

General Description

The MAX6443–MAX6452 low-current microprocessor reset circuits feature single or dual manual reset inputs with an extended setup period. Because of the extended setup period, short switch closures (nuisance resets) are ignored.

On all devices, the reset output asserts when any of the monitored supply voltages drops below its specified threshold. The reset output remains asserted for the reset timeout period (210ms typ) after all monitored supplies exceed their reset thresholds. The reset output is one-shot pulse asserted for the reset timeout period (140ms min) when selected manual reset input(s) are held low for an extended setup timeout period. These devices ignore manual reset transitions of less than the extended setup timeout period.

The MAX6443–MAX6448 are single fixed-voltage µP supervisors. The MAX6443/MAX6444 have a single extended manual reset input. The MAX6445/MAX6446 have two extended manual reset inputs. The MAX6447/MAX6448 have one extended and one immediate manual reset input.

The MAX6449–MAX6452 have one fixed-threshold µP supervisor and one adjustable-threshold µP supervisor. The MAX6449/MAX6450 have two delayed manual reset inputs. The MAX6451/MAX6452 have one delayed and one immediate manual reset input.

The MAX6443–MAX6452 have an active-low $\overline{\text{RESET}}$ with push-pull or open-drain output logic options. These devices, offered in small SOT packages, are fully guaranteed over the extended temperature range (-40°C to +85°C).

Applications

- Set-Top Boxes
- Consumer Electronics
- DVD Players
- Cable/DSL Modems
- MP3 Players
- Industrial Equipment
- Automotive
- Medical Devices

Features

- Single or Dual-Supply Voltage Monitors
- Precision Factory-Set Reset Thresholds from 1.6V to 4.6V
- Adjustable Threshold to Monitor Voltages Down to 0.63V (MAX6449–MAX6452)
- Single or Dual Manual Reset Inputs with Extended Setup Period
- Optional Short Setup Time Manual Reset Input (MAX6447/MAX6448 and MAX6451/MAX6452)
- Immune to Short Voltage Transients
- Low 6µA Supply Current
- Guaranteed Valid Reset Down to $V_{CC} = 1.0V$
- Active-Low $\overline{\text{RESET}}$ (Push-Pull or Open-Drain) Outputs
- 140ms (min) Reset Timeout Period
- Small SOT143 and SOT23 Packages
- AEC-Q100 Qualified (MAX6444US16K/V+T)

Ordering Information at end of data sheet.

Typical Operating Circuit

Absolute Maximum Ratings

MANUAL RESET TO RESET DELAY (MAX6445L/MAX6446L/MAX6449L/MAX6450L)

V_{CC} TO RESET DELAY

Pin Description

PIN					NAME	FUNCTION
MAX6443 MAX6444	MAX6445 MAX6446	MAX6447 MAX6448	MAX6449 MAX6450	MAX6451 MAX6452		
1	2	2	2	2	GND	Ground
2	1	1	1	1	$\overline{\text{RESET}}$	Active-Low Push-Pull or Open-Drain Output. $\overline{\text{RESET}}$ changes from high to low when V_{CC} or RSTIN drops below its selected reset threshold and remains low for the 210ms reset timeout period after all monitored power-supply inputs exceed their selected reset thresholds. $\overline{\text{RESET}}$ is one-shot pulsed low for the reset timeout period (140ms min) after selected manual reset inputs are asserted longer than the specified setup period. For the open-drain output, use a minimum 20kΩ pullup resistor to V_{CC} .
3	—	3	—	3	$\overline{\text{MR1}}$	Manual Reset Input, Active Low. Internal 50kΩ pullup to V_{CC} . Pull $\overline{\text{MR1}}$ low for the typical input pulse width (t_{MR}) to one-shot pulse $\overline{\text{RESET}}$ for the reset timeout period.
—	3	—	3	—		Manual Reset Input, Active Low. Pull both $\overline{\text{MR1}}$ and $\overline{\text{MR2}}$ low for the typical input pulse width (t_{MR}) to one-shot pulse $\overline{\text{RESET}}$ for the reset timeout period.
4	4	4	4	4	V_{CC}	V_{CC} Voltage Input. Power supply and input for the primary microprocessor voltage reset monitor.
—	5	—	6	—	$\overline{\text{MR2}}$	Manual Reset Input, Active Low. Internal 50kΩ pullup to V_{CC} . Pull both $\overline{\text{MR1}}$ and $\overline{\text{MR2}}$ low for the typical input pulse width (t_{MR}) to one-shot pulse $\overline{\text{RESET}}$ for the reset timeout period.
—	—	5	—	6	MR2	Manual Reset Input. Pull the MR2 high to immediately one-shot pulse $\overline{\text{RESET}}$ for the reset timeout period.
—	—	—	5	5	RSTIN	Reset Input. High-impedance input to the adjustable reset comparator. Connect RSTIN to the center point of an external resistor-divider to set the threshold of the externally monitored voltage.

Detailed Description

Reset Output

The reset output is typically connected to the reset input of a microprocessor (μP). A μP's reset input starts or restarts the μP in a known state. The MAX6443–MAX6452 μP supervisory circuits provide the reset logic to prevent code-execution errors during power-up, power-down and brownout conditions (see the *Typical Operating Circuit*).

