Base 16 numbers are represented by a string of hexadecimal digits followed by the character “h” (for example, F82Eh). A hexadecimal digit is a character from the following set: 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, and F. Hexadecimal numbers can also be shown using an “x” character (for example 0x2A).

Base 2 (binary) numbers are represented by a string of 1s and 0s, sometimes followed by the character “b” (for example, 1010001b). The “b” designation is only used in situations where confusion as to the type of the number might arise.

Base 10 numbers are represented by a string of decimal digits followed by the character “d” (for example, 23d). The “d” designation is only used in situations where confusion as to the type of the number might arise.

§ §

# 44 System Agent - B0, D0, F0

## 44.1 Introduction and Index

The host-accessible registers for the System Agent are described here. The legend for the register access codes are described in Chapter 43, "Introduction."

### 44.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 0 (decimal), Function 0. The offset addresses are listed.

**Table 44-1. Summary of PCI Configuration Registers—0/0/0**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 19908086 | "Device ID and Vendor ID Register (DEVICE_ID_VENDOR_ID_0_0_0_PCI)—Offset 0h" on page 1103 |
| 4 | 4 | 00000007 | "PCI Status and PCI Command Register (PCI_STATUS_COMMAND_0_0_0_PCI)—Offset 4h" on page 1103 |
| 8 | 4 | 06000000 | "PCI Revision ID and PCI Class Code Register (REVISION_ID_CLASS_CODE_0_0_0_PCI)—Offset 8h" on page 1104 |
| C | 4 | 00800000 | "Master Latency Timer and Header Type Register (MASTER_LATENCY_TIME_0_0_0_PCI)—Offset Ch" on page 1104 |
| 2C | 4 | 00000000 | "PCI Subsystem Vendor ID and PCI Subsystem ID (SVID_SID_0_0_0_PCI)—Offset 2Ch" on page 1105 |
| 34 | 4 | 000000E0 | "Capability Register Pointer (CAPPTR_0_0_0_PCI)—Offset 34h" on page 1105 |
| 48 | 4 | 00000000 | "Memory Controller Hub Base Address Register (MCHBAR_LO_0_0_0_PCI)—Offset 48h" on page 1106 |
| 4C | 4 | 00000000 | "Memory Controller Hub Base Address Register (MCHBAR_HI_0_0_0_PCI)—Offset 4Ch" on page 1106 |
| 54 | 4 | 00000033 | "Device Enable Register (DEVEN_0_0_0_PCI)—Offset 54h" on page 1107 |
| 60 | 4 | 00000000 | "PCI Express Enhanced Configuration Range Base Address Low (PCIEXBAR_LO_0_0_0_PCI)—Offset 60h" on page 1108 |
| 64 | 4 | 00000000 | "PCI Express Enhanced Configuration Range Base Address High (PCIEXBAR_HI_0_0_0_PCI)—Offset 64h" on page 1109 |
| A8 | 4 | 00000000 | "Top of Upper Usable DRAM Low (TOUUD_LO_0_0_0_PCI)—Offset A8h" on page 1110 |
| AC | 4 | 00000000 | "Top of Upper Usable DRAM High (TOUUD_HI_0_0_0_PCI)—Offset ACh" on page 1111 |
| B0 | 4 | 00000000 | "Base of Data Stolen Memory (BDSM_0_0_0_PCI)—Offset B0h" on page 1112 |
| B4 | 4 | 00000000 | "Base of Graphics Stolen Memory (BGSM_0_0_0_PCI)—Offset B4h" on page 1113 |
| B8 | 4 | 00100000 | "Top Segment Memory Base (TSEGMB_0_0_0_PCI)—Offset B8h" on page 1114 |
| BC | 4 | 00100000 | "Top of Lower Usable DRAM (TOLUD_0_0_0_PCI)—Offset BCh" on page 1115 |
| DC | 4 | 00000000 | "Scratchpad (SKPD_0_0_0_PCI)—Offset DCh" on page 1115 |
| E0 | 4 | 010C0009 | "Capability ID0 Capability Control (CAPID0_CAPCTRL0_0_0_0_PCI)—Offset E0h" on page 1116 |
| E4 | 4 | 00000000 | "Capability ID0 A (CAPID0_A_0_0_0_PCI)—Offset E4h" on page 1117 |
| E8 | 4 | 00000000 | "Capability ID0 B (CAPID0_B_0_0_0_PCI)—Offset E8h" on page 1118 |
| F4 | 4 | 00000000 | "Manufacturer ID Register (MANUFACTURER_ID_0_0_0_PCI)—Offset F4h" on page 1119 |

### 44.1.2 Host Memory Space—MCHBAR

An index of the registers that are accessible in Host Memory Space is shown here.

**Table 44-2. Summary of Memory Mapped I/O Registers for C-Unit—MCHBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| **C-Unit Registers** | | | |
| 6C80 | 8 | 0000000000000000 | "Default VTd Base Address Register (DEFVTDBAR_0_0_0_MCHBAR_C)—Offset 6C80h" on page 1120 |

## Table 44-3. Summary of Memory Mapped I/O Registers for A-Unit—MCHBAR

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 647C | 4 | 00000000 | "Spare BIOS (A_CR_SPARE_BIOS_MCHBAR)—Offset 647Ch" on page 1121 |
| 6588 | 4 | 00000000 | "Uncorrectable Error Status Register (A_CR_UNCERRSTS_0_0_0_MCHBAR)—Offset 6588h" on page 1122 |
| 658C | 4 | FFFFFFFF | "Uncorrectable Error Mask Register (A_CR_UNCERRMSK_0_0_0_MCHBAR)—Offset 658Ch" on page 1125 |
| 6590 | 4 | 00000000 | "Uncorrectable Error Severity Register (A_CR_UNCERRSEV_0_0_0_MCHBAR)—Offset 6590h" on page 1127 |
| 6594 | 4 | 00000000 | "First Uncorrectable Error Register (A_CR_UNCFERRSTS_0_0_0_MCHBAR)—Offset 6594h" on page 1129 |
| 6598 | 4 | 00000000 | "Next Uncorrectable Error Register (A_CR_UNCNERRSTS_0_0_0_MCHBAR)—Offset 6598h" on page 1132 |
| 659C | 4 | 00000000 | "Uncorrectable Error Select Register (A_CR_UNCERRCNTSEL_0_0_0_MCHBAR)—Offset 659Ch" on page 1135 |
| 65A0 | 4 | 00000000 | "Uncorrectable Error Count (A_CR_UNCERRCNT_0_0_0_MCHBAR)—Offset 65A0h" on page 1137 |
| 65A4 | 4 | 00000000 | "Correctable Error Status Register (A_CR_CORERRSTS_0_0_0_MCHBAR)—Offset 65A4h" on page 1138 |
| 65A8 | 4 | FFFFFFFF | "Correctable Error Mask Register (A_CR_CORERRMSK_0_0_0_MCHBAR)—Offset 65A8h" on page 1141 |
| 65AC | 4 | 00000000 | "First Correctable Error Register (A_CR_CORFERRSTS_0_0_0_MCHBAR)—Offset 65ACh" on page 1143 |
| 65B0 | 4 | 00000000 | "Next Correctable Error Register (A_CR_CORNERRSTS_0_0_0_MCHBAR)—Offset 65B0h" on page 1146 |
| 65B4 | 4 | FFFFFFFF | "Correctable Error Count Select (A_CR_CORERRCNTSEL_0_0_0_MCHBAR)—Offset 65B4h" on page 1149 |
| 65B8 | 4 | 00000000 | "Correctable Error Count (A_CR_CORERRCNT_0_0_0_MCHBAR)—Offset 65B8h" on page 1151 |
| 65C0 | 8 | 0000000000000000 | "Slice and Channel Hash (A_CR_SLICE_CHANNEL_HASH_0_0_0_MCHBAR)—Offset 65C0h" on page 1152 |
| 65D0 | 4 | 00000000 | "A_CR_ASYM_MEM_REGION0_0_0_0_MCHBAR—Offset 65D0h" on page 1154 |
| 65D4 | 4 | 00000000 | "A_CR_ASYM_MEM_REGION1_0_0_0_MCHBAR—Offset 65D4h" on page 1154 |

## Table 44-4. Summary of Memory Mapped I/O Registers for B-Unit—MCHBAR (Sheet 1 of 6)

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 6800 | 4 | 00000007 | "B-Unit Miscellaneous Configuration (B_CR_BMISC_0_0_0_MCHBAR)—Offset 6800h" on page 1155 |
| 6868 | 4 | 00000000 | "Slice 0 Memory Access Count (B_CR_MEM_ACCESS_COUNT_SLICE0)—Offset 6868h" on page 1155 |
| 686C | 4 | 00000000 | "Slice 1 Memory Access Count (B_CR_MEM_ACCESS_COUNT_SLICE1)—Offset 686Ch" on page 1155 |
| 6870 | 4 | 00000000 | "IMR0 Base (B_CR_BIMR0BASE_0_0_0_MCHBAR)—Offset 6870h" on page 1156 |
| 6874 | 4 | 00000000 | "IMR0 Mask (B_CR_BIMR0MASK_0_0_0_MCHBAR)—Offset 6874h" on page 1157 |
| 6878 | 8 | 00000C0061010202 | "IMR0 Control Policy (B_CR_BIMR0CP_0_0_0_MCHBAR)—Offset 6878h" on page 1157 |
| 6880 | 8 | 0000000000000000 | "IMR0 Read Access Policy (B_CR_BIMR0RAC_0_0_0_MCHBAR)—Offset 6880h" on page 1158 |
| 6888 | 8 | 0000000000000000 | "IMR0 Write Access Policy (B_CR_BIMR0WAC_0_0_0_MCHBAR)—Offset 6888h" on page 1161 |
| 6890 | 4 | 00000000 | "B_CR_BIMR1BASE_0_0_0_MCHBAR—Offset 6890h" on page 1164 |
| 6894 | 4 | 00000000 | "IMR1 Mask (B_CR_BIMR1MASK_0_0_0_MCHBAR)—Offset 6894h" on page 1165 |
| 6898 | 8 | 00000C0061010202 | "IMR1 Control Policy (B_CR_BIMR1CP_0_0_0_MCHBAR)—Offset 6898h" on page 1165 |
| 68A0 | 8 | 0000000000000000 | "IMR1 Read Access Policy (B_CR_BIMR1RAC_0_0_0_MCHBAR)—Offset 68A0h" on page 1166 |
| 68A8 | 8 | 0000000000000000 | "IMR1 Write Access Policy (B_CR_BIMR1WAC_0_0_0_MCHBAR)—Offset 68A8h" on page 1169 |
| 68B0 | 4 | 00000000 | "Base 0 IMR2 Base (B_CR_BIMR2BASE_0_0_0_MCHBAR)—Offset 68B0h" on page 1172 |
| 68B4 | 4 | 00000000 | "IMR2 Mask (B_CR_BIMR2MASK_0_0_0_MCHBAR)—Offset 68B4h" on page 1173 |
| 68B8 | 8 | 00000C0061010202 | "IMR2 Control Policy (B_CR_BIMR2CP_0_0_0_MCHBAR)—Offset 68B8h" on page 1173 |
| 68C0 | 8 | 0000000000000000 | "IMR2 Read Access Policy (B_CR_BIMR2RAC_0_0_0_MCHBAR)—Offset 68C0h" on page 1174 |
| 68C8 | 8 | 0000000000000000 | "IMR2 Write Access Policy (B_CR_BIMR2WAC_0_0_0_MCHBAR)—Offset 68C8h" on page 1177 |
| 68D0 | 4 | 00000000 | "IMR3 Base (B_CR_BIMR3BASE_0_0_0_MCHBAR)—Offset 68D0h" on page 1180 |
| 68D4 | 4 | 00000000 | "IMR3 Mask (B_CR_BIMR3MASK_0_0_0_MCHBAR)—Offset 68D4h" on page 1181 |
| 68D8 | 8 | 00000C0061010202 | "IMR3 Control Policy (B_CR_BIMR3CP_0_0_0_MCHBAR)—Offset 68D8h" on page 1181 |
| 68E0 | 8 | 0000000000000000 | "IMR3 Read Access Policy (B_CR_BIMR3RAC_0_0_0_MCHBAR)—Offset 68E0h" on page 1182 |
| 68E8 | 8 | 0000000000000000 | "IMR3 Write Access Policy (B_CR_BIMR3WAC_0_0_0_MCHBAR)—Offset 68E8h" on page 1185 |
| 68F0 | 4 | 00000000 | "IMR4 Base (B_CR_BIMR4BASE_0_0_0_MCHBAR)—Offset 68F0h" on page 1188 |
| 68F4 | 4 | 00000000 | "IMR4 Mask (B_CR_BIMR4MASK_0_0_0_MCHBAR)—Offset 68F4h" on page 1189 |

## Table 44-4. Summary of Memory Mapped I/O Registers for B-Unit—MCHBAR (Sheet 2 of 6)

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 68F8 | 8 | 00000C0061010202 | "B-Unit IMR4 Control Policy (B_CR_BIMR4CP_0_0_0_MCHBAR)—Offset 68F8h" on page 1189 |
| 6900 | 8 | 0000000000000000 | "IMR4 Read Access Policy (B_CR_BIMR4RAC_0_0_0_MCHBAR)—Offset 6900h" on page 1190 |
| 6908 | 8 | 0000000000000000 | "IMR4 Write Access Policy (B_CR_BIMR4WAC_0_0_0_MCHBAR)—Offset 6908h" on page 1193 |
| 6910 | 4 | 00000000 | "IMR5 Base (B_CR_BIMR5BASE_0_0_0_MCHBAR)—Offset 6910h" on page 1196 |
| 6914 | 4 | 00000000 | "IMR5 Mask (B_CR_BIMR5MASK_0_0_0_MCHBAR)—Offset 6914h" on page 1197 |
| 6918 | 8 | 00000C0061010202 | "IMR5 Control Policy (B_CR_BIMR5CP_0_0_0_MCHBAR)—Offset 6918h" on page 1197 |
| 6920 | 8 | 0000000000000000 | "IMR5 Read Access Policy (B_CR_BIMR5RAC_0_0_0_MCHBAR)—Offset 6920h" on page 1198 |
| 6928 | 8 | 0000000000000000 | "IMR5 Write Access Policy (B_CR_BIMR5WAC_0_0_0_MCHBAR)—Offset 6928h" on page 1201 |
| 6930 | 4 | 00000000 | "IMR6 Base (B_CR_BIMR6BASE_0_0_0_MCHBAR)—Offset 6930h" on page 1204 |
| 6934 | 4 | 00000000 | "IMR6 Mask (B_CR_BIMR6MASK_0_0_0_MCHBAR)—Offset 6934h" on page 1205 |
| 6938 | 8 | 00000C0061010202 | "IMR6 Control Policy (B_CR_BIMR6CP_0_0_0_MCHBAR)—Offset 6938h" on page 1205 |

| 508 | 8 | 0200000000000000 | "IOTLB Invalidate Register (IOTLB_REG_0_0_0_VTDBAR)—Offset 508h" on page 1439 |

### 44.1.5 Sideband Registers

An index of the Sideband registers that are accessible to the Host are listed here. Each is accessible in Host Memory Space using the Sideband Base Address Register (BAR) DEFVTDBAR. It is located in Host Root Memory Space MCHBAR +offset 6C80h.

See Section 44.3.123, "Default VTd BAR (B_CR_DEFVTDBAR_0_0_0_MCHBAR)—Offset 6C80h" on page 1316. Also see Section 3.4.2, "Accessing System Agent Sideband Registers" on page 187.

The Sideband registers for Memory Controller 0 are shown in Table 44-8. For Memory Controller 1 see Table 44-9.

**Table 44-8. Summary of Sideband Registers—0x10 (Memory Controller 0)**

| Offset from Sideband Port 10h (hex) | Memory-Mapped I/O offset from SBREG_BAR (hex) | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 64 | 10_0064 | 00000800 | "UCELOG—Offset 64h" on page 1441 |
| 68 | 10_0068 | 00000000 | "UCEADDR—Offset 68h" on page 1442 |

## Table 44-10. Summary of Sideband Registers—0x99

| Offset from Sideband Port 99h (hex) | Memory-Mapped I/O offset from SBREG_BAR (hex) | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 220 | 99_0220 | 00042222 | "ICLK_DWORD8—Port 99h, Offset 220h" on page 1480 |

## 44.2 Registers in Configuration Space

### 44.2.1 Device ID and Vendor ID Register (DEVICE_ID_VENDOR_ID_0_0_0_PCI)—Offset 0h

This register uniquely identifies any PCI device.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + 0h

**Default:** 19908086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x1990<br>RO | **Device ID (DID):** This field identifies the particular function as allocated by Intel. |
| 15:0 | 0x8086<br>RO | **Vendor ID (VENDOR_ID):** This field identifies Intel as the manufacturer of the device. |

### 44.2.2 PCI Status and PCI Command Register (PCI_STATUS_COMMAND_0_0_0_PCI)—Offset 4h

PCI Status is used to record status information for PCI bus related events. PCI Command provides coarse control over a device's ability to generate and respond to PCI cycles.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + 4h

**Default:** 00000007h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x7<br>RO | **PCI Status and PCI Command (PCI_STATUS_AND_COMMAND):**<br>Allowing this device to respond to I/O space and Memory Space accesses.<br>This device is also allowed to behave as a bus master. |

### 44.2.3 PCI Revision ID and PCI Class Code Register (REVISION_ID_CLASS_CODE_0_0_0_PCI)—Offset 8h

Revision ID contains the revision number of the device. Class Code identifies the basic function of the device.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + 8h

**Default:** 06000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x600<br>RO | **Class Code 1 (CLASS_CODE1):** This device is a Host Bridge. |
| 15:8 | 0x0<br>RO | **Class Code 0 (CLASS_CODE0):** This device is a Host Bridge. |
| 7:0 | 0x0<br>RW/V | **Revision ID (REVISION_ID):** Revision ID |

### 44.2.4 Master Latency Timer and Header Type Register (MASTER_LATENCY_TIME_0_0_0_PCI)—Offset Ch

This register defines Latency Timer and layout of the device Configuration Space header.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + Ch

**Default:** 00800000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Reserved (RESERVED_1):** Reserved. |
| 23:16 | 0x80<br>RO | **Header Type (HEADER_TYPE):** This is a multi-function device. |
| 15:8 | 0x0<br>RO | **Master Latency Timer (MASTER_LATENCY_TIMER):** This field specifies, in units of PCI bus clocks, the value of the Latency Timer for this PCI bus master. |
| 7:0 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |

## 44.2.5 PCI Subsystem Vendor ID and PCI Subsystem ID (SVID_SID_0_0_0_PCI)—Offset 2Ch

This register is used to uniquely identify the subsystem where the PCI device resides.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + 2Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **Subsystem ID (SUBSYSTEM_ID):** PCI Subsystem ID:<br>This field should be programmed during BIOS initialization. |
| 15:0 | 0x0<br>RW | **Subsystem Vendor ID (SUBSYSTEM_VENDOR_ID):** PCI Subsystem Vendor ID:<br>This field should be programmed by BIOS during boot-up to indicate the vendor of the system board. |

## 44.2.6 Capability Register Pointer (CAPPTR_0_0_0_PCI)—Offset 34h

This register contains a pointer to the first Capability Register in a linked list.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + 34h

**Default:** 000000E0h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |
| 7:0 | 0xe0<br>RO | **Base Address of First Capability Register (BASE_ADDR):** This pointer is an 8-bit address to an offset within this device's Configuration Space that holds the first Capability Register (CAPID0_CAPCTRL). |

## 44.2.7 Memory Controller Hub Base Address Register (MCHBAR_LO_0_0_0_PCI)—Offset 48h

This register contains the lower 32bits of the MCHBAR base address.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + 48h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:15 | 0x0<br>RW | **Base Address of MCHBAR (BASE_ADDR):** Defines the base address of MCHBAR.<br>MCHBAR[38:15] is MCHBAR_HI[6:0],MCHBAR_LO[31:15].<br>If incoming Request Address[38:15] matches MCHBAR[38:15] then the request hits and address in the MCHBAR range. |
| 14:4 | 0x0<br>RO | **Reserved:** Reserved |
| 3:1 | 0x0<br>RO | **Reserved:** Reserved |
| 0 | 0x0<br>RW | **MCHBAR Enable (MCHBAREN):**<br>• 0: MCHBAR is disabled and does not claim any memory<br>• 1: MCHBAR memory mapped accesses are claimed and decoded appropriately |

## 44.2.8 Memory Controller Hub Base Address Register (MCHBAR_HI_0_0_0_PCI)—Offset 4Ch

This register contains the upper 32bits of the MCHBAR base address.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + 4Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:7 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |
| 6:0 | 0x0<br>RW | **Base Address of MCHBAR (BASE_ADDR):** Defines the base address of the MCHBAR.<br>If incoming Request Address[38:15] matches MCHBAR[38:15], then request hits an address in the MCHBAR range. |

## 44.2.9 Device Enable Register (DEVEN_0_0_0_PCI)—Offset 54h

The DEVEN register allows for enabling/disabling of PCI devices and functions that are within the CPU package.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + 54h

**Default:** 00000033h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RO | **Reserved (RESERVED_1):** Reserved. |
| 5 | 0x1<br>RW/V | **Device 3 Function 0 Enable (D3F0EN):**<br>• 0: Bus 0 Device 3 Function 0 is disabled and hidden<br>• 1: Bus 0 Device 3 Function 0 is enabled and visible<br>This bit will be set to 0b and remain 0b if Device 3 capability is disabled. |
| 4 | 0x1<br>RW/V | **Device 2 Function 0 Enable (D2F0EN):**<br>• 0: Bus 0 Device 2 Function 0 is disabled and hidden<br>• 1: Bus 0 Device 2 Function 0 is enabled and visible<br>This bit will be set to 0b and remain 0b if Device 2 capability is disabled. |
| 3 | 0x0<br>RO | **RSVD0:** Reserved |
| 2 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |
| 1 | 0x1<br>RW/V | **Device 0 Function 1 Enable (D0F1EN):**<br>• 0: Bus 0 Device 0 Function 1 is disabled and hidden<br>• 1: Bus 0 Device 0 Function 1 is enabled and visible<br>This bit will be set to 0b and remain 0b if Device 0/0/1 capability is disabled. |
| 0 | 0x1<br>RO | **Device 0 Function 0 Enable (D0F0EN):** Bus 0 Device 0 Function 0 may not be disabled, and is therefore hardwired to 1. |

## 44.2.10 PCI Express Enhanced Configuration Range Base Address Low (PCIEXBAR_LO_0_0_0_PCI)—Offset 60h

This register contains the lower 32bits of the base address of the PCI Express Enhanced Configuration region.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + 60h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RW | **PCI Express Base Address Register (PCIEXBAR):** PCIEXBAR[38:28] is PCIEXBAR_HI[6:0],PCIEXBAR_LO[31:28].<br>Describes bits [38:28] of the base address of the contiguous 256MB region for PCI Express Enhanced Configuration region.<br>If bits [38:28] of the request address matches the PCIEXBAR[38:28] then the request targets the PCI Express Enhanced Configuration Space region.<br><br>**Power Well:** prst |
| 27 | 0x0<br>RO | **Address Mask for 128MB region (ADMSK128):** Reserved.<br><br>**Power Well:** prst |
| 26 | 0x0<br>RO | **Address Mask for 64MB region (ADMSK64):** Reserved.<br><br>**Power Well:** prst |
| 25:3 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved.<br><br>**Power Well:** prst |
| 2:1 | 0x0<br>RO | **Length of the Region (LENGTH):** Reserved.<br><br>**Power Well:** prst |
| 0 | 0x0<br>RW | **PCIEXBAR Range Enable (PCIEXBAREN):**<br>• 0: The PCIEXBAR range is disabled. Address may target DRAM or MMIO, depending on other address decode rules.<br>• 1: The PCIEXBAR range is enabled. Incoming request address must be compared with PCIEXBAR to determine whether the request targets PCI Express Enhanced Configuration region.<br><br>**Power Well:** prst |

## 44.2.11 PCI Express Enhanced Configuration Range Base Address High (PCIEXBAR_HI_0_0_0_PCI)—Offset 64h

This register contains the upper 32bits of the base address of the PCI Express Enhanced Configuration region.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + 64h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:7 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved.<br><br>**Power Well:** prst |
| 6:0 | 0x0<br>RW | **PCI Express Base Address Register (PCIEXBAR_HI):** PCIEXBAR[38:28] is PCIEXBAR_HI[6:0],PCIEXBAR_LO[31:28].<br>Describes bits [38:28] of the base address of the contiguous 256MB region for PCI Express Enhanced Configuration region.<br>If bits [38:28] of the request address matches the PCIEXBAR[38:28] then the request targets the PCI Express Enhanced Configuration Space region.<br><br>**Power Well:** prst |

## 44.2.12 Top of Upper Usable DRAM Low (TOUUD_LO_0_0_0_PCI)—Offset A8h

Defines the top of the upper usable DRAM range and start of the upper MMIO address range. Formerly defined in BMBOUND_HI. This register contains the lower 32 bits of TOUUD.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + A8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RW | **Top of Upper Usable DRAM (TOUUD):** TOUUD[38:20] is TOUUD_HI[6:0],TOUUD_LO[31:20].<br>Upper usable DRAM address range ends at the preceding byte.<br>Upper MMIO Range starts at this address and extends up to the maximum system addressable memory range.<br>Bits 38:20 are compared with bits 38:20 of the incoming request address to determine whether the request targets the upper usable DRAM range or upper MMIO range.<br>If Request Address[38:20])=TOUUD[38:20] and any bit in Request Address[38:32] is set, request is determined to target the upper MMIO range.<br><br>**Power Well:** prst |
| 19:1 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved should return 0s on read.<br><br>**Power Well:** prst |
| 0 | 0x0<br>RW | **TOUUD Register Lock (LOCK_RESERVED):** This bit will lock all writable settings in this register, including itself (client definition).<br><br>**Power Well:** prst |

## 44.2.13 Top of Upper Usable DRAM High (TOUUD_HI_0_0_0_PCI)—Offset ACh

Defines the top of the upper usable DRAM range and start of the upper MMIO address range. Formerly defined in BMBOUND_HI. This register contains the upper 32 bits of TOUUD.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + ACh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:7 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved.<br><br>**Power Well:** prst |
| 6:0 | 0x0<br>RW | **Top of Upper Usable DRAM (TOUUD_HI):** TOUUD[38:20] is TOUUD_HI[6:0],TOUUD_LO[31:20].<br>Upper usable DRAM address range ends at the preceding byte.<br>Upper MMIO Range starts at this address and extends up to the maximum system addressable memory range.<br>Bits 38:20 are compared with bits 38:20 of the incoming request address to determine whether the request targets the upper usable DRAM range or upper MMIO range.<br>If Request Address[38:20])=TOUUD[38:20] and any bit in Request Address[38:32] is set, request is determined to target the upper MMIO range.<br><br>**Power Well:** prst |

## 44.2.14 Base of Data Stolen Memory (BDSM_0_0_0_PCI)—Offset B0h

Defines the Base of the Data Stolen Memory. In addition, the GSM range is defined to end at the preceding byte. See BGSM register.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + B0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RW | **Base of Data Stolen Memory (BDSM):** This register contains the base address of the Data Stolen Memory.<br>The limit for the Data Stolen Memory is TOLUD-1.<br>This range is not decoded by the system agent, but is a sub-region of BGSM decoded by the Integrated Graphics Device.<br>Incoming Request Address[31:20] is compared against BDSM[31:20] and TOLUD[31:20] to determine if the address falls in the range.<br>The comparison check is as follows: BDSM[31:20](=Address[31:20] and Address[31:20](TOLUD[31:20] and Address[38:32]==0.<br>Request SAI is then checked against the allowed SAIs to determine if access is allowed.<br><br>**Power Well:** prst |
| 19:1 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved.<br><br>**Power Well:** prst |
| 0 | 0x0<br>RW | **BDSM Register Lock (LOCK):** This bit will lock all writable settings in this register, including itself.<br><br>**Power Well:** prst |

## 44.2.15 Base of Graphics Stolen Memory (BGSM_0_0_0_PCI)—Offset B4h

Defines the Base of the Graphics Stolen Memory. In addition, the SMM range is defined to end at the preceding byte. See TSEGMB register.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + B4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RW | **Base of Graphics Stolen Memory (BGSM):** This register contains the base address of the Graphics Stolen Memory.<br>The limit for the Graphics Stolen Memory is TOLUD-1.<br>Incoming Request Address[31:20] is compared against BGSM[31:20] and TOLUD[31:20] to determine if the address falls in the range.<br><br>**Power Well:** prst |
| 19:1 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved.<br><br>**Power Well:** prst |
| 0 | 0x0<br>RW | **BGSM Register Lock (LOCK):** This bit will lock all writable settings in this register, including itself.<br><br>**Power Well:** prst |

## 44.2.16 Top Segment Memory Base (TSEGMB_0_0_0_PCI)—Offset B8h

TSEGMB defines the base of the SMM range, and the BGSM register defines the limit of the SMM range.

*Note:* In prior SoCs, the base register was defined in SMMRRL register and the limit was defined in the SMMRRH register.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + B8h

**Default:** 00100000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x1<br>RW | **Base address of Top Segment DRAM Memory (TSEGMB):** BIOS determines the base of TSEG memory, which must be at or below Graphics Base of GTT Stolen Memory BGSM.<br>SMM range starts at this base and ends at BGSM1.<br>Incoming Request Address [31:20] will be compared with TSEGMB[31:20] and BGSM[31:20] to determine if the request targets the SMM range.<br><br>**Power Well:** prst |
| 19:1 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved.<br><br>**Power Well:** prst |
| 0 | 0x0<br>RW | **TSEGMB Register Lock (LOCK):** This bit will lock all writable settings in this register, including itself.<br><br>**Power Well:** prst |

## 44.2.17 Top of Lower Usable DRAM (TOLUD_0_0_0_PCI)—Offset BCh

This register defines the Top of Lower Usable DRAM range and start of the Lower MMIO Address range. Formerly defined in BMBOUND.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + BCh

**Default:** 00100000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x1<br>RW | **Top of Lower Usable DRAM (TOLUD):** Defines the top of lower usable DRAM, which ends at the preceding byte.<br>Lower MMIO Address range starts at this address and continues up to the 4GB Address 0xFFFF_FFFF.<br>Bits 31:20 are compared with incoming request Address[31:20] to determine whether the request targets lower usable DRAM range or the lower MMIO range.<br>If Request Address[31:20])=TOLUD[31:20] and Request Address[38:32]==0 then the Request Address falls in the Lower MMIO Address range.<br><br>**Power Well:** prst |
| 19:1 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved.<br><br>**Power Well:** prst |
| 0 | 0x0<br>RW | **TOLUD register lock (LOCK):** Reserved.<br><br>**Power Well:** prst |

## 44.2.18 Scratchpad (SKPD_0_0_0_PCI)—Offset DCh

This register holds 32 writable bits with no functionality behind them. It is for the convenience of BIOS and graphics drivers.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + DCh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Scratchpad (SKPD):** 1 DWORD of data storage. |

## 44.2.19 Capability ID0 Capability Control (CAPID0_CAPCTRL0_0_0_0_PCI)—Offset E0h

Control bits in this register describe the attributes of CAPID0_A and CAPID0_B capability registers.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + E0h

**Default:** 010C0009h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |
| 27:24 | 0x1<br>RO | **Capability ID Version (CAPID_VER):** This field has the value 0001b to identify the first revision of the CAPID register definition. |
| 23:16 | 0xc<br>RO | **Capability ID0 Structure Length (CAPIDLEN):** This field has the value 0Ch to indicate the structure length 12 bytes.<br>This is the total size of this CAPCTRL and the CAPID0_A and CAPID0_B registers in the following bytes. |
| 15:8 | 0x0<br>RO | **Next Capability Register Pointer (NEXT_CAP):** This field is hardwired to 00h, indicating the end of the capabilities linked list. |
| 7:0 | 0x9<br>RO | **Capability ID (CAP_ID):** This field has the value 1001b to identify the CAP_ID assigned by the PCI SIG for vendor dependent capability pointers. |

## 44.2.20 Capability ID0 A (CAPID0_A_0_0_0_PCI)—Offset E4h

Control of bits in this register is only required for customer visible SKU differentiation.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + E4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RW | **Reserved:** Reserved |
| 23 | 0x0<br>RW/Fuse | **VTd Disable (VTDD):**<br>• 0: Enable VTd<br>• 1: Disable VTd |
| 22:16 | 0x0<br>RW/Fuse | **Reserved:** Reserved for future capabilities. |
| 15 | 0x0<br>RO/V | **Dynamic Power Performance Management (DPPM) Disable:**<br>• 0: DPPM associated memory spaces are accessible.<br>• 1: DPPM associated memory and IO spaces are disabled. DEVEN_0_0_0_PCI field for DPPM cannot be set. |
| 14:0 | 0x0<br>RW/Fuse | **Reserved:** Reserved |

## 44.2.21 Capability ID0 B (CAPID0_B_0_0_0_PCI)—Offset E8h

Control of bits in this register is only required for customer visible SKU differentiation.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + E8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO/V | **Reserved:** Reserved |
| 30 | 0x0<br>RW/Fuse | **Reserved:** Reserved |
| 29 | 0x0<br>RW/Fuse | **Reserved:** Reserved |
| 28 | 0x0<br>RW/Fuse | **Reserved:** Reserved |
| 27 | 0x0<br>RW/Fuse | **Reserved:** Reserved |
| 26 | 0x0<br>RW/Fuse | **Reserved:** Reserved |
| 25 | 0x0<br>RW/Fuse | **Reserved:** Reserved |
| 24 | 0x0<br>RO/V | **Shared Virtual Memory Disable (SVMDIS):**<br>• 0: Enable Shared Virtual Memory mode<br>• 1: Disable Shared Virtual Memory mode |
| 23:0 | 0x0<br>RW | **Spare bits[23:0] (SPARE23_0):** Reserved for future capabilities. |

## 44.2.22 Manufacturer ID Register (MANUFACTURER_ID_0_0_0_PCI)—Offset F4h

This register describes the manufacturing characteristics of the device.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + F4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RW/V | **Reserved (RESERVED_0):** Reserved. |
| 27:24 | 0x0<br>RW/V | **DOT Portion of Process ID (DOT_PORTION_OF_PROCESS_ID):** |
| 23:16 | 0x0<br>RW/V | **Process Portion or Process ID (PROCESS_PORTION_OF_PROCESS_ID):** |
| 15:8 | 0x0<br>RW/V | **Manufacturing ID (MID):** |
| 7:0 | 0x0<br>RW/V | **Manufacturing Stepping ID (MSID):** |

## 44.3 Registers in Memory Space—MCHBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) MCHBAR. It is a 64-bit BAR and is located in Host Root Configuration Space at Bus 0, Device 0, Function 0, offset 48h and 4Ch.

See Section 44.2.7, "Memory Controller Hub Base Address Register (MCHBAR_LO_0_0_0_PCI)—Offset 48h" on page 1106 and Section 44.2.8, "Memory Controller Hub Base Address Register (MCHBAR_HI_0_0_0_PCI)—Offset 4Ch" on page 1106.

### 44.3.1 Default VTd Base Address Register (DEFVTDBAR_0_0_0_MCHBAR_C)—Offset 6C80h

This is the base address for the Default VT configuration space. There is no physical memory within this 4KB window that can be addressed. The 4KB reserved by this register does not alias to any PCI 2.3 compliant memory mapped space. On reset the DEFVTd configuration space is disabled and must be enabled by writing a 1'b1 to DEFVTBAREN. BIOS programs this register after which the register cannot be altered. BIOS must write DEFVTDBAR and then immediately follow it up with a read to DEFVTDBAR to ensure that all copies of DEFVTDBAR in the system are updated.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6C80h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:40 | 0x0<br>RO | **Reserved (RESERVED_1):** Reserved. |
| 39 | 0x0<br>RO | **Reserved:** Reserved |
| 38:12 | 0x0<br>RW | **Default VTd Base Address Register (DEFVTDBAR):** If DEFVTDBAR is enabled this field corresponds to bits 38:12 of the base address default IOMMU VTd configuration space.<br>BIOS will program this register, resulting in a base address for a 4KB block of contiguous memory address space.<br>This register ensures that a naturally aligned 4KB space is allocated within the first 512GB of addressable memory space.<br>System Software uses this base address to program the default VTd IOMMU register set.<br>If DEFVTDBAR is enabled and incoming Request Address[38:12] matches DEFVTDBAR[38:12], the request targets the Default VTd BAR. |
| 11:2 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |
| 1 | 0x0<br>RW | **DEFVTDBAR Register Lock (LOCK):** Locks the contents of the register, including itself. |
| 0 | 0x0<br>RW/L | **Default VTd Base Address Range Enable (DEFVTDBAREN):**<br>• 0: DEFVTDBAR is disabled and does not claim any memory<br>• 1: DEFVTDBAR memory mapped accesses are claimed and decoded appropriately.<br>This bit will remain 1'b0 if VTd capability is disabled. |

## 44.3.2 Spare BIOS (A_CR_SPARE_BIOS_MCHBAR)—Offset 647Ch

Spare CR in MCHBAR.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MCHBAR] + 647Ch

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **SPARE RW Bits (SPARE_RW):** Spare RW 32 bits in BIOSWR policy group. |

## 44.3.3 Uncorrectable Error Status Register (A_CR_UNCERRSTS_0_0_0_MCHBAR)—Offset 6588h

Errors that have been seen in A-Unit. The error is only logged if the respective bit in UNCERRMSK is 0.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6588h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved**<br><br>**Power Well:** prst |
| 30 | 0x0<br>RO | **Reserved**<br><br>**Power Well:** prst |
| 29 | 0x0<br>RO | **Reserved**<br><br>**Power Well:** prst |
| 28 | 0x0<br>RO | **Reserved**<br><br>**Power Well:** prst |
| 27 | 0x0<br>RO | **Reserved**<br><br>**Power Well:** prst |

## 44.3.4 Uncorrectable Error Mask Register (A_CR_UNCERRMSK_0_0_0_MCHBAR)—Offset 658Ch

Masks whether a reported error is logged and signaled to the IEH.

1- do not log/signal.

0 - log/signal.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 658Ch

**Default:** FFFFFFFFh

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x1<br>RO | **Reserved** |
| 30 | 0x1<br>RO | **Reserved** |

| 9 | 0x0<br>RW | **gpa overflow (gpa_overflow):** A transaction was received with a guest physical address that was too large |
| 8 | 0x0<br>RW | **illegal msi (illegal_msi):** A malformed/illegal MSI was received in the upstream direction |
| 7 | 0x0<br>RW | **at translated illegal device (at_translated_illegal_device):** A device that is not support to set the AT bit set it to an illegal value |
| 6 | 0x0<br>RO | **Reserved** |
| 5 | 0x0<br>RW | **bad sai cmpl (bad_sai_cmpl):** An incorrect/illegal sai was received with an upstream completion transaction. |
| 4 | 0x0<br>RW | **received lk cmpl (received_lk_cmpl):** Received a CmplLck completion from iosf. |
| 3 | 0x0<br>RW | **bad sai nonposted (bad_sai_nonposted):** An incorrect/illegal sai was received with an upstream non-posted transaction. |
| 2 | 0x0<br>RW | **illegal nonposted opcode (illegal_nonposted_opcode):** Illegal/Unsupported non-posted opcode received from iosf. |
| 1 | 0x0<br>RW | **bad sai posted (bad_sai_posted):** An incorrect/illegal sai was received with an upstream posted transaction. |
| 0 | 0x0<br>RW | **illegal posted opcode (illegal_posted_opcode):** Illegal/Unsupported posted opcode received from iosf. |

## 44.3.9 Uncorrectable Error Count (A_CR_UNCERRCNT_0_0_0_MCHBAR)—Offset 65A0h

Counts the number of uncorrectable errors that have occurred.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 65A0h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15 | 0x0<br>RW/1C | **Overflow (OVERFLOW):** Error count overflow.<br><br>**Power Well:** prst |
| 14:0 | 0x0<br>RW/1C | **Error Count (ERR_CNT):** Uncorrectable error count.<br><br>**Power Well:** prst |

## 44.3.10 Correctable Error Status Register (A_CR_CORERRSTS_0_0_0_MCHBAR)—Offset 65A4h

Errors that have been seen in A-Unit. This will always log errors irrespective of the CORERRMSK bit setting

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 65A4h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |

## 44.3.15 Correctable Error Count (A_CR_CORERRCNT_0_0_0_MCHBAR)—Offset 65B8h

Counts the number of correctable errors that have occurred

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 65B8h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15 | 0x0<br>RW/1C | **Overflow (OVERFLOW):** Error count overflowed.<br><br>**Power Well:** prst |
| 14:0 | 0x0<br>RW/1C | **Error Count (ERR_CNT):** Correctable error count<br><br>**Power Well:** prst |

## 44.3.16 Slice and Channel Hash (A_CR_SLICE_CHANNEL_HASH_0_0_0_MCHBAR)—Offset 65C0h

A-Unit slice and channel hash function.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 65C0h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **Lock (LOCK):** Intended usage is for BIOS to set the LOCK when it updates the CR. |
| 62:52 | 0x0<br>RO | **RSVD0:** Reserved |
| 51:38 | 0x0<br>RW | **Channel Hash Mask (CH_HASH_MASK):** When both PMI channels in a slice are enabled, this field specifies the Channel Hash Mask to be applied on Addr[19:6] postremap DRAM address of the request to compute which PMI channel a request must be routed to.<br>Relevant only when HVM mode is disabled and only for requests that do not fall under the MOT region.<br>B-Unit will override the programmed value to include the Channel Selector bit See SLICEHASH.INTERLEAVE_MODE field.<br>Note that HVM mode and MOT regions have special hash requirements and hence they do not use the CH_HASH_MASK. |
| 37:33 | 0x0<br>RO | **RSVD1:** Reserved |
| 32 | 0x0<br>RW | **Channel 1 Disabled (CH_1_DISABLED):** Channel 1 in both slices are disabled no memory address mapped to ch 1. All requests sent to channel 0. |
| 31 | 0x0<br>RW | **Spare (SPARE):** No identified usage yet. |
| 30:20 | 0x0<br>RO | **RSVD2:** Reserved |
| 19:6 | 0x0<br>RW | **Slice Hash Mask (SLICE_HASH_MASK):** When both slices are enabled this field specifies the Slice Hash Mask to be applied on Addr[19:6] physical address of the request to compute which slice a request must be routed to.<br>Relevant only when HVM mode is disabled and only for physical addresses that do not fall under the Asymmetric Memory Region and the MOT region.<br>B-Unit will override the programmed value to include the Slice Selector bit See INTERLEAVE_MODE field.<br>Note that HVM mode non-address IDI requests asymmetric memory region and MOT regions have special hash requirements and hence they do not use the SLICE_HASH_MASK. |
| 5 | 0x0<br>RO | **RSVD3:** Reserved |
| 4 | 0x0<br>RW | **Reserved** |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3:2 | 0x0<br>RW | **Interleave Mode (INTERLEAVE_MODE):** Default interleave mode that specifies how the Slice Selector and Channel Selector bits are to be determined. Relevant only when HVM mode is disabled and only for system memory addresses that do not fall under the MOT region or the Asymmetric memory region in the System Address Map. Legal encodings are 0x0 0x1 and 0x2. An encoding of 0x3 is treated as if it was 0x2. When both slices and all four PMI channels are enabled:<br>• 0h: Default Slice Selector is Addr[10] and Default Channel Selector is Addr[11]<br>• 1h: Default Slice Selector is Addr[11] and Default Channel Selector is Addr[12]<br>• 2h: Default Slice Selector is Addr[12] and Default Channel Selector is Addr[13]<br>When both slices are enabled but only one channel in each slice enabled:<br>• 0h: Default Slice Selector is Addr[10]<br>• 1h: Default Slice Selector is Addr[11]<br>• 2h: Default Slice Selector is Addr[12]<br>When only SLICE0 is enabled and both channels on that slice are enabled:<br>• 0h: Default Channel Selector is Addr[10]<br>• 1h: Default Channel Selector is Addr[11]<br>• 2h: Default Channel Selector is Addr[12]<br>When SLICE0 and only one channel in that slice is enabled this field is not relevant. B-Unit overrides the setting of the SLICE_HASH_MASK to always include the Slice Selector bit. Similarly, B-Unit overrides the setting of the CH_HASH_MASK to always include the Channel Selector bit. |
| 1 | 0x0<br>RW | **Reserved** |
| 0 | 0x0<br>RW | **Slice 1 Disabled (SLICE_1_DISABLED):** Slice 1 is disabled; no memory address mapped to Slice 1. All request sent to Slice 0. |

## 44.3.17 A_CR_ASYM_MEM_REGION0_0_0_0_MCHBAR—Offset 65D0h

Specification of asymmetric memory region 0 (in slice 0) for the configuration with 2 asymmetric memory regions.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 65D0h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **SLICE0_ASYM_ENABLE:** Setting this bit to 0 disables asymmetric memory region 0; setting it to 1 enables the region. |
| 30:28 | 0x0<br>RO | **RSVD0:** Reserved |
| 27:20 | 0x0<br>RW | **SLICE0_ASYM_LIMIT:** Specifies bits [38:31] of the highest address of asymmetric memory region 0 (in slice 0); all the lower bits of the region's highest address are equal to 1. |
| 19:12 | 0x0<br>RO | **RSVD1:** Reserved |
| 11:4 | 0x0<br>RW | **SLICE0_ASYM_BASE:** Specifies bits [38:31] of the base address of asymmetric memory region 0 (in slice 0); all the lower bits of the region's base address are equal to 0. |
| 3:0 | 0x0<br>RO | **RSVD2:** Reserved |

## 44.3.18 A_CR_ASYM_MEM_REGION1_0_0_0_MCHBAR—Offset 65D4h

Specification of asymmetric memory region 1 (in slice 1) for the configuration with 2 asymmetric memory regions.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 65D4h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **SLICE1_ASYM_ENABLE:** Setting this bit to 0 disables asymmetric memory region 1; setting it to 1 enables the region. |
| 30:28 | 0x0<br>RO | **RSVD0:** Reserved |
| 27:20 | 0x0<br>RW | **SLICE1_ASYM_LIMIT:** Specifies bits [38:31] of the highest address of asymmetric memory region 1 (in slice 1); all the lower bits of the region's highest address are equal to 1. |
| 19:12 | 0x0<br>RO | **RSVD1:** Reserved |
| 11:4 | 0x0<br>RW | **SLICE1_ASYM_BASE:** Specifies bits [38:31] of the base address of asymmetric memory region 1 (in slice 1); all the lower bits of the region's base address are equal to 0. |
| 3:0 | 0x0<br>RO | **RSVD2:** Reserved |

## 44.3.19 B-Unit Miscellaneous Configuration (B_CR_BMISC_0_0_0_MCHBAR)—Offset 6800h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000007h

**BAR and Offset:** [MCHBAR] + 6800h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |
| 3 | 0x0<br>RW | **Send Boot Vector to DRAM (SEND_BOOT_VECTOR_TO_DRAM):** When set, IA accesses to 0xFFFF_0000 to 0XFFFF_FFFF will be sent to memory, regardless of the Host IO Boundary setting in TOLUD. |
| 2 | 0x1<br>RW | **ABSeginDRAM Legacy Video Area (ABSEGINDRAM):** When this bit is set, reads and writes targeting A or Bsegments are routed to DRAM. Asegment corresponds to the memory range 0xA_0000 to 0xA_FFFF. Bsegment corresponds to the memory ranges 0xB_0000 to 0xB_7FFF and 0xB_8000 to 0xB_FFFF. |
| 1 | 0x1<br>RW | **Read FSeg from DRAM (READ_FSEG_FROM_DRAM):** Writes and reads targeting Fsegment are routed to DRAM. Fsegment corresponds to the memory range 0xF_0000 to 0xF_FFFF.<br>This bit must be set '1'. |
| 0 | 0x1<br>RW | **Read ESeg from DRAM (READ_ESEG_FROM_DRAM):** Writes and reads targeting Esegment are routed to DRAM. Esegment corresponds to the memory range 0xE_0000 to 0xE_FFFF.<br>This bit must be set '1'. |

## 44.3.20 Slice 0 Memory Access Count (B_CR_MEM_ACCESS_COUNT_SLICE0)—Offset 6868h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MCHBAR] + 6868h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Memory Access Count (MEM_ACCESS_COUNT):** Counts the number of PMI transactions that the B-Unit has sent to any PMI channel. Counts both reads and writes. Counter is not saturating and will roll over to zero. It is up to the consumer of the counter to handle roll over cases. |

## 44.3.21 Slice 1 Memory Access Count (B_CR_MEM_ACCESS_COUNT_SLICE1)—Offset 686Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MCHBAR] + 686Ch

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Memory Access Count (MEM_ACCESS_COUNT):** Counts the number of PMI transactions that the B-Unit has sent to any PMI channel. Counts both reads and writes. Counter is not saturating and will roll over to zero. It is up to the consumer of the counter to handle roll over cases. |

## 44.3.22 IMR0 Base (B_CR_BIMR0BASE_0_0_0_MCHBAR)—Offset 6870h

This register, along with IMR0MASK, IMR0RAC, and IMR0WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR0RAC and IMR0WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6870h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **Reserved (RESERVED_1):** Reserved. |
| 28:0 | 0x0<br>RW | **Base 0 IMR0 Base (IMR0_BASE):** Specifies bits 38:10 of the start address of IMR0 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR0MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR0 defined region. |

## 44.3.23 IMR0 Mask (B_CR_BIMR0MASK_0_0_0_MCHBAR)—Offset 6874h

This register, along with IMR0BASE, IMR0RAC, and IMR0WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR0RAC and IMR0WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6874h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |
| 28:0 | 0x0<br>RW | **Mask 0 IMR0 Mask (IMR0_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR0BASE[28:0] value. A match indicates that the incoming address falls within the IMR0 region. |

## 44.3.24 IMR0 Control Policy (B_CR_BIMR0CP_0_0_0_MCHBAR)—Offset 6878h

This register controls the access policy to the Read Access Policy BIMR0RAC, Write Access Policy BIMR0WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6878h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **IMR0 Control Policy (IMR0_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field. |

## 44.3.25 IMR0 Read Access Policy (B_CR_BIMR0RAC_0_0_0_MCHBAR)—Offset 6880h

This register, along with IMR0BASE, IMR0MASK and IMR0WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR0. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6880h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR0 Read Access Policy 63 (IMR0_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value. |
| 62 | 0x0<br>RO | **IMR0 Read Access Policy 62 (IMR0_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value. |
| 61 | 0x0<br>RO | **IMR0 Read Access Policy 61 (IMR0_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value. |
| 60 | 0x0<br>RO | **IMR0 Read Access Policy 60 (IMR0_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value. |
| 59 | 0x0<br>RO | **IMR0 Read Access Policy 59 (IMR0_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value. |
| 58 | 0x0<br>RO | **IMR0 Read Access Policy 58 (IMR0_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value. |
| 57 | 0x0<br>RO | **IMR0 Read Access Policy 57 (IMR0_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value. |
| 56 | 0x0<br>RW | **IMR0 Read Access Policy 56 (IMR0_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value. |
| 55 | 0x0<br>RW | **IMR0 Read Access Policy 55 (IMR0_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value. |
| 54 | 0x0<br>RW | **IMR0 Read Access Policy 54 (IMR0_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value. |
| 53 | 0x0<br>RO | **IMR0 Read Access Policy 53 (IMR0_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value. |
| 52 | 0x0<br>RO | **IMR0 Read Access Policy 52 (IMR0_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value. |
| 51 | 0x0<br>RO | **IMR0 Read Access Policy 51 (IMR0_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value. |
| 50 | 0x0<br>RW | **IMR0 Read Access Policy 50 (IMR0_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value. |

## 44.3.26 IMR0 Write Access Policy (B_CR_BIMR0WAC_0_0_0_MCHBAR)—Offset 6888h

This register, along with IMR0BASE, IMR0MASK and IMR0RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR0. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6888h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR0 Write Access Policy 63 (IMR0_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value. |

## 44.3.27 B_CR_BIMR1BASE_0_0_0_MCHBAR—Offset 6890h

This register, along with IMR1MASK, IMR1RAC and IMR1WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR1RAC and IMR1WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6890h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Trace Enable (TR_EN):** Asset Classification AC[0]: Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 28:0 | 0x0<br>RW | **Base 1 IMR1 Base (IMR1_BASE):** Specifies bits 38:10 of the start address of IMR1 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR1MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR1 defined region. |

## 44.3.28 IMR1 Mask (B_CR_BIMR1MASK_0_0_0_MCHBAR)—Offset 6894h

This register, along with IMR1BASE, IMR1RAC and IMR1WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR1RAC and IMR1WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6894h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **GT Implicit Writeback Enable (GT_IWB_EN):** Asset Classification AC[2]: Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requestor of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 28:0 | 0x0<br>RW | **Mask 1 IMR1 Mask (IMR1_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR1BASE[28:0] value. A match indicates that the incoming address falls within the IMR1 region. |

## 44.3.29 IMR1 Control Policy (B_CR_BIMR1CP_0_0_0_MCHBAR)—Offset 6898h

This register controls the access policy to the Read Access Policy BIMR1RAC, the Write Access Policy BIMR1WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6898h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **IMR1 Control Policy (IMR1_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers, based on the value from each agent's 6bit SAI field. |

## 44.3.30 IMR1 Read Access Policy (B_CR_BIMR1RAC_0_0_0_MCHBAR)—Offset 68A0h

This register, along with IMR1BASE, IMR1MASK and IMR1WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR1. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 68A0h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR1 Read Access Policy 63 (IMR1_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 62 | 0x0<br>RO | **IMR1 Read Access Policy 62 (IMR1_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 61 | 0x0<br>RO | **IMR1 Read Access Policy 61 (IMR1_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 60 | 0x0<br>RO | **IMR1 Read Access Policy 60 (IMR1_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 59 | 0x0<br>RO | **IMR1 Read Access Policy 59 (IMR1_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value. |

| 5 | 0x0<br>RW | **IMR1 Read Access Policy 5 (IMR1_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 4 | 0x0<br>RW | **IMR1 Read Access Policy 4 (IMR1_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 3 | 0x0<br>RW | **IMR1 Read Access Policy 3 (IMR1_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 2 | 0x0<br>RW | **IMR1 Read Access Policy 2 (IMR1_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 1 | 0x0<br>RW | **IMR1 Read Access Policy 1 (IMR1_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 0 | 0x0<br>RW | **IMR1 Read Access Policy 0 (IMR1_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value. |

## 44.3.31 IMR1 Write Access Policy (B_CR_BIMR1WAC_0_0_0_MCHBAR)—Offset 68A8h

This register, along with IMR1BASE, IMR1MASK and IMR1RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR1. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 68A8h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR1 Write Access Policy 63 (IMR1_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 62 | 0x0<br>RO | **IMR1 Write Access Policy 62 (IMR1_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 61 | 0x0<br>RO | **IMR1 Write Access Policy 61 (IMR1_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 60 | 0x0<br>RO | **IMR1 Write Access Policy 60 (IMR1_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 59 | 0x0<br>RO | **IMR1 Write Access Policy 59 (IMR1_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value. |

| 7 | 0x0<br>RO | **IMR1 Write Access Policy 7 (IMR1_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 6 | 0x0<br>RO | **IMR1 Write Access Policy 6 (IMR1_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 5 | 0x0<br>RW | **IMR1 Write Access Policy 5 (IMR1_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 4 | 0x0<br>RW | **IMR1 Write Access Policy 4 (IMR1_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 3 | 0x0<br>RW | **IMR1 Write Access Policy 3 (IMR1_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 2 | 0x0<br>RW | **IMR1 Write Access Policy 2 (IMR1_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 1 | 0x0<br>RW | **IMR1 Write Access Policy 1 (IMR1_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value. |
| 0 | 0x0<br>RW | **IMR1 Write Access Policy 0 (IMR1_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value. |

## 44.3.32 Base 0 IMR2 Base (B_CR_BIMR2BASE_0_0_0_MCHBAR)—Offset 68B0h

This register, along with IMR2MASK, IMR2RAC and IMR2WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR2RAC and IMR2WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 68B0h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 28:0 | 0x0<br>RW | **Base 0 IMR2 Base (IMR2_BASE):** Specifies bits 38:10 of the start address of IMR2 region. IMR region size must be a strict poweroftwo, at least 1KB and naturally aligned to the size. These bits are compared with the result of the IMR2MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR2 defined region. |

## 44.3.33 IMR2 Mask (B_CR_BIMR2MASK_0_0_0_MCHBAR)—Offset 68B4h

This register, along with IMR2BASE, IMR2RAC, and IMR2WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR2RAC and IMR2WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 68B4h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestpr depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 28:0 | 0x0<br>RW | **Mask 0 IMR2 Mask (IMR2_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR2BASE[28:0] value. A match indicates that the incoming address falls within the IMR2 region. |

## 44.3.34 IMR2 Control Policy (B_CR_BIMR2CP_0_0_0_MCHBAR)—Offset 68B8h

This register controls the access policy to the Read Access Policy BIMR2RAC, Write Access Policy BIMR2WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 68B8h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **IMR2 Control Policy (IMR2_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers, based on the value from each agent's 6bit SAI field. |

## 44.3.35 IMR2 Read Access Policy (B_CR_BIMR2RAC_0_0_0_MCHBAR)—Offset 68C0h

This register, along with IMR2BASE, IMR2MASK and IMR2WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR2. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 68C0h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR2 Read Access Policy 63 (IMR2_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value. |
| 62 | 0x0<br>RO | **IMR2 Read Access Policy 62 (IMR2_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value. |

| 1 | 0x0<br>RW | **IMR2 Write Access Policy 1 (IMR2_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value. |
| 0 | 0x0<br>RW | **IMR2 Write Access Policy 0 (IMR2_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value. |

## 44.3.37 IMR3 Base (B_CR_BIMR3BASE_0_0_0_MCHBAR)—Offset 68D0h

This register, along with IMR3MASK, IMR3RAC and IMR3WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR3RAC and IMR3WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 68D0h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 28:0 | 0x0<br>RW | **Base 0 IMR3 Base (IMR3_BASE):** Specifies bits 38:10 of the start address of IMR3 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR3MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR3 defined region. |

## 44.3.38 IMR3 Mask (B_CR_BIMR3MASK_0_0_0_MCHBAR)—Offset 68D4h

This register, along with IMR3BASE, IMR3RAC and IMR3WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR3RAC and IMR3WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 68D4h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 28:0 | 0x0<br>RW | **Mask 0 IMR3 Mask (IMR3_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR3BASE[28:0] value. A match indicates that the incoming address falls within the IMR3 region. |

## 44.3.39 IMR3 Control Policy (B_CR_BIMR3CP_0_0_0_MCHBAR)—Offset 68D8h

This register controls the access policy to the Read Access Policy BIMR3RAC, the Write Access Policy BIMR3WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 68D8h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **IMR3 Control Policy (IMR3_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers, based on the value from each agent's 6bit SAI field. |

## 44.3.40 IMR3 Read Access Policy (B_CR_BIMR3RAC_0_0_0_MCHBAR)—Offset 68E0h

This register, along with IMR3BASE, IMR3MASK and IMR3WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR3. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 68E0h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR3 Read Access Policy 63 (IMR3_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value. |
| 62 | 0x0<br>RO | **IMR3 Read Access Policy 62 (IMR3_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value. |
| 61 | 0x0<br>RO | **IMR3 Read Access Policy 61 (IMR3_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value. |
| 60 | 0x0<br>RO | **IMR3 Read Access Policy 60 (IMR3_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value. |

## 44.3.41 IMR3 Write Access Policy (B_CR_BIMR3WAC_0_0_0_MCHBAR)—Offset 68E8h

This register, along with IMR3BASE, IMR3MASK and IMR3RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR3. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 68E8h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR3 Write Access Policy 63 (IMR3_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value. |

| 1 | 0x0<br>RW | **IMR3 Write Access Policy 1 (IMR3_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value. |
| 0 | 0x0<br>RW | **IMR3 Write Access Policy 0 (IMR3_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value. |

## 44.3.42 IMR4 Base (B_CR_BIMR4BASE_0_0_0_MCHBAR)—Offset 68F0h

This register, along with IMR4MASK, IMR4RAC and IMR4WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR4RAC and IMR4WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 68F0h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 28:0 | 0x0<br>RW | **Base 0 IMR4 Base (IMR4_BASE):** Specifies bits 38:10 of the start address of IMR4 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR4MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR4 defined region. |

## 44.3.43 IMR4 Mask (B_CR_BIMR4MASK_0_0_0_MCHBAR)—Offset 68F4h

This register, along with IMR4BASE, IMR4RAC and IMR4WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR4RAC and IMR4WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 68F4h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor, depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor, depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 28:0 | 0x0<br>RW | **Mask 0 IMR4 Mask (IMR4_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR4BASE[28:0] value. A match indicates that the incoming address falls within the IMR4 region. |

## 44.3.44 B-Unit IMR4 Control Policy (B_CR_BIMR4CP_0_0_0_MCHBAR)—Offset 68F8h

This register controls the access policy to the Read Access Policy BIMR4RAC, the Write Access Policy BIMR4WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 68F8h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **B-Unit IMR4 Control Policy (IMR4_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers, based on the value from each agent's 6bit SAI field. |

## 44.3.45 IMR4 Read Access Policy (B_CR_BIMR4RAC_0_0_0_MCHBAR)—Offset 6900h

This register, along with IMR4BASE, IMR4MASK and IMR4WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR4. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6900h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| 1 | 0x0<br>RW | **IMR4_WRITE_POL_1:** B-Unit IMR4 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value. |
| 0 | 0x0<br>RW | **IMR4_WRITE_POL_0:** B-Unit IMR4 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value. |

## 44.3.47 IMR5 Base (B_CR_BIMR5BASE_0_0_0_MCHBAR)—Offset 6910h

This register, along with IMR5MASK, IMR5RAC and IMR5WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR5RAC and IMR5WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6910h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 28:0 | 0x0<br>RW | **Base 0 IMR5 Base (IMR5_BASE):** Specifies bits 38:10 of the start address of IMR5 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR5MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR5 defined region. |

## 44.3.48 IMR5 Mask (B_CR_BIMR5MASK_0_0_0_MCHBAR)—Offset 6914h

This register, along with IMR5BASE, IMR5RAC and IMR5WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR5RAC and IMR5WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6914h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor, depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor, depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 28:0 | 0x0<br>RW | **Mask 0 IMR5 Mask (IMR5_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR5BASE[28:0] value. A match indicates that the incoming address falls within the IMR5 region. |

## 44.3.49 IMR5 Control Policy (B_CR_BIMR5CP_0_0_0_MCHBAR)—Offset 6918h

This register controls the access policy to the Read Access Policy BIMR5RAC, the Write Access Policy BIMR5WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6918h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **IMR5 Control Policy (IMR5_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers, based on the value from each agent's 6bit SAI field. |

## 44.3.50 IMR5 Read Access Policy (B_CR_BIMR5RAC_0_0_0_MCHBAR)—Offset 6920h

This register, along with IMR5BASE, IMR5MASK and IMR5WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR5. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6920h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR5 Read Access Policy 63 (IMR5_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 62 | 0x0<br>RO | **IMR5 Read Access Policy 62 (IMR5_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 61 | 0x0<br>RO | **IMR5 Read Access Policy 61 (IMR5_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 60 | 0x0<br>RO | **IMR5 Read Access Policy 60 (IMR5_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 59 | 0x0<br>RO | **IMR5 Read Access Policy 59 (IMR5_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 58 | 0x0<br>RO | **IMR5 Read Access Policy 58 (IMR5_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 57 | 0x0<br>RO | **IMR5 Read Access Policy 57 (IMR5_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 56 | 0x0<br>RW | **IMR5 Read Access Policy 56 (IMR5_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 55 | 0x0<br>RW | **IMR5 Read Access Policy 55 (IMR5_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 54 | 0x0<br>RW | **IMR5 Read Access Policy 54 (IMR5_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 53 | 0x0<br>RO | **IMR5 Read Access Policy 53 (IMR5_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 52 | 0x0<br>RO | **IMR5 Read Access Policy 52 (IMR5_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 51 | 0x0<br>RO | **IMR5 Read Access Policy 51 (IMR5_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 50 | 0x0<br>RW | **IMR5 Read Access Policy 50 (IMR5_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 49 | 0x0<br>RW | **IMR5 Read Access Policy 49 (IMR5_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 48 | 0x0<br>RW | **IMR5 Read Access Policy 48 (IMR5_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 47 | 0x0<br>RO | **IMR5 Read Access Policy 47 (IMR5_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 46 | 0x0<br>RO | **IMR5 Read Access Policy 46 (IMR5_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 45 | 0x0<br>RO | **IMR5 Read Access Policy 45 (IMR5_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 44 | 0x0<br>RW | **IMR5 Read Access Policy 44 (IMR5_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 43 | 0x0<br>RW | **IMR5 Read Access Policy 43 (IMR5_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 42 | 0x0<br>RW | **IMR5 Read Access Policy 42 (IMR5_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 41 | 0x0<br>RW | **IMR5 Read Access Policy 41 (IMR5_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 40 | 0x0<br>RW | **IMR5 Read Access Policy 40 (IMR5_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |

| 23 | 0x0<br>RO | **IMR5 Read Access Policy 23 (IMR5_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 22 | 0x0<br>RO | **IMR5 Read Access Policy 22 (IMR5_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 21 | 0x0<br>RW | **IMR5 Read Access Policy 21 (IMR5_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 20 | 0x0<br>RO | **IMR5 Read Access Policy 20 (IMR5_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 19 | 0x0<br>RO | **IMR5 Read Access Policy 19 (IMR5_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 18 | 0x0<br>RO | **IMR5 Read Access Policy 18 (IMR5_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 17 | 0x0<br>RW | **IMR5 Read Access Policy 17 (IMR5_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 16 | 0x0<br>RW | **IMR5 Read Access Policy 16 (IMR5_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 15 | 0x0<br>RO | **IMR5 Read Access Policy 15 (IMR5_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 14 | 0x0<br>RO | **IMR5 Read Access Policy 14 (IMR5_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 13 | 0x0<br>RW | **IMR5 Read Access Policy 13 (IMR5_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 12 | 0x0<br>RW | **IMR5 Read Access Policy 12 (IMR5_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 11 | 0x0<br>RO | **IMR5 Read Access Policy 11 (IMR5_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 10 | 0x0<br>RO | **IMR5 Read Access Policy 10 (IMR5_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 9 | 0x0<br>RO | **IMR5 Read Access Policy 9 (IMR5_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 8 | 0x0<br>RW | **IMR5 Read Access Policy 8 (IMR5_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 7 | 0x0<br>RO | **IMR5 Read Access Policy 7 (IMR5_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 6 | 0x0<br>RO | **IMR5 Read Access Policy 6 (IMR5_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 5 | 0x0<br>RW | **IMR5 Read Access Policy 5 (IMR5_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 4 | 0x0<br>RW | **IMR5 Read Access Policy 4 (IMR5_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 3 | 0x0<br>RW | **IMR5 Read Access Policy 3 (IMR5_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 2 | 0x0<br>RW | **IMR5 Read Access Policy 2 (IMR5_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 1 | 0x0<br>RW | **IMR5 Read Access Policy 1 (IMR5_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 0 | 0x0<br>RW | **IMR5 Read Access Policy 0 (IMR5_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value. |

## 44.3.51 IMR5 Write Access Policy (B_CR_BIMR5WAC_0_0_0_MCHBAR)—Offset 6928h

This register, along with IMR5BASE, IMR5MASK and IMR5RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR5. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6928h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR5 Write Access Policy 63 (IMR5_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 62 | 0x0<br>RO | **IMR5 Write Access Policy 62 (IMR5_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 61 | 0x0<br>RO | **IMR5 Write Access Policy 61 (IMR5_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 60 | 0x0<br>RO | **IMR5 Write Access Policy 60 (IMR5_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 59 | 0x0<br>RO | **IMR5 Write Access Policy 59 (IMR5_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 58 | 0x0<br>RO | **IMR5 Write Access Policy 58 (IMR5_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 57 | 0x0<br>RO | **IMR5 Write Access Policy 57 (IMR5_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 56 | 0x0<br>RW | **IMR5 Write Access Policy 56 (IMR5_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 55 | 0x0<br>RW | **IMR5 Write Access Policy 55 (IMR5_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 54 | 0x0<br>RW | **IMR5 Write Access Policy 54 (IMR5_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 53 | 0x0<br>RO | **IMR5 Write Access Policy 53 (IMR5_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 52 | 0x0<br>RO | **IMR5 Write Access Policy 52 (IMR5_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 51 | 0x0<br>RO | **IMR5 Write Access Policy 51 (IMR5_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 50 | 0x0<br>RW | **IMR5 Write Access Policy 50 (IMR5_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 49 | 0x0<br>RW | **IMR5 Write Access Policy 49 (IMR5_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 48 | 0x0<br>RW | **IMR5 Write Access Policy 48 (IMR5_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 47 | 0x0<br>RO | **IMR5 Write Access Policy 47 (IMR5_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 46 | 0x0<br>RO | **IMR5 Write Access Policy 46 (IMR5_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 45 | 0x0<br>RO | **IMR5 Write Access Policy 45 (IMR5_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 44 | 0x0<br>RW | **IMR5 Write Access Policy 44 (IMR5_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 43 | 0x0<br>RW | **IMR5 Write Access Policy 43 (IMR5_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 42 | 0x0<br>RW | **IMR5 Write Access Policy 42 (IMR5_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 41 | 0x0<br>RW | **IMR5 Write Access Policy 41 (IMR5_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 40 | 0x0<br>RW | **IMR5 Write Access Policy 40 (IMR5_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 39 | 0x0<br>RO | **IMR5 Write Access Policy 39 (IMR5_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 38 | 0x0<br>RW | **IMR5 Write Access Policy 38 (IMR5_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 37 | 0x0<br>RO | **IMR5 Write Access Policy 37 (IMR5_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 36 | 0x0<br>RW | **IMR5 Write Access Policy 36 (IMR5_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 35 | 0x0<br>RO | **IMR5 Write Access Policy 35 (IMR5_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 34 | 0x0<br>RW | **IMR5 Write Access Policy 34 (IMR5_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 33 | 0x0<br>RW | **IMR5 Write Access Policy 33 (IMR5_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 32 | 0x0<br>RW | **IMR5 Write Access Policy 32 (IMR5_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 31 | 0x0<br>RO | **IMR5 Write Access Policy 31 (IMR5_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 30 | 0x0<br>RW | **IMR5 Write Access Policy 30 (IMR5_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 29 | 0x0<br>RW | **IMR5 Write Access Policy 29 (IMR5_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 28 | 0x0<br>RW | **IMR5 Write Access Policy 28 (IMR5_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 27 | 0x0<br>RW | **IMR5 Write Access Policy 27 (IMR5_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 26 | 0x0<br>RW | **IMR5 Write Access Policy 26 (IMR5_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 25 | 0x0<br>RW | **IMR5 Write Access Policy 25 (IMR5_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 24 | 0x0<br>RW | **IMR5 Write Access Policy 24 (IMR5_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 23 | 0x0<br>RO | **IMR5 Write Access Policy 23 (IMR5_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 22 | 0x0<br>RO | **IMR5 Write Access Policy 22 (IMR5_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 21 | 0x0<br>RW | **IMR5 Write Access Policy 21 (IMR5_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 20 | 0x0<br>RO | **IMR5 Write Access Policy 20 (IMR5_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 19 | 0x0<br>RO | **IMR5 Write Access Policy 19 (IMR5_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 18 | 0x0<br>RO | **IMR5 Write Access Policy 18 (IMR5_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 17 | 0x0<br>RW | **IMR5 Write Access Policy 17 (IMR5_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 16 | 0x0<br>RW | **IMR5 Write Access Policy 16 (IMR5_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 15 | 0x0<br>RO | **IMR5 Write Access Policy 15 (IMR5_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 14 | 0x0<br>RO | **IMR5 Write Access Policy 14 (IMR5_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 13 | 0x0<br>RW | **IMR5 Write Access Policy 13 (IMR5_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 12 | 0x0<br>RW | **IMR5 Write Access Policy 12 (IMR5_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 11 | 0x0<br>RO | **IMR5 Write Access Policy 11 (IMR5_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 10 | 0x0<br>RO | **IMR5 Write Access Policy 10 (IMR5_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 9 | 0x0<br>RO | **IMR5 Write Access Policy 9 (IMR5_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 8 | 0x0<br>RW | **IMR5 Write Access Policy 8 (IMR5_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 7 | 0x0<br>RO | **IMR5 Write Access Policy 7 (IMR5_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 6 | 0x0<br>RO | **IMR5 Write Access Policy 6 (IMR5_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 5 | 0x0<br>RW | **IMR5 Write Access Policy 5 (IMR5_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 4 | 0x0<br>RW | **IMR5 Write Access Policy 4 (IMR5_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 3 | 0x0<br>RW | **IMR5 Write Access Policy 3 (IMR5_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 2 | 0x0<br>RW | **IMR5 Write Access Policy 2 (IMR5_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 1 | 0x0<br>RW | **IMR5 Write Access Policy 1 (IMR5_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |
| 0 | 0x0<br>RW | **IMR5 Write Access Policy 0 (IMR5_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value. |

