frequency falls between 0.05MHz to 32MHz.

The PLL loop filter is the only external block of the synthesizer. A typical PLL filter is a classic C-R-C network at the charge-pump output. The charge-pump output sink and source current is 0.5mA by default, and the LO tuning gain is 57MHz/V. As an example, see the *Typical Application Circuit* for the recommended loopfilter component values for f_{COMP} = 1.023MHz and loop bandwidth = 50kHz.

To calculate the loop filter component values for different LO frequencies, please refer to the Design Resources section of the product page.

The desired integer and fractional divider ratios can be calculated by dividing the LO frequency (f_{LO}) by f_{COMP}. f_{COMP} can be calculated by dividing the TCXO frequency (f_{TCXO}) by the reference division ratio (RDIV). For example, let the TCXO frequency be 20MHz, RDIV be 1, and the nominal LO frequency be 1575.42MHz. The following method can be used when calculating divider ratios supporting various reference and comparison frequencies:

$$\text{Comparison Frequency} = \frac{f_{TCXO}}{RDIV} = \frac{20MHz}{1} = 20MHz$$

$$\text{LO Frequency Divider} = \frac{f_{LO}}{f_{COMP}} = \frac{1575.42MHz}{20MHz} = 78.771$$

Integer Divider = 78(d) = 000 0000 0100 1110 (binary)

Fractional Divider = 0.771 x 2^{20} = 808452 (decimal) = 1100 0101 0110 0000 0100

In the fractional mode, the synthesizer should not be operated with integer division ratios greater than 251.

Crystal Oscillator

The MAX2769C includes an on-chip crystal oscillator. A parallel mode crystal is required when the crystal oscillator is being used. It is recommended that an AC-coupling capacitor be used in series with the crystal and the XTAL pin to optimize the desired load capacitance and to center the crystal-oscillator frequency. Take the parasitic loss of interconnect traces on the PCB into account when optimizing the load capacitance. For example, the MAX2769C EV kit utilizes a 16.368MHz crystal designed for a 12pF load capacitance. A series capacitor of 23pF is used to center the crystal oscillator frequency, see Figure 1. In addition, the 5-bit serial-interface word, XTALCAP in the PLL Configuration register, can be used to vary the crystal-oscillator frequency electronically. The range of the electronic adjustment depends on how much the chosen crystal frequency can be pulled by the varying capacitor. The frequency of the crystal oscillator used on the MAX2769C EV kit has a range of approximately 200Hz.

The MAX2769C provides a reference clock output. The frequency of the clock can be adjusted to crystal-oscillator frequency, a quarter of the oscillator frequency, a half of the oscillator frequency (f_{XTAL} ≤ 32MHz), or twice the oscillator frequency (f_{XTAL} ≤ 16MHz), by programming bits REFDIV in the PLL Configuration register. See Table 11.

Table 11. Reference Divider Settings

REFDIV (PLL CONFIGURATION REGISTER)	CLOCK OUTPUT
00	XTAL frequency x2
01	XTAL frequency ÷4
10	XTAL frequency ÷2
11	XTAL frequency

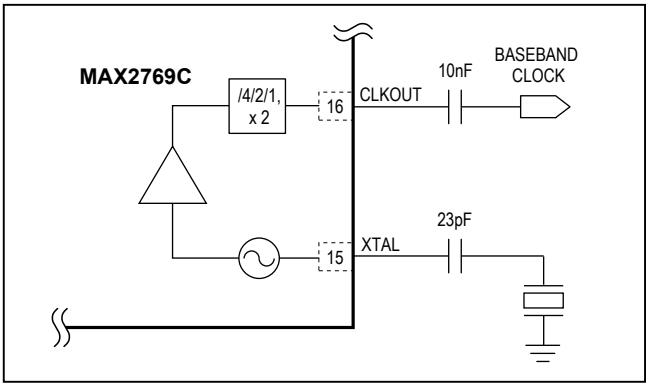

Figure 1. Schematic of the Crystal Oscillator in the MAX2679B EV Kit

ADC

The MAX2769C features an on-chip ADC to digitize the downconverted GPS signal. The ADC can be enabled by configuring the bits, DRVCFG to 00 in the Configuration Register 2. See Table 12.