$\overline{\text{RESET}}$ changes from high to low whenever the monitored voltages (RSTIN or V_{CC}) drop below the reset

threshold voltages. Once V_{RSTIN} and V_{CC} exceed their respective reset threshold voltages, $\overline{\text{RESET}}$ remains low for the reset timeout period and then goes high. $\overline{\text{RESET}}$ is one-shot pulsed whenever selected manual reset inputs are asserted. $\overline{\text{RESET}}$ stays asserted for the normal reset timeout period (140ms min).

$\overline{\text{RESET}}$ is guaranteed to be in the proper output logic state for V_{CC} inputs $\geq 1V$. For applications requiring valid reset logic when V_{CC} is less than 1V, see the *Ensuring a Valid $\overline{\text{RESET}}$ Output Down to $V_{CC} = 0V$* section.

Manual Reset Input Options

Unlike typical manual reset functions associated with supervisors, each device in the MAX6443–MAX6452 family includes at least one manual reset input, which must be held logic-low for an extended setup period (t_{MR}) before the \overline{RESET} output asserts. When valid manual reset input conditions/setup periods are met, the \overline{RESET} output is one-shot pulse asserted low for a fixed reset timeout period (140ms min). Existing front-panel pushbutton switches (i.e., power on/off, channel up/down, or mode select) can be used to drive the manual reset inputs. The extended manual reset setup period prevents nuisance system resets during normal front-panel usage or resulting from inadvertent short-term pushbutton closure.

The MAX6443/MAX6444, MAX6447/MAX6448, and MAX6451/MAX6452 include a single manual reset input with extended setup period ($\overline{MR1}$). The MAX6445/MAX6446 and MAX6449/MAX6450 include two manual reset inputs ($\overline{MR1}$ and $\overline{MR2}$) with extended setup periods. For dual $\overline{MR1}$, $\overline{MR2}$ devices, both inputs must be held low simultaneously for the extended setup period (t_{MR}) before the reset output is pulse asserted. The dual extended setup provides greater protection from nuisance resets. (For example, the user or service technician is informed to simultaneously push both the on/off button and the channel-select button for 6.72s (L suffix) to reset the system.)

The MAX6443/MAX6452 \overline{RESET} output is pulse asserted once for the reset timeout period after each valid manual reset input condition. At least one manual reset input must be released (go high) and then be driven low for the extended setup period before \overline{RESET} asserts again. Internal timing circuitry debounces low-to-high manual reset logic transitions, so no external circuitry is required. Figure 1 illustrates the single manual reset function of the MAX6443/MAX6444 single-voltage monitors, and Figure 2 represents the dual manual reset function of the MAX6445/MAX6446 and MAX6449/MAX6450.

The MAX6447/MAX6448 and MAX6451/MAX6452 include both an extended setup period and immediate setup period manual reset inputs. A low-to-high $\overline{MR2}$ rising edge transition immediately pulse asserts the \overline{RESET} output for the reset timeout period (140ms min). If the MAX6447/MAX6448 and MAX6451/MAX6452 $\overline{MR2}$ input senses another rising edge before the end of the 140ms timeout period (Figure 3), the internal timer clears and begins counting again. If no rising edges are detected within the 210ms timeout period, \overline{RESET} deasserts. The high-to-low transition on $\overline{MR2}$ input is internally debounced for 210ms to ensure that

Figure 1. MAX6443/MAX6444 Manual Reset Timing Diagram

Figure 2. MAX6445/MAX6446/MAX6449/MAX6450 Manual Reset Timing Diagram

there are no false \overline{RESET} assertions when $\overline{MR2}$ is driven from high to low (Figure 4). The $\overline{MR2}$ input can be used for system test purposes or smart-card-detect applications (see the *Applications Information* section).

Adjustable Input Voltage (RSTIN)

The MAX6449–MAX6452 monitor the voltage on RSTIN using an adjustable reset threshold set with an external resistor voltage-divider (Figure 5). Use the following formula to calculate the externally monitored voltage (V_{MON-TH}):

$$V_{MON-TH} = V_{TH-RSTIN} \times (R1 + R2)/R2$$

where V_{MON-TH} is the desired reset threshold voltage and $V_{TH-RSTIN}$ is the reset input threshold (0.63V). Resistors $R1$ and $R2$ can have very high values to minimize current consumption because of low leakage currents. Set $R2$ to some conveniently high value (250k Ω , for example), and calculate $R1$ based on the desired reset threshold voltage, using the following formula:

$$R1 = R2 \times (V_{MON-TH}/V_{TH-RSTIN} - 1) \Omega$$

Figure 3. MAX6447/MAX6448/MAX6451/MAX6452 MR2 Assertion Debouncing Timing Diagram

$$V_{MON_TH} = 0.63 \times (R1 + R2) / R2$$

Applications Information

Interrupt Before Reset

To minimize data loss and speed system recovery, many applications interrupt the processor or reset only portions of the system before a processor hard reset is asserted. The extended setup time of the MAX6443–MAX6452 manual reset inputs allows the same pushbutton (connected to both the processor interrupt and the extended $\overline{MR1}$ input, as shown in Figure 6) to control both the interrupt and hard reset functions. If the pushbutton is closed for less than t_{MR} , the processor is only interrupted. If the system still does not respond properly, the pushbutton (or two buttons for the dual manual reset) can be closed for the full extended setup period to hard reset the processor. If desired, connect an LED to the \overline{RESET} output to blink off (or on) for the reset timeout period to signify when the pushbutton is

Figure 6. Interrupt Before Reset Application Circuit

closed long enough for a hard reset (the same LED might be used as the front-panel power-on display).