## 44.3.52 IMR6 Base (B_CR_BIMR6BASE_0_0_0_MCHBAR)—Offset 6930h

This register, along with IMR6MASK, IMR6RAC and IMR6WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR6RAC and IMR6WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6930h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 28:0 | 0x0<br>RW | **Base 0 IMR6 Base (IMR6_BASE):** Specifies bits 38:10 of the start address of IMR6 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR6MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR6 defined region. |

## 44.3.53 IMR6 Mask (B_CR_BIMR6MASK_0_0_0_MCHBAR)—Offset 6934h

This register, along with IMR6BASE, IMR6RAC and IMR6WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR6RAC and IMR6WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6934h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor, depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor, depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 28:0 | 0x0<br>RW | **Mask 0 IMR6 Mask (IMR6_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR6BASE[28:0] value. A match indicates that the incoming address falls within the IMR6 region. |

## 44.3.54 IMR6 Control Policy (B_CR_BIMR6CP_0_0_0_MCHBAR)—Offset 6938h

This register controls the access policy to the Read Access Policy BIMR6RAC, the Write Access Policy BIMR6WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6938h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **IMR6 Control Policy (IMR6_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC, BIMR6CP registers, based on the value from each agent's 6bit SAI field. |

## 44.3.55 IMR6 Read Access Policy (B_CR_BIMR6RAC_0_0_0_MCHBAR)—Offset 6940h

This register, along with IMR6BASE, IMR6MASK and IMR6WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR6. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6940h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR6 Read Access Policy 63 (IMR6_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 62 | 0x0<br>RO | **IMR6 Read Access Policy 62 (IMR6_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 61 | 0x0<br>RO | **IMR6 Read Access Policy 61 (IMR6_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 60 | 0x0<br>RO | **IMR6 Read Access Policy 60 (IMR6_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 59 | 0x0<br>RO | **IMR6 Read Access Policy 59 (IMR6_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 58 | 0x0<br>RO | **IMR6 Read Access Policy 58 (IMR6_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 57 | 0x0<br>RO | **IMR6 Read Access Policy 57 (IMR6_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 56 | 0x0<br>RW | **IMR6 Read Access Policy 56 (IMR6_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 55 | 0x0<br>RW | **IMR6 Read Access Policy 55 (IMR6_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 54 | 0x0<br>RW | **IMR6 Read Access Policy 54 (IMR6_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 53 | 0x0<br>RO | **IMR6 Read Access Policy 53 (IMR6_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 52 | 0x0<br>RO | **IMR6 Read Access Policy 52 (IMR6_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 51 | 0x0<br>RO | **IMR6 Read Access Policy 51 (IMR6_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 50 | 0x0<br>RW | **IMR6 Read Access Policy 50 (IMR6_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 49 | 0x0<br>RW | **IMR6 Read Access Policy 49 (IMR6_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 48 | 0x0<br>RW | **IMR6 Read Access Policy 48 (IMR6_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 47 | 0x0<br>RO | **IMR6 Read Access Policy 47 (IMR6_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 46 | 0x0<br>RO | **IMR6 Read Access Policy 46 (IMR6_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 45 | 0x0<br>RO | **IMR6 Read Access Policy 45 (IMR6_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 44 | 0x0<br>RW | **IMR6 Read Access Policy 44 (IMR6_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 43 | 0x0<br>RW | **IMR6 Read Access Policy 43 (IMR6_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 42 | 0x0<br>RW | **IMR6 Read Access Policy 42 (IMR6_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 41 | 0x0<br>RW | **IMR6 Read Access Policy 41 (IMR6_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 40 | 0x0<br>RW | **IMR6 Read Access Policy 40 (IMR6_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 39 | 0x0<br>RO | **IMR6 Read Access Policy 39 (IMR6_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |

| 1 | 0x0<br>RW | **IMR6 Read Access Policy 1 (IMR6_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |
| 0 | 0x0<br>RW | **IMR6 Read Access Policy 0 (IMR6_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value. |

## 44.3.56 IMR6 Write Access Policy (B_CR_BIMR6WAC_0_0_0_MCHBAR)—Offset 6948h

This register, along with IMR6BASE, IMR6MASK and IMR6RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with a SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR6. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6948h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |

| 0 | 0x0<br>RW | **IMR6 Write Access Policy 0 (IMR6_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value. |

## 44.3.57 IMR7 Base (B_CR_BIMR7BASE_0_0_0_MCHBAR)—Offset 6950h

This register, along with IMR7MASK, IMR7RAC and IMR7WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR7RAC and IMR7WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6950h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 28:0 | 0x0<br>RW | **Base 0 IMR7 Base (IMR7_BASE):** Specifies bits 38:10 of the start address of IMR7 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR7MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR7 defined region. |

## 44.3.58 IMR7 Mask (B_CR_BIMR7MASK_0_0_0_MCHBAR)—Offset 6954h

This register, along with IMR7BASE, IMR7RAC and IMR7WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR7RAC and IMR7WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6954h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor, depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor, depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 28:0 | 0x0<br>RW | **Mask 0 IMR7 Mask (IMR7_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR7BASE[28:0] value. A match indicates that the incoming address falls within the IMR7 region. |

## 44.3.59 IMR7 Control Policy (B_CR_BIMR7CP_0_0_0_MCHBAR)—Offset 6958h

This register controls the access policy to the Read Access Policy BIMR7RAC, the Write Access Policy BIMR7WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6958h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **IMR7 Control Policy (IMR7_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers, based on the value from each agent's 6bit SAI field. |

## 44.3.60 IMR7 Read Access Policy (B_CR_BIMR7RAC_0_0_0_MCHBAR)—Offset 6960h

This register, along with IMR7BASE, IMR7MASK and IMR7WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR7. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6960h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

## 44.3.62 IMR8 Base (B_CR_BIMR8BASE_0_0_0_MCHBAR)—Offset 6970h

This register, along with IMR8MASK, IMR8RAC and IMR8WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR8RAC and IMR8WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6970h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 28:0 | 0x0<br>RW | **Base 0 IMR8 Base (IMR8_BASE):** Specifies bits 38:10 of the start address of IMR8 region. IMR region size must be a strict poweroftwo at least 1KB and naturally aligned to the size. These bits are compared with the result of the IMR8MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR8 defined region. |

## 44.3.63 IMR8 Mask (B_CR_BIMR8MASK_0_0_0_MCHBAR)—Offset 6974h

This register, along with IMR8BASE, IMR8RAC and IMR8WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR8RAC and IMR8WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6974h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 28:0 | 0x0<br>RW | **Mask 0 IMR8 Mask (IMR8_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR8BASE[28:0] value. A match indicates that the incoming address falls within the IMR8 region. |

## 44.3.64 IMR8 Control Policy (B_CR_BIMR8CP_0_0_0_MCHBAR)—Offset 6978h

This register controls the access policy to the Read Access Policy BIMR8RAC, the Write Access Policy BIMR8WAC, and, self-referentially to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6978h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **IMR8 Control Policy (IMR8_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers, based on the value from each agent's 6bit SAI field. |

## 44.3.65 IMR8 Read Access Policy (B_CR_BIMR8RAC_0_0_0_MCHBAR)—Offset 6980h

This register, along with IMR8BASE, IMR8MASK and IMR8WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR8. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6980h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR8 Read Access Policy 63 (IMR8_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value. |
| 62 | 0x0<br>RO | **IMR8 Read Access Policy 62 (IMR8_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value. |
| 61 | 0x0<br>RO | **IMR8 Read Access Policy 61 (IMR8_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value. |
| 60 | 0x0<br>RO | **IMR8 Read Access Policy 60 (IMR8_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value. |

## 44.3.66 IMR8 Write Access Policy (B_CR_BIMR8WAC_0_0_0_MCHBAR)—Offset 6988h

This register, along with IMR8BASE, IMR8MASK and IMR8RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR8. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6988h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR8 Write Access Policy 63 (IMR8_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value. |

| 3 | 0x0<br>RW | **IMR8 Write Access Policy 3 (IMR8_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value. |
| 2 | 0x0<br>RW | **IMR8 Write Access Policy 2 (IMR8_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value. |
| 1 | 0x0<br>RW | **IMR8 Write Access Policy 1 (IMR8_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value. |
| 0 | 0x0<br>RW | **IMR8 Write Access Policy 0 (IMR8_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value. |

## 44.3.67 IMR9 Base (B_CR_BIMR9BASE_0_0_0_MCHBAR)—Offset 6990h

This register, along with IMR9MASK, IMR9RAC and IMR9WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR9RAC and IMR9WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6990h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 28:0 | 0x0<br>RW | **Base 1 IMR9 Base (IMR9_BASE):** Specifies bits 38:10 of the start address of IMR9 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR9MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR9 defined region. |

## 44.3.68 IMR9 Mask (B_CR_BIMR9MASK_0_0_0_MCHBAR)—Offset 6994h

This register, along with IMR9BASE, IMR9RAC and IMR9WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR9RAC and IMR9WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6994h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor, depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 28:0 | 0x0<br>RW | **Mask 1 IMR9 Mask (IMR9_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR9BASE[28:0] value. A match indicates that the incoming address falls within the IMR9 region. |

## 44.3.69 IMR9 Control Policy (B_CR_BIMR9CP_0_0_0_MCHBAR)—Offset 6998h

This register controls the access policy to the Read Access Policy BIMR9RAC, the Write Access Policy BIMR9WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6998h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **IMR9 Control Policy (IMR9_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC, BIMR9CP registers based on the value from each agent's 6bit SAI field. |

## 44.3.70 IMR9 Read Access Policy (B_CR_BIMR9RAC_0_0_0_MCHBAR)—Offset 69A0h

This register, along with IMR9BASE, IMR9MASK and IMR9WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR9. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 69A0h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR9 Read Access Policy 63 (IMR9_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value. |
| 62 | 0x0<br>RO | **IMR9 Read Access Policy 62 (IMR9_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value. |
| 61 | 0x0<br>RO | **IMR9 Read Access Policy 61 (IMR9_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value. |
| 60 | 0x0<br>RO | **IMR9 Read Access Policy 60 (IMR9_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value. |
| 59 | 0x0<br>RO | **IMR9 Read Access Policy 59 (IMR9_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value. |
| 58 | 0x0<br>RO | **IMR9 Read Access Policy 58 (IMR9_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value. |
| 57 | 0x0<br>RO | **IMR9 Read Access Policy 57 (IMR9_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value. |
| 56 | 0x0<br>RW | **IMR9 Read Access Policy 56 (IMR9_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value. |

| 4 | 0x0<br>RW | **IMR9 Read Access Policy 4 (IMR9_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value. |
| 3 | 0x0<br>RW | **IMR9 Read Access Policy 3 (IMR9_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value. |
| 2 | 0x0<br>RW | **IMR9 Read Access Policy 2 (IMR9_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value. |
| 1 | 0x0<br>RW | **IMR9 Read Access Policy 1 (IMR9_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value. |
| 0 | 0x0<br>RW | **IMR9 Read Access Policy 0 (IMR9_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value. |

## 44.3.71 IMR9 Write Access Policy (B_CR_BIMR9WAC_0_0_0_MCHBAR)—Offset 69A8h

This register, along with IMR9BASE, IMR9MASK and IMR9RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR9. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 69A8h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR9 Write Access Policy 63 (IMR9_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value. |

## 44.3.72 IMR10 Base (B_CR_BIMR10BASE_0_0_0_MCHBAR)—Offset 69B0h

This register, along with IMR10MASK, IMR10RAC and IMR10WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR10RAC and IMR10WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 69B0h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 28:0 | 0x0<br>RW | **Base 0 IMR10 Base (IMR10_BASE):** Specifies bits 38:10 of the start address of IMR10 region. IMR region size must be a strict poweroftwo at least 1KB and naturally aligned to the size. These bits are compared with the result of the IMR10MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR10 defined region. |

## 44.3.73 B_CR_BIMR10MASK_0_0_0_MCHBAR—Offset 69B4h

This register, along with IMR10BASE, IMR10RAC and IMR10WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR10RAC and IMR10WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 69B4h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 28:0 | 0x0<br>RW | **Mask 0 IMR10 Mask (IMR10_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR10BASE[28:0] value. A match indicates that the incoming address falls within the IMR10 region. |

## 44.3.74 IMR10 Control Policy (B_CR_BIMR10CP_0_0_0_MCHBAR)—Offset 69B8h

This register controls the access policy to the Read Access Policy BIMR10RAC, the Write Access Policy BIMR10WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 69B8h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **IMR10 Control Policy (IMR10_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP, registers based on the value from each agent's 6bit SAI field. |

## 44.3.75 IMR10 Read Access Policy (B_CR_BIMR10RAC_0_0_0_MCHBAR)—Offset 69C0h

This register, along with IMR10BASE, IMR10MASK and IMR10WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR10. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 69C0h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR10 Read Access Policy 63 (IMR10_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value. |

| 0 | 0x0<br>RW | **IMR10 Read Access Policy 0 (IMR10_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value. |

## 44.3.76 IMR10 Write Access Policy (B_CR_BIMR10WAC_0_0_0_MCHBAR)—Offset 69C8h

This register along with IMR10BASE, IMR10MASK and IMR10RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR10. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 69C8h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0 RW | **IMR10 Write Access Policy 63 (IMR10_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value. |

## 44.3.77 IMR11 Base (B_CR_BIMR11BASE_0_0_0_MCHBAR)—Offset 69D0h

This register, along with IMR11MASK, IMR11RAC and IMR11WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR11RAC and IMR11WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 69D0h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 28:0 | 0x0<br>RW | **Base 0 IMR11 Base (IMR11_BASE):** Specifies bits 38:10 of the start address of IMR11 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR11MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR11 defined region. |

## 44.3.78 IMR11 Mask (B_CR_BIMR11MASK_0_0_0_MCHBAR)—Offset 69D4h

This register, along with IMR11BASE, IMR11RAC and IMR11WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR11RAC and IMR11WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 69D4h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor, depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor, depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 28:0 | 0x0<br>RW | **Mask 0 IMR11 Mask (IMR11_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR11BASE[28:0] value. A match indicates that the incoming address falls within the IMR11 region. |

## 44.3.79 IMR11 Control Policy (B_CR_BIMR11CP_0_0_0_MCHBAR)—Offset 69D8h

This register controls the access policy to the Read Access Policy BIMR11RAC, the Write Access Policy BIMR11WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 69D8h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **IMR11 Control Policy (IMR11_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR11RAC, BIMR11WAC and BIMR11CP registers, based on the value from each agent's 6bit SAI field. |

## 44.3.80 IMR11 Read Access Policy (B_CR_BIMR11RAC_0_0_0_MCHBAR)—Offset 69E0h

This register, along with IMR11BASE, IMR11MASK and IMR11WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR11. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 69E0h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR11 Read Access Policy 63 (IMR11_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value. |

| 1 | 0x0<br>RW | **IMR11 Read Access Policy 1 (IMR11_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value. |
| 0 | 0x0<br>RW | **IMR11 Read Access Policy 0 (IMR11_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value. |

## 44.3.81 IMR11 Write Access Policy (B_CR_BIMR11WAC_0_0_0_MCHBAR)—Offset 69E8h

This register, along with IMR11BASE, IMR11MASK and IMR11RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR11. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 69E8h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR11 Write Access Policy 63 (IMR11_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value. |
| 62 | 0x0<br>RO | **IMR11 Write Access Policy 62 (IMR11_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value. |
| 61 | 0x0<br>RO | **IMR11 Write Access Policy 61 (IMR11_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value. |
| 60 | 0x0<br>RO | **IMR11 Write Access Policy 60 (IMR11_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value. |
| 59 | 0x0<br>RO | **IMR11 Write Access Policy 59 (IMR11_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value. |
| 58 | 0x0<br>RO | **IMR11 Write Access Policy 58 (IMR11_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value. |

## 44.3.82 IMR12 Base (B_CR_BIMR12BASE_0_0_0_MCHBAR)—Offset 69F0h

This register, along with IMR12MASK, IMR12RAC and IMR12WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR12RAC and IMR12WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 69F0h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 28:0 | 0x0<br>RW | **Base 0 IMR12 Base (IMR12_BASE):** Specifies bits 38:10 of the start address of IMR12 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR12MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR12 defined region. |

## 44.3.83 IMR12 Mask (B_CR_BIMR12MASK_0_0_0_MCHBAR)—Offset 69F4h

This register, along with IMR12BASE, IMR12RAC and IMR12WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR12RAC and IMR12WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 69F4h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor, depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor, depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 28:0 | 0x0<br>RW | **Mask 0 IMR12 Mask (IMR12_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR12BASE[28:0] value. A match indicates that the incoming address falls within the IMR12 region. |

## 44.3.84 IMR12 Control Policy (B_CR_BIMR12CP_0_0_0_MCHBAR)—Offset 69F8h

This register controls the access policy to the Read Access Policy BIMR12RAC, the Write Access Policy BIMR12WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 69F8h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **IMR12 Control Policy (IMR12_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers, based on the value from each agent's 6bit SAI field. |

## 44.3.85 IMR12 Read Access Policy (B_CR_BIMR12RAC_0_0_0_MCHBAR)—Offset 6A00h

This register, along with IMR12BASE, IMR12MASK and IMR12WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR12. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6A00h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR12 Read Access Policy 63 (IMR12_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 62 | 0x0<br>RO | **IMR12 Read Access Policy 62 (IMR12_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 61 | 0x0<br>RO | **IMR12 Read Access Policy 61 (IMR12_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 60 | 0x0<br>RO | **IMR12 Read Access Policy 60 (IMR12_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 59 | 0x0<br>RO | **IMR12 Read Access Policy 59 (IMR12_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 58 | 0x0<br>RO | **IMR12 Read Access Policy 58 (IMR12_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 57 | 0x0<br>RO | **IMR12 Read Access Policy 57 (IMR12_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 56 | 0x0<br>RW | **IMR12 Read Access Policy 56 (IMR12_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 55 | 0x0<br>RW | **IMR12 Read Access Policy 55 (IMR12_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 54 | 0x0<br>RW | **IMR12 Read Access Policy 54 (IMR12_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 53 | 0x0<br>RO | **IMR12 Read Access Policy 53 (IMR12_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 52 | 0x0<br>RO | **IMR12 Read Access Policy 52 (IMR12_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 51 | 0x0<br>RO | **IMR12 Read Access Policy 51 (IMR12_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 50 | 0x0<br>RW | **IMR12 Read Access Policy 50 (IMR12_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 49 | 0x0<br>RW | **IMR12 Read Access Policy 49 (IMR12_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 48 | 0x0<br>RW | **IMR12 Read Access Policy 48 (IMR12_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 47 | 0x0<br>RO | **IMR12 Read Access Policy 47 (IMR12_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 46 | 0x0<br>RO | **IMR12 Read Access Policy 46 (IMR12_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 45 | 0x0<br>RO | **IMR12 Read Access Policy 45 (IMR12_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 44 | 0x0<br>RW | **IMR12 Read Access Policy 44 (IMR12_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |

| 5 | 0x0<br>RW | **IMR12 Read Access Policy 5 (IMR12_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 4 | 0x0<br>RW | **IMR12 Read Access Policy 4 (IMR12_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 3 | 0x0<br>RW | **IMR12 Read Access Policy 3 (IMR12_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 2 | 0x0<br>RW | **IMR12 Read Access Policy 2 (IMR12_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 1 | 0x0<br>RW | **IMR12 Read Access Policy 1 (IMR12_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 0 | 0x0<br>RW | **IMR12 Read Access Policy 0 (IMR12_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value. |

## 44.3.86 IMR12 Write Access Policy (B_CR_BIMR12WAC_0_0_0_MCHBAR)—Offset 6A08h

This register, along with IMR12BASE, IMR12MASK and IMR12RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR12. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6A08h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR12 Write Access Policy 63 (IMR12_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |

| 25 | 0x0<br>RW | **IMR12 Write Access Policy 25 (IMR12_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 24 | 0x0<br>RW | **IMR12 Write Access Policy 24 (IMR12_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 23 | 0x0<br>RO | **IMR12 Write Access Policy 23 (IMR12_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 22 | 0x0<br>RO | **IMR12 Write Access Policy 22 (IMR12_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 21 | 0x0<br>RW | **IMR12 Write Access Policy 21 (IMR12_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 20 | 0x0<br>RO | **IMR12 Write Access Policy 20 (IMR12_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 19 | 0x0<br>RO | **IMR12 Write Access Policy 19 (IMR12_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 18 | 0x0<br>RO | **IMR12 Write Access Policy 18 (IMR12_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 17 | 0x0<br>RW | **IMR12 Write Access Policy 17 (IMR12_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 16 | 0x0<br>RW | **IMR12 Write Access Policy 16 (IMR12_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 15 | 0x0<br>RO | **IMR12 Write Access Policy 15 (IMR12_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 14 | 0x0<br>RO | **IMR12 Write Access Policy 14 (IMR12_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 13 | 0x0<br>RW | **IMR12 Write Access Policy 13 (IMR12_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 12 | 0x0<br>RW | **IMR12 Write Access Policy 12 (IMR12_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 11 | 0x0<br>RO | **IMR12 Write Access Policy 11 (IMR12_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 10 | 0x0<br>RO | **IMR12 Write Access Policy 10 (IMR12_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 9 | 0x0<br>RO | **IMR12 Write Access Policy 9 (IMR12_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 8 | 0x0<br>RW | **IMR12 Write Access Policy 8 (IMR12_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 7 | 0x0<br>RO | **IMR12 Write Access Policy 7 (IMR12_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 6 | 0x0<br>RO | **IMR12 Write Access Policy 6 (IMR12_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 5 | 0x0<br>RW | **IMR12 Write Access Policy 5 (IMR12_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 4 | 0x0<br>RW | **IMR12 Write Access Policy 4 (IMR12_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 3 | 0x0<br>RW | **IMR12 Write Access Policy 3 (IMR12_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 2 | 0x0<br>RW | **IMR12 Write Access Policy 2 (IMR12_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 1 | 0x0<br>RW | **IMR12 Write Access Policy 1 (IMR12_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |
| 0 | 0x0<br>RW | **IMR12 Write Access Policy 0 (IMR12_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value. |

## 44.3.87 IMR13 Base (B_CR_BIMR13BASE_0_0_0_MCHBAR)—Offset 6A10h

This register, along with IMR13MASK, IMR13RAC and IMR13WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR13RAC and IMR13WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6A10h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 28:0 | 0x0<br>RW | **Base 0 IMR13 Base (IMR13_BASE):** Specifies bits 38:10 of the start address of IMR13 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR13MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR13 defined region. |

## 44.3.88 IMR13 Mask (B_CR_BIMR13MASK_0_0_0_MCHBAR)—Offset 6A14h

This register, along with IMR13BASE, IMR13RAC and IMR13WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR13RAC and IMR13WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6A14h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 28:0 | 0x0<br>RW | **Mask 0 IMR13 Mask (IMR13_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR13BASE[28:0] value. A match indicates that the incoming address falls within the IMR13 region. |

## 44.3.89 IMR13 Control Policy (B_CR_BIMR13CP_0_0_0_MCHBAR)—Offset 6A18h

This register controls the access policy to the Read Access Policy BIMR13RAC, the Write Access Policy BIMR13WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6A18h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **IMR13 Control Policy (IMR13_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers, based on the value from each agent's 6bit SAI field. |

## 44.3.90 IMR13 Read Access Policy (B_CR_BIMR13RAC_0_0_0_MCHBAR)—Offset 6A20h

This register, along with IMR13BASE, IMR13MASK and IMR13WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR13. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6A20h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR13 Read Access Policy 63 (IMR13_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |
| 62 | 0x0<br>RO | **IMR13 Read Access Policy 62 (IMR13_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |
| 61 | 0x0<br>RO | **IMR13 Read Access Policy 61 (IMR13_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |
| 60 | 0x0<br>RO | **IMR13 Read Access Policy 60 (IMR13_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |
| 59 | 0x0<br>RO | **IMR13 Read Access Policy 59 (IMR13_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |
| 58 | 0x0<br>RO | **IMR13 Read Access Policy 58 (IMR13_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |
| 57 | 0x0<br>RO | **IMR13 Read Access Policy 57 (IMR13_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |
| 56 | 0x0<br>RW | **IMR13 Read Access Policy 56 (IMR13_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |
| 55 | 0x0<br>RW | **IMR13 Read Access Policy 55 (IMR13_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |
| 54 | 0x0<br>RW | **IMR13 Read Access Policy 54 (IMR13_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |
| 53 | 0x0<br>RO | **IMR13 Read Access Policy 53 (IMR13_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |
| 52 | 0x0<br>RO | **IMR13 Read Access Policy 52 (IMR13_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |
| 51 | 0x0<br>RO | **IMR13 Read Access Policy 51 (IMR13_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |
| 50 | 0x0<br>RW | **IMR13 Read Access Policy 50 (IMR13_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |
| 49 | 0x0<br>RW | **IMR13 Read Access Policy 49 (IMR13_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |
| 48 | 0x0<br>RW | **IMR13 Read Access Policy 48 (IMR13_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |
| 47 | 0x0<br>RO | **IMR13 Read Access Policy 47 (IMR13_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |
| 46 | 0x0<br>RO | **IMR13 Read Access Policy 46 (IMR13_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 45 | 0x0<br>RO | **IMR13 Read Access Policy 45 (IMR13_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |
| 44 | 0x0<br>RW | **IMR13 Read Access Policy 44 (IMR13_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value. |

## 44.3.91 IMR13 Write Access Policy (B_CR_BIMR13WAC_0_0_0_MCHBAR)—Offset 6A28h

This register, along with IMR13BASE, IMR13MASK and IMR13RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR13. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6A28h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|

## 44.3.92 IMR14 Base (B_CR_BIMR14BASE_0_0_0_MCHBAR)—Offset 6A30h

This register, along with IMR14MASK, IMR14RAC and IMR14WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR14RAC and IMR14WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6A30h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 28:0 | 0x0<br>RW | **Base 0 IMR14 Base (IMR14_BASE):** Specifies bits 38:10 of the start address of IMR14 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR14MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR14 defined region. |

## 44.3.93 IMR14 Mask (B_CR_BIMR14MASK_0_0_0_MCHBAR)—Offset 6A34h

This register, along with IMR14BASE, IMR14RAC and IMR14WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR14RAC and IMR14WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6A34h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor, depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 28:0 | 0x0<br>RW | **Mask 0 IMR14 Mask (IMR14_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR14BASE[28:0] value. A match indicates that the incoming address falls within the IMR14 region. |

## 44.3.94 IMR14 Control Policy (B_CR_BIMR14CP_0_0_0_MCHBAR)—Offset 6A38h

This register controls the access policy to the Read Access Policy BIMR14RAC, the Write Access Policy BIMR14WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6A38h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **IMR14 Control Policy (IMR14_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers, based on the value from each agent's 6bit SAI field. |

## 44.3.95 IMR14 Read Access Policy (B_CR_BIMR14RAC_0_0_0_MCHBAR)—Offset 6A40h

This register, along with IMR14BASE, IMR14MASK and IMR14WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR14. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6A40h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

## 44.3.96 IMR14 Write Access Policy (B_CR_BIMR14WAC_0_0_0_MCHBAR)—Offset 6A48h

This register, along with IMR14BASE IMR14MASK and IMR14RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR14. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6A48h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

## 44.3.97 IMR15 Base (B_CR_BIMR15BASE_0_0_0_MCHBAR)—Offset 6A50h

This register, along with IMR15MASK, IMR15RAC and IMR15WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR15RAC and IMR15WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6A50h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 28:0 | 0x0<br>RW | **Base 0 IMR15 Base (IMR15_BASE):** Specifies bits 38:10 of the start address of IMR15 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR15MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR15 defined region. |

## 44.3.98 IMR15 Mask (B_CR_BIMR15MASK_0_0_0_MCHBAR)—Offset 6A54h

This register, along with IMR15BASE, IMR15RAC and IMR15WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR15RAC and IMR15WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6A54h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor, depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 28:0 | 0x0<br>RW | **Mask 0 IMR15 Mask (IMR15_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR15BASE[28:0] value. A match indicates that the incoming address falls within the IMR15 region. |

## 44.3.99 IMR15 Control Policy (B_CR_BIMR15CP_0_0_0_MCHBAR)—Offset 6A58h

This register controls the access policy to the Read Access Policy BIMR15RAC, the Write Access Policy BIMR15WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6A58h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **IMR15 Control Policy (IMR15_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers, based on the value from each agent's 6bit SAI field. |

## 44.3.100 IMR15 Read Access Policy (B_CR_BIMR15RAC_0_0_0_MCHBAR)—Offset 6A60h

This register, along with IMR15BASE, IMR15MASK and IMR15WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR15. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6A60h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |

## 44.3.101 IMR15 Write Access Policy (B_CR_BIMR15WAC_0_0_0_MCHBAR)—Offset 6A68h

This register, along with IMR15BASE, IMR15MASK and IMR15RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR15. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6A68h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR15 Write Access Policy 63 (IMR15_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value. |

| 0 | 0x0<br>RW | **IMR15 Write Access Policy 0 (IMR15_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value. |

## 44.3.102 IMR16 Base (B_CR_BIMR16BASE_0_0_0_MCHBAR)—Offset 6A70h

This register, along with IMR16MASK, IMR16RAC and IMR16WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR16RAC and IMR16WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6A70h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 28:0 | 0x0<br>RW | **Base 0 IMR16 Base (IMR16_BASE):** Specifies bits 38:10 of the start address of IMR16 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR16MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR16 defined region. |

## 44.3.103 IMR16 Mask (B_CR_BIMR16MASK_0_0_0_MCHBAR)—Offset 6A74h

This register, along with IMR16BASE, IMR16RAC and IMR16WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR16RAC and IMR16WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6A74h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor, depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 28:0 | 0x0<br>RW | **Mask 0 IMR16 Mask (IMR16_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR16BASE[28:0] value. A match indicates that the incoming address falls within the IMR16 region. |

## 44.3.104 IMR16 Control Policy (B_CR_BIMR16CP_0_0_0_MCHBAR)—Offset 6A78h

This register controls the access policy to the Read Access Policy BIMR16RAC, the Write Access Policy BIMR16WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6A78h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **IMR16 Control Policy (IMR16_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers, based on the value from each agent's 6bit SAI field. |

## 44.3.105 IMR16 Read Access Policy (B_CR_BIMR16RAC_0_0_0_MCHBAR)—Offset 6A80h

This register, along with IMR16BASE, IMR16MASK and IMR16WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR16. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6A80h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR16 Read Access Policy 63 (IMR16_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value. |
| 62 | 0x0<br>RO | **IMR16 Read Access Policy 62 (IMR16_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value. |
| 61 | 0x0<br>RO | **IMR16 Read Access Policy 61 (IMR16_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value. |

| 0 | 0x0<br>RW | **IMR16 Read Access Policy 0 (IMR16_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value. |

## 44.3.106 IMR16 Write Access Policy (B_CR_BIMR16WAC_0_0_0_MCHBAR)—Offset 6A88h

This register, along with IMR16BASE, IMR16MASK and IMR16RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR16. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6A88h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR16 Write Access Policy 63 (IMR16_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value. |

## 44.3.107 IMR17 Base (B_CR_BIMR17BASE_0_0_0_MCHBAR)—Offset 6A90h

This register, along with IMR17MASK, IMR17RAC and IMR17WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR17RAC and IMR17WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6A90h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 28:0 | 0x0<br>RW | **Base 0 IMR17BASE (IMR17_BASE):** Specifies bits 38:10 of the start address of IMR17 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR17MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR17 defined region. |

## 44.3.108 IMR17 Mask (B_CR_BIMR17MASK_0_0_0_MCHBAR)—Offset 6A94h

This register, along with IMR17BASE, IMR17RAC and IMR17WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR17RAC and IMR17WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6A94h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor, depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 28:0 | 0x0<br>RW | **Mask 0 IMR17 Mask (IMR17_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR17BASE[28:0] value. A match indicates that the incoming address falls within the IMR17 region. |

## 44.3.109 IMR17 Control Policy (B_CR_BIMR17CP_0_0_0_MCHBAR)—Offset 6A98h

This register controls the access policy to the Read Access Policy BIMR17RAC, the Write Access Policy BIMR17WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6A98h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **IMR17 Control Policy (IMR17_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers, based on the value from each agent's 6bit SAI field. |

## 44.3.110 IMR17 Read Access Policy (B_CR_BIMR17RAC_0_0_0_MCHBAR)—Offset 6AA0h

This register, along with IMR17BASE, IMR17MASK and IMR17WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR17. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6AA0h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR17 Read Access Policy 63 (IMR17_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value. |
| 62 | 0x0<br>RO | **IMR17 Read Access Policy 62 (IMR17_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value. |
| 61 | 0x0<br>RO | **IMR17 Read Access Policy 61 (IMR17_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value. |
| 60 | 0x0<br>RO | **IMR17 Read Access Policy 60 (IMR17_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value. |

| 1 | 0x0<br>RW | **IMR17 Read Access Policy 1 (IMR17_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value. |
| 0 | 0x0<br>RW | **IMR17 Read Access Policy 0 (IMR17_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value. |

## 44.3.111 IMR17 Write Access Policy (B_CR_BIMR17WAC_0_0_0_MCHBAR)—Offset 6AA8h

This register, along with IMR17BASE, IMR17MASK and IMR17RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with a SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR17. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6AA8h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR17 Write Access Policy 63 (IMR17_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value. |
| 62 | 0x0<br>RO | **IMR17 Write Access Policy 62 (IMR17_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value. |
| 61 | 0x0<br>RO | **IMR17 Write Access Policy 61 (IMR17_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value. |

| 2 | 0x0<br>RW | **IMR17 Write Access Policy 2 (IMR17_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value. |
| 1 | 0x0<br>RW | **IMR17 Write Access Policy 1 (IMR17_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value. |
| 0 | 0x0<br>RW | **IMR17 Write Access Policy 0 (IMR17_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value. |

## 44.3.112 IMR18 Base (B_CR_BIMR18BASE_0_0_0_MCHBAR)—Offset 6AB0h

This register, along with IMR18MASK, IMR18RAC and IMR18WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR18RAC and IMR18WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6AB0h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 28:0 | 0x0<br>RW | **Base 0 IMR18 Base (IMR18_BASE):** Specifies bits 38:10 of the start address of IMR18 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR18MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR18 defined region. |

## 44.3.113 IMR18 Mask (B_CR_BIMR18MASK_0_0_0_MCHBAR)—Offset 6AB4h

This register, along with IMR18BASE, IMR18RAC and IMR18WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR18RAC and IMR18WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6AB4h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 28:0 | 0x0<br>RW | **Mask 0 IMR18 Mask (IMR18_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR18BASE[28:0] value. A match indicates that the incoming address falls within the IMR18 region. |

## 44.3.114 IMR18 Control Policy (B_CR_BIMR18CP_0_0_0_MCHBAR)—Offset 6AB8h

This register controls the access policy to the Read Access Policy BIMR18RAC, the Write Access Policy BIMR18WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6AB8h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **IMR18 Control Policy (IMR18_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers, based on the value from each agent's 6bit SAI field. |

## 44.3.115 IMR18 Read Access Policy (B_CR_BIMR18RAC_0_0_0_MCHBAR)—Offset 6AC0h

This register, along with IMR18BASE, IMR18MASK and IMR18WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR18. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6AC0h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR18 Read Access Policy 63 (IMR18_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value. |
| 62 | 0x0<br>RO | **IMR18 Read Access Policy 62 (IMR18_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value. |
| 61 | 0x0<br>RO | **IMR18 Read Access Policy 61 (IMR18_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value. |
| 60 | 0x0<br>RO | **IMR18 Read Access Policy 60 (IMR18_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value. |
| 59 | 0x0<br>RO | **IMR18 Read Access Policy 59 (IMR18_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value. |
| 58 | 0x0<br>RO | **IMR18 Read Access Policy 58 (IMR18_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value. |
| 57 | 0x0<br>RO | **IMR18 Read Access Policy 57 (IMR18_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value. |
| 56 | 0x0<br>RW | **IMR18 Read Access Policy 56 (IMR18_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value. |

| 0 | 0x0<br>RW | **IMR18 Read Access Policy 0 (IMR18_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value. |

## 44.3.116 IMR18 Write Access Policy (B_CR_BIMR18WAC_0_0_0_MCHBAR)—Offset 6AC8h

This register, along with IMR18BASE, IMR18MASK and IMR18RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR18. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6AC8h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

## 44.3.117 IMR19 Base (B_CR_BIMR19BASE_0_0_0_MCHBAR)—Offset 6AD0h

This register, along with IMR19MASK, IMR19RAC and IMR19WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR19RAC and IMR19WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6AD0h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **IMR Enable (IMR_EN):** Enables access checking for the IMR region. |
| 30 | 0x0<br>RW | **Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents. |
| 29 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 28:0 | 0x0<br>RW | **Base 0 IMR19 Base (IMR19_BASE):** Specifies bits 38:10 of the start address of IMR19 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR19MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR19 defined region. |

## 44.3.118 IMR19 Mask (B_CR_BIMR19MASK_0_0_0_MCHBAR)—Offset 6AD4h

This register, along with IMR19BASE, IMR19RAC and IMR19WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR19RAC and IMR19WAC registers.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6AD4h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor depending on the setting of the IA_IWB_EN bit. |
| 30 | 0x0<br>RW | **Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor depending on the setting of the GT_IWB_EN bit. |
| 29 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 28:0 | 0x0<br>RW | **Mask 0 IMR19 Mask (IMR19_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR19BASE[28:0] value. A match indicates that the incoming address falls within the IMR19 region. |

## 44.3.119 IMR19 Control Policy (B_CR_BIMR19CP_0_0_0_MCHBAR)—Offset 6AD8h

This register controls the access policy to the Read Access Policy BIMR19RAC, the Write Access Policy BIMR19WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6AD8h

**Default:** 00000C0061010202h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0xc0061010202<br>RW | **IMR19 Control Policy (IMR19_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC, BIMR19CP registers, based on the value from each agent's 6bit SAI field. |

## 44.3.120 IMR19 Read Access Policy (B_CR_BIMR19RAC_0_0_0_MCHBAR)—Offset 6AE0h

This register, along with IMR19BASE, IMR19MASK and IMR19WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR19. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6AE0h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR19 Read Access Policy 63 (IMR19_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value. |

| 0 | 0x0<br>RW | **IMR19 Read Access Policy 0 (IMR19_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value. |

## 44.3.121 IMR19 Write Access Policy (B_CR_BIMR19WAC_0_0_0_MCHBAR)—Offset 6AE8h

This register, along with IMR19BASE, IMR19MASK and IMR19RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR19. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6AE8h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW | **IMR19 Write Access Policy 63 (IMR19_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value. |

## 44.3.122 TPM Selector (B_CR_TPM_SELECTOR_0_0_0_MCHBAR)—Offset 6C24h

Specifies where the TPM lives in the platform. B-Unit uses this register to source decode for requests whose addresses fall within the fixed address range for the TPM.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6C24h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |
| 1:0 | 0x0<br>RW | **TPM Selector (TPM_SELECTOR):**<br>• 0h: SoC doesn't support - fTPM enabled. Target of TPM accesses is the Intel ME.<br>• 1h: SPI TPM enabled. Target of TPM accesses is SPI.<br>• 2h: LPC TPM enabled. Target of TPM accesses is LPC.<br>• 3h: All TPMs disabled. Target of TPM accesses is the Error Handler. |

## 44.3.123 Default VTd BAR (B_CR_DEFVTDBAR_0_0_0_MCHBAR)—Offset 6C80h

BIOS must write DEFVTDBAR and then immediately follow it up with a read to DEFVTDBAR to ensure that all copies of DEFVTDBAR in the system are updated.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 6C80h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:40 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |
| 39 | 0x0<br>RO | **Reserved** |
| 38:12 | 0x0<br>RW | **Default IOMMU VTd Config Space Base (DEFVTDBAR):** If DEFVTDBAR is enabled, this field corresponds to bits 38:12 of the base address default IOMMU VTd configuration space. BIOS will program this register resulting in a base address for a 4KB block of contiguous memory address space.<br>This register ensures that a naturally aligned 4KB space is allocated within the first 512GB of addressable memory space.<br>System Software uses this base address to program the default VTd IOMMU register set.<br>If DEFVTDBAR is enabled and incoming Request Address[38:12] matches DEFVTDBAR[38:12] the request targets the Default VTd BAR. |
| 11:2 | 0x0<br>RO | **Reserved (RESERVED_1):** Reserved. |
| 1 | 0x0<br>RW | **Lock Register Content (LOCK):** Locks the contents of the register including itself. |
| 0 | 0x0<br>RW/L | **DEFVTDBAR Enable (DEFVTDBAREN):**<br>• 0: DEFVTDBAR is disabled and does not claim any memory<br>• 1: DEFVTDBAR memory mapped accesses are claimed and decoded appropriately. This bit will remain 0 if VTd capability is disabled. |

## 44.3.124 B-Unit Arbiter Control BARBCTRL0 (B_CR_BARBCTRL0)—Offset 6D4Ch

Specifies the weighting for Agents 03 used by the B-Unit's Badmit Arbiter. The value specified in the Agent Weight field is used by the Badmit arbiters weight counters to determine the number of requests from an agent that are allowed to be granted before updating the requester's age register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6D4Ch

**Default:** 04040404h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |
| 29:24 | 0x4<br>RW | **Agent 3 Weight (AGENT3_WEIGHT):** Arbiter weight for Agent 3. |
| 23:22 | 0x0<br>RO | **Reserved (RESERVED_1):** Reserved. |
| 21:16 | 0x4<br>RW | **Agent 2 Weight (AGENT2_WEIGHT):** Arbiter weight for Agent 2. |

| 5:0 | 0x4<br>RW | **Agent 4 Weight (AGENT4_WEIGHT):** Arbiter weight for Agent 4. |

## 44.3.126 B-Unit Scheduler Control (B_CR_BSCHWT0)—Offset 6D54h

Specifies the weighting for Agents 0-3 used by the B-Unit Scheduler. The value is used by the B-Unit Scheduler to determine how many requests can be granted for the agent before the agent's requests are masked by the Scheduler Arbiter, to allow other agents' requests to be granted.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6D54h

**Default:** 04040404h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |
| 29:24 | 0x4<br>RW | **Agent 3 Weight (AGENT3_WEIGHT):** Arbiter weight for Agent 3. |
| 23:22 | 0x0<br>RO | **Reserved (RESERVED_1):** Reserved. |
| 21:16 | 0x4<br>RW | **Agent 2 Weight (AGENT2_WEIGHT):** Arbiter weight for Agent 2. |
| 15:14 | 0x0<br>RO | **Reserved (RESERVED_2):** Reserved. |
| 13:8 | 0x4<br>RW | **Agent 1 Weight (AGENT1_WEIGHT):** Arbiter weight for Agent 1. |
| 7:6 | 0x0<br>RO | **Reserved (RESERVED_3):** Reserved. |
| 5:0 | 0x4<br>RW | **Agent 0 Weight (AGENT0_WEIGHT):** Arbiter weight for Agent 0. |

## 44.3.127 B-Unit Scheduler Control (B_CR_BSCHWT1)—Offset 6D58h

Specifies the weighting for Agents 4-7 used by the B-Unit Scheduler. The value is used by the B-Unit Scheduler to determine how many requests can be granted for the agent before the agent's requests are masked by the Scheduler Arbiter to allow other agents' requests to be granted.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6D58h

**Default:** 04040404h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |
| 29:24 | 0x4<br>RW | **Agent 7 Weight (AGENT7_WEIGHT):** Arbiter weight for Agent 7. |
| 23:22 | 0x0<br>RO | **Reserved (RESERVED_1):** Reserved. |
| 21:16 | 0x4<br>RW | **Agent 6 Weight (AGENT6_WEIGHT):** Arbiter weight for Agent 6. |
| 15:14 | 0x0<br>RO | **Reserved (RESERVED_2):** Reserved. |
| 13:8 | 0x4<br>RW | **Agent 5 Weight (AGENT5_WEIGHT):** Arbiter weight for Agent 5. |
| 7:6 | 0x0<br>RO | **Reserved (RESERVED_3):** Reserved. |
| 5:0 | 0x4<br>RW | **Agent 4 Weight (AGENT4_WEIGHT):** Arbiter weight for Agent 4. |

## 44.3.128 B-Unit Scheduler Control (B_CR_BSCHWT2)—Offset 6D5Ch

Specifies the weighting for Agents 8-11 used by the B-Unit Scheduler. The value is used by the B-Unit Scheduler to determine how many requests can be granted for the agent before the agent's requests are masked by the Scheduler Arbiter to allow other agents' requests to be granted.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6D5Ch

**Default:** 04040404h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |
| 29:24 | 0x4<br>RW | **Agent 11 Weight (AGENT11_WEIGHT):** Arbiter weight for Agent 11. |
| 23:22 | 0x0<br>RO | **Reserved (RESERVED_1):** Reserved. |
| 21:16 | 0x4<br>RW | **Agent 10 Weight (AGENT10_WEIGHT):** Arbiter weight for Agent 10. |
| 15:14 | 0x0<br>RO | **Reserved (RESERVED_2):** Reserved. |
| 13:8 | 0x4<br>RW | **Agent 9 Weight (AGENT9_WEIGHT):** Arbiter weight for Agent 9. |
| 7:6 | 0x0<br>RO | **Reserved (RESERVED_3):** Reserved. |
| 5:0 | 0x4<br>RW | **Agent 8 Weight (AGENT8_WEIGHT):** Arbiter weight for Agent 8. |

## 44.3.129 B-Unit Scheduler Control (B_CR_BSCHWT3)—Offset 6D60h

Specifies the weighting for Agents 12-15 used by the B-Unit Scheduler. The value is used by the B-Unit Scheduler to determine how many requests can be granted for the agent before the agent's requests are masked by the Scheduler Arbiter to allow other agents' requests to be granted.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6D60h

**Default:** 04040404h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |
| 29:24 | 0x4<br>RW | **Agent 15 Weight (AGENT15_WEIGHT):** Arbiter weight for Agent 15. |
| 23:22 | 0x0<br>RO | **Reserved (RESERVED_1):** Reserved. |
| 21:16 | 0x4<br>RW | **Agent 14 Weight (AGENT14_WEIGHT):** Arbiter weight for Agent 14. |
| 15:14 | 0x0<br>RO | **Reserved (RESERVED_2):** Reserved. |
| 13:8 | 0x4<br>RW | **Agent 13 Weight (AGENT13_WEIGHT):** Arbiter weight for Agent 13. |
| 7:6 | 0x0<br>RO | **Reserved (RESERVED_3):** Reserved. |
| 5:0 | 0x4<br>RW | **Agent 12 Weight (AGENT12_WEIGHT):** Arbiter weight for Agent 12. |

## 44.3.130 B-Unit Flush Control (B_CR_BWFLUSH)—Offset 6D64h

Controls the policy used to determine when dirty entries must be flushed to DRAM. When the number of dirty entries is lower than a high watermark dirty_hwm the B-Unit will opportunistically flush data to DRAM after the write flush timeout value. When the number of dirty entries exceeds the high water mark, the B-Unit will initiate a high priority flush and push dirty data to DRAM until the count is once again below the low water mark.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** FF010000h

**BAR and Offset:** [MCHBAR] + 6D64h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0xff<br>RW | **Flush Threshold (FLUSH_THRESHOLD):** All write commands are blocked at Badmit if the number of write commands in the Flush Pool exceeeds this value. |
| 23:17 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |
| 16 | 0x1<br>RO/V | **All Entries Flushed (ALL_ENTRIES_FLUSHED):** All dirty entries in the B-Unit, in both slices, have been flushed. |
| 15:8 | 0x0<br>RW | **Dirty Low Water Mark (DIRTY_LWM):** Low water mark for dirty entries retained by the B-Unit. B-Unit will immediately attempt to flush any dirty entry, hence setting the low water mark to 0. |
| 7:0 | 0x0<br>RW | **Dirty High Water Mark (DIRTY_HWM):** High water mark for dirty entries retained by the B-Unit. B-Unit will immediately attempt to flush any dirty entry, hence setting the low water mark to 0. |

## 44.3.131 B-Unit Flush Weights (B_CR_BFLWT)—Offset 6D68h

Controls B-Unit alternate scheduling of reads and writes to DRAM.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000404h

**BAR and Offset:** [MCHBAR] + 6D68h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Disable Flush Weights (DISABLE_FLUSH_WEIGHTS):** When set to 1, disables flush weights. Flushing of dirty entries will start when Dirty Limit is HWM, and continue until Dirty Limit is LWM. No reads will be scheduled in between. |
| 30:14 | 0x0<br>RO | **Reserved (RESERVED_1):** Reserved. |
| 13:8 | 0x4<br>RW | **Write Weights (WRITE_WEIGHTS):** Number of write requests sent to a PMI channel before switching to scheduling read requests, when use of flush weights is not disabled. |
| 7:6 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |
| 5:0 | 0x4<br>RW | **Read Weights (READ_WEIGHTS):** Number of read requests sent to a PMI channel before switching to scheduling write requests, when use of flush weights is not disabled. |

## 44.3.132 Weighted Scheduling Control of High Priority ISOC and Other Requests (B_CR_BISOCWT)—Offset 6D6Ch

Controls alternate scheduling of High Priority ISOC requests and other requests.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6D6Ch

**Default:** 80003F0Fh

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x1<br>RW | **Enable ISOC Requests (ENABLE_ISOC_WEIGHTS):** When set to 1, enables switching from scheduling High Priority ISOC requests to scheduling Best Effort and Low Priority ISOC requests, based on ISOC weights and NONISOC weights. |
| 30:14 | 0x0<br>RO | **Reserved (RESERVED_1):** Reserved. |
| 13:8 | 0x3f<br>RW | **ISOC Request Weights (ISOC_REQUEST_WEIGHTS):** Weight for high priority isochronous requests. |
| 7:6 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |
| 5:0 | 0xf<br>RW | **Non ISOC Request Weights (NON_ISOC_REQUEST_WEIGHTS):** Weight for non-high priority isochronous and best effort requests. |

## 44.3.133 B-Unit Control (B_CR_BCTRL2)—Offset 6D70h

Contains basic control information used by the B-Unit.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 000F0014h

**BAR and Offset:** [MCHBAR] + 6D70h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Enable Read Invalidate Timer (ENABLE_READ_INVALIDATE_TIMER):** When set to 1, enables the BRAM to clear the RD_DONE bit and flush dirty data when a timer expires.<br>Used when parity is not enabled, to force the B-Unit to not indefinitely cache previously read lines, and also to cause a flush of dirty data that has been written to the BRAM entry. |
| 30:25 | 0x0<br>RO | **Reserved (RESERVED_2):** Reserved. |
| 24 | 0x0<br>RW | **MOT Disable Stall Arbiter on Error (MOT_DISABLE_STALL_ARB_ON_ERR):** If the HH widget gets an error, allow transactions to get arbitrated. |
| 23:16 | 0xf<br>RW | **BRAM Read Invalidate Time (BRAM_READ_INVALIDATE_TIME):** Timer threshold to clear rd_done bits or flush a BRAM entry, if dirty.<br>The value specified is in multiples of 250ns. For each time interval specified, the read done status of one BRAM entry will be cleared based on a BTAG index which is then incremented to point to the next BRAM entry. |
| 15:8 | 0x0<br>RW | **Casual Timer (CASUAL_TIMER):** The number of clock cycles that the B-Unit waits before starting a casual dirty flush.<br>Casual Flush feature will not be enabled by PND2 architecture. Instead, a dirty write will be made eligible for scheduling immediately. |
| 7:5 | 0x0<br>RO | **Reserved (RESERVED_1):** Reserved. |
| 4 | 0x1<br>RO | **Enable 64B Read (ENABLE_64B_READ):** When set, B-unit will send 64B PMI read requests for transactions requiring read access to DRAM.<br>Must always be set to one, otherwise functional errors may occur. Not applicable to the SoC, because the SoC is always 64 byte memory accesses. |
| 3 | 0x0<br>RW | **Demand Scrub Enable (DEMAND_SCRUB_ENABLE):** This mode causes B-Unit to automatically issue a flush to PMI, thus writing correct data back to memory for any read request that returns with a correctable data error. |
| 2 | 0x1<br>RW | **Enable Read Done for Write (ENABLE_READ_DONE_FOR_WRITE):** Enable Any writes (IWB or normal writes) to set the read_done bit in bstat, which enables return of data from the BRAM cache instead of Memory. |
| 1 | 0x0<br>RW | **Miss Valid Entries (MISS_VALID_ENTRIES):** This mode causes reads to clean valid B-Unit buffer entries to look like misses instead of hits.<br>When this bit is set -- even when all requested bytes are valid and present in the BRAM data buffer -- B-Unit will send read requests over the PMI interface to re-fetch the data from DRAM, instead of returning it from the BRAM. |
| 0 | 0x0<br>RW | **Dirty Stall (DIRTY_STALL):** This mode causes reads or writes from any requester interface to dirty valid B-Unit buffer entries to stall on the appropriate requester interface until the entry has been flushed from the B-Unit. |

## 44.3.134 Uncorrectable Error Status Register (B_CR_UNCERRSTS_0_0_0_MCHBAR)—Offset 6E04h

Errors that have been seen in bunit. The error is only logged if the respective bit in UNCERRMSK is 0.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 6E04h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

## 44.3.139 Uncorrectable Error Select Register (B_CR_UNCERRCNTSEL_0_0_0_MCHBAR)—Offset 6E18h

Selects which errors cause the UNCERRCNT register to increment. 0-do not count 1-count.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MCHBAR] + 6E18h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |

## 44.3.143 Data Parity Header Log Low (B_CR_DPHDRLOG_LO_0_0_0_MCHBAR)—Offset 6E28h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MCHBAR] + 6E28h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Location of Bad Data Byte (UNCDPLOG):** Reserved.<br><br>**Power Well:** prst |

## 44.3.144 Data Parity Header Log High (B_CR_DPHDRLOG_HI_0_0_0_MCHBAR)—Offset 6E2Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MCHBAR] + 6E2Ch

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Location of Bad Data Byte (UNCDPLOG):** Reserved.<br><br>**Power Well:** prst |

## 44.3.145 Data Parity Address Log Low (B_CR_DPADDRLOG_LO_0_0_0_MCHBAR)—Offset 6E30h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MCHBAR] + 6E30h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Data Parity Address (DPADDR):** Reserved.<br><br>**Power Well:** prst |

## 44.3.146 Data Parity Address Log High (B_CR_DPADDRLOG_HI_0_0_0_MCHBAR)—Offset 6E34h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MCHBAR] + 6E34h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |

## 44.3.147 D-Unit Error Address Log (B_CR_DERRADDRLOG_LO_0_0_0_MCHBAR)—Offset 6E38h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MCHBAR] + 6E38h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Address (ADDR):** D-Unit error address.<br><br>**Power Well:** prst |

## 44.3.148 D-Unit Error Address Log (B_CR_DERRADDRLOG_HI_0_0_0_MCHBAR)—Offset 6E3Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MCHBAR] + 6E3Ch

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:0 | 0x0<br>RO/V | **Data Parity Address (ADDR):** Reserved.<br><br>**Power Well:** prst |

## 44.3.149 Asymmetric Memory Region 0 (B_CR_ASYM_MEM_REGION0_0_0_0_MCHBAR)—Offset 6E40h

Specification of asymmetric memory region 0 (in slice 0) for the configuration with 2 asymmetric memory regions.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MCHBAR] + 6E40h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Slice 0 Asymmetric Enable (SLICE0_ASYM_ENABLE):** Setting this bit to 0 disables asymmetric memory region 0; setting it to 1 enables the region. |
| 30:28 | 0x0<br>RO | **RSVD0:** Reserved |
| 27:20 | 0x0<br>RW | **SLICE0_ASYM_LIMIT:** Specifies bits [38:31] of the highest address of asymmetric memory region 0 (in slice 0); all the lower bits of the region's highest address are equal to 1. |
| 19:12 | 0x0<br>RO | **RSVD1:** Reserved |
| 11:4 | 0x0<br>RW | **Slice 0 Asymmetric Limit (SLICE0_ASYM_BASE):** Specifies bits [38:31] of the base address of asymmetric memory region 0 (in slice 0); all the lower bits of the region's base address are equal to 0. |

## 44.3.150 Asymmetric Memory Region 1 (B_CR_ASYM_MEM_REGION1_0_0_0_MCHBAR)—Offset 6E44h

Specification of asymmetric memory region 1 (in slice 1) for the configuration with 2 asymmetric memory regions.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MCHBAR] + 6E44h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Slice 1 Asymmetric Enable (SLICE1_ASYM_ENABLE):** Setting this bit to 0 disables asymmetric memory region 1; setting it to 1 enables the region. |
| 30:28 | 0x0<br>RO | **RSVD0:** Reserved |
| 27:20 | 0x0<br>RW | **SLICE1_ASYM_LIMIT:** Specifies bits [38:31] of the highest address of asymmetric memory region 1 (in slice 1); all the lower bits of the region's highest address are equal to 1. |
| 19:12 | 0x0<br>RO | **RSVD1:** Reserved |
| 11:4 | 0x0<br>RW | **Slice 1 Asymmetric Limit (SLICE1_ASYM_BASE):** Specifies bits [38:31] of the base address of asymmetric memory region 1 (in slice 1); all the lower bits of the region's base address are equal to 0. |
| 3:0 | 0x0<br>RO | **RSVD2:** Reserved |

## 44.3.151 B-Unit Machine Check Mode Low (B_CR_BMCMODE_LOW)—Offset 6E48h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000001h

**BAR and Offset:** [MCHBAR] + 6E48h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |
| 0 | 0x1<br>RW | **Machine Check Signal Mode (MC_SIGNAL_MODE):** When set to 1, B-Unit will not allow any transaction with uncorrectable error or subsequent memory transaction to propagate through to Requester.<br>This will essentially hang CPU and CPU will end up with IERR shutdown.<br>Issue: When set to zero B-Unit will allow transaction with an uncorrectable error to propagate and signal MC event to CPU if enabled in IA32_MC5_CTL.<br>If enabled MC event will be taken by CPU cores at the end of instruction boundary after it detected by ROB<br><br>**Power Well:** prst |

## 44.3.152 B-Unit Machine Check Mode High (B_CR_BMCMODE_HIGH)—Offset 6E4Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MCHBAR] + 6E4Ch

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |

## 44.3.153 PWR_LIMIT_MISC_0_0_0_MCHBAR (P_CR_PWR_LIMIT_MISC_0_0_0_MCHBAR)—Offset 7014h

This register is Read Only. The register is used to report Skt power at Pn - mapped from FUSE_PN_POWER_OF_SKU and Minimal Time window - mapped from FUSE_PBM_MINIMAL_TAU_ALLOWED. Added new register for relaying IA PBM information to the use.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7014h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:22 | 0x0<br>RO | **Reserved:** Reserved<br><br>**Power Well:** prst |
| 21:15 | 0x0<br>RO/V | **PBM_MINIMAL_TAU_ALLOWED:** Minimal Tau Time window allowed.<br><br>**Power Well:** prst |
| 14:0 | 0x0<br>RO/V | **PN_POWER_OF_SKU:** Package Power of SKU.<br><br>**Power Well:** prst |

## 44.3.154 CAPABILITY_ID_0_0_0_MCHBAR (P_CR_CAPABILITY_ID_0_0_0_MCHBAR)—Offset 7018h

This register is Read Only. The register is used to report to BIOS certain PM features for this Part.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7018h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RO | **Reserved:** Reserved<br><br>**Power Well:** prst |
| 1:0 | 0x0<br>RO/V | **FUSE_THERMAL_PROFILE:**<br><br>**Power Well:** prst |

## 44.3.155 MC_BIOS_REQ_0_0_0_MCH (P_CR_MC_BIOS_REQ_0_0_0_MCHBAR)—Offset 7020h

This register is defined to support memSS reset flow, handshake between SOC FW (aka Pcode) and BIOS MRC

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7020h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **RUN_BUSY:** This bit indicates that the BIOS request is pending. BIOS sets this bit together with a command in the lower bits of this register. |
| 30:20 | 0x0<br>RW | **RSVD0:** Reserved - Future data bits for fastpath action or status indication. |
| 19 | 0x0<br>RW | **MEM_INIT_DONE:** BIOS programs this bit after DUNIT and DDRIO configuration is complete. |
| 18:16 | 0x0<br>RW | **Reserved** |
| 15 | 0x0<br>RW | **CH1_DIMMS:** BIOS writes this value indicates |
| 14 | 0x0<br>RW | **CH0_DIMMS:** BIOS writes this value indicates |
| 13 | 0x0<br>RW | **CH1_ENABLED:** BIOS writes this value indicates if memory channel 1 has device attached or not. 1'b1 = 1 or 2 DIMMs populated. |
| 12 | 0x0<br>RW | **CH0_ENABLED:** BIOS writes this value indicates if memory channel 1 has device attached or not. 1'b1 = 1 or 2 DIMMs populated. |
| 11:7 | 0x0<br>RW | **Reserved** |
| 6 | 0x0<br>RW | **DDR_TYPE_VOLTAGE:** BIOS set VDDQ Voltage: 0: DDR3 Memory Technology (VDDQ = 1.35V); 1: DDR4 Memory Technology (VDDQ = 1.25V); |
| 5:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 44.3.156 MCA_ERROR_SRC_0_0_0_MCHBAR (P_CR_MCA_ERROR_SRC_0_0_0_MCHBAR)—Offset 702Ch

This register logs error source information i.e IERR or MCERR information for Pcode. The error fields are cleared by HW or BIOS.This register is also shadowed in the I/O space.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 702Ch

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/V | **CATERR:** Asserted by HW on IERR or MCERR assertion.<br><br>**Power Well:** prst |
| 30 | 0x0<br>RW/V | **IERR:** Asserted by HW on IERR assertion.<br><br>**Power Well:** prst |
| 29 | 0x0<br>RW/V | **MCERR:** Asserted by HW on MCERR assertion.<br><br>**Power Well:** prst |
| 28:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:0 | 0x0<br>RW | **RESERVED:**<br><br>**Power Well:** prst |

## 44.3.157 DDR_THERM_THRT_CTRL_0_0_0_MCHBAR (P_CR_DDR_THERM_THRT_CTRL_0_0_0_MCHBAR)—Offset 7030h

This register is used to configure thermal throttling policies for both near and far memory.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00010000h

**BAR and Offset:** [MCHBAR] + 7030h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:17 | 0x0<br>RO | **RESERVED** |
| 16 | 0x1<br>RW/V | **RESERVED** |
| 15:10 | 0x0<br>RO | **RESERVED** |
| 9 | 0x0<br>RW/V | **MEM_THRT_ENABLE:** When set, memory traffic is throttled if near Wide-IO or far LPDDR memory MR4 value = FM/NM_THERM_THRT_THRESHOLD, respectively. Thermal throttling is achieved by applying memory bandwidth clips in the memory subsystem. |
| 8 | 0x0<br>RW/V | **MEM_THRT_CFG:** Configure memory throttling behavior. Policies are defined as follows:<br>• 0 = Thermal throttling policy uses instantaneous MR4 status for FM/ NM_THERM_THRT_THRESHOLD<br>• 1 = Thermal throttling policy uses time filtered MR4 status for FM/NM_THERM_THRT_THRESHOLD. Filtering time constant is configured in the DDR_THERM_INTERRUPT register. |
| 7 | 0x0<br>RW/V | **NM_THERM_THRT_ENABLE:** When set, throttling is activated if near Wide I/O memory MR4 value is greater than or equal to NM_THERM_THRT_THRESHOLD |
| 6:4 | 0x0<br>RW/V | **NM_THERM_THRT_THRESHOLD:** Configurable threshold of near Wide I/O memory MR4 value greater than or equal to which thermal throttling is activated.<br>• Near Memory MR4 (Threshold = Enable thermal throttling)<br>• Near Memory MR4 (Threshold = Disable thermal throttling) |
| 3 | 0x0<br>RW/V | **FM_THERM_THRT_ENABLE:** When enabled throttling is activated if far LPDDR memory MR4 value is greater than or equal to FM_THERM_THRT_THRESHOLD.<br>For the standard LPDDR DRAM that is only capable up to Tcasemax of 85C this bit should be set to enable far LPDDR throttling to keep DRAM within its Tcasemax spec. |
| 2:0 | 0x0<br>RW/V | **FM_THERM_THRT_THRESHOLD:** Configurable threshold of far LPDDR memory MR4 value greater than or equal to which thermal throttling is activated.<br>For the standard LPDDR DRAM that is only capable up to Tcasemax of 85C this field should be configured to avoid DRAM to exceed its Tcasemax spec.<br>• Far Memory MR4 (Threshold = Enable thermal throttling)<br>• Far Memory MR4 (Threshold = Disable thermal throttling) |

## 44.3.158 PACKAGE_THERM_MARGIN (P_CR_PACKAGE_THERM_MARGIN_0_0_0_MCHBAR)—Offset 703Ch

Temperature margin in PECI temperature counts from the thermal profile specification. Platform fan control SW is expected to read therm_margin value to control fan or blower speed.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MCHBAR] + 703Ch

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **RESERVED** |
| 15:0 | 0x0<br>RW | **THERM_MARGIN:** Temperature margin in PECI temperature counts from the thermal profile specification.<br>THERM_MARGIN is in 2's complement format (8.8 format where MSB equals 1 Sign bit + 7 bits of integer temperature value and the LSB equals 8 precision bits of temperature value).<br>A value of zero indicates the hottest CPU die temperature is on the thermal profile line.<br>A negative value indicates gap to the thermal profile that platform SW should increase cooling capacity.<br>A sustained negative value should be avoided as it may impact part reliability. |

## 44.3.159 DDR_RAPL_LIMIT (P_CR_DDR_RAPL_LIMIT_0_0_0_MCHBAR)—Offset 7040h

RAPL power limit for DDR domain. This register is written by platform software and read by Pcode once per 1ms. There are actually two instances of this register: one with MSR access and one with MMIO access. There is a separate PECI/PCS command which is also analogous.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 7040h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW/L | **LOCKED:** When set this entire register becomes read-only. This bit will typically be set by BIOS during boot. |
| 62:32 | 0x0<br>RO | **Reserved:** Reserved |
| 31:24 | 0x0<br>RO | **Reserved:** Reserved |
| 23:22 | 0x0<br>RW/L | **LIMIT1_TIME_WINDOW_X:** The time window for RAPL is expressed in a format called TAU. TAU is specified in a mantissa+exponent format.<br>This format is common across all RAPL interfaces for TAU. The format is specified with a 7 bit number that looks like: XXYYYYY (2 bits of mantissa followed by 5 exponent)<br>The time window corresponding to this config is calculated as: (1+ XXb / 4) * (2^YYYYYb) The value that results from this math species the time window in units that are defined in PACKAGE_POWER_SKU_UNIT.TIME_UNIT MSR. |
| 21:17 | 0x0<br>RW/L | **LIMIT1_TIME_WINDOW_Y:** The Tau Exponent. See TIME_WINDOW_X for more information. |
| 16 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 15 | 0x0<br>RW/L | **LIMIT1_ENABLE:** Power Limit[0] enable bit for DDR domain. |
| 14:0 | 0x0<br>RW/L | **LIMIT1_POWER:** Power Limit[0] for DDR domain. The power units of this field are specified by the PACKAGE_POWER_SKU_UNIT_MSR.PWR_UNIT. |

## 44.3.160 DDR_ENERGY_STATUS (P_CR_DDR_ENERGY_STATUS_0_0_0_MCHBAR)—Offset 7048h

Reports total energy consumed in DRAM. The energy status is reported in units which are defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT. The counter will wrap around and continue counting from zero when it reaches its limit and therefore should be polled sufficiently frequently to avoid aliasing. Typically, software will calculate delta energy and delta time and divide the two to estimate Watts consumed over a time window. The value of this register is updated at approximately every 1ms. This energy status is what is used by DDR RAPL or OLTM control algorithms if the product supports those features.

To calculate Watts: **Watts = delta(energy) / delta(time) / 2^PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT** THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7048h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **JOULES:** Total Joules of energy consumed by all DIMMs. Units are proportional to Joules and are defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT.<br><br>**Power Well:** prst |

## 44.3.161 DDR_RAPL_PERF_STATUS (P_CR_DDR_RAPL_PERF_STATUS_0_0_0_MCHBAR)—Offset 704Ch

Memory RAPL performance throttling counter. This counter accumulates time that any channel in the memory controller is bandwidth throttled due to memory RAPL constraints. This counter counts total time (in PACKAGE_POWER_SKU_UNIT_MSR.TIME_UNIT units) that any channel is throttled. If two channels are throttled, this counter increments at a 2x rate, so that for 1ms in wall clock time the counter counts 2ms. This counter does not include throttling as a result of thermal management or MEMHOT. This register is updated at approximately 1ms intervals. This counter is normalized to 'seconds' and is not subject to variation of actual DRAM clock speeds. This register is read-only for software via MMIO MSR and PECI/PCS. This register starts counting at zero from reset and continues counting forever and wraparounds may occur, so software should ensure the sample rate is sufficient to avoid aliasing. This is an unsigned value.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 704Ch

**Default:** 000058F0h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x58f0<br>RW | **DURATION:** Bandwidth throttle duration counter due to Memory RAPL. Sum across all channels in PACKAGE_POWER_SKU_UNIT_MSR.TIME_UNIT units. This data can serve as a proxy for the potential performance impacts of RAPL on memory accesses.<br><br>**Power Well:** prst |

## 44.3.162 PACKAGE_RAPL_PERF_STATUS (P_CR_PACKAGE_RAPL_PERF_STATUS_0_0_0_MCHBAR)—Offset 7050h

Counts time that any core in the IA domain is performance throttled below OS request and below the base frequency (P1) because of power limits (PL1 or PL2). Counts in time units defined by PACKAGE_POWER_SKU_UNIT_MSR.TIME_UNIT. If software uses the TURBO_ACTIVATION_RATIO or PECI ACPI P-NOTIFY, the turbo activation ratios described by those features will may elevate the effective OS request (as calculated by this counter) to max turbo. This register starts counting at zero from reset and continues counting forever and wraparounds may occur, so software should ensure the sample rate is sufficient to avoid aliasing. This is an unsigned value.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7050h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **COUNTS:** Time that any core in the IA domain is performance throttled below OS request and below the base frequency (P1) because of power limits (PL1 or PL2).<br>Counts in time units defined by PACKAGE_POWER_SKU_UNIT_MSR.TIME_UNIT<br><br>**Power Well:** prst |

## 44.3.163 PRIMARY_PLANE_TURBO_POWER_POLICY (P_CR_PRIMARY_PLANE_TURBO_PLCY_0_0_0_MCHBAR)—Offset 7054h

The PRIMARY_PLANE_TURBO_POWER_POLICY and SECONDARY_PLANE_TURBO_POWER_POLICY are used together as hints to balance the power budget between the primary (IA core) and secondary (Graphics) power planes. This biasing is effectively a performance biasing, and it helps Punit firmware assess where software needs performance the most.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7054h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:5 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 4:0 | 0x0<br>RW | **PRIPTP:** Performance priority Level for the IA Core (primary) power plane.<br>A higher number implies a higher priority. |

## 44.3.164 SECONDARY_PLANE_TURBO_POWER_POLICY (P_CR_SECONDARY_PLANE_TURBO_PLCY_0_0_0_MCHBAR)—Offset 7058h

The PRIMARY_PLANE_TURBO_POWER_POLICY and SECONDARY_PLANE_TURBO_POWER_POLICY are used together as hints to balance the power budget between the primary (IA core) and secondary (Graphics) power planes. This biasing is effectively a performance biasing, and it helps Punit firmware assess where software needs performance the most.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7058h

**Default:** 00000010h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:5 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 4:0 | 0x10<br>RW | **SECPTP:** Performance priority Level for the Graphics (secondary) power plane.<br>A higher number implies a higher priority. |

## 44.3.165 PRIMARY_PLANE_ENERGY_STATUS (P_CR_PRIMARY_PLANE_ENERGY_STATUS_0_0_0_MCHBAR)—Offset 705Ch

Reports total energy consumed across all IA cores. The energy status is reported in units which are defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT. The counter will wrap around and continue counting from zero when it reaches its limit and therefore should be polled sufficiently frequently to avoid aliasing. Typically, software will calculate delta energy and delta time and divide the two to estimate Watts consumed over a time window. The value of this register is updated at approximately every 1ms.