The ADC supports the digital outputs in three different formats: the unsigned binary, the sign and magnitude, or the two's complement format by setting bits FORMAT in Configuration register 2. See Table 13.

The maximum sampling rate of the ADC is approximately 50Msps. The sampled output is provided in a 2-bit format (1-bit magnitude and 1-bit sign) by default and also can be configured as a 1-bit or 2-bit in both I and Q channels, or 1-bit, 2-bit, or 3-bit in the I channel only. This selection can be done using IQEN in configuration 2 register. See Table 14.

MSB bits are output at I1 or Q1 pins and LSB bits are output at I0 or Q0 pins, for I or Q channel, respectively. In the case of 3-bit, output data format is selected in the I channel only, the MSB is output at I1, the second bit is at I0, and the LSB is at Q1. The number of bits of the ADC can be configured through BITS in configuration 2 register. See Table 15.

Figure 2 illustrates the ADC quantization levels for 2-bit and 3-bit cases and also describes the sign/magnitude data mapping. The variable T = 1 designates the location of the magnitude threshold for the 2-bit case.

Analog Outputs

The on-chip ADCs can be bypassed and the analog output from the PGA can be taken out directly when the bits, DRVCFG are set to 1X. See Table 12.

Table 12. Output Driver Configuration

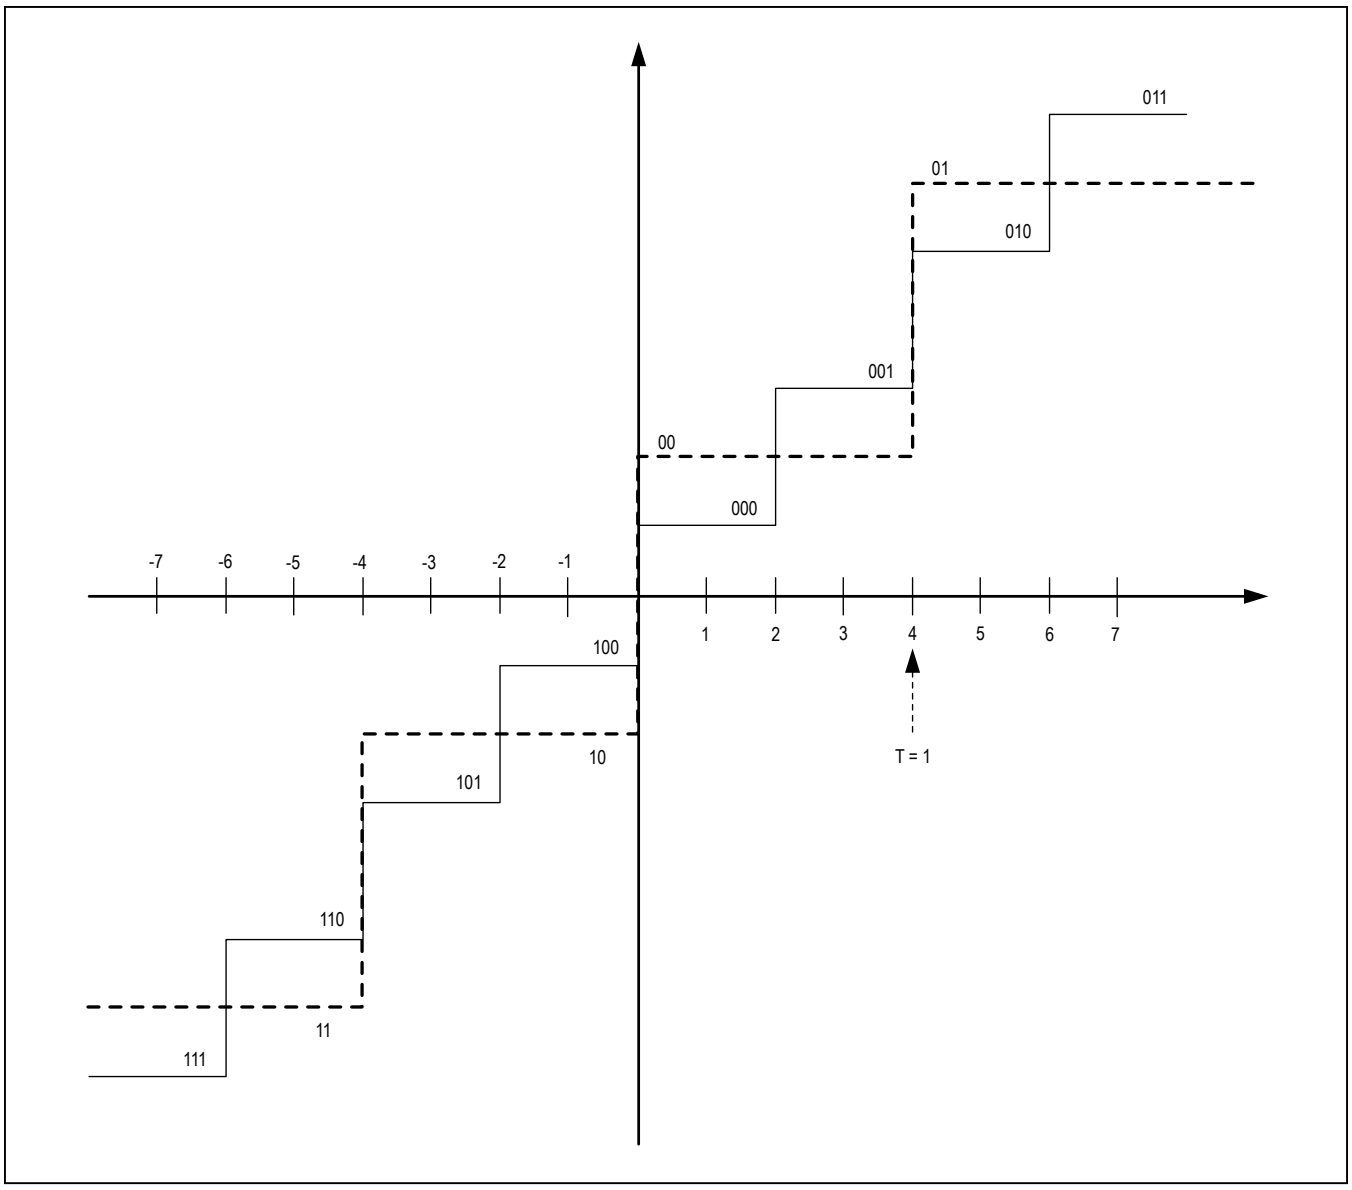

Figure 2. ADC Quantization Levels for 2- and 3-Bit Cases

ADC Fractional Clock Divider

A 12-bit fractional clock divider is located in the clock path prior to the ADC and can be used to generate the ADC clock that is a fraction of the reference input clock. In a fractional divider mode, the instantaneous division ratio alternates between integer division ratios to achieve the required fraction. For example, if the fractional output clock is 4.5 times slower than the input clock, an average division ratio of 4.5 is achieved through an equal series of alternating divide-by-4 and divide-by-5 periods. The fractional division ratio is given by:

$$f_{OUT}/f_{IN} = L_{COUNT}/(4096 - M_{COUNT} + L_{COUNT})$$

where L_{COUNT} and M_{COUNT} are the 12-bit counter values programmed through the serial interface.

This divider can be enabled or bypassed by setting the bit, FCLKIN in Fractional Division Ratio Register to either 0 or 1. Also the sampling clock, ADCCLK can be taken either before or after the Reference Clock Divider/Multiplier depending on the ADCCLK bit setting.

DSP Interface

GPS data is output from the ADC as the four logic signals (bit_0, bit_1, bit_2, and bit_3) that represent sign/magnitude, unsigned binary, or two's complement binary data in the I (bit_0 and bit_1) and Q (bit_2 and bit_3) channels. The resolution of the ADC can be set up to 3 bits per channel. For example, the 2-bit I and Q data in sign/magnitude format is mapped as follows: $bit_0 = I_{SIGN}$, $bit_1 = I_{MAG}$, $bit_2 = Q_{SIGN}$, and $bit_3 = Q_{MAG}$. The data can be serialized in 16-bit segments of bit_0, followed by bit_1, bit_2, and bit_3. The number of bits to be serialized is controlled by the bits STRMBITS in the Configuration 3 register. This selects between bit_0; bit_0 and bit_1; bit_0 and bit_2; and bit_0, bit_1, bit_2, and bit_3 cases. If only bit_0 is serialized, the data stream consists of bit_0 data only. If a serialization of bit_0 and bit_1 (or bit_2) is selected, the stream data pattern consists of 16 bits of bit_0 data followed by 16 bits of bit_1 (or bit_2) data, which, in turn, is followed by 16 bits of bit_0 data, and so on. In this case, the serial clock must be at least twice as fast as the ADC clock. If a 4-bit serialization of bit_0, bit_1, bit_2, and bit_3 is chosen, the serial clock must be at least four times faster than the ADC clock.

