### DESCRIPTION

The *ISSI* IS62/65LV256AL is a very high-speed, low power, 32,768-word by 8-bit static RAM. It is fabricated using *ISSI*'s high-performance CMOS technology. This highly reliable process coupled with innovative circuit design techniques, yields access times as fast as 15 ns maximum.

When  $\overline{CE}$  is HIGH (deselected), the device assumes a standby mode at which the power dissipation is reduced to 150  $\mu$ W (typical) with CMOS input levels.

Easy memory expansion is provided by using an active LOW Chip Enable ( $\overline{CE}$ ). The active LOW Write Enable ( $\overline{WE}$ ) controls both writing and reading of the memory.

The IS62/65LV256AL is available in the JEDEC standard 28-pin SOJ, 28-pin SOP, and the 28-pin TSOP (Type I) package.

2. Tested with the load in Figure 2. Transition is measured  $\pm 500$  mV from steady-state voltage. Not 100% tested.
3. Not 100% tested.

### READ CYCLE NO. 1<sup>(1,2)</sup>

### READ CYCLE NO. 2<sup>(1,3)</sup>

#### Notes:

1.  $\overline{WE}$  is HIGH for a Read Cycle.
2. The device is continuously selected.  $\overline{OE}$ ,  $\overline{CE}$  =  $V_{IL}$ .
3. Address is valid prior to or coincident with  $\overline{CE}$  LOW transitions.

**Notes:**

1. Test conditions assume signal transition times of 3 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V and output loading specified in Figure 1.
2. Tested with the load in Figure 2. Transition is measured  $\pm 500$  mV from steady-state voltage. Not 100% tested.
3. The internal write time is defined by the overlap of CE LOW and WE LOW. All signals must be in valid states to initiate a Write, but any one can go inactive to terminate the Write. The Data Input Setup and Hold timing are referenced to the rising or falling edge of the signal that terminates the Write.
4. Tested with OE HIGH.

**WRITE CYCLE NO. 1 ( $\overline{\text{WE}}$  Controlled)<sup>(1,2)</sup>**

WRITE CYCLE NO. 2 ( $\overline{\text{CE}}$  Controlled)<sup>(1,2)</sup>

**Notes:**

1. The internal write time is defined by the overlap of  $\overline{\text{CE}}$  LOW and  $\overline{\text{WE}}$  LOW. All signals must be in valid states to initiate a Write, but any one can go inactive to terminate the Write. The Data Input Setup and Hold timing are referenced to the rising or falling edge of the signal that terminates the Write.
2. I/O will assume the High-Z state if  $\overline{\text{OE}} \geq V_{\text{IH}}$ .