To calculate Watts: **Watts = delta(energy) / delta(time) / 2^PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT** THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 705Ch

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **DATA:** Contains an accumulated value of the energy consumed in the primary power plane.<br>To find the energy consumed in a given time window, software should subtract the two energy readings.<br>Software will have to take care of counter wrapping around when it overflows.<br>Units are proportional to Joules exact precision is defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT |

## 44.3.166 SECONDARY_PLANE_ENERGY_STATUS (P_CR_SECONDARY_PLANE_ENERGY_STATUS_0_0_0_MCHBAR)—Offset 7060h

Reports total energy consumed across all IA cores. The energy status is reported in units which are defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT. The counter will wrap around and continue counting from zero when it reaches its limit and therefore should be polled sufficiently frequently to avoid aliasing. Typically, software will calculate delta energy and delta time and divide the two to estimate Watts consumed over a time window. The value of this register is updated at approximately every 1ms.

To calculate Watts: **Watts = delta(energy) / delta(time) / 2^PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT** THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7060h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **DATA:** Contains an accumulated value of the energy consumed in the secondary power plane.<br>To find the energy consumed in a given time window, software should subtract the two energy readings.<br>Software will have to take care of counter wrapping around when it overflows.<br>Units are proportional to Joules exact precision is defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT |

## 44.3.167 PACKAGE_POWER_SKU_UNIT (P_CR_PACKAGE_POWER_SKU_UNIT_0_0_0_MCHBAR)—Offset 7068h

Defines units for calculating SKU power, current, energy, resistance and timing parameters.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 330A0E08h

**BAR and Offset:** [MCHBAR] + 7068h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x3<br>RW | **RESISTANCE_UNIT:** Used to define the units of resistance for control registers that describe parameters in ohms such as VR_CURRENT_CONFIG.<br>The actual unit value is calculated by 1mohm / 2^RESISTANCE_UNIT.<br>The default value of 3 corresponds to 0.125mohm. |
| 27:24 | 0x3<br>RW | **CURRENT_UNIT:** Used to define the units of amps in control registers such as VR_CURRENT_CONFIG.<br>The actual unit value is calculated by 1A / 2^CURRENT_UNIT.<br>The default value of 3 corresponds to 0.125A. |
| 23:20 | 0x0<br>RO | **RESERVED_2:** Reserved |
| 19:16 | 0xa<br>RW | **TIME_UNIT:** Used for to define the time units in registers such as PL1, PL2, PL3 and PL4.<br>The actual unit value is calculated by 1s / 2^TIME_UNIT.<br>The default value of 10 corresponds to 0.977ms. |
| 15:13 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 12:8 | 0xe<br>RW | **ENERGY_UNIT:** Used to define the units of energy reporting registers such as PACKAGE_ENERGY_STATUS.<br>The actual unit value is calculated by 1 J / 2^ENERGY_UNIT.<br>The default value of 14 corresponds to ~61uJ per bit. |
| 7:4 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 3:0 | 0x8<br>RW | **PWR_UNIT:** Used to define the units of power control registers such as PL1, PL2, PL3 and PL4.<br>The actual unit value is calculated by 1 W / 2^PWR_UNIT.<br>The default value of 8 corresponds to 3.9mW per bit. |

## 44.3.168 PACKAGE_ENERGY_STATUS (P_CR_PACKAGE_ENERGY_STATUS_0_0_0_MCHBAR)—Offset 706Ch

Reports total energy consumed across the entire SOC / Package. The energy status is reported in units which are defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT. The counter will wrap around and continue counting from zero when it reaches its limit and therefore should be polled sufficiently frequently to avoid aliasing. Typically, software will calculate delta energy and delta time and divide the two to estimate Watts consumed over a time window. The value of this register is updated at approximately every 1ms. This energy status is what is used by RAPL PL1, PL2 and PL3 control algorithms.

To calculate Watts: **Watts = delta(energy) / delta(time) / 2^PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT** THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 706Ch

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **DATA:** Contains accumulated energy consumed by the entire CPU.<br>This counter will wrap around and keep counting when the counter overflows.<br>Units are proportional to Joules exact precision is defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT |

## 44.3.169 GT_PERF_STATUS (P_CR_GT_PERF_STATUS_0_0_0_MCHBAR)—Offset 7070h

Contains the voltage and ratio status for GT. This register is mapped to GT_PERF_STATUS_0_0_0_MCHBAR.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7070h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:26 | 0x0<br>RO | **RSVD0:** Reserved |
| 25:17 | 0x0<br>RO/V | **RP_STATE_RATIO_SLICE:** Ratio of the current RP-state, in 16.6Mhz 1xclks.<br>When the graphics engine is in RC6, this field is zeroed out.<br>For the SoC the Unslice and Slice run at the same ratio. |
| 16:8 | 0x0<br>RO/V | **RP_STATE_RATIO_UNSLICE:** Ratio of the current RP-state, in 16.6Mhz 1xclks.<br>When the graphics engine is in RC6, this field is zeroed out.<br>For the SoC the Unslice and Slice run at the same ratio. |
| 7:0 | 0x0<br>RO/V | **RP_STATE_VOLTAGE:** RP-State Voltage GT Target Voltage in U1.7 Volts |

## 44.3.170 TEMPERATURE_TARGET (P_CR_TEMPERATURE_TARGET_0_0_0_MCHBAR)—Offset 7074h

This register contains information about the fan speed control target temperature as well as details on the reference temperature for IA core DTS relative temperature reading.

**MSR_Name**: TEMPERATURE_TARGET **MSR_Addr**: 0x1A2

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7074h

**Default:** 005A0000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 30:24 | 0x0<br>RW | **TJ_MAX_TCC_OFFSET:** This field allows platform software to configure the temperature at which thermal monitor engages to be lower than the manufacturing configured maximum constraint.<br>This field is programmed in 1'C units. E.g., if the default silicon configured maximum temperature is 100'C and this field is configured to 10, then the silicon will engage thermal throttling algorithms at 90'C |
| 23:16 | 0x5a<br>RO/V | **REF_TEMP:** Tjmax a.k.a. Thermal Monitor activation temperature or Prochot Temperature.<br>This is the maximum junction temperature at which thermal throttling aka thermal monitor is activated.<br>This temperature is the maximum temperature at which the silicon is capable of operating at.<br>All IA core digital thermal sensor readings are reported as a relative negative offset from this reference temperature, such that a read-on of zero implies the cores are running at this temperature. |
| 15:8 | 0x0<br>RO/V | **FAN_TEMP_TARGET_OFFSET:** Fan Temperature Target Offset a.k.a. TControl indicates the relative offset from the the Thermal Monitor Trip Temperature at which fans should be engaged. |
| 7:0 | 0x0<br>RO | **RESERVED_0:** Reserved |

## 44.3.171 BIOS_RESET_CPL (P_CR_BIOS_RESET_CPL_0_0_0_MCHBAR)—Offset 7078h

This register is used as a means for BIOS to communicate staging to the Punit / Pcode. The exact definition and utility of each bit may differ across products. The general philosophy is that when BIOS is done with stage0, it writes the RST_CPL0 bit and then waits for the PCODE_INIT_DONE0 bit to be set before proceeding to the next step.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7078h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **RESERVED0:** reserved |
| 15 | 0x0<br>RO/V | **PCODE_INIT_DONE7:** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage.<br>Stage validity is product-specific and this stage may not be applicable to this product. |

| 0 | 0x0<br>RW | **RST_CPL:** Set by BIOS to indicate that all power management configurations as part of reset are complete.<br>This must include Punit patch load done as well as all relevant Punit power management register and mailbox configurations done.<br>Once this bit is set, Punit will allow normal power management to start.<br>Before setting this bit, P-states and C-states support is disabled. BIOS should wait before receiving the Pcode Stage0 reset complete before proceeding with any further steps. |

## 44.3.172 BIOS_MAILBOX_DATA (P_CR_BIOS_MAILBOX_DATA_0_0_0_MCHBAR)—Offset 7080h

Data register for the BIOStoPCODE mailbox. This mailbox is implemented as a means for accessing statistics and implementing BIOS-Pcode handshakes. This register is used in conjunction with BIOS_MAILBOX_INTERFACE.

THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7080h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **DATA:** This field contains the data associated with specific commands. |

## 44.3.173 BIOS_MAILBOX_INTERFACE (P_CR_BIOS_MAILBOX_INTERFACE_0_0_0_MCHBAR)—Offset 7084h

Control and Status register for the BIOS to Pcode mailbox. This mailbox is implemented as a means for accessing statistics and implementing BIOS-Pcode handshakes. This register is used in conjunction with BIOS_MAILBOX_DATA.

THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7084h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/1S/V | **RUN_BUSY:** SW may write to the two mailbox registers only when RUN_BUSY is clear(0).<br>Setting RUN_BUSY to 1 will pend a Fast Path event to Pcode.<br>After setting this bit SW will poll this bit until it is cleared.<br>Pcode will clear RUN_BUSY after updating the mailbox registers with the result and error code. |
| 30:29 | 0x0<br>RO | **RSVD0:** Reserved |
| 28:8 | 0x0<br>RW/V | **ADDRESS:** This field is used to specify an additional parameter to extend the command when needed. |
| 7:0 | 0x0<br>RW/V | **COMMAND:** This field contains the SW request command or the Pcode response code depending on the setting of RUN_BUSY. |

## 44.3.174 CORE_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_CORE_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 7088h

PUNIT_MMIO: Core Frequency Capabilities This register describes the frequency capabilities of the IA cores. Units are 100MHz multiplied by the ratio. Minimum and maximum ratio fields are initialized by pCode at reset. Last resolved ratio is updated upon changes to the processing system frequency. The efficient ratio is determined by firmware and may be updated dynamically depending on firmware support.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MCHBAR] + 7088h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO/V | **LAST_RESOLVED_FREQ:** Last resolved ratio for the IA cores.<br>Units are 100MHz multiplied by the ratio.<br>This value is updated dynamically whenever the IA core frequency changes. |
| 23:16 | 0x0<br>RO/V | **MAX_SUPPORTED_FREQ:** Maximum ratio for the IA cores.<br>Units are 100MHz multiplied by the ratio. |
| 15:8 | 0x0<br>RO/V | **EFFICIENT_FREQ:** Firmware-calculated efficient ratio for the IA cores.<br>Units are 100MHz multiplied by the ratio. |
| 7:0 | 0x0<br>RO/V | **MIN_SUPPORTED_FREQ:** Minimum supported ratio for the IA cores.<br>Units are 100MHz multiplied by the ratio. |

## 44.3.175 GRAPHICS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_GRAPHICS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 708Ch

PUNIT_MMIO: Graphics Engine Frequency Capabilities This register describes the frequency capabilities of the integrated graphics engine. Units are 50MHz multiplied by the ratio. Minimum and maximum ratio fields are initialized by pCode at reset. Last resolved ratio is updated upon changes to the integrated graphics engine frequency. The efficient ratio is determined by firmware and may be updated dynamically depending on firmware support.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MCHBAR] + 708Ch

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO/V | **LAST_RESOLVED_FREQ:** Last resolved ratio for the integrated graphics engine.<br>Units are 50MHz multiplied by the ratio.<br>This value is updated dynamically whenever the graphics engine frequency changes. |
| 23:16 | 0x0<br>RO/V | **MAX_SUPPORTED_FREQ:** Maximum supported ratio for the integrated graphics engine.<br>Units are 50MHz multiplied by the ratio. |
| 15:8 | 0x0<br>RO/V | **EFFICIENT_FREQ:** Firmware-calculated efficient ratio for the integrated graphics engine.<br>Units are 50MHz multiplied by the ratio. |
| 7:0 | 0x0<br>RO/V | **MIN_SUPPORTED_FREQ:** Minimum supported ratio for the integrated graphics engine.<br>Units are 50MHz multiplied by the ratio. |

## 44.3.176 SYSTEM_AGENT_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_SYSTEM_AGENT_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 7090h

PUNIT_MMIO: System Agent Frequency Capabilities This register describes the frequency capabilities of the System Agent. Units are 16.666MHz multiplied by the ratio. Last resolved ratio is updated upon changes to the System Agent frequency.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MCHBAR] + 7090h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0 RO/V | **LAST_RESOLVED_RATIO:** Last resolved System Agent ratio, in units of 16.666MHz. |
| 23:16 | 0x0 RO/V | **RESERVED_2:** Reserved |
| 15:8 | 0x0 RO/V | **RESERVED_1:** Reserved |
| 7:0 | 0x0 RO/V | **RESERVED_0:** Reserved |

## 44.3.177 FAR_MEMORY_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_FAR_MEMORY_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 7094h

This register reports out the DDR far memory frequency. The actual capabilities of the SOC with respect to DDR frequency is described in the MEMSS_FREQUENCY_CAPABILITIES register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MCHBAR] + 7094h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0 RO/V | **LAST_RESOLVED_RATIO:** This field reports out the DDR far memory frequency in integer multiple. This register reflects what BIOS has programmed as the default DDR frequency |
| 23:16 | 0x0 RO/V | **RESERVED_2:** Reserved |
| 15:8 | 0x0 RO/V | **RESERVED_1:** Reserved |
| 7:0 | 0x0 RO/V | **RESERVED_0:** Reserved |

## 44.3.178 NEAR_MEMORY_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_NEAR_MEMORY_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 7098h

This register reports out the Wide I/O near memory frequency. A value of zero indicates there is no Wide I/O DRAM present. The actual capabilities of the SOC with respect to Wide I/O frequency is described in the MEMSS_FREQUENCY_CAPABILITIES register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MCHBAR] + 7098h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO/V | **LAST_RESOLVED_RATIO:** This field reports out the Wide I/O near memory frequency in integer multiple of 133.33MHz.<br>This register reflects what BIOS has programmed as the default Wide I/O near memory frequency |
| 23:16 | 0x0<br>RO/V | **RESERVED_2:** Reserved |
| 15:8 | 0x0<br>RO/V | **RESERVED_1:** Reserved |
| 7:0 | 0x0<br>RO/V | **RESERVED_0:** Reserved |

## 44.3.179 PACKAGE_POWER_SKU (P_CR_PACKAGE_POWER_SKU_0_0_0_MCHBAR)—Offset 70A0h

This register describes the power SKU of the part and limits on time window and power limit configuration allowed in the RAPL PL1 and PL2 configuration registers.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**Default:** 0012024000600118h

**BAR and Offset:** [MCHBAR] + 70A0h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:55 | 0x0<br>RO | **RESERVED_3:** Reserved |
| 54:48 | 0x12<br>RW | **PKG_MAX_WIN:** The maximal time window allowed to be programmed for RAPL PL1 and PL2 controls for the SKU.<br>Higher values will be clamped to this value.<br>The bits of this field describe parameters for a mathematical equation for time window configuration.<br>This field is split into two sub-fields:<br>• x = bits[6:5]<br>• y = bits[4:0]<br>Time window equation:<br>**time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)**<br><br>**Power Well:** prst |
| 47 | 0x0<br>RO | **RESERVED_2:** Reserved |
| 46:32 | 0x240<br>RW | **PKG_MAX_PWR:** The maximal package power setting allowed for the SKU.<br>Higher values will be clamped to this value.<br>The maximum setting is typical not guaranteed.<br>The default value for this field is determined by fuses.<br>The units for this value are defined in PACKAGE_POWER_SKU_MSR[PWR_UNIT].<br><br>**Power Well:** prst |
| 31 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 30:16 | 0x60<br>RW | **PKG_MIN_PWR:** The minimal package power setting allowed for the SKU.<br>Lower values may not be achievable by run-time RAPL PL1 and PL2 control algorithms.<br><br>**Power Well:** prst |
| 15 | 0x0<br>RO | **RESERVED_0:** Reserved |
| 14:0 | 0x118<br>RW | **PKG_TDP:** The TDP package power setting allowed for the SKU.<br>The units for this value are defined in PACKAGE_POWER_SKU_MSR[PWR_UNIT]. |

## 44.3.180 PACKAGE_RAPL_LIMIT (P_CR_PACKAGE_RAPL_LIMIT_0_0_0_MCHBAR)—Offset 70A8h

Package RAPL Power Limit allows a software agent to define power limitation for the package domain. Power limitation is defined in terms of average power usage (Watts) over a time window specified. Two power limits and associated time windows can be specified. These power limits are commonly referred to as PL1 (long time window) and PL2 (short time window). Each power limit provides independent clamping control that would permit the processor cores to go below OS-requested state to meet the power limits. A lock mechanism allow the software agent to enforce power limit settings. Once the lock bit is set, the power limit settings are static and un-modifiable until next RESET.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 70A8h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW/L | **PKG_PWR_LIM_LOCK:** When set all settings in this register are locked and are treated as Read Only.<br>This lock control is persistent until the next reset.<br>This bit will typically set by BIOS during boot time or resume from Sx. |
| 62:56 | 0x0<br>RO | **RESERVED_1:** Reserved |
| 55:49 | 0x0<br>RW/L | **PKG_PWR_LIM_2_TIME:** Time window for Power Limit 1 (PL2).<br>This describes the control window of the power limit.<br>This time window is described in an RC time constant format, which means that if 1s is programmed, the power limit constraint really applies at more like 5s.<br>The maximal time window is bounded by PACKAGE_POWER_SKU_MSR.PKG_MAX_WIN.<br>There is no constraint on the minimum programmable time window, however at very short time windows the control algorithms may not be effective.<br>The bits of this field describe parameters for a mathematical equation for time window configuration. This field is split into two sub-fields:<br>• x = bits[6:5]<br>• y = bits[4:0]<br>Time window equation:<br>**time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)** |
| 48 | 0x0<br>RW/VL | **PKG_CLMP_LIM_2:** Clamp mode control for PL2.<br>• 0 = PL2 power control is prevented from forcing P-states below the base frequency / P1 for any domain in the SOC.<br>• 1 = PL2 power control will take all actions necessary to meet the power target, even if that involves running at clock frequencies below the base frequency / P1 level.<br>In order to ensure proper SOC cooling, it is generally recommended that the clamp mode is always enabled. |
| 47 | 0x0<br>RW/VL | **PKG_PWR_LIM_2_EN:** Enable for Power Limit 2 (PL2).<br>Setting this bit activates the power limit and time window defined for PL2. |
| 46:32 | 0x0<br>RW/L | **PKG_PWR_LIM_2:** Sets the average power usage limit of the package domain corresponding to the PL2 time window.<br>The power units of this field are specified by the PACKAGE_POWER_SKU_UNIT_MSR.PWR_UNIT.<br>This power limit must be configured by software before it will engage.<br>The PL2 limit is most commonly associated with long time windows (1s and longer), although there are no explicit constraints on what software configures. |
| 31:24 | 0x0<br>RO | **RESERVED_0:** Reserved |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 23:17 | 0x0<br>RW/L | **PKG_PWR_LIM_1_TIME:** Time window for Power Limit 1 (PL1).<br>This describes the control window of the power limit.<br>This time window is described in an RC time constant format, which means that if 1s is programmed, the power limit constraint really applies at more like 5s.<br>The maximal time window is bounded by PACKAGE_POWER_SKU_MSR.PKG_MAX_WIN.<br>There is no constraint on the minimum programmable time window, however at very short time windows the control algorithms may not be effective.<br>The bits of this field describe parameters for a mathematical equation for time window configuration.<br>This field is split into two sub-fields:<br>• x = bits[6:5]<br>• y = bits[4:0]<br>Time window equation:<br>**time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)** |
| 16 | 0x0<br>RW/VL | **PKG_CLMP_LIM_1:** Clamp mode control for PL1.<br>• 0 = PL1 power control is prevented from forcing P-states below the base frequency / P1 for any domain in the SOC.<br>• 1 = PL1 power control will take all actions necessary to meet the power target, even if that involves running at clock frequencies below the base frequency / P1 level.<br>In order to ensure proper SOC cooling, it is generally recommended that the clamp mode is always enabled. |
| 15 | 0x0<br>RW/VL | **PKG_PWR_LIM_1_EN:** Enable for Power Limit 1 (PL1).<br>Setting this bit activates the power limit and time window defined for PL1. |
| 14:0 | 0x0<br>RW/L | **PKG_PWR_LIM_1:** Sets the average power usage limit of the package domain corresponding to the PL1 time window.<br>The power units of this field are specified by the PACKAGE_POWER_SKU_UNIT_MSR.PWR_UNIT.<br>This power limit must be configured by software before it will engage.<br>The PL1 limit is most commonly associated with long time windows (1s and longer), although there are no explicit constraints on what software configures. |

## 44.3.181 IA_PERF_LIMIT_REASONS (P_CR_IA_PERF_LIMIT_REASONS_0_0_0_MCHBAR)—Offset 70B0h

This register reports reasons for performance limitations on the IA cores. Status bits are an instantaneous indication of an active constraint. Log bits indicate that a constraint was enforced since the log bit was last cleared.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 70B0h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/0C/V | **QOS_LOG:** Logged indication that frequency was clamped below the software-defined quality-of-service floor.<br>This bit is set by firmware, and is clearable by software. |
| 30 | 0x0<br>RW/0C/V | **MAX_EFFICIENCY_FREQ_LOG:** Logged indication that frequency was clamped below the firmware-calculated maximum efficiency frequency.<br>This bit is set by firmware, and is clearable by software. |
| 29 | 0x0<br>RW/0C/V | **MCT_LOG:** Logged indication that frequency was clamped due to ratio change transition attenuation.<br>This bit is set by firmware, and is clearable by software. |
| 28 | 0x0<br>RW/0C/V | **EDP_LOG:** Logged indication that frequency was clamped due to the package-level Electrical Design Point constraint.<br>This bit is set by firmware, and is clearable by software. |
| 27 | 0x0<br>RW/0C/V | **MULTI_CORE_TURBO_LOG:** Logged indication that frequency was clamped due to effective multi-core turbo constraints.<br>This bit is set by firmware, and is clearable by software. |
| 26 | 0x0<br>RW/0C/V | **VR_THERMALERT_LOG:** Logged indication that frequency was clamped due to a voltage regulator thermal excursion.<br>This bit is set by firmware, and is clearable by software. |
| 25 | 0x0<br>RW/0C/V | **IA_UTILIZATION_LOG:** Logged indication that frequency was clamped due to the autonomous utilization-based P-state control algorithm.<br>This bit is set by firmware, and is clearable by software. |
| 24 | 0x0<br>RW/0C/V | **DEV3_LOG:** Logged indication that frequency was clamped due to a Device 3 driver override.<br>This bit is set by firmware, and is clearable by software. |
| 23 | 0x0<br>RW/0C/V | **DEV2_LOG:** Logged indication that frequency was clamped due to a Device 2 driver override.<br>This bit is set by firmware, and is clearable by software. |
| 22 | 0x0<br>RW/0C/V | **SPARE6_LOG:** Spare log bit.<br>This bit is set by firmware, and is clearable by software. |
| 21 | 0x0<br>RW/0C/V | **SPARE5_LOG:** Spare log bit.<br>This bit is set by firmware, and is clearable by software. |
| 20 | 0x0<br>RW/0C/V | **SPARE4_LOG:** Spare log bit.<br>This bit is set by firmware, and is clearable by software. |
| 19 | 0x0<br>RW/0C/V | **PL2_LOG:** Logged indication that frequency was clamped due to a package-level PL2 excursion.<br>This bit is set by firmware, and is clearable by software. |
| 18 | 0x0<br>RW/0C/V | **PL1_LOG:** Logged indication that frequency was clamped due to a package-level PL1 excursion.<br>This bit is set by firmware, and is clearable by software. |
| 17 | 0x0<br>RW/0C/V | **THERMAL_LOG:** Logged indication that frequency was clamped due to a thermal excursion.<br>This bit is set by firmware, and is clearable by software. |
| 16 | 0x0<br>RW/0C/V | **PROCHOT_LOG:** Logged indication that frequency was clamped due to PROCHOT assertion.<br>This bit is set by firmware, and is clearable by software. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO/V | **QOS_STATUS:** Frequency is limited below the operating system or driver Quality-of-Service floor. |
| 14 | 0x0<br>RO/V | **MAX_EFFICIENCY_FREQ_STATUS:** Frequency is limited below the maximum efficiency frequency. |
| 13 | 0x0<br>RO/V | **MCT_STATUS:** Frequency is limited due to ratio change transition attenuation (MCT, prevents frequent ratio changes due to core C-state entry/exit). |
| 12 | 0x0<br>RO/V | **EDP_STATUS:** Frequency is limited due to a package-level EDP constraint. |
| 11 | 0x0<br>RO/V | **MULTI_CORE_TURBO_STATUS:** Frequency is limited due to effective multi-core turbo constraints. |
| 10 | 0x0<br>RO/V | **VR_THERMALERT_STATUS:** Frequency is limited due to a VR thermal excursion. |
| 9 | 0x0<br>RO/V | **IA_UTILIZATION_STATUS:** Frequency is limited due to autonomous utilization-based P-state control. |
| 8 | 0x0<br>RO/V | **DEV3_STATUS:** Frequency is limited due to Dev3 driver override. |
| 7 | 0x0<br>RO/V | **DEV2_STATUS:** Frequency is limited due to Dev2 driver override. |
| 6 | 0x0<br>RO/V | **SPARE6_STATUS:** Spare status bit. |
| 5 | 0x0<br>RO/V | **SPARE5_STATUS:** Spare status bit. |
| 4 | 0x0<br>RO/V | **SPARE4_STATUS:** Spare status bit. |
| 3 | 0x0<br>RO/V | **PL2_STATUS:** Frequency is limited due to a package-level PL2 excursion. |
| 2 | 0x0<br>RO/V | **PL1_STATUS:** Frequency is limited due to a package-level PL1 excursion. |
| 1 | 0x0<br>RO/V | **THERMAL_STATUS:** Frequency is limited due to thermal excursion. |
| 0 | 0x0<br>RO/V | **PROCHOT_STATUS:** Frequency is limited due to external PROCHOT assertion. |

## 44.3.182 MEMHOT_THERM_STATUS_0_0_0_MCHBAR (P_CR_MEMHOT_THERM_STATUS_0_0_0_MCHBAR)—Offset 70D8h

Memhot indications and logging

THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 70D8h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |

## 44.3.191 TELEM_NEAR_MEMORY_ACTIVE_ACCUMULATOR (P_CR_TELEM_NEAR_MEMORY_ACTIVE_0_0_0_MCHBAR)—Offset 70E0h

This counter measures the total time spent with near memory active, as measured by any rank being in the active or active idle state. The inverse of this counter indicates the total time spent with all near memory in the self-refresh state. This counter counts at the crystal clock frequency divided by 16.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 70E0h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0x0<br>RO/V | **DATA:** This counter measures the total time spent with near memory active, as measured by any rank being in the active or active idle state.<br>The inverse of this counter indicates the total time spent with all near memory in the self-refresh state.<br>This counter counts at the crystal clock frequency divided by 16. |

## 44.3.192 TELEM_FAR_MEMORY_ACTIVE_ACCUMULATOR (P_CR_TELEM_FAR_MEMORY_ACTIVE_0_0_0_MCHBAR)—Offset 70E8h

This counter measures the total time spent with far memory active, as measured by any rank being in the active or active idle state. The inverse of this counter indicates the total time spent with all far memory in the self-refresh state. This counter counts at the crystal clock frequency divided by 16.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 70E8h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0x0<br>RO/V | **DATA:** This counter measures the total time spent with far memory active, as measured by any rank being in the active or active idle state.<br>The inverse of this counter indicates the total time spent with all far memory in the self-refresh state.<br>This counter counts at the crystal clock frequency divided by 16. |

## 44.3.193 TURBO_ACTIVATION_RATIO (P_CR_TURBO_ACTIVATION_RATIO_0_0_0_MCHBAR)—Offset 70F0h

PUNIT_MSR: Used by software to configure the P-state at which turbo activates. This feature is functionally identical to the ACPI P-state notify supported over PECI (PCS 33). Turbo activation starts at clock ratios above the turbo activation ratio threshold configured in this register.

**MSR_Name**: TURBO_ACTIVATION_RATIO **MSR_Addr**: 0x64C

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 70F0h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/L | **TURBO_ACTIVATION_RATIO_LOCK:** Write to 1b to lock the setting in this register until next reset |
| 30:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:0 | 0x0<br>RW/L | **MAX_NON_TURBO_RATIO:** The P-unit will treat any P-state request above this ratio as a request for maximum turbo. Zero is special encoding which disables the feature |

## 44.3.194 C2C3TT_CFG (P_CR_C2C3TT_CFG_0_0_0_MCHBAR)—Offset 7034h

DEPRECATED. This register contains the initial snoop timer (pop-down) value. BIOS can update this value during run-time. Pcode will sample this register at slow loop. If the value has changed since the previous sample and in addition there is no valid Hysteresis parameter (HYS) from a previous PM_DMD or PM_RSP message, then Pcode will configure IMPH_CR_SNP_RELOAD[LIM] with this value. This register is not used by the SoC.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7034h

**Default:** 00000032h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RO | **RSVD0:** Reserved |
| 11:0 | 0x32<br>RW | **PPDN_INIT:** Value |

## 44.3.195 DTS_CONFIG1_CFG (P_CR_DTS_CONFIG1_CFG_0_0_0_MCHBAR)—Offset 7110h

DEPRECATED. DTS 2.0 is not supported. Location of correction factor F and scale factor C for DTS2.0

bscherka: IVT HSD i1112231 DTS2.0 added this csr isteiner: Moved DTS registers for re-convergence

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7110h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0x0 RW/L | **RSVD1:** Reserved |
| 28:16 | 0x0 RW/L | **C:** Scale factor C May be unlocked for select OEMs |
| 15:13 | 0x0 RW/L | **RSVD:** reserved |
| 12:0 | 0x0 RW/L | **F:** Correction Factor F May be unlocked for select OEMs |

## 44.3.196 DTS_CONFIG2_CFG (P_CR_DTS_CONFIG2_CFG_0_0_0_MCHBAR)—Offset 7114h

DEPRECATED. DTS 2.0 is not supported. Location of time constant coefficients for implementation.

bscherka: IVT HSD i1112231 added this csr isteiner: Moved DTS registers for re-convergence

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7114h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0x0 RW/L | **RSVD1:** Reserved be4538196 - attached to correct fuse |
| 28:16 | 0x0 RW/L | **AS:** Time constant coefficient AS May be unlocked for select OEMs |
| 15:13 | 0x0 RW/L | **RSVD:** reserved |
| 12:0 | 0x0 RW/L | **AF:** Time constant coefficient AF May be unlocked for select OEMs |

## 44.3.197 DTS_CONFIG3_CFG (P_CR_DTS_CONFIG3_CFG_0_0_0_MCHBAR)—Offset 7118h

Location of Tcontrol_offset for DTS2.0

bscherka: IVT added HSD i1112231 isteiner: Moved DTS registers for re-convergence

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7118h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|

| 3:0 | 0x0<br>RW | **USB2_LANES:** Snapshot of the number of USB2 lanes for power meter. |

## 44.3.199 DRAM_BIOS_INFO (P_CR_DRAM_BIOS_INFO_0_0_0_MCHBAR)—Offset 7128h

This register provides DRAM interface information for initial boot and SPD warm reset. It is populated by Pcode and read by BIOS.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7128h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RW | **Reserved:** Reserved |
| 23:16 | 0x0<br>RW | **CURRENT_VID_VALUE:** Current voltage of VDDQ SVID Rail. |
| 15:12 | 0x0<br>RW | **RSVD1:** Reserved |
| 11 | 0x0<br>RW | **SPD_RESET_STATUS:** This field indicates to BIOS that a SPD Warm Reset has already occurred. |
| 10:8 | 0x0<br>RW | **DDR_CURRENT_FREQ:** This field indicates the current DDR IO clock frequency. |
| 7:4 | 0x0<br>RW | **RSVD2:** Reserved |
| 3 | 0x0<br>RW | **Reserved:** Reserved |
| 2:0 | 0x0<br>RW | **DDR_MAX_FREQ_LIMIT:** This field indicates to BIOS the Maximum supported DDR frequency for this product.<br>Pcode populates this information from fuses.<br>For the DDR_MAX_Freg_Limit, the value always shows 4 (100b).<br>• 000b = 1600 MHz<br>• 001b = 1833 MHz<br>• 010b = 2133 MHz<br>• 011b = 2400 MHz<br>• 100b = 2666 MHz |

## 44.3.200 ADR_COMMAND (P_CR_ADR_COMMAND_0_0_0_MCHBAR)—Offset 712Ch

This register provides PMC Firmware the ability to trigger an ADR (Asynchronous DRAM Self-Refresh). Fast path event for Pcode to take action and flush context information to DRAMs on imminent power loss.

THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 712Ch

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |

| 14:0 | 0x118<br>RW/L | **DRAM_TDP:** The Spec power allowed for DRAM.<br>The TDP setting is typical (not guaranteed). |

## 44.3.202 PCODE_WRITE_SPARE (P_CR_PCODE_WRITE_SPARE_0_0_0_MCHBAR)—Offset 7138h

Spare register for future use

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7138h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **SPARE_BITS:** spare bits for stepping ID use |

## 44.3.203 PACKAGE_TEMPERATURES_0_0_0_MCHBAR (P_CR_PACKAGE_TEMPERATURES_0_0_0_MCHBAR)—Offset 70F4h

Read-only register used for monitoring thermal status from all domains in the package.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 70F4h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO/V | **SA_Temperature:** System agent domain max temperature in degrees C.<br>Reported in a signed, 2's complement format with the LSB representing 1'C resolution (S8.7.0).<br>Raw, unfiltered |
| 23:16 | 0x0<br>RO/V | **Reserved:** Reserved |
| 15:8 | 0x0<br>RO/V | **Reserved:** Reserved |
| 7:0 | 0x0<br>RO/V | **IA_Temperature:** Virtual max temperature of all IA cores in degrees C.<br>Reported in a signed, 2's complement format with the LSB representing 1'C resolution (S8.7.0).<br>Raw, unfiltered |

## 44.3.204 MEMSS_FREQUENCY_CAPABILITIES (P_CR_MEMSS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 7108h

Describes the minimum and maximum frequency capabilities of LPDDR and WideIO on this particular SOC. If the maximum supported frequency reports a zero for LPDDR or WideIO, it indicates that the respective DRAM technology is not supported on this product.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7108h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0<br>RW | **NUM_NM_CH:** Reserved. |
| 29:24 | 0x0<br>RW | **WIO_FREQ:** Reserved. |

| 17:12 | 0x0<br>RW | **LP4_FREQ_LOW:** Reserved. |
| 11:6 | 0x0<br>RW | **LP3_FREQ_HIGH:** Reserved. |
| 5:0 | 0x0<br>RW | **LP3_FREQ_LOW:** Reserved. |

## 44.3.205 PP1_C0_CORE_CLOCK_0_0_0_MCHBAR (P_CR_PP1_C0_CORE_CLOCK_0_0_0_MCHBAR)—Offset 7160h

GT RC0 residency counter. Holds the accumulated number of CS clks that GT has been in RC0.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7160h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **DATA:** Accumulated cycles GT has been in RC0. |

## 44.3.206 Core Exists Vector (P_CR_CORE_EXISTS_VECTOR_0_0_0_MCHBAR)—Offset 7164h

Indication of the physical presence of IA cores in this silicon. IA core modules are defined as containing pairs of cores and an associated L2 cache. Module existence can therefore be inferred by OR'ing pairs of COREx_EXISTS in this register. This register does not reflect the impact of any software-based core disabling. It always reflects the capabilities of the silicon.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7164h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15 | 0x0<br>RW | **CORE15_EXISTS:** A 1 indicates this core is enabled in the SoC. |
| 14 | 0x0<br>RW | **CORE14_EXISTS:** A 1 indicates this core is enabled in the SoC. |
| 13 | 0x0<br>RW | **CORE13_EXISTS:** A 1 indicates this core is enabled in the SoC. |
| 12 | 0x0<br>RW | **CORE12_EXISTS:** A 1 indicates this core is enabled in the SoC. |

| 5 | 0x0<br>RW | **CORE5_EXISTS:** A 1 indicates this core is enabled in the SoC. |
| 4 | 0x0<br>RW | **CORE4_EXISTS:** A 1 indicates this core is enabled in the SoC. |
| 3 | 0x0<br>RW | **CORE3_EXISTS:** A 1 indicates this core is enabled in the SoC. |
| 2 | 0x0<br>RW | **CORE2_EXISTS:** A 1 indicates this core is enabled in the SoC. |
| 1 | 0x0<br>RW | **CORE1_EXISTS:** A 1 indicates this core is enabled in the SoC. |
| 0 | 0x0<br>RW | **CORE0_EXISTS:** A 1 indicates this core is enabled in the SoC. |

## 44.3.207 Software Core Disable Mask (P_CR_CORE_DISABLE_MASK_0_0_0_MCHBAR)—Offset 7168h

Software may disable cores using this interface. The bit definition of this register exactly matches that defined in the CORE_EXISTS_VECTOR register. The flow is as follows:

- Cold boot
- BIOS reads CORE_EXISTS_VECTOR to establish which modules and cores are present
- BIOS writes 1b to the corresponding core that it wishes to **disable**.
- BIOS may disable entire modules by writing 1b to a pair of cores.
- The results of the configuration are maintained in the sustain power well.
- BIOS initiates a cold reset flow at the platform. In a cold reset, the sustain power well maintains power most other rails are power cycled.
- On cold reset exit, launches only the cores requested by BIOS. To software, it will appear as if these cores do not exist.

Software may discover the resolved core exists vector: resolved_core_exists_vector = (!CORE_DISABLE_MASK) and CORE_EXISTS_VECTOR

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7168h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |

## 44.3.208 PL3_CONTROL_MCHBAR (P_CR_PL3_CONTROL_0_0_0_MCHBAR)—Offset 71F0h

Control Power Limit 3 (PL3) and Power Limit 4 (PL4) using this register. This limit control is physically different from the same control in the IA core MSR space.

- PL3 is designed to clamp peak sustained power to levels supported by the battery or input power supply and as such manage lifetime degradation of that power delivery element. With PL3, peak power excursions above the limit are allowed so long as they do not exceed the configured duty cycle constraint in this register.
- PL4 is designed to clamp peak instantaneous power to levels below the max supported by the battery or input power supply. These clamps are implemented a priori and the SOC is guaranteed to constrain itself below the PL4 limit always.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [MCHBAR] + 71F0h

**Default:** 0000000000000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW/L | **LOCK:** Write a 1b to lock this register until next reset.<br>Once locked, no further updates may be written to any bits in the register. |

## 44.3.214 Graphics Superqueue Active Clocks (P_CR_PP1_ANY_THREAD_ACTIVITY_0_0_0_MCHBAR)—Offset 7244h

Graphics Superqueue active residency counter. Counts at ART)) 4.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MCHBAR] + 7244h

**Default:** 00000000h

**MCHBAR Type:** PCI Configuration Register (Size: 64 bits)
**MCHBAR Reference:** [B:0, D:0, F:0] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **SUPERQUEUE_ACTIVE_RESIDENCY:** Graphics Superqueue active residency counter. Counts in 19.2MHz reference clocks. |

## 44.3.215 B-Unit Copy of Default VTd BAR PMEN (B_CR_PMEN_REG_0_0_0_DEFVTDBAR)—Offset 64h

B-Unit copy of the Default VTd BAR PMEN register. Bit 31 is the only bit used for B-Unit.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + 64h

**Default:** 00000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** MCHBAR + 6C80)h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/V | **EPM:** This field controls DMA accesses to the protected lowmemory and protected highmemory regions.<br>• 0: Protected memory regions are disabled.<br>• 1: Protected memory regions are enabled. |
| 30:1 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |
| 0 | 0x0<br>RO | **PRS Unused (PRS):** Unused by the B-Unit. This field indicates the status of protected memory regions:<br>• 0: Protected memory regions are disabled.<br>• 1: Protected memory regions are enabled. |

## 44.3.216 B-Unit Copy of Default VTd BAR PLM Base Register (B_CR_PLMBASE_REG_0_0_0_DEFVTDBAR)—Offset 68h

Register to set up the base address of DMA-protected low-memory region below 4GB. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected low memory region (PLMR field reported as Clear in the Capability register). The alignment of the protected low memory region base depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1s to this register, and finding the most significant bit position with 0 in the value read back from the register. Bits N:0 of this register are decoded by hardware as all 0s. Software must setup the protected low memory region below 4GB. Section 10.4.18 of the Intel Virtualization Technology for Directed I/O: Spec describes the Protected Low-Memory Limit register and hardware decoding of these registers. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + 68h

**Default:** 00000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** MCHBAR + 6C80)h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RW/V | **Protected Low Memory Base (PLMB):** This register specifies the base of the protected low-memory region in system memory. |
| 19:0 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |

## 44.3.217 B-Unit Copy of Default VTd BAR PLM Limit Register (B_CR_PLMLIMIT_REG_0_0_0_DEFVTDBAR)—Offset 6Ch

This register sets up the limit address of DMA-protected low-memory region below 4GB. This register must be set up before enabling protected memory through PMEN_REG, and it must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected low memory region (PLMR field reported as Clear in the Capability register). The alignment of the protected low memory region limit depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1's to this register, and then finding most significant zero bit position with 0 in the value read back from the register. Bits N:0 of the limit register are decoded by hardware as all 1s.

The Protected low-memory base and limit registers function as follows:

Programming the protected low-memory base and limit registers with the same value in bits 31:(N+1) specifies a protected low-memory region of size 2^(N+1) bytes. Programming the protected low-memory limit register with a value less than the protected low-memory base register disables the protected low-memory region. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [DEFVTDBAR] + 6Ch

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** MCHBAR + 6C80)h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RW/V | **Protected Low Memory Limit (PLML):** This register specifies the last host physical address of the DMAprotected lowmemory region in system memory. |
| 19:0 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |

## 44.3.218 B-Unit Copy of Default VTd BAR PHM Base Register (B_CR_PHMBASE_REG_0_0_0_DEFVTDBAR)—Offset 70h

This is the register to set up the base address of the DMA-protected high-memory region. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected high memory region (PHMR field reported as Clear in the Capability register). The alignment of the protected high memory region base depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1's to this register, and finding most significant zero bit position below host address width (HAW) in the value read back from the register. Bits N:0 of this register are decoded by hardware as all 0s. Software may setup the protected high memory region either above or below 4GB. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [DEFVTDBAR] + 70h

**Default:** 0000000000000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** MCHBAR + 6C80)h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:39 | 0x0<br>RO | **Reserved (RESERVED_1):** Reserved. |
| 38:20 | 0x0<br>RW/V | **Protected High Memory Base (PHMB):** This register specifies the base of protected high memory region in system memory.<br>Hardware ignores and does not implement bits 63:HAW, where HAW is the host address width. |
| 19:0 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |

## 44.3.219 B-Unit Copy of Default VTd BAR PHM Limit Register (B_CR_PHMLIMIT_REG_0_0_0_DEFVTDBAR)—Offset 78h

Register to set up the limit address of DMA-protected high-memory region. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected high memory region (PHMR field reported as Clear in the Capability register). The alignment of the protected high memory region limit depends on the number of reserved bits (N:0) of this register. Software may determine the value of N by writing all ones to this register, and finding most significant zero bit position below host address width (HAW) in the value read back from the register. Bits N:0 of the limit register are decoded by hardware as all ones.

The protected high-memory base and limit registers function as follows:

Programming the protected low-memory base and limit registers with the same value in bits HAW:(N+1) specifies a protected low-memory region of size 2^(N+1) bytes. Programming the protected high-memory limit register with a value less than the protected high-memory base register disables the protected high-memory region. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [DEFVTDBAR] + 78h

**Default:** 0000000000000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** MCHBAR + 6C80)h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:39 | 0x0<br>RO | **Reserved (RESERVED_1):** Reserved. |
| 38:20 | 0x0<br>RW/V | **Protected High Memory Limit (PHML):** This register specifies the last host physical address of the DMA protected high memory region in system memory.<br>Hardware ignores and does not implement bits 63:HAW where HAW is the host address width. |
| 19:0 | 0x0<br>RO | **Reserved (RESERVED_0):** Reserved. |

# 44.4 Registers in Memory Space—DEFVTDBAR

## 44.4.1 Version Register (VER_REG_0_0_0_VTDBAR)—Offset 0h

Register to report the architecture version supported. Backward compatibility for the architecture is maintained with new revision numbers, allowing software to load remapping hardware drivers written for prior architecture versions.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + 0h

**Default:** 00000010h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:4 | 0x1<br>RO | **Major Version Number (MAJOR):** Indicates supported architecture version. |
| 3:0 | 0x0<br>RO | **Minor Version Number (MINOR):** Indicates supported architecture minor version. |

## 44.4.2 Capability Register (CAP_REG_0_0_0_VTDBAR)—Offset 8h

Register to report general remapping hardware capabilities.

Note: These values can change based on defeature bits.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [DEFVTDBAR] + 8h

**Default:** 00D2008C40660462h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:57 | 0x0<br>RO | **Reserved:** Reserved |
| 56 | 0x0<br>RO | **First Level 64-KByte Page SupportP (FL1GP):** A value of 1 in this field indicates 1-GByte page size is supported for first-level translation. |
| 55 | 0x1<br>RO | **Read Draining (DRD):**<br>• 0 = Hardware does not support draining of DMA read requests.<br>• 1 = Hardware supports draining of DMA read requests. |
| 54 | 0x1<br>RO | **Write Draining (DWD):**<br>• 0 = Hardware does not support draining of DMA write requests.<br>• 1 = Hardware supports draining of DMA write requests. |

| 4 | 0x0<br>RO | **Required Write-Buffer Flushing (RWBF):**<br>• 0 = Indicates no write-buffer flushing is needed to ensure changes to memory-resident structures are visible to hardware.<br>• 1 = Indicates software must explicitly flush the write buffers to ensure updates made to memory-resident remapping structures are visible to hardware. |
| 3 | 0x0<br>RO | **Advanced Fault Logging (AFL):**<br>• 0 = Indicates advanced fault logging is not supported. Only primary fault logging is supported.<br>• 1 = Indicates advanced fault logging is supported. |
| 2:0 | 0x2<br>RO | **Number of Domains Supported (ND):**<br>• 010b = Hardware supports 8-bit domain-ids with support for up to 256 domains. |

## 44.4.3 Extended Capability Register (ECAP_REG_0_0_0_VTDBAR)—Offset 10h

Register to report remapping hardware extended capabilities. Note: These values can change based on defeature bits.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [DEFVTDBAR] + 10h

**Default:** 0000000000F050DAh

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:40 | 0x0<br>RO | **RSVD0:** Reserved |
| 39:35 | 0x0<br>RO | **PASID Size Supported (PSS):** This field reports the PASID size supported by the remapping hardware for requests-with-PASID.<br>A value of N in this field indicates hardware supports PASID field of N+1 bits (For example, value of 7 in this field, indicates 8-bit PASIDs are supported).<br>Requests-with-PASID with PASID value beyond the limit specified by this field are treated as error by the remapping hardware.<br>This field is valid only when PASID field is reported as Set. |
| 34 | 0x0<br>RO | **Extended Accessed Flag Support (EAFS):**<br>• 0 = Hardware does not support the extended-accessed (EA) bit in first-level paging-structure entries.<br>• 1 = Hardware supports the extended accessed (EA) bit in first-level paging-structure entries.<br>This field is valid only when PASID field is reported as Set. |
| 33 | 0x0<br>RO | **No Write Flag Support (NWFS):**<br>• 0 = Hardware ignores the No Write (NW) flag in Device-TLB translation requests, and behaves as if NW is always 0.<br>• 1 = Hardware supports the No Write (NW) flag in Device-TLB translation requests.<br>This field is valid only when Device-TLB support (DT) field is reported as Set. |
| 32 | 0x0<br>RO | **PASID-Only Translations (POT):**<br>• 0 = Hardware does not support PASID-only Translation Type in extended-context-entries.<br>• 1 = Hardware supports PASID-only Translation Type in extended-context-entries.<br>This field is valid only when PASID field is reported as Set. |
| 31 | 0x0<br>RO | **Supervisor Request Support (SRS):**<br>• 0 = H/W does not support requests-with-PASID seeking supervisor privilege.<br>• 1 = H/W supports requests-with-PASID seeking supervisor privilege.<br>The field is valid only when PASID field is reported as Set. |
| 30 | 0x0<br>RO | **Execute Request Support (ERS):**<br>• 0 = H/W does not support requests-with-PASID seeking execute permission.<br>• 1 = H/W supports requests-with-PASID seeking execute permission.<br>This field is valid only when PASID field is reported as Set. |
| 29 | 0x0<br>RO | **Page Request Support (PRS):**<br>• 0 = Hardware does not support Page Requests.<br>• 1 = Hardware supports Page Requests<br>This field is valid only when Device-TLB (DT) field is reported as Set. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 28 | 0x0<br>RO | **Process Address Space ID Support (PASID):**<br>• 0 = Hardware does not support requests tagged with Process Address Space IDs.<br>• 1 = Hardware supports requests tagged with Process Address Space IDs. |
| 27 | 0x0<br>RO | **Deferred Invalidate Support (DIS):**<br>• 0 = Hardware does not support deferred invalidations of IOTLB and Device-TLB.<br>• 1 = Hardware supports deferred invalidations of IOTLB and Device-TLB.<br>This field is valid only when PASID field is reported as Set. |
| 26 | 0x0<br>RO | **Nested Translation Support (NEST):**<br>• 0 = Hardware does not support nested translations.<br>• 1 = Hardware supports nested translations.<br>This field is valid only when PASID field is reported as Set. |
| 25 | 0x0<br>RO | **Memory Type Support (MTS):**<br>• 0 = Hardware does not support Memory Type in first-level translation and Extended Memory type in second-level translation.<br>• 1 = Hardware supports Memory Type in first-level translation and Extended Memory type in second-level translation.<br>This field is valid only when PASID and ECS fields are reported as Set.<br>Remapping hardware units with, one or more devices that operate in processor coherency domain, under its scope must report this field as Set. |
| 24 | 0x0<br>RO | **Extended Context Support (ECS):**<br>• 0 = Hardware does not support extended-root-entries and extended-context-entries.<br>• 1 = Hardware supports extended-root-entries and extended-context-entries.<br>Implementations reporting PASID or PRS fields as Set, must report this field as Set. |
| 23:20 | 0xf<br>RO | **Maximum Handle Mask Value (MHMV):** The value in this field indicates the maximum supported value for the Handle Mask (HM) field in the interrupt entry cache invalidation descriptor (iec_inv_dsc). This field is valid only when the IR field in Extended Capability register is reported as Set. |
| 19:18 | 0x0<br>RO | **RSVD1:** Reserved |
| 17:8 | 0x50<br>RO | **IOTLB Register Offset (IRO):** This field specifies the offset to the IOTLB registers relative to the register base address of this remapping hardware unit.<br>If the register base address is X, and the value reported in this field is Y, the address for the first IOTLB invalidation register is calculated as X+(16*Y). |
| 7 | 0x1<br>RO | **Snoop Control (SC):**<br>• 0 = Hardware does not support 1-setting of the SNP field in the page-table entries.<br>• 1 = Hardware supports the 1-setting of the SNP field in the page-table entries. |
| 6 | 0x1<br>RO | **Pass Through (PT):**<br>• 0 = Hardware does not support pass-through translation type in context entries and extended-context-entries.<br>• 1 = Hardware supports pass-through translation type in context entries and extended-context-entries.<br>Pass-through translation is specified through Translation-Type (T) field value of 10b in context-entries, or T field value of 010b in extended-context-entries.<br>Hardware implementations supporting PASID must report a value of 1b in this field. |
| 5 | 0x0<br>RO | **RSVD2:** Reserved |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 4 | 0x1<br>RO | **Extended Interrupt Mode (EIM):**<br>• 0 = On Intel64 platforms, hardware supports only 8-bit APIC-IDs (xAPIC mode).<br>• 1 = On Intel64 platforms, hardware supports 32-bit APIC-IDs (x2APIC mode).<br>This field is valid only on Intel64 platforms reporting Interrupt Remapping support (IR field Set). |
| 3 | 0x1<br>RO | **Interrupt Remapping Suport (IR):**<br>• 0 = Hardware does not support interrupt remapping.<br>• 1 = Hardware supports interrupt remapping.<br>Implementations reporting this field as Set must also support Queued Invalidation (QI). |
| 2 | 0x0<br>RO | **Device-TLB Support (DT):**<br>• 0 = Hardware does not support device-IOTLBs.<br>• 1 = Hardware supports Device-IOTLBs.<br>Implementations reporting this field as Set must also support Queued Invalidation (QI). Hardware implementations supporting I/O Page Requests (PRS field Set in Extended Capability register) must report a value of 1b in this field. |
| 1 | 0x1<br>RO | **Queued Invalidation Support (QI):**<br>• 0 = Hardware does not support queued invalidations.<br>• 1 = Hardware supports queued invalidations. |
| 0 | 0x0<br>RO | **Page-Walk Coherency (C):** This field indicates if hardware access to the root, context, extended-context and interrupt-remap tables, and second-level paging structures for requests-without-PASID, are coherent (snooped) or not.<br>• 0 = Indicates hardware accesses to remapping structures are non-coherent.<br>• 1 = Indicates hardware accesses to remapping structures are coherent.<br>Hardware access to advanced fault log, invalidation queue, invalidation semaphore, page-request queue, PASID-table, PASID-state table, and first-level page-tables are always coherent. |

## 44.4.4 Global Command Register (GCMD_REG_0_0_0_VTDBAR)—Offset 18h

Register to control remapping hardware. If multiple control fields in this register need to be modified, software must serialize the modifications through multiple writes to this register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + 18h

**Default:** 00000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Translation Enable (TE):** Software writes to this field to request hardware to enable/disable DMA-remapping:<br>• 0 = Disable DMA remapping.<br>• 1 = Enable DMA remapping. |
| 30 | 0x0<br>WO | **Set Root Table Pointer (SRTP):** Software sets this field to set/update the root-entry table pointer used by hardware.<br>The root-entry table pointer is specified through the Root-entry Table Address (RTA_REG) register.<br>The Set Root Table Pointer operation must be performed before enabling or re-enabling (after disabling) DMA remapping through the TE field. |
| 29 | 0x0<br>RO | **Reserved:** Reserved |
| 28 | 0x0<br>RO | **Reserved:** Reserved |
| 27 | 0x0<br>RO | **Reserved:** Reserved |
| 26 | 0x0<br>RW | **Queued Invalidation Enable (QIE):** This field is valid only for implementations supporting queued invalidations. Software writes to this field to enable or disable queued invalidations.<br>• 0 = Disable queued invalidations.<br>• 1 = Enable use of queued invalidations. |
| 25 | 0x0<br>RW | **Interrupt Remapping Enable (IRE):** This field is valid only for implementations supporting interrupt remapping.<br>• 0 = Disable interrupt-remapping hardware.<br>• 1 = Enable interrupt-remapping hardware. |
| 24 | 0x0<br>WO | **Set Interrupt Remap Table Pointer (SIRTP):** This field is valid only for implementations supporting interrupt-remapping.<br>Software sets this field to set/update the interrupt remapping table pointer used by hardware.<br>The interrupt remapping table pointer is specified through the Interrupt Remapping Table Address (IRTA_REG) register. |
| 23 | 0x0<br>RW | **Compatibility Format Interrupt (CFI):** This field is valid only for Intel64 implementations supporting interrupt-remapping. Software writes to this field to enable or disable Compatibility Format interrupts on Intel64 platforms. The value in this field is effective only when interrupt-remapping is enabled and Extended Interrupt Mode (x2APIC mode) is not enabled.<br>• 0 = Block Compatibility format interrupts.<br>• 1 = Process Compatibility format interrupts as pass-through (bypass interrupt remapping). |
| 22:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 44.4.5 Global Status Register (GSTS_REG_0_0_0_VTDBAR)—Offset 1Ch

Register to report general remapping hardware status.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + 1Ch

**Default:** 00000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO/V | **Reserved:** Reserved |
| 30 | 0x0<br>RO/V | **Reserved:** Reserved |
| 29 | 0x0<br>RO | **Fault Log Status (FLS):** This field:<br>• Is cleared by hardware when software Sets the SFL field in the Global Command register.<br>• Is Set by hardware when hardware completes the Set Fault Log Pointer operation using the value provided in the Advanced Fault Log register. |
| 28 | 0x0<br>RO | **Advanced Fault Logging Status (AFLS):** This field is valid only for implementations supporting advanced fault logging. It indicates the advanced fault logging status:<br>• 0 = Advanced Fault Logging is not enabled.<br>• 1 = Advanced Fault Logging is enabled. |
| 27 | 0x0<br>RO | **Write Buffer Flush Status (WBFS):** This field is valid only for implementations requiring write buffer flushing. This field indicates the status of the write buffer flush command. |
| 26 | 0x0<br>RO/V | **Queued Invalidation Enable Status (QIES):** This field indicates queued invalidation enable status.<br>• 0 = queued invalidation is not enabled.<br>• 1 = queued invalidation is enabled |
| 25 | 0x0<br>RO/V | **Interrupt Remapping Enable Status (IRES):** This field indicates the status of Interrupt-remapping hardware.<br>• 0 = Interrupt-remapping hardware is not enabled.<br>• 1 = Interrupt-remapping hardware is enabled |
| 24 | 0x0<br>RO/V | **Interrupt Remapping Pointer Status (IRTPS):** This field indicates the status of the interrupt remapping table pointer in hardware.<br>This field is cleared by hardware when software sets the SIRTP field in the Global Command register. |
| 23 | 0x0<br>RO/V | **Compatibility Format Interrupt Status (CFIS):** This field indicates the status of Compatibility format interrupts on Intel64 implementations supporting interrupt-remapping.<br>The value reported in this field is applicable only when interrupt-remapping is enabled and Extended Interrupt Mode (x2APIC mode) is not enabled.<br>• 0 = Compatibility format interrupts are blocked.<br>• 1 = Compatibility format interrupts are processed as pass-through (bypassing interrupt remapping). |
| 22:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 44.4.6 Root Table Address Register (RTADDR_REG_0_0_0_VTDBAR)—Offset 20h

Register providing the base address of root-entry table.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [DEFVTDBAR] + 20h

**Default:** 0000000000000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:12 | 0x0<br>RW | **Root Table Address (RTA):** This register points to base of page aligned, 4KB-sized root-entry table in system memory. |
| 11 | 0x0<br>RW | **Root Table Type (RTT):** This field specifies the type of root-table referenced by the Root Table Address (RTA) field:<br>• 0 = Root Table.<br>• 1 = Extended Root Table |
| 10:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 44.4.7 Context Command Register (CCMD_REG_0_0_0_VTDBAR)—Offset 28h

Register to manage context cache. The act of writing the uppermost byte of the CCMD_REG with the ICC field Set causes the hardware to perform the context-cache invalidation.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [DEFVTDBAR] + 28h

**Default:** 0800000000000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW/V | **Invalidate Context Cache (ICC):** Software requests invalidation of context-cache by setting this field.<br>Software must also set the requested invalidation granularity by programming the CIRG field.<br>Software must read back and check the ICC field is Clear to confirm the invalidation is complete.<br>Software must not update this register when this field is set.<br>Hardware clears the ICC field to indicate the invalidation request is complete.<br>Hardware also indicates the granularity at which the invalidation operation was performed through the CAIG field.<br>Software must submit a context-cache invalidation request through this field only when there are no invalidation requests pending at this remapping hardware unit.<br>Since information from the context-cache may be used by hardware to tag IOTLB entries, software must perform domain-selective (or global) invalidation of IOTLB after the context cache invalidation has completed.<br>Hardware implementations reporting write-buffer flushing requirement (RWBF=1 in Capability register) must implicitly perform a write buffer flush before invalidating the context cache. |
| 62:61 | 0x0<br>RW | **Context Invalidation Request Granularity (CIRG):** Software provides the requested invalidation granularity through this field when setting the ICC field:<br>• 00: Reserved.<br>• 01: Global Invalidation request.<br>• 10: Domain-selective invalidation request. The target domain-id must be specified in the DID field.<br>• 11: Device-selective invalidation request. The target source-id(s) must be specified through the SID and FM fields, and the domain-id (that was programmed in the context-entry for these device(s)) must be provided in the DID field.<br>Hardware implementations may process an invalidation request by performing invalidation at a coarser granularity than requested.<br>Hardware indicates completion of the invalidation request by clearing the ICC field.<br>At this time, hardware also indicates the granularity at which the actual invalidation was performed through the CAIG field. |
| 60:59 | 0x1<br>RO/V | **Context Actual Invalidation Granularity (CAIG):** Hardware reports the granularity at which an invalidation request was processed through the CAIG field at the time of reporting invalidation completion (by clearing the ICC field).<br>The following are the encodings for this field:<br>• 00: Reserved.<br>• 01: Global Invalidation performed. This could be in response to a global, domain-selective or device-selective invalidation request.<br>• 10: Domain-selective invalidation performed using the domain-id specified by software in the DID field. This could be in response to a domain-selective or device-selective invalidation request.<br>• 11: Device-selective invalidation performed using the source-id and domain-id specified by software in the SID and FM fields. This can only be in response to a device-selective invalidation request. |
| 58:34 | 0x0<br>RO | **RSVD0:** Reserved |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 33:32 | 0x0<br>RW | **Function Mask (FM):** Software may use the Function Mask to perform device-selective invalidations on behalf of devices supporting PCI Express Phantom Functions.<br>This field specifies which bits of the function number portion (least significant three bits) of the SID field to mask when performing device-selective invalidations.<br>The following encodings are defined for this field:<br>• 00: No bits in the SID field masked.<br>• 01: Mask most significant bit of function number in the SID field.<br>• 10: Mask two most significant bit of function number in the SID field.<br>• 11: Mask all three bits of function number in the SID field.<br>The context-entries corresponding to all the source-ids specified through the FM and SID fields must have to the domain-id specified in the DID field. |
| 31:16 | 0x0<br>RW | **Source-ID (SID):** Indicates the source-id of the device whose corresponding context-entry needs to be selectively invalidated.<br>This field along with the FM field must be programmed by software for device-selective invalidation requests. |
| 15:0 | 0x0<br>RW | **Domain-ID (DID):** Indicates the id of the domain whose context-entries need to be selectively invalidated.<br>This field must be programmed by software for both domain-selective and device-selective invalidation requests.<br>The Capability register reports the domain-id width supported by hardware.<br>Software must ensure that the value written to this field is within this limit.<br>Hardware may ignore and not implement bits15:N, where N is the supported domain-id width reported in the Capability register. |

## 44.4.8 Fault Status Register (FSTS_REG_0_0_0_VTDBAR)—Offset 34h

Register indicating the various error status.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + 34h

**Default:** 00000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15:8 | 0x0<br>RO | **Fault Record Index (FRI):** This field is valid only when the PPF field is Set.<br>The FRI field indicates the index (from base) of the fault recording register to which the first pending fault was recorded when the PPF field was Set by hardware.<br>The value read from this field is undefined when the PPF field is clear. |
| 7 | 0x0<br>RW/1C | **Page Request Overflow (PRO):** Hardware detected a Page Request Overflow error.<br>Hardware implementations not supporting the Page Request Queue implement this bit as RsvdZ.<br><br>**Power Well:** prst |
| 6 | 0x0<br>RO | **Invalidation Time-out Error (ITE):** Hardware detected a Device-IOTLB invalidation completion time-out.<br>At this time, a fault event may be generated based on the programming of the Fault Event Control register.<br>Hardware implementations not supporting device Device-IOTLBs implement this bit as RsvdZ. |
| 5 | 0x0<br>RO | **Invalidation Completion Error (ICE):** Hardware received an unexpected or invalid Device-IOTLB invalidation completion.<br>This could be due to either an invalid ITag or invalid source-id in an invalidation completion response.<br>At this time, a fault event may be generated based on the programming of hte Fault Event Control register.<br>Hardware implementations not supporting Device-IOTLBs implement this bit as RsvdZ. |
| 4 | 0x0<br>RW/1C | **Invalidation Queue Error (IQE):** Hardware detected an error associated with the invalidation queue.<br>This could be due to either a hardware error while fetching a descriptor from the invalidation queue, or hardware detecting an erroneous or invalid descriptor in the invalidation queue.<br>At this time, a fault event may be generated based on the programming of the Fault Event Control register.<br>Hardware implementations not supporting queued invalidations implement this bit as RsvdZ.<br><br>**Power Well:** prst |
| 3 | 0x0<br>RO | **Advanced Pending Fault (APF):** When this field is Clear, hardware sets this field when the first fault record (at index 0) is written to a fault log.<br>At this time, a fault event is generated based on the programming of the Fault Event Control register. Software writing 1 to this field clears it.<br>Hardware implementations not supporting advanced fault logging implement this bit as RsvdZ. |
| 2 | 0x0<br>RO | **Advanced Fault Overflow (AFO):** Hardware sets this field to indicate advanced fault log overflow condition.<br>At this time, a fault event is generated based on the programming of the Fault Event Control register. Software writing 1 to this field clears it.<br>Hardware implementations not supporting advanced fault logging implement this bit as RsvdZ. |
| 1 | 0x0<br>RO/V | **Primary Pending Fault (PPF):** This field indicates if there are one or more pending faults logged in the fault recording registers.<br>Hardware computes this field as the logical OR of Fault (F) fields across all the fault recording registers of this remapping hardware unit.<br>• 0 = No pending faults in any of the fault recording registers.<br>• 1 = One or more fault recording registers has pending faults. The FRI field is updated by hardware whenever the PPF field is set by hardware. Also, depending on the programming of Fault Event Control register, a fault event is generated when hardware sets this field.<br><br>**Power Well:** prst |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 0 | 0x0<br>RW/1C | **Primary Fault Overflow (PFO):** Hardware sets this field to indicate overflow of fault recording registers.<br>Software writing 1 clears this field.<br>When this field is Set, hardware does not record any new faults until software clears this field.<br><br>**Power Well:** prst |

## 44.4.9 Fault Event Control Register (FECTL_REG_0_0_0_VTDBAR)—Offset 38h

Register specifying the fault event interrupt message control bits.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + 38h

**Default:** 80000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x1<br>RW | **Interrupt Mask (IM):**<br>• 0 = No masking of interrupt. When an interrupt condition is detected, hardware issues an interrupt message (using the Fault Event Data and Fault Event Address register values).<br>• 1 = This is the value on reset. Software may mask interrupt message generation by setting this field. Hardware is prohibited from sending the interrupt message when this field is set. |
| 30 | 0x0<br>RO/V | **Interrupt Pending (IP):** Hardware sets the IP field whenever it detects an interrupt condition, which is defined as:<br>• When primary fault logging is active, an interrupt condition occurs when hardware records a fault through one of the Fault Recording registers and sets the PPF field in Fault Status register.<br>• When advanced fault logging is active, an interrupt condition occurs when hardware records a fault in the first fault record (at index 0) of the current fault log and sets the APF field in the Fault Status register.<br>• Hardware detected error associated with the Invalidation Queue, setting the IQE field in the Fault Status register.<br>• Hardware detected invalid Device-IOTLB invalidation completion, setting the ICE field in the Fault Status register.<br>• Hardware detected Device-IOTLB invalidation completion time-out, setting the ITE field in the Fault Status register.<br>If any of the status fields in the Fault Status register was already Set at the time of setting any of these fields, it is not treated as a new interrupt condition.<br>The IP field is kept set by hardware while the interrupt message is held pending.<br>The interrupt message could be held pending due to interrupt mask (IM field) being Set or other transient hardware conditions.<br>The IP field is cleared by hardware as soon as the interrupt message pending condition is serviced. This could be due to either:<br>• Hardware issuing the interrupt message due to either change in the transient hardware condition that caused interrupt message to be held pending, or due to software clearing the IM field.<br>• Software servicing all the pending interrupt status fields in the Fault Status register as follows:<br>• When primary fault logging is active, software clearing the Fault (F) field in all the Fault Recording registers with faults, causing the PPF field in Fault Status register to be evaluated as clear.<br>• Software clearing other status fields in the Fault Status register by writing back the value read from the respective fields. |
| 29:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 44.4.10 Fault Event Data Register (FEDATA_REG_0_0_0_VTDBAR)—Offset 3Ch

Register specifying the interrupt message data

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + 3Ch

**Default:** 00000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **Extended Interrupt Message Data (EIMD):** This field is valid only for implementations supporting 32-bit interrupt data fields.<br>Hardware implementations supporting only 16-bit interrupt data may treat this field as RsvdZ. |
| 15:0 | 0x0<br>RW | **Interrupt Message Data (IMD):** Data value in the interrupt request. |

## 44.4.11 Fault Event Address Register (FEADDR_REG_0_0_0_VTDBAR)—Offset 40h

Register specifying the interrupt message address.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + 40h

**Default:** 00000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **Message Address (MA):** When fault events are enabled, the contents of this register specify the DWORD-aligned address (bits 31:2) for the interrupt request. |
| 1:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 44.4.12 Fault Event Upper Address Register (FEUADDR_REG_0_0_0_VTDBAR)—Offset 44h

Register specifying the interrupt message upper address.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + 44h

**Default:** 00000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Message Upper Address (MUA):** Hardware implementations supporting Extended Interrupt Mode are required to implement this register.<br>Hardware implementations not supporting Extended Interrupt Mode may treat this field as RsvdZ. |

## 44.4.13 Advanced Fault Log Register (AFLOG_REG_0_0_0_VTDBAR)—Offset 58h

Register to specify the base address of the memory-resident fault-log region. This register is treated as RsvdZ for implementations not supporting advanced translation fault logging (AFL field reported as 0 in the Capability register).