The ADC data is loaded in parallel into four holding registers that correspond to four ADC outputs. Holding registers are 16 bits long and are clocked by the ADC clock. At the end of the 16-bit ADC cycle, the data is transferred into four shift registers and shifted serially to the output during the next 16-bit ADC cycle. Shift registers are clocked by a serial clock that must be chosen fast enough so that all data is shifted out before the next set of data is loaded from the ADC. An all-zero pattern follows the data after all valid ADC data are streamed to the output. A DATASYNC signal is used to signal the beginning of each valid 16-bit data slice. In addition, there is a TIME_SYNC signal that is output every 128 to 16,384 cycles of the ADC clock. see Figure 3 for details.

Preconfigured Device States

When a serial interface is not available, the device can be used in preconfigured states that don't require programming through the serial interface. Connecting the PGM pin to logic-high and SCLK, SDATA, and $\overline{CS}$ pins to either logic-high or logic-low sets the device in one of the preconfigured states according to Table 19.

Power-On Reset (POR)

The MAX2769C incorporates power-on reset circuitry to ensure that register settings are loaded upon power-up. To ensure proper operation, the rising edge of PGM must occur no sooner than when $V_{CC\_}$ reaches 90% of its final nominal value; see Figure 4 for details.

Table 19. Preconfigured Device States

DEVICE STATE	DEVICE ELECTRICAL CHARACTERISTICS									3-WIRE CONTROL PINS

Serial Interface, Address, and Bit Assignments

A serial interface is used to program the MAX2769C for configuring the different operating modes.

The serial interface is controlled by three signals: SCLK (serial clock), $\overline{CS}$ (chip select), and SDATA (serial data). The control of the PLL, AGC, test, and block selection is performed through the serial-interface bus from the baseband controller. A 32-bit word, with the MSB (D27) being sent first, is clocked into a serial shift register when the chip-select signal is asserted low. The timing of the interface signals is shown in Figure 5 and Table 20 along with typical values for setup and hold time requirements.

