2.5V/3.3V SiGe Differential Receiver/Driver with RSECL* Outputs

*Reduced Swing ECL

Description

The NBSG16 is a differential receiver/driver targeted for high frequency applications. The device is functionally equivalent to the EP16 and LVEP16 devices with much higher bandwidth and lower EMI capabilities.

Inputs incorporate internal 50 Ω termination resistors and accept NECL (Negative ECL), PECL (Positive ECL), HSTL, LVTTTL, LVCMOS, CML, or LVDS. Outputs are RSECL (Reduced Swing ECL), 400 mV.

The V_{BB} and V_{MM} pins are internally generated voltage supplies available to this device only. The V_{BB} is used as a reference voltage for single-ended NECL or PECL inputs and the V_{MM} pin is used as a reference voltage for LVCMOS inputs. For all single-ended input conditions, the unused complementary differential input is connected to V_{BB} or V_{MM} as a switching reference voltage. V_{BB} or V_{MM} may also rebias AC coupled inputs. When used, decouple V_{BB} and V_{MM} via a 0.01 μ F capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} and V_{MM} outputs should be left open.

The pad is not electrically connected to the die but may be electrically and thermally connected to V_{EE} on the PC board.

1. The NC pins are electrically connected to the die and MUST be left open.
2. All V_{CC} and V_{EE} pins must be externally connected to Power Supply to guarantee proper operation. The thermally exposed pad on package bottom (see case drawing) must be attached to a heat-sinking conduit.
3. In the differential configuration when the input termination pins (VTD, VTD) are connected to a common termination voltage, and if no signal is applied then the device will be susceptible to self-oscillation.