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [DEFVTDBAR] + 58h

**Default:** 0000000000000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:12 | 0x0<br>RO | **Fault Log Address (FLA):** This field specifies the base of 4KB aligned fault-log region in system memory.<br>Hardware ignores and does not implement bits 63:HAW, where HAW is the host address width. Software specifies the base address and size of the fault log region through this register, and programs it in hardware through the SFL field in the Global Command register.<br>When implemented, reads of this field return the value that was last programmed to it. |
| 11:9 | 0x0<br>RO | **Fault Log Size (FLS):** This field specifies the size of the fault log region pointed by the FLA field.<br>The size of the fault log region is 2X * 4KB, where X is the value programmed in this register.<br>When implemented, reads of this field return the value that was last programmed to it. |
| 8:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 44.4.14 Protected Memory Enable Register (PMEN_REG_0_0_0_VTDBAR)—Offset 64h

Register to enable the DMA-protected memory regions setup through the PLMBASE,..PLMLIMT, PHMBASE, PHMLIMIT registers. This register is always treated as RO for implementations not supporting protected memory regions (PLMR and PHMR fields reported as Clear in the Capability register). Protected memory regions may be used by software to securely initialize remapping structures in memory. To avoid impact to legacy BIOS usage of memory, software is recommended to not overlap protected memory regions with any reserved memory regions of the platform reported through the Reserved Memory Region Reporting (RMRR) structures.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + 64h

**Default:** 00000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Enable Protected Memory (EPM):** This field controls DMA accesses to the protected low-memory and protected high-memory regions.<br>• 0 = Protected memory regions are disabled.<br>• 1 = Protected memory regions are enabled.DMA requests accessing protected memory regions are handled as follows:<br>When DMA remapping is not enabled, all DMA requests accessing protected memory regions are blocked.<br>When DMA remapping is enabled:<br>DMA requests processed as pass-through (Translation Type value of 10b in Context-Entry) and accessing the protected memory regions are blocked.<br>DMA requests with translated address (AT=10b) and accessing the protected memory regions are blocked.<br>DMA requests that are subject to address remapping, and accessing the protected memory regions may or may not be blocked by hardware. For such requests, software must not depend on hardware protection of the protected memory regions, and instead program the DMA-remapping page-tables to not allow DMA to protected memory regions.<br>Remapping hardware access to the remapping structures are not subject to protected memory region checks. DMA requests blocked due to protected memory region violation are not recorded or reported as remapping faults.<br>Hardware reports the status of the protected memory enable/disable operation through the PRS field in this register.<br>Hardware implementations supporting DMA draining must drain any in-flight translated DMA requests queued within the Root-Complex before indicating the protected memory region as enabled through the PRS field. |
| 30:1 | 0x0<br>RO | **RSVD0:** Reserved |
| 0 | 0x0<br>RO/V | **Protected Region Status (PRS):** This field indicates the status of protected memory region(s):<br>• 0 = Protected memory region(s) disabled.<br>• 1 = Protected memory region(s) enabled. |

## 44.4.15 Protected Low Memory Base Register (PLMBASE_REG_0_0_0_VTDBAR)—Offset 68h

Register to set up the base address of DMA-protected low-memory region below 4GB. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected low memory region (PLMR field reported as Clear in the Capability register). The alignment of the protected low memory region base depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1s to this register, and finding the most significant zero bit position with 0 in the value read back from the register. Bits N:0 of this register is decoded by hardware as all 0s...Software must setup the protected low memory region below 4GB. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + 68h

**Default:** 00000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RW | **Protected Low-Memory Base (PLMB):** This register specifies the base of protected low-memory region in system memory. |
| 19:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 44.4.16 Protected Low-Memory Limit Register (PLMLIMIT_REG_0_0_0_VTDBAR)—Offset 6Ch

Register to set up the limit address of DMA-protected low-memory region below 4GB. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled This register is always treated as RO for implementations not supporting protected low memory region (PLMR field reported as Clear in the Capability register) The alignment of the protected low memory region limit depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1s to this register, and finding most significant zero bit position with 0 in the value read back from the register. Bits N:0 of the limit register is decoded by hardware as all 1s The Protected low-memory base and limit registers functions as follows:

- Programming the protected low-memory base and limit registers with the same value in bits 31: (N+1) specifies a protected low-memory region of size 2(N+1) bytes
- Programming the protected low-memory limit register with a value less than the protected low-memory base register disables the protected low-memory region

Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + 6Ch

**Default:** 00000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RW | **Protected Low-Memory Limit (PLML):** This register specifies the last host physical address of the DMA-protected low-memory region in system memory. |
| 19:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 44.4.17 Protected High-Memory Base Register (PHMBASE_REG_0_0_0_VTDBAR)—Offset 70h

Register to set up the base address of DMA-protected high-memory region. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled This register is always treated as RO for implementations not supporting protected high memory region (PHMR field reported as Clear in the Capability register) The alignment of the protected high memory region base depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1s to this register, and finding most significant zero bit position below host address width (HAW) in the value read back from the register. Bits N:0 of this register are decoded by hardware as all 0s Software may setup the protected high memory region either above or below 4GB Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [DEFVTDBAR] + 70h

**Default:** 0000000000000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:39 | 0x0<br>RO | **RSVD0:** Reserved |
| 38:20 | 0x0<br>RW | **Protected High-Memory Base (PHMB):** This register specifies the base of protected (high) memory region in system memory.<br>Hardware ignores, and does not implement, bits 63:HAW, where HAW is the host address width. |
| 19:0 | 0x0<br>RO | **RSVD1:** Reserved |

## 44.4.18 Protected High-Memory Limit Register (PHMLIMIT_REG_0_0_0_VTDBAR)—Offset 78h

Register to set up the limit address of DMA-protected high-memory region. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled This register is always treated as RO for implementations not supporting protected high memory region (PHMR field reported as Clear in the Capability register) The alignment of the protected high memory region limit depends on the number of reserved bits (N:0) of this register. Software may determine the value of N by writing all 1s to this register, and finding most significant zero bit position below host address width (HAW) in the value read back from the register. Bits N:0 of the limit register is decoded by hardware as all 1s The protected high-memory base and limit registers functions as follows

- Programming the protected low-memory base and limit registers with the same value in bits HAW:(N+1) specifies a protected low-memory region of size 2(N+1) bytes
- Programming the protected high-memory limit register with a value less than the protected high-memory base register disables the protected high-memory region

Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [DEFVTDBAR] + 78h

**Default:** 0000000000000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:39 | 0x0<br>RO | **RSVD0:** Reserved |
| 38:20 | 0x0<br>RW | **Protected High-Memory Limit (PHML):** This register specifies the last host physical address of the DMA-protected high-memory region in system memory.<br>Hardware ignores and does not implement bits 63:HAW, where HAW is the host address width. |
| 19:0 | 0x0<br>RO | **RSVD1:** Reserved |

## 44.4.19 Invalidation Queue Head Register (IQH_REG_0_0_0_VTDBAR)—Offset 80h

Register indicating the invalidation queue head. This register is treated as RsvdZ by implementations reporting Queued Invalidation (QI) as not supported in the Extended Capability register.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [DEFVTDBAR] + 80h

**Default:** 0000000000000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:19 | 0x0<br>RO | **RSVD0:** Reserved |
| 18:4 | 0x0<br>RO/V | **Queue Head (QH):** Specifies the offset (128-bit aligned) to the invalidation queue for the command that will be fetched next by hardware.<br>Hardware resets this field to 0 whenever the queued invalidation is disabled (QIES field Clear in the Global Status register). |
| 3:0 | 0x0<br>RO | **RSVD1:** Reserved |

## 44.4.20 Invalidation Queue Tail Register (IQT_REG_0_0_0_VTDBAR)—Offset 88h

Register indicating the invalidation tail head. This register is treated as RsvdZ by implementations reporting Queued Invalidation (QI) as not supported in the Extended Capability register.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [DEFVTDBAR] + 88h

**Default:** 0000000000000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:19 | 0x0<br>RO | **RSVD0:** Reserved |
| 18:4 | 0x0<br>RW | **Queue Tail (QT):** Specifies the offset (128-bit aligned) to the invalidation queue for the command that will be written next by software. |
| 3:0 | 0x0<br>RO | **RSVD1:** Reserved |

## 44.4.21 Invalidation Queue Address Register (IQA_REG_0_0_0_VTDBAR)—Offset 90h

Register to configure the base address and size of the invalidation queue. This register is treated as RsvdZ by implementations reporting Queued Invalidation (QI) as not supported in the Extended Capability register.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [DEFVTDBAR] + 90h

**Default:** 0000000000000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:39 | 0x0<br>RO | **RSVD0:** Reserved |
| 38:12 | 0x0<br>RW | **Invalidation Queue Base Address (IQA):** This field points to the base of 4KB aligned invalidation request queue.<br>Hardware ignores and does not implement bits 63:HAW, where HAW is the host address width.<br>Reads of this field return the value that was last programmed to it. |
| 11:3 | 0x0<br>RO | **RSVD1:** Reserved |
| 2:0 | 0x0<br>RW | **Queue Size (QS):** This field specifies the size of the invalidation request queue. A value of X in this field indicates an invalidation request queue of (2X) 4KB pages.<br>The number of entries in the invalidation queue is 2(X + 8). |

## 44.4.22 Invalidation Completion Status Register (ICS_REG_0_0_0_VTDBAR)—Offset 9Ch

Register to report completion status of invalidation wait descriptor with Interrupt Flag (IF) Set This register is treated as RsvdZ by implementations reporting Queued Invalidation (QI) as not supported in the Extended Capability register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + 9Ch

**Default:** 00000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x0<br>RO | **RSVD0:** Reserved |
| 0 | 0x0<br>RW/1C | **Invalidation Wait Descriptor Complete (IWC):** Indicates completion of Invalidation Wait Descriptor with Interrupt Flag (IF) field Set. Hardware implementations not supporting queued invalidations implement this field as RsvdZ.<br><br>**Power Well:** prst |

## 44.4.23 Invalidation Event Control Register (IECTL_REG_0_0_0_VTDBAR)—Offset A0h

Register specifying the invalidation event interrupt control bits This register is treated as RsvdZ by implementations reporting Queued Invalidation (QI) as not supported in the Extended Capability register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + A0h

**Default:** 80000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x1<br>RW | **Interrupt Mask (IM):**<br>• 0= No masking of interrupt. When a invalidation event condition is detected, hardware issues an interrupt message (using the Invalidation Event Data and Invalidation Event Address register values)<br>• 1= This is the value on reset. Software may mask interrupt message generation by setting this field. Hardware is prohibited from sending the interrupt message when this field is Set. |
| 30 | 0x0<br>RO/V | **Interrupt Pending (IP):** Hardware sets the IP field whenever it detects an interrupt condition. Interrupt condition is defined as:<br>• An Invalidation Wait Descriptor with Interrupt Flag (IF) field Set completed, setting the IWC field in the Invalidation Completion Status register<br>• If the IWC field in the Invalidation Completion Status register was already Set at the time of setting this field, it is not treated as a new interrupt condition<br>The IP field is kept Set by hardware while the interrupt message is held pending. The interrupt message could be held pending due to interrupt mask (IM field) being Set, or due to other transient hardware conditions. The IP field is cleared by hardware as soon as the interrupt message pending condition is serviced. This could be due to either:<br>• 0= Hardware issuing the interrupt message due to either change in the transient hardware condition that caused interrupt message to be held pending or due to software clearing the IM field<br>• 1= Software servicing the IWC field in the Invalidation Completion Status register. |
| 29:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 44.4.24 Invalidation Event Data Register (IEDATA_REG_0_0_0_VTDBAR)—Offset A4h

Register specifying the Invalidation Event interrupt message data This register is treated as RsvdZ by implementations reporting Queued Invalidation (QI) as not supported in the Extended Capability register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + A4h

**Default:** 00000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **Extended Interrupt Message Data (EIMD):** This field is valid only for implementations supporting 32-bit interrupt data fields.<br>Hardware implementations supporting only 16-bit interrupt data treat this field as Rsvd. |
| 15:0 | 0x0<br>RW | **Interrupt Message Data (IMD):** Data value in the interrupt request. |

## 44.4.25 Invalidation Event Address Register (IEADDR_REG_0_0_0_VTDBAR)—Offset A8h

Register specifying the Invalidation Event Interrupt message address This register is treated as RsvdZ by implementations reporting Queued Invalidation (QI) as not supported in the Extended Capability register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + A8h

**Default:** 00000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **Message Address (MA):** When fault events are enabled, the contents of this register specify the DWORD-aligned address (bits 31:2) for the interrupt request. |
| 1:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 44.4.26 Invalidation Event Upper Address Register (IEUADDR_REG_0_0_0_VTDBAR)—Offset ACh

Register specifying the Invalidation Event interrupt message upper address.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + ACh

**Default:** 00000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Message Upper Address (MUA):** Hardware implementations supporting Queued Invalidations and Extended Interrupt Mode are required to implement this register.<br>Hardware implementations not supporting Queued Invalidations or Extended Interrupt Mode may treat this field as RsvdZ. |

## 44.4.27 Interrupt Remapping Table Address Register (IRTA_REG_0_0_0_VTDBAR)—Offset B8h

Register providing the base address of Interrupt remapping table.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [DEFVTDBAR] + B8h

**Default:** 0000000000000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:12 | 0x0<br>RW | **Interrupt Remapping Table Address (IRTA):** This field points to the base of 4KB aligned interrupt remapping table |
| 11 | 0x0<br>RW | **Extended Interrupt Mode Enable (EIME):** This field is used by hardware on Intel64 platforms as follows:<br>• 0=xAPIC mode is active. Hardware interprets only low 8-bits of Destination-ID field in the IRTEs. The high 24-bits of the Destination-ID field are treated as reserved<br>• 1= x2APIC mode is active. Hardware interprets all 32-bits of Destination-ID field in the IRTEs |
| 10:4 | 0x0<br>RO | **RSVD0:** Reserved |
| 3:0 | 0x0<br>RW | **Size (S):** This field specifies the size of the interrupt remapping table. The number of entries in the interrupt remapping table is 2(X+1), where X is the value programmed in this field. |

## 44.4.28 Page Request Status Register (PRESTS_REG_0_0_0_VTDBAR)—Offset DCh

Register to report pending page request in page request queue. This register is treated as RsvdZ by implementations reporting Page Request Support (PRS) as not supported in the Extended Capability register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + DCh

**Default:** 00000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x0<br>RO | **RSVD0:** Reserved |
| 0 | 0x0<br>RW/1C | **Pending Page Request (PPR):** Pending Page Request: Indicates pending page requests to be serviced by software in the page request queue.<br>This field is Set by hardware when a streaming page request entry (page_stream_reg_dsc) or a page group request (page_grp_req_dsc) with Last Page in Group (LPG) field Set, is added to the page request queue.<br><br>**Power Well:** prst |

## 44.4.29 Page Request Event Control Register (PRECTL_REG_0_0_0_VTDBAR)—Offset E0h

Register specifying the page request event interrupt control bits.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + E0h

**Default:** 80000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x1<br>RW | **Interrupt Mask (IM):** Interrupt Mask<br>• 0=No masking of interrupt. When a page request event condition is detected, hardware issues an interrupt message<br>• 1=This is the value on reset. Software may mask interrupt message generation by setting this field. |
| 30 | 0x0<br>RO/V | **Interrupt Pending (IP):** Interrupt Pending: Hardware sets the IP field whenever it detects an interrupt condition.<br>The IP field is kept Set by hardware while the interrupt message is held pending. |
| 29:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 44.4.30 Page Request Event Data Register (PREDATA_REG_0_0_0_VTDBAR)—Offset E4h

Register specifying the Page Request Event interrupt message data. This register is treated as RsvdZ by implementations reporting Page Request Support (PRS) as not supported in the Extended Capability register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + E4h

**Default:** 00000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **Extended Interrupt Message Data (EIMD):** Extended Interrupt Message Data |
| 15:0 | 0x0<br>RW | **Interrupt Message Data (IMD):** Interrupt Message Data: Data value in the interrupt request. Software requirements for programming this register are described in VTd Spec |

## 44.4.31 Page Request Event Address Register (PREADDR_REG_0_0_0_VTDBAR)—Offset E8h

Register specifying the Page Request Event Interrupt message address. This register is treated as RsvdZ by implementations reporting Page Request Support (PRS) as not supported in the Extended Capability register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + E8h

**Default:** 00000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **Message Address (MA):** Message Address: When fault events are enabled, the contents of this register specify the DWORD-aligned address (bits 31:2) for the interrupt request. |
| 1:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 44.4.32 Page Request Event Upper Address Register (PREUADDR_REG_0_0_0_VTDBAR)—Offset ECh

Register specifying the Page Request Event interrupt message upper address.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [DEFVTDBAR] + ECh

**Default:** 00000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Message Upper Address (MUA):** Message Upper Address:<br>This field specifies the upper address (bits.. 63:32) for the page request event interrupt. |

## 44.4.33 Fault Recording Register Low [0] (FRCDL_REG_0_0_0_VTDBAR)—Offset 400h

Register to record fault information when primary fault logging is active. Hardware reports the number and location of fault recording registers through the Capability register. This register is relevant only for primary fault logging This register is sticky and can be cleared only through power good reset or by software clearing the RW1C fields by writing a 1.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [DEFVTDBAR] + 400h

**Default:** 0000000000000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:12 | 0x0<br>RO/V | **Fault Info (FI):** When the Fault Reason (FR) field indicates one of the DMA-remapping fault conditions, bits 63:12 of this field contain the page address in the faulted DMA request.<br>Hardware treats bits 63:N as reserved (0), where N is the maximum guest address width (MGAW) supported.<br>When the Fault Reason (FR) field indicates one of the interrupt-remapping fault conditions, bits 63:48 of this field indicate the interrupt_index computed for the faulted interrupt request, and bits 47:12 are cleared.<br>This field is relevant only when the F field is Set.<br><br>**Power Well:** prst |
| 11:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 44.4.34 Fault Recording Register High [0] (FRCDH_REG_0_0_0_VTDBAR)—Offset 408h

Register to record fault information when primary fault logging is active. Hardware reports the number and location of fault recording registers through the Capability register. This register is relevant only for primary fault logging This register is sticky and can be cleared only through power good reset or by software clearing the RW1C fields by writing a 1.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [DEFVTDBAR] + 408h

**Default:** 0000000000000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW/1C | **Fault (F):** Hardware sets this field to indicate a fault is logged in this Fault Recording register.<br>The F field is set by hardware after the details of the fault is recorded in other fields.<br>When this field is Set, hardware may collapse additional faults from the same source-id (SID)<br><br>**Power Well:** prst |
| 62 | 0x0<br>RO/V | **Type (T):** Type of the faulted request:<br>• 0=0: Write request<br>• 1=1: Read request or AtomicOp request<br>This field is relevant only when the F field is Set, and when the fault reason (FR) indicates one of the DMA-remapping fault conditions.<br><br>**Power Well:** prst |
| 61:60 | 0x0<br>RO/V | **Address Type (AT):** This field captures the AT field from the faulted DMA request.<br>Hardware implementations not supporting Device-IOTLBs (DI field Clear in Extended Capability register) treat this field as RsvdZ.<br>When supported, this field is valid only when the F field is Set, and when the fault reason (FR) indicates one of the DMA-remapping fault conditions.<br><br>**Power Well:** prst |
| 59:40 | 0x0<br>RO/V | **PASID Value (PN):** PASID value in the faulted request.<br>This field is relevant only when the PP field is set. Hardware implementations not supporting PASID (PASID field Clear in Extended Capability register) implement this field as RsvdZ.<br><br>**Power Well:** prst |
| 39:32 | 0x0<br>RO/V | **Fault Reason (FR):** Reason for the fault<br>This field is relevant only when the F field is set.<br><br>**Power Well:** prst |
| 31 | 0x0<br>RO/V | **PASID Present (PP):** When set, indicates the faulted request has a PASID tag.<br>The value of the PASID field is reported in the PASID Value (PV) field.<br>This field is relevant only when the F field is Set, and when the fault reason (FR) indicates one of the non-recoverable address translation fault conditions. Hardware implementations not supporting PASID (PASID field Clear in Extended Capability register) implement this field as RsvdZ.<br><br>**Power Well:** prst |
| 30 | 0x0<br>RO/V | **Execute Permission Requested (EXE):** When set, indicates Execute permission was requested by the faulted read request.<br>This field is relevant only when the PP field and T field are both Set.<br>Hardware implementations not supporting PASID (PASID field Clear in Extended Capability register) implement this field as RsvdZ.<br><br>**Power Well:** prst |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 29 | 0x0<br>RO/V | **Privilege Mode Requested (PRIV):** When set, indicates Supervisor privilege was requested by the faulted request.<br>This field is relevant only when the PP field is Set.<br>Hardware implementations not supporting PASID (PASID field Clear in Extended Capability register) implement this field as RsvdZ.<br><br>**Power Well:** prst |
| 28:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15:0 | 0x0<br>RO/V | **Source Identifier (SID):** Requester-id associated with the fault condition.<br>This field is relevant only when the F field is set.<br><br>**Power Well:** prst |

## 44.4.35 Invalidate Address Register (IVA_REG_0_0_0_VTDBAR)—Offset 500h

Register to provide the DMA address whose corresponding IOTLB entry needs to be invalidated through the corresponding IOTLB Invalidate register. This register is a write-only register.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [DEFVTDBAR] + 500h

**Default:** 0000000000000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:12 | 0x0<br>RW | **Address (ADDR):** Software provides the DMA address that needs to be page-selectively invalidated.<br>To make a page-selective invalidation request to hardware, software must first write the appropriate fields in this register, and then issue the appropriate page-selective invalidate command through the IOTLB_REG.<br>Hardware ignores bits 63:N, where N is the maximum guest address width (MGAW) supported.<br>A value returned on a read of this field is undefined. |
| 11:7 | 0x0<br>RO | **RSVD0:** Reserved |
| 6 | 0x0<br>RW | **Invalidation Hint (IH):** The field provides hint to hardware about preserving or flushing the non-leaf (page-directory) entries that may be cached in hardware:<br>• 0 = Software may have modified both leaf and non-leaf page-table entries corresponding to mappings specified in the ADDR and AM fields. On a page-selective invalidation request, hardware must flush both the cached leaf and non-leaf page-table entries corresponding to the mappings specified by ADDR and AM fields.<br>• 1 = Software has not modified any non-leaf page-table entries corresponding to mappings specified in the ADDR and AM fields. On a page-selective invalidation request, hardware may preserve the cached non-leaf page-table entries corresponding to mappings specified by ADDR and AM fields.<br>A value returned on a read of this field is undefined. |
| 5:0 | 0x0<br>RW | **Address Mask (AM):** The value in this field specifies the number of low order bits of the ADDR field that must be masked for the invalidation operation.<br>This field enables software to request invalidation of contiguous mappings for size-aligned regions.<br>For example:..Mask ADDR bits Pages..Value masked invalidated.. 0 None 1.. 1 12 2.. 2 13:12 4.. 3 14:12 8.. 4 15:12 16<br>When invalidating mappings for super-pages, software must specify the appropriate mask value. For example, when invalidating mapping for a 2MB page, software must specify an address mask value of at least 9...Hardware implementations report the maximum supported mask value through the Capability register. |

## 44.4.36 IOTLB Invalidate Register (IOTLB_REG_0_0_0_VTDBAR)—Offset 508h

Register to invalidate IOTLB. The act of writing the upper byte of the IOTLB_REG with IVT field Set causes the hardware to perform the IOTLB invalidation.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [DEFVTDBAR] + 508h

**Default:** 0200000000000000h

**DEFVTDBAR Type:** Memory Mapped I/O Register (Size: 64 bits)
**DEFVTDBAR Reference:** B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x0<br>RW/V | **Invalidate IOTLB (IVT):** Software requests IOTLB invalidation by setting this field.<br>Software must also set the requested invalidation granularity by programming the IIRG field. Hardware clears the IVT field to indicate the invalidation request is complete.<br>Hardware also indicates the granularity at which the invalidation operation was performed through the IAIG field.<br>Software must not submit another invalidation request through this register while the IVT field is Set, nor update the associated Invalidate Address register.<br>Software must not submit IOTLB invalidation requests when there is a context-cache invalidation request pending at this remapping hardware unit.<br>Hardware implementations reporting write-buffer flushing requirement (RWBF=1 in Capability register) must implicitly perform a write buffer flushing before invalidating the IOTLB. |
| 62 | 0x0<br>RO | **RSVD0:** Reserved |
| 61:60 | 0x0<br>RW | **IOTLB Invalidation Request Granularity (IIRG):** When requesting hardware to invalidate the IOTLB (by setting the IVT field), software writes the requested invalidation granularity through this field.<br>The following are the encodings for the field:<br>• 00 = Reserved<br>• 01 = Global invalidation request<br>• 10 = Domain-selective invalidation request. The target domain-id must be specified in the DID field<br>• 11 = Page-selective invalidation request. The target address, mask and invalidation hint must be specified in the Invalidate Address register, and the domain-id must be provided in the DID field<br>Hardware implementations may process an invalidation request by performing invalidation at a coarser granularity than requested.<br>Hardware indicates completion of the invalidation request by clearing the IVT field.<br>At this time, the granularity at which actual invalidation was performed is reported through the IAIG field. |
| 59 | 0x0<br>RO | **RSVD1:** Reserved |
| 58:57 | 0x1<br>RO/V | **IOTLB Actual Invalidation Granularity (IAIG):** Hardware reports the granularity at which an invalidation request was processed through this field when reporting invalidation completion (by clearing the IVT field).<br>The following are the encodings for this field<br>• 00 = Reserved. This indicates hardware detected an incorrect invalidation request and ignored the request. Examples of incorrect invalidation requests include detecting an unsupported address mask value in Invalidate Address register for page-selective invalidation requests<br>• 01 = Global Invalidation performed. This could be in response to a global, domain-selective, or page-selective invalidation request<br>• 10 = Domain-selective invalidation performed using the domain-id specified by software in the DID field. This could be in response to a domain-selective or a page-selective invalidation request<br>• 11 = Domain-page-selective invalidation performed using the address, mask and hint specified by software in the Invalidate Address register and domain-id specified in DID field. This can be in response to a page-selective invalidation request. |
| 56:50 | 0x0<br>RO | **RSVD2:** Reserved |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 49 | 0x0<br>RW | **Drain Reads (DR):** This field is ignored by hardware if the DRD field is reported as clear in the Capability register.<br>When the DRD field is reported as Set in the Capability register, the following encodings are supported for this field:<br>• 0 = Hardware may complete the IOTLB invalidation without draining any translated DMA read requests<br>• 1 = Hardware must drain DMA read requests. |
| 48 | 0x0<br>RW | **Drain Writes (DW):** This field is ignored by hardware if the DWD field is reported as Clear in the Capability register.<br>When the DWD field is reported as Set in the Capability register, the following encodings are supported for this field:<br>• 0 = Hardware may complete the IOTLB invalidation without draining DMA write requests<br>• 1 = Hardware must drain relevant translated DMA write requests. |
| 47:32 | 0x0<br>RW | **Domain-ID (DID):** Indicates the ID of the domain whose IOTLB entries need to be selectively invalidated.<br>This field must be programmed by software for domain-selective and page-selective invalidation requests.<br>The Capability register reports the domain-id width supported by hardware.<br>Software must ensure that the value written to this field is within this limit. Hardware ignores and not implements bits 47:(32+N), where N is the supported domain-id width reported in the Capability register. |
| 31:0 | 0x0<br>RO | **RSVD3:** Reserved |

## 44.5 Sideband Registers

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space using the Sideband Base Address Register (BAR) DEFVTDBAR. It is located in Host Root Memory Space MCHBAR +offset 6C80h.

See Section 44.3.123, "Default VTd BAR (B_CR_DEFVTDBAR_0_0_0_MCHBAR)—Offset 6C80h" on page 1316.

### 44.5.1 UCELOG—Offset 64h

Uncorrectable Error Log This register captures the log information when the corresponding channel DERRSTS.UCE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.UCE[1:0] is cleared to 0.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 64h
**Host Memory Space:** SBREG_BAR + 0x100000 + 64h

**Default:** 00000800h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:22 | 0x0<br>RSV | **Rsvd_UCELOG_1:** Reserved |
| 21:20 | 0x0<br>RO/V/P | **UCERNK:** Rank Address: This is the rank address that contained the error |
| 19:16 | 0x0<br>RO/V/P | **UCEBNK:** Bank Address: This is the bank address that contained the error. DDR3: UCEBNK[3] will always be 0 UCEBNK[2:0] = BA[2:0] DDR4: UCEBNK[3:2] = BG[1:0] UCEBNK[1:0] = BA[1:0] |
| 15 | 0x0<br>RO/V/P | **UCEAP:** Auto Pre-charge was issued on the read that contained the error. This will always be 0 since AP is not supported. |
| 14 | 0x0<br>RO/V/P | **UCELAST:** Last Burst: If this bit is set, then the error occurred within that last four DQ bus bursts before a DQ bus turn-around cycle. |
| 13 | 0x0<br>RO/V/P | **UCEFIRST:** First Burst: If this bit is set, then the error occurred within the first four DQ bus bursts after a DQ bus turn-around cycle. |
| 12 | 0x0<br>RO/V/P | **UCEA5:** Address bit 5: This is A[5] from the original request |
| 11 | 0x1<br>RO/V/P | **UCEBL8:** Burst Length 8: 0 = Burst Chop 4, 1 = Burst Length 8. This will always be 1 for DNV. |
| 10:8 | 0x0<br>RO/V/P | **UCEBOFF:** Burst Offset: This is the burst number that contained the error. Note that all 8 bursts are always numbered starting from 0. Thus, even when the critical chunk causes the bursts to occur in the logical order of 4,5,6,7,0,1,2,3, UCEBOFF will still number these starting from 0. So, for example, if an error is detected on logical byte 0, it is possible that this may be recorded as byte offset 4 with critical chunk reordering. |
| 7:0 | 0x0<br>RO/V/P | **UCESYND:** ECC Syndrome: This is the 8-bit syndrome output of the ECC checker logic. For DNV, this field does not provide useful information and is not reliable. |

## 44.5.2 UCEADDR—Offset 68h

Uncorrectable Error Address This register captures the log information when the corresponding channel DERRSTS.UCE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.UCE[1:0] is cleared to 0.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 68h
**Host Memory Space:** SBREG_BAR + 0x100000 + 68h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V/P | **UCEADDR:** Address Log: Captures the PMI address A[35:6] of the UCE error location. |

## 44.5.3 SBELOG—Offset 6Ch

Correctable (Single Bit) Error Log This register captures the log information when the corresponding channel DERRSTS.SBE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.SBE[1:0] is cleared to 0.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 6Ch
**Host Memory Space:** SBREG_BAR + 0x100000 + 6Ch

**Default:** 00000800h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:22 | 0x0<br>RSV | **Rsvd_SBELOG_1:** Reserved |
| 21:20 | 0x0<br>RO/V/P | **SBERNK:** Rank Address: This is the rank address that contained the error |
| 19:16 | 0x0<br>RO/V/P | **SBEBNK:** Bank Address: This is the bank address that contained the error. DDR3: UCEBNK[3] will always be 0 UCEBNK[2:0] = BA[2:0] DDR4: UCEBNK[3:2] = BG[1:0] UCEBNK[1:0] = BA[1:0] |
| 15 | 0x0<br>RO/V/P | **Reserved:** Reserved |
| 14 | 0x0<br>RO/V/P | **SBELAST:** Last Burst: If this bit is set, then the error occurred within that last four DQ bus bursts before a DQ bus turn-around cycle. |
| 13 | 0x0<br>RO/V/P | **SBEFIRST:** First Burst: If this bit is set, then the error occurred within the first four DQ bus bursts after a DQ bus turn-around cycle. |
| 12 | 0x0<br>RO/V/P | **SBEA5:** Address bit 5: This is A[5] from the original request. In 32 bit mode this field is undefined. |
| 11 | 0x1<br>RO/V/P | **Reserved:** Reserved |
| 10:8 | 0x0<br>RO/V/P | **SBEBOFF:** Burst Offset: This is the burst number that contained the error. Note that all 8 bursts are always numbered starting from 0. |
| 7:0 | 0x0<br>RO/V/P | **SBESYND:** ECC Syndrome: This is the 8-bit syndrome output of the ECC checker logic |

### 44.5.4 SBEADDR—Offset 70h

Correctable Error Address This register captures the log information when the corresponding channel DERRSTS.SBE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.SBE[1:0] is cleared.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 70h
**Host Memory Space:** SBREG_BAR + 0x100000 + 70h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V/P | **SBEADDR:** Address Log: Captures the PMI address A[35:6] of the SBE error location. |

## 44.5.5 SBECNT0—Offset 74h

SBE Count for Rank 0

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 74h
**Host Memory Space:** SBREG_BAR + 0x100000 + 74h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:17 | 0x0<br>RSV | **Rsvd_SBECNT0_0:** Reserved |
| 16 | 0x0<br>RW/C/V/P | **CORRERRORSTATUS:** The per rank status bits are set when a rank's error count equals the threshold. The status bits are what tell the BIOS/BMC what caused SMI/ERR[0] to get triggered. Once the status bits are set, they will remain set until cleared by BIOS and will cause the SMI/ERR[0] to get signaled to the cores. |
| 15:0 | 0x0<br>RW/C/V/P | **CNT:** Single Bit Error Count for Rank 0. Any write to this register will clear the counter to 0. |

## 44.5.6 SBECNT1—Offset 78h

SBE Count for Rank 1

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 78h
**Host Memory Space:** SBREG_BAR + 0x100000 + 78h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:17 | 0x0<br>RSV | **Rsvd_SBECNT1_0:** Reserved |
| 16 | 0x0<br>RW/C/V/P | **CORRERRORSTATUS:** The per rank status bits are set when a rank's error count equals the threshold. The status bits are what tell the BIOS/BMC what caused SMI/ERR[0] to get triggered. Once the status bits are set, they will remain set until cleared by BIOS and will cause the SMI/ERR[0] to get signaled to the cores. |
| 15:0 | 0x0<br>RW/C/V/P | **CNT:** Single Bit Error Count for Rank 1. Any write to this register will clear the counter to 0. |

## 44.5.7 SBECNT2—Offset 7Ch

SBE Count for Rank 2

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 7Ch
**Host Memory Space:** SBREG_BAR + 0x100000 + 7Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:17 | 0x0<br>RSV | **Rsvd_SBECNT2_0:** Reserved |
| 16 | 0x0<br>RW/C/V/P | **CORRERRORSTATUS:** The per rank status bits are set when a rank's error count equals the threshold. The status bits are what tell the BIOS/BMC what caused SMI/ERR[0] to get triggered. Once the status bits are set, they will remain set until cleared by BIOS and will cause the SMI/ERR[0] to get signaled to the cores. |
| 15:0 | 0x0<br>RW/C/V/P | **CNT:** Single Bit Error Count for Rank 2. Any write to this register will clear the counter to 0. |

## 44.5.8 SBECNT3—Offset 80h

SBE Count for Rank 3

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 80h
**Host Memory Space:** SBREG_BAR + 0x100000 + 80h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:17 | 0x0<br>RSV | **Rsvd_SBECNT3_0:** Reserved |
| 16 | 0x0<br>RW/C/V/P | **CORRERRORSTATUS:** The per rank status bits are set when a rank's error count equals the threshold. The status bits are what tell the BIOS/BMC what caused SMI/ERR[0] to get triggered. Once the status bits are set, they will remain set until cleared by BIOS and will cause the SMI/ERR[0] to get signaled to the cores. |
| 15:0 | 0x0<br>RW/C/V/P | **CNT:** Single Bit Error Count for Rank 3. Any write to this register will clear the counter to 0. |

## 44.5.9 SBEACC0—Offset 84h

SBE Accumulator for Rank0

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 84h
**Host Memory Space:** SBREG_BAR + 0x100000 + 84h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0x0<br>RSV | **Rsvd_SBEACC0_0:** Reserved |
| 17:0 | 0x0<br>RW/C/V/P | **LANE:** Single Bit Accumulator per Nibble Lane: This allows for identification of the failing x4 or x8 device. This value is cleared by any write to this register. |

## 44.5.10 SBEACC1—Offset 88h

SBE Accumulator for Rank1

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 88h
**Host Memory Space:** SBREG_BAR + 0x100000 + 88h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0x0<br>RSV | **Rsvd_SBEACC1_0:** Reserved |
| 17:0 | 0x0<br>RW/C/V/P | **LANE:** Single Bit Accumulator per Nibble Lane: This allows for identification of the failing x4 or x8 device. This value is cleared by any write to this register. |

## 44.5.11 SBEACC2—Offset 8Ch

SBE Accumulator for Rank2

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 8Ch
**Host Memory Space:** SBREG_BAR + 0x100000 + 8Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0x0<br>RSV | **Rsvd_SBEACC2_0:** Reserved |
| 17:0 | 0x0<br>RW/C/V/P | **LANE:** Single Bit Accumulator per Nibble Lane: This allows for identification of the failing x4 or x8 device. This value is cleared by any write to this register. |

## 44.5.12 SBEACC3—Offset 90h

SBE Accumulator for Rank3

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 90h
**Host Memory Space:** SBREG_BAR + 0x100000 + 90h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0x0<br>RSV | **Rsvd_SBEACC3_0:** Reserved |
| 17:0 | 0x0<br>RW/C/V/P | **LANE:** Single Bit Accumulator per Nibble Lane: This allows for identification of the failing x4 or x8 device. This value is cleared by any write to this register. |

## 44.5.13 DPATROL_SCRUB_CFG—Offset B0h

Patrol Scrub Config Register

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + B0h
**Host Memory Space:** SBREG_BAR + 0x100000 + B0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/P | **PAT_SCRUB_ENABLE:** Bit to enable/disable patrol scrub<br>• 0: Disable patrol scrub<br>• 1: Enable patrol scrub |
| 30 | 0x0<br>RW/P | **DIMM1_COL_ADDR_BITS:** Total number of column bits for devices on rank 0 = 10 + DIMM1_COL_ADDR_BITS<br>• 0: DDR4 and DDR3<br>• 1: Only DDR3 |
| 29 | 0x0<br>RW/P | **DIMM0_COL_ADDR_BITS:** Total number of column bits for devices on rank 0 = 10 + DIMM0_COL_ADDR_BITS<br>• 0: DDR4 and DDR3<br>• 1: Only DDR3 |
| 28:23 | 0x0<br>RW/P | **DIMM1_MAX_ROW_ADDR:** Maximum row address for DIMM1 - bits 17 to 12. Bits 11:0 are assumed to all be 1. |
| 22:17 | 0x0<br>RW/P | **DIMM0_MAX_ROW_ADDR:** Maximum row address for DIMM0 - bits 17 to 12. Bits 11:0 are assumed to all be 1. |
| 16 | 0x0<br>RW/P | **PATSCRUB_FORCE_WRITEBACK:** When set to 1, force write back of data with no errors. When set to 0, don't write back data that had no errors. |
| 15:0 | 0x0<br>RW/P | **MAX_PATSCRUB_DEBIT_CNT:** Maximum number of debit patrol scrub operations. Once the patrol scrub debit counter exceeds this value, patrol scrubs will be issued until the debit counter reaches 0. Set 0 to disable debit mode. |

## 44.5.14 UCELOG1—Offset CCh

This register captures the log information when the corresponding channel DERRSTS.UCE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.UCE[1:0] is cleared to 0.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + CCh
**Host Memory Space:** SBREG_BAR + 0x100000 + CCh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x0<br>RSV | **RSVD (reg_RSVD):** Reserved |
| 26:18 | 0x0<br>RO/V/P | **UCE_COL:** Column address bits above A[5] |
| 17:0 | 0x0<br>RO/V/P | **UCE_ROW:** Row bits |

## 44.5.15 SBELOG1—Offset D0h

Single bit error log 1 This register captures the log information when the corresponding channel DERRSTS.SBE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.SBE[1:0] is cleared.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + D0h
**Host Memory Space:** SBREG_BAR + 0x100000 + D0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x0<br>RSV | **RSVD (reg_RSVD):** Reserved |
| 26:18 | 0x0<br>RO/V/P | **SBE_COL:** Column bits [11,9:2], in 32 bit mode SBE_COL[0] will always be 0, SBE_COL[1] contains information for SBEBOFF[2] |
| 17:0 | 0x0<br>RO/V/P | **SBE_ROW:** Row bits |

## 44.5.16 CORRERRTHRSHLD0—Offset 100h

Correctable Error Threshold for Rank 0

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 100h
**Host Memory Space:** SBREG_BAR + 0x100000 + 100h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RSV | **Rsvd_CORRERRTHRSHLD0_0:** Reserved |
| 15:0 | 0x0<br>RW/P | **THRSH_RNK:** Correctable error threshold for rank 0. When the error accumulation in SBECNT0 hits this value, then the CORRERRSTATUS is set and a DO_SMI message is sent if the threshold value is greater than 0. |

## 44.5.17 CORRERRTHRSHLD1—Offset 104h

Correctable Error Threshold for Rank 1

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 104h
**Host Memory Space:** SBREG_BAR + 0x100000 + 104h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RSV | **Rsvd_CORRERRTHRSHLD1_0:** Reserved |
| 15:0 | 0x0<br>RW/P | **THRSH_RNK:** Correctable error threshold for rank 1. When the error accumulation in SBECNT1 hits this value, then the CORRERRSTATUS is set and a DO_SMI message is sent if the threshold value is greater than 0. |

## 44.5.18 CORRERRTHRSHLD2—Offset 108h

Correctable Error Threshold for Rank 2

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 108h
**Host Memory Space:** SBREG_BAR + 0x100000 + 108h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RSV | **Rsvd_CORRERRTHRSHLD2_0:** Reserved |
| 15:0 | 0x0<br>RW/P | **THRSH_RNK:** Correctable error threshold for rank 2. When the error accumulation in SBECNT2 hits this value, then the CORRERRSTATUS is set and a DO_SMI message is sent if the threshold value is greater than 0. |

## 44.5.19 CORRERRTHRSHLD3—Offset 10Ch

Correctable Error Threshold for Rank 3

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 10Ch
**Host Memory Space:** SBREG_BAR + 0x100000 + 10Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RSV | **Rsvd_CORRERRTHRSHLD3_0:** Reserved |
| 15:0 | 0x0<br>RW/P | **THRSH_RNK:** Correctable error threshold for rank 3. When the error accumulation in SBECNT3 hits this value, then the CORRERRSTATUS is set and a DO_SMI message is sent if the threshold value is greater than 0. |

## 44.5.20 LEAKY_BUCKET_CFG0—Offset 110h

Leaky Bucket Configuration Rank 0

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 110h
**Host Memory Space:** SBREG_BAR + 0x100000 + 110h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/P | **CNTR_HI:** Specifies the leaky bucket leak rat in CNTR_LO ticks. When the leaky bucket counter counts through CNTR_HI, the correctable error count for rank 0 is decremented by one. |
| 15:0 | 0x0<br>RW/P | **CNTR_LO:** Units for this register are 8192 DRAM clocks. When greater than zero, leaky bucket is enabled. This is the unit for the high order counter for rank 0, CNTR_HI. |

## 44.5.21 LEAKY_BUCKET_CFG1—Offset 114h

Leaky Bucket Configuration Rank 1

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 114h
**Host Memory Space:** SBREG_BAR + 0x100000 + 114h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/P | **CNTR_HI:** Specifies the leaky bucket leak rat in CNTR_LO ticks. When the leaky bucket counter counts through CNTR_HI, the correctable error count for rank 1 is decremented by one. |
| 15:0 | 0x0<br>RW/P | **CNTR_LO:** Units for this register are 8192 DRAM clocks. When greater than zero, leaky bucket is enabled. This is the unit for the high order counter for rank 1, CNTR_HI. |

## 44.5.22 LEAKY_BUCKET_CFG2—Offset 118h

Leaky Bucket Configuration Rank 2

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 118h
**Host Memory Space:** SBREG_BAR + 0x100000 + 118h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/P | **CNTR_HI:** Specifies the leaky bucket leak rat in CNTR_LO ticks. When the leaky bucket counter counts through CNTR_HI, the correctable error count for rank 2 is decremented by one. |
| 15:0 | 0x0<br>RW/P | **CNTR_LO:** Units for this register are 8192 DRAM clocks. When greater than zero, leaky bucket is enabled. This is the unit for the high order counter for rank 2, CNTR_HI. |

## 44.5.23 LEAKY_BUCKET_CFG3—Offset 11Ch

Leaky Bucket Configuration Rank 3

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 11Ch
**Host Memory Space:** SBREG_BAR + 0x100000 + 11Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/P | **CNTR_HI:** Specifies the leaky bucket leak rat in CNTR_LO ticks. When the leaky bucket counter counts through CNTR_HI, the correctable error count for rank 3 is decremented by one. |
| 15:0 | 0x0<br>RW/P | **CNTR_LO:** Units for this register are 8192 DRAM clocks. When greater than zero, leaky bucket is enabled. This is the unit for the high order counter for rank 3, CNTR_HI. |

## 44.5.24 FERRNERR—Offset 120h

First Error and Next Error Register

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 120h
**Host Memory Space:** SBREG_BAR + 0x100000 + 120h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:21 | 0x0<br>RSV | **Rsvd_FERRNERR_1 (Rsvd_FERRNERR_3):** Reserved |
| 20 | 0x0<br>RO/V/P | **FERRUCEPAT:** First Error Uncorrectable Patrol Scrub Read Error Detected: When set, the first error detected was an uncorrectable (multiple bit) error on the patrol scrub read from memory. |
| 19 | 0x0<br>RO/V/P | **FERRAPE:** First Error Uncorrectable DDR4 Command Address Parity Error: When set, the first error detected was the assertion of the xxDDR3_0_ALERT_N pin indicating that one or more DRAMs detected a Command/Address parity error. |
| 18 | 0x0<br>RO/V/P | **FERRWPE:** First Error Uncorrectable Write Parity Error Detected: When set, the first error detected was an uncorrectable (parity) error on the write data received from the Bunit. |
| 17 | 0x0<br>RO/V/P | **FERRUCE:** First Error Uncorrectable Read Error Detected: When set, the first error detected was an uncorrectable (multiple bit) error on the read data from memory. |
| 16 | 0x0<br>RO/V/P | **FERRSBE:** First Error Correctable Read Error Detected: When set, the first error detected was a single bit error on the read data from memory and the error was corrected. |
| 15:5 | 0x0<br>RSV | **Rsvd_FERRNERR_0 (Rsvd_FERRNERR_1):** Reserved |
| 4 | 0x0<br>RO/V/P | **NERRUCEPAT:** Next Error Uncorrectable Patrol Scrub Read Error: When set, the second error detected was an uncorrectable (mutliple bit) error on the patrol scrub read data from memory. |
| 3 | 0x0<br>RO/V/P | **NERRAPE:** Next Error Uncorrectable DDR4 Command Address Parity Error: When set, the second error detected was the assertion of the xxDDR3_0_ALERT_N pin indicating that one or more DRAMs detected a Command/Address parity error. Note that this bit can never be set as the same time as FERRAPE |
| 2 | 0x0<br>RO/V/P | **NERRWPE:** Next Error Uncorrectable Write Parity Error Detected: When set, the second error detected was an uncorrectable (parity) error on the write data received from the Bunit. |
| 1 | 0x0<br>RO/V/P | **NERRUCE:** Next Error Uncorrectable Read Error Detected: When set, the second error detected was an uncorrectable (multiple bit) error on the read data from memory. |
| 0 | 0x0<br>RO/V/P | **NERRSBE:** Next Error Correctable Read Error Detected: When set, the second error detected was a single bit error on the read data from memory and the error was corrected. |

## 44.5.25 DERRSTS—Offset 124h

Error Status Register

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 124h
**Host Memory Space:** SBREG_BAR + 0x100000 + 124h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:7 | 0x0<br>RSV | **Rsvd_DERRSTS_0 (Rsvd_DERRSTS_1):** Reserved |
| 6 | 0x0<br>RW/1C/V/P | **CAP_ERR_STATE:** Channel Command Address Parity Error State. 1 = CAP error seen, error state entered. All PMI reads will be returned with bad parity. 0 = No CAP error seen. Normal PMI operation. |
| 5 | 0x0<br>RO/V/P | **ALERT:** Current state of the channel ALERT_N pin, captured here as active high: 1 = Error being driven by at least one DRAM device 0 = No error currently detected by any DRAM device |
| 4 | 0x0<br>RW/1C/V/P | **UCEPAT:** Uncorrectable (multiple bit) patrol scrub error: When set, an uncorrectable (multiple bit error was detected on the read data from memory. |
| 3 | 0x0<br>RW/1C/V/P | **APE:** Uncorrectable DDR4 Command/Address Parity Error: When set, an uncorrectable DDR4 command/address parity error was detected by one or more of the DRAMs on channel 0. |
| 2 | 0x0<br>RW/1C/V/P | **WPE:** Uncorrectable (Parity) Write Error: When set, an uncorrectable (parity) error was detected on the write data received from the Bunit. |
| 1 | 0x0<br>RW/1C/V/P | **UCE:** Uncorrectable (Double Bit) Read Error: When set, a double bit error was detected on the read data from memory. |
| 0 | 0x0<br>RW/1C/V/P | **SBE:** Correctable (Single Bit) Read Error: When set, a single bit error was detected on the read data from memory and the error was corrected. |

## 44.5.26 DERRMSKSEV—Offset 128h

Error Mask and Severity

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 128h
**Host Memory Space:** SBREG_BAR + 0x100000 + 128h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|

## 44.5.28 DERRCNT—Offset 130h

Uncorrectable Error Count

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 130h
**Host Memory Space:** SBREG_BAR + 0x100000 + 130h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RSV | **Rsvd_DERRCNT:** Reserved |
| 7:0 | 0x0<br>RW/1C/V/P | **UNCCNT:** Uncorrectable Error Count: The count of uncorrectable errors that have occurred since the last time the count was cleared. The count limit is 128 (80h) and the count is cleared by writing ones to all bits (FFh). The type of uncorrectable errors that are counted is determined by the DERRCNTSEL register. Additionally, if two uncorrectable errors occur in the same clock cycle, only one type will be counted, even if multiple types are selected. |

## 44.5.29 ERRINJCTL—Offset 134h

Error Injection Control

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 134h
**Host Memory Space:** SBREG_BAR + 0x100000 + 134h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RW/P | **INJECCPAR:** Error Injection ECC/Parity[7:0]: Error injection ECC/parity. Zero bits indicate no injection; one bits indicate that the corresponding read/write ECC or parity bit should be inverted. |
| 23:20 | 0x0<br>RSV | **Rsvd_ERRINJCTL_2:** Reserved |
| 19 | 0x0<br>RW/P | **INJAMSK4:** Error Injection Address Mask[4]: This is the mask bit for error injection address bit 4; address mask bits 36:5 are located in the ERRINJAMSK register. |
| 18 | 0x0<br>RW/P | **INJADDR4:** Error Injection Address[4]: This is error injection address bit 4; address bits 36:5 are located in the ERRINJADDR register. |
| 17 | 0x0<br>RW/P | **INJAMSK3:** Error Injection Address Mask[3]: This is the mask bit for error injection address bit 3; address mask bits 36:5 are located in the ERRINJAMSK register. |
| 16 | 0x0<br>RW/P | **INJADDR3:** Error Injection Address[3]: This is error injection address bit 3; address bits 35:4 are located in the ERRINJADDR register. |
| 15:14 | 0x0<br>RW/P | **INJTRIGSEL:** Error Injection Trigger Selection: 0x = Disable error injection trigger sources 10 = Enable error injection when trigger source 0 (ddr_fsta_trigev[0]) is asserted 11 = Enable error injection when trigger source 1 (ddr_fsta_trigev[1]) is asserted. When setting this field to 1X, the INJEN field should be set to 0 since it will be set automatically when the trigger asserts. |
| 13:12 | 0x0<br>RW/P | **INJCAP:** Command address parity injection per dclk half |
| 11:8 | 0x0<br>RW/P | **INJSRC:** Error Injection Source[3:0]: The selected requestor source ID match against when selecting the transaction for error injection. |
| 7 | 0x0<br>RW/P | **INJPAT:** Inject on patrol scrub request. Address match/mask logic is not used here. Error injection will occur on the next patrol scrub once INJEN is set. |
| 6 | 0x0<br>RW/P | **INJREAD:** Error Injection in the Read Data Path: 0 = Disable 1 = Enabled |
| 5 | 0x0<br>RW/P | **INJWRITE:** Error Injection in the Write Data Path: 0 = Disable 1 = Enabled |
| 4 | 0x0<br>RW/P | **INJECC:** Error Injection in ECC or Parity Path Selection: 0 = Inject in the Data/Parity Path 1 = Inject in the Data/ECC Path |
| 3 | 0x0<br>RW/P | **INJSRCEN:** Error Injection Source Enable: When set, the error injection will be performed only for the specified requestor source. |
| 2 | 0x0<br>RW/P | **INJADREN:** Error Injection Address Enable: When set, the error injection will be performed only for addresses that match the address specified in the ERRINJADDR and ERRINJAMSK registers. |
| 1 | 0x0<br>RW/P | **INJONCE:** Error Injection Once: When set, a single error will be injected after error injection is enabled. Otherwise, error injection will be continuous until disabled. Note that error injection has a minimum temporal granularity of one dunit clock cycle. Thus, if the address match/match bits allow injections on multiple bursts, it is possible to inject up to 4 errors (across the 4 bursts per dunit cycle) even with this bit set. To ensure predictable single error injection INJAMSK3, INJAMSK4 and ERRINJAMSK.INJAMSK[0] must be set to 0. |
| 0 | 0x0<br>RW/V/P | **INJEN:** Error Injection Enable: 0 - Error injection is disabled 1 - Error injection is enabled. This bit is self clearing when inject once is selected and the single error injection has been performed. This bit should be set to 0 when INJTRIGSEL is set to 1X. Upon assertion, the trigger will automatically set the INJEN field. |

## 44.5.30 ERRINJADDR—Offset 138h

Error Injection Address

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 138h
**Host Memory Space:** SBREG_BAR + 0x100000 + 138h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/P | **INJADDR:** Error Injection PMI Address[36:5] |

## 44.5.31 ERRINJAMSK—Offset 13Ch

Error Injection Address Mask

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 13Ch
**Host Memory Space:** SBREG_BAR + 0x100000 + 13Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/P | **INJAMSK:** Error Injection PMI Address Mask[36:5]: For each bit that is 0 in the address mask, the corresponding PMI address bit will be compared against the same bit in ERRINJADDR. |

## 44.5.32 ERRINJDATA0—Offset 140h

Error Injection Data 0

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 140h
**Host Memory Space:** SBREG_BAR + 0x100000 + 140h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/P | **INJDATA0:** Error Injection Data[31:0]: Zero bits indicate no injection; one bits indicate that the corresponding read/write data bit should be inverted. |

## 44.5.33 ERRINJDATA1—Offset 144h

Error Injection Data 1

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 144h
**Host Memory Space:** SBREG_BAR + 0x100000 + 144h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/P | **INJDATA1:** Error Injection Data[63:32]: Zero bits indicate no injection; one bits indicate that the corresponding read/write data bit should be inverted. |

## 44.5.34 DCS—Offset 170h

DRAM Control and Status

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 170h
**Host Memory Space:** SBREG_BAR + 0x100000 + 170h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0x0<br>RSV | **Rsvd_DCS_5:** Reserved |
| 28 | 0x0<br>RW | **Reserved:** Reserved |
| 27:24 | 0x0<br>RSV | **Rsvd_DCS_4:** Reserved |

| 22 | 0x0<br>RSV | **Rsvd_DCS_3:** Reserved |
| 21 | 0x0<br>RW/P | **MPRMODE:** Mask Chip-Selects for all commands except read commands and MRS commands |
| 20 | 0x0<br>RW/P | **Reserved:** Reserved |
| 19:18 | 0x0<br>RSV | **Rsvd_DCS_2:** Reserved |
| 17:16 | 0x0<br>RW/P | **Reserved:** Reserved |
| 15:13 | 0x0<br>RSV | **Rsvd_DCS_1:** Reserved |
| 12 | 0x0<br>RW/P | **ODTMODE:** ODT Control Mode:<br>• 0 - Dunit auto controls the ODT pins based on DRAM Write transactions.<br>• 1 - The value of ODTVAL above directly controls the ODT pins. |
| 11:8 | 0x0<br>RW/P | **ODTVAL:** ODT Control Value: Each bit of ODTVAL directly controls an ODT pin, when ODTMODE is set to 1. Used only during init flow by BIOS. |
| 7:5 | 0x0<br>RSV | **Rsvd_DCS_0:** Reserved |
| 4 | 0x0<br>RW/P | **CKEMODE:** CKE Control Mode:<br>• 0 - Dunit auto controls the CKE pins based on Power-Down and Self Refresh entry and exit.<br>• 1 - The value of CKEVAL above directly controls the CKE pins. |
| 3:0 | 0x0<br>RW/P | **CKEVAL:** CKE Control Value: Each bit of CKEVAL directly controls a CKE pin, when CKEMODE is set to 1. Used only during init flow by BIOS. |

## 44.5.35 DECCCTRL—Offset 180h

Dunit ECC Control

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 180h
**Host Memory Space:** SBREG_BAR + 0x100000 + 180h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:26 | 0x0<br>RSV | **Rsvd_DECCCTRL_1:** Reserved |
| 25 | 0x0<br>RW/P | **RD2CLRACC:** Read to Clear C[1:0]SBEACC Registers:<br>• 0 = C[1:0]SBEACC Registers are cleared when written<br>• 1 = C[1:0]SBEACC Registers are cleared when written or read |
| 24:18 | 0x0<br>RSV | **Rsvd_DECCCTRL_0:** Reserved |
| 17 | 0x0<br>RW/P | **ENCBGEN:** Enable Generation of ECC Check Bits:<br>• 0 - Disable generation of ECC Check Bits<br>ECC for Bunit is 0<br>ECC for CPGC is generated by the CPCC<br>• 1 - Enable generation of ECC Check Bits<br>ECC is generated for both the Bunit and the CPGC |
| 16 | 0x0<br>RW/P | **ECCOVREN:** ECC Check Bits Override Enable:<br>• 0 - Normal ECC is generated.<br>• 1 - ECC override enabled, the value in ECCOVR will be used for the ECC code. |
| 15:8 | 0x0<br>RW/P | **ECCOVR:** ECC Check Bits Override Value:<br>The ECC override code to be used on writes if enabled by ECCOVREN. |
| 7:5 | 0x0<br>RW/P | **UCE_FILTER:** Uncorrectable Error Filter:<br>• 000: Normal mode; All 8 byte ECC checks/corrections are performed independently, no anti-aliasing filters are applied.<br>• 011: An uncorrectable error that is detected in any 8 byte ECC check will cause all four parallel 8 byte ECC checks to be treated as uncorrectable errors. |
| 4 | 0x0<br>RW/P | **DPAREN:** Data Parity Enable:<br>When set, data path parity is enabled. The write data parity is checked at the point when ECC is generated and read data parity is generated at the point that ECC is checked. |
| 3 | 0x0<br>RW/P | **CAPERREN:** Enable Command Address Parity Error Detection:<br>When set, command address parity errors are detected and signaled to the Bunit. |
| 2 | 0x0<br>RW/P | **DERREN:** Enable Uncorrectable Error Notification:<br>When set, uncorrectable ECC errors are signaled to the Bunit and patrol scrub. |
| 1 | 0x0<br>RW/P | **SERREN:** Enable Correctable Error Notification:<br>When set, correctable ECC errors are signaled to the Bunit and patrol scrub which indicates that the read data needs to be written back to memory. This causes the DRAM cell with the single bit error to be scrubbed. |
| 0 | 0x0<br>RW/V/P | **ECCEN:** ECC Enable: When set, single bit error correction and double bit error detection (SEC/DED ECC) is enabled. The ECC is an 8 bit protection code for every 64 bits of data stored in DRAM. ECC is generated on writes and checked on reads, requiring a 72 bit DDR3 data bus width. |

## 44.5.36 LEAKY_BUCKET_CNTR_UPPER—Offset 18Ch

Leaky Bucket Counter Upper

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 18Ch
**Host Memory Space:** SBREG_BAR + 0x100000 + 18Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RW/P | **CNTR_UPPER_RANK3:** Rank 3 CNTR_UPPER configuration.<br>Total Leak Rate = (CNTR_UPPER_RANK3 + 1)* (LEAKY_BUCKET_CFG3.CNTR_HI + 1) * (LEAKY_BUCKET_CFG3.CNTR_LO + 1) * 8192 DRAM clocks. Setting CNTR_LO to zero will disable the leaky bucket. |
| 23:16 | 0x0<br>RW/P | **CNTR_UPPER_RANK2:** Rank 2 CNTR_UPPER configuration.<br>Total Leak Rate = (CNTR_UPPER_RANK2 + 1)* (LEAKY_BUCKET_CFG2.CNTR_HI + 1) * (LEAKY_BUCKET_CFG2.CNTR_LO + 1) * 8192 DRAM clocks. Setting CNTR_LO to zero will disable the leaky bucket. |
| 15:8 | 0x0<br>RW/P | **CNTR_UPPER_RANK1:** Rank 1 CNTR_UPPER configuration.<br>Total Leak Rate = (CNTR_UPPER_RANK1 + 1)* (LEAKY_BUCKET_CFG1.CNTR_HI + 1) * (LEAKY_BUCKET_CFG1.CNTR_LO + 1) * 8192 DRAM clocks. Setting CNTR_LO to zero will disable the leaky bucket. |
| 7:0 | 0x0<br>RW/P | **CNTR_UPPER_RANK0:** Rank 0 CNTR_UPPER configuration.<br>Total Leak Rate = (CNTR_UPPER_RANK0 + 1)* (LEAKY_BUCKET_CFG0.CNTR_HI + 1) * (LEAKY_BUCKET_CFG0.CNTR_LO + 1) * 8192 DRAM clocks. Setting CNTR_LO to zero will disable the leaky bucket. |

## 44.5.37 DPATROL_SCRUB_TMR—Offset 194h

Patrol Scrub Timer Register

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x10] + 194h
**Host Memory Space:** SBREG_BAR + 0x100000 + 194h

**Default:** FFFFFFFFh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0xffffffff<br>RW/P | **PATSCRTIMER:** Patrol scrub interval timer in DCLKs (DRAM cmd clk divided by 2). A new patrol scrub is scheduled every time the timer ticks to the value in this register. Any non zero value is valid |

## 44.5.38 UCELOG—Offset 64h

Uncorrectable Error Log This register captures the log information when the corresponding channel DERRSTS.UCE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.UCE[1:0] is cleared to 0.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 64h
**Host Memory Space:** SBREG_BAR + 0x120000 + 64h

**Default:** 00000800h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:22 | 0x0<br>RSV | **Rsvd_UCELOG_1:** Reserved |
| 21:20 | 0x0<br>RO/V/P | **UCERNK:** Rank Address: This is the rank address that contained the error |
| 19:16 | 0x0<br>RO/V/P | **UCEBNK:** Bank Address: This is the bank address that contained the error. DDR3: UCEBNK[3] will always be 0 UCEBNK[2:0] = BA[2:0] DDR4: UCEBNK[3:2] = BG[1:0] UCEBNK[1:0] = BA[1:0] |
| 15 | 0x0<br>RO/V/P | **Reserved:** Reserved |
| 14 | 0x0<br>RO/V/P | **UCELAST:** Last Burst: If this bit is set, then the error occurred within that last four DQ bus bursts before a DQ bus turn-around cycle. |
| 13 | 0x0<br>RO/V/P | **UCEFIRST:** First Burst: If this bit is set, then the error occurred within the first four DQ bus bursts after a DQ bus turn-around cycle. |
| 12 | 0x0<br>RO/V/P | **UCEA5:** Address bit 5: This is A[5] from the original request |
| 11 | 0x1<br>RO/V/P | **Reserved:** Reserved |
| 10:8 | 0x0<br>RO/V/P | **UCEBOFF:** Burst Offset: This is the burst number that contained the error. Note that all 8 bursts are always numbered starting from 0. |
| 7:0 | 0x0<br>RO/V/P | **UCESYND:** ECC Syndrome: This is the 8-bit syndrome output of the ECC checker logic. For DNV, this field does not provide useful information and is not reliable. |

## 44.5.39 UCEADDR—Offset 68h

Uncorrectable Error Address This register captures the log information when the corresponding channel DERRSTS.UCE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.UCE[1:0] is cleared to 0.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 68h
**Host Memory Space:** SBREG_BAR + 0x120000 + 68h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V/P | **UCEADDR:** Address Log: Captures the PMI address A[35:6] of the UCE error location. |

## 44.5.40 SBELOG—Offset 6Ch

Correctable (Single Bit) Error Log This register captures the log information when the corresponding channel DERRSTS.SBE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.SBE[1:0] is cleared to 0.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 6Ch
**Host Memory Space:** SBREG_BAR + 0x120000 + 6Ch

**Default:** 00000800h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:22 | 0x0<br>RSV | **Rsvd_SBELOG_1:** Reserved |

| 19:16 | 0x0<br>RO/V/P | **SBEBNK:** Bank Address: This is the bank address that contained the error. DDR3: UCEBNK[3] will always be 0 UCEBNK[2:0] = BA[2:0] DDR4: UCEBNK[3:2] = BG[1:0] UCEBNK[1:0] = BA[1:0] |
| 15 | 0x0<br>RO/V/P | **Reserved:** Reserved |
| 14 | 0x0<br>RO/V/P | **SBELAST:** Last Burst: If this bit is set, then the error occurred within that last four DQ bus bursts before a DQ bus turn-around cycle. |
| 13 | 0x0<br>RO/V/P | **SBEFIRST:** First Burst: If this bit is set, then the error occurred within the first four DQ bus bursts after a DQ bus turn-around cycle. |
| 12 | 0x0<br>RO/V/P | **SBEA5:** Address bit 5: This is A[5] from the original request. In 32 bit mode this field is undefined. |
| 11 | 0x1<br>RO/V/P | **Reserved:** Reserved |
| 10:8 | 0x0<br>RO/V/P | **SBEBOFF:** Burst Offset: This is the burst number that contained the error. Note that all 8 bursts are always numbered starting from 0. |
| 7:0 | 0x0<br>RO/V/P | **SBESYND:** ECC Syndrome: This is the 8-bit syndrome output of the ECC checker logic |

## 44.5.41 SBEADDR—Offset 70h

Correctable Error Address This register captures the log information when the corresponding channel DERRSTS.SBE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.SBE[1:0] is cleared.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 70h
**Host Memory Space:** SBREG_BAR + 0x120000 + 70h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V/P | **SBEADDR:** Address Log: Captures the PMI address A[35:6] of the SBE error location. |

## 44.5.42 SBECNT0—Offset 74h

SBE Count for Rank 0

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 74h
**Host Memory Space:** SBREG_BAR + 0x120000 + 74h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:17 | 0x0<br>RSV | **Rsvd_SBECNT0_0:** Reserved |
| 16 | 0x0<br>RW/C/V/P | **CORRERRORSTATUS:** The per rank status bits are set when a rank's error count equals the threshold. The status bits are what tell the BIOS/BMC what caused SMI/ERR[0] to get triggered. Once the status bits are set, they will remain set until cleared by BIOS and will cause the SMI/ERR[0] to get signaled to the cores. |
| 15:0 | 0x0<br>RW/C/V/P | **CNT:** Single Bit Error Count for Rank 0. Any write to this register will clear the counter to 0. |

## 44.5.43 SBECNT1—Offset 78h

SBE Count for Rank 1

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 78h
**Host Memory Space:** SBREG_BAR + 0x120000 + 78h

**Default:** 00000000h

| 16 | 0x0<br>RW/C/V/P | **CORRERRORSTATUS:** The per rank status bits are set when a rank's error count equals the threshold. The status bits are what tell the BIOS/BMC what caused SMI/ERR[0] to get triggered. Once the status bits are set, they will remain set until cleared by BIOS and will cause the SMI/ERR[0] to get signaled to the cores. |
| 15:0 | 0x0<br>RW/C/V/P | **CNT:** Single Bit Error Count for Rank 1. Any write to this register will clear the counter to 0. |

## 44.5.44 SBECNT2—Offset 7Ch

SBE Count for Rank 2

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 7Ch
**Host Memory Space:** SBREG_BAR + 0x120000 + 7Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:17 | 0x0<br>RSV | **Rsvd_SBECNT2_0:** Reserved |
| 16 | 0x0<br>RW/C/V/P | **CORRERRORSTATUS:** The per rank status bits are set when a rank's error count equals the threshold. The status bits are what tell the BIOS/BMC what caused SMI/ERR[0] to get triggered. Once the status bits are set, they will remain set until cleared by BIOS and will cause the SMI/ERR[0] to get signaled to the cores. |
| 15:0 | 0x0<br>RW/C/V/P | **CNT:** Single Bit Error Count for Rank 2. Any write to this register will clear the counter to 0. |

## 44.5.45 SBECNT3—Offset 80h

SBE Count for Rank 3

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 80h
**Host Memory Space:** SBREG_BAR + 0x120000 + 80h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:17 | 0x0<br>RSV | **Rsvd_SBECNT3_0:** Reserved |
| 16 | 0x0<br>RW/C/V/P | **CORRERRORSTATUS:** The per rank status bits are set when a rank's error count equals the threshold. The status bits are what tell the BIOS/BMC what caused SMI/ERR[0] to get triggered. Once the status bits are set, they will remain set until cleared by BIOS and will cause the SMI/ERR[0] to get signaled to the cores. |
| 15:0 | 0x0<br>RW/C/V/P | **CNT:** Single Bit Error Count for Rank 3. Any write to this register will clear the counter to 0. |

## 44.5.46 SBEACC0—Offset 84h

SBE Accumulator for Rank0

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 84h
**Host Memory Space:** SBREG_BAR + 0x120000 + 84h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0x0<br>RSV | **Rsvd_SBEACC0_0:** Reserved |
| 17:0 | 0x0<br>RW/C/V/P | **LANE:** Single Bit Accumulator per Nibble Lane: This allows for identification of the failing x4 or x8 device. This value is cleared by any write to this register. |

## 44.5.47 SBEACC1—Offset 88h

SBE Accumulator for Rank1

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 88h
**Host Memory Space:** SBREG_BAR + 0x120000 + 88h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0x0<br>RSV | **Rsvd_SBEACC1_0:** Reserved |
| 17:0 | 0x0<br>RW/C/V/P | **LANE:** Single Bit Accumulator per Nibble Lane: This allows for identification of the failing x4 or x8 device. This value is cleared by any write to this register. |

## 44.5.48 SBEACC2—Offset 8Ch

SBE Accumulator for Rank2

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 8Ch
**Host Memory Space:** SBREG_BAR + 0x120000 + 8Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0x0<br>RSV | **Rsvd_SBEACC2_0:** Reserved |
| 17:0 | 0x0<br>RW/C/V/P | **LANE:** Single Bit Accumulator per Nibble Lane:<br>This allows for identification of the failing x4 or x8 device. |

## 44.5.49 SBEACC3—Offset 90h

SBE Accumulator for Rank3

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 90h
**Host Memory Space:** SBREG_BAR + 0x120000 + 90h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0x0<br>RSV | **Rsvd_SBEACC3_0:** Reserved |
| 17:0 | 0x0<br>RW/C/V/P | **LANE:** Single Bit Accumulator per Nibble Lane:<br>This allows for identification of the failing x4 or x8 device. |

## 44.5.50 DPATROL_SCRUB_CFG—Offset B0h

Patrol Scrub Config Register

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + B0h
**Host Memory Space:** SBREG_BAR + 0x120000 + B0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/P | **PAT_SCRUB_ENABLE:** Bit to enable/disable patrol scrub<br>0: Disable patrol scrub<br>1: Enable patrol scrub |
| 30 | 0x0<br>RW/P | **DIMM1_COL_ADDR_BITS:** Total number of column bits for devices on rank 0 = 10 + DIMM1_COL_ADDR_BITS<br>0: DDR4 and DDR3<br>1: Only DDR3 |
| 29 | 0x0<br>RW/P | **DIMM0_COL_ADDR_BITS:** Total number of column bits for devices on rank 0 = 10 + DIMM0_COL_ADDR_BITS<br>0: DDR4 and DDR3<br>1: Only DDR3 |
| 28:23 | 0x0<br>RW/P | **DIMM1_MAX_ROW_ADDR:** Maximum row address for DIMM1 - bits 17 to 12. Bits 11:0 are assumed to all be 1. |
| 22:17 | 0x0<br>RW/P | **DIMM0_MAX_ROW_ADDR:** Maximum row address for DIMM0 - bits 17 to 12. Bits 11:0 are assumed to all be 1. |
| 16 | 0x0<br>RW/P | **PATSCRUB_FORCE_WRITEBACK:** When set to 1, force write back of data with no errors. When set to 0, don't write back data that had no errors. |
| 15:0 | 0x0<br>RW/P | **MAX_PATSCRUB_DEBIT_CNT:** Maximum number of debit patrol scrub operations. Once the patrol scrub debit counter exceeds this value, patrol scrubs will be issued until the debit counter reaches 0. Set 0 to disable debit mode. |

## 44.5.51 UCELOG1—Offset CCh

This register captures the log information when the corresponding channel DERRSTS.UCE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.UCE[1:0] is cleared to 0.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + CCh
**Host Memory Space:** SBREG_BAR + 0x120000 + CCh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x0<br>RSV | **RSVD (reg_RSVD):** Reserved |
| 26:18 | 0x0<br>RO/V/P | **UCE_COL:** Column address bits above A[5] |
| 17:0 | 0x0<br>RO/V/P | **UCE_ROW:** Row bits |

## 44.5.52 SBELOG1—Offset D0h

Single bit error log 1 This register captures the log information when the corresponding channel DERRSTS.SBE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.SBE[1:0] is cleared.