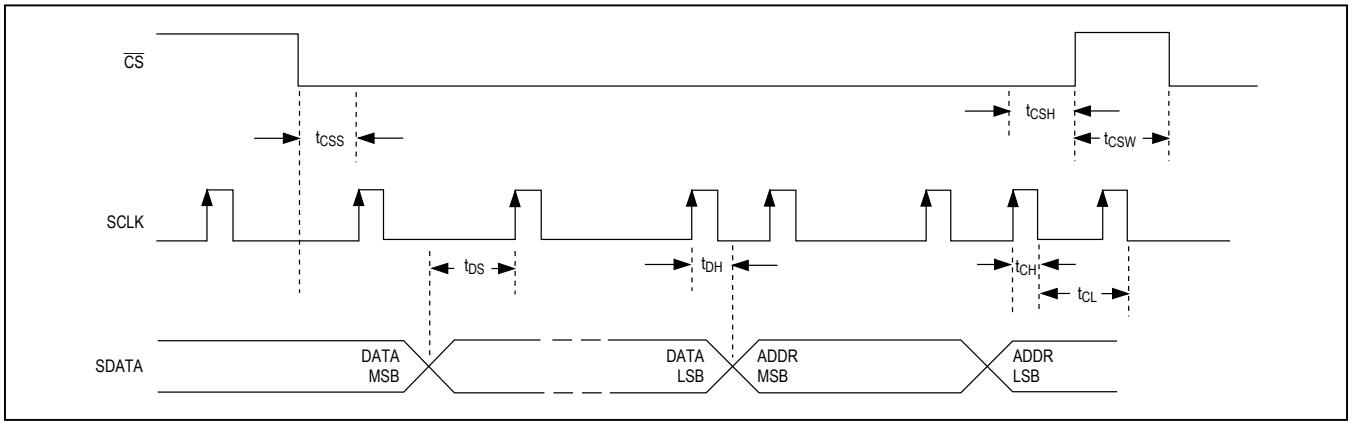

Figure 5. 3-Wire Timing Diagram

Table 20. Serial-Interface Timing Requirements

SYMBOL	PARAMETER	TYP VALUE	UNITS
t_{CSS}	Falling edge of $\overline{CS}$ to rising edge of the first SCLK time.	10	ns
t_{DS}	Data to serial-clock setup time.	10	ns
t_{DH}	Data to clock hold time.	10	ns
t_{CH}	Serial clock pulse-width high.	25	ns
t_{CL}	Clock pulse-width low.	25	ns
t_{CSH}	Last SCLK rising edge to rising edge of $\overline{CS}$.	10	ns
t_{CSW}	$\overline{CS}$ high pulse width.	1	clock

Table 21. Default Register Settings Overview

REGISTER NAME	ADDRESS (A3:A0)	DATA
CONF1	0000	Configures RX and IF sections, bias settings for individual blocks.

Detailed Register Definitions

Table 23. Configuration 1 (Address: 0000)

DATA BIT	LOCATION	DEFAULT VALUE (PGM = 0)	DESCRIPTION
CHIPEN	27	1	Chip enable. Set 1 to enable the device and 0 to disable the entire device except the serial bus.
IDLE	26	0	Idle enable. Set 1 to put the chip in the idle mode and 0 for operating mode.
RESERVED	25:22	1000	—
RESERVED	21:20	10	—
RESERVED	19:18	10	—
RESERVED	17:16	01	—
MIXPOLE	15	0	Mixer pole selection. Set 1 to program the passive filter pole at mixer output at 36MHz, or set 0 to program the pole at 13MHz.
LNAMODE	14:13	00	LNA mode selection, D14:D13 = 00: LNA selection gated by the antenna bias circuit, 01: LNA2 is active; 10: LNA1 is active; 11: both LNA1 and LNA2 are off.
MIXEN	12	1	Mixer enable. Set 1 to enable the mixer and 0 to shut down the mixer.
ANTEN	11	1	Antenna bias enable. Set 1 to enable the antenna bias and 0 to shut down the antenna bias.
FCEN	10:5	001101	IF center frequency programming. Default for f_{CENTER} = 3.9 MHz, BW = 2.5MHz. The MSB of FCEN is located in Register Test Mode 2 (Table 32).
FBW	4:3	00	IF filter center bandwidth selection. D4:D3 = 00: 2.5MHz; 10: 4.2MHz; 01: 9.66MHz; 11: Reserved.
F3OR5	2	0	Filter order selection. Set 0 to select the 5th-order Butterworth filter. Set 1 to select the 3rd-order Butterworth filter.
FCENX	1	1	Polyphase filter selection. Set 1 to select bandpass filter mode. Set 0 to select lowpass filter mode.
FGAIN	0	1	IF filter gain setting. Set 0 to reduce the filter gain by 6dB.

Table 24. Configuration 2 (Address: 0001)

DATA BIT	LOCATION	DEFAULT VALUE (PGM = 0)	DESCRIPTION
IQEN	27	0	I and Q channels enable. Set 1 to enable both I and Q channels and 0 to enable I channel only.
GAINREF	26:15	170d	AGC gain reference value expressed by the number of MSB counts (magnitude bit density). 10101010 = 234 magnitude bit density reference, 1010100 = 84 magnitude bit density reference, 100111010 = 314 magnitude bit density reference.
RESERVED	14:13	00	Reserved.
AGCMODE	12:11	00	AGC mode control. Set D12:D11 = 00: independent I and Q; 01: reserved; 10: gain is set directly from the serial interface by GAININ; 11: reserved.
FORMAT	10:9	01	Output data format. Set D10:D9 = 00: unsigned binary; 01: sign and magnitude; 1X: two's complement binary.
BITS	8:6	010	Number of bits in the ADC. Set D8:D6 = 000: 1 bit, 001: reserved; 010: 2 bits; 011: reserved, 100: 3 bits.
DRVCFG	5:4	00	Output driver configuration. Set D5:D4 = 00: CMOS logic, 01: reserved; 1X: analog outputs.
RESERVED	3	1	—
RESERVED	2	0	—
DIEID	1:0	00	Identifies a version of the IC.