Smart Card Insertion/Removal

The MAX6447/MAX6448/MAX6451/MAX6452 dual manual resets are useful in applications in which both an extended and immediate setup periods are needed. Figure 7 illustrates the insertion and removal of a smart card. $\overline{MR1}$ monitors a front-panel pushbutton. When closed for t_{MR} , \overline{RESET} one-shot pulses low for 140ms min. Because $\overline{MR1}$ is internally pulled to V_{CC} through a 50kΩ resistor, the front-panel switch can be connected to a microprocessor for general-purpose I/O control. $\overline{MR2}$ monitors a switch to detect when a smart card is inserted. When the switch is closed high (card inserted),

Figure 7. MAX6451/MAX6452 Application Circuit

$\overline{\text{RESET}}$ one-shot pulses low for 140ms. MR2 is internally debounced for 210ms to prevent false resets when the smart card is removed.

Interfacing to Other Voltages for Logic Compatibility

The open-drain $\overline{\text{RESET}}$ output can be used to interface to a μP with other logic levels. As shown in Figure 8, the open-drain output can be connected to voltages from 0 to 6V.

Generally, the pullup resistor connected to the $\overline{\text{RESET}}$ connects to the supply voltage that is being monitored at the IC's V_{CC} pin. However, some systems may use the open-drain output to level-shift from the monitored supply to reset circuitry powered by some other supply (Figure 8). Keep in mind that as the supervisor's V_{CC} decreases toward 1V, so does the IC's ability to sink current at $\overline{\text{RESET}}$. $\overline{\text{RESET}}$ is pulled high as V_{CC} decays toward 0. The voltage where this occurs depends on the pullup resistor value and the voltage to which it is connected.

Figure 8. Interfacing to Other Voltage Levels

Ensuring a Valid $\overline{\text{RESET}}$ Down to $V_{CC} = 0V$ (Push-Pull $\overline{\text{RESET}}$)

When V_{CC} falls below 1V, $\overline{\text{RESET}}$ current-sinking capabilities decline drastically. The high-impedance CMOS-logic inputs connected to $\overline{\text{RESET}}$ can drift to undetermined voltages. This presents no problems in most applications, because most μPs and other circuitry do not operate with V_{CC} below 1V.

In applications in which $\overline{\text{RESET}}$ must be valid down to 0V, add a pulldown resistor between $\overline{\text{RESET}}$ and GND for the push-pull outputs. The resistor sinks any stray leakage currents, holding $\overline{\text{RESET}}$ low (Figure 9). The value of the pulldown resistor is not critical; 100kΩ is large enough not to load $\overline{\text{RESET}}$ and small enough to pull $\overline{\text{RESET}}$ to ground. The external pulldown cannot be used with the open-drain reset outputs.

Transient Immunity

In addition to issuing a reset to the μP during power-up, power-down, and brownout conditions, these supervisors are relatively immune to short-duration falling transients (glitches). The graph Maximum Transient Duration vs. Reset Threshold Overdrive in the *Typical Operating Characteristics* section shows this relationship.

Figure 9. Ensuring \overline{RESET} Valid to $V_{CC} = 0V$

The area below the curves of the graph is the region in which these devices typically do not generate a reset pulse. This graph was generated using a falling pulse applied to V_{CC} , starting above the actual reset threshold (V_{TH}) and ending below it by the magnitude indicated (reset threshold overdrive). As the magnitude of the transient increases (V_{CC} goes further below the reset threshold), the maximum allowable pulse width decreases. Typically, a V_{CC} transient that goes 100mV below the reset threshold and lasts 20µs or less does not cause a reset pulse to be asserted.

Note: The first “__” is a placeholder for the threshold voltage level of the devices. A desired threshold level is set by the two-number suffix found in Table 1. The third “_” is a placeholder for the manual reset setup period of the devices. A desired setup period is set by the letter suffix found in Table 2. All devices are available in tape-and-reel only. There is a 2500-piece minimum order increment for standard versions (Table 2). Sample stock is typically held on standard versions only. Nonstandard versions require a minimum order increment of 10,000 pieces. Contact factory for availability. Most devices are available in lead(Pb)-free packaging only. See Ordering Information for devices available in both leaded and lead(Pb)-free packaging. /V denotes an automotive qualified part. *Future product—contact factory for availability. +Denotes Lead(Pb)-free packages and - denotes leaded packages. For top mark information, please go to <https://www.maximintegrated.com/en/design/packaging/topmark/>.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