**Type:** Sideband Register (Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + D0h
**Host Memory Space:** SBREG_BAR + 0x120000 + D0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x0<br>RSV | **RSVD (reg_RSVD):** Reserved |
| 26:18 | 0x0<br>RO/V/P | **SBE_COL:** Column bits [11,9:2], in 32 bit mode SBE_COL[0] will always be 0, SBE_COL[1] contains information for SBEBOFF[2] |
| 17:0 | 0x0<br>RO/V/P | **SBE_ROW:** Row bits |

## 44.5.53 CORRERRTHRSHLD0—Offset 100h

Correctable Error Threshold for Rank 0

**Type:** Sideband Register (Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 100h
**Host Memory Space:** SBREG_BAR + 0x120000 + 100h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RSV | **Rsvd_CORRERRTHRSHLD0_0:** Reserved |
| 15:0 | 0x0<br>RW/P | **THRSH_RNK:** Correctable error threshold for rank 0. When the error accumulation in SBECNT0 hits this value, then the CORRERRSTATUS is set and a DO_SMI message is sent if the threshold value is greater than 0. |

## 44.5.54 CORRERRTHRSHLD1—Offset 104h

Correctable Error Threshold for Rank 1

**Type:** Sideband Register (Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 104h
**Host Memory Space:** SBREG_BAR + 0x120000 + 104h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RSV | **Rsvd_CORRERRTHRSHLD1_0:** Reserved |
| 15:0 | 0x0<br>RW/P | **THRSH_RNK:** Correctable error threshold for rank 1. When the error accumulation in SBECNT1 hits this value, then the CORRERRSTATUS is set and a DO_SMI message is sent if the threshold value is greater than 0. |

## 44.5.55 CORRERRTHRSHLD2—Offset 108h

Correctable Error Threshold for Rank 2

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 108h
**Host Memory Space:** SBREG_BAR + 0x120000 + 108h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RSV | **Rsvd_CORRERRTHRSHLD2_0:** Reserved |
| 15:0 | 0x0<br>RW/P | **THRSH_RNK:** Correctable error threshold for rank 2. When the error accumulation in SBECNT2 hits this value, then the CORRERRSTATUS is set and a DO_SMI message is sent if the threshold value is greater than 0. |

## 44.5.56 CORRERRTHRSHLD3—Offset 10Ch

Correctable Error Threshold for Rank 3

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 10Ch
**Host Memory Space:** SBREG_BAR + 0x120000 + 10Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RSV | **Rsvd_CORRERRTHRSHLD3_0:** Reserved |
| 15:0 | 0x0<br>RW/P | **THRSH_RNK:** Correctable error threshold for rank 3. When the error accumulation in SBECNT3 hits this value, then the CORRERRSTATUS is set and a DO_SMI message is sent if the threshold value is greater than 0. |

## 44.5.57 LEAKY_BUCKET_CFG0—Offset 110h

Leaky Bucket Configuration Rank 0

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 110h
**Host Memory Space:** SBREG_BAR + 0x120000 + 110h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/P | **CNTR_HI:** Specifies the leaky bucket leak rat in CNTR_LO ticks. When the leaky bucket counter counts through CNTR_HI, the correctable error count for rank 0 is decremented by one. |
| 15:0 | 0x0<br>RW/P | **CNTR_LO:** Units for this register are 8192 DRAM clocks. When greater than zero, leaky bucket is enabled. This is the unit for the high order counter for rank 0, CNTR_HI. |

## 44.5.58 LEAKY_BUCKET_CFG1—Offset 114h

Leaky Bucket Configuration Rank 1

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 114h
**Host Memory Space:** SBREG_BAR + 0x120000 + 114h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/P | **CNTR_HI:** Specifies the leaky bucket leak rat in CNTR_LO ticks. When the leaky bucket counter counts through CNTR_HI, the correctable error count for rank 1 is decremented by one. |
| 15:0 | 0x0<br>RW/P | **CNTR_LO:** Units for this register are 8192 DRAM clocks. When greater than zero, leaky bucket is enabled. This is the unit for the high order counter for rank 1, CNTR_HI. |

## 44.5.59 LEAKY_BUCKET_CFG2—Offset 118h

Leaky Bucket Configuration Rank 2

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 118h
**Host Memory Space:** SBREG_BAR + 0x120000 + 118h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/P | **CNTR_HI:** Specifies the leaky bucket leak rat in CNTR_LO ticks. When the leaky bucket counter counts through CNTR_HI, the correctable error count for rank 2 is decremented by one. |
| 15:0 | 0x0<br>RW/P | **CNTR_LO:** Units for this register are 8192 DRAM clocks. When greater than zero, leaky bucket is enabled. This is the unit for the high order counter for rank 2, CNTR_HI. |

## 44.5.60 LEAKY_BUCKET_CFG3—Offset 11Ch

Leaky Bucket Configuration Rank 3

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 11Ch
**Host Memory Space:** SBREG_BAR + 0x120000 + 11Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/P | **CNTR_HI:** Specifies the leaky bucket leak rat in CNTR_LO ticks. When the leaky bucket counter counts through CNTR_HI, the correctable error count for rank 3 is decremented by one. |
| 15:0 | 0x0<br>RW/P | **CNTR_LO:** Units for this register are 8192 DRAM clocks. When greater than zero, leaky bucket is enabled. This is the unit for the high order counter for rank 3, CNTR_HI. |

## 44.5.61 FERRNERR—Offset 120h

First Error and Next Error Register

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 120h
**Host Memory Space:** SBREG_BAR + 0x120000 + 120h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:21 | 0x0<br>RSV | **Rsvd_FERRNERR_1 (Rsvd_FERRNERR_3):** Reserved |
| 20 | 0x0<br>RO/V/P | **FERRUCEPAT:** First Error Uncorrectable Patrol Scrub Read Error Detected: When set, the first error detected was an uncorrectable (multiple bit) error on the patrol scrub read from memory. |
| 19 | 0x0<br>RO/V/P | **FERRAPE:** First Error Uncorrectable DDR4 Command Address Parity Error: When set, the first error detected was the assertion of the xxDDR3_0_ALERT_N pin indicating that one or more DRAMs detected a Command/Address parity error. |
| 18 | 0x0<br>RO/V/P | **FERRWPE:** First Error Uncorrectable Write Parity Error Detected: When set, the first error detected was an uncorrectable (parity) error on the write data received from the Bunit. |
| 17 | 0x0<br>RO/V/P | **FERRUCE:** First Error Uncorrectable Read Error Detected: When set, the first error detected was an uncorrectable (multiple bit) error on the read data from memory. |
| 16 | 0x0<br>RO/V/P | **FERRSBE:** First Error Correctable Read Error Detected: When set, the first error detected was a single bit error on the read data from memory and the error was corrected. |
| 15:5 | 0x0<br>RSV | **Rsvd_FERRNERR_0 (Rsvd_FERRNERR_1):** Reserved |
| 4 | 0x0<br>RO/V/P | **NERRUCEPAT:** Next Error Uncorrectable Patrol Scrub Read Error: When set, the second error detected was an uncorrectable (mutliple bit) error on the patrol scrub read data from memory. |
| 3 | 0x0<br>RO/V/P | **NERRAPE:** Next Error Uncorrectable DDR4 Command Address Parity Error: When set, the second error detected was the assertion of the xxDDR3_0_ALERT_N pin indicating that one or more DRAMs detected a Command/Address parity error. Note that this bit can never be set as the same time as FERRAPE |
| 2 | 0x0<br>RO/V/P | **NERRWPE:** Next Error Uncorrectable Write Parity Error Detected: When set, the second error detected was an uncorrectable (parity) error on the write data received from the Bunit. |
| 1 | 0x0<br>RO/V/P | **NERRUCE:** Next Error Uncorrectable Read Error Detected: When set, the second error detected was an uncorrectable (multiple bit) error on the read data from memory. |
| 0 | 0x0<br>RO/V/P | **NERRSBE:** Next Error Correctable Read Error Detected: When set, the second error detected was a single bit error on the read data from memory and the error was corrected. |

## 44.5.62 DERRSTS—Offset 124h

Error Status Register

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 124h
**Host Memory Space:** SBREG_BAR + 0x120000 + 124h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:7 | 0x0<br>RSV | **Reserved:** Reserved |
| 6 | 0x0<br>RW/1C/V/P | **CAP_ERR_STATE:** Channel Command Address Parity Error State. 1 = CAP error seen, error state entered. All PMI reads will be returned with bad parity. 0 = No CAP error seen. Normal PMI operation. |
| 5 | 0x0<br>RO/V/P | **ALERT:** Current state of the channel ALERT_N pin, captured here as active high: 1 = Error being driven by at least one DRAM device 0 = No error currently detected by any DRAM device |
| 4 | 0x0<br>RW/1C/V/P | **UCEPAT:** Uncorrectable (multiple bit) patrol scrub error: When set, an uncorrectable (multiple bit error was detected on the read data from memory. |
| 3 | 0x0<br>RW/1C/V/P | **APE:** Uncorrectable DDR4 Command/Address Parity Error: When set, an uncorrectable DDR4 command/address parity error was detected by one or more of the DRAMs on channel 0. |
| 2 | 0x0<br>RW/1C/V/P | **WPE:** Uncorrectable (Parity) Write Error: When set, an uncorrectable (parity) error was detected on the write data received from the Bunit. |
| 1 | 0x0<br>RW/1C/V/P | **UCE:** Uncorrectable (Double Bit) Read Error: When set, a double bit error was detected on the read data from memory. |
| 0 | 0x0<br>RW/1C/V/P | **SBE:** Correctable (Single Bit) Read Error: When set, a single bit error was detected on the read data from memory and the error was corrected. |

## 44.5.63 DERRMSKSEV—Offset 128h

Error Mask and Severity

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 128h
**Host Memory Space:** SBREG_BAR + 0x120000 + 128h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:21 | 0x0<br>RSV | **Rsvd_DERRMSKSEV_2:** Reserved |
| 20 | 0x0<br>RW/P | **MSK_UCEPAT:** Uncorrectable patrol scrub error mask: When set, uncorrectable patrol scrub ECC data errors will not be logged in DERRESTS[0], DO_SERR_SEV messages will not be sent to the IEH, and derrcnt will not count for this error. |
| 19 | 0x0<br>RW/P | **MSK_APE:** Uncorrectable command/address parity error mask: When set, uncorrectable DDR4 command/address parity errors will not be logged in DERRESTS[0], DO_SERR_SEV messages will not be sent to the IEH, and derrcnt will not count for this error. |
| 18 | 0x0<br>RW/P | **MSK_WDBR:** Uncorrectable (parity) write data buffer read error mask: When set, uncorrectable (pairty) write data buffer read errors will not be logged in DERRESTS[0], DO_SERR_SEV messages will not be sent to the IEH, and derrcnt will not count for this error. |
| 17 | 0x0<br>RW/P | **MSK_UCE:** Uncorrectable (multiple bit) error mask: When set, uncorrectable (multiple bit) read and patrol scrub errors will not be logged in DERRESTS[0], DO_SERR_SEV messages will not be sent to the IEH, and derrcnt will not count for this error. |
| 16 | 0x0<br>RW/P | **MSK_SBE:** Correctable (single bit) error mask: When set, correctable (single bit) read and patrol scrub errors will not be logged in DERRESTS[0] and DO_SERR_SEV messages will not be sent to the IEH. |
| 15:5 | 0x0<br>RSV | **Rsvd_DERRMSKSEV_1:** Reserved |
| 4 | 0x0<br>RW/P | **SEV_UCEPAT:** Uncorrectable (Multiple Bit) Patrol Scrub Read Error Severity: When set, UCE errors logged in DERRSTS[5] will be escalated to the global error logic as a fatal error; otherwise it will be escalated as a non-fatal error. |
| 3 | 0x0<br>RW/P | **SEV_APE:** Uncorrectable DDR4 Command/Address Parity Error Severity: When set, APE errors logged in DERRSTS[3] will be escalated to the global error logic as a fatal error; otherwise it will be escalated as a non-fatal error. |
| 2 | 0x0<br>RW/P | **SEV_WDBR:** Uncorrectable (Parity) Write Error Severity: When set, WPE errors logged in DERRSTS[2] will be escalated to the global error logic as a fatal error; otherwise it will be escalated as a non-fatal error. |
| 1 | 0x0<br>RW/P | **SEV_UCE:** Uncorrectable (Multiple Bit) Read Error Severity: When set, UCE errors logged in DERRSTS[1] will be escalated to the global error logic as a fatal error; otherwise it will be escalated as a non-fatal error. |
| 0 | 0x0<br>RSV | **Rsvd_DERRMSKSEV_0:** Reserved |

## 44.5.64 DERRCNTSEL—Offset 12Ch

Uncorrectable Error Count Select

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 12Ch
**Host Memory Space:** SBREG_BAR + 0x120000 + 12Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:5 | 0x0<br>RSV | **Rsvd_DERRCNTSEL_2:** Reserved |
| 4 | 0x0<br>RW/P | **SEL_UCEPAT:** Uncorrectable (Multiple Bit) Patrol Scrub Read Error Count Select: When set, UCE errors logged in DERRSTS[1] will be counted in DERRCNT.UNCCNT1. |
| 3 | 0x0<br>RW/P | **SEL_APE:** Uncorrectable DDR4 Command/Address Parity Error Count Select: When set, APE0 errors logged in DERRSTS[3] will be counted in DERRCNT.UNCCNT0. |
| 2 | 0x0<br>RW/P | **SEL_WPE:** Uncorrectable (Parity) Write Error Count Select: When set, WPE0 errors logged in DERRSTS[2] will be counted in DERRCNT.UNCCNT0. |
| 1 | 0x0<br>RW/P | **SEL_UCE:** Uncorrectable (Multiple Bit) Read Error Count Select: When set, UCE0 errors logged in DERRSTS[1] will be counted in DERRCNT.UNCCNT0. |
| 0 | 0x0<br>RSV | **Rsvd_DERRCNTSEL_0:** Reserved |

## 44.5.65 DERRCNT—Offset 130h

Uncorrectable Error Count

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 130h
**Host Memory Space:** SBREG_BAR + 0x120000 + 130h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RSV | **Rsvd_DERRCNT:** Reserved |
| 7:0 | 0x0<br>RW/1C/V/P | **UNCCNT:** Uncorrectable Error Count: The count of uncorrectable errors that have occurred since the last time the count was cleared. The count limit is 128 (80h) and the count is cleared by writing ones to all bits (FFh). The type of uncorrectable errors that are counted is determined by the DERRCNTSEL register. Additionally, if two uncorrectable errors occur in the same clock cycle, only one type will be counted, even if multiple types are selected. |

## 44.5.66 ERRINJCTL—Offset 134h

Error Injection Control

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 134h
**Host Memory Space:** SBREG_BAR + 0x120000 + 134h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RW/P | **INJECCPAR:** Error Injection ECC/Parity[7:0]: Error injection ECC/parity. Zero bits indicate no injection; one bits indicate that the corresponding read/write ECC or parity bit should be inverted. |
| 23:20 | 0x0<br>RSV | **Rsvd_ERRINJCTL_2:** Reserved |
| 19 | 0x0<br>RW/P | **INJAMSK4:** Error Injection Address Mask[4]: This is the mask bit for error injection address bit 4; address mask bits 36:5 are located in the ERRINJAMSK register. |
| 18 | 0x0<br>RW/P | **INJADDR4:** Error Injection Address[4]: This is error injection address bit 4; address bits 36:5 are located in the ERRINJADDR register. |
| 17 | 0x0<br>RW/P | **INJAMSK3:** Error Injection Address Mask[3]: This is the mask bit for error injection address bit 3; address mask bits 36:5 are located in the ERRINJAMSK register. |
| 16 | 0x0<br>RW/P | **INJADDR3:** Error Injection Address[3]: This is error injection address bit 3; address bits 35:4 are located in the ERRINJADDR register. |
| 15:14 | 0x0<br>RW/P | **INJTRIGSEL:** Error Injection Trigger Selection: 0x = Disable error injection trigger sources 10 = Enable error injection when trigger source 0 (ddr_fsta_trigev[0]) is asserted 11 = Enable error injection when trigger source 1 (ddr_fsta_trigev[1]) is asserted. When setting this field to 1X, the INJEN field should be set to 0 since it will be set automatically when the trigger asserts. |
| 13:12 | 0x0<br>RW/P | **INJCAP:** Command address parity injection per dclk half |
| 11:8 | 0x0<br>RW/P | **INJSRC:** Error Injection Source[3:0]: The selected requestor source ID match against when selecting the transaction for error injection. |
| 7 | 0x0<br>RW/P | **INJPAT:** Inject on patrol scrub request. Address match/mask logic is not used here. Error injection will occur on the next patrol scrub once INJEN is set. |
| 6 | 0x0<br>RW/P | **INJREAD:** Error Injection in the Read Data Path: 0 = Disable 1 = Enabled |
| 5 | 0x0<br>RW/P | **INJWRITE:** Error Injection in the Write Data Path: 0 = Disable 1 = Enabled |
| 4 | 0x0<br>RW/P | **INJECC:** Error Injection in ECC or Parity Path Selection: 0 = Inject in the Data/Parity Path 1 = Inject in the Data/ECC Path |
| 3 | 0x0<br>RW/P | **INJSRCEN:** Error Injection Source Enable: When set, the error injection will be performed only for the specified requestor source. |
| 2 | 0x0<br>RW/P | **INJADREN:** Error Injection Address Enable: When set, the error injection will be performed only for addresses that match the address specified in the ERRINJADDR and ERRINJAMSK registers. |
| 1 | 0x0<br>RW/P | **INJONCE:** Error Injection Once: When set, a single error will be injected after error injection is enabled. Otherwise, error injection will be continuous until disabled. Note that error injection has a minimum temporal granularity of one dunit clock cycle. Thus, if the address match/match bits allow injections on multiple bursts, it is possible to inject up to 4 errors (across the 4 bursts per dunit cycle) even with this bit set. To ensure predictable single error injection INJAMSK3, INJAMSK4 and ERRINJAMSK.INJAMSK[0] must be set to 0. |
| 0 | 0x0<br>RW/V/P | **INJEN:** Error Injection Enable: 0 - Error injection is disabled 1 - Error injection is enabled. This bit is self clearing when inject once is selected and the single error injection has been performed. This bit should be set to 0 when INJTRIGSEL is set to 1X. Upon assertion, the trigger will automatically set the INJEN field. |

## 44.5.67 ERRINJADDR—Offset 138h

Error Injection Address

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 138h
**Host Memory Space:** SBREG_BAR + 0x120000 + 138h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/P | **INJADDR:** Error Injection PMI Address[36:5] |

## 44.5.68 ERRINJAMSK—Offset 13Ch

Error Injection Address Mask

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 13Ch
**Host Memory Space:** SBREG_BAR + 0x120000 + 13Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/P | **INJAMSK:** Error Injection PMI Address Mask[36:5]: For each bit that is 0 in the address mask, the corresponding PMI address bit will be compared against the same bit in ERRINJADDR. |

## 44.5.69 ERRINJDATA0—Offset 140h

Error Injection Data 0

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 140h
**Host Memory Space:** SBREG_BAR + 0x120000 + 140h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/P | **INJDATA0:** Error Injection Data[31:0]: Zero bits indicate no injection; one bits indicate that the corresponding read/write data bit should be inverted. |

## 44.5.70 ERRINJDATA1—Offset 144h

Error Injection Data 1

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 144h
**Host Memory Space:** SBREG_BAR + 0x120000 + 144h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/P | **INJDATA1:** Error Injection Data[63:32]: Zero bits indicate no injection; one bits indicate that the corresponding read/write data bit should be inverted. |

## 44.5.71 DCS—Offset 170h

DRAM Control and Status

**Type:** Sideband Register (Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 170h
**Host Memory Space:** SBREG_BAR + 0x120000 + 170h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0x0<br>RSV | **Rsvd_DCS_5:** Reserved |
| 28 | 0x0<br>RW | **PMICTL:** PMI Control:<br>• 0: Connect to the Bunit<br>• 1: Connect to CPGC<br>When this field is changed, the Dunit will only switch after all previous transactions from the previous unit have been completed. Since the Dunit is a slave to the PMI interface and it cannot prevent the Bunit or CPGC from sendign transactions, the initiatior of this request will have to make sure that the Bunit/CPGC are configured appropriately.<br>Status of this operation from the Dunit perspective is provided in the PMI STAT register. |
| 27:24 | 0x0<br>RSV | **Rsvd_DCS_4:** Reserved |
| 23 | 0x0<br>RW/V/P | **SCRAMBLE_ENABLE:** Data Scrambler Enable:<br>When set to 1 the data lanes (DDR3_DQ[63:0]) and the ECC lanes (DDR3_DQECC[7:0]) will be scrambled, otherwise no scrambling will occur. |
| 22 | 0x0<br>RSV | **Rsvd_DCS_3:** Reserved |
| 21 | 0x0<br>RW/P | **MPRMODE:** Mask Chip-Selects for all commands except read commands and MRS commands |
| 20 | 0x0<br>RW/P | **BLKPHASEB:** Block Phase_B Commands:<br>The Dunit runs at half the frequency of the DRAM clock to save power. In order to issue back-to-back commands on every DRAM clock cycles, the Dunit has to schedule two commands per Dunit clock. Therefore, it processes requests thru two separate arbitration paths labeled as Phase_A and Phase_B. Setting this bit to a 1 will disable Phase_B completely, and all memory requests will be processed thru Phase_A arbitration path. With only Phase_A, the DRAM devices will never see back-to-back commands. The best it will see is a command every other DRAM clock cycle.<br>• 0 - No block<br>• 1 - Block |
| 19:18 | 0x0<br>RSV | **Rsvd_DCS_2:** Reserved |
| 17:16 | 0x0<br>RW/P | **ECCLANESWAP:** ECC Byte Lane Swap: This feature is not supported in 32 bit mode and this field must be set to 0.<br>• 0h - Normal mode<br>• 1h - Swap ECC and Data Byte 0<br>• 2h - Reserved<br>• 3h - Reserved |
| 15:13 | 0x0<br>RSV | **Rsvd_DCS_1:** Reserved |
| 12 | 0x0<br>RW/P | **ODTMODE:** ODT Control Mode:<br>• 0 - Dunit auto controls the ODT pins based on DRAM Write transactions.<br>• 1 - The value of ODTVAL above directly controls the ODT pins. |
| 11:8 | 0x0<br>RW/P | **ODTVAL:** ODT Control Value: Each bit of ODTVAL directly controls an ODT pin, when ODTMODE is set to 1. Used only during init flow by BIOS. |
| 7:5 | 0x0<br>RSV | **Rsvd_DCS_0:** Reserved |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 4 | 0x0<br>RW/P | **CKEMODE:** CKE Control Mode:<br>• 0 - Dunit auto controls the CKE pins based on Power-Down and Self Refresh entry and exit.<br>• 1 - The value of CKEVAL above directly controls the CKE pins. |
| 3:0 | 0x0<br>RW/P | **CKEVAL:** CKE Control Value: Each bit of CKEVAL directly controls a CKE pin, when CKEMODE is set to 1. Used only during init flow by BIOS. |

## 44.5.72 DECCCTRL—Offset 180h

Dunit ECC Control

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 180h
**Host Memory Space:** SBREG_BAR + 0x120000 + 180h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:26 | 0x0<br>RSV | **Rsvd_DECCCTRL_1:** Reserved |
| 25 | 0x0<br>RW/P | **RD2CLRACC:** Read to Clear C[1:0]SBEACC Registers:<br>• 0 = C[1:0]SBEACC Registers are cleared when written<br>• 1 = C[1:0]SBEACC Registers are cleared when written or read |
| 24:18 | 0x0<br>RSV | **Rsvd_DECCCTRL_0:** Reserved |
| 17 | 0x0<br>RW/P | **ENCBGEN:** Enable Generation of ECC Check Bits:<br>• 0 - Disable generation of ECC Check Bits<br>• 1 - Enable generation of ECC Check Bits<br>ECC is generated for both the Bunit and the CPGC |
| 16 | 0x0<br>RW/P | **ECCOVREN:** ECC Check Bits Override Enable:<br>• 0 - Normal ECC is generated.<br>• 1 - ECC override enabled, the value in ECCOVR will be used for the ECC code. |
| 15:8 | 0x0<br>RW/P | **ECCOVR:** ECC Check Bits Override Value: The ECC override code to be used on writes if enabled by ECCOVREN. |
| 7:5 | 0x0<br>RW/P | **UCE_FILTER:** Uncorrectable Error Filter:<br>• 000: Normal mode; All 8 byte ECC checks/corrections are performed independently, no anti-aliasing filters are applied.<br>• 011: An uncorrectable error that is detected in any 8 byte ECC check will cause all four parallel 8 byte ECC checks to be treated as uncorrectable errors. |
| 4 | 0x0<br>RW/P | **DPAREN:** Data Parity Enable: When set, data path parity is enabled. The write data parity is checked at the point when ECC is generated and read data parity is generated at the point that ECC is checked. |
| 3 | 0x0<br>RW/P | **CAPERREN:** Enable Command Address Parity Error Detection: When set, command address parity errors are detected and signalled to the Bunit. |
| 2 | 0x0<br>RW/P | **DERREN:** Enable Uncorrectable Error Notification: When set, uncorrectable ECC errors are signalled to the Bunit and patrol scrub. |
| 1 | 0x0<br>RW/P | **SERREN:** Enable Correctable Error Notification: When set, correctable ECC errors are signalled to the Bunit and patrol scrub which indicates that the read data needs to be written back to memory. This causes the DRAM cell with the single bit error to be scrubbed. |
| 0 | 0x0<br>RW/V/P | **ECCEN:** ECC Enable: When set, single bit error correction and double bit error detection (SEC/DED ECC) is enabled. The ECC is an 8 bit protection code for every 64 bits of data stored in DRAM. ECC is generated on writes and checked on reads, requiring a 72 bit DDR3 data bus width. |

## 44.5.73 LEAKY_BUCKET_CNTR_UPPER—Offset 18Ch

Leaky Bucket Counter Upper

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 18Ch
**Host Memory Space:** SBREG_BAR + 0x120000 + 18Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RW/P | **CNTR_UPPER_RANK3:** Rank 3 CNTR_UPPER configuration.<br>Total Leak Rate = (CNTR_UPPER_RANK3 + 1)* (LEAKY_BUCKET_CFG3.CNTR_HI + 1) * (LEAKY_BUCKET_CFG3.CNTR_LO + 1) * 8192 DRAM clocks. Setting CNTR_LO to zero will disable the leaky bucket. |
| 23:16 | 0x0<br>RW/P | **CNTR_UPPER_RANK2:** Rank 2 CNTR_UPPER configuration.<br>Total Leak Rate = (CNTR_UPPER_RANK2 + 1)* (LEAKY_BUCKET_CFG2.CNTR_HI + 1) * (LEAKY_BUCKET_CFG2.CNTR_LO + 1) * 8192 DRAM clocks. Setting CNTR_LO to zero will disable the leaky bucket. |
| 15:8 | 0x0<br>RW/P | **CNTR_UPPER_RANK1:** Rank 1 CNTR_UPPER configuration.<br>Total Leak Rate = (CNTR_UPPER_RANK1 + 1)* (LEAKY_BUCKET_CFG1.CNTR_HI + 1) * (LEAKY_BUCKET_CFG1.CNTR_LO + 1) * 8192 DRAM clocks. Setting CNTR_LO to zero will disable the leaky bucket. |
| 7:0 | 0x0<br>RW/P | **CNTR_UPPER_RANK0:** Rank 0 CNTR_UPPER configuration.<br>Total Leak Rate = (CNTR_UPPER_RANK0 + 1)* (LEAKY_BUCKET_CFG0.CNTR_HI + 1) * (LEAKY_BUCKET_CFG0.CNTR_LO + 1) * 8192 DRAM clocks. Setting CNTR_LO to zero will disable the leaky bucket. |

## 44.5.74 DPATROL_SCRUB_TMR—Offset 194h

Patrol Scrub Timer Register

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x12] + 194h
**Host Memory Space:** SBREG_BAR + 0x120000 + 194h

**Default:** FFFFFFFFh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0xffffffff<br>RW/P | **PATSCRTIMER:** Patrol scrub interval timer in DCLKs (DRAM cmd clk divided by 2). A new patrol scrub is scheduled every time the timer ticks to the value in this register. Any non zero value is valid |

## 44.5.75 ICLK_DWORD8—Port 99h, Offset 220h

Flex Clock 0 and Flex Clock 1 Frequency Register

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x99] + 220h
**Host Memory Space:** SBREG_BAR + 0x990000 + 220h

**Default:** 0004_2222h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:14 | 0x0<br>RSV | **Reserved** |
| 13 | 0x1<br>RW/V | **sel_flex_base1:** Selects the frequency of flex_base1:<br>0=200 MHz for flex1 clock<br>1=96 MHz for flex1 clock |
| 12 | 0x0<br>RSV | **Reserved** |
| 11:8 | 0x2<br>RW/V | **flex_ck_div1:** flex clock 1 is flex_base1/flex_ck_div1. |
| 7:6 | 0x0<br>RSV | **Reserved** |
| 5 | 0x1<br>RW/V | **sel_flex_base0** Selects the frequency of flex_base0:<br>0=200 MHz for flex1 clock<br>1=96 MHz for flex1 clock |
| 4 | 0x0<br>RSV | **Reserved** |
| 3:0 | 0x2<br>RW/V | **flex_ck_div0:** flex clock 0 is flex_base0/flex_ck_div0. |

§ §

# 45 Global and Local Error Registers (GLMREG) - B0, D4, F0

## 45.1 Introduction and Index

The host-accessible registers for the Global and Local Error Registers (GLMREG) are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

### 45.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 4 (decimal), Function 0. The offset addresses are listed.

**Table 45-1. Summary of PCI Configuration Registers—0/4/0**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 2 | 8086 | "GLREG Vendor ID (GLREG_VID)—Offset 0h" on page 1483 |
| 4 | 2 | 0000 | "GLREG PCI Command (GLREG_PCICMD)—Offset 4h" on page 1484 |
| 6 | 2 | 0010 | "GLREG PCI Status (GLREG_PCISTS)—Offset 6h" on page 1485 |
| 9 | 3 | 00060000 | "GLREG Class Code (GLREG_CC)—Offset 9h" on page 1486 |
| C | 1 | 00 | "GLREG Cacheline Size (GLREG_CLS)—Offset Ch" on page 1486 |
| 2C | 2 | 8086 | "GLREG Subsystem Vendor ID (GLREG_SVID)—Offset 2Ch" on page 1487 |
| 34 | 1 | 40 | "GLREG Capabilities Pointer (GLREG_CAPPTR)—Offset 34h" on page 1487 |
| 3D | 3 | 00 | "GLREG Interrupt Pin (GLREG_INTP)—Offset 3Dh" on page 1488 |
| 40 | 2 | 0010 | "GLREG PCI Express Capability List (GLREG_EXPCAPLST)—Offset 40h" on page 1488 |
| 42 | 2 | 0092 | "GLREG PCI Express Capability List (GLREG_EXPCAPLST)—Offset 40h" on page 1488 |
| 48 | 2 | 0000 | "GLREG Device Control (GLREG_DEVCTL)—Offset 48h" on page 1490 |
| 4A | 1 | 00 | "GLREG Device Status (GLREG_DEVSTS)—Offset 4Ah" on page 1491 |
| 200 | 4 | 00000000 | "GLREG Global Correctable Error Status (GLREG_GCOERRSTS)—Offset 200h" on page 1492 |
| 204 | 4 | 00000000 | "GLREG Global Non-Fatal Error Status (GLREG_GNFERRSTS)—Offset 204h" on page 1494 |
| 208 | 4 | 00000000 | "GLREG Global Fatal Error Status (GLREG_GFAERRSTS)—Offset 208h" on page 1496 |
| 20C | 4 | 00000000 | "GLREG Global Error Mask (GLREG_GERRMSK)—Offset 20Ch" on page 1498 |
| 228 | 8 | 0000000000000000 | "GLREG Global Error Timer (GLREG_GTIME)—Offset 228h" on page 1500 |
| 230 | 8 | 0000000000000000 | "GLREG Global Correctable FERR Error Time Stamp (GLREG_GCOFERRTIME)—Offset 230h" on page 1500 |
| 238 | 8 | 0000000000000000 | "GLREG Global Nonfatal FERR Error Time Stamp (GLREG_GNFFERRTIME)—Offset 238h" on page 1501 |
| 240 | 8 | 0000000000000000 | "GLREG Global Fatal FERR Error Time Stamp (GLREG_GFAFERRTIME)—Offset 240h" on page 1501 |
| 248 | 4 | 00000000 | "GLREG Global System Event Status (GLREG_GSYSEVTSTS)—Offset 248h" on page 1502 |
| 24C | 4 | 00000000 | "GLREG Global System Event Mask (GLREG_GSYSEVTMSK)—Offset 24Ch" on page 1502 |
| 250 | 4 | 00000025 | "GLREG Global System Event Map (GLREG_GSYSEVTMAP)—Offset 250h" on page 1503 |
| 254 | 4 | 00000025 | "GLREG Error Pin Control (GLREG_ERRPINCTRL)—Offset 254h" on page 1504 |
| 258 | 4 | 00000000 | "GLREG Error Pin Status (GLREG_ERRPINSTS)—Offset 258h" on page 1504 |
| 25C | 4 | 00000000 | "GLREG Error Pin Data (GLREG_ERRPINDATA)—Offset 25Ch" on page 1505 |
| 294 | 1 | 00 | "GLREG Uncorrectable Error Counter (GLREG_LUNCERRCNT)—Offset 294h" on page 1506 |

## 45.2 Registers in Configuration Space

### 45.2.1 GLREG Vendor ID (GLREG_VID)—Offset 0h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:4, F:0] + 0h

**Default:** 8086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x8086<br>RO | **VID:** This field identifies Intel as the manufacturer of the device. |

## 45.2.2 GLREG PCI Command (GLREG_PCICMD)—Offset 4h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:4, F:0] + 4h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **Reserved:** Reserved. |
| 10 | 0x0<br>RO | **INTxD:** This bit controls the ability of the PCI-Express Function to generate INTx interrupt message. When set, functions are prevented from asserting INTx interrupt messages.<br>Any INTx emulation interrupts already asserted by the function must be deserted when this bit is set by generating a Deassert_INTx message(s). |
| 9 | 0x0<br>RO | **FBE:** Not applicable to PCI-Express. Hardwired to 0. |
| 8 | 0x0<br>RO | **SEE:** When set, this bit enables reporting of Non-Fatal and Fatal Errors detected by the Function to the Root Complex. ERR_COR messages are not affected by this bit.<br>Errors are reported when enabled either through this bit or through the PCI Express-specific bits in the Device Control Register (GLREG_DEVCTL). |
| 7 | 0x0<br>RO | **WCC:** Not applicable to PCI-Express. Hardwired to 0. |
| 6 | 0x0<br>RO | **PERE:** This bit controls the setting of the master data parity error bit in the Status Register (GLREG_PCISTS) in response to a parity error received on the PCI Express interface (poisoned TLP). |
| 5 | 0x0<br>RO | **VGA_PSE:** Not applicable to PCI-Express. Hardwired to 0. |
| 4 | 0x0<br>RO | **MWIE:** Not applicable to PCI-Express. Hardwired to 0. |
| 3 | 0x0<br>RO | **SCE:** Not applicable to PCI-Express. Hardwired to 0. |
| 2 | 0x0<br>RO | **BME:** This bit controls the ability of the Function to issue Memory and I/O read or write requests, and the ability of Root or Switch port to forward memory and I/O read or write requests in the upstream direction. |
| 1 | 0x0<br>RO | **MSE:** This bit controls the function's response to Memory Space accesses. |
| 0 | 0x0<br>RO | **IOSE:** This bit controls the function's response to IO Space accesses. |

## 45.2.3 GLREG PCI Status (GLREG_PCISTS)—Offset 6h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:4, F:0] + 6h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO | **DPE:** This bit is set when a poisoned TLP is received.<br>This bit is set even when the parity error response enable bit (bit[6] of the PCICMD Register (GLREG_PCICMD) is not set. |
| 14 | 0x0<br>RO | **SSE:** This bit is set when ERR_FATAL or ERR_NONFATAL messages are sent to the root complex event collector and the SERR enable bit in the PCICMD Register (GLREG_PCICMD) is set. |
| 13 | 0x0<br>RO | **RMA:** This bit is set when the requester receives a completion with an UR completion status. |
| 12 | 0x0<br>RO | **RTA:** This bit is set when a requester receives a CA completions status. |
| 11 | 0x0<br>RO | **STA:** This bit is set when the switch generates a completion packet with Completer Abort (CA) status is generated by its primary side. |
| 10:9 | 0x0<br>RO | **Reserved:** Reserved |
| 8 | 0x0<br>RO | **MDPD:** This bit is set by a requester if the parity error response enable bit (PERE) in the Command Register (GLREG_PCICMD) is set and either of the following two conditions occur:<br>• Requester receives a completion marked poisoned.<br>• Requester poisons a write requests.<br>If the parity error bit is 0b, this bit is never set. |
| 7 | 0x0<br>RO | **Reserved:** Reserved |
| 6 | 0x0<br>RO | **RSVD0:** Reserved |
| 5 | 0x0<br>RO | **Reserved:** Reserved |
| 4 | 0x1<br>RO | **CAPE:** This bit indicates the presence of an Extended capabilities list items.<br>This bit is hardwired to 1b. |
| 3 | 0x0<br>RO | **INTS:** When set, this bit indicates that an INTx emulation interrupt is pending internally in this function. |
| 2:0 | 0x0<br>RO | **RSVD1:** Reserved |

## 45.2.4 GLREG Class Code (GLREG_CC)—Offset 9h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:4, F:0] + 9h

**Default:** 00060000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **RSVD0:** Reserved |
| 23:16 | 0x6<br>RO | **BC:** This function is hardwired to 06h indicating a Host bridge. |
| 15:8 | 0x0<br>RO | **SC:** This function is hardwired to 00h, indicating a Host Bridge. |
| 7:0 | 0x0<br>RO | **RLPI:** Set to 00h for all non-APIC devices. |

## 45.2.5 GLREG Cacheline Size (GLREG_CLS)—Offset Ch

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:4, F:0] + Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **CLS:** These bits specify the system cache-line size in units of DWords.<br>This field is implemented by PCI Express devices but has no effect on device behavior. |

## 45.2.6 GLREG Subsystem Vendor ID (GLREG_SVID)—Offset 2Ch

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:4, F:0] + 2Ch

**Default:** 8086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x8086<br>RW/O | **SVID:** This field identifies Intel as the manufacturer of the device. |

## 45.2.7 GLREG Capabilities Pointer (GLREG_CAPPTR)—Offset 34h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:4, F:0] + 34h

**Default:** 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x40<br>RO | **CPTR:** Contains the offset of the first item in the list of capabilities. (GLREG_EXPCAPLST) |

## 45.2.8 GLREG Interrupt Pin (GLREG_INTP)—Offset 3Dh

**Type:** PCI Configuration Register
(Size: 8 bits)

**Offset:** [B:0, D:4, F:0] + 3Dh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **INTP:** This register tells which interrupt pin the function uses.<br>• 01h: Generate INTA<br>• 02h: Generate INTB<br>• 03h: Generate INTC<br>• 04h: Generate INTD<br>• Others: Reserved<br>• Devices (or device functions) that do not use an interrupt pin must put a 0 in this register.<br>Not applicable since this device does not generate any interrupts on its own. |

## 45.2.9 GLREG PCI Express Capability List (GLREG_EXPCAPLST)—Offset 40h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:4, F:0] + 40h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **NP:** Contains the offset of the next item in the capabilities list. Indicates that this is the last capability in the list. |
| 7:0 | 0x10<br>RO | **CAPID:** Identifies the function as PCI Express capable. |

## 45.2.10 GLREG PCI Express Capabilities (GLREG_EXPCAP)—Offset 42h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:4, F:0] + 42h

**Default:** 0092h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:14 | 0x0<br>RO | **RSVD0:** Reserved |
| 13:9 | 0x0<br>RO | **IMN:** This field indicates the interrupt message number that is generated from the PCI Express port. |
| 8 | 0x0<br>RO | **SI:** Indicates the PCI Express link associated with this port is connected to a slot. |
| 7:4 | 0x9<br>RO | **DT:** 1001b Root Complex Integrated Endpoint (RCEC). |
| 3:0 | 0x2<br>RO | **VN:** These bits indicate the version number of the PCI Express capability structure. |

## 45.2.11 GLREG Device Control (GLREG_DEVCTL)—Offset 48h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:4, F:0] + 48h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO | **RSVD0:** Reserved |
| 14:12 | 0x0<br>RO | **MRRS:** This field sets the maximum Read Requests size for the function as a requester. The Function must not generate read requests with size exceeding the set value.<br>• 000b: 128 bytes maximum Read Request size<br>• 001b: 256 bytes maximum Read Request size<br>• 010b: 512 bytes maximum Read Request size<br>• 011b: 1024 bytes maximum Read Request size<br>• 100b: 2048 bytes maximum Read Request size<br>• 101b: 4096 bytes maximum Read Request size<br>• Others: Reserved<br>Functions that do not generate Read Requests larger than 128B and functions that do not generate Read Requests on their own behalf are permitted to implement this field as Read Only (RO) with a value of 000b. |
| 11 | 0x0<br>RO | **ENOSNP:** This bit is permitted to be hardwired to 0b if a function would never set the No Snoop attribute in transactions it initiates. |
| 10 | 0x0<br>RO | **AUXPME:** Not supported |
| 9 | 0x0<br>RO | **PFE:** Functions that do not implement this capability hardware this bit to 0b. |
| 8 | 0x0<br>RO | **ETFE:** Functions that do not implement this capability hardwire this bit to 0b. |
| 7:5 | 0x0<br>RW | **MPS:** This field sets maximum TLP payload size for the function. As a receiver, the function must handle TLPs as larger as the set value. As a Transmitter, the function must not generate TLPs exceeding the set value.<br>• 000b: 128 bytes maximum payload size<br>• 001b: 256 bytes maximum payload size<br>• 010b: 512 bytes maximum payload size (Unsupported)<br>• 011b: 1024 bytes maximum payload size (Unsupported)<br>• 100b: 2048 bytes maximum payload size (Unsupported)<br>• 101b: 4096 bytes maximum payload size (Unsupported)<br>• Others: Reserved |
| 4 | 0x0<br>RO | **ENRO:** A function is permitted to hardwire this bit to 0b if it never sets the Relaxed ordering attribute in transactions it initiates as a requester. |
| 3 | 0x0<br>RO | **URRE:** This bit controls the enabling of ERR_CORR, ERR_NONFATAL or ERR_FATAL messages on PCI Express for reporting Unsupported Request (UR) errors. |
| 2 | 0x0<br>RO | **FERE:** Generation of the ERR_FATAL message is disabled. |
| 1 | 0x0<br>RO | **NFERE:** Generation of the ERR_NONFATAL message is disabled. |
| 0 | 0x0<br>RO | **CERE:** Generation of the ERR_CORR message is disabled. |

## 45.2.12 GLREG Device Status (GLREG_DEVSTS)—Offset 4Ah

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:4, F:0] + 4Ah

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:6 | 0x0<br>RO | **RSVD0:** Reserved |
| 5 | 0x0<br>RO | **Reserved:** Reserved |
| 4 | 0x0<br>RO | **APD:** Auxiliary Power is not supported. |
| 3 | 0x0<br>RO | **URD:** This bit indicates that the device received an Unsupported Request (UR). |
| 2 | 0x0<br>RO | **FED:** This bit indicates status of Fatal Errors detected. |
| 1 | 0x0<br>RO | **NFED:** This bit indicates status of Non-Fatal Errors detected. |
| 0 | 0x0<br>RO | **CED:** This bit indicates status of Correctable Errors detected. |

## 45.2.13 GLREG Global Correctable Error Status (GLREG_GCOERRSTS)—Offset 200h

This register indicates that a Correctable Error is reported to the global error logic. An individual error status bit that is set indicates that a particular local device or RCEC has detected an error.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:4, F:0] + 200h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0 RW/1C/V/P | **Reserved:** Reserved. |
| 23 | 0x0 RW/1C/V/P | **NPK_CO_STS:** NPK Error Status - Not used by the SoC |
| 22 | 0x0 RW/1C/V/P | **SPIESPI_CO_STS:** SPIESPI Error Status - Not used by the SoC |
| 21 | 0x0 RW/1C/V/P | **HSUART_CO_STS:** HSUART Error Status - Not used by the SoC |
| 20 | 0x0 RW/1C/V/P | **SMBUS_CO_STS:** SMBUS Error Status - Not used by the SoC |
| 19 | 0x0 RW/1C/V/P | **LPC_CO_STS:** LPC Error Status - Not used by the SoC |
| 18 | 0x0 RW/1C/V/P | **USB_CO_STS:** USB Error Status - Not used by the SoC |
| 17 | 0x0 RW/1C/V/P | **SATA1_CO_STS:** SATA1 Error Status - Not used by the SoC |
| 16 | 0x0 RW/1C/V/P | **SATA0_CO_STS:** SATA0 Error Status - Not used by the SoC |
| 15 | 0x0 RW/1C/V/P | **VRP2_CO_STS:** |
| 14 | 0x0 RW/1C/V/P | **VRP1_CO_STS:** |
| 13 | 0x0 RW/1C/V/P | **VRP0_CO_STS:** |
| 12 | 0x0 RW/1C/V/P | **PCIeRP7_CO_STS:** |
| 11 | 0x0 RW/1C/V/P | **PCIeRP6_CO_STS:** |
| 10 | 0x0 RW/1C/V/P | **PCIeRP5_CO_STS:** |
| 9 | 0x0 RW/1C/V/P | **PCIeRP4_CO_STS:** |
| 8 | 0x0 RW/1C/V/P | **PCIeRP3_CO_STS:** |
| 7 | 0x0 RW/1C/V/P | **PCIeRP2_CO_STS:** |
| 6 | 0x0 RW/1C/V/P | **PCIeRP1_CO_STS:** |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 5 | 0x0<br>RW/1C/V/P | **PCIeRP0_CO_STS:** |
| 4 | 0x0<br>RW/1C/V/P | **Dunit1_CO_STS:** |
| 3 | 0x0<br>RW/1C/V/P | **Dunit0_CO_STS:** |
| 2 | 0x0<br>RW/1C/V/P | **Bunit_CO_STS:** |
| 1 | 0x0<br>RW/1C/V/P | **Aunit_CO_STS:** |
| 0 | 0x0<br>RW/1C/V/P | **RCEC_CO_STS:** |

## 45.2.14 GLREG Global Non-Fatal Error Status (GLREG_GNFERRSTS)—Offset 204h

This register indicates that a Non-Fatal Error is reported to the global error logic. An individual error status bit that is set indicates that a particular local device or RCEC has detected an error.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:4, F:0] + 204h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0 RW/1C/V/P | **Reserved:** Reserved. |
| 23 | 0x0 RW/1C/V/P | **NPK_NF_STS:** NPK Error Status - Not used by the SoC |
| 22 | 0x0 RW/1C/V/P | **SPIESPI_NF_STS:** SPIESPI Error Status - Not used by the SoC |
| 21 | 0x0 RW/1C/V/P | **HSUART_NF_STS:** Reserved. |
| 20 | 0x0 RW/1C/V/P | **SMBUS_NF_STS:** SMBUS Error Status - Not used by the SoC |
| 19 | 0x0 RW/1C/V/P | **LPC_NF_STS:** LPC Error Status - Not used by the SoC |
| 18 | 0x0 RW/1C/V/P | **USB_NF_STS:** USB Error Status - Not used by the SoC |
| 17 | 0x0 RW/1C/V/P | **SATA1_NF_STS:** SATA1 Error Status - Not used by the SoC |
| 16 | 0x0 RW/1C/V/P | **SATA0_NF_STS:** SATA0 Error Status - Not used by the SoC |
| 15 | 0x0 RW/1C/V/P | **VRP2_NF_STS:** |
| 14 | 0x0 RW/1C/V/P | **VRP1_NF_STS:** |
| 13 | 0x0 RW/1C/V/P | **VRP0_NF_STS:** |
| 12 | 0x0 RW/1C/V/P | **PCIeRP7_NF_STS:** |
| 11 | 0x0 RW/1C/V/P | **PCIeRP6_NF_STS:** |
| 10 | 0x0 RW/1C/V/P | **PCIeRP5_NF_STS:** |
| 9 | 0x0 RW/1C/V/P | **PCIeRP4_NF_STS:** |
| 8 | 0x0 RW/1C/V/P | **PCIeRP3_NF_STS:** |
| 7 | 0x0 RW/1C/V/P | **PCIeRP2_NF_STS:** |
| 6 | 0x0 RW/1C/V/P | **PCIeRP1_NF_STS:** |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 5 | 0x0<br>RW/1C/V/P | **PCIeRP0_NF_STS:** |

| 0 | 0x0<br>RW/1C/V/P | **RCEC_NF_STS:** |

## 45.2.15 GLREG Global Fatal Error Status (GLREG_GFAERRSTS)—Offset 208h

This register indicates that a Fatal Error is reported to the global error logic. An individual error status bit that is set indicates that a particular local device or RCEC has detected an error.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:4, F:0] + 208h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0 RW/1C/V/P | **Reserved:** Reserved. |
| 23 | 0x0 RW/1C/V/P | **NPK_FA_STS:** |
| 22 | 0x0 RW/1C/V/P | **SPIESPI_FA_STS:** |
| 21 | 0x0 RW/1C/V/P | **HSUART_FA_STS:** |
| 20 | 0x0 RW/1C/V/P | **SMBUS_FA_STS:** |
| 19 | 0x0 RW/1C/V/P | **LPC_FA_STS:** |
| 18 | 0x0 RW/1C/V/P | **USB_FA_STS:** |
| 17 | 0x0 RW/1C/V/P | **SATA1_FA_STS:** |
| 16 | 0x0 RW/1C/V/P | **SATA0_FA_STS:** |
| 15 | 0x0 RW/1C/V/P | **VRP2_FA_STS:** |
| 14 | 0x0 RW/1C/V/P | **VRP1_FA_STS:** |
| 13 | 0x0 RW/1C/V/P | **VRP0_FA_STS:** |
| 12 | 0x0 RW/1C/V/P | **PCIeRP7_FA_STS:** |
| 11 | 0x0 RW/1C/V/P | **PCIeRP6_FA_STS:** |

## 45.2.16 GLREG Global Error Mask (GLREG_GERRMSK)—Offset 20Ch

This register masks the reporting of errors detected by local devices. An individual error mask bit that is set masks error reporting of the particular local device, software may set or clear the mask bit. This register is sticky and can only be reset by PWRGOOD. Global Error Mask register masks errors reported from the local devices or RCEC to the global register. If the error reporting is masked in this register, all errors from the corresponding local device or RCEC will not set any of the global error status bits.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:4, F:0] + 20Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RW/P | **Reserved:** Reserved. |
| 23 | 0x0<br>RW/P | **NPK_MSK:**<br>• 1=mask<br>• 0=unmask |
| 22 | 0x0<br>RW/P | **SPIESPI_MSK:**<br>• 1=mask<br>• 0=unmask |
| 21 | 0x0<br>RW/P | **HSUART_MSK:**<br>• 1=mask<br>• 0=unmask |

## 45.2.17 GLREG Global Error Timer (GLREG_GTIME)—Offset 228h

Global Error Timer register is a free running 64-bit counter and will indicate the current value of the 64-bit counter. This counter is reset to 0 by PWRGOOD. Once out of PWRGOOD reset, the counter begins to run.

**Type:** PCI Configuration Register (Size: 64 bits)

**Offset:** [B:0, D:4, F:0] + 228h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0x0<br>RO/V/P | **GTIME_Value:** This is the 64-bit free running counter. |

## 45.2.18 GLREG Global Correctable FERR Error Time Stamp (GLREG_GCOFERRTIME)—Offset 230h

The time stamp register logs the 64-bit free running counter when the first Correctable Error was logged.

**Type:** PCI Configuration Register (Size: 64 bits)

**Offset:** [B:0, D:4, F:0] + 230h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0x0<br>RO/V/P | **G_COFERR_TIME:** The time stamp register logs the 64-bit free running counter when the first Correctable Error was logged. |

## 45.2.19 GLREG Global Nonfatal FERR Error Time Stamp (GLREG_GNFFERRTIME)—Offset 238h

The time stamp register logs the 64-bit free running counter when the first Nonfatal Error was logged.

**Type:** PCI Configuration Register (Size: 64 bits)

**Offset:** [B:0, D:4, F:0] + 238h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0x0<br>RO/V/P | **G_NFFERR_TIME:** The time stamp register logs the 64-bit free running counter when the first Non-Fatal Error was logged. |

## 45.2.20 GLREG Global Fatal FERR Error Time Stamp (GLREG_GFAFERRTIME)—Offset 240h

The time stamp register logs the 64-bit free running counter when the first Fatal Error was logged.

**Type:** PCI Configuration Register (Size: 64 bits)

**Offset:** [B:0, D:4, F:0] + 240h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0x0<br>RO/V/P | **G_FAFERR_TIME:** The time stamp register logs the 64-bit free running counter when the first Fatal Error was logged. |

## 45.2.21 GLREG Global System Event Status (GLREG_GSYSEVTSTS)—Offset 248h

This register indicates the error severity signaled by the global error logic. Setting of an individual error status bit indicates that the corresponding error severity has been detected.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:4, F:0] + 248h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0x0<br>RO | **Reserved:** Reserved. |
| 2 | 0x0<br>RO/V/P | **FA_SYSEV_STS:** A Fatal Error was detected when set |
| 1 | 0x0<br>RO/V/P | **NF_SYSEV_STS:** A Nonfatal Error was detected when set |
| 0 | 0x0<br>RO/V/P | **CO_SYSEV_STS:** A Correctable Error was detected when set |

## 45.2.22 GLREG Global System Event Mask (GLREG_GSYSEVTMSK)—Offset 24Ch

The System Event Mask register masks the reporting the errors indicated by the system event status register. When set, the error severity does not cause the generation of the system event. When cleared, detection of the error severity generates system event(s) according to System Event Map Register (SYSEVMAP)

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:4, F:0] + 24Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0x0<br>RO | **Reserved:** Reserved. |
| 2 | 0x0<br>RW/P | **FA_SYSEV_M:** Fatal Error System Event Mask<br>• 0 - Unmask system event reporting of the Fatal Error<br>• 1 - Mask system event reporting of the Fatal Error |
| 1 | 0x0<br>RW/P | **NF_SYSEV_M:** Nonfatal Error System Event Mask<br>• 0 - Unmask system event reporting of the nonfatal error<br>• 1 - Mask system event reporting of the Nonfatal Error |
| 0 | 0x0<br>RW/P | **CO_SYSEV_M:** Correctable Error System Event Mask<br>• 0 - Unmask system event reporting of the Correctable Error<br>• 1 - Mask system event reporting of the Correctable Error |

## 45.2.23 GLREG Global System Event Map (GLREG_GSYSEVTMAP)—Offset 250h

This register maps the error severity detected to one of the system events. When an error is detected, its corresponding error severity determines which system event to generate according to this register.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:4, F:0] + 250h

**Default:** 00000025h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RO | **Reserved:** Reserved. |
| 5:4 | 0x2<br>RW/P | **FA_SYSEV_MAP:**<br>• 11: Reserved<br>• 10: Generate NMI<br>• 01: Generate SMI<br>• 00: No system event generation<br>***Note:*** NMIE.NMI=1 and NSC.SERR#_NMI_enable=1 to generate an NMI. |
| 3:2 | 0x1<br>RW/P | **NF_SYSEV_MAP:**<br>• 11: Reserved<br>• 10: Generate NMI<br>• 01: Generate SMI<br>• 00: No system event generation<br>***Note:*** NMIE.NMI=1 and NSC.SERR#_NMI_enable=1 to generate an NMI. |
| 1:0 | 0x1<br>RW/P | **CO_SYSEV_MAP:**<br>• 11: Reserved<br>• 10: Generate NMI<br>• 01: Generate SMI<br>• 00: No system event generation<br>***Note:*** NMIE.NMI=1 and NSC.SERR#_NMI_enable=1 to generate an NMI. |

## 45.2.24 GLREG Error Pin Control (GLREG_ERRPINCTRL)—Offset 254h

This register provides the option to configure an error pin to either as a special purpose error pin which is asserted based on the detected error severity, or as a general purpose output which is asserted based on the value in the ERRPINDAT. The assertion of the error pins can also be completely disabled by this register.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:4, F:0] + 254h

**Default:** 00000025h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RO | **Reserved:** Reserved. |
| 5:4 | 0x2<br>RW/P | **ERR2_ENABLE:**<br>• 11: Reserved.<br>• 10: Assert Error Pin when Fatal Error is set in the system event status reg.<br>• 01: Assert and Deassert Error pin according to Error Pin Data register<br>• 00: Disable Error pin assertion |
| 3:2 | 0x1<br>RW/P | **ERR1_ENABLE:**<br>• 11: Reserved.<br>• 10: Assert Error Pin when Non-Fatal Error is set in the system event status reg.<br>• 01: Assert and Deassert Error pin according to Error Pin Data register<br>• 00: Disable Error pin assertion |
| 1:0 | 0x1<br>RW/P | **ERR0_ENABLE:**<br>• 11: Reserved.<br>• 10: Assert Error Pin when Correctable Error is set in the system event status reg.<br>• 01: Assert and Deassert Error pin according to Error Pin Data register<br>• 00: Disable Error pin assertion |

## 45.2.25 GLREG Error Pin Status (GLREG_ERRPINSTS)—Offset 258h

This register reflects the state of the error pin assertion. The status bit of the corresponding error pin is set upon the deassertion to assertion transition of the error pin.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:4, F:0] + 258h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0x0<br>RO | **Reserved:** Reserved. |
| 2 | 0x0<br>RW/1C/V/P | **ERR2_STS:** This bit is set upon the transition of deassertion to assertion of the Error pin. Software writes '1' to clear the status. |
| 1 | 0x0<br>RW/1C/V/P | **ERR1_STS:** This bit is set upon the transition of deassertion to assertion of the Error pin. Software writes '1' to clear the status. |
| 0 | 0x0<br>RW/1C/V/P | **ERR0_STS:** This bit is set upon the transition of deassertion to assertion of the Error pin. Software writes '1' to clear the status. |

## 45.2.26 GLREG Error Pin Data (GLREG_ERRPINDATA)—Offset 25Ch

This register provides the data value when the error pin is configured as a general purpose output.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:4, F:0] + 25Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0x0<br>RO | **Reserved:** Reserved. |
| 2 | 0x0<br>RW | **ERR2_PINDATA:** (applies when ERRPINCTL[5:4]=01, otherwise reserved)<br>This bit acts as the general purpose output for the ERR[2] pin. ERR [2] pin value will follow the value programmed in ERR[2] Pin Data register.<br>• 0 - Deassert ERR[2] pin<br>• 1 - Assert ERR[2] pin |
| 1 | 0x0<br>RW | **ERR1_PINDATA:** (applies when ERRPINCTL[3:2]=01, otherwise reserved).<br>This bit acts as the general purpose output for the ERR[1] pin. ERR [1] pin value will follow the value programmed in ERR[1] Pin Data register.<br>• 0 - Deassert ERR[1] pin<br>• 1 - Assert ERR[1] pin |
| 0 | 0x0<br>RW | **ERR0_PINDATA:** (applies when ERRPINCNTL[1:0]=01, otherwise reserved).<br>This bit acts as the general purpose output for the ERR[0] pin. Error [0] pin value will follow the value programmed in ERR[0] Pin Data register.<br>• 0 - Deassert ERR[0] pin<br>• 1 - Assert ERR[0] pin |

## 45.2.27 GLREG Uncorrectable Error Counter (GLREG_LUNCERRCNT)—Offset 294h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:4, F:0] + 294h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RW/1C/V/P | **ERR_OVF:**<br>• 0: No overflow occurred<br>• 1: Error overflow. The error count may not be valid. |
| 6:0 | 0x0<br>RW/1C/V/P | **ERRCNT:** This counter accumulates errors that occur when the associated error type is selected in the FNBERRCNTSEL register.<br>This field is cleared by writing 7Fh. Maximum counter available is 127d (7Fh).<br>***Note:*** Single bit write clears the corresponding bit. |

§ §

# 46 Root Complex Event Collector - B0, D5, F0

## 46.1 Introduction and Index

The host-accessible registers for the Root Complex Event Collector (RCEC) are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

### 46.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 5 (decimal), Function 0. The offset addresses are listed.

**Table 46-1. Summary of PCI Configuration Registers—0/5/0**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 2 | 8086 | "RCEC Vendor ID (RCEC_VID)—Offset 0h" on page 1509 |
| 4 | 2 | 0000 | "RCEC PCI Command (RCEC_PCICMD)—Offset 4h" on page 1510 |
| 6 | 2 | 0010 | "RCEC PCI Status (RCEC_PCISTS)—Offset 6h" on page 1511 |
| 9 | 3 | 00080700 | "RCEC Class Code (RCEC_CC)—Offset 9h" on page 1512 |
| C | 2 | 00 | "RCEC Cacheline Size (RCEC_CLS)—Offset Ch" on page 1512 |
| 3D | 3 | 01 | "RCEC Interrupt Pin (RCEC_INTP)—Offset 3Dh" on page 1513 |
| 40 | 2 | 8010 | "RCEC PCI Express Capability List (RCEC_EXPCAPLST)—Offset 40h" on page 1513 |

| 12C | 1 | 00 | "RCEC Root Error Command (RCEC_ROOTERRCMD)—Offset 12Ch" on page 1527 |
| 130 | 4 | 00000000 | "RCEC Root Error Status (RCEC_ROOTERRSTS)—Offset 130h" on page 1528 |
| 134 | 4 | 00000000 | "RCEC Error Source Identification (RCEC_ERRSRCID)—Offset 134h" on page 1529 |

## 46.2 Registers in Configuration Space

### 46.2.1 RCEC Vendor ID (RCEC_VID)—Offset 0h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:5, F:0] + 0h

**Default:** 8086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x8086<br>RO | **VID:** This field identifies Intel as the manufacturer of the device. |

## 46.2.2 RCEC PCI Command (RCEC_PCICMD)—Offset 4h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:5, F:0] + 4h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **Reserved:** Reserved. |
| 10 | 0x0<br>RW | **INTxD:** This bit controls the ability of the PCI-Express Function to generate INTx interrupt message. When set, functions are prevented from asserting INTx interrupt messages.<br>Any INTx emulation interrupts already asserted by the function must be deserted when this bit is set by generating a Deassert_INTx message(s). |
| 9 | 0x0<br>RO | **FBE:** Not applicable to PCI-Express. Hardwired to 0. |
| 8 | 0x0<br>RW | **SEE:** (SERR Enable) When set, this bit enables reporting of Non-Fatal and Fatal Errors detected by the Function of the Root Complex. ERR_COR messages are not affected by this bit.<br>Errors are reported when enabled either through this bit or through the PCI Express-specific bits in the Device Control Register (RCEC_DEVCTL). |
| 7 | 0x0<br>RO | **WCC:** Not applicable to PCI-Express. Hardwired to 0. |
| 6 | 0x0<br>RW | **PERE:** This bit controls the setting of the master data parity error bit in the Status Register (RCEC_PCISTS) in response to a parity error received on the PCI Express interface (poisoned TLP). |
| 5 | 0x0<br>RO | **VGA_PSE:** Not applicable to PCI-Express. Hardwired to 0. |
| 4 | 0x0<br>RO | **MWIE:** Not applicable to PCI-Express. Hardwired to 0. |
| 3 | 0x0<br>RO | **SCE:** Not applicable to PCI-Express. Hardwired to 0. |
| 2 | 0x0<br>RW | **BME:** This bit controls the ability of the Function to issue Memory and I/O read or write requests, and the ability of Root or Switch port to forward memory and I/O read or write requests in the upstream direction. MSI interrupts are inband memory writes and are blocked when this bit is 0b. |
| 1 | 0x0<br>RO | **MSE:** This bit controls the function's response to Memory Space accesses. When this bit is 0b, the function will handle memory transactions targeting the Function as an Unsupported Request (UR). |
| 0 | 0x0<br>RO | **IOSE:** This bit controls the function's response to IO Space accesses. When this bit is 0b, the function will handle memory transactions targeting the Function as an Unsupported Request (UR). |

## 46.2.3 RCEC PCI Status (RCEC_PCISTS)—Offset 6h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:5, F:0] + 6h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C/V | **DPE:** This bit is set when a poisoned TLP is received. This bit is set even when the parity error response enable, bit 6 of the PCICMD Register (RCEC_PCICMD) is not set. |
| 14 | 0x0<br>RW/1C/V | **SSE:** This bit is set when ERR_FATAL or ERR_NONFATAL messages are sent to the root complex event collector and the SERR enable bit in the PCICMD Register (RCEC_PCICMD) is set. |
| 13 | 0x0<br>RO | **RMA:** This bit is set when the requester receives a completion with an UR completion status. |
| 12 | 0x0<br>RO | **RTA:** This bit is set when a requester receives a CA completions status. |
| 11 | 0x0<br>RO | **STA:** This bit is set when the switch generates a completion packet with Completer Abort (CA) status is generated by its primary side. |
| 10:9 | 0x0<br>RO | **DVT:** These bits have no meaning on PCI Express. Fast decode timing is reported. |
| 8 | 0x0<br>RO | **MDPD:** This bit is set by a requester (primary side for type1 configuration header functions) if the parity error response enable bit (PERE) in the Command Register (RCEC_PCICMD) is set and either of the following two conditions occur:<br>• Requester receives a completion marked poisoned.<br>• Requester poisons a write requests.<br>If the parity error bit is 0b, this bit is never set. |
| 7 | 0x0<br>RO | **FBC:** This bit has no meaning on PCI Express. |
| 6 | 0x0<br>RO | **RSVD0:** Reserved |
| 5 | 0x0<br>RO | **C66:** This bit has no meaning on PCI Express. |
| 4 | 0x1<br>RO | **CAPE:** This bit indicates the presence of an Extended capabilities list items. |
| 3 | 0x0<br>RO/V | **INTS:** When set, this bit indicates that an INTx emulation interrupt is pending internally in this function. |
| 2:0 | 0x0<br>RO | **RSVD1:** Reserved |

## 46.2.4 RCEC Class Code (RCEC_CC)—Offset 9h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:5, F:0] + 9h

**Default:** 00080700h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **RSVD0:** Reserved |
| 23:16 | 0x8<br>RW/O | **BC:** Root Complex Event Collector |
| 15:8 | 0x7<br>RW/O | **SC:** Root Complex Event Collector |
| 7:0 | 0x0<br>RW/O | **RLPI:** Reserved. |

## 46.2.5 RCEC Cacheline Size (RCEC_CLS)—Offset Ch

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:5, F:0] + Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **CLS:** These bits specify the system cache-line size in units of DWords.<br>This field is implemented by PCI Express devices but has no effect on device behavior. |

## 46.2.6 RCEC Interrupt Pin (RCEC_INTP)—Offset 3Dh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:5, F:0] + 3Dh

**Default:** 01h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x1<br>RO | **INTP:** This register tells which interrupt pin the function uses.<br>• 01h: Generate INTA<br>• 02h: Generate INTB<br>• 03h: Generate INTC<br>• 04h: Generate INTD<br>• Others: Reserved<br>Devices (or device functions) that do not use an interrupt pin must put a 0 in this register. As a single function device, this device specifies INTA as its interrupt pin. |

## 46.2.7 RCEC PCI Express Capability List (RCEC_EXPCAPLST)—Offset 40h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:5, F:0] + 40h

**Default:** 8010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x80<br>RO | **NP:** Contains the offset of the next item in the capabilities list (RCEC_PMCAPLST). |
| 7:0 | 0x10<br>RO | **CAPID:** Identifies the function as PCI Express capable. |

## 46.2.8 RCEC PCI Express Capabilities (RCEC_EXPCAP)—Offset 42h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:5, F:0] + 42h

**Default:** 00A2h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:14 | 0x0<br>RO | **RSVD0:** Reserved |
| 13:9 | 0x0<br>RO | **IMN:** This field indicates the interrupt message number that is generated from the PCI Express port. |
| 8 | 0x0<br>RO | **SI:** Indicates the PCI Express link associated with this port is connected to a slot. |
| 7:4 | 0xa<br>RO | **DT:** 1010b Root Complex Event Collector |
| 3:0 | 0x2<br>RO | **VN:** These bits indicate the version number of the PCI Express capability structure. |

## 46.2.9 RCEC Device Control (RCEC_DEVCTL)—Offset 48h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:5, F:0] + 48h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO | **RSVD0:** Reserved |
| 14:12 | 0x0<br>RO | **MRRS:** This field sets the maximum Read Requests size for the function as a requester. The Function must not generate read requests with size exceeding the set value.<br>• 000b: 128 bytes maximum Read Request size<br>• 001b: 256 bytes maximum Read Request size<br>• 010b: 512 bytes maximum Read Request size<br>• 011b: 1024 bytes maximum Read Request size<br>• 100b: 2048 bytes maximum Read Request size<br>• 101b: 4096 bytes maximum Read Request size<br>• Others: Reserved<br>Functions that do not generate Read Requests larger than 128B and functions that do not generate Read Requests on their own behalf are permitted to implement this field as Read Only (RO) with a value of 000b. |
| 11 | 0x0<br>RO | **Reserved:** Reserved |
| 10 | 0x0<br>RO | **AUXPME:** Not supported |
| 9 | 0x0<br>RO | **Reserved:** Reserved |
| 8 | 0x0<br>RO | **ETFE:** When set, this bit enables a function to use an 8-bit tag field as a Requester. |
| 7:5 | 0x0<br>RW | **MPS:** This field sets maximum TLP payload size for the function. As a receiver, the function must handle TLPs as larger as the set value. As a Transmitter, the function must not generate TLPs exceeding the set value.<br>• 000b: 128 bytes maximum payload size<br>• 001b: 256 bytes maximum payload size<br>• 010b: 512 bytes maximum payload size (Unsupported)<br>• 011b: 1024 bytes maximum payload size (Unsupported)<br>• 100b: 2048 bytes maximum payload size (Unsupported)<br>• 101b: 4096 bytes maximum payload size (Unsupported)<br>• Others: Reserved |
| 4 | 0x0<br>RO | **ENRO:** When set, the function is permitted to set the relaxed ordering bit in the attribute field of transactions it initiates that do not require strong write ordering. |
| 3 | 0x0<br>RW | **URRE:** This bit controls the enabling of ERR_CORR, ERR_NONFATAL or ERR_FATAL messages on PCI Express for reporting Unsupported Request (UR) errors. |
| 2 | 0x0<br>RW | **FERE:** When this bit is set, generation of the ERR_FATAL message is enabled. |
| 1 | 0x0<br>RW | **NFERE:** When this bit is set, generation of the ERR_NONFATAL message is enabled. |
| 0 | 0x0<br>RW | **CERE:** When this bit is set, generation of the ERR_CORR message is enabled. |

## 46.2.10 RCEC Device Status (RCEC_DEVSTS)—Offset 4Ah

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:5, F:0] + 4Ah

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:6 | 0x0<br>RO | **RSVD0:** Reserved |
| 5 | 0x0<br>RO | **Reserved:** Reserved |
| 4 | 0x0<br>RO | **APD:** Auxiliary Power is not supported. |
| 3 | 0x0<br>RW/1C/V | **URD:** This bit indicates that the device received an Unsupported Request (UR).<br>Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control Register. |
| 2 | 0x0<br>RW/1C/V | **FED:** This bit indicates status of Fatal Errors detected.<br>Errors are logged in this register regardless of the settings of the Correctable Error mask register. |
| 1 | 0x0<br>RW/1C/V | **NFED:** This bit indicates status of Non-Fatal Errors detected. |
| 0 | 0x0<br>RW/1C/V | **CED:** This bit indicates status of Correctable Errors detected. |