Table 25. Configuration 3 (Address: 0010)

DATA BIT	LOCATION	DEFAULT VALUE (PGM = 0)	DESCRIPTION
GAININ	27:22	111010	PGA gain value programming from the serial interface in steps of dB per LSB. 000000 = PGA gain set to 0dB, 101011 = 42dB, 101100 = 43dB, 101110 = 45dB, 111010 = 57dB, 111111 = 62dB.
RESERVED	21	1	—
HILOADEN	20	0	Set 1 to enable the output driver to drive high loads.
RESERVED	19	1	—
RESERVED	18	1	—
RESERVED	17	1	—
RESERVED	16	1	—
FHIPEN	15	1	High-pass coupling enable. Set 1 to enable the highpass coupling between the filter and PGA, or 0 to disable the coupling.
RESERVED	14	1	—
PGAIEN	13	1	I-Channel PGA Enable. Set 1 to enable PGA in the I channel or 0 to disable.
PGAQEN	12	0	Q-Channel PGA Enable. Set 1 to enable PGA in the Q channel or 0 to disable.
STRMEN	11	0	DSP Interface for Serial Streaming of Data Enable. This bit configures the IC such that the DSP interface is inserted in the signal path. Set 1 to enable the interface or 0 to disable the interface.

Table 25. Configuration 3 (Address: 0010) (continued)

DATA BIT	LOCATION	DEFAULT VALUE (PGM = 0)	DESCRIPTION
STRMSTART	10	0	The positive edge of this command enables data streaming to the output. It also enables clock, data sync, and frame sync outputs.
STRMSTOP	9	0	The positive edge of this command disables data streaming to the output. It also disables clock, data sync, and frame sync outputs.
RESERVED	8:6	111	—
STRMBITS	5:4	01	Number of Bits Streamed. D5:D4 = 00: reserved; 01: 1 MSB, 1 LSB; 10: reserved, Q MSB; 11: 1 MSB, 1 LSB, Q MSB, Q LSB.
STAMPEN	3	1	The signal enables the insertion of the frame number at the beginning of each frame. If disabled, only the ADC data is streamed to the output.
TIMESYNCEN	2	1	This signal enables the output of the time sync pulses at all times when streaming is enabled by the STRMEN command. Otherwise, the time sync pulses are available only when data streaming is active at the output, for example, in the time intervals bound by the STRMSTART and STRMSTOP commands.
DATSYNCEN	1	0	This control signal enables the sync pulses at the DATASYNC output. Each pulse is coincident with the beginning of the 16-bit data word that corresponds to a given output bit.
STRMRST	0	0	This command resets all the counters irrespective of the timing within the stream cycle.

FCENMSB	0	0	When combined with FCEN, this bit represents the MSB of a 7-bit FCEN word.

Applications Information

The LNA and mixer inputs require careful consideration in matching to 50Ω lines. Proper supply bypassing, grounding, and layout are required for reliable performance from any RF circuit.

IF Filter Center Frequency Configuration

FCEN is the center frequency of the IF Filter and it is dependent on the configured Bandwidth, FBW setting.

The basic step to calculate the center frequency of the IF filter is that the FCEN bits that are set in the GUI need to be flipped. This means the FCENMSB bit is actually LSB for center frequency setting when the bits are flipped due to which the FCENMSB setting will slightly change the center frequency of the IF filter.

If FBW = 00 which corresponds to 2.5MHz BW, the center frequency of the IF filter can be calculated as below:

$$F_{CENTER} = \left(\frac{\left(128 - FCEN_{flipped}\right)}{2} \right) \times 0.195\,MHz$$

If FBW = 10 which corresponds to 4.2MHz BW, the center frequency of the IF filter can be calculated as below:

$$F_{CENTER} = \left(\frac{\left(128 - FCEN_{flipped}\right)}{2} \right) \times 0.355\,MHz$$

Similarly, If FBW = 01 which corresponds to 9.6MHz BW, the center frequency of the IF filter can be calculated as shown below:

$$F_{CENTER} = \left(\frac{\left(128 - FCEN_{flipped}\right)}{2} \right) \times 0.66MHz$$

Where F_{CENTER} is Center Frequency of the IF filter

$FCEN_{flipped}$ is Flipped bits decimal value

For detailed FCEN configuration, please refer to the *Design Resources* section of the product page.

