

CAT3604V

4-Channel Quad-Mode® LED Driver with Open/Short LED Detection

Description

The CAT3604V is a high efficiency Quad-Mode® fractional charge pump that can drive up to four LEDs with input supply voltages as low as 2.5 V.

An external RSET resistor is used to control the LED channel brightness while channel diagnostics include automatic detection for both short and open LED channel conditions, ensuring the CAT3604V maintains the highest efficiency level in all operating modes.

Each operating mode uses a constant high frequency switching scheme which allows the use of small form factor external ceramic capacitors while delivering excellent low noise input supply ripple up to 5.5 volts.

The EN input control supports direct PWM dimming and can accommodate dimming frequencies in excess of 10 kHz thereby providing extremely high resolution brightness levels.

The device is available in the 16-pad low profile 0.8 mm thin QFN (4 mm x 4 mm).

Features

- Quad-mode Charge Pump: 1x, 1.33x, 1.5x, 2x
- Drives up to 4 LEDs at 30 mA Each
- Pin Compatible with Industry Standard '604
- Open/Short LED Automatic Detection
- Power Efficiency up to 92%
- High Resolution PWM Dimming
- Low Noise Supply Ripple in All Modes
- Soft Start and Current Limiting
- Short Circuit and Thermal Overload Protection
- 16-Pad TQFN Package, 4 mm x 4 mm
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Applications

- LCD Display Backlight
- Cellular Phones
- Digital Still Cameras
- Handheld Devices

Table 6. PIN DESCRIPTION

Pin #	Name	Function
1	EN	Device enable (active high).
2	NC	Not connected inside the package.
3	NC	Not connected inside the package.
4	NC	Not connected inside the package.
5	RSET	Connect resistor RSET to set the LED current.
6	VOOUT	Charge pump output connected to the LED anodes.
7	VIN	Charge pump input, connect to battery or supply.
8	C1+	Bucket capacitor 1 Positive terminal
9	C1–	Bucket capacitor 1 Negative terminal
10	C2–	Bucket capacitor 2 Negative terminal
11	C2+	Bucket capacitor 2 Positive terminal
12	GND	Ground Reference
13	LED4	LED4 cathode terminal.
14	LED3	LED3 cathode terminal.
15	LED2	LED2 cathode terminal.
16	LED1	LED1 cathode terminal.
TAB	GND	Connect to GND on the PCB.

Pin Function

VIN is the supply pin for the charge pump. A small 1 μ F ceramic bypass capacitor is required between the VIN pin and ground near the device. The operating input voltage range is from 2.5 V to 5.5 V. Whenever the input supply falls below the under-voltage threshold (1.8 V), all the LED channels are disabled and the device enters shutdown mode.

EN is the enable input and the high resolution PWM dimming control. Levels of logic high and logic low are set at 1.3 V and 0.4 V respectively. When EN is initially taken high, the device becomes enabled and all LED currents are set according to the RSET resistor. To place the device into “zero current” shutdown mode, the EN pin must be held low for at least 1.5 ms.

VOOUT is the charge pump output that is connected to the LED anodes. A small 1 μ F ceramic bypass capacitor is required between the VOOUT pin and ground near the device.

GND is the ground reference for the charge pump. The pin must be connected to the ground plane on the PCB.

C1+, C1– are connected to each side of the ceramic bucket capacitor C₁.

C2+, C2– are connected to each side of the ceramic bucket capacitor C₂.

LED1 to LED4 provide the internal regulated current source for each of the LED cathodes. These pins enter high-impedance zero current state whenever the device is placed in shutdown mode. If an LED pin is directly tied to VOOUT, that channel is disabled.

TAB is the exposed pad underneath the package. For best thermal performance, the tab should be soldered to the PCB and connected to the ground plane.

RSET is connected to the resistor (RSET) to set the current for the LEDs. The voltage at this pin regulated to 0.6 V. The ground side of the external resistor should be star connected back to the GND of the PCB. In shutdown mode, RSET becomes high impedance.

Block Diagram

Figure 25. CAT3604V Functional Block Diagram

Basic Operation

At power-up, the CAT3604V starts operating in 1x mode where the output will be approximately equal to the input supply voltage (less any internal voltage losses). If the output voltage is sufficient to regulate all LED currents, the device remains in 1x operating mode.

If the input voltage is insufficient or falls to a level where the regulated currents cannot be maintained, the device automatically switches into 1.33x mode (after a fixed delay time of about 400 μ s). In 1.33x mode, the output voltage is approximately equal to 1.33 times the input supply voltage (less any internal voltage losses).