## 46.2.11 RCEC Root Control (RCEC_ROOTCTL)—Offset 5Ch

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:5, F:0] + 5Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:5 | 0x0<br>RO | **RSVD0:** Reserved |
| 4 | 0x0<br>RO | **CRSSVE:** This bit, when set, enables the Root Port to return Configuration Retry Status (CRS) Completion status to software.<br>• 1: Enable software to received a CRS status. This allows software to make the decision to re-issue the configuration request or move on and re-issue the request at a later time.<br>• 0: Disable software from receiving a CRS response. The PCI-E will wait and re-issue the configuration request until it receives a response other than CRS without notifying software. |
| 3 | 0x0<br>RO | **PMEIE:** This field controls the generation of interrupts for PME messages.<br>• 1: Enables interrupt generation upon receipt of a PME message as reflected in the PME Status bit defined in the ROOTSTS register. A PME interrupt is generated if the PMESTATUS register bit is set when this bit is set from a cleared state.<br>• 0: Disables interrupt generation for PME messages. |
| 2 | 0x0<br>RW | **SEFEE:** This field controls generation of system errors in the PCI-Express root Complex Event Collector for Fatal Errors.<br>• 1: indicates that a System Error should be generated if a Fatal Error (ERR_FATAL) is reported by any of the devices associated with and including this PCI-Express root complex event collector.<br>• 0: No System Error should be generated on a Fatal Error (ERR_FATAL) reported by any of the devices associated with and including this PCI-Express root complex event collector. |
| 1 | 0x0<br>RW | **SENFEE:** This field controls generation of system errors in the PCI-Express root Complex Event Collector for Non-Fatal Errors.<br>• 1: indicates that a System Error should be generated if a Non-Fatal Error (ERR_NONFATAL) is reported by any of the devices associated with and including this PCI-Express root complex event collector.<br>• 0: No System Error should be generated on a Non-Fatal Error (ERR_NONFATAL) reported by any of the devices associated with and including this PCI-Express root complex event collector. |
| 0 | 0x0<br>RW | **SECEE:** This field controls generation of system errors in the PCI-Express root Complex Event Collector for Correctable Errors.<br>• 1: indicates that a System Error should be generated if a Correctable Error (ERR_COR) is reported by any of the devices associated with and including this PCI-Express root complex event collector<br>• 0: No System Error should be generated on a Correctable Error (ERR_COR) reported by any of the devices associated with and including this PCI-Express root complex event collector. |

## 46.2.12 RCEC Power Management Capabilities (RCEC_PMCAP)—Offset 82h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:5, F:0] + 82h

**Default:** C803h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x19<br>RO | **PMESUP:** PME assertion is supported when in D3hot.<br>PME assertion from D3cold is not supported. |
| 10 | 0x0<br>RO | **D2S:** Not supported |
| 9 | 0x0<br>RO | **D1S:** Not supported |
| 8:6 | 0x0<br>RO | **AC:** Auxiliary power is not supported. |
| 5 | 0x0<br>RO | **DSI:** Device-specific initialization is not required when transitioning to D0 from D3hot state.<br>This bit is zero. |
| 4 | 0x0<br>RO | **RSVD0:** Reserved |
| 3 | 0x0<br>RO | **PMECLK:** Does not apply to PCI Express.<br>Hard-wired to 0. |
| 2:0 | 0x3<br>RO | **VER:** PM implementation is compliant with PCI Bus Power Management Interface Specification, Revision 11 1.2. |

## 46.2.13 RCEC Power Management Control / Status (RCEC_PMCSR)—Offset 84h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:5, F:0] + 84h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C/V/P | **PMESTS:** Reserved. |
| 14:13 | 0x0<br>RO | **DC:** Not supported |
| 12:9 | 0x0<br>RO | **DS:** Not supported |
| 8 | 0x0<br>RW/P | **PMEEN:** Gates assertion of the PME message. |
| 7:2 | 0x0<br>RO | **RSVD0:** Reserved |
| 1:0 | 0x0<br>RW/V | **PS:** This field is used both to determine the current power state of a function and to set the function into a new power state. The definition of the supported values is given below:<br>• 0h - D0<br>• 3h - D3hot |

## 46.2.14 RCEC MSI Capability List (RCEC_MSICAPLST)—Offset 90h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:5, F:0] + 90h

**Default:** 0005h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **NP:** Contains the offset of the next item in the capabilities list. A null value is used to indicate that this is the last capability. |
| 7:0 | 0x5<br>RO | **CAPID:** Identifies the function as MSI capable. |

## 46.2.15 RCEC MSI Message Control (RCEC_MSICTL)—Offset 92h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:5, F:0] + 92h

**Default:** 0100h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:9 | 0x0<br>RO | **RSVD0:** Reserved |
| 8 | 0x1<br>RO | **PVM:** This bit indicates that this device supports MSI per-vector masking. |
| 7 | 0x0<br>RO | **AD64C:** When set, this bit indicates that the function is capable of generating a 64-bit message address. |
| 6:4 | 0x0<br>RW | **MMEN:** Only one message is supported.<br>These bits are R/W for software compatibility. |
| 3:1 | 0x0<br>RO | **MMC:** Only one message is supported. |
| 0 | 0x0<br>RW | **MSIE:** When set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. |

## 46.2.16 RCEC MSI Message Address (RCEC_MSIADDR)—Offset 94h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:5, F:0] + 94h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **Address:** Message address specified by the system, always DWORD aligned |
| 1:0 | 0x0<br>RO | **Reserved:** Reserved. |

## 46.2.17 RCEC MSI Message Data (RCEC_MSIDATA)—Offset 98h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:5, F:0] + 98h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW | **TM:**<br>• 0: Edge Triggered<br>• 1: Level Triggered |
| 14 | 0x0<br>RW | **LVL:** if TM is 0h, then this field is a don't care.<br>Edge triggered messages are always treated as assert messages. For level triggered interrupts, this bit reflects the state of the interrupt input if TM is 1h, then:<br>• 0: Deassert Messages<br>• 1: Assert Messages |
| 13:12 | 0x0<br>RW | **Reserved:** Reserved |
| 11:8 | 0x0<br>RW | **DM:**<br>• 0000: Fixed: Trigger Mode can be edge or level.<br>• 0001: Lowest Priority: Trigger Mode can be edge or level.<br>• 0010: SMI/PMI/MCA - Not supported via MSI of root port<br>• 0011: Reserved - Not supported via MSI of root port<br>• 0100: NMI - Not supported via MSI of root port<br>• 0101: INIT - Not supported via MSI of root port<br>• 0110: Reserved<br>• 0111: ExtINT - Not supported via MSI of primary port<br>• 1000 -1111: Reserved |
| 7:0 | 0x0<br>RW | **Reserved:** Reserved |

## 46.2.18 RCEC MSI Mask Bit (RCEC_MSIMSK)—Offset 9Ch

The MSI Mask Bit register enables software to disable message sending on a per-vector basis.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:5, F:0] + 9Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x0<br>RO | **RSVD0:** Reserved |
| 0 | 0x0<br>RW | **MSKB:** For each Mask bit that is set, the device is prohibited from sending the associated message. Corresponding bits are masked if set to '1' |

## 46.2.19 RCEC MSI Pending Bit (RCEC_MSIPENDING)—Offset A0h

The Mask Pending register enables software to defer message sending on a per-vector basis.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:5, F:0] + A0h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:1 | 0x0<br>RO | **RSVD0:** Reserved |
| 0 | 0x0<br>RO/V | **PB:** For each Pending bit that is set, the device has a pending associated message. Corresponding bits are pending if set to '1' |

## 46.2.20 RCEC Advanced Error Reporting Extended Capability Header (RCEC_AERCAPHDR)—Offset 100h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:5, F:0] + 100h

**Default:** 15010001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x150<br>RO | **NCO:** Contains the offset of the next structure in the Extended Capabilities list (RCEC_RCECEPACAPHDR). |
| 19:16 | 0x1<br>RO | **CV:** Indicates the version of the Capability structure present. |
| 15:0 | 0x1<br>RO | **EXCAPID:** Identifies the function as Advanced Error Reporting (AER) capable. |

## 46.2.21 RCEC Uncorrectable Error Status (RCEC_ERRUNCSTS)—Offset 104h

This register reports the error status of individual Uncorrectable Error sources. An individual error status bit that is set to 1 indicates that a particular error occurred. Software can clear an error status by writing a 1 to the respective bit.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:5, F:0] + 104h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:23 | 0x0<br>RO | **RSVD0:** Reserved |
| 22 | 0x0<br>RW/1C/V/P | **UIE:** This bit is set whenever an IEH Uncorrectable Internal Error as defined in IEH_UNCERRSTS is detected. |
| 21 | 0x0<br>RO | **RSVD1:** Reserved |
| 20 | 0x0<br>RW/1C/V/P | **URE:** As a receiver, Set whenever an Unsupported Request (negatively-decoded transaction) is detected. The Header is logged. |
| 19 | 0x0<br>RO | **RSVD2:** Reserved |
| 18 | 0x0<br>RW/1C/V/P | **MalformedTLP:** As a receiver, set whenever a malformed TLP (Length not equal to 000000001b for config requests) is detected. The Header is logged. |
| 17 | 0x0<br>RO | **RSVD3:** Reserved |
| 16 | 0x0<br>RW/1C/V/P | **UnexpectedCompletion:** As a receiver, set whenever a completion is received that does not match the requestor ID or outstanding Tag. The Header is logged. |
| 15:0 | 0x0<br>RO | **RSVD4:** Reserved |

## 46.2.22 RCEC Correctable Error Status (RCEC_ERRCORSTS)—Offset 110h

This register reports the error status of individual Correctable Error sources on a PCI Express device. An individual error status bit set to 1 indicates that a particular error has occurred. Software can clear the error status by writing a 1 to the respective bit.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:5, F:0] + 110h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO | **HLOE:** Reserved. |
| 14 | 0x0<br>RO | **CIE:** Reserved. |
| 13 | 0x0<br>RW/1C/V/P | **ANFE:** Reserved. |
| 12 | 0x0<br>RO | **RTTE:** The PCI-E sets this bit when replay timer time-out occurs. |
| 11:9 | 0x0<br>RO | **RSVD0:** Reserved |
| 8 | 0x0<br>RO | **RNRE:** The PCI-E sets this bit when the replay number rolls over from 11 to 00. |
| 7 | 0x0<br>RO | **BDLLPE:** The switch sets this bit on CRC errors on DLLP. |
| 6 | 0x0<br>RO | **BTLPE:** The switch sets this bit on CRC errors on TLP. |
| 5:1 | 0x0<br>RO | **RSVD1:** Reserved |
| 0 | 0x0<br>RO | **RE:** The PCI-E sets this bit when the physical layer detects a receiver error. |

## 46.2.23 RCEC Correctable Error Mask (RCEC_ERRCORMSK)—Offset 114h

This register controls the reporting of individual Correctable Errors via ERR_COR message. A masked error (respective bit set in mask register) is not reported to the host bridge by the switch. There is a mask bit corresponding to every bit in the Correctable Error Status Register.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:5, F:0] + 114h

**Default:** E000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x1<br>RO | **HLOEM:** Reserved. |
| 14 | 0x1<br>RO | **CIEM:** Reserved. |
| 13 | 0x1<br>RW/P | **ANFEM:** This bit is set by default to enable compatibility with software that does not comprehend Role-Based Error Reporting. |
| 12 | 0x0<br>RO | **RTTEM:** Reserved. |
| 11:9 | 0x0<br>RO | **RSVD0:** Reserved |
| 8 | 0x0<br>RO | **RNREM:** Reserved. |
| 7 | 0x0<br>RO | **BDLLPEM:** Reserved. |
| 6 | 0x0<br>RO | **BTLPEM:** Reserved. |
| 5:1 | 0x0<br>RO | **RSVD1:** Reserved |
| 0 | 0x0<br>RO | **REM:** Reserved. |

## 46.2.24 RCEC Advanced Error Capabilities and Control (RCEC_AERCAPCTL)—Offset 118h

This register gives the status and control for ECRC checks and also the pointer to the first Uncorrectable Error that happened.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:5, F:0] + 118h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **RSVD0:** Reserved |
| 10 | 0x0<br>RO | **MHRE:** When set, this bit enables the function to record more than one error header. |
| 9 | 0x0<br>RO | **MHRC:** Supports more than one error header. |
| 8 | 0x0<br>RO | **ECE:** Not supported. Hard-wired to 0 |
| 7 | 0x0<br>RO | **ECC:** Not supported. Hard-wired to 0 |
| 6 | 0x0<br>RO | **EGE:** Not supported. Hard-wired to 0 |
| 5 | 0x0<br>RO | **EGC:** Not supported. Hard-wired to 0 |
| 4:0 | 0x0<br>RO/V/P | **FEP:** This field identifies the bit position of the first error reported in the Uncorrectable Error Status Register.<br>This register re-arms itself (which does not change its current value) as soon as the error status bit indicated by the pointer is cleared by the software by writing a 1 to that status bit. |

## 46.2.25 RCEC Header Log (RCEC_AERHDRLOG1)—Offset 11Ch

This register logs the 4 Dwords of the transaction header for PCI Express errors.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:5, F:0] + 11Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V/P | **TLPHDRLOG:** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again). |

## 46.2.26 RCEC Header Log (RCEC_AERHDRLOG2)—Offset 120h

This register logs the 4 Dwords of the transaction header for PCI Express errors.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:5, F:0] + 120h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RO/V/P | **TLPHDRLOG:** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again). |

## 46.2.27 RCEC Header Log (RCEC_AERHDRLOG3)—Offset 124h

This register logs the 4 Dwords of the transaction header for PCI Express errors.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:5, F:0] + 124h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RO/V/P | **TLPHDRLOG:** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again). |

## 46.2.28 RCEC Header Log (RCEC_AERHDRLOG4)—Offset 128h

This register logs the 4 Dwords of the transaction header for PCI Express errors.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:5, F:0] + 128h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RO/V/P | **TLPHDRLOG:** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again). |

## 46.2.29 RCEC Root Error Command (RCEC_ROOTERRCMD)—Offset 12Ch

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:5, F:0] + 12Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>RO | **RSVD0:** Reserved |
| 2 | 0x0<br>RW | **FERE:** When set, this bit enables the generation of an interrupt when a Fatal Error is reported by any of the functions in the hierarchy associated with this Root Port. |
| 1 | 0x0<br>RW | **NFERE:** When set, this bit enables the generation of an interrupt when a Non-Fatal Error is reported by any of the functions in the hierarchy associated with this Root Port. |
| 0 | 0x0<br>RW | **CERE:** When set, this bit enables the generation of an interrupt when a Correctable Error is reported by any of the functions in the hierarchy associated with this Root Port. |

## 46.2.30 RCEC Root Error Status (RCEC_ROOTERRSTS)—Offset 130h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:5, F:0] + 130h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x0<br>RO | **AEMN:** This register indicates which MSI/MSI-X vector is used for the interrupt message generated in association with any of the status bits of this Capability.<br><br>For MSI, the value in this register indicates the offset between the base Message Data and the interrupt message that is generated. Hardware is required to update this field so that it is correct if the number of MSI Messages assigned to the Function changes when software writes to the Multiple Message Enable field in the MSI Message Control register.<br><br>For MSI-X, the value in this register indicates which MSI-X Table entry is used to generate the interrupt message. The entry must be one of the first 32 entries even if the Function implements more than 32 entries. For a given MSI-X implementation, the entry must remain constant.<br><br>• If both MSI and MSI-X are implemented, they are permitted to use different vectors, though software is permitted to enable only one mechanism at a time. If software enables both MSI and MSI-X at the same time, the value in this register is undefined.<br>• If MSI-X is enabled, the value in this register must indicate the vector for MSI-X.<br>• If MSI is enabled or neither is enabled, the value in this register must indicate the vector for MSI. |
| 26:7 | 0x0<br>RO | **RSVD0:** Reserved |
| 6 | 0x0<br>RW/1C/V/P | **FEMR:** Set when one or more Fatal Uncorrectable Error Messages have been received. |
| 5 | 0x0<br>RW/1C/V/P | **NFEMR:** Set when one or more Non-Fatal Uncorrectable Error Messages have been received. |
| 4 | 0x0<br>RW/1C/V/P | **FUF:** Set when the first Uncorrectable Error Message or PCI_error Message received is for a Fatal Error. |
| 3 | 0x0<br>RW/1C/V/P | **MEFR:** Set when either a Fatal or a Non-Fatal Error is received and ERR_FATAL/NONFATAL Received is already Set. |
| 2 | 0x0<br>RW/1C/V/P | **EFR:** Set when a Fatal or a Non-Fatal Error Message is received and this bit is not already Set. |
| 1 | 0x0<br>RW/1C/V/P | **MCER:** Set when a Correctable Error Message is received and ERR_COR Received is already Set. |
| 0 | 0x0<br>RW/1C/V/P | **CER:** Set when a Correctable Error Message is received and this bit is not already Set. |

### 46.2.31 RCEC Error Source Identification (RCEC_ERRSRCID)—Offset 134h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:5, F:0] + 134h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO/V/P | **EFSID:** Requester ID of the source when a Fatal or Non-Fatal Error is received and the Fatal Error Message Received (FEMR) or Non-Fatal Error Message Received (NFEMR) bit is not already set. |
| 15:0 | 0x0<br>RO/V/P | **ECSID:** Requester ID of the source when a Correctable Error is received and the Correctable Error Received (CER) bit is not already set. |

§ §

# 47 RP - Intel® QuickAssist Technology - B0, D6/D22/D23, F0

## 47.1 Introduction and Index

The host-accessible registers for the "Virtual Root Port" (vRP) dedicated to the Intel® QuickAssist Technology Controller are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The SoC also contains a vRP (Device 22) dedicated to LAN Controller 0 and another vRP (Device 23) dedicated to LAN Controller 1.

The registers shown in this chapter apply to vRP Device 6 as well as vRP Devices 22 and 23. Register information unique to a device is explained in the register and bit field descriptions.

The legend for the register access codes are described in Chapter 43, "Introduction."

### 47.1.1 Host Configuration Space

These Virtual Root Port (vRP) registers are discovered in Host Configuration Space starting at:

- Bus 0, Device 6, Function 0 for the vRP of the Intel® QuickAssist Technology Controller
- Bus 0, Device 22 (decimal), Function 0 for the vRP of LAN Controller 0
- Bus 0, Device 23 (decimal), Function 0 for the vRP of LAN Controller 1

**Table 47-1. Summary of PCI Configuration Registers—0/6/0, 0/22/0, and 0/23/0 (Sheet 1 of 3)**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 2 | 8086 | "VID—Offset 0h" on page 1534 |
| 2 | 2 | See register | "DID—Offset 2h" on page 1534 |
| 4 | 2 | 0000 | "PCICMD—Offset 4h" on page 1535 |
| 6 | 2 | 0010 | "PCISTS—Offset 6h" on page 1536 |

| 2E8 | 2 | 0010 | "IDFDEVCLKGCTL—Offset 2E8h" on page 1590 |

## 47.2 Registers in Configuration Space

### 47.2.1 VID—Offset 0h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] + 0h
**Offset:** [B:0, D:22, F:0] + 0h
**Offset:** [B:0, D:23, F:0] + 0h

**Default:** 8086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x8086<br>RO | **Vendor ID (VID):** This field identifies Intel as the manufacturer of the device. |

### 47.2.2 DID—Offset 2h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] + 2h
**Offset:** [B:0, D:22, F:0] + 2h
**Offset:** [B:0, D:23, F:0] + 2h

**Default:** 19A3h for D6
**Default:** 19D1h for D22
**Default:** 19D2h for D23

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | D6: 0x19A3<br>D22: 0x19D1<br>D23: 0x19D2<br>RO/V | **Device ID (DID):** This field identifies the particular function as allocated by Intel. |

## 47.2.3 PCICMD—Offset 4h

This register controls how the device behaves on the primary interface (PCI Express).

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] + 4h
**Offset:** [B:0, D:22, F:0] + 4h
**Offset:** [B:0, D:23, F:0] + 4h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **RSVD0:** Reserved |
| 10 | 0x0<br>RW | **Interrupt Disable (INTxD):** This bit controls the ability of the PCI-Express Function to generate legacy INTx interrupt message.<br>When set, functions are prevented from asserting INTx interrupt messages. Any INTx emulation interrupts already asserted by the function must be deasserted when this bit is set by generating a Deassert_INTx message(s). |
| 9 | 0x0<br>RO | **Fast Back-to-back enable (FBE):** Not applicable to PCI-Express. Hardwired to 0. |
| 8 | 0x0<br>RW | **SERR# Enable (SEE):** When set, this bit enables reporting of Non-Fatal and Fatal errors detected by the Function of the Root Complex. |
| 7 | 0x0<br>RO | **Wait Cycle Control (WCC):** Not applicable to PCI-Express. Hardwired to 0. |
| 6 | 0x0<br>RW | **Parity Error Response Enable (PERE):** This bit controls the setting of the master data parity error bit in the Status Register PCI Status Register (PCISTS) in response to a parity error received on the PCI Express interface (either internal queue errors or a poisoned TLP). |
| 5 | 0x0<br>RO | **VGA Palette Snoop Enable (VGA_PSE):** Not applicable to PCI-Express. Hardwired to 0. |
| 4 | 0x0<br>RO | **Memory Write and Invalidate Enable (MWIE):** Not applicable to PCI-Express. Hardwired to 0. |
| 3 | 0x0<br>RO | **Special Cycle Enable (SCE):** Not applicable to PCI-Express. Hardwired to 0. |
| 2 | 0x0<br>RW | **Bus Master Enable (BME):** This bit controls the ability of the Function to issue Memory and I/O read or write requests, and the ability of Root or Switch port to forward memory and I/O read or write requests in the upstream direction.<br>When this bit is 0b, memory and I/O requests received at the root port or downstream side of a switch port (secondary side) must be handled as an Unsupported Request (UR).<br>MSI interrupts are inband memory writes and are blocked when this bit is 0b. |
| 1 | 0x0<br>RW | **Memory Space Enable (MSE):**<br>• 0 - Respond to all Memory Requests on the primary interface as Unsupported Request Received. Forward all memory requests from the secondary interface to the primary interface.<br>• 1- Enable forwarding of memory transactions to the secondary interface and any internal function. |
| 0 | 0x0<br>RW | **I/O Space Enable (IOSE):**<br>• 0 - Respond to all I/O Requests on the primary interface with an Unsupported Request Completion. Forward all I/O transactions from the secondary interface to the primary interface (if supported).<br>• 1 - Enable forwarding of I/O Requests to the secondary interface. |

## 47.2.4 PCISTS—Offset 6h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] + 6h
**Offset:** [B:0, D:22, F:0] + 6h
**Offset:** [B:0, D:23, F:0] + 6h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C/V | **Detected Parity Error (DPE):** This bit is set when a poisoned TLP is received from PCIe or IOSF.<br>This bit is set even when the parity error response enable bit (bit[6] of the PCI Command Register (PCICMD) is not set. |
| 14 | 0x0<br>RW/1C/V | **Signaled System Error (SSE):** This bit is set when ERR_FATAL or ERR_NONFATAL messages are sent to the root complex and the SERR enable bit in the PCICMD Register PCI Command Register (PCICMD) is set. |
| 13 | 0x0<br>RW/1C/V | **Received Master Abort (RMA):** This bit is set when the requester receives a completion with an UR completion status. |
| 12 | 0x0<br>RW/1C/V | **Received Target Abort (RTA):** This bit is set when a requester receives a CA completions status. |
| 11 | 0x0<br>RW/1C/V | **Signaled Target Abort (STA):** This bit is Set when the port completes a Posted or Non-Posted Request as a Completer Abort error. |
| 10:9 | 0x0<br>RO | **DEVSEL# Timing (DVT):** These bits have no meaning on PCI Express. |
| 8 | 0x0<br>RW/1C/V | **Master Data Parity Error Detected (MDPD):** This bit is set if the parity error response enable bit (PERE) in the Command Register PCI Command Register (PCICMD) is set and either of the following two conditions occur:<br>• Requester receives a completion marked poisoned.<br>• Requester sends a poisoned request (includes writes and messages).<br>If the parity error bit is 0b, this bit is never set. |
| 7 | 0x0<br>RO | **Fast Back-to-Back Capable (FBC):** This bit has no meaning on PCI Express. |
| 6 | 0x0<br>RO | **RSVD0:** Reserved |
| 5 | 0x0<br>RO | **Reserved:** Reserved |
| 4 | 0x1<br>RO | **Capabilities List Enable (CAPE):** This bit indicates the presence of an Extended capabilities list items. |
| 3 | 0x0<br>RO/V | **Interrupt Status (INTS):** When set, this bit indicates that an INTx emulation interrupt is pending internally in this function. |
| 2:0 | 0x0<br>RO | **RSVD1:** Reserved |

## 47.2.5 CCR—Offset 9h

The CCR register has an attribute of RW-L PRST to allow configuration software to modify and lock the register from further update. Lock Key bit is located in the Personality Lock Key Control Register ('PLKCTL').

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] + 9h
**Offset:** [B:0, D:22, F:0] + 9h
**Offset:** [B:0, D:23, F:0] + 9h

**Default:** 00060400h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **RSVD0:** Reserved |
| 23:16 | 0x6<br>RW/L | **Base Class (BC):** The value of 06h indicates that this is a bridge device.<br><br>**Power Well:** PRST |
| 15:8 | 0x4<br>RW/L | **Sub-Class (SC):** This 8-bit value indicates that this device is a PCI-to-PCI Bridge.<br><br>**Power Well:** PRST |
| 7:0 | 0x0<br>RW/L | **Register-Level Programming Interface (RLPI):** This bit indicates that this device is standard (non-subtractive) PCI-to-PCI Bridge.<br><br>**Power Well:** PRST |

## 47.2.6 CLS—Offset Ch

**Type:** PCI Configuration Register
(Size: 8 bits)

**Offset:** [B:0, D:6, F:0] + Ch
**Offset:** [B:0, D:22, F:0] + Ch
**Offset:** [B:0, D:23, F:0] + Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Cache Line Size (CLS):** These bits specify the system cache-line size in units of DWords. This field is implemented by PCI Express devices but has no effect on device behavior. |

## 47.2.7 IOBASE—Offset 1Ch

The I/O Base and I/O Limit registers define an address range that is used by the PCI-Express port to determine when to forward I/O transactions from one interface to the other using the following formula: IO_BASE (= A[15:12](=IO_LIMIT Only the upper 4 bits are programmable. For the purpose of address decode, address bits A[11:0] are treated as 0. The bottom of the defined I/O address range will be aligned to a 4KB boundary while the top of the region specified by IO_LIMIT will be one less than a 4 KB multiple.

**Type:** PCI Configuration Register
(Size: 8 bits)

**Offset:** [B:0, D:6, F:0] + 1Ch
**Offset:** [B:0, D:22, F:0] + 1Ch
**Offset:** [B:0, D:23, F:0] + 1Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:4 | 0x0<br>RW | **I/O Base Address Bits (IOBA):** These bits define the bottom address of an address range to determine when to forward I/O transactions from one interface to another.<br>These bits correspond to address lines[15:12] for 4 KB alignment. Bits[11:0] are assumed to be 000h. |
| 3:0 | 0x0<br>RO | **I/O Base Addressing Capability (IOBC):** Each of these bits is hard-wired to 0, indicating support for 16-bit I/O addressing only. |

## 47.2.8 IOLIMIT—Offset 1Dh

The I/O Base and I/O Limit registers define an address range that is used by the PCI-Express bridge to determine when to forward I/O transactions from one interface to the other using the following formula: IO_BASE (= A[15:12] (=IO_LIMIT Only the upper 4 bits are programmable. For the purpose of address decode, address bits A[11:0] of the IO limit register is treated as FFFh.

**Type:** PCI Configuration Register
(Size: 8 bits)

**Offset:** [B:0, D:6, F:0] + 1Dh
**Offset:** [B:0, D:22, F:0] + 1Dh
**Offset:** [B:0, D:23, F:0] + 1Dh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:4 | 0x0<br>RW | **I/O Limit Address Bits (IOLA):** These bits define the top address of an address range to determine when to forward I/O transactions from PCI Express to PCI.<br>These bits correspond to address lines[15:12] for 4 KB aligned window. Bits[11:0] are assumed to be FFFh. |
| 3:0 | 0x0<br>RO | **I/O Limit Addressing Capability (IOLC):** Each of these bits is hard-wired to 0, indicating support for 16-bit I/O addressing only. |

## 47.2.9 MEMBASE—Offset 20h

The Memory Base and Memory Limit registers define a memory mapped I/O non-prefetchable address range (32-bit addresses) and direct the accesses in this range to the PCI-Express port based on the following formula: MEMORY_BASE (= A[31:20] (= MEMORY_LIMIT The upper 12 bits of both the Memory Base and Memory Limit registers are read/write and corresponds to the upper 12 address bits, AD[31:20], of 32-bit addresses. For the purpose of address decoding, the bridge assumes that the lower 20 address bits, AD[19:0], of the memory base address are zero. Similarly, the bridge assumes that the lower 20 address bits, AD[19:0], of the memory limit address (not implemented in the Memory Limit register) are FFFFFh. Thus, the bottom of the defined memory address range will be aligned to a 1 MB boundary and the top of the defined memory address range will be one less than a 1 MB boundary

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] + 20h
**Offset:** [B:0, D:22, F:0] + 20h
**Offset:** [B:0, D:23, F:0] + 20h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:4 | 0x0<br>RW | **Memory Base (MB):** These bits are compared with bits[31:20] of the incoming address to determine the lower 1 MB-aligned value (inclusive) of the range.<br>The incoming address must be greater than or equal to this value. |
| 3:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 47.2.10 MEMLIMIT—Offset 22h

This register controls the processor to PCI-Express non-prefetchable memory access routing based on the following formula as described above: MEMORY_BASE (= A[31:20] The upper 12 bits of the register are read/write and correspond to the upper 12 address bits A[31:20] of the 32 bit address. The bottom 4 bits of this register are read-only and return zeroes when read. This register must be initialized by the configuration software. For the purpose of address decode address bits A[19:0] are assumed to be FFFFFh. Memory range covered by MEMBASE and MEMLIM registers, are used to map non-prefetchable PCIExpress address ranges (typically where control/ status memory-mapped I/O data structures reside) and PFBASE and PFLIMIT are used to map prefetchable address ranges.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:6, F:0] + 22h
**Offset:** [B:0, D:22, F:0] + 22h
**Offset:** [B:0, D:23, F:0] + 22h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:4 | 0x0<br>RW | **Memory Limit (ML):** These bits are compared with bits[31:20] of the incoming address to determine the upper limit of the range of memory accesses that will be passed by the port.<br>The incoming address must be less than or equal to this value as described in the formula in 'Memory Base Register' (MEMBASE). |
| 3:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 47.2.11 PFBASE—Offset 24h

The Prefetchable Memory Base and Memory Limit registers define a memory mapped I/O prefetchable address range (32-bit addresses) which is used by the PCI-Express bridge to determine when to forward memory transactions based on the following formula: PREFETCH_MEMORY_BASE (= A[31:20] The upper 12 bits of both the Prefetchable Memory Base and Memory Limit registers are read/ write and corresponds to the upper 12 address bits, A[31:20], of 32-bit addresses. For the purpose of address decoding, the bridge assumes that the lower 20 address bits, A[19:0], of the memory base address are zero. Similarly, the bridge assumes that the lower 20 address bits, A[19:0], of the memory limit address (not implemented in the Memory Limit register) are FFFFFh. Thus, the bottom of the defined memory address range will be aligned to a 1 MB boundary and the top of the defined memory address range will be one less than a 1 MB boundary.

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] + 24h
**Offset:** [B:0, D:22, F:0] + 24h
**Offset:** [B:0, D:23, F:0] + 24h

**Default:** 0001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:4 | 0x0<br>RW | **Prefetchable Memory Base (PMB):** These bits are compared with bits[31:20] of the incoming address to determine the lower 1 MB-aligned value (inclusive) of the range.<br>The incoming address must be greater than or equal to this value. |
| 3:0 | 0x1<br>RO | **Prefetchable Memory Base Address Capability (PFMCAP):**<br>• 0: 32-bit Prefetchable Memory addressing<br>• 1: 64-bit Prefetchable Memory addressing<br><br>This field indicates that 64-bit addressing is supported for the limit. |

## 47.2.12 PFLIMIT—Offset 26h

This register controls the processor to PCI-Express prefetchable memory access routing based on the following formula as described above: PREFETCH_MEMORY_BASE (= A[31:20] The upper 12 bits of the register are read/write and correspond to the upper 12 address bits A[31:20] of the 32 bit address. This register must be initialized by the configuration software. For the purpose of address decode address bits A[19:0] are assumed to be FFFFFh.

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] + 26h
**Offset:** [B:0, D:22, F:0] + 26h
**Offset:** [B:0, D:23, F:0] + 26h

**Default:** 0001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:4 | 0x0<br>RW | **Prefetchable Memory Limit (PML):** These bits are compared with bits[31:20] of the incoming address to determine the upper limit of the prefetchable memory range.<br>The incoming address must be less than or equal to this value as described in the formula in 'Prefetchable Memory Limit Register (PFLIMIT). |
| 3:0 | 0x1<br>RO | **Prefetchable Memory Limit Address Capability (PMLC):** This field indicates that 64-bit addressing is supported for the limit. |

## 47.2.13 PFBASEU—Offset 28h

The Prefetchable Base Upper 32 Bits and Prefetchable Limit Upper 32 Bits registers are extensions to the Prefetchable Memory Base and Prefetchable Memory Limit registers. If a 64-bit prefetchable memory address range is supported, the Prefetchable Base Upper 32 Bits and Prefetchable Limit Upper 32 Bits registers specify the upper 32-bits, corresponding to A[63:32], of the 64-bit base and limit addresses which specify the prefetchable memory address range. PREFETCH_MEMORY_BASE_UPPER (= A[63:32] PREFETCH_MEMORY_BASE_LIMIT_UPPER

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] + 28h
**Offset:** [B:0, D:22, F:0] + 28h
**Offset:** [B:0, D:23, F:0] + 28h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Prefetchable Memory Base Upper Portion (PMBU):** Corresponds to A[63:32] of the memory address that maps to the upper base of the prefetchable range of memory accesses that will be passed by the PCI-Express bridge. |

## 47.2.14 PFLIMITU—Offset 2Ch

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] + 2Ch
**Offset:** [B:0, D:22, F:0] + 2Ch
**Offset:** [B:0, D:23, F:0] + 2Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Prefetchable Memory Limit Upper Portion (PMLU):** Corresponds to A[63:32] of the memory address that maps to the upper limit of the prefetchable range of memory accesses that will be passed by the PCI-Express bridge.<br>The incoming address must be less than or equal to this value as described in the formula in 'Prefetchable Memory Base Upper 32 Bits Register' (PFBASEU). |

## 47.2.15 CAPPTR—Offset 34h

**Type:** PCI Configuration Register
(Size: 8 bits)

**Offset:** [B:0, D:6, F:0] + 34h
**Offset:** [B:0, D:22, F:0] + 34h
**Offset:** [B:0, D:23, F:0] + 34h

**Default:** 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x40<br>RO | **Capabilities Pointer (CPTR):** Contains the offset of the first item in the list of capabilities. (EXPCAPLST) |

## 47.2.16 INTL—Offset 3Ch

**Type:** PCI Configuration Register
(Size: 8 bits)

**Offset:** [B:0, D:6, F:0] + 3Ch
**Offset:** [B:0, D:22, F:0] + 3Ch
**Offset:** [B:0, D:23, F:0] + 3Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Interrupt Line (INTL):** This register is used to communicate interrupt line routing information. |

## 47.2.17 INTP—Offset 3Dh

**Type:** PCI Configuration Register
(Size: 8 bits)

**Offset:** [B:0, D:6, F:0] + 3Dh
**Offset:** [B:0, D:22, F:0] + 3Dh
**Offset:** [B:0, D:23, F:0] + 3Dh

**Default:** 01h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x1<br>RW/L | **Interrupt Pin (INTP):** This register tells which interrupt pin the function uses.<br>• 01h: Generate INTA<br>• 02h: Generate INTB<br>• 03h: Generate INTC<br>• 04h: Generate INTD<br>• Others: Reserved<br><br>**Power Well:** PRST |

## 47.2.18 BCTL—Offset 3Eh

This register provides extensions to the PCI Command Register (PCICMD) that are specific to a bridge. The Bridge Control Register provides many of the same controls for the secondary interface that are provided by the Command Register for the primary interface. Some bits affect operation of both interfaces of the bridge.

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] + 3Eh
**Offset:** [B:0, D:22, F:0] + 3Eh
**Offset:** [B:0, D:23, F:0] + 3Eh

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:12 | 0x0<br>RO | **RSVD0:** Reserved |
| 11 | 0x0<br>RO | **Discard Timer SERR# Enable (DTSE):** Not applicable to PCI Express. Hardwired to 0. |
| 10 | 0x0<br>RO | **Discard Timer Status (DTS):** Not applicable to PCI Express. Hardwired to 0. |
| 9 | 0x0<br>RO | **Secondary Discard Timer (SDT):** Not applicable to PCI Express. Hardwired to 0. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 8 | 0x0<br>RO | **Primary Discard Timer (PDT):** Not applicable to PCI Express. Hardwired to 0. |
| 7 | 0x0<br>RO | **Fast Back-to-Back Enable (FBE):** Not applicable to PCI Express. Hardwired to 0. |
| 6 | 0x0<br>RW | **Secondary Bus Reset (SBR):** Setting this bit triggers a hot reset on the downstream link for the corresponding PCIe Express port and the PCI Express hierarchy domain subordinate to the port. Software must ensure a minimum reset duration of 1us as defined in the PCI Local Bus Specification, Revision 3.0. Hardware will continue to maintain the hot reset state as long as the SBR bit is set. For Root Ports, it is recommended that software assert this field for a minimum of 2 ms to ensure that all downstream links enters hot reset state. A secondary bus reset will not reset any register of a Type 1 configuration space header function. |
| 5 | 0x0<br>RO | **Master Abort Mode (MAM):** Not applicable to PCI Express. Hardwired to 0. |
| 4 | 0x0<br>RW | **VGA 16-bit Decode (VGA16BD):** This bit enables the bridge to provide 16-bit decoding of VGA I/O address precluding the decoding of VGA alias addresses every 1 KB. This bit requires the VGA enable bit (bit 3 of this register) to be set to 1.<br>• 0: execute 10-bit address decode on VGA I/O accesses<br>• 1: execute 16-bit address decode on VGA I/O accesses |
| 3 | 0x0<br>RW | **VGA Enable (VGAE):** This bit modifies the response to VGA-compatible addresses.<br>When set to 1b, the bridge positively decodes and forwards the following transactions from primary side to secondary side regardless of the value of the I/O base and limit registers.<br>The transactions are qualified by the memory enable and I/O enable in the command register.<br>Memory addresses:<br>• 000A 0000h-000B FFFFh<br>I/O addresses:<br>• 3B0h-3BBh and 3C0h-3DFh in first 64 KB of I/O address space (Inclusive of ISA address aliases when IO address bits[15:10] are not decoded) |
| 2 | 0x0<br>RW | **ISA Enable (IE):** This bit modifies the response by the bridge to ISA I/O addresses.<br>This field applies only to I/O addresses that are enabled by the I/O base and I/O limit registers and are in the first 64 KB of PCI I/O space.<br>When this bit is set, the bridge blocks all forwarding from primary to secondary of I/O transactions addressing the last 768 bytes in each 1 KB block (offsets 100h to 3FFh).<br>In the opposite direction (secondary to primary), I/O transactions will be forwarded if they address the last 768B in each 1 KB block.<br>• 1: Forward upstream ISA I/O addresses in the address range defined by the I/O Base and I/O Limit registers that are in the firsts 64KB of PCI I/O address space (Top 768B of each 1K block).<br>• 0: Forward downstream all I/O addresses in the address range defined by the I/O Base and I/O Limit registers. |
| 1 | 0x0<br>RW | **SERR# Enable (SE):** This bit controls the forwarding of PCI Express ERR_COR, ERR_NONFATAL and ERR_FATAL messages to the primary side.<br>• 1: Enables forwarding of ERR_COR, ERR_NONFATAL, ERR_FATAL messages.<br>• 0: Disables forwarding of ERR_COR, ERR_NONFATAL, ERR_FATAL messages. |
| 0 | 0x0<br>RW | **Parity Error Response Enable (PERE):** This bit controls the response to poisoned TLPs in the PCI Express port.<br>• 1: Enables reporting of poisoned TLP errors.<br>• 0: Disables reporting of poisoned TLP errors. |

## 47.2.19 EXPCAPLST—Offset 40h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +40h
**Offset:** [B:0, D:22, F:0] +40h
**Offset:** [B:0, D:23, F:0] +40h

**Default:** 8010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x80<br>RO | **Next Pointer (NP):** Contains the offset of the next item in the capabilities list. (PMCAPLST) |
| 7:0 | 0x10<br>RO | **Capability ID (CAPID):** Identifies the function as PCI Express capable. |

## 47.2.20 EXPCAP—Offset 42h

This register stores the version number of the capability item and other base information contained in the capability structure.

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +42h
**Offset:** [B:0, D:22, F:0] +42h
**Offset:** [B:0, D:23, F:0] +42h

**Default:** 0042h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:14 | 0x0<br>RO | **RSVD0:** Reserved |
| 13:9 | 0x0<br>RO | **Interrupt Message Number (IMN):** This field indicates the interrupt message number that is generated from the PCI Express port. |
| 8 | 0x0<br>RO | **Slot Implemented (SI):** Hardwired to 0 for non root ports and non DP. |
| 7:4 | 0x4<br>RO | **Device/Port Type (DT):** 4h: Virtual Root Port |
| 3:0 | 0x2<br>RO | **Version Number (VN):** These bits indicate the version number of the PCI Express capability structure. |

## 47.2.21 DEVCAP—Offset 44h

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +44h
**Offset:** [B:0, D:22, F:0] +44h
**Offset:** [B:0, D:23, F:0] +44h

**Default:** 00008001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **RSVD0:** Reserved |
| 27:26 | 0x0<br>RO | **Captured Slot Power Limit Scale (CSPLS):** In combination with the Slot Power Limit value (bits[25:18], this field specifies the upper limit of the power supplied by slot.<br>The power limit (in Watts) is calculated by multiplying the value in this field by the value in the Slot Power Limit Value field.<br>This value is set by the Set_Slot_Power_Limit message. Does not apply to root ports or integrated devices or end points or downstream ports or Virtual Root Port/switch port |
| 25:18 | 0x0<br>RO | **Captured Slot Power Limit Value (CSPLV):** In combination with the Slot Power Limit Scale value (bits[27:26]), this field specifies the upper limit of the power supplied by slot.<br>The power limit (in Watts) is calculated by multiplying the value in this field by the value in the Slot Power Limit Scale field.<br>This value is set by the Set_Slot_Power_Limit message. Does not apply to root ports or integrated devices or end points or downstream ports or Virtual Root Port/switch ports |
| 17:16 | 0x0<br>RO | **RSVD1:** Reserved |
| 15 | 0x1<br>RO | **Role-Based Error Reporting (RBER):** The PCIe cluster supports Role-based Error Reporting. |
| 14:12 | 0x0<br>RO | **Undefined:** Reserved. |
| 11:9 | 0x0<br>RO | **Endpoint L1 Acceptable Latency (EPL1AL):** This field only applies to Endpoint and is hardwired to 0 for other types such as root ports, upstream/downstream ports |
| 8:6 | 0x0<br>RO | **Endpoint L0s Acceptable Latency (EPL0AL):** This field only applies to Endpoint and is hardwired to 0 for other types such as root ports, upstream/downstream ports |
| 5 | 0x0<br>RO | **Extended Tag Field Supported (ETFG):**<br>• 0: The PCIe supports 5-bit extended tag<br>• 1: The PCIe supports 8-bit extended tag |
| 4:3 | 0x0<br>RO | **Phantom Functions Supported (PFS):** This field indicates the number of most significant bits of the function number portion of Requester ID in a TLP that are logically combined with the Tag identifier.<br>The PCIe cluster does not support phantom functions |
| 2:0 | 0x1<br>RO/V | **Max Payload size Supported (MPSS):** The PCIe SIP can tolerate upto 512-byte packets as maximum payload for project specific. |

## 47.2.22 DEVCTL—Offset 48h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +48h
**Offset:** [B:0, D:22, F:0] +48h
**Offset:** [B:0, D:23, F:0] +48h

**Default:** 2000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO | **RSVD0:** Reserved |
| 14:12 | 0x2<br>RW | **Max_Read_Request_Size (MRRS):** This field sets the maximum Read Requests size of the function as a requester.<br>• 000b: 128 bytes maximum Read Request size<br>• 001b: 256 bytes maximum Read Request size<br>• 010b: 512 bytes maximum Read Request size<br>• 011b: 1024 bytes maximum Read Request size<br>• 100b: 2048 bytes maximum Read Request size<br>• 101b: 4096 bytes maximum Read Request size<br>• Others: Reserved |
| 11 | 0x0<br>RO | **Enable No Snoop (ENOSNP):** If this bit this is set, the function is permitted to set the No Snoop bit in the Requester attributes of transactions it initiates that do not require hardware enforced cache coherency. |
| 10 | 0x0<br>RO | **Auxiliary Power PM Enable (AUXPME):** Not supported |
| 9 | 0x0<br>RO | **Reserved:** Reserved |
| 8 | 0x0<br>RO | **Reserved:** Reserved |
| 7:5 | 0x0<br>RW | **Maximum Payload Size (MPS):** This field sets maximum TLP payload size for the function. As a receiver, the function must handle TLPs as large as the set value. As a Transmitter, the function must not generate TLPs exceeding the set value.<br>• 000b: 128 bytes maximum payload size (default)<br>• 001b: 256 bytes maximum payload size<br>• 010b: 512 bytes maximum payload size<br>• 011b: 1024 bytes maximum payload size<br>• 100b: 2048 bytes maximum payload size<br>• 101b: 4096 bytes maximum payload size<br>• Others: Reserved |
| 4 | 0x0<br>RO | **Reserved:** Reserved |
| 3 | 0x0<br>RW | **Unsupported Request Reporting Enable (URRE):** This bit controls the enabling of ERR_CORR, ERR_NONFATAL or ERR_FATAL messages on PCI Express for reporting 'Unsupported Request' errors. |
| 2 | 0x0<br>RW | **Fatal Error Reporting Enable (FERE):** When this bit is set, generation of the ERR_FATAL message is enabled. |
| 1 | 0x0<br>RW | **NonFatal Error Reporting Enable (NFERE):** When this bit is set, generation of the ERR_NONFATAL message is enabled. |
| 0 | 0x0<br>RW | **Correctable Error Reporting Enable (CERE):** When this bit is set, generation of the ERR_CORR message is enabled. |

## 47.2.23 DEVSTS—Offset 4Ah

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +4Ah
**Offset:** [B:0, D:22, F:0] +4Ah
**Offset:** [B:0, D:23, F:0] +4Ah

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:6 | 0x0<br>RO | **RSVD0:** Reserved |
| 5 | 0x0<br>RO/V | **Transactions Pending (TP):** When set, this bit indicates that the function has issued Non-Posted Requests that have not been completed. |
| 4 | 0x0<br>RO | **Auxiliary Power Detected (APD):** Auxiliary Power is not supported. |
| 3 | 0x0<br>RW/1C/V | **Unsupported Request Detected (URD):** This bit indicates that this function received an unsupported request from PCI Express link. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. |
| 2 | 0x0<br>RW/1C/V | **Fatal Error Detected (FED):** This bit indicates that this function has detected a Fatal error. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. |
| 1 | 0x0<br>RW/1C/V | **Non-Fatal Error Detected (NFED):** This bit indicates that this function has detected a Non-Fatal error. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. |
| 0 | 0x0<br>RW/1C/V | **Correctable Error Detected (CED):** This bit indicates that this function has detected a Correctable error. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. |

## 47.2.24 LINKCAP—Offset 4Ch

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +4Ch
**Offset:** [B:0, D:22, F:0] +4Ch
**Offset:** [B:0, D:23, F:0] +4Ch

**Default:** 06000C11h for D6
**Default:** 16000C11h for D22
**Default:** 17000C11h for D23

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | D6: 0x6<br>D22: 0x16<br>D23: 0x17<br>RW/L | **Port Number (PN):** This field indicates the PCI Express port number assigned to this link for Virtual Root Port/Switch Port.<br><br>**Power Well:** PRST |
| 23:22 | 0x0<br>RO | **RSVD0:** Reserved |
| 21 | 0x0<br>RO | **Link Bandwidth Notification Capability (LBNC):** A value of 1b indicates support for the Link Bandwidth Notification status and interrupt mechanisms. |
| 20 | 0x0<br>RO | **Data Link Layer Active Error Reporting Capable (DLLERC):** For Upstream Ports and components that do not support this optional capability, this bit must be hardwired to 0b Used device number to distinguish the vRP and vSP for default values |
| 19 | 0x0<br>RO | **Surprise Down Error Reporting Capable (SLDERC):** For Upstream Ports and components that do not support this optional capability, this bit must be hardwired to 0b. |
| 18 | 0x0<br>RO | **Clock Power Management Capable (CPMC):** For Downstream Ports, this bit must be hardwired to 0b. |
| 17:15 | 0x0<br>RO | **L1 Exit Latency (L1EL):** This field indicates the L1 exit latency for the given PCI-Express Link. It indicates the length of time this port requires to complete transition from L1 to L0.<br>• 000: Less than 1us<br>• 001: 1us to less than 2us<br>• 010: 2us to less than 4us<br>• 011: 4us to less than 8us<br>• 100: 8us to less than 16us<br>• 101: 16us to less than 32us<br>• 110: 32us to less than 64us<br>• 111: More than 64us<br><br>If L1 is not supported, the value is undefined |
| 14:12 | 0x0<br>RO | **L0s Exit Latency (L0sEL):** This field indicates the L0s exit latency for the given PCI-Express Link. It indicates the length of time this port requires to complete transition from L0s to L0.<br>• 000b: Less than 64ns<br>• 001b: 64ns to less than 128ns<br>• 010b: 128ns to less than 256ns<br>• 011b: 256ns to less than 512ns<br>• 100b 512 ns to less than 1us<br>• 101b: 1us to less than 2us<br>• 110b: 2us to less than 4us<br>• 111b: More than 4us<br><br>If L0s is not supported, the value is undefined |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 11:10 | 0x3<br>RO | **ASPM Support (ASPMSUP):** This field indicates the level of ASPM supported on the given PCI Express Link.<br>• 00b: No ASPM Support<br>• 01b: L0s Supported<br>• 10b: L1 Supported<br>• 11b: L0s and L1 Supported |
| 9:4 | 0x1<br>RO | **Maximum Link Width (MLW):**<br>This field indicates the maximum link width implemented by the given PCI Express Link.<br>• 00h: Reserved<br>• 01h: x1<br>• 02h: x2<br>• 04h: x4<br>• 08h: x8<br>• 10h: x16<br>• 20h: x32 (Unsupported)<br>• Others Reserved |
| 3:0 | 0x1<br>RO | **Maximum Link Speed (MLS):**<br>This field indicates the maximum supported link speed(s) of the associated port.<br>• 0001b: 2.5 Gb/s link speed is supported<br>• 0010b: 5.0 Gb/s and 2.5 Gb/s link speed supported<br>• 0011b: 8.0 Gb/s and 5.0 and 2.5 Gb/s link speed supported<br>• Others: Reserved. |

## 47.2.25 LINKCTL—Offset 50h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +50h
**Offset:** [B:0, D:22, F:0] +50h
**Offset:** [B:0, D:23, F:0] +50h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:12 | 0x0<br>RO | **RSVD0:** Reserved |
| 11 | 0x0<br>RO | **Reserved:** Reserved |
| 10 | 0x0<br>RO | **Link Bandwidth Management Interrupt Enable (LBMIE):** When set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been set. |
| 9 | 0x0<br>RO | **Reserved:** Reserved |
| 8 | 0x0<br>RW/L | **Enable Clock Power Management (ECPM):** Applicable only for Upstream Ports and with form factors that support a 'Clock Request' (CLKREQ#) mechanism, this bit operates as follows:<br>• 0b Clock power management is disabled and device must hold CLKREQ# signal low.<br>• 1b When this bit is Set, the device is permitted to use CLKREQ# signal to power manage Link clock according to protocol defined.<br><br>**Power Well:** PRST |
| 7 | 0x0<br>RW | **Extended Synch (ES):** When set, this bit forces extended transmission of 4096 FTS ordered sets in FTS and an extra 1024 TS1 at exit from L1 prior to entering L0. |
| 6 | 0x0<br>RW | **Common Clock Configuration (CCCFG):** When set, this bit indicates that this component and the component at the opposite end of this link are operating with distributed common reference clocks. A value of 0b indicates that this component and the component at the opposite end of this link are operating with asynchronous reference clock. |
| 5 | 0x0<br>RO | **Retrain Link (RL):** When set, this bit initiates link retraining by directing the physical layer LTSSM to recovery state. For the upstream port or virtual switch port, it is Read-only. |
| 4 | 0x0<br>RW | **Link Disable (LD):** This bit is reserved on Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches. |
| 3 | 0x0<br>RO | **Read Completion Boundary (RCB):**<br>This bit indicates the RCB value for Root Port, Endpoints and Bridges.<br>• 0b: 64 byte<br>• 1b: 128 byte |
| 2 | 0x0<br>RO | **RSVD1:** Reserved |
| 1:0 | 0x0<br>RW | **ASPM Control (ASPMCTL):** This field controls the level of ASPM enabled on a given PCI Express Link.<br>• 00b: Disabled<br>• 01b: L0s Entry Enabled<br>• 10b: L1 Entry Enabled<br>• 11b: L0s and L1 Entry Enabled<br>''L0s Entry Enabled' enables the Transmitter to enter L0s. |

## 47.2.26 LINKSTS—Offset 52h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +52h
**Offset:** [B:0, D:22, F:0] +52h
**Offset:** [B:0, D:23, F:0] +52h

**Default:** 1011h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO | **Link Autonomous Bandwidth Status (LABS):** This bit is set by hardware. |
| 14 | 0x0<br>RO | **Link Bandwidth Management Status (LBMS):** This bit is set by hardware. This bit must be set if the Physical Layer reports a non-autonomous speed or width change initiated by the Upstream Port. |
| 13 | 0x0<br>RO | **Data Link Layer Link Active (DLLLA):** This bit indicates the status of the Data Link Control and Management Status Machine. It returns a 1b to indicate the DL_Active state, 0b otherwise. |
| 12 | 0x1<br>RW/L | **Slot Clock Configuration (SCC):** When to 1b, this bit indicates that the component uses the same physical reference clock that he platform provides on the connector.<br>If the device uses an independent clock irrespective of the presence of a reference on the connector, this bit must be clear.<br>• 1: Indicates same reference clock.<br>• 0: Indicates independent reference clock<br><br>**Power Well:** PRST |
| 11 | 0x0<br>RO | **Link Training (LT):** This bit indicates that the Physical Layer LTSSM is in the Configuration or Recovery state, or a 1b was written to the Retrain Link bit but the Link training has not yet begun. Hardware clears this bit when the LTSSM exits the Configuration/Recovery state. |
| 10 | 0x0<br>RO | **Undefined:** Not applicable |
| 9:4 | 0x1<br>RO | **Negotiated Link Width (NLW):** This field indicates the negotiated width of the PCI Express link.<br>• 00 0001b: x1<br>• 00 0010b: X2<br>• 00 0100b: x4<br>• 00 1000b: X8<br>• 00 1100b: X12 not supported<br>• 01 0000b: X16<br>• 10 0000b: X32 not supported<br>• All other values are reserved.<br><br>The value in this field is undefined when the link is not up. |
| 3:0 | 0x1<br>RO | **Current Link Speed (CLS):**<br>This field indicates the negotiated link speed of the given PCI Express link.<br>• 0001b: 2.5 Gb/s PCI Express Link<br>• 0010b: 5.0 Gb/s PCI Express Link<br>• 0011b: 8.0 Gb/s PCI Express Link<br>• Others: Reserved |

## 47.2.27 SLOTSTS—Offset 5Ah

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +5Ah
**Offset:** [B:0, D:22, F:0] +5Ah
**Offset:** [B:0, D:23, F:0] +5Ah

**Default:** 0040h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:7 | 0x0<br>RO | **RSVD0:** Reserved |
| 6 | 0x1<br>RO/V | **Presence Detect State (PDS):** This field conveys the Presence Detect status of an adapter in the slot.<br>• 0: Card/Module/Cable slot empty or Cable Slot occupied but not powered<br>• 1: Card/module Present in slot (powered or unpowered) or cable present and powered on the other end. |
| 5:0 | 0x0<br>RO | **RSVD1:** Reserved |

## 47.2.28 ROOTCTL—Offset 5Ch

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +5Ch
**Offset:** [B:0, D:22, F:0] +5Ch
**Offset:** [B:0, D:23, F:0] +5Ch

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:5 | 0x0<br>RO | **RSVD0:** Reserved |
| 4 | 0x0<br>RO | **CRS Software Visibility Enable (CRSSVE):** This bit, when set, enables the Root Port to return Configuration Retry Status (CRS) Completion status to software.<br>• 1: Enable software to received a CRS status. This allows software to make the decision to re-issue the configuration request or move on and re-issue the request at a later time.<br>• 0: Disable software from receiving a CRS response. The PCIe will wait and re-issue the configuration request until it receives a response other than CRS without notifying software. |
| 3 | 0x0<br>RW | **PME Interrupt Enable (PMEIE):** This field controls the generation of interrupts for PME messages.<br>• 1: Enables interrupt generation upon receipt of a PME message as reflected in the PME Status bit defined in the ROOTSTS register. A PME interrupt is generated if the PMESTATUS register bit defined in Root Status Register (ROOTSTS), is set when this bit is set from a cleared state.<br>0: Disables interrupt generation for PME messages. |
| 2 | 0x0<br>RW | **System Error on Fatal Error Enable (SEFEE):** This field controls generation of system errors in the PCI-Express port hierarchy for fatal errors.<br>• 1: indicates that a System Error should be generated if a fatal error (ERR_FATAL) is reported by any of the devices in the hierarchy associated with and including this PCI-Express port.<br>• 0: No System Error should be generated on a fatal error (ERR_FATAL) reported by any of the devices in the hierarchy. |
| 1 | 0x0<br>RW | **System Error on Non-Fatal Error Enable (SENFEE):** This field controls generation of system errors in the PCI-Express port hierarchy for non-fatal errors.<br>• 1: indicates that a System Error should be generated if a non-fatal error (ERR_NONFATAL) is reported by any of the devices in the hierarchy associated with and including this PCI-Express port.<br>• 0: No System Error should be generated on a non-fatal error (ERR_NONFATAL) reported by any of the devices in the hierarchy. |
| 0 | 0x0<br>RW | **System Error on Correctable Error Enable (SECEE):** This field controls generation of system errors in the PCI-Express port hierarchy for correctable errors.<br>• 1: indicates that a System Error should be generated if a correctable error (ERR_COR) is reported by any of the devices in the hierarchy associated with and including this PCI-Express port<br>• 0: No System Error should be generated on a correctable error (ERR_COR) reported by any of the devices in the hierarchy associated with and including this PCI-Express port. |

## 47.2.29 ROOTCAP—Offset 5Eh

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +5Eh
**Offset:** [B:0, D:22, F:0] +5Eh
**Offset:** [B:0, D:23, F:0] +5Eh

**Default:** 0001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:1 | 0x0<br>RO | **RSVD0:** Reserved |
| 0 | 0x1<br>RW/L | **CRS Software Visibility (CRSSV):** This bit, when set, indicates that the Root Port is capable of returning Configuration Retry Status (CRS) on completions to software. Based on Design input, the CRS notification will be implemented in the EIP PCIe macro and hence the default is set to 1. The field attribute is made as RW-O for any specific changes to be installed by BIOS<br><br>**Power Well:** PRST |

## 47.2.30 ROOTSTS—Offset 60h

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +60h
**Offset:** [B:0, D:22, F:0] +60h

Must be 00b for other function types. |
| 11 | 0x0<br>RW/L | **LTR Mechanism Supported (LTRMS):** This bit when set indicates support for the Latency Tolerance Reporting (LTR) mechanism.<br><br>**Power Well:** PRST |
| 10 | 0x0<br>RO | **No RO-enabled PR-PR Passing (NROEPRPASS):** This bit if set to 1b disables passing permitted by row entry A2b in PCIe ordering table that is associated with the Relaxed Ordering Attribute field being set. This bit applies only for Switches and RCs that support peer-to-peer traffic between ports. The bit only applies to posted requests being forwarded through the switch or RC. It does not apply to traffic originating or terminating with in the switch or RC itself. |
| 9 | 0x0<br>RO | **AD128 CAS Completer Supported (AD128ACS):** This bit must be set to 1b if the function supports this optional capability. Applicable to functions with memory space BARs as well as Root Ports. This is not implemented in Virtual Root port |
| 8 | 0x0<br>RO | **AD64-bit AtomicOp Completer Supported (AD64ACS):** This bit must be set to 1b if the function supports this optional capability. Applicable to Functions with Memory Space BARs as well as all Root Ports, must be 0b otherwise. Includes FetchAdd, Swap, and CAS AtomicOps. This is not implemented in Virtual Root port |
| 7 | 0x0<br>RO | **AD32 bit AtomicOp Completer Supported (AD32ACS):** Applicable to Functions with Memory Space BARs as well as all Root Ports, must be 0b otherwise. Includes FetchAdd, Swap, and CAS AtomicOps. This bit must be set to 1b if the Function supports this optional capability. This is not implemented in Virtual Root port |
| 6 | 0x0<br>RW/L | **AtomicOp Routing Supported (ARS):** This bit must be set to 1b if the port supports this optional capability. Applicable only to switch upstream ports, Switch downstream ports, and root ports,. This is not implemented in Virtual Root port.<br><br>**Power Well:** PRST |
| 5 | 0x1<br>RW/L | **ARI Forwarding Supported (ARI):** This bit is set to 1b indicating that the downstream port supports this capability. Applicable only to Switch Downstream Ports and Root Ports, must be 0b for other Function types. This bit must be set to 1b if a Switch Downstream Port or Root Port supports this optional capability.<br><br>**Power Well:** PRST |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 4 | 0x0<br>RO | **Completion Timeout Disable Support (CTDS):** A value of 1b indicates support for the completion Timeout Disable Mechanism. Support of completion timeout disable is optional for Root Ports. The Completion timeout is not supported for vRP/vSP |
| 3:0 | 0x0<br>RO | **Completion Timeout Range Supported (CTRS):** This field indicates device support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of request issues on PCI Express.<br>Four time values ranges are defined:<br>• Range A: 50us to 10ms<br>• Range B: 10ms to 250ms<br>• Range C: 250ms to 4s<br>• Range D: 4s to 64s<br><br>Bits ares set according to table below to show timeout value ranges supported.<br>• 0000b: Completions Timeout programming not supported -- values is fixed by implementation in the range 50us to 50ms.<br>• 0001b: Range A<br>• 0010b: Range B<br>• 0011b: Range A and B<br>• 0110b: Range B and C<br>• 0111b: Range A, B, and C<br>• 1110b: Range B, C, and D<br>• 1111b: Range A, B, C, and D<br>• All other values are reserved.<br><br>For all other devices this field is reserved and maybe be hardwired to 0000b. Lock Key bit is located in the Personality Lock Key Control Register ('PLKCTL'). CT Ranges are defined for Virtual Root Port / Virtual Switch Port is 0 (unsupported) |

## 47.2.32 DEVCTL2—Offset 68h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +68h
**Offset:** [B:0, D:22, F:0] +68h
**Offset:** [B:0, D:23, F:0] +68h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO | **RSVD0:** Reserved |
| 14:13 | 0x0<br>RO | **OBFF Enable (OBFFE):** Reserved. |
| 12:11 | 0x0<br>RO | **RSVD1:** Reserved |
| 10 | 0x0<br>RW/V | **LTR Mechanism Enable (LTRME):** When set to 1b, this bit enables Upstream Ports to send LTR messages and Downstream Ports to process LTR Messages. Applicable to Root Ports, Switches, and Endpoints that implement the LTR capability must implement this bit. For Downstream Ports, this bit must be reset to the default value if the Port goes to DL_Down status. |
| 9 | 0x0<br>RO | **IDO Completion Enable (IDOCE):** This bit when set to 1b allows the function to set the ID-Based Ordering (IDO) bit of completions it returns. Applicable only to Endpoints including RC integrated Endpoints and Root Ports. |
| 8 | 0x0<br>RO | **IDO Request Enable (IDORE):** This bit when set to 1b allows the function to set the ID-Based Ordering (IDO) bit on requests it initiates. Applicable only to Endpoints including RC integrated Endpoints and Root Ports. |
| 7 | 0x0<br>RO | **AtomicOp Egress Blocking (AEB):** When this bit is set, AtomicOp requests that target this out going Egress port must be blocked. Applicable and mandatory for switch Upstream Ports, Switch Downstream Ports, and Root Ports that implement AtomicOp routing capability. Otherwise, must be hardwired to 0b. AEB is not supported for Virtual Root port but applicable for Virtual Switch Port if supported. |
| 6 | 0x0<br>RO | **AtomicOp Requester Enable (ARE):** Applicable only to Endpoints and Root Ports, must be hardwired to 0b for other Function types. |
| 5 | 0x0<br>RW | **ARI Forwarding Enable (ARIE):** When set to 1b, ARI is enabled for the downstream port or root ports. The Downstream Port disables its traditional Device Number field being 0 enforcement when turning a Type 1 Configuration Request into a Type 0 Configuration Request, permitting access to Extended Functions in an ARI Device immediately below the Port. Default value of this bit is 0b. |
| 4 | 0x0<br>RO | **Completion Timeout Disable (CTD):**<br>• 1: Disable the completions timeout mechanism for all NP transactions.<br>• 0: Completion timeout is enabled for all NP transactions. |
| 3:0 | 0x0<br>RO | **Completion Timeout Value (CTV):** In devices that support completion timeout programmability, this field allows system software to modify the completion timeout range. The following encodings and corresponding timeout ranges are defined based on implementation choice. This field provides finer control based over the ranges chosen by DEVAP2.CTRS.<br>The implementation specific range is shown in brackets<br>• 0000b: 50us to 50ms (16.8ms - 25.2ms based on core clk period)<br>• 0001b: 50us to 100us (65.5us - 99.3us based on core clk period)<br>• 0010b: 1ms to 10ms (4.2ms - 6.3ms based on core clk period)<br>• 0101b: 16ms to 55ms (33.6ms - 50.3ms based on core clk period)<br>• 0110b: 65ms to 210ms (134.2ms - 201.3ms based on core clk period)<br>• 1001b: 260ms to 900ms (536.9ms - 805.3ms based on core clk period)<br>• 1010b: 1s to 3.5s (2.1s - 3.2s based on core clk period)<br>• 1101b: 4s to 13s (8.6s - 12.9s based on core clk period)<br>• 1110b: 17s to 64s (34.4s - 51.5s based on core clk period)<br>• All others are reserved.<br><br>CTV is not supported in UP, DP and vRP/vSP It is highly recommended that the completion timeout value not be less then 10ms. A small completion timeout value may result in premature completion timeout for slower responding devices. |

## 47.2.33 LINKCAP2—Offset 6Ch

**Type:** PCI Configuration Register

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +70h
**Offset:** [B:0, D:22, F:0] +70h
**Offset:** [B:0, D:23, F:0] +70h

**Default:** 0001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:12 | 0x0<br>RO | **Compliance Preset/De-emphasis (CD):** For 8 GT/s and 5 GT/s: This bit sets the transmitter preset level forPolling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b.<br>The Encoding are defined as follows:<br><br>8 GT/s Rate:<br>• 0000b: -6 dB for de-emphasis, 0 dB for preshoot<br>• 0001b: -3.5 dB for de-emphasis, 0 dB for preshoot<br>• 0010b: -4.5 dB for de-emphasis, 0 dB for preshoot<br>• 0011b: -2.5 dB for de-emphasis, 0 dB for preshoot<br>• 0100b: 0 dB for de-emphasis, 0 dB for preshoot<br>• 0101b: 0 dB for de-emphasis, 2 dB for preshoot<br>• 0110b: 0 dB for de-emphasis, 2.5 dB for preshoot<br>• 0111b: -6 dB for de-emphasis, 3.5 dB for preshoot<br>• 1000b: -3.5 dB for de-emphasis, 3.5 dB for preshoot<br>• 1001b: 0 dB for de-emphasis, 3.5 dB for preshoot<br>• 1010b: The Transmitter Preset encoding of 1010b corresponds to the maximum Vtx-boost that the Transmitter advertises with FS and LF in both full swing and reduced swing modes with C-1 = 0 and C+1 = FS - (2*LF).<br>• All other encodings are reserved.<br><br>5 GT/s Rate:<br>• 001b: -3.5dB<br>• 000b: -6 dB<br>• All other are reserved.<br><br>When the link is operating at 2.5 Gb/s, the setting of this bit has no effect. Components that support only 2.5 GT/s speed are permitted to hardwire this bit to 0b. |
| 11 | 0x0<br>RO | **Compliance SOS (CSOS):** When set to 1b, the LTSSM is required to send Skip Ordered Sets periodically in between the (modified) compliance patterns. |
| 10 | 0x0<br>RO | **Enter Modified Compliance (EMC):** When set to 1b, the device transmits Modified Compliance Pattern if the LTSSM enters Polling.Compliance substate. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value. |
| 9:7 | 0x0<br>RO | **Transmit Margin (TM):** This field controls the value of the non-de-emphasized voltage level at the transmitter pins. This field is reset to 000b on entry to the LTSSM Polling.Configuration substate.<br>• 000b: Normal operating range<br>• 001b: 800-1200mV for full swing and 400-700mV for half-swing<br>• 010b-110b: TBD<br>• Others: Reserved<br><br>This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value. |
| 6 | 0x0<br>RO | **Selectable De-emphasis (SD):** This bit is not applicable and reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and upstream ports of switches. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 5 | 0x0<br>RO | **Hardware Autonomous Speed Disable (HASD):** When set, this bit disables hardware from changing the link speed for device specific reasons other than attempting to correct unreliable link operation by reducing link speed for device-specific reasons other than attempting to correct unreliable link operations by reducing link speed. Initial transition to the highest supported common link speed is not blocked by this bit. |
| 4 | 0x0<br>RO | **Enter Compliance (EC):** Software is permitted to force a link to enter compliance mode at the speed indicated in the Target Link Speed field by setting this bit to 1b in both components on a link and then initiating a hot reset on the link. |
| 3:0 | 0x1<br>RO | **Target Link Speed (TLS):** For downstream ports and root ports, this field sets an upper limit on link operational speed by restricting the values advertised by the Downstream Port in its training sequences.<br>• 0001b: 2.5 Gb/s Target Link Speed<br>• 0010b: 5.0 Gb/s Target Link Speed<br>• 0011b: 8.0 Gb/s Target Link Speed<br>• Others: Reserved<br><br>The encoding is the binary value of the bit in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the desired target Link speed. All other encodings are reserved If a value is written to this field that does not correspond to a speed included in the Supported Link Speeds field, the result is undefined. The default value of this field is the highest Link speed supported by the component (as reported in the Max Link Speed field of the Link Capabilities register) unless the corresponding platform/form factor requires a different default value. For both Upstream and Downstream Ports, this field is used to set the target compliance mode speed when software is using the Enter Compliance bit to force a Link into compliance mode. |

## 47.2.35 LINKSTS2—Offset 72h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +72h
**Offset:** [B:0, D:22, F:0] +72h
**Offset:** [B:0, D:23, F:0] +72h

| 1 | 0x0<br>RO | **Equalization Complete (EQCMPLT):** When set to 1b, this bit indicates that the Transmitter Equalization procedure has successfully completed. |
| 0 | 0x0<br>RO | **Current De-emphasis Level (CDL):** When the link is operating at 5 Gb/s speed, this bit reflects the level of de-emphasis.<br>• 1b: -3.5 dB<br>• 0b: -6dB<br>The value in this bit is undefined when the Link is not operating at 25.0 GT/s speed. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 0b. |

## 47.2.36 PMCAPLST—Offset 80h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +80h
**Offset:** [B:0, D:22, F:0] +80h
**Offset:** [B:0, D:23, F:0] +80h

**Default:** 8801h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x88<br>RO | **Next Pointer (NextPointer):** Contains the offset of the next item in the capabilities list. (SSCAPLST) |
| 7:0 | 0x1<br>RO | **Capability ID (CapabilityID):** Identifies the function as PCI Power Management capable. |

## 47.2.37 PMCAP—Offset 82h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +82h
**Offset:** [B:0, D:22, F:0] +82h
**Offset:** [B:0, D:23, F:0] +82h

**Default:** C803h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x19<br>RO | **PME_Support (PMES):** PME assertion is supported when in D3hot/D3cold. Identifies power states in which the PCIe can send an 'Assert_PMEGPE/ Deassert PMEGPE' message. Bits 15, 14 and 11 must be set to '1' for PCIPCI bridge structures representing ports on root complexes. The definition of these bits is taken from the PCI Bus Power Management Interface Specification Revision 1.1.<br>• XXXX1b - Assert_PMEGPE/Deassert PMEGPE can be sent from D0<br>• XXX1Xb - Assert_PMEGPE/Deassert PMEGPE can be sent from D1 (Not supported by PCI-E)<br>• XX1XXb - Assert_PMEGPE/Deassert PMEGPE can be sent from D2 (Not supported by PCI-E)<br>• X1XXXb - Assert_PMEGPE/Deassert PMEGPE can be sent from D3 hot (Supported by PCI-E)<br>• 1XXXXb - Assert_PMEGPE/Deassert PMEGPE can be sent from D3 cold (Supported by PCI-E)<br>In the EIP PCIe implementation, there is no PME support for D3 cold as the part does not have the capability. For PCIe compliance purposes, bit 15 is set to 1. |
| 10 | 0x0<br>RO | **D2 Support (D2S):** Not supported |
| 9 | 0x0<br>RO | **D1 Support (D1S):** Not supported |
| 8:6 | 0x0<br>RO | **Auxiliary Current (AC):** Auxiliary power is not supported. |
| 5 | 0x0<br>RO | **Device Specific Initialization (DSI):** Device-specific initialization is not required when transitioning to D0 from D3hot state. This bit is zero. |
| 4 | 0x0<br>RO | **RSVD0:** Reserved |
| 3 | 0x0<br>RO | **PME Clock (PMECLK):** Does not apply to PCI Express. Hard-wired to 0. |
| 2:0 | 0x3<br>RO | **Version (VER):** The PM implementation in the PCIe cluster is compliant with PCI Bus Power Management Interface Specification, Revision 1.2. |

## 47.2.38 PMCSR—Offset 84h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +84h
**Offset:** [B:0, D:22, F:0] +84h
**Offset:** [B:0, D:23, F:0] +84h

**Default:** 0008h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C/V/P | **PME Status (PMESTS):** Reserved. |
| 14:13 | 0x0<br>RO | **Data Scale (DC):** Not supported |
| 12:9 | 0x0<br>RO | **Data Select (DS):** Not supported |
| 8 | 0x0<br>RW/P | **PME Enable (PMEEN):** Gates assertion of the PME message. |
| 7:4 | 0x0<br>RO | **RSVD0:** Reserved |
| 3 | 0x1<br>RW/L | **No Soft Reset (NSR):** This bit when 1b indicates that a device transitioning from D3hot to D0 does not perform an internal reset. The configuration context is preserved.<br><br>**Power Well:** PRST |
| 2 | 0x0<br>RO | **RSVD1:** Reserved |
| 1:0 | 0x0<br>RW/V | **Power State (PS):** This field is used both to determine the current power state of a function and to set the function into a new power state. The definition of the supported values is given below:<br>• 0h - D0<br>• 3h - D3hot<br>If software attempts to write an unsupported, optional state to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. |

## 47.2.39 PMBSE—Offset 86h

**Type:** PCI Configuration Register
(Size: 8 bits)

**Offset:** [B:0, D:6, F:0] +86h
**Offset:** [B:0, D:22, F:0] +86h
**Offset:** [B:0, D:23, F:0] +86h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **Bus Power/Clock Control Enable (BPCC_EN):** Neither bus or clock control of PCI is supported when in D3hot state. This bit is hard-wired to 0. |
| 6 | 0x0<br>RO | **B2/B3# (B23EN):** Not supported. This bit has no meaning since the BPCC_En bit is hard-wired to 0. |
| 5:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 47.2.40 SSCAPLST—Offset 88h

**Type:** PCI Configuration Register

**Offset:** [B:0, D:22, F:0] +88h
**Offset:** [B:0, D:23, F:0] +88h

**Default:** 900Dh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x90<br>RO | **Next Pointer (NP):** Contains the offset of the next item in the capabilities list. (MSICAPLST) |
| 7:0 | 0xd<br>RO | **Capability ID (CAPID):** Identifies the function as Subsystem Identification capable. |

## 47.2.41 SSVID—Offset 8Ch

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +8Ch
**Offset:** [B:0, D:22, F:0] +8Ch
**Offset:** [B:0, D:23, F:0] +8Ch

**Default:** 8086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x8086<br>RW/L | **Subsystem Vendor Identifier (SSVID):** Assigned by PCI-SIG for vendor ID.<br><br>**Power Well:** PRST |

## 47.2.42 SSID—Offset 8Eh

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +8Eh
**Offset:** [B:0, D:22, F:0] +8Eh
**Offset:** [B:0, D:23, F:0] +8Eh

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW/L | **Subsystem Identifier (SSID):** Assigned to uniquely identify the subsystem vendor.<br><br>**Power Well:** PRST |

## 47.2.43 MSICAPLST—Offset 90h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +90h
**Offset:** [B:0, D:22, F:0] +90h
**Offset:** [B:0, D:23, F:0] +90h

**Default:** 0005h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **Next Pointer (NP):** Contains the offset of the next item in the capabilities list (MSIXCAPLST). A null value is used to indicate that this is the last capability. The Next Pointer is terminated for DP, vRP/vSP, RP and DMI EP in RC. |
| 7:0 | 0x5<br>RO | **Capability ID (CAPID):** Identifies the function as MSI capable. |

## 47.2.44 MSICTL—Offset 92h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +92h
**Offset:** [B:0, D:22, F:0] +92h
**Offset:** [B:0, D:23, F:0] +92h

**Default:** 0100h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:9 | 0x0<br>RO | **RSVD0:** Reserved |
| 8 | 0x1<br>RW/L | **Per-vector masking capable (PVM):** This bit indicates that PCI Express ports support MSI per-vector masking.<br><br>**Power Well:** PRST |
| 7 | 0x0<br>RO | **Address 64-Bit Capable (AD64C):** When set, this bit indicates that the function is capable of generating a 64-bit message address. |
| 6:4 | 0x0<br>RW | **Multiple Message Enable (MMEN):** Only one message is supported. These bits are R/W for software compatibility. |
| 3:1 | 0x0<br>RO | **Multiple Message Capable (MMC):** Only one message is supported. |
| 0 | 0x0<br>RW | **MSI Enable (MSIE):** When set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. |

## 47.2.45 MSIADDR—Offset 94h

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +94h
**Offset:** [B:0, D:22, F:0] +94h
**Offset:** [B:0, D:23, F:0] +94h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **Address:** Message address specified by the system, always DWORD aligned |
| 1:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 47.2.46 MSIDATA—Offset 98h

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +98h
**Offset:** [B:0, D:22, F:0] +98h
**Offset:** [B:0, D:23, F:0] +98h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15 | 0x0<br>RW | **Trigger Mode (TM):**<br>• 0: Edge Triggered<br>• 1: Level Triggered |
| 14 | 0x0<br>RW | **Level (LVL):** if TM is 0h, then this field is a don't care. Edge triggered messages are always treated as assert messages.<br>For level triggered interrupts, this bit reflects the state of the interrupt input if TM is 1h, then<br>• 0: Deassert Messages<br>• 1: Assert Messages |
| 13:12 | 0x0<br>RW | **Future:** These bits are don't care for an IOxAPIC interrupt message data field specification. |
| 11:8 | 0x0<br>RW | **Delivery Mode (DM):**<br>• 0000: Fixed: Trigger Mode can be edge or level.<br>• 0001: Lowest Priority: Trigger Mode can be edge or level.<br>• 0010: SMI/PMI/MCA - Not supported via MSI of root port<br>• 0011: Reserved - Not supported via MSI of root port<br>• 0100: NMI - Not supported via MSI of root port<br>• 0101: INIT - Not supported via MSI of root port<br>• 0110: Reserved<br>• 0111: ExtINT - Not supported via MSI of primary port<br>• 1000 -1111 - Reserved |
| 7:0 | 0x0<br>RW | **Interrupt Vector (IV):** The interrupt vector will be modified by the EIP PCIe Gen3 to provide context sensitive interrupt information for different events that require attention from the processor. |

## 47.2.47 MSIMSK—Offset 9Ch

The MSI Mask Bit register enables software to disable message sending on a per-vector basis.