Operation in Wideband Galileo and GLONASS Applications

The use of the wideband receiver options is recommended for Galileo and GLONASS applications. The frequency synthesizer is used to tune LO to a desired frequency, which, in turn, determines the choice of the IF center frequency. Either a fractional-N or an integer-N mode of the frequency synthesizer can be used depending on the choice of the reference frequency.

For Galileo reception, set the IF filter bandwidth to 4.2MHz (FBW = 10) and adjust the IF center frequency through a control word FCEN to the middle of the downconverted signal band. Alternatively, use wideband settings of 8MHz and 18MHz when the receiver is in a zero-IF mode.

For GLONASS as well as GPS P-code reception, a zero-IF receiver configuration is used in which the IF filter is used in a lowpass filter mode (FCENX = 1) with a two-sided bandwidth of 18MHz.

It is recommended that an active antenna LNA be used in wide-bandwidth applications such that the PGA is operated at lower gain levels for a maximum bandwidth. If a PGA gain is programmed directly from a serial nterface, GAININ values between 32 and 38 are recommended. Set the filter pole at the mixer output to 36MHz through MIXPOLE = 1.

Layout Issues

The MAX2769C EV kit can be used as a starting point for layout. For best performance, take into consideration grounding and routing of RF, baseband, and power-supply PCB proper line. Make connections from vias to the ground plane as short as possible. On the high impedance ports, keep traces short to minimize shunt capacitance. EV kit Gerber files can be requested at **www.maximintegrated.com**.

Power-Supply Layout

To minimize coupling between different sections of the IC, a star power-supply routing configuration with a large decoupling capacitor at a central $V_{CC\_}$ node is recommended. The $V_{CC\_}$ traces branch out from this node, each going to a separate $V_{CC\_}$ node in the circuit. Place a bypass capacitor as close as possible to each supply pin This arrangement provides local decoupling at each $V_{CC\_}$ pin. Use at least one via per bypass capacitor for a low-inductance ground connection. Do not share the capacitor ground vias with any other branch.

Refer to **Maxim's Wireless and RF Application Notes** for more information.

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX2769CETI+	-40°C to +85°C	28 TQFN-EP*
MAX2769CETI+T	-40°C to +85°C	28 TQFN-EP*

**EP = Exposed paddle.*

+Denotes lead(Pb)-free/RoHS-compliant package.

T = Tape and reel.

Chip Information

PROCESS: SiGe BiCMOS

Package Information

For the latest package outline information and land patterns (footprints), go to **www.maximintegrated.com/packages**. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

PACKAGE TYPE	PACKAGE CODE	OUTLINE NO.	LAND PATTERN NO.
28 TQFN-EP	T2855+3	21-0140	90-0023

Revision History

REVISION NUMBER	REVISION DATE	DESCRIPTION	PAGES CHANGED
0	9/16	Initial release	—
1	10/16	Corrected various typos, updated GAINREF value, QPGA EN bits made visible	14, 15, 18, 23

ООО «ЛайфЭлектроникс» **“LifeElectronics” LLC**

ИНН 7805602321 КПП 780501001 Р/С 40702810122510004610 ФАКБ "АБСОЛЮТ БАНК" (ЗАО) в г.Санкт-Петербурге К/С 30101810900000000703 БИК 044030703

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- *Конкурентоспособные цены и скидки постоянным клиентам.*
- *Специальные условия для постоянных клиентов.*
- *Подбор аналогов.*
- *Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.*

- *Приемлемые сроки поставки, возможна ускоренная поставка.*
- *Доставку товара в любую точку России и стран СНГ.*
- *Комплексную поставку.*
- *Работу по проектам и поставку образцов.*
- *Формирование склада под заказчика.*

- *Сертификаты соответствия на поставляемую продукцию (по желанию клиента).*
- *Тестирование поставляемой продукции.*
- *Поставку компонентов, требующих военную и космическую приемку.*
- *Входной контроль качества.*
- *Наличие сертификата ISO.*

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- *Регистрацию проекта у производителя компонентов.*
- *Техническую поддержку проекта.*
- *Защиту от снятия компонента с производства.*
- *Оценку стоимости проекта по компонентам.*
- *Изготовление тестовой платы монтаж и пусконаладочные работы.*