This sequence repeats in the 1.33x and 1.5x mode until the driver enters the 2x mode. In 1.5x mode, the output voltage is approximately equal to 1.5 times the input supply voltage. While in 2x mode, the output is approximately equal to 2 times the input supply voltage.

If the device detects a sufficient input voltage is present to drive all LED currents in 1x mode, it will change automatically back to 1x mode. This only applies for changing back to the 1x mode. The difference between the input voltage when exiting 1x mode and returning to 1x mode is called the 1x mode transition hysteresis (V_{HYS}) and is about 500 mV.

LED Current Selection

The LED current is set to by the external resistor RSET as follows:

$$\text{LED current} = 132 \times \frac{0.6 \text{ V}}{R_{\text{SET}}}$$

The EN pin enables and disables the device. The LED driver enters a “zero current” shutdown mode if EN is held low for 1.5 ms or more.

As soon as the EN input goes low, all LED channels are instantly disabled, where the LED current is set to zero. As long as the CAT3604V is not in shutdown mode, the LEDs turn on as soon as the EN goes high.

Unused LED Channels

For applications not requiring all the channels, it is recommended to connect the unused LED pins directly to VOUT (see Figure 26).

Figure 26. Application with 3 LEDs

Protection Mode

If an LED is disconnected, the device senses that, run the diagnostics, then ignores that channel and goes back to the most effective mode. When all LEDs are disconnected, the

device runs diagnostics and goes to 1x mode where the output is basically equal to the input voltage.

As soon as the output exceeds about 6 V, the driver resets itself and reevaluate the mode.

If the die temperature reaches +150°C, the device enters a thermal protection shutdown mode. When the device temperature drops to about +130°C, the device resumes normal operation.

LED Selection

LEDs with forward voltages (V_F) ranging from 1.3 V to 4.3 V may be used. Selecting LEDs with lower V_F is recommended in order to extend battery life and keep the driver in 1x mode longer as the battery voltage decreases.

For example, if a 3.3 V V_F LED is selected instead of a 3.5 V V_F LED, the driver will stay in 1x mode for a lower supply voltage of 0.2 V.

External Components

The driver requires four external 1 μ F ceramic capacitors for decoupling input, output, and for the charge pump. Both capacitors type X5R and X7R are recommended for the LED driver application. In all charge pump modes, the input current ripple is kept very low by design and an input bypass capacitor of 1 μ F is sufficient.

In 1x mode, the device operates in linear mode and does not introduce switching noise back onto the supply.

Recommended Layout

In charge pump mode, the driver switches internally at a high frequency. It is recommended to minimize trace length to all four capacitors. A ground plane should cover the area under the driver IC as well as the bypass capacitors. Short connection to ground on capacitors C_{IN} and C_{OUT} can be implemented with the use of multiple via. A copper area matching the TQFN exposed pad (TAB) must be connected to the ground plane underneath. The use of multiple via improves the package heat dissipation.

Figure 27. PCB Layout

PWM Dimming

The EN pin is used to provide total Shutdown of the device as well as High Resolution PWM dimming control on the LED Channels.

Shutdown of the device occurs after the EN pin has been held low for 1.5 ms. During the “soft-start” power-up sequence from the shutdown mode, the LED current typically settles within 40 μ s (for 1X mode operation). This LED current settling time becomes 400 μ s if 1.33X operation is needed (i.e low battery voltage).

For High Resolution PWM dimming control (typically frequencies at 2 kHz or above), the device will remain powered and only the LED channels output will be switched on and off during the PWM (the rest of the device will remain powered-up). This allows the output channels to have “instant-on” response, where the LED current settles within 1 μ s of the applied PWM dimming signals. This “instant-on” modes makes the device suitable for extremely high frequency PWM dimming schemes.

Figure 28 shows the output current for PWM frequencies up to 100 kHz and with duty cycles of 30% and 70%.

Figure 28. Output Current vs. PWM Frequency

For best performance, the duty cycle off-time T_{OFF} should meet the following timing limits:

- for slow frequency ≤ 600 Hz, $T_{OFF} \geq 800$ μ s
- for fast frequency ≥ 1 kHz, $T_{OFF} \leq 400$ μ s

TYPICAL PERFORMANCE CHARACTERISTICS

($V_{IN} = 3.6\text{ V}$, $I_{OUT} = 80\text{ mA}$ (4 LEDs at 20 mA), $C_{IN} = C_{OUT} = C_1 = C_2 = 1\text{ }\mu\text{F}$, $T_{AMB} = 25^\circ\text{C}$ unless otherwise specified.)

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