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +9Ch
**Offset:** [B:0, D:22, F:0] +9Ch
**Offset:** [B:0, D:23, F:0] +9Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x0<br>RO | **RSVD0:** Reserved |
| 0 | 0x0<br>RW | **Mask Bits (MSKB):** For each Mask bit that is set, the PCI Express port is prohibited from sending the associated message. Corresponding bits are masked if set to '1' |

## 47.2.48 MSIPENDING—Offset A0h

The Mask Pending register enables software to defer message sending on a per-vector basis.

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +A0h
**Offset:** [B:0, D:22, F:0] +A0h
**Offset:** [B:0, D:23, F:0] +A0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x0<br>RO | **RSVD0:** Reserved |
| 0 | 0x0<br>RO/V | **Pending Bits (PB):** For each Pending bit that is set, the PCI Express port has a pending associated message. Corresponding bits are pending if set to '1' |

## 47.2.49 RPPMCSR—Offset A8h

bek_eip_pcie3_regs_usx16.fm bek_eip_pcie3_regs_usx8.fm bek_eip_pcie3_regs_vsp.fm cnx_eip_pcie3_regs_dmix4.fm cnx_eip_pcie3_regs_rp4px4.fm cnx_eip_pcie3_regs_rp4px16.fm cnx_eip_pcie3_regs_ep.fm cnx_eip_pcie3_regs_rldsx16.fm cdf_eip_pcie3_regs_rlusx16.fm dnv_eip_pcie3_regs_rp4px8.fm dnv_eip_pcie3_regs_rp4px16.fm dnv_eip_pcie3_regs_rp4px4.fm dnv_eip_pcie3_regs_vrp.fm

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +A8h
**Offset:** [B:0, D:22, F:0] +A8h
**Offset:** [B:0, D:23, F:0] +A8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RO | **RSVD0:** Reserved |
| 3:2 | 0x0<br>RW | **PME_TO_ACK Timeout (PME_TO_ACK_TO):** This timer is activated from the time the PME_Turn_Off message is sent to the link. It will be reset once the timer expires or when PME_TO_ACK has been received from the downstream device and link has been put into L2/L3 Ready state. Once the timer expires, the Sx sequence will continue to take the link down.<br>• 00: 1 ms (default)<br>• 01: 10 ms<br>• 10: 1 us (Pre-Si)<br>• 11: Disable |
| 1:0 | 0x0<br>RO | **RSVD1:** Reserved |

## 47.2.50 PMCSRS—Offset B0h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +B0h
**Offset:** [B:0, D:22, F:0] +B0h
**Offset:** [B:0, D:23, F:0] +B0h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/P | **PME Status (PMESTS):** This field is utilized for Software to restore the PME Status once exit Sx State. Hardware will reflect the value to the associated PMCSR.PMESTS if this bit was written by Software. |
| 14:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 47.2.51 SMICSR—Offset C8h

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +C8h
**Offset:** [B:0, D:22, F:0] +C8h
**Offset:** [B:0, D:23, F:0] +C8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0x0<br>RO | **RSVD0:** Reserved |
| 18 | 0x0<br>RW/1C/V | **Hot Plug DLLSC SMI Status (HPLSCSMISTS):** This bit is set when rising edge detected as result of both SLOTSTS.DLLSCS and SMICSR.HPSMIE being set. This field will be treated as reserved for vRP. |
| 17 | 0x0<br>RW/1C/V | **Hot Plug SMI Status (HPSMISTS):** This bit is set when rising edge detected as result of both SLOTSTS.PDCS and SMICSR.HPSMIE being set. This field will be treated as reserved for vRP. |
| 16 | 0x0<br>RW/1C/V | **Power Management SMI Status (PMSMISTS):** This bit is set when rising edge detected as result of both ROOTSTS.PMESTS and SMICSR.PMSMIE being set. |
| 15:2 | 0x0<br>RO | **RSVD1:** Reserved |
| 1 | 0x0<br>RW | **Hot Plug SMI Enable (HPSMIE):** Enables the Root Port/DSP to generate SMI whenever a Hot Plug event is detected. This field will be treated as reserved for vRP. |
| 0 | 0x0<br>RW | **Power Management SMI Enable (PMSMIE):** Enables the Root Port to generate SMI whenever a power management event is detected. |

## 47.2.52 SCICSR—Offset CCh

The Tag field is being used to differentiate between PMSCI (Tag = '001') and HPSCI (Tag = '000') for PMC whenever a single set of Assert/Deassert SCI is sent.

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +CCh
**Offset:** [B:0, D:22, F:0] +CCh
**Offset:** [B:0, D:23, F:0] +CCh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0x0<br>RO | **RSVD0:** Reserved |
| 18 | 0x0<br>RW/1C/V | **Hot Plug DLLSC SCI Status (HPLSCSCISTS):** This bit is set when rising edge detected as result of both SLOTSTS.DLLSCS and SCICSR.HPSCIE being set. This field will be treated as reserved for vRP. |
| 17 | 0x0<br>RW/1C/V | **Hot Plug SCI Status (HPSCISTS):** This bit is set when rising edge detected as result of both SLOTSTS.PDCS and SCICSR.HPSCIE being set. This field will be treated as reserved for vRP. |
| 16 | 0x0<br>RW/1C/V | **Power Management SCI Status (PMSCISTS):** This bit is set when rising edge detected as result of both ROOTSTS.PMESTS and SCICSR.PMSCIE being set. |
| 15:2 | 0x0<br>RO | **RSVD1:** Reserved |
| 1 | 0x0<br>RW | **Hot Plug SCI Enable (HPSCIE):** Enables the Root Port/DSP to generate SCI whenever a Hot Plug event is detected. This field will be treated as reserved for vRP. |
| 0 | 0x0<br>RW | **Power Management SCI Enable (PMSCIE):** Enables the Root Port to generate SCI whenever a power management event is detected. |

## 47.2.53 PBTXNCTL—Offset D8h

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +D8h
**Offset:** [B:0, D:22, F:0] +D8h
**Offset:** [B:0, D:23, F:0] +D8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0x0<br>RW/P | **ECO31:** These register fields are of type 'RWS' and have no associated functionality currently. They are allocated for future use to add defeature capability as the need arise during tapeout/ECO netlist fixes. |
| 17:0 | 0x0<br>RW/P | **ECO17:** These register fields are of type 'RWS' and have no associated functionality currently. They are allocated for future use to add defeature capability as the need arise during tapeout/ECO netlist fixes. |

## 47.2.54 PLKCTL—Offset EAh

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +EAh
**Offset:** [B:0, D:22, F:0] +EAh
**Offset:** [B:0, D:23, F:0] +EAh

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:3 | 0x0<br>RO | **RSVD0:** Reserved |
| 2 | 0x0<br>RW/L | **Lnk Layer Capability Lock (LLCL):** Lock key bit for all RWS-L bits located in the following CSRs. Once this bit is set to a 1b, this key bit can not be unlocked. Writing a 0b has no affect on this bit.<br><br>**Power Well:** PRST |
| 0 | 0x0<br>RW/L | **Capability Lock (CL):** Lock key bit for all RWS-L bits (capabilities, next capability pointer, SSID/SVID, slot register, etc) bits for the function.<br>• 1b: Lock<br>• 0b: Unlocked<br>This bit is self-locking. Once this bit is set to a 1b, this key bit can not be unlocked. Writing a 0b has no affect on this bit.<br><br>**Power Well:** PRST |

## 47.2.55 LTRCSR—Offset ECh

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +ECh
**Offset:** [B:0, D:22, F:0] +ECh
**Offset:** [B:0, D:23, F:0] +ECh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/L | **Capability Lock (CL):** Lock key bit for all RW-L bits of LTRCSR and LTROVR register only.<br>• 1b: Lock<br>• 0b: Unlocked<br>This bit is self-locking. Once this bit is set to a 1b, this key bit can not be unlocked. Writing a 0b has no affect on this bit.<br><br>**Power Well:** PRST |
| 30:18 | 0x0<br>RO | **RSVD0:** Reserved |
| 17 | 0x0<br>RW/1C/V | **Invalid LTR Latency Scale Value Received (IVLSVR):** Set to '1' by hardware when an LTR message is received with Not Permitted Latency Scale Value and both the LTR Mechanism Supported bit and the LTR Mechanism Enable bit are set. Cleared to '0' by software writing 1 to this register. |
| 16 | 0x0<br>RW/1C/V | **LTR Received (LTRR):** Set to '1' by hardware when an LTR message is received and both the LTR Mechanism Supported bit and LTR Mechanism Enable bit are set. It can be set/cleared by hardware internally, or software by writing 1 to clear it. |
| 15:4 | 0x0<br>RO | **RSVD1:** Reserved |
| 3 | 0x0<br>RW/P | **LTR Aggregation Mode Disable (LTRAMD):**<br>• Default is 0 to enable LTR aggregation mode.<br>• Set 1 to disable LTR Aggregation Mode. |
| 2 | 0x0<br>RW/L | **LTR Override Policy (LTROVRPLCY):** This register bit defines the LTR override behavior when the respective LTR Override Enable bits are set. 0: The LTR Override values will be in effect when the link is up and in D0, until a valid new LTR message is received from the device. 1: The LTR Override values will be in effect when the link is up and in D0. LTR values from the valid new LTR message received from device will be ignored. Note: This register should be programmed prior to enabling LTR override and should not be modified after LTR override has been enabled.<br><br>**Power Well:** PRST |
| 1 | 0x0<br>RW/L | **LTR No-Snoop Override Enable (LTRNSOVREN):** When this bit is set, the latency tolerance values for this port will be overridden to the values programmed in the LTRNSLOVRV, LTRNSLSOVRV and LTRNSROVR fields. The latency values from the LTR messages received from the devices will be ignored. Hardware should treat this bit as dynamic and the transition of this bit from '0' to '1' will cause a new IOSF sideband LTR message to be sent to update PMC if the new aggregated latency values change as a result of this.<br><br>**Power Well:** PRST |
| 0 | 0x0<br>RW/L | **LTR Snoop Override Enable (LTRSOVREN):** When this bit is set, the latency tolerance values for this port will be overridden to the values programmed in the LTRSLOVRV, LTRSLSOVRV and LTRSROVR fields. The latency values from the LTR messages received from the devices will be ignored. Hardware should treat this bit as dynamic and the transition of this bit from '0' to '1' will cause a new IOSF sideband LTR message to be sent to update PMC if the new aggregated latency values change as a result of this.<br><br>**Power Well:** PRST |

## 47.2.56 LTRL—Offset F0h

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +F0h
**Offset:** [B:0, D:22, F:0] +F0h
**Offset:** [B:0, D:23, F:0] +F0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO/V | **LTR No-Snoop Latency Field (LTRNSLF):** This field contains the No-Snoop Latency field of the latest received LTR Message. When an LTR message is received and both the LTR Mechanism Supported bit and LTR Mechanism Enable field are set, bytes 12:13 of the PCIe header are stored in this register. This includes the case where the Latency Scale Value contains 'Not Permitted' encoding. |
| 15:0 | 0x0<br>RO/V | **LTR Snoop Latency Field (LTRSLF):** This field contains the Snoop Latency field of the latest received LTR Message. When an LTR message is received and both the LTR Mechanism Supported bit and LTR Mechanism Enable field are set, bytes 14:15 of the PCIe header are stored in this register. This includes the case where the Latency Scale Value contains 'Not Permitted' encoding. |

## 47.2.57 LTROVR—Offset F4h

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +F4h
**Offset:** [B:0, D:22, F:0] +F4h
**Offset:** [B:0, D:23, F:0] +F4h

**Default:** 00000000h

| 9:0 | 0x0<br>RW/L | **LTR Snoop Latency Override Value (LTRSLOVRV):** This field contains the Snoop latency override value for this particular PCIe root port. This field is Read-Only when LTRCSR.CL is set.<br><br>**Power Well:** PRST |

## 47.2.58 INTXSWZCTL—Offset F8h

This register provides software the ability to swizzle the legacy interrupts (INTx) from each port and remap them to a different interrupt type for purposes of interrupt rebalancing. This swizzling only applies to inbound INTx messages that arrive on the secondary side of the switch or root port. This register does not affect PCI-Express defined INTx re-map based on device # that is required by the PCI-Express base specification. This register should be treated as reserved if not applicable to device/ project specific.

**Type:** PCI Configuration Register
(Size: 8 bits)

**Offset:** [B:0, D:6, F:0] +F8h
**Offset:** [B:0, D:22, F:0] +F8h
**Offset:** [B:0, D:23, F:0] +F8h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>RO | **RSVD0:** Reserved |
| 2:0 | 0x0<br>RW/L | **INTx Swizzle (INTXSWZ):** The encoding below defines the target INTx type to which the incoming INTx message is mapped to for that port.<br>• 000b:INTA=)INTA, INTB=)INTB, INTC=)INTC, INTD=)INTD<br>• 001b:INTA=)INTB, INTB=)INTC, INTC=)INTD, INTD=)INTA<br>• 010b:INTA=)INTC, INTB=)INTD, INTC=)INTA, INTD=)INTB<br>• 011b:INTA=)INTD, INTB=)INTA, INTC=)INTB, INTD=)INTC<br>• 100b:INTA=)INTA, INTB=)INTA, INTC=)INTA, INTD=)INTA<br><br>**Power Well:** PRST |

## 47.2.59 AERCAPCTL—Offset 118h

This register gives the status and control for ECRC checks and also the pointer to the first uncorrectable error that happened.

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +118h
**Offset:** [B:0, D:22, F:0] +118h
**Offset:** [B:0, D:23, F:0] +118h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:13 | 0x0<br>RO | **RSVD0:** Reserved |
| 12 | 0x0<br>RO | **Completion Timeout Prefix/Header Log Capable (CTPHLC):** If Set, this bit indicates that the Function records the prefix/header of Request TLPs that experience a Completion Timeout error. |
| 11 | 0x0<br>RO/V/P | **TLP Prefix Log Present (TLPPLP):** If Set and the First Error Pointer is valid, indicates that the TLP Prefix Log register contains valid information. If Clear or if First Error Pointer is invalid, the TLP Prefix Log register is undefined. |
| 10 | 0x0<br>RO | **Multiple Header Recording Enable (MHRE):** When set, this bit enables the function to record more than one error header. |
| 9 | 0x0<br>RO | **Multiple Header Recording Capable (MHRC):** Supports more than one error header. |
| 8 | 0x0<br>RW/P | **ECRC Check Enable (ECE):** When Set, ECRC checking is enabled. Functions that do not implement the associated mechanism are permitted to hardwire this bit to 0b. |
| 7 | 0x0<br>RW/L | **ECRC Check Capable (ECC):** If Set, this bit indicates that the Function is capable of checking ECRC.<br><br>**Power Well:** PRST |
| 6 | 0x0<br>RW/P | **ECRC Generation Enable (EGE):** When Set, ECRC generation is enabled. Functions that do not implement the associated mechanism are permitted to hardwire this bit to 0b. Default value of this bit is 0b. |
| 5 | 0x0<br>RW/L | **ECRC Generation Capable (EGC):** If Set, this bit indicates that the Function is capable of generating ECRC.<br><br>**Power Well:** PRST |
| 4:0 | 0x0<br>RO/V/P | **First Error Pointer (FEP):** This field identifies the bit position of the first error reported in the Uncorrectable Error Status Register (xref). This register re-arms itself (which does not change its current value) as soon as the error status bit indicated by the pointer is cleared by the software by writing a 1 to that status bit. |

## 47.2.60 AERHDRLOG1—Offset 11Ch

This register logs the 4 Dwords of the transaction header for PCI Express errors.

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +11Ch
**Offset:** [B:0, D:22, F:0] +11Ch
**Offset:** [B:0, D:23, F:0] +11Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V/P | **TLP Header Log (TLPHDRLOG):** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again). |

## 47.2.61 AERHDRLOG2—Offset 120h

This register logs the 4 Dwords of the transaction header for PCI Express errors.

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +120h
**Offset:** [B:0, D:22, F:0] +120h
**Offset:** [B:0, D:23, F:0] +120h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V/P | **TLP Header Log (TLPHDRLOG):** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again). |

## 47.2.62 AERHDRLOG3—Offset 124h

This register logs the 4 Dwords of the transaction header for PCI Express errors.

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +124h
**Offset:** [B:0, D:22, F:0] +124h
**Offset:** [B:0, D:23, F:0] +124h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V/P | **TLP Header Log (TLPHDRLOG):** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again). |

## 47.2.63 AERHDRLOG4—Offset 128h

This register logs the 4 Dwords of the transaction header for PCI Express errors.

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +128h
**Offset:** [B:0, D:22, F:0] +128h
**Offset:** [B:0, D:23, F:0] +128h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V/P | **TLP Header Log (TLPHDRLOG):** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again). |

## 47.2.64 ROOTERRCMD—Offset 12Ch

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +12Ch
**Offset:** [B:0, D:22, F:0] +12Ch
**Offset:** [B:0, D:23, F:0] +12Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0x0<br>RO | **RSVD0:** Reserved |
| 2 | 0x0<br>RW | **Fatal Error Reporting Enable (FERE):** When set, this bit enables the generation of an interrupt when a Fatal error is reported by any of the functions in the hierarchy associated with this Root Port. |
| 1 | 0x0<br>RW | **Non-Fatal Error Reporting Enable (NFERE):** When set, this bit enables the generation of an interrupt when a Non-Fatal error is reported by any of the functions in the hierarchy associated with this Root Port. |
| 0 | 0x0<br>RW | **Correctable Error Reporting Enable (CERE):** When set, this bit enables the generation of an interrupt when a Correctable error is reported by any of the functions in the hierarchy associated with this Root Port. |

## 47.2.65 ROOTERRSTS—Offset 130h

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +130h
**Offset:** [B:0, D:22, F:0] +130h
**Offset:** [B:0, D:23, F:0] +130h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x0<br>RO/V | **Advanced Error Interrupt Message Number (AEMN):** This register indicates which MSI/MSI-X vector is used for the interrupt message generated in association with any of the status bits of this Capability. For MSI, the value in this register indicates the offset between the base Message Data and the interrupt message that is generated. Hardware is required to update this field so that it is correct if the number of MSI Messages assigned to the Function changes when software writes to the Multiple Message Enable field in the MSI Message Control register. For MSI-X, the value in this register indicates which MSI-X Table entry is used to generate the interrupt message. The entry must be one of the first 32 entries even if the Function implements more than 32 entries. For a given MSI-X implementation, the entry must remain constant. For remaining fields info, please refer to PCIe Spec. for more details. |

## 47.2.66 ERRSRCID—Offset 134h

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +134h
**Offset:** [B:0, D:22, F:0] +134h
**Offset:** [B:0, D:23, F:0] +134h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO/V/P | **Fatal/Non-Fatal Error Source ID (EFSID):** Requester ID of the source when an Fatal or No Fatal Error is received and the Fatal Error Message Received (FEMR) or Non-Fatal Error message Received (NFEMR) bit is not already set. |
| 15:0 | 0x0<br>RO/V/P | **Correctable Error Source ID (ECSID):** Requester ID of the source when a correctable error is received and the Correctable Error Received (CER) bit is not already set. |

## 47.2.67 ACSCAPHDR—Offset 138h

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +138h
**Offset:** [B:0, D:22, F:0] +138h
**Offset:** [B:0, D:23, F:0] +138h

**Default:** 0001000Dh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RW/L | **Next Capability Offset (NCO):** Contains the offset of the next structure in the Extended Capabilities. Software will need to program this field appropriately for linked capabilities list if default is not supported.<br><br>**Power Well:** PRST |
| 19:16 | 0x1<br>RO | **Capability Version (CV):** Indicates the version of the Capability structure present. |
| 15:0 | 0xd<br>RO | **Extended Capability ID (ECID):** Identifies the function as Access Control Services capable. |

## 47.2.68 ACSCAP—Offset 13Ch

This register identifies the Access Control Services (ACS) capabilities.

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +13Ch
**Offset:** [B:0, D:22, F:0] +13Ch
**Offset:** [B:0, D:23, F:0] +13Ch

**Default:** 005Fh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **Egress Control Vector Size (ECVS):** Indicates the number of bits in the Egress Control Vector. This is set to 00h as ACS P2P Egress Control (ACSP2PEC) bit 5 in this register is 0b. |
| 7 | 0x0<br>RO | **RSVD0:** Reserved |
| 6 | 0x1<br>RO | **ACS Direct Translated P2P (TACSDTP2P):** Indicates that the component does implement ACS Direct Translated P2P. Required for Root Ports that support Address Translation Services (ATS) and also support peer-to-peer traffic with other Root Ports, required for Switch Downstream Ports, |
| 5 | 0x0<br>RO | **ACS P2P Egress Control (EACSP2PEC):** Hardwired to 0. Indicates that the component does not implement ACS P2P Egress Control. |
| 4 | 0x1<br>RO | **ACS Upstream Forwarding (UACSUF):** Indicates that the component implements ACS Upstream Forwarding. |
| 3 | 0x1<br>RO | **ACS P2P Completion Redirect (CACSP2PRR):** Indicates that the component implements ACS P2P Completion Redirect. This includes Read Completions, AtomicOp Completions, and other Completions, either with or without data. |
| 2 | 0x1<br>RO | **ACS P2P Request Redirect (RACSP2PRR):** Indicates that the component implements ACS P2P Request Redirect. |
| 1 | 0x1<br>RO | **ACS Translation Blocking (BACSTB):** Indicates that the component implements ACS Translation Blocking. |
| 0 | 0x1<br>RO | **ACS Source Validation (VACSSV):** Indicates that the component implements ACS Source Validation. |

## 47.2.69 ACSCTL—Offset 13Eh

This register identifies the Access Control Services (ACS) control bits.

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +13Eh
**Offset:** [B:0, D:22, F:0] +13Eh
**Offset:** [B:0, D:23, F:0] +13Eh

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:7 | 0x0<br>RO | **RSVD0:** Reserved |
| 6 | 0x0<br>RW | **ACS Direct Translated P2P Enable (TACSP2PECE):** When Set, overrides the ACS P2P Request Redirect and ACS P2P Egress Control mechanisms with peer-to-peer Memory Requests whose Address Translation (AT) field indicates a Translated address This bit is ignored if ACS Translation Blocking (B) is enabled. |
| 5 | 0x0<br>RO | **ACS P2P Egress Control Enable (EACSP2PECE):** This is hardwired to 0b as the component does not implement ACS P2P Egress Control. |
| 4 | 0x0<br>RW | **ACS Upstream Forwarding Enable (UACSUFE):** When set, the component forwards upstream any Request or Completion TLPs it receives that were redirected upstream by a component lower in the hierarchy. Note that the U bit only applies to upstream TLPs arriving at a Downstream Port, and whose normal routing targets the same Downstream Port. |
| 3 | 0x0<br>RW | **ACS P2P Completion Redirect Enable (CACSP2PCRE):** Determines when the component redirects peer-to-peer Completions upstream, applicable only to Read Completions whose Relaxed Ordering Attribute is clear. |
| 2 | 0x0<br>RW | **ACS P2P Request Redirect Enable (RACSP2PRRE):** This bit determines when the component redirects peer-to-peer Requests upstream. |
| 1 | 0x0<br>RW | **ACS Translation Blocking Enable (BACSTBE):** When set, the component blocks all upstream Memory Requests whose Address Translation (AT) field is not set to the default value. |
| 0 | 0x0<br>RW | **ACS Source Validation Enable (VACSSVE):** When set, the component validates the Bus Number from the Requester ID of upstream Requests against the secondary / subordinate Bus Numbers. |

## 47.2.70 XPTDEF—Offset 2DCh

Lock Key bit is located in the Personality Lock Key Control Register (PLKCTL.TLCL).

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +2DCh
**Offset:** [B:0, D:22, F:0] +2DCh
**Offset:** [B:0, D:23, F:0] +2DCh

**Default:** 00008000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0<br>RO | **RSVD0:** Reserved |
| 29 | 0x0<br>RW/P/L | **Internal Sideband Error Message Disable (SBEMSGD):** This bit when set to 1b will disable the generation of the internal sideband message, thus losing some of the error logging capability. It is used to avoid deadlocks on internal sideband bus (if one is discovered). |
| 28:27 | 0x0<br>RO | **RSVD1:** Reserved |
| 26 | 0x0<br>RW/P/L | **Tx Quick Data Credit Return Override (TXQDCRO):** On the IOSF interface, the data for a TLP is required to be sent in back to back clocks after the request is granted. The design is parameterized to either return data credits on each data queue read for the amount of data read, or return all data credits for a TLP when it is granted, assuming that the returned credits cannot be reused before all the data is read out. This bit switches the mode that the data credits are returned. If the design is compiled with the parameter set to return all credits at once, setting this bit will cause each data queue read to return the credits for the amount of data read from the queue (Tx). |
| 25 | 0x0<br>RW/P/L | **Rx Quick Data Credit Return Override (RXQDCRO):** On the IOSF interface, the data for a TLP is required to be sent in back to back clocks after the request is granted. The design is parameterized to either return data credits on each data queue read for the amount of data read, or return all data credits for a TLP when it is granted, assuming that the returned credits cannot be reused before all the data is read out. This bit switches the mode that the data credits are returned. If the design is compiled with the parameter set to return all credits at once, setting this bit will cause each data queue read to return the credits for the amount of data read from the queue (Rx). |
| 24 | 0x0<br>RO | **RSVD2:** Reserved |
| 23:21 | 0x0<br>RW/P/L | **IDF Master Request Throttle Flow (IDFMRTFCCSEL):** This field selects which traffic (flow) class to throttle. Setting this bit causes the IDF Master to only issue a single request at a time (non-pipeline mode) regardless of the fabric advertised credits.<br>These bits are independent of each other.<br>• xx1: Posted<br>• x1x: Non-Posted<br>• 1xx: Completion<br>• 111: Any traffic class.<br>***Note:*** '111' would limit all traffic (flow) classes to a single credit, i.e. each flow class would have a single request credit without sharing a single credit across all flow classes. |
| 20 | 0x0<br>RO | **RSVD3:** Reserved |
| 19:17 | 0x0<br>RW/P/L | **IOSF Master Request Throttle Flow Control Class Select (IMRTFCCSEL):** This field selects which flow control class to throttle. Setting this bit causes the IOSF(CPT/PPF/SWF) Master to only issue a single request at a time (non-pipeline mode) regardless advertised credits by fabric.<br>• These bits are independent of each other.<br>• xx1: Posted<br>• x1x: Non-Posted<br>• 1xx: Completion<br>• 111: Any flow control class<br>***Note:*** '111' would limit all flow classes to a single credit, i.e. each flow class would have a single request credit without sharing a single credit across all flow classes. |
| 16 | 0x0<br>RO | **RSVD4:** Reserved |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x1<br>RW/P/L | **Disable Inbound Peer to Peer Configuration (DIS_INB_P2PCFG):** This bit is actually a disable of type1 configuration upstream. This bit is used for controlling configuration request accesses through the PCI-Express port (security feature) for Type1 Configuration access upstream direction, Type0 will still get UR'd.<br>• 1: Upstream type1 configuration accesses will be Master Aborted by IP.<br>• 0: Allows Upstream type1 configuration access. This register bit is of type 'write once' and is controlled by BIOS/special initialization firmware and applies only to upstream type1 configuration. The default value is to disable upstream type1 configuration access. |
| 14 | 0x0<br>RW/P/L | **Config Type 1 Check Disable (CFGT1CD):** This bit controls the Express Port's type1 configuration check in both direction. This bit applies only if DIS_INB_P2PCFG is clear. Setting this bit bypasses all type1 configuration checks and forwards the type1 configuration instead of UR. This bit does not apply type1 configuration targeting the IP, which follows the proper check. This is not applicable to NTB. |
| 13 | 0x0<br>RW/P/L | **MSG Route by ID Disable (MSGRIDCD):** This bit controls the Express Port's message Route by ID check in both direction. Setting this bit bypasses messages route by ID checks and forwards the message instead of UR/Drop. This bit does not apply messages targeting the IP, which follows the proper check. This is not applicable to NTB. |
| 12 | 0x0<br>RW/P/L | **Completion Check Disable (CCD):** This bit controls the Express Port's completion check (Requester ID/Transaction ID) in both direction. Setting this bit bypasses all completion checks based and forwards the completion instead of unexpected completion check. This bit does not apply completion targeting the IP, which follows the proper check. This is not applicable to NTB and Root Ports. |
| 11 | 0x0<br>RW/P/L | **ISA Check Disable (ISACD):** This bit controls the Express Port's ISA IO region check in both direction. Setting this bit bypasses ISA IO decode checks and forwards access instead of UR. ISA region check (ISACD) is don't care when bit 9 (IOCD) is set. This is not applicable to NTB. |
| 10 | 0x0<br>RW/P/L | **VGA Check Disable (VGACD):** This bit controls the Express Port's VGA Memory and IO check in upstream direction only. Setting this bit bypasses upstream VGA Memory and IO decode checks and forwards the VGA access upstream instead of UR. VGA Memory checks are don't care when bit 8 (MCD) is set, while VGA IO check is a don't care when bit 9 (IOCD) is set. This is not applicable to NTB. |
| 9 | 0x0<br>RW/P/L | **IO Check Disable (IOCD):** This bit controls the Express Port's IO check in both direction. Setting this bit bypasses all IO decode checks based on base/limit or BAR registers and forwards the IO access. This bit does not apply for any IO region decoded for IP's internal resources. IO txn ) 64K will be UR'd when this bit is set. This is not applicable to NTB. |
| 8 | 0x0<br>RW/P/L | **Memory Check Disable (MCD):** This bit controls the Express Port's Memory check in both direction. Setting this bit bypasses all memory decode checks based on base/limit or BAR registers and forwards the memory access. This bit does not apply for any memory region decoded for IP's internal resources. This is not applicable to NTB. |
| 7 | 0x0<br>RW/P/L | **Reserved ECO 7 (RECO7):** This field is reserved for ECO purpose. |
| 6:5 | 0x0<br>RW/P/L | **Store Forward Override (SFO):** These bits are used to override the store forward of TLPs through the transmit queue. One bit enables the override and the other bit selects whether to force store-forwarding on or off. Note that store-forward on is safer in all cases, but impacts latency. If they clock frequencies are known such that store forwarding is not needed, it can be overridden here.<br>• 0x - No override.<br>• 10 - Force store forward disable.<br>• 11 - Force store forward enable. |
| 4:0 | 0x0<br>RW/P/L | **Reserved ECO 0 (RECO0):** This field is reserved for ECO purpose. |

## 47.2.71 XPTDEF2—Offset 2E0h

Lock Key bit is located in the Personality Lock Key Control Register (PLKCTL.TLCL).

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:6, F:0] +2E0h
**Offset:** [B:0, D:22, F:0] +2E0h
**Offset:** [B:0, D:23, F:0] +2E0h

**Default:** 00001D00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/1C/V/P | **MSI Address Violation Status (MSIAVS):** MSI address violation check status that does not target 0xFEEx_xxxx while MSIAVCD is not being set. This is only valid for RPs usage. |
| 30:19 | 0x0<br>RW/P/L | **Reserved ECO (RECO):** This field is reserved for ECO purpose. |
| 18 | 0x0<br>RW/P/L | **Hold Retrain during Surprise Removal Disable (HRSRD):** For Surprise Removal, EIP RPs will not allow retrain to occur until the SLOTSTS.PDCS bit has been cleared by software for the removal event. This bit is to disable the above behavior and allow the retrain to occur. This field is only applicable to RPs and should be treated as reserved for other devices. |
| 17 | 0x0<br>RW/P/L | **ECRC Malformed Error Precedence Disable (ECRCMFEPD):** This bit changes the error precedence if a TLP has both a ECRC error and is malform.<br>• When this bit is set to 1, the packet will be logged as an ECRC error.<br>• When set to 0, the packet will be logged as a malform TLP, which is compliant to the PCIe spec errata.<br>Only the type of error logged is affected. If the TLP is malform, it will be dropped with no credit return. If there is only an ECRC error detected on a packet, it will be dropped and credits will be returned per PCI-SIG Errata. |
| 16 | 0x0<br>RW/P/L | **MSI Address Violation Check Disable (MSIAVCD):** Disable MSI address violation check that does not target 0xFEEx_xxxx. This is only valid for RPs usage. |
| 15 | 0x0<br>RW/P/L | **Force Downstream Relaxed Order (FORCERODN):** Forces all downstream completions to follow relaxed ordering rules. This allows downstream completions to pass downstream posted requests. Note that setting this bit breaks the producer consumer model when the data is in the address space below the port and the flag is in the address space outside the port, because the read of the flag will not push the data writes down the port. The belief is that usage model is not used. |
| 14 | 0x0<br>RW/P/L | **Downstream Relaxed Order Disable (DNRODIS):** Disables the ability of downstream relaxed ordered completions from passing posted requests in the same direction. |
| 13 | 0x0<br>RW/P/L | **Upstream Relaxed Order Disable (UPRODIS):** Disables the ability of upstream relaxed ordered completions from passing posted requests in the same direction. |
| 12 | 0x1<br>RW/P/L | **IOSF tdparity check disable (TDPAR_CHK_DIS):** When set this bit disables the data parity check for incoming data into the IOSF Target block. The logic will ignore the data parity bit and will operate as though the parity bit did not exist. No errors will be logged and good DW based parity will be written into the data queue. |
| 11 | 0x1<br>RW/P/L | **IOSF tcparity check disable (TCPAR_CHK_DIS):** When set this bit disables the command parity check for incoming commands into the IOSF Target block. The logic will ignore the command parity bit and will operate as though the parity bit did not exist. No errors will be logged and good DW based parity will be written into the header queue. |
| 10 | 0x1<br>RW/P/L | **MCTP Message Bus Number Check Enable (MMBNCE):** When set, if the Requester ID bus number of an MCTP message request received on the PCIe link does not fall within the range between SCBN and SBBN, the MCTP message will be silently discarded. |
| 9 | 0x0<br>RW/P/L | **Completion credit advertisement enable (CPLCDT_EN):** Endpoints are required to advertise infinite completion credits. Setting this defeature bit breaks that rule and enables the advertisement of non-infinite completion credits and flow control updates for completion credits. This is only valid for project specific |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 8 | 0x1<br>RW/P/L | **Enable Virtual Port IDs (EVPID):**<br>• 1: Enables SB Virtual Port ID mode with allocated VPIDs which is associated with ports for all the egress INTx and LTR messages based on project specific. We will assign (N-1) virtual sideband PortID's to associate with the physical PortID which is port 0. The physical one is the same one as being assigned by the router as we have now, and would be used for all non-INTx messages and INTx messages from port 0. However, the VPIDs would be used for INTx messages routing from port(N-1:1), respectively. This allows all INTx from N ports to be forwarded to the ILB accordingly, so ILB can differentiate the source of the INTx message.<br>• 0: Normal operation with single SB Port ID per cluster for INTx delivery. This is only valid for project specific with multi root ports. |
| 7 | 0x0<br>RW/P/L | **Enable Receive Completion Ordering (ERCO):** The default ordering is to allow received completions to pass received posted requests to avoid receiver overflow conditions if posted requests cannot be processed. Setting this bit will enable PCI Express ordering for completions, preventing completions from passing posted requests. This is only valid for project specific |
| 6 | 0x0<br>RW/P/L | **Enable MSI Generation Override (MSIGENOV):**<br>• 1: Enables Root Port MSI generation override even if PCICMD.BME = 0 for the root port device as required by PCI Express specification.<br>• 0: Normal operation for Root Port behavior. If PCICMD.BME = 0, the root port will not generate a MSI. This is only valid for project specific . |
| 5 | 0x0<br>RW/P/L | **Completion Combining Disable (CPLCOMBINE_D):** When a larger read request is split into smaller read requests, the completions for the small requests may be opportunistically combined into larger completions to enable higher bandwidth and link utilization, as long as packet formation rules are not violated. This bit disables the port from combining completions. This is only valid for project specific . |
| 4 | 0x0<br>RW/P/L | **Config Retry Disable (CRD):** Setting this bit disables the re-issuing of a configuration request if the request is completed with a configuration retry status (CRS). The completion with CRS will be returned to the requestor. |
| 3 | 0x0<br>RW/P/L | **Optional Unexpected Completion Check Disable (UCCHKD):** Setting this bit disables some optional unexpected checks on completions. Specifically, it disables the checking on the byte count and lower address fields. |
| 2 | 0x0<br>RW/P/L | **MCTP Disable Bus Check (MCTPDBC):** Setting this bit will disable the Bus 0 check for all MCTP VDM Type1 messages. The check is enabled by default as following:<br>• Upstream - ReqBus =/= 0<br>• Downstream - TgtBus =/= 0 |
| 1 | 0x0<br>RW/P/L | **Reserved ECO 1 (RECO1):** This field is reserved for ECO purpose. |
| 0 | 0x0<br>RW/P/L | **Global Stop Disable (GBLSTOPD):** When the design detects an uncorrectable internal error, a stop signal in the design asserts, blocking the processing of transactions in both directions in the transaction layer. Setting this bit, disables the stop mechanism, allowing the transactions to proceed as if no error occurred. |

## 47.2.72 IOSFDEVCLKGCTL—Offset 2E4h

It is included for DMI in RC as an extension of Rootport definition.

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +2E4h
**Offset:** [B:0, D:22, F:0] +2E4h
**Offset:** [B:0, D:23, F:0] +2E4h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW | **Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur.<br><br>**Power Well:** PRST |
| 14:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:0 | 0x10<br>RW | **Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block controls the delay before going into IDLE. 16 (default value) is the minimum number of clocks recommended.<br><br>**Power Well:** PRST |

## 47.2.73 SBDEVCLKGCTL—Offset 2E6h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +2E6h
**Offset:** [B:0, D:22, F:0] +2E6h
**Offset:** [B:0, D:23, F:0] +2E6h

**Default:** 8010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x1<br>RW | **Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer.<br><br>**Power Well:** PRST |
| 14:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:0 | 0x10<br>RW | **Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended.<br><br>**Power Well:** PRST |

## 47.2.74 IDFDEVCLKGCTL—Offset 2E8h

The IDF Device Clock Gate control register is defined only for the Virtual Root port/ Switch Port.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:6, F:0] +2E8h
**Offset:** [B:0, D:22, F:0] +2E8h
**Offset:** [B:0, D:23, F:0] +2E8h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW | **Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer.<br><br>**Power Well:** PRST |
| 14:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:0 | 0x10<br>RW | **Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended.<br><br>**Power Well:** PRST |

§ §

# 48 PCI Express Root Ports - B0, D(9-12, 14-17), F0

## 48.1 Introduction and Index

The host-accessible registers for the PCI Express Root Ports are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

### 48.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device (9-12, 14-17) (decimal), Function 0. The offset addresses are listed.

**Table 48-1. Summary of PCI Configuration Registers—0/9-12, 14-17/0 (Sheet 1 of 7)**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 2 | 8086 | "VID—Offset 0h" on page 1600 |
| 2 | 2 | 19A4 | "DID—Offset 2h" on page 1600 |
| 4 | 2 | 0000 | "PCICMD—Offset 4h" on page 1601 |
| 6 | 2 | 0010 | "PCISTS—Offset 6h" on page 1602 |
| 8 | 1 | 00 | "RID—Offset 8h" on page 1603 |
| 9 | 3 | 060400 | "CCR—Offset 9h" on page 1603 |
| C | 1 | 00 | "CLS—Offset Ch" on page 1604 |
| D | 1 | 00 | "PLAT—Offset Dh" on page 1604 |
| E | 1 | 01 | "HDR—Offset Eh" on page 1604 |
| F | 1 | 00 | "BIST—Offset Fh" on page 1605 |
| 18 | 1 | 00 | "PRIBUS—Offset 18h" on page 1605 |
| 19 | 1 | 00 | "SECBUS—Offset 19h" on page 1606 |
| 1A | 2 | 00 | "SUBBUS—Offset 1Ah" on page 1606 |
| 1C | 1 | 00 | "IOBASE—Offset 1Ch" on page 1607 |
| 1D | 1 | 00 | "IOLIMIT—Offset 1Dh" on page 1607 |
| 1E | 2 | 0000 | "SECSTS—Offset 1Eh" on page 1608 |
| 20 | 2 | 0000 | "MEMBASE—Offset 20h" on page 1609 |
| 22 | 2 | 0000 | "MEMLIMIT—Offset 22h" on page 1610 |
| 24 | 2 | 0001 | "PFBASE—Offset 24h" on page 1611 |
| 26 | 2 | 0001 | "PFLIMIT—Offset 26h" on page 1612 |
| 28 | 4 | 00000000 | "PFBASEU—Offset 28h" on page 1612 |
| 2C | 4 | 00000000 | "PFLIMITU—Offset 2Ch" on page 1613 |
| 34 | 1 | 40 | "CAPPTR—Offset 34h" on page 1613 |
| 3C | 1 | 00 | "INTL—Offset 3Ch" on page 1614 |
| 3D | 1 | 01 | "INTP—Offset 3Dh" on page 1614 |
| 3E | 2 | 0000 | "BCTL—Offset 3Eh" on page 1615 |
| 40 | 2 | 8010 | "EXPCAPLST—Offset 40h" on page 1617 |
| 42 | 2 | 0042 | "EXPCAPLST—Offset 40h" on page 1617 |
| 44 | 4 | 00008021 | "DEVCAP—Offset 44h" on page 1618 |
| 48 | 2 | 2000 | "DEVCTL—Offset 48h" on page 1619 |
| 4A | 2 | 0000 | "DEVSTS—Offset 4Ah" on page 1620 |
| 4C | 4 | 09794883 | "LINKCAP—Offset 4Ch" on page 1621 |
| 50 | 2 | 0000 | "LINKCTL—Offset 50h" on page 1623 |
| 52 | 2 | 1001 | "LINKSTS—Offset 52h" on page 1625 |
| 54 | 4 | 00000000 | "SLOTCAP—Offset 54h" on page 1626 |
| 58 | 2 | 03C0 | "SLOTCTL—Offset 58h" on page 1628 |

## Table 48-1. Summary of PCI Configuration Registers—0/9-12, 14-17/0 (Sheet 2 of 7)

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 5A | 2 | 0040 | "SLOTSTS—Offset 5Ah" on page 1630 |
| 5C | 2 | 0000 | "ROOTCTL—Offset 5Ch" on page 1632 |
| 5E | 2 | 0001 | "ROOTCAP—Offset 5Eh" on page 1633 |
| 60 | 4 | 00000000 | "ROOTSTS—Offset 60h" on page 1633 |
| 64 | 4 | 00000437 | "DEVCAP2—Offset 64h" on page 1634 |
| 68 | 2 | 0000 | "DEVCTL2—Offset 68h" on page 1637 |
| 6C | 4 | 0000000E | "LINKCAP2—Offset 6Ch" on page 1639 |
| 70 | 2 | 0003 | "LINKCTL2—Offset 70h" on page 1640 |
| 72 | 2 | 0000 | "LINKSTS2—Offset 72h" on page 1642 |
| 80 | 2 | 8801 | "PMCAPLST—Offset 80h" on page 1642 |
| 82 | 2 | C803 | "PMCAPLST—Offset 80h" on page 1642 |
| 84 | 2 | 0008 | "PMCSR—Offset 84h" on page 1644 |

### 48.1.2 Sideband Registers

An index of the Sideband registers that are accessible to the Host are listed here. Each is accessible in Host Memory Space using the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

**Table 48-2. Summary of Sideband Registers—0xB4 (Devices 9-12)**

| Offset (hex) | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|
| 10 | 00000000 | "PPBIFCTL_PRIV—Offset 10h" on page 1815 |

**Table 48-3. Summary of Sideband Registers—0xB3 (Devices 14-17)**

| Offset (hex) | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|
| 10 | 00000000 | "PPBIFCTL_PRIV—Offset 10h" on page 1816 |

## 48.2 Registers in Configuration Space

### 48.2.1 VID—Offset 0h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 0h

**Default:** 8086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x8086<br>RO | **Vendor ID (VID):** This field identifies Intel as the manufacturer of the device. |

### 48.2.2 DID—Offset 2h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 2h

**Default:** 19A4h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | *See the Field Description for the default value for each Root Port*<br><br>RO/V | **Device ID (DID):** This field identifies the particular function as allocated by Intel.<br>The default ID values assigned to each Host Root Port:<br>• RP0 = 0x19A4 (PCI Device 9)<br>• RP1 = 0x19A5 (PCI Device 10)<br>• RP2 = 0x19A6 (PCI Device 11)<br>• RP3 = 0x19A7 (PCI Device 12)<br>• RP4 = 0x19A8 (PCI Device 14)<br>• RP5 = 0x19A9 (PCI Device 15)<br>• RP6 = 0x19AA (PCI Device 16)<br>• RP7 = 0x19AB (PCI Device 17) |

## 48.2.3 PCICMD—Offset 4h

This register controls how the device behaves on the primary interface (PCI Express).

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 4h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **RSVD0:** Reserved |
| 10 | 0x0<br>RW | **Interrupt Disable (INTxD):** This bit controls the ability of the PCI-Express Function to generate legacy INTx interrupt message.<br>When set, functions are prevented from asserting INTx interrupt messages.<br>Any INTx emulation interrupts already asserted by the function must be deasserted when this bit is set by generating a Deassert_INTx message(s). |
| 9 | 0x0<br>RO | **Fast Back-to-back enable (FBE):** Not applicable to PCI-Express. Hardwired to 0. |
| 8 | 0x0<br>RW | **SERR# Enable (SEE):** When set, this bit enables reporting of Non-Fatal and Fatal errors detected by the Function of the Root Complex. |
| 7 | 0x0<br>RO | **Wait Cycle Control (WCC):** Not applicable to PCI-Express. Hardwired to 0. |
| 6 | 0x0<br>RW | **Parity Error Response Enable (PERE):** This bit controls the setting of the master data parity error bit in the Status Register ('PCI Status Register "PCISTS—Offset 6h" on page 1602) in response to a parity error received on the PCI Express interface (either internal queue errors or a poisoned TLP). |
| 5 | 0x0<br>RO | **VGA Palette Snoop Enable (VGA_PSE):** Not applicable to PCI-Express. Hardwired to 0. |
| 4 | 0x0<br>RO | **Memory Write and Invalidate Enable (MWIE):** Not applicable to PCI-Express. Hardwired to 0. |
| 3 | 0x0<br>RO | **Special Cycle Enable (SCE):** Not applicable to PCI-Express. Hardwired to 0. |
| 2 | 0x0<br>RW | **Bus Master Enable (BME):** This bit controls the ability of the Function to issue Memory and I/O read or write requests, and the ability of Root or Switch port to forward memory and I/O read or write requests in the upstream direction.<br>When this bit is 0b, memory and I/O requests received at the root port or downstream side of a switch port (secondary side) must be handled as an Unsupported Request (UR). |
| 1 | 0x0<br>RW | **Memory Space Enable (MSE):**<br>• 0 - Respond to all Memory Requests on the primary interface as Unsupported Request Received.<br>• 1 - Enable forwarding of memory transactions to the secondary interface and any internal function. |
| 0 | 0x0<br>RW | **I/O Space Enable (IOSE):**<br>• 0 - Respond to all I/O Requests on the primary interface with an Unsupported Request Completion.<br>• 1 - Enable forwarding of I/O Requests to the secondary interface. |

## 48.2.4 PCISTS—Offset 6h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 6h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C/V | **Detected Parity Error (DPE):** This bit is set when a poisoned TLP is received from PCIe or IOSF. This bit is set even when the parity error response enable bit (bit[6] of the PCICMD Register 'PCI Command Register "PCICMD—Offset 4h" on page 1601) is not set. |
| 14 | 0x0<br>RW/1C/V | **Signaled System Error (SSE):** This bit is set when ERR_FATAL or ERR_NONFATAL messages are sent to the root complex and the SERR enable bit in the PCICMD Register ('PCI Command Register "PCICMD—Offset 4h" on page 1601) is set. |
| 13 | 0x0<br>RW/1C/V | **Received Master Abort (RMA):** This bit is set when the requester receives a completion with an UR completion status.<br>On Type 1 configuration header functions, the bit is set when a UR completions status is received on the primary side. |
| 12 | 0x0<br>RW/1C/V | **Received Target Abort (RTA):** This bit is set when a requester receives a CA completions status.<br>On Type 1 configuration header functions, the bit is set when a 'Completer Abort' is received on the primary side. |
| 11 | 0x0<br>RW/1C/V | **Signaled Target Abort (STA):** This bit is Set when the port completes a Posted or Non-Posted Request as a Completer Abort error.<br>This applies to a Function with a Type 1 Configuration header when the Completer Abort was generated by its Primary Side. |
| 10:9 | 0x0<br>RO | **DEVSEL# Timing (DVT):** These bits have no meaning on PCI Express. |
| 8 | 0x0<br>RW/1C/V | **Master Data Parity Error Detected (MDPD):** This bit is set by a requester (primary side for type1 configuration header functions) if the parity error response enable bit (PERE) in the Command Register ('PCI Command Register "PCICMD—Offset 4h" on page 1601) is set and either of the following two conditions occur: |
| 7 | 0x0<br>RO | **Fast Back-to-Back Capable (FBC):** This bit has no meaning on PCI Express. |
| 6 | 0x0<br>RO | **RSVD0:** Reserved |
| 5 | 0x0<br>RO | **66 MHz Capable (C66):** This bit has no meaning on PCI Express. |
| 4 | 0x1<br>RO | **Capabilities List Enable (CAPE):** This bit indicates the presence of an Extended capabilities list items. Offset 34H indicates the offset for the first entry in the linked list of capabilities. |
| 3 | 0x0<br>RO/V | **Interrupt Status (INTS):** When set, this bit indicates that an INTx emulation interrupt is pending internally in this function. |
| 2:0 | 0x0<br>RO | **RSVD1:** Reserved |

## 48.2.5 RID—Offset 8h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 8h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V/P | **Revision ID (RID):** This field specifies the specific revision of this function and should be viewed as a extension to the Device ID. |

## 48.2.6 CCR—Offset 9h

The CCR register has an attribute of RW-L PRST to allow configuration software to modify and lock the register from further update. Lock Key bit is located in the Personality Lock Key Control Register ('PLKCTL').

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 9h

**Default:** 060400h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **RSVD0:** Reserved |
| 23:16 | 0x6<br>RW/L | **Base Class (BC):** The value of 06h indicates that this is a bridge device.<br><br>**Power Well:** PRST |
| 15:8 | 0x4<br>RW/L | **Sub-Class (SC):** This 8-bit value indicates that this device is a PCI-to-PCI Bridge.<br><br>**Power Well:** PRST |
| 7:0 | 0x0<br>RW/L | **Register-Level Programming Interface (RLPI):** This bit indicates that this device is standard (non-subtractive) PCI-to-PCI Bridge.<br><br>**Power Well:** PRST |

## 48.2.7 CLS—Offset Ch

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Cache Line Size (CLS):** These bits specify the system cache-line size in units of DWords. |

## 48.2.8 PLAT—Offset Dh

This register denotes the maximum time slice for a burst transaction in legacy PCI 2.3 on the primary interface. It does not affect/influence PCI-Express functionality.

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + Dh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Primary Latency Timer (Prim_Lat_timer):** Not applicable to PCI-Express. Hardwired to 00h. This register is typically called as 'latency Timer' for Endpoints in PCI 3.0 specification |

## 48.2.9 HDR—Offset Eh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + Eh

**Default:** 01h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RW/L | **Multi-function device (MFD):** The root port, DMI in RC, Virtual Root port/switch port and downstream ports are single function only.<br><br>**Power Well:** PRST |
| 6:0 | 0x1<br>RW/L | **Header Type (HTYPE):** These bits define the layout of addresses 10h through 3Fh in the configuration space.<br>These bits read as 01h to indicate that the register layout conforms to the standard PCI-to-PCI Bridge layout.<br><br>**Power Well:** PRST |

## 48.2.10 BIST—Offset Fh

This register is used for reporting control and status information of BIST checks within a PCIExpress port. It is not supported in this implementation.

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + Fh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **BIST Tests (BIST_TST):** Not supported. Hardwired to 0h |

## 48.2.11 PRIBUS—Offset 18h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 18h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Primary Bus Number (PBN):** These bits indicate the PCI Express bus number. |

## 48.2.12 SECBUS—Offset 19h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 19h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Secondary Bus Number (SCBN):** These bits indicate the bus number of the PCI device to which the secondary interface is connected. |

## 48.2.13 SUBBUS—Offset 1Ah

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 1Ah

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Subordinate Bus Number (SBBN):** These bits indicate the highest PCI bus number downstream of this bridge. |

## 48.2.14 IOBASE—Offset 1Ch

The I/O Base and I/O Limit registers define an address range that is used by the PCI-Express port to determine when to forward I/O transactions from one interface to the other using the following formula:

IO_BASE (= A[15:12](=IO_LIMIT Only the upper 4 bits are programmable. For the purpose of address decode, address bits A[11:0] are treated as 0.

The bottom of the defined I/O address range will be aligned to a 4KB boundary while the top of the region specified by IO_LIMIT will be one less than a 4 KB multiple.

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 1Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:4 | 0x0<br>RW | **I/O Base Address Bits (IOBA):** These bits define the bottom address of an address range to determine when to forward I/O transactions from one interface to another.<br>These bits correspond to address lines[15:12] for 4 KB alignment. Bits[11:0] are assumed to be 000h. |
| 3:0 | 0x0<br>RO | **I/O Base Addressing Capability (IOBC):** Each of these bits is hard-wired to 0, indicating support for 16-bit I/O addressing only. |

## 48.2.15 IOLIMIT—Offset 1Dh

The I/O Base and I/O Limit registers define an address range that is used by the PCI-Express bridge to determine when to forward I/O transactions from one interface to the other using the following formula:

IO_BASE (= A[15:12] (=IO_LIMIT Only the upper 4 bits are programmable. For the purpose of address decode, address bits A[11:0] of the IO limit register is treated as FFFh.

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 1Dh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:4 | 0x0<br>RW | **I/O Limit Address Bits (IOLA):** These bits define the top address of an address range to determine when to forward I/O transactions from PCI Express to PCI. These bits correspond to address lines[15:12] for 4 KB aligned window. |
| 3:0 | 0x0<br>RO | **I/O Limit Addressing Capability (IOLC):** Each of these bits is hard-wired to 0, indicating support for 16-bit I/O addressing only. |

## 48.2.16 SECSTS—Offset 1Eh

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 1Eh

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |

## 48.2.17 MEMBASE—Offset 20h

The Memory Base and Memory Limit registers define a memory mapped I/O non-prefetchable address range (32-bit addresses) and direct the accesses in this range to the PCI-Express port based on the following formula:

MEMORY_BASE (= A[31:20] (= MEMORY_LIMIT The upper 12 bits of both the Memory Base and Memory Limit registers are read/write and corresponds to the upper 12 address bits, AD[31:20], of 32-bit addresses.

For the purpose of address decoding, the bridge assumes that the lower 20 address bits, AD[19:0], of the memory base address are zero. Similarly, the bridge assumes that the lower 20 address bits, AD[19:0], of the memory limit address (not implemented in the Memory Limit register) are FFFFFh. Thus, the bottom of the defined memory address range will be aligned to a 1 MB boundary and the top of the defined memory address range will be one less than a 1 MB boundary

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 20h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:4 | 0x0<br>RW | **Memory Base (MB):** These bits are compared with bits[31:20] of the incoming address to determine the lower 1 MB-aligned value (inclusive) of the range. |
| 3:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 48.2.18 MEMLIMIT—Offset 22h

This register controls the processor to PCI-Express non-prefetchable memory access routing based on the following formula as described above:

MEMORY_BASE (= A[31:20] (= MEMORY_LIMIT The upper 12 bits of the register are read/write and correspond to the upper 12 address bits A[31:20] of the 32 bit address. The bottom 4 bits of this register are read-only and return zeros when read. This register must be initialized by the configuration software. For the purpose of address decode address bits A[19:0] are assumed to be FFFFFh.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 22h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:4 | 0x0<br>RW | **Memory Limit (ML):** These bits are compared with bits[31:20] of the incoming address to determine the upper limit of the range of memory accesses that will be passed by the port. |
| 3:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 48.2.19 PFBASE—Offset 24h

The Prefetchable Memory Base and Memory Limit registers define a memory mapped I/O prefetchable address range (32-bit addresses) which is used by the PCI-Express bridge to determine when to forward memory transactions based on the following formula:

PREFETCH_MEMORY_BASE (= A[31:20] (= PREFETCH_MEMORY_LIMIT The upper 12 bits of both the Prefetchable Memory Base and Memory Limit registers are read/ write and corresponds to the upper 12 address bits, A[31:20], of 32-bit addresses. For the purpose of address decoding, the bridge assumes that the lower 20 address bits, A[19:0], of the memory base address are zero. Similarly, the bridge assumes that the lower 20 address bits, A[19:0], of the memory limit address (not implemented in the Memory Limit register) are FFFFFh.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 24h

**Default:** 0001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:4 | 0x0<br>RW | **Prefetchable Memory Base (PMB):** These bits are compared with bits[31:20] of the incoming address to determine the lower 1 MB-aligned value (inclusive) of the range.<br>The incoming address must be greater than or equal to this value. |
| 3:0 | 0x1<br>RO | **Prefetchable Memory Base Address Capability (PFMCAP):**<br>• 0: 32-bit Prefetchable Memory addressing.<br>• 1: 64-bit Prefetchable Memory addressing.<br>This field indicates that 64-bit addressing is supported for the limit. |

## 48.2.20 PFLIMIT—Offset 26h

This register controls the processor to PCI-Express prefetchable memory access routing based on the following formula as described above:

PREFETCH_MEMORY_BASE (= A[31:20] (= PREFTCH_MEMORY_LIMIT The upper 12 bits of the register are read/write and correspond to the upper 12 address bits A[31:20] of the 32 bit address. This register must be initialized by the configuration software. For the purpose of address decode address bits A[19:0] are assumed to be FFFFFh.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 26h

**Default:** 0001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:4 | 0x0<br>RW | **Prefetchable Memory Limit (PML):** These bits are compared with bits[31:20] of the incoming address to determine the upper limit of the prefetchable memory range. |
| 3:0 | 0x1<br>RO | **Prefetchable Memory Limit Address Capability (PMLC):** This field indicates that 64-bit addressing is supported for the limit. |

## 48.2.21 PFBASEU—Offset 28h

The Prefetchable Base Upper 32 Bits and Prefetchable Limit Upper 32 Bits registers are extensions to the Prefetchable Memory Base and Prefetchable Memory Limit registers. If a 64-bit prefetchable memory address range is supported, the Prefetchable Base Upper 32 Bits and Prefetchable Limit Upper 32 Bits registers specify the upper 32-bits, corresponding to A[63:32], of the 64-bit base and limit addresses which specify the prefetchable memory address range. PREFETCH_MEMORY_BASE_UPPER (= A[63:32] (= PREFETCH_MEMORY_BASE_LIMIT_UPPER

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 28h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Prefetchable Memory Base Upper Portion (PMBU):** Corresponds to A[63:32] of the memory address that maps to the upper base of the prefetchable range of memory accesses that will be passed by the PCI-Express bridge. |

## 48.2.22 PFLIMITU—Offset 2Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 2Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Prefetchable Memory Limit Upper Portion (PMLU):** Corresponds to A[63:32] of the memory address that maps to the upper limit of the prefetchable range of memory accesses that will be passed by the PCI-Express bridge. |

## 48.2.23 CAPPTR—Offset 34h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 34h

**Default:** 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x40<br>RO | **Capabilities Pointer (CPTR):** Contains the offset of the first item in the list of capabilities. (EXPCAPLST) |

## 48.2.24 INTL—Offset 3Ch

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 3Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Interrupt Line (INTL):** This register is used to communicate interrupt line routing information. The device itself does not use this value, rather it is used by device drivers and operating systems. (compatibility) |

## 48.2.25 INTP—Offset 3Dh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 3Dh

**Default:** 01h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x1<br>RW/L | **Interrupt Pin (INTP):** This register tells which interrupt pin the function uses.<br>• 01h: Generate INTA<br>• 02h: Generate INTB<br>• 03h: Generate INTC<br>• 04h: Generate INTD<br>• Others: Reserved BIOS has the ability to write this register once during boot to setup the correct interrupt for the Function.<br><br>**Power Well:** PRST |

## 48.2.26 BCTL—Offset 3Eh

This register provides extensions to the Command Register ('PCI Command Register "PCICMD—Offset 4h" on page 1601) that are specific to a bridge. The Bridge Control Register provides many of the same controls for the secondary interface that are provided by the Command Register for the primary interface. Some bits affect operation of both interfaces of the bridge.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 3Eh

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:12 | 0x0<br>RO | **RSVD0:** Reserved |
| 11 | 0x0<br>RO | **Discard Timer SERR# Enable (DTSE):** Not applicable to PCI Express. Hardwired to 0. |
| 10 | 0x0<br>RO | **Discard Timer Status (DTS):** Not applicable to PCI Express. Hardwired to 0. |
| 9 | 0x0<br>RO | **Secondary Discard Timer (SDT):** Not applicable to PCI Express. Hardwired to 0. |
| 8 | 0x0<br>RO | **Primary Discard Timer (PDT):** Not applicable to PCI Express. Hardwired to 0. |

| 4 | 0x0<br>RO | **RSVD:** Reserved |
| 3 | 0x0<br>RW/1C/V | **Unsupported Request Detected (URD):** This bit indicates that this function received an unsupported request from PCI Express link.<br>Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. |
| 2 | 0x0<br>RW/1C/V | **Fatal Error Detected (FED):** This bit indicates that this function has detected a Fatal error.<br>Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. |
| 1 | 0x0<br>RW/1C/V | **Non-Fatal Error Detected (NFED):** This bit indicates that this function has detected a Non-Fatal error.<br>Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. |
| 0 | 0x0<br>RW/1C/V | **Correctable Error Detected (CED):** This bit indicates that this function has detected a Correctable error.<br>Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. |

## 48.2.32 LINKCAP—Offset 4Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 4Ch

**Default:** 09794883h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x9<br>RW/V/L | **Port Number (PN):** This field indicates the PCI Express port number assigned to this link.<br><br>**Power Well:** PRST |
| 23 | 0x0<br>RO | **RSVD0:** Reserved |
| 22 | 0x1<br>RW/L | **ASPM Optionality Compliance (ASPMOPCMP):** The ASPM Optionality Compliance bit was created as a tool to set clear expectations for hardware and software interaction.<br>This bit is Set to indicate hardware that conforms to the current specification.<br><br>**Power Well:** PRST |
| 21 | 0x1<br>RW/L | **Link Bandwidth Notification Capability (LBNC):** A value of 1b indicates support for the Link Bandwidth Notification status and interrupt mechanisms.<br><br>**Power Well:** PRST |
| 20 | 0x1<br>RW/L | **Data Link Layer Active Error Reporting Capable (DLLERC):** For a Downstream Port, this bit must be hardwired to 1b if the component supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine.<br><br>**Power Well:** PRST |
| 19 | 0x1<br>RW/L | **Surprise Down Error Reporting Capable (SLDERC):** For a Downstream Port, this bit must be Set if the component supports the optional capability of detecting and reporting a Surprise Down error condition.<br><br>**Power Well:** PRST |
| 18 | 0x0<br>RO | **Clock Power Management Capable (CPMC):** A value of 0b indicates the component does not have this capability and that reference clock(s) must not be removed in these Link states. |
| 17:15 | 0x2<br>RW/L | **L1 Exit Latency (L1EL):** This field indicates the L1 exit latency for the given PCI-Express Link.<br>It indicates the length of time this port requires to complete transition from L1 to L0.<br>• 000: Less than 1us<br>• 001: 1us to less than 2us<br>• 010: 2us to less than 4us<br>• 011: 4us to less than 8us<br>• 100: 8us to less than 16us<br>• 101: 16us to less than 32us<br>• 110: 32us to less than 64us<br>• 111: More than 64us<br>If L1 is not supported, the value is undefined.<br><br>**Power Well:** PRST |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 14:12 | 0x4<br>RW/L | **L0s Exit Latency (L0sEL):** This field indicates the L0s exit latency for the given PCI-Express Link. It indicates the length of time this port requires to complete transition from L0s to L0.<br>• 000b: Less than 64ns<br>• 001b: 64ns to less than 128ns<br>• 010b: 128ns to less than 256ns<br>• 011b: 256ns to less than 512ns<br>• 100b 512 ns to less than 1 us<br>• 101b: 1us to less than 2us<br>• 110b: 2us to less than 4us<br>• 111b: More than 4us<br>If L0s is not supported, the value is undefined.<br><br>**Power Well:** PRST |
| 11:10 | 0x2<br>RW/L | **ASPM Support (ASPMSUP):** This field indicates the level of ASPM supported on the given PCI Express Link.<br>• 00b: No ASPM Support<br>• 01b: L0s Supported<br>• 10b: L1 Supported<br>• 11b: L0s and L1 Supported<br><br>**Power Well:** PRST |
| 9:4 | 0x8<br>RO/V | **Maximum Link Width (MLW):** This field indicates the maximum link width implemented by the given PCI Express Link.<br>• 00h: Reserved<br>• 01h: x1<br>• 02h: x2<br>• 04h: x4<br>• 08h: x8<br>• 10h: x16<br>• 20h: x32 (Unsupported)<br>• Others: Reserved |
| 3:0 | 0x3<br>RO/V | **Maximum Link Speed (MLS):** This field indicates the supported link speed(s) of the associated port.<br>• 0001b: 2.5 Gb/s link speed is supported<br>• 0010b: 5.0 Gb/s and 2.5 Gb/s link speed supported<br>• 0011b: 8.0 Gb/s and 5.0 and 2.5 Gb/s link speed supported<br>• Others: Reserved. |

## 48.2.33 LINKCTL—Offset 50h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 50h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:12 | 0x0<br>RO | **RSVD0:** Reserved |
| 11 | 0x0<br>RW | **Link Autonomous Bandwidth Interrupt Enable (LABIE):** When Set, this bit enables the generation of an interrupt to indicate that the Link Autonomous Bandwidth Status bit has been set.<br>Functions that do not implement the Link Bandwidth Notification Capability must hardwire this bit to 0b. |
| 10 | 0x0<br>RW | **Link Bandwidth Management Interrupt Enable (LBMIE):** When set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been set.<br>This bit is not applicable and is reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. |
| 9 | 0x0<br>RW | **Hardware Autonomous Width Disable (HAWD):** Set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width.<br>For a Multi-Function device associated with an Upstream Port, the bit in Function 0 is of type RW, and only Function 0 controls the components Link behavior.<br>In all other Functions of that device, this bit is of type RsvdP. Components that do not implement the ability autonomously to change Link width are permitted to hardwire this bit to 0b.<br>Default value of this bit is 0b. |
| 8 | 0x0<br>RW/L | **Enable Clock Power Management (ECPM):** Applicable only for Upstream Ports and with form factors that support a 'Clock Request' (CLKREQ#) mechanism, this bit operates as follows:<br>• 0b Clock power management is disabled and device must hold CLKREQ# signal low.<br>• 1b When this bit is Set, the device is permitted to use CLKREQ# signal to power manage Link clock according to protocol defined in appropriate form factor specification.<br>For a non-ARI multi-Function device, power-management-configuration software must only Set this bit if all Functions of the multi-Function device indicate a 1b in the Clock Power Management bit of the Link Capabilities register.<br>The component is permitted to use the CLKREQ# signal to power manage Link clock only if this bit is Set for all Functions.<br>For ARI Devices, Clock Power Management is enabled solely by the setting in Function 0.<br>The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component.<br>The CLKREQ# signal may also be controlled via the L1 PM Substates mechanism.<br>Such control is not affected by the setting of this bit. Downstream Ports and components that do not support Clock Power Management (as indicated by a 0b value in the Clock Power Management bit of the Link Capabilities register) must hardwire this bit to 0b. Default value of this bit is 0b, unless specified otherwise by the form factor specification.<br><br>**Power Well:** PRST |
| 7 | 0x0<br>RW | **Extended Synch (ES):** When set, this bit forces extended transmission of 4096 FTS ordered sets in FTS and an extra 1024 TS1 at exit from L1 prior to entering L0.<br>This mode provides external devices monitoring the link time to achieve bit and symbol lock before the link enters L0 state and resumes communication. Default value for this bit is 0. |
| 6 | 0x0<br>RW | **Common Clock Configuration (CCCFG):** When set, this bit indicates that this component and the component at the opposite end of this link are operating with distributed common reference clocks.<br>A value of 0b indicates that this component and the component at the opposite end of this link are operating with asynchronous reference clock.<br>After changing the value in this bit in both components on a link, software must trigger the link to retrain by writing a 1b to the Retrain Link bit of the Downstream Port. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 5 | 0x0<br>RW/V | **Retrain Link (RL):** When set, this bit initiates link retraining by directing the physical layer LTSSM to recovery state.<br>If the LTSSM is already in recovery or configuration, re-entering Recovery is permitted but not required.<br>Reads of this bit always return 0b.<br>This is used by the downstream ports, Root ports or DMI EP in RC only.<br>For the upstream port or virtual switch port, it is Read-only. |
| 4 | 0x0<br>RW | **Link Disable (LD):** This bit disables the Link by directing the LTSSM to the Disabled state when Set,<br>This is used by the downstream ports, Root ports or DMI EP in RC only.<br>For the upstream port or virtual switch port, it is Read-only. |
| 3 | 0x0<br>RO | **Read Completion Boundary (RCB):** This bit indicates the RCB value for Root Port, Endpoints and Bridges.<br>• 0b: 64 byte<br>• 1b: 128 byte<br>Configuration software must only set this bit if the Root Port Upstream from the Endpoint or Bridge reports an RCB value of 128 bytes (Root Port only) |
| 2 | 0x0<br>RO | **RSVD1:** Reserved |
| 1:0 | 0x0<br>RW | **ASPM Control (ASPMCTL):** This field controls the level of ASPM enabled on a given PCI Express Link.<br>• 00b: Disabled<br>• 01b: L0s Entry Enabled<br>• 10b: L1 Entry Enabled<br>• 11b: L0s and L1 Entry Enabled<br>''L0s Entry Enabled' enables the Transmitter to enter L0s.<br>If L0s is supported, the Receiver must be capable of entering L0s even when the Transmitter is disabled from entering L0s (00b or 10b). |

## 48.2.34 LINKSTS—Offset 52h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 52h

**Default:** 1001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C/V | **Link Autonomous Bandwidth Status (LABS):** This bit is set by hardware to indicate that the PCIe cluster has autonomously changed link or width, without the port transitioning through DL_Down status, for reason other than to attempt to correct unreliable link operation.<br>This bit must be set if the Physical Layer reports an autonomous speed or width change initiated by the Upstream Port. |
| 14 | 0x0<br>RW/1C/V | **Link Bandwidth Management Status (LBMS):** This bit is set by hardware to indicate that either of the following has occurred without the port transitioning through DL_Down status: |
| 13 | 0x0<br>RO/V | **Data Link Layer Link Active (DLLLA):** This bit indicates the status of the Data Link Control and Management Status Machine. |
| 12 | 0x1<br>RW/L | **Slot Clock Configuration (SCC):** When to 1b, this bit indicates that the component uses the same physical reference clock that he platform provides on the connector.<br>If the device uses an independent clock irrespective of the presence of a reference on the connector, this bit must be clear.<br>• 1: Indicates same reference clock.<br>• 0: Indicates independent reference clock<br><br>**Power Well:** PRST |
| 11 | 0x0<br>RO/V | **Link Training (LT):** This bit indicates that the Physical Layer LTSSM is in the Configuration or Recovery state |
| 10 | 0x0<br>RO | **Undefined:** Not applicable |
| 9:4 | 0x0<br>RO/V | **Negotiated Link Width (NLW):** This field indicates the negotiated width of the PCI Express link.<br>• 00 0001b: x1<br>• 00 0010b: x2<br>• 00 0100b: x4<br>• 00 1000b: X8<br>• 00 1100b: x12 not supported<br>• 01 0000b: x16<br>• 10 0000b: x32 not supported<br>• All other values are reserved.<br>The value in this field is undefined when the link is not up. |
| 3:0 | 0x1<br>RO/V | **Current Link Speed (CLS):** This field indicates the negotiated link speed of the given PCI Express link.<br>• 0001b: 2.5 Gb/s PCI Express Link<br>• 0010b: 5.0 Gb/s PCI Express Link<br>• 0011b: 8.0 Gb/s PCI Express Link<br>• Others: Reserved |

## 48.2.35 SLOTCAP—Offset 54h

Lock Key bit is located in the Personality Lock Key Control Register ('PLKCTL').

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 54h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0x0<br>RW/L | **Physical Slot Number (PSN):** This field indicates the physical slot number connected to the PCI-Express port.<br>It should be initialized to 0 for ports connected to devices that are either integrated on the system board or integrated within the same silicon such as the switch device or the Root port.<br><br>**Power Well:** PRST |
| 18 | 0x0<br>RW/L | **No Command Completed Support (NCCS):** When Set, this bit indicates that this slot does not generate software notification when an issued command is completed by the Hot-Plug Controller.<br>This bit is only permitted to be Set if the hot-plug capable Port is able to accept writes to all fields of the Slot Control register without delay between successive writes.<br><br>**Power Well:** PRST |
| 17 | 0x0<br>RW/L | **Electromechanical Interlock Present (EMIP):** This bit when set indicates that an Electromechanical Interlock is implemented on the chassis for this slot and that lock is controlled by bit 11 in Slot Control Register.<br><br>**Power Well:** PRST |
| 16:15 | 0x0<br>RW/L | **Slot Power Limit Scale (SPLS):** This field specifies the scale used for the Slot Power Limit Value.<br>Range of Values:<br>• 00: 1.0x<br>• 01: 0.1x<br>• 10: 0.01x<br>• 11: 0.001x<br>This register must be implemented if the Slot Implemented bit is set in EXPCAP. Writes to this register (SLOTCAP) when the Data Link Layer reports DL_Up status, or the link transitions from a non-DL_Up to a DL_Up would cause the Port to send the Set_Slot_Power_Limit Message.<br><br>**Power Well:** PRST |
| 14:7 | 0x0<br>RW/L | **Slot Power Limit Value (SPLV):** This field specifies the upper limit on power supplied by slot in conjunction with the Slot Power Limit Scale value defined previously Power limit (in Watts). i.e Power limit = SPLS x SPLV.<br>This register must be implemented if the Slot Implemented bit is set in EXPCAP.<br>Writes to this register (SLOTCAP) when the Data Link Layer reports DL_Up status, or the link transitions from a non-DL_Up to a DL_Up would cause the Port to send the Set_Slot_Power_Limit Message.<br><br>**Power Well:** PRST |
| 6 | 0x0<br>RW/L | **Hot-plug Capable (HPC):** This field defines hot-plug support capabilities for the PCI-Express port.<br>• 0: indicates that this slot is not capable of supporting Hot-plug operations.<br>• 1: indicates that this slot is capable of supporting Hot-plug operations<br><br>**Power Well:** PRST |
| 5 | 0x0<br>RW/L | **Hot-plug Surprise (HPS):** This field indicates that a device in this slot may be removed from the system without prior notification.<br>• 0: indicates that hot-plug surprise is not supported<br>• 1: indicates that hot-plug surprise is supported<br><br>**Power Well:** PRST |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 4 | 0x0<br>RW/L | **Power Indicator Present (PIP):** This bit indicates that a Power Indicator is implemented on the chassis for this slot.<br>• 0: indicates that Power Indicator is not present<br>• 1: indicates that Power Indicator is present<br><br>**Power Well:** PRST |
| 3 | 0x0<br>RW/L | **Attention Indicator Present (AIP):** This bit indicates that an Attention Indicator is implemented on the chassis for this slot.<br>• 0: indicates that an Attention Indicator is not present<br>• 1: indicates that an Attention Indicator is present<br><br>**Power Well:** PRST |
| 2 | 0x0<br>RW/L | **MRL Sensor Present (MRLSP):** This bit indicates that an MRL Sensor is implemented on the chassis for this slot.<br>• 0: indicates that an MRL Sensor is not present<br>• 1: indicates that an MRL Sensor is present<br><br>**Power Well:** PRST |
| 1 | 0x0<br>RW/L | **Power Controller Present (PCP):** This bit indicates that a Power Controller is implemented on the chassis for this slot.<br>• 0: indicates that a Power Controller is not present<br>• 1: indicates that a Power Controller is present<br><br>**Power Well:** PRST |
| 0 | 0x0<br>RW/L | **Attention Button Present (ABP):** This bit indicates that an Attention Button is implemented on the chassis for this slot.<br>• 0: indicates that an Attention Button is not present<br>• 1: indicates that an Attention Button is present<br><br>**Power Well:** PRST |

## 48.2.36 SLOTCTL—Offset 58h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 58h

**Default:** 03C0h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:14 | 0x0<br>RO | **RSVD0:** Reserved |
| 13 | 0x0<br>RW | **Auto Slot Power Limit Disable (ASPLD):** When Set, this disables the automatic sending of a Set_Slot_Power_Limit Message when a Link transitions from a non-DL_Up status to a DL_Up status. |
| 12 | 0x0<br>RW | **Data Link Layer State Changed Enable (DLLSCE):** When set to 1, this field enables software notification when Data Link Layer Link Active reporting field is changed. |
| 11 | 0x0<br>RW/V | **Electromechanical Interlock Control (EIC):** When software writes either a 1 to this bit, The PCIe port pulses the EMIL pin per PCIExpress Server/Workstation Module Electromechanical Spec Rev 1.0. Write of 0 has no effect.<br>This bit always returns a 0 when read. If electromechanical lock is not implemented, then either a write of 1 or 0 to this register has no effect. |
| 10 | 0x0<br>RW | **Power Controller Control (PCC):** This bit indicates the current state of the Power applied to the slot of the PCIExpress port.<br>Reads of this field must reflect the value from the latest write, even if the corresponding hot-plug command is not executed yet at the VPP, unless software issues a write without waiting for the previous command to complete in which case the read value is undefined.<br>• 0: Power On<br>• 1: Power Off |
| 9:8 | 0x3<br>RW | **Power Indicator Control (PIC):** If a Power Indicator is implemented, writes to this register set the Power Indicator to the written state.<br>Reads of this field must reflect the value from the latest write, even if the corresponding hot-plug command is not executed yet at the VPP, unless software issues a write without waiting for the previous command to complete in which case the read value is undefined.<br>• 00: Reserved.<br>• 01: On<br>• 10: Blink (The PCIe cluster drives 1.5 Hz square wave for Chassis mounted LEDs in the case of legacy card form factor for PCI-Express devices)<br>• 11: Off When this register is written, the event is signaled via the virtual pins of the switch over a dedicated SMBus port.<br>The switch does not generated the Power_Indicator_On/Off/Blink messages on PCI Express when this field is written to by software. |
| 7:6 | 0x3<br>RW | **Attention Indicator Control (AIC):** If an Attention Indicator is implemented, writes to this register sets the Attention Indicator to the written state.<br>Reads of this field reflect the value from the latest write, even if the corresponding hot-plug command is not executed yet at the VPP, unless software issues a write without waiting for the previous command to complete in which case the read value is undefined.<br>• 00: Reserved.<br>• 01: On<br>• 10: Blink (The switch drives 1.5 Hz square wave)<br>• 11: Off When this register is written, the event is signaled via the virtual pins of the switch over a dedicated SMBus port. |
| 5 | 0x0<br>RW | **Hot-plug Interrupt Enable (HPIE):** This field enables the generation of Hot-plug interrupts and events in the PCIExpress port.<br>• 0: Disables Hot-plug events and interrupts<br>• 1: Enables Hot-plug events and interrupts |
| 4 | 0x0<br>RW | **Command Completed Interrupt Enable (CCIE):** This field enables the generation of Hot-plug interrupts when a command is completed by the Hot-plug controller connected to the PCI-Express port.<br>• 0: Disables hot-plug interrupts on a command completion by a hot-plug Controller<br>• 1: Enables hot-plug interrupts on a command completion by a hot-plug Controller |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3 | 0x0<br>RW | **Presence Detect Changed Enable (PDCIE):** This bit enables the generation of hot-plug interrupts or wake messages via a presence detect changed event.<br>• 0: Disables generation of hot-plug interrupts or wake messages when a presence detect changed event happens.<br>• 1- Enables generation of hot-plug interrupts or wake messages when a presence detect changed event happens. |
| 2 | 0x0<br>RW | **MRL Sensor Changed Enable (MSCIE):** This bit enables the generation of hot-plug interrupts or wake messages via a MRL Sensor changed event.<br>• 0: Disables generation of hot-plug interrupts or wake messages when an MRL Sensor changed event happens.<br>• 1: Enables generation of hot-plug interrupts or wake messages when an MRL Sensor changed event happens. |
| 1 | 0x0<br>RW | **Power Fault Detected Enable (PFDIE):** This bit enables the generation of hot-plug interrupts or wake messages via a power fault event.<br>• 0: Disables generation of hot-plug interrupts or wake messages when a power fault event happens.<br>• 1: Enables generation of hot-plug interrupts or wake messages when a power fault event happens. |
| 0 | 0x0<br>RW | **Attention Button Pressed Enable (ABPE):** This bit enables the generation of hot-plug interrupts or wake messages via an attention button pressed event.<br>• 0: Disables generation of hot-plug interrupts or wake messages when the attention button is pressed.<br>• 1: Enables generation of hot-plug interrupts or wake messages when the attention button is pressed |

## 48.2.37 SLOTSTS—Offset 5Ah

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 5Ah

**Default:** 0040h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:9 | 0x0<br>RO | **RSVD0:** Reserved |
| 8 | 0x0<br>RW/1C/V | **Data Link Layer State Changed (DLLSCS):** This bit is set (if it is not already set) when the state of the Data Link Layer Link Active bit in the Link Status register has changed.<br>Software must read Data Link Layer Active field to determine the link state before initiating configuration cycles to the hot plugged device. |
| 7 | 0x0<br>RO/V | **Electromechanical Interlock Status (ELS):** A read to this register returns the current state of the Electromechanical Interlock (the EMILS pin) which has the defined encodings as:<br>• 0: Electromechanical Interlock Disengaged<br>• 1: Electromechanical Interlock Engaged |
| 6 | 0x1<br>RO/V | **Presence Detect State (PDS):** This field conveys the Presence Detect status of an adapter in the slot.<br>It reflects the Logical 'OR' of the Physical Layer in-band presence detect mechanism and any out-of-band presence detect mechanism defined for the slot's corresponding form factor.<br>• 0: Card/Module/Cable slot empty or Cable Slot occupied but not powered<br>• 1: Card/module Present in slot (powered or unpowered) or cable present and powered on the other end.<br>This field is set to 1 by the switch following reset for all the ports since it is related to the complement of the EXPCAP.SI bit whose default is 0 implying that the card is connected to the switch on the motherboard.<br>Software should ensure that for those standard PCI-Express ports which are hot-plug capable, it sets the EXPCAP.SI field to '1' such that PDS becomes 0.<br>Then any subsequent hotplug action will ensure that this field is set. Refer to the algorithm given below:<br>if (EXPCAP.SI == FALSE) // always set to 1b and ignore the input from inband/OOB presence detect SLOTSTS.PDS = 1b else //<br>if (EXPCAP.SI == TRUE) // Slot Empty = 0, Card Present = 1 SLOTSTS.PDS reflects slot status of side-band SMBUS Presence Detect signal OR Inband Presence Detect Mechanism. |
| 5 | 0x0<br>RO/V | **MRL Sensor State (MRLSS):** This bit reports the status of an MRL sensor if it is implemented.<br>• 0: MRL Closed<br>• 1: MRL Open<br>If Hotplug is implemented through VPP, the correct polarity of the external MRL sensor in the motherboard should be translated to map to the encodings as defined in this register field.<br>(Tylersburg issue) |
| 4 | 0x0<br>RW/1C/V | **Command Completed (CCS):** This bit is set when the hot-plug controller completes an issued command and is ready to accept a new command.<br>It is subsequently cleared by software after the field has been read and processed.<br>If Command Completed notification is supported, then the No Command Completed Support bit in the Slot Capabilities register should be 0. |
| 3 | 0x0<br>RW/1C/V | **Presence Detect Changed (PDCS):** This bit is set when a Presence Detect Changed event is detected.<br>It is subsequently cleared by software after the field has been read and processed.<br>On-board logic per slot must set the VPP signal corresponding to this bit inactive if the FF/system does not support out-of-band presence detect.<br>RPs may hold the re-training to occur until the SLOTSTS.PDCS bit has been cleared by software for the removal event. If the device is configured as a slot in the EXPCAP_.SI bit, this bit will need to be cleared before re-training will occur. |
| 2 | 0x0<br>RW/1C/V | **MRL Sensor Changed (MRLSC):** This bit is set when an MRL Sensor Changed event is detected.<br>It is subsequently cleared by software after the field has been read and processed.<br>On-board logic per slot must set the VPP signal corresponding to this bit inactive if the FF/system does not support out-of-band presence detect. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1 | 0x0<br>RW/1C/V | **Power Fault Detected (PFD):** This bit is set when a power fault event is detected by the power controller.<br>It is subsequently cleared by software after the field has been read and processed.<br>On-board logic per slot must set the VPP signal corresponding to this bit inactive if the FF/system does not support out-of-band presence detect. |
| 0 | 0x0<br>RW/1C/V | **Attention Button Pressed (ABP):** This bit is set when the attention button is pressed.<br>It is subsequently cleared by software after the field has been read and processed.<br>On-board logic per slot must set the VPP signal corresponding to this bit inactive if the FF/system does not support out-of-band presence detect.<br>Design should implement this as an edge detection logic in the chipset/platform to recognize a 0 -) 1 transition as a ABP event.<br>Due to the long time frames for human interaction, software could potentially have serviced and cleared this event while the operator is pressing the attention button.<br>For instance, if the user presses the Attention button that lasts for 2ms and the VPP sampling rate is, say 100us and if the Interrupt Service routine (ISR) processes and clears the ABP in 100us, there could be up to 10 (i.e 2000/(100+100)) different interrupts for the same event.Hardware must only generate 1 interrupt for every ABP event by treating it as edge based rather than level based event. |

## 48.2.38 ROOTCTL—Offset 5Ch

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 5Ch

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:5 | 0x0<br>RO | **RSVD0:** Reserved |
| 4 | 0x0<br>RW | **CRS Software Visibility Enable (CRSSVE):** This bit, when set, enables the Root Port to return Configuration Retry Status (CRS) Completion status to software.<br>• 1: Enable software to received a CRS status. This allows software to make the decision to re-issue the configuration request or move on and re-issue the request at a later time.<br>• 0: Disable software from receiving a CRS response. The PCIe will wait and re-issue the configuration request until it receives a response other than CRS without notifying software. CRS is implemented for general Root ports. (See 'ROOTCAP'). |
| 3 | 0x0<br>RW | **PME Interrupt Enable (PMEIE):** This field controls the generation of interrupts for PME messages.<br>• 1: Enables interrupt generation upon receipt of a PME message as reflected in the PME Status bit defined in the ROOTSTS register. A PME interrupt is generated if the PMESTATUS register bit defined i 'Root Status Register "ROOTSTS—Offset 60h" on page 1466, is set when this bit is set from a cleared state.<br>• 0: Disables interrupt generation for PME messages. |
| 2 | 0x0<br>RW | **System Error on Fatal Error Enable (SEFEE):** This field controls generation of system errors in the PCI-Express port hierarchy for fatal errors.<br>• 1: indicates that a System Error should be generated if a fatal error (ERR_FATAL) is reported by any of the devices in the hierarchy associated with and including this PCI-Express port.<br>• 0: No System Error should be generated on a fatal error (ERR_FATAL) reported by any of the devices in the hierarchy. |
| 1 | 0x0<br>RW | **System Error on Non-Fatal Error Enable (SENFEE):** This field controls generation of system errors in the PCI-Express port hierarchy for non-fatal errors.<br>• 1: indicates that a System Error should be generated if a non-fatal error (ERR_NONFATAL) is reported by any of the devices in the hierarchy associated with and including this PCI-Express port.<br>• 0: No System Error should be generated on a non-fatal error (ERR_NONFATAL) reported by any of the devices in the hierarchy. |
| 0 | 0x0<br>RW | **System Error on Correctable Error Enable (SECEE):** This field controls generation of system errors in the PCI-Express port hierarchy for correctable errors.<br>• 1: indicates that a System Error should be generated if a correctable error (ERR_COR) is reported by any of the devices in the hierarchy associated with and including this PCI-Express port.<br>• 0: No System Error should be generated on a correctable error (ERR_COR) reported by any of the devices in the hierarchy associated with and including this PCI-Express port. |

## 48.2.39 ROOTCAP—Offset 5Eh

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 5Eh

**Default:** 0001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:1 | 0x0<br>RO | **RSVD0:** Reserved |
| 0 | 0x1<br>RW/L | **CRS Software Visibility (CRSSV):** This bit, when set, indicates that the Root Port is capable of returning Configuration Retry Status (CRS) on completions to software.<br>Based on Design input, the CRS notification will be implemented in the EIP PCIe macro and hence the default is set to 1.<br>The field attribute is made as RW-O for any specific changes to be installed by BIOS<br><br>**Power Well:** PRST |

## 48.2.40 ROOTSTS—Offset 60h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 60h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0x0<br>RO | **RSVD0:** Reserved |
| 17 | 0x0<br>RO/V | **PME Pending (PMEPEND):** This field indicates that another PME is pending when the PME Status bit is set.<br>When the PME Status bit is cleared by software, the pending PME is delivered by hardware by setting the PME Status bit again and updating the Requestor ID appropriately.<br>The PME pending bit is cleared by hardware if no more PMEs are pending.<br>***Note:*** The root port can handle two outstanding PM_PME messages in its internal queues of the Power Management controller per port. If the downstream device issues more than 2 PM_PME messages successively, it will be dropped. |
| 16 | 0x0<br>RW/1C/V | **PME Status (PMESTS):** This field indicates status of a PME that is underway in the PCI-Express port.<br>1: PME was asserted by a requester as indicated by the PMEREQID field.<br>This bit is cleared by software by writing a '1'. Subsequent PMEs are kept pending until the PME Status is cleared. |
| 15:0 | 0x0<br>RO/V | **PME Requester ID (PMERID):** This field indicates the PCI requester ID of the last PME requestor. |

## 48.2.41 DEVCAP2—Offset 64h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 64h

**Default:** 00000437h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **RSVD0:** Reserved |
| 23:22 | 0x0<br>RW/L | **Max End-End TLP Prefixes (MAXE2ETLP):** Indicates the maximum number of End-End TLP Prefixes supported by this Function.<br>TLPs received by this Function that contain more End-End TLP Prefixes than are supported must be handled as Malformed TLPs.<br>• 01: 1 End-End TLP Prefix<br>• 10: 2 End-End TLP Prefixes<br>• 11: 3 End-End TLP Prefixes<br>• 00: 4 End-End TLP Prefixes<br>• If End-End TLP Prefix Supported is Clear, this field is Reserved.<br><br>**Power Well:** PRST |
| 21 | 0x0<br>RW/L | **End-End TLP Prefix Supported (E2ETLPS):** Indicates whether End-End TLP Prefix support is offered by a Function.<br>• 0: No Support<br>• 1: Support is provided to receive TLPs containing End-End TLP Prefixes.<br>The EIP does not support E2E TLP prefix and is hardwired to 0.<br><br>**Power Well:** PRST |
| 20 | 0x0<br>RW/L | **Extended Fmt Field Supported (EXFMTFS):**<br>• 0: The Function supports a 2-bit definition of the Fmt field (default)<br>• 1: The Function supports the 3-bit definition of the Fmt field.<br>Must be Set for Functions that support End-End TLP Prefixes.<br><br>**Power Well:** PRST |
| 19:18 | 0x0<br>RW/L | **OBFF Supported (OBFFS):**<br>• 00b: OBFF Not Supported<br>• 01b: OBFF supported using Message signaling only<br>• 10b: OBFF supported using WAKE# signaling only<br>• 11b: OBFF supported using WAKE# and Message signaling<br>Applicable only to Root Ports, Switch Ports, and Endpoints that support this capability. Must be 00b for other function types.<br><br>**Power Well:** PRST |
| 17:14 | 0x0<br>RO | **RSVD1:** Reserved |
| 13:12 | 0x0<br>RW/L | **TPH Completer Supported (TPHCS):** Value indicates Completer support for TPH or Extended TPH.<br>• 00b:TPH and Extended TPH Completer not supported<br>• 01b: TPH Completer supported, Extended TPH completer not supported<br>• 10b: Reserved<br>• 11b: Both TPH and Extended TPH Completer supported<br>Applicable only to Root Ports and Endpoints. Must be 00b for other function types.<br><br>**Power Well:** PRST |
| 11 | 0x0<br>RW/L | **LTR Mechanism Supported (LTRMS):** This bit when set indicates support for the Latency Tolerance Reporting (LTR) mechanism.<br><br>**Power Well:** PRST |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 10 | 0x1<br>RW/L | **No RO-enabled PR-PR Passing (NROEPRPASS):** This bit if set to 1b disables passing permitted by row entry A2b in PCIe ordering table that is associated with the Relaxed Ordering Attribute field being set.<br>This bit applies only for Switches and RCs that support peer-to-peer traffic between ports.<br>The bit only applies to posted requests being forwarded through the switch or RC.<br>It does not apply to traffic originating or terminating with in the switch or RC itself.<br><br>**Power Well:** PRST |
| 9 | 0x0<br>RW/L | **AD128 CAS Completer Supported (AD128ACS):** This bit must be set to 1b if the function supports this optional capability. Applicable to functions with memory space BARs as well as Root Ports.<br><br>**Power Well:** PRST |
| 8 | 0x0<br>RW/L | **AD64-bit AtomicOp Completer Supported (AD64ACS):** This bit must be set to 1b if the function supports this optional capability.<br>Applicable to Functions with Memory Space BARs as well as all Root Ports, must be 0b otherwise.<br>Includes FetchAdd, Swap, and CAS AtomicOps.<br><br>**Power Well:** PRST |
| 7 | 0x0<br>RW/L | **AD32 bit AtomicOp Completer Supported (AD32ACS):** Applicable to Functions with Memory Space BARs as well as all Root Ports, must be 0b otherwise.<br>Includes FetchAdd, Swap, and CAS AtomicOps.<br>This bit must be set to 1b if the Function supports this optional capability. This is set to 1 for Rootport implementations in the PCIe EIP.<br><br>**Power Well:** PRST |
| 6 | 0x0<br>RW/L | **AtomicOp Routing Supported (ARS):** This bit must be set to 1b if the port supports this optional capability.<br>Applicable only to switch upstream ports, Switch downstream ports, and root ports.<br>Must be 00b for other function types.<br><br>**Power Well:** PRST |
| 5 | 0x1<br>RW/L | **ARI Forwarding Supported (ARI):** This bit is set to 1b indicating that the downstream port supports this capability.<br>Applicable only to Switch Downstream Ports and Root Ports, must be 0b for other Function types.<br>This bit must be set to 1b if a Switch Downstream Port or Root Port supports this optional capability.<br><br>**Power Well:** PRST |
| 4 | 0x1<br>RW/L | **Completion Timeout Disable Support (CTDS):** A value of 1b indicates support for the completion Timeout Disable Mechanism.<br>Support of completion timeout disable is optional for Root Ports.<br>The PCIe port supports completions timeout disable.<br><br>**Power Well:** PRST |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3:0 | 0x7<br>RW/L | **Completion Timeout Range Supported (CTRS):** This field indicates device support for the optional Completion Timeout programmability mechanism.<br>This mechanism allows system software to modify the Completion Timeout value.<br>This field is applicable only to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of request issues on PCI Express.<br>Four time values ranges are defined:<br>• Range A: 50us to 10ms<br>• Range B: 10ms to 250ms<br>• Range C: 250ms to 4s<br>• Range D: 4s to 64s<br>Bits ares set according to table below to show timeout value ranges supported.<br>• 0000b: Completions Timeout programming not supported -- values are fixed by implementation in the range 50us to 50ms.<br>• 0001b: Range A<br>• 0010b: Range B<br>• 0011b: Range A and B<br>• 0110b: Range B and C<br>• 0111b: Range A, B, and C<br>• 1111b: Range A, B, C and D All other values are reserved.<br>• For all other devices this field is reserved and maybe be hardwired to 0000b.<br><br>**Power Well:** PRST |

## 48.2.42 DEVCTL2—Offset 68h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 68h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO | **End-End TLP Prefix Blocking (E2ETLPBLK):** Controls whether the routing function is permitted to forward TLPs containing an End-End TLP Prefix.<br>• 0: Forwarding Enabled - Function is permitted to send TLPs with End-End TLP Prefixes.<br>• 1: Forwarding Blocked - Function is not permitted to send TLPs with End-End TLP Prefixes. |
| 14:13 | 0x0<br>RW | **OBFF Enable (OBFFE):**<br>• 00b: OBFF Disabled<br>• 01b: OBFF Enabled using Message signaling [Variation A]<br>• 10b: OBFF Enabled using Message signaling [Variation B]<br>• 11b: OBFF Enabled using WAKE# signaling<br>This field is required for all Ports that support the OBFF Capability. For a Multi-Function Device associated with an Upstream Port of a Device that implements OBFF, the field in Function 0 is of type RW, and only Function 0 controls the Component's behavior. In all other Functions of that Device, this field is of type RsvdP. |
| 12:11 | 0x0<br>RO | **RSVD0:** Reserved |
| 10 | 0x0<br>RW/V | **LTR Mechanism Enable (LTRME):** When set to 1b, this bit enables Upstream Ports to send LTR messages and Downstream Ports to process LTR Messages.<br>Applicable to Root Ports, Switches, and Endpoints that implement the LTR capability must implement this bit.<br>For Downstream Ports, this bit must be reset to the default value if the Port goes to DL_Down status. |
| 9 | 0x0<br>RO | **IDO Completion Enable (IDOCE):** This bit when set to 1b allows the function to set the ID-Based Ordering (IDO) bit of completions it returns.<br>Applicable only to Endpoints including RC integrated Endpoints and Root Ports. |
| 8 | 0x0<br>RO | **IDO Request Enable (IDORE):** This bit when set to 1b allows the function to set the ID-Based Ordering (IDO) bit on requests it initiates.<br>Applicable only to Endpoints including RC integrated Endpoints and Root Ports. |
| 7 | 0x0<br>RW | **AtomicOp Egress Blocking (AEB):** When this bit is set, AtomicOp requests that target this out going Egress port must be blocked.<br>Applicable and mandatory for switch Upstream Ports, Switch Downstream Ports, and Root Ports that implement AtomicOp routing capability. Otherwise, must be hardwired to 0b. |
| 6 | 0x0<br>RW | **AtomicOp Requester Enable (ARE):** Applicable only to Endpoints and Root Ports, must be hardwired to 0b for other Function types.<br>The Function is allowed to initiate AtomicOp Requests only if this bit and the Bus Master Enable bit in the Command register are both Set. |
| 5 | 0x0<br>RW | **ARI Forwarding Enable (ARIE):** When set to 1b, ARI is enabled for the downstream port or root ports.<br>The Downstream Port disables its traditional Device Number field being 0 enforcement when turning a Type 1 Configuration Request into a Type 0 Configuration Request, permitting access to Extended Functions in an ARI Device immediately below the Port. Default value of this bit is 0b. |
| 4 | 0x0<br>RW | **Completion Timeout Disable (CTD):**<br>• 1: Disable the completions timeout mechanism for all NP transactions.<br>• 0: Completion timeout is enabled for all NP transactions. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3:0 | 0x0<br>RW | **Completion Timeout Value (CTV):** In devices that support completion timeout programmability, this field allows system software to modify the completion timeout range.<br>The following encodings and corresponding timeout ranges are defined based on implementation choice.<br>This field provides finer control based over the ranges chosen by DEVAP2.CTRS.<br>The implementation specific range is shown in brackets<br>• 0000b: 50us to 50ms (16.8ms - 25.2ms based on core clk period)<br>• 0001b: 50us to 100us (65.5us - 99.3us based on core clk period)<br>• 0010b: 1ms to 10ms (4.2ms - 6.3ms based on core clk period)<br>• 0101b: 16ms to 55ms (33.6ms - 50.3ms based on core clk period)<br>• 0110b: 65ms to 210ms (134.2ms - 201.3ms based on core clk period)<br>• 1001b: 260ms to 900ms (536.9ms - 805.3ms based on core clk period)<br>• 1010b: 1s to 3.5s (2.1s - 3.2s based on core clk period)<br>• 1101b: 4s to 13s (8.6s - 12.9s based on core clk period)<br>• 1110b: 17s to 64s (34.4s - 51.5s based on core clk period)<br>• All others are reserved.<br>It is highly recommended that the completion timeout value not be less then 10ms.<br>A small completion timeout value may result in premature completion timeout for slower responding devices. |

## 48.2.43 LINKCAP2—Offset 6Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 6Ch

**Default:** 0000000Eh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:23 | 0x0<br>RO | **RSVD0:** Reserved |
| 22:16 | 0x0<br>RW/L | **Lower SKP OS Reception Supported Speeds Vector (LSKPOSRSSV):** If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports receiving SKP OS at the rate defined for SRNS while running in SRIS.<br>Bit definitions within this field are:<br>• Bit 0 2.5 GT/s<br>• Bit 1 5.0 GT/s<br>• Bit 2 8.0 GT/s<br>• Bits 6:3 RsvdP<br>Multi-Function devices associated with an Upstream Port must report the same value in this field for all Functions. Behavior is undefined if a bit is Set in this field and the corresponding bit is not Set in the Supported Link Speeds Vector.<br>Currently, design does not support reception of low frequency SOS in L0.<br><br>**Power Well:** PRST |
| 15:9 | 0x0<br>RW/L | **Lower SKP OS Generation Supported Speeds Vector (LSKPOSGSSV):** If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports software control of the SKP Ordered Set transmission scheduling rate.<br>Bit definitions within this field are:<br>• Bit 0 2.5 GT/s<br>• Bit 1 5.0 GT/s<br>• Bit 2 8.0 GT/s<br>• Bits 6:3 RsvdP<br>Multi-Function devices associated with an Upstream Port must report the same value in this field for all Functions. Behavior is undefined if a bit is Set in this field and the corresponding bit is not Set in the Supported Link Speeds Vector.<br><br>**Power Well:** PRST |
| 8 | 0x0<br>RW/L | **Crosslink Supported (CLS):**<br>When set to 1b, this bit indicates that the associated Port supports crosslinks<br>When set to 0b on a Port that supports Link speeds of 8.0 GT/s or higher, this bit indicates that the associated Port does not support crosslinks.<br>When set to 0b on a Port that only supports Link speeds of 2.5 GT/s or 5.0 GT/s, this bit provides no information regarding the Port's level of crosslink support.<br>It is recommended that this bit be Set in any Port that supports crosslinks even though doing so is only required for Ports that also support operating at 8.0 GT/s or higher Link speeds.<br>***Note:*** Software should use this bit when referencing fields whose definition depends on whether or not the Port supports crosslinks.<br><br>**Power Well:** PRST |
| 7:1 | 0x7<br>RO/V | **Supported Link Speeds Vector (SLNKSPV):** This field indicates the supported Link speed(s) of the associated Port.<br>For each bit, a value of 1b indicates that the corresponding Link speed is supported, otherwise, the Link speed is not supported.<br>Bit definitions are:<br>• Bit 1 2.5 GT/s<br>• Bit 2 5.0 GT/s<br>• Bit 3 8.0 GT/s<br>• Others: Reserved |
| 0 | 0x0<br>RO | **RSVD1:** Reserved |

## 48.2.44 LINKCTL2—Offset 70h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 70h

**Default:** 0003h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:12 | 0x0<br>RW/P | **Compliance Preset/De-emphasis (CD):** For 8 GT/s and 5 GT/s: This bit sets the transmitter preset level for Polling.<br>Compliance state if the entry occurred due to the Enter Compliance bit being 1b.<br>The Encoding are defined as follows:<br>8 GT/s Rate:<br>• 0000b: -6 dB for de-emphasis, 0 dB for preshoot<br>• 0001b: -3.5 dB for de-emphasis, 0 dB for preshoot<br>• 0010b: -4.5 dB for de-emphasis, 0 dB for preshoot<br>• 0011b: -2.5 dB for de-emphasis, 0 dB for preshoot<br>• 0100b: 0 dB for de-emphasis, 0 dB for preshoot<br>• 0101b: 0 dB for de-emphasis, 2 dB for preshoot<br>• 0110b: 0 dB for de-emphasis, 2.5 dB for preshoot<br>• 0111b: -6 dB for de-emphasis, 3.5 dB for preshoot<br>• 1000b: -3.5 dB for de-emphasis, 3.5 dB for preshoot<br>• 1001b: 0 dB for de-emphasis, 3.5 dB for preshoot<br>• 1010b: The Transmitter Preset encoding of 1010b corresponds to the maximum Vtx-boost that the Transmitter advertises with FS and LF in both full swing and reduced swing modes with C-1 = 0 and C+1 = FS - (2*LF).<br>• All other encodings are reserved.<br>5 GT/s Rate:<br>• 001b: -3.5dB<br>• 000b: -6 dB<br>• All other are reserved.<br>When the link is operating at 2.5 Gb/s, the setting of this bit has no effect.<br>Components that support only 2.5 GT/s speed are permitted to hardwire this bit to 0b. |
| 11 | 0x0<br>RW/P | **Compliance SOS (CSOS):** When set to 1b, the LTSSM is required to send Skip Ordered Sets periodically in between the (modified) compliance patterns. |
| 10 | 0x0<br>RW/P | **Enter Modified Compliance (EMC):** When set to 1b, the device transmits Modified Compliance Pattern if the LTSSM enters Polling.<br>Compliance substate. This register is intended for debug, compliance testing purposes only.<br>System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value. |
| 9:7 | 0x0<br>RW/V/P | **Transmit Margin (TM):** This field controls the value of the non-de-emphasized voltage level at the transmitter pins. This field is reset to 000b on entry to the LTSSM Polling.<br>Configuration substate.<br>• 000b: Normal operating range<br>• 001b: 800-1200mV for full swing and 400-700mV for half-swing<br>• 010b-110b: TBD<br>• Others: Reserved<br>This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing.<br>In all other cases, the system must ensure that this register is set to the default value. |
| 6 | 0x0<br>RW/L | **Selectable De-emphasis (SD):** Applicable to RootPorts and downstream ports of PCI Express to PCIe bridges.<br>When the link is operating at 5 Gb/s speed, this bit selects the level of de-emphasis for an Downstream Port.<br>Encodings: 1b -3.5 dB 0b -6 dB When the Link is operating at 2.5 GT/s speed, the setting of this bit has no effect.<br><br>**Power Well:** PRST |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 5 | 0x0<br>RW/P | **Hardware Autonomous Speed Disable (HASD):** When set, this bit disables hardware from changing the link speed for device specific reasons other than attempting to correct unreliable link operation by reducing link speed for device-specific reasons other than attempting to correct unreliable link operations by reducing link speed.<br>Initial transition to the highest supported common link speed is not blocked by this bit. |
| 4 | 0x0<br>RW/V/P | **Enter Compliance (EC):** Software is permitted to force a link to enter compliance mode at the speed indicated in the Target Link Speed field by setting this bit to 1b in both components on a link and then initiating a hot reset on the link. |
| 3:0 | 0x3<br>RW/V/P | **Target Link Speed (TLS):** For downstream ports and root ports, this field sets an upper limit on link operational speed by restricting the values advertised by the Downstream Port in its training sequences.<br>• 0001b: 2.5 Gb/s Target Link Speed<br>• 0010b: 5.0 Gb/s Target Link Speed<br>• 0011b: 8.0 Gb/s Target Link Speed<br>• Others: Reserved. The encoding is the binary value of the bit in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the desired target Link speed.<br>• All other encodings are reserved<br>If a value is written to this field that does not correspond to a speed included in the Supported Link Speeds field, the result is undefined.<br>The default value of this field is the highest Link speed supported by the component (as reported in the Max Link Speed field of the Link Capabilities register) unless the corresponding platform/form factor requires a different default value.<br>For both Upstream and Downstream Ports, this field is used to set the target compliance mode speed when software is using the Enter Compliance bit to force a Link into compliance mode. |

## 48.2.45 LINKSTS2—Offset 72h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 72h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:6 | 0x0<br>RO | **RSVD0:** Reserved |
| 5 | 0x0<br>RW/1C/V/P | **Link Equalization Request (LNKEQREQ):** This bit is set by hardware to request the Link equalization process to be performed on the Link. |
| 4 | 0x0<br>RO/V/P | **Equalization Phase 3 Successful (EQPH3SUCC):** When set to 1b, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed. |
| 3 | 0x0<br>RO/V/P | **Equalization Phase 2 Successful (EQPH2SUCC):** When set to 1b, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed. |
| 2 | 0x0<br>RO/V/P | **Equalization Phase 1 Successful (EQPH1SUCC):** When set to 1b, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed. |
| 1 | 0x0<br>RO/V/P | **Equalization Complete (EQCMPLT):** When set to 1b, this bit indicates that the Transmitter Equalization procedure has successfully completed. |
| 0 | 0x0<br>RO/V | **Current De-emphasis Level (CDL):** When the link is operating at 5 Gb/s speed, this bit reflects the level of de-emphasis.<br>• 1b: -3.5 dB<br>• 0b: -6dB<br>The value in this bit is undefined when the Link is not operating at 5.0 GT/s speed.<br>Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 0b. |

## 48.2.46 PMCAPLST—Offset 80h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 80h

**Default:** 8801h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x88<br>RO | **Next Pointer (NextPointer):** Contains the offset of the next item in the capabilities list. (SSCAPLST) |
| 7:0 | 0x1<br>RO | **Capability ID (CapabilityID):** Identifies the function as PCI Power Management capable. |

## 48.2.47 PMCAP—Offset 82h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 82h

**Default:** C803h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x19<br>RO | **PME_Support (PMES):** PME assertion is supported when in D3hot/D3cold.<br>Identifies power states in which the PCIe can send an 'Assert_PMEGPE/Deassert PMEGPE' message.<br>Bits 15, 14 and 11 must be set to '1' for PCIPCI bridge structures representing ports on root complexes.<br>The definition of these bits is taken from the PCI Bus Power Management Interface Specification Revision 1.1.<br>• XXXX1b - Assert_PMEGPE/Deassert PMEGPE can be sent from D0<br>• XXX1Xb - Assert_PMEGPE/Deassert PMEGPE can be sent from D1 (Not supported by PCI-E)<br>• XX1XXb - Assert_PMEGPE/Deassert PMEGPE can be sent from D2 (Not supported by PCI-E)<br>• X1XXXb - Assert_PMEGPE/Deassert PMEGPE can be sent from D3 hot (Supported by PCI-E)<br>• 1XXXXb - Assert_PMEGPE/Deassert PMEGPE can be sent from D3 cold (Supported by PCI-E)<br>In the EIP PCIe implementation, there is no PME support for D3 cold as the part does not have the capability. For PCIe compliance purposes, bit 15 is set to 1. |
| 10 | 0x0<br>RO | **D2 Support (D2S):** Not supported |
| 9 | 0x0<br>RO | **D1 Support (D1S):** Not supported |
| 8:6 | 0x0<br>RO | **Auxiliary Current (AC):** Auxiliary power is not supported. |
| 5 | 0x0<br>RO | **Device Specific Initialization (DSI):** Device-specific initialization is not required when transitioning to D0 from D3hot state. This bit is zero. |
| 4 | 0x0<br>RO | **RSVD0:** Reserved |
| 3 | 0x0<br>RO | **PME Clock (PMECLK):** Does not apply to PCI Express. Hard-wired to 0. |
| 2:0 | 0x3<br>RO | **Version (VER):** The PM implementation in the PCIe cluster is compliant with PCI Bus Power Management Interface Specification, Revision 1.2. |

## 48.2.48 PMCSR—Offset 84h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 84h

**Default:** 0008h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C/V/P | **PME Status (PMESTS):** Reserved. |
| 14:13 | 0x0<br>RO | **Data Scale (DC):** Not supported |
| 12:9 | 0x0<br>RO | **Data Select (DS):** Not supported |
| 8 | 0x0<br>RW/P | **PME Enable (PMEEN):** Gates assertion of the PME message. |
| 7:4 | 0x0<br>RO | **RSVD0:** Reserved |
| 3 | 0x1<br>RW/L | **No Soft Reset (NSR):** This bit when 1b indicates that a device transitioning from D3hot to D0 does not perform an internal reset. The configuration context is preserved.<br><br>**Power Well:** PRST |
| 2 | 0x0<br>RO | **RSVD1:** Reserved |
| 1:0 | 0x0<br>RW/V | **Power State (PS):** This field is used both to determine the current power state of a function and to set the function into a new power state.<br>The definition of the supported values is given below:<br>• 0h - D0<br>• 3h - D3hot<br>If software attempts to write an unsupported, optional state to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. |

## 48.2.49 PMBSE—Offset 86h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 86h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **Bus Power/Clock Control Enable (BPCC_EN):** Neither bus or clock control of PCI is supported when in D3hot state. This bit is hard-wired to 0. |
| 6 | 0x0<br>RO | **B2/B3# (B23EN):** Not supported. This bit has no meaning since the BPCC_En bit is hard-wired to 0. |
| 5:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 48.2.50 SSCAPLST—Offset 88h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 88h

**Default:** 900Dh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x90<br>RO | **Next Pointer (NP):** Contains the offset of the next item in the capabilities list. (MSICAPLST) |
| 7:0 | 0xd<br>RO | **Capability ID (CAPID):** Identifies the function as Subsystem Identification capable. |

## 48.2.51 SSVID—Offset 8Ch

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 8Ch

**Default:** 8086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x8086<br>RW/L | **Subsystem Vendor Identifier (SSVID):** Assigned by PCI-SIG for vendor ID.<br><br>**Power Well:** PRST |

## 48.2.52 SSID—Offset 8Eh

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 8Eh

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW/L | **Subsystem Identifier (SSID):** Assigned to uniquely identify the subsystem vendor.<br><br>**Power Well:** PRST |

## 48.2.53 MSICAPLST—Offset 90h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 90h

**Default:** 0005h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **Next Pointer (NP):** Contains the offset of the next item in the capabilities list (MSIXCAPLST). A null value is used to indicate that this is the last capability. The Next Pointer is terminated for DP, vRP/vSP, RP and DMI EP in RC. |
| 7:0 | 0x5<br>RO | **Capability ID (CAPID):** Identifies the function as MSI capable. |

## 48.2.54 MSICTL—Offset 92h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 92h

**Default:** 0100h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:9 | 0x0<br>RO | **RSVD0:** Reserved |
| 8 | 0x1<br>RW/L | **Per-vector masking capable (PVM):** This bit indicates that PCI Express ports support MSI per-vector masking.<br><br>**Power Well:** PRST |
| 7 | 0x0<br>RO | **Address 64-Bit Capable (AD64C):** When set, this bit indicates that the function is capable of generating a 64-bit message address. |
| 6:4 | 0x0<br>RW | **Multiple Message Enable (MMEN):** Only one message is supported.<br>These bits are R/W for software compatibility. |
| 3:1 | 0x0<br>RO | **Multiple Message Capable (MMC):** Only one message is supported. |
| 0 | 0x0<br>RW | **MSI Enable (MSIE):** When set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. |

## 48.2.55 MSIADDR—Offset 94h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 94h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **Address:** Message address specified by the system, always DWORD aligned |
| 1:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 48.2.56 MSIDATA—Offset 98h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 98h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15 | 0x0<br>RW | **Trigger Mode (TM):**<br>• 0: Edge Triggered<br>• 1: Level Triggered |
| 14 | 0x0<br>RW | **Level (LVL):** if TM is 0h, then this field is a don't care.<br>Edge triggered messages are always treated as assert messages.<br>For level triggered interrupts, this bit reflects the state of the interrupt input if TM is 1h, then<br>• 0: Deassert Messages<br>• 1: Assert Messages |
| 13:12 | 0x0<br>RW | **Future:** These bits are don't care for an IOxAPIC interrupt message data field specification. |
| 11:8 | 0x0<br>RW | **Delivery Mode (DM):**<br>• 0000: Fixed: Trigger Mode can be edge or level.<br>• 0001: Lowest Priority: Trigger Mode can be edge or level.<br>• 0010: SMI/PMI/MCA - Not supported via MSI of root port<br>• 0011: Reserved - Not supported via MSI of root port<br>• 0100: NMI - Not supported via MSI of root port<br>• 0101: INIT - Not supported via MSI of root port<br>• 0110: Reserved<br>• 0111: ExtINT - Not supported via MSI of primary port<br>• 1000 -1111 - Reserved |
| 7:0 | 0x0<br>RW | **Interrupt Vector (IV):** The interrupt vector will be modified by the EIP PCIe Gen3 to provide context sensitive interrupt information for different events that require attention from the processor. e.g Hot plug, Power Management and RAS error events. |

## 48.2.57 MSIMSK—Offset 9Ch

The MSI Mask Bit register enables software to disable message sending on a per-vector basis.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 9Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x0<br>RO | **RSVD0:** Reserved |
| 0 | 0x0<br>RW | **Mask Bits (MSKB):** For each Mask bit that is set, the PCI Express port is prohibited from sending the associated message. Corresponding bits are masked if set to '1' |

## 48.2.58 MSIPENDING—Offset A0h

The Mask Pending register enables software to defer message sending on a per-vector basis.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + A0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x0<br>RO | **RSVD0:** Reserved |
| 0 | 0x0<br>RO/V | **Pending Bits (PB):** For each Pending bit that is set, the PCI Express port has a pending associated message. Corresponding bits are pending if set to '1' |

## 48.2.59 RPPMCSR—Offset A8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + A8h

**Default:** 00000020h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:9 | 0x0<br>RO | **RSVD0:** Reserved |
| 8 | 0x0<br>RO/V | **Mod-PHY Core Well Power Gating Status (MCWPGS):** This field reflects the effective 'Logical OR' state of the mod-PHY data lane 'Core Power Request' from controller to PHY and 'Core Power Ack' from PHY to controller for all the data lanes owned by the port.<br>Software can read this bit to know that the mod-PHY Core Well power gating handshake is completed, before it proceeds to power down the mod-PHY Suspend Well using the RPPGEN.MDLSWPR and RPPGEN.MDLSWPA bits.<br>This bit is intended to be used for RTD3, as part of the flow to power gate the mod-PHY Core Well. |
| 7 | 0x0<br>RO/V | **Mod-PHY Data Lane Suspend Well Power Gating Exit Ack (MDLSWPGXA):** This fields reflects the effective 'Logical AND' of mod-PHY Data Lane Suspend Well Power Gating Exit Ack for all the data lanes owned by this port.<br>• A '1b' indicates that at all the Data Lane Suspend Well Power Gating Exit Ack is asserted.<br>• A '0b' indicates that at least one of the Data Lane Suspend Well Power Gating Exit Ack has been de-asserted.<br>This bit is intended to be used for RTD3, as part of the flow to power gate the mod-PHY data lane Suspend Well. |
| 6 | 0x0<br>RO/V | **Mod-PHY Data Lane Suspend Well Power Gating Entry Ack (MDLSWPGEA):** This fields reflects the effective 'Logical OR' of mod-PHY Data Lane Suspend Well Power Gating Entry Ack for all the data lanes owned by this port.<br>• A '1b' indicates that at least one of the Data Lane Suspend Well Power Gating Entry Ack is still asserted.<br>• A '0b' indicates that all the Data Lane Suspend Well Power Ack has been de-asserted.<br>This bit is intended to be used for RTD3, as part of the flow to power gate the mod-PHY data lane Suspend Well. |
| 5 | 0x1<br>RW | **Mod-PHY Data Lane Suspend Well Power Request (MDLSWPR):** Software can write a '0b' to this field to de-assert 'Suspend Well Power Request' to all the data lanes owned by this port only when MDLSWPGXA is '1b'.<br>Software can write a '1b' to this field to assert Suspend Well Power Request to all the data lanes owned by this port only when MDLSWPGEA is '0b'.<br>This bit is intended to be used for RTD3, as part of the flow to power gate the mod-PHY data lane Suspend Well. |
| 4 | 0x0<br>RW | **PME_TO_ACK Timeout Policy (PME_TO_ACK_TOP):** When set, Root Port will trigger an exit if the link is in TXL0s or L1 and PME_TO_ACK timer times out. |
| 3:2 | 0x0<br>RW | **PME_TO_ACK Timeout (PME_TO_ACK_TO):** This timer is activated from the time the PME_Turn_Off message is sent to the link.<br>It will be reset once the timer expires or when PME_TO_ACK has been received from the downstream device and link has been put into L2/L3 Ready state.<br>Once the timer expires, the Sx sequence will continue to take the link down.<br>• 00: 1 ms (default)<br>• 01: 10 ms<br>• 10: 1 us (Pre-Si)<br>• 11: Disable |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1 | 0x0<br>RW/V/P | **L23Rdy to Detect Transition (L23RDY2DT):** When set by software, the LTSSM moves from L2/L3 Ready to Detect state.<br>This bit is cleared by hardware once the LTSSM is in Detect state.<br>The PHY power and clocks needed to enable this transition is brought up in response to this bit being set by software.<br>If the link is not in L2/L3 Ready when this bit is set, the bit is cleared immediately by hardware. |
| 0 | 0x0<br>RW/V/P | **L23Rdy Entry Request (L23RDYER):** When set by software, the corresponding Root Port will initiate the sequence to put the link into L2/L3 Ready state.<br>PME_Turn_Off message will be sent and the corresponding PME_TO_Ack response will be returned by the device.<br>Once the link enters L2/L3 Ready, this bit will be cleared by hardware.<br>Alternatively, this bit will be cleared by hardware when PME_Turn_Off timer time-out. |

## 48.2.60 PMCSRS—Offset B0h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + B0h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/P | **PME Status (PMESTS):** This field is utilized for Software to restore the PME Status once exit Sx State. Hardware will reflect the value to the associated PMCSR.PMESTS if this bit was written by Software. |
| 14:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 48.2.61 PPBIFCTL—Offset C0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + C0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO/V/P | **Capability Lock (CL):** Lock key bit for all RW-L bits of PPBIFCTL register only.<br>• 1b: Lock<br>• 0b: Unlocked<br>This bit is self-locking.<br>Once this bit is set to a 1b from IOSF-SB, this key bit can not be unlocked.<br>Writing a 0b has no affect on this bit. |
| 30:3 | 0x0<br>RO | **RSVD0:** Reserved |
| 2:0 | 0x0<br>RO/V/P | **Bifurcation Control 0 (BIFCTL0):**<br>• 111-101: Reserved<br>• 100: x8<br>• 011: x4x4<br>• 010: x4x2x2<br>• 001: x2x2x4<br>• 000: x2x2x2x2<br>A write of '1' on the CL will lock this register field down as bifurcation control status information. |

## 48.2.62 SMICSR—Offset C8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + C8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0x0<br>RO | **RSVD0:** Reserved |
| 18 | 0x0<br>RW/1C/V | **Hot Plug DLLSC SMI Status (HPLSCSMISTS):** This bit is set when rising edge detected as result of both SLOTSTS.DLLSCS and SMICSR.HPSMIE being set. |
| 17 | 0x0<br>RW/1C/V | **Hot Plug SMI Status (HPSMISTS):** This bit is set when rising edge detected as result of both SLOTSTS.PDCS and SMICSR.HPSMIE being set. |
| 16 | 0x0<br>RW/1C/V | **Power Management SMI Status (PMSMISTS):** This bit is set when rising edge detected as result of both ROOTSTS.PMESTS and SMICSR.PMSMIE being set. |
| 15:2 | 0x0<br>RO | **RSVD1:** Reserved |
| 1 | 0x0<br>RW | **Hot Plug SMI Enable (HPSMIE):** Enables the Root Port/DSP to generate SMI whenever a Hot Plug event is detected. |
| 0 | 0x0<br>RW | **Power Management SMI Enable (PMSMIE):** Enables the Root Port to generate SMI whenever a power management event is detected. |

## 48.2.63 SCICSR—Offset CCh

The Tag field is being used to differentiate between PMSCI (Tag = '001') and HPSCI (Tag = '000') for PMC whenever a single set of Assert/Deassert SCI is sent.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + CCh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0x0<br>RO | **RSVD0:** Reserved |
| 18 | 0x0<br>RW/1C/V | **Hot Plug DLLSC SCI Status (HPLSCSCISTS):** This bit is set when rising edge detected as result of both SLOTSTS.DLLSCS and SCICSR.HPSCIE being set. |
| 17 | 0x0<br>RW/1C/V | **Hot Plug SCI Status (HPSCISTS):** This bit is set when rising edge detected as result of both SLOTSTS.PDCS and SCICSR.HPSCIE being set. |
| 16 | 0x0<br>RW/1C/V | **Power Management SCI Status (PMSCISTS):** This bit is set when rising edge detected as result of both ROOTSTS.PMESTS and SCICSR.PMSCIE being set. |
| 15:2 | 0x0<br>RO | **RSVD1:** Reserved |
| 1 | 0x0<br>RW | **Hot Plug SCI Enable (HPSCIE):** Enables the Root Port/DSP to generate SCI whenever a Hot Plug event is detected. |
| 0 | 0x0<br>RW | **Power Management SCI Enable (PMSCIE):** Enables the Root Port to generate SCI whenever a power management event is detected. |

## 48.2.64 SSCTL—Offset D0h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + D0h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:9 | 0x0<br>RO | **RSVD0:** Reserved |
| 8 | 0x0<br>RW/1C/V/P | **Stop and Scream Event Status (SSES):** This bit indicates that a stop and scream event has occurred on the Tx side of the PCI Express port due to a header or data parity error. |
| 7:2 | 0x0<br>RO | **RSVD1:** Reserved |
| 1 | 0x0<br>RW | **Stop and Scream LTSSM Operation (SSLTOP):**<br>• 0: PCIe will set the affected link to 'link.disabled' state when the stop and scream condition is signaled by the Transaction Layer due to poisoned data.<br>• 1: PCIe will set the affected link to 'link.disabled' state and then provide feedback to the Transaction Layer.<br>The transaction layer will then initiate a link retraining sequence via the LTSSM to bring it back alive.<br>Sometime the PCI Express port will be unable to return to normal operation due to the nature of the error that initiated the stop and scream mechanism.<br>If Software desires to retrain the link when this field is set to 0, it can perform either of the following tasks:<br>Change the LINKCTL.RL register field or Change mode field (SSLTOP) in this register to 1b or Initialize the BCTL.SBR to clear the sub-hierarchy of the PCI-Express port and reset.<br>This SBR method is only applicable to standard PCI-Express ports and not the DMI This field will only return the PCI Express link back to normal operation after a logged Stop and Scream event.<br>Errors such as header/control parity error which utilize the Stop and Scream mechanism will not be controlled by this register field. A platform reset will be required to re-enable the link.<br><br>**Power Well:** PRST |
| 0 | 0x0<br>RW | **Stop and Scream Enable (SSEN):**<br>• 0: Disable Stop and Scream (normal/default operation)<br>• 1: Enables the link to perform Stop and Scream functionality.<br>When this bit is set, if PCIe root port or downstream port encounters a poisoned data traversing the outbound path, the cluster stops the data, sets the link_down condition internally and places the link in disable.<br>Inbound/outbound paths are blocked and all outstanding requests will be master aborted including Memory, I/O and configuration requests.<br><br>**Power Well:** PRST |

## 48.2.65 EXPPTMBARCTL—Offset D2h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + D2h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:9 | 0x0<br>RO | **RSVD0:** Reserved |
| 8 | 0x0<br>RW/L | **Disable MBAR mPhy (DMBARMPHY):** When set to a 1b, memory transaction targeting the 64K-128K space of the EXPPTMBAR dedicated for mPhy will be prevented from accessing control registers. Memory read transactions will return 0's. Memory writes will have no effect.<br><br>**Power Well:** PRST |
| 7:4 | 0x0<br>RO | **RSVD1:** Reserved |
| 3 | 0x0<br>RW/L | **Disable Forth 4K Page (D4THPAGE):** When set to a 1b, memory transaction targeting the forth 4K page of the EXPPTMBAR will be prevented from accessing control registers.<br>Memory read transactions will return 0's. Memory writes will have no effect.<br><br>**Power Well:** PRST |
| 2 | 0x0<br>RW/L | **Disable Third 4K Page (D3RDPAGE):** When set to a 1b, memory transaction targeting the third 4K page of the EXPPTMBAR will be prevented from accessing control registers.<br>Memory read transactions return 0's. Memory writes will have no effect.<br><br>**Power Well:** PRST |
| 1 | 0x0<br>RW/L | **Disable Second 4K Page (D2NDPAGE):** When set to a 1b, memory transaction targeting the Second 4K page of the EXPPTMBAR will be prevented from accessing control registers.<br>Memory read transactions will return 0's. Memory writes will have no effect.<br><br>**Power Well:** PRST |
| 0 | 0x0<br>RW/L | **Disable First 4K Page (D1STPAGE):** When set to a 1b, memory transaction targeting the first 4K page of the EXPPTMBAR will be prevented from accessing control registers.<br>Memory read transactions will return 0's. Memory writes will have no effect.<br><br>**Power Well:** PRST |

## 48.2.66 PPD0—Offset D4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + D4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/L | **Capability Lock (CL):** Lock key bit for all RW-L bits of PPD0 register only.<br>• 1b: Lock<br>• 0b: Unlocked<br>This bit is self-locking. Once this bit is set to a 1b, this key bit can not be unlocked.<br>Writing a 0b has no affect on this bit.<br><br>**Power Well:** PRST |
| 30:14 | 0x0<br>RO | **RSVD0:** Reserved |
| 13 | 0x0<br>RW/V/L | **Configuration Retry Enable (CRE):** This bit controls the ability of the external side of the NTB to respond to transactions (normal, UR, CRS).<br>The PCIe link is expected to be active after training in about 10-100ms from platform reset deassertion.<br>However, the internal controller may take longer to boot, and to initialize its registers.<br>To allow longer boot time, the CRE bit is used to ensure that the Internal side and related functionality is up and operational before allowing transactions from the external side to be processed even though link training could have been completed prior.<br>• 0: External Link handles PCIe transactions (configuration, memory, messages) in the normal fashion during linkup state.<br>• 1: External Link presents Configuration Retry Status (CRS) to the incoming configuration cycle on the external cycle in the linkup state.<br>• All other requests will be URed.<br>The NTB will respond with Configuration Retry Status (CRS) on the PCIe link for configuration cycles until such time when the internal firmware completes initialization of all internal resources.<br>If the external side sends any other request (memory, messages) before this initialization is done, it will be master aborted (UR) on the external side.<br>It is the responsibility of software to adhere to this flow.<br>This bit is reserved in Root Ports, Downstream Port and DMI EP in RC. This bit is not functional. |

## 48.2.73 INTXSWZCTL—Offset F8h

This register provides software the ability to swizzle the legacy interrupts (INTx) from each port and remap them to a different interrupt type for purposes of interrupt rebalancing. This swizzling only applies to inbound INTx messages that arrive on the secondary side of the switch or root port. This register does not affect PCI-Express defined INTx re-map based on device # that is required by the PCI-Express base specification.

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + F8h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>RO | **RSVD0:** Reserved |
| 2:0 | 0x0<br>RW/L | **INTx Swizzle (INTXSWZ):** The encoding below defines the target INTx type to which the incoming INTx message is mapped to for that port.<br>• 000b:INTA=)INTA, INTB=)INTB, INTC=)INTC, INTD=)INTD,<br>• 001b:INTA=)INTB, INTB=)INTC, INTC=)INTD, INTD=)INTA,<br>• 010b:INTA=)INTC, INTB=)INTD, INTC=)INTA, INTD=)INTB,<br>• 011b:INTA=)INTD, INTB=)INTA, INTC=)INTB, INTD=)INTC,<br>• 100b:INTA=)INTA, INTB=)INTA, INTC=)INTA, INTD=)INTA,<br><br>**Power Well:** PRST |

## 48.2.74 CFGAGTERR—Offset FCh

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + FCh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|

## 48.2.75 AERCAPHDR—Offset 100h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 100h

**Default:** 13810001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x138<br>RW/L | **Next Capability Offset (NCO):** Contains the offset of the next structure in the Extended Capabilities list. (ACSCAPHDR).<br>Software will need to program this field appropriately for linked capabilities list if default is not supported.<br><br>**Power Well:** PRST |
| 19:16 | 0x1<br>RO | **Capability Version (CV):** Indicates the version of the Capability structure present. |
| 15:0 | 0x1<br>RO | **Extended Capability ID (EXCAPID):** Identifies the function as Advanced Error Reporting capable. |

## 48.2.76 ERRUNCSTS—Offset 104h

This register reports the error status of individual uncorrectable error sources. An individual error status bit that is set to 1 indicates that a particular error occurred. Software can clear an error status by writing a 1 to the respective bit.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 104h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x0<br>RO | **RSVD0:** Reserved |
| 26 | 0x0<br>RW/1C/V/P | **Poisoned TLP Egress Blocked Status (PTLPEBS):** Reserved. |
| 25 | 0x0<br>RO | **TLP Prefix Blocked Error Status (TPBES):** Reserved. |
| 24 | 0x0<br>RW/1C/V/P | **Atomic Egress Blocked Status (AEBE):** This bit is set whenever an Atomic OP TLP is blocked on any egress port |
| 23 | 0x0<br>RW/1C/V/P | **MC Blocked TLP Status (MCE):** This bit is set whenever a Multicast TLP is blocked. |
| 22 | 0x0<br>RW/1C/V/P | **Uncorrectable Internal Error Status (UIE):** This bit is set whenever an uncorrectable internal error is detected. |
| 21 | 0x0<br>RW/1C/V/P | **ACS Violation Status (ACSE):** This bit is set whenever an ACS violation is detected by the PCI Express port. |
| 20 | 0x0<br>RW/1C/V/P | **Unsupported Request Error Status (URE):** This bit is set whenever an unsupported request is detected on PCI Express port |
| 19 | 0x0<br>RW/1C/V/P | **ECRC Error Status (ECRCE):** ECRC checking is optional for project specific. |
| 18 | 0x0<br>RW/1C/V/P | **Malformed TLP Status (MTLPE):** This bit is set when it receives a malformed TLP. Header logging is performed. |
| 17 | 0x0<br>RW/1C/V/P | **Receiver Overflow Status (ROE):** This bit is set when the PCI Express interface unit receive buffers overflow. |
| 16 | 0x0<br>RW/1C/V/P | **Unexpected Completion Status (UCE):** This bit is set whenever a completion is received with a requestor ID that does not match side A or side B, or when a completion is received with a matching requestor ID but an unexpected tag field. Header logging is performed. |
| 15 | 0x0<br>RW/1C/V/P | **Completer Abort Status (CAE):** The bridge sets this bit and logs the header associated with the request when the configuration unit signals a completer abort. |
| 14 | 0x0<br>RW/1C/V/P | **Completion Timeout Status (CTE):** For Switch Ports, this bit is set if the Switch Port issues Non-Posted Requests on its own behalf (vs. only forwarding such as Requests generated by other devices). |
| 13 | 0x0<br>RW/1C/V/P | **Flow Control Protocol Error Status (FCE):** This bit is set when a flow control protocol error is detected. |
| 12 | 0x0<br>RW/1C/V/P | **Poisoned TLP Received Status (PTLPE):** This bit is set and the bridge logs the header when a poisoned TLP is received from PCI Express. |
| 11:6 | 0x0<br>RO | **RSVD1:** Reserved |
| 5 | 0x0<br>RW/1C/V/P | **Surprise Down Error Status (SLDE):** This bit is set when a surprise down error is detected. This bit does not apply to the upstream port. |
| 4 | 0x0<br>RW/1C/V/P | **Data Link Protocol Error Status (DLPE):** This bit is set when a data link protocol error is detected. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3:0 | 0x0<br>RO | **RSVD2:** Reserved |

## 48.2.77 ERRUNCMSK—Offset 108h

This register controls the reporting of individual uncorrectable errors by device to the host bridge via a PCI Express error message. This register also controls the logging of the header. Refer to the PCI Express specifications for details of how the mask bits function. A masked error (respective bit set in the mask register) is not reported to the host bridge by the switch, nor is the header logged (status bits unaffected by the mask bit). There is a mask bit per bit of the Uncorrectable Error Status Register. The attr. of AER Error Mask bits in VRSP will be changed to be compliant with PCIe Spec.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 108h

**Default:** 04400000h

| Bit Range | Default & Access | Field Name (ID): Description |

| 4 | 0x0<br>RW/P | **Data Link Protocol Error Mask (DLPEM):** Reserved. |
| 3:0 | 0x0<br>RO | **RSVD2:** Reserved |

## 48.2.78 ERRUNCSEV—Offset 10Ch

This register controls whether an individual uncorrectable error is reported as a fatal error. An uncorrectable error is reported as fatal when the corresponding error bit in this register is set. When the bit is cleared, the corresponding error is considered non-fatal. The attr. of AER Error Severity bits in VRSP will be changed to be compliant with PCIe Spec.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 10Ch

**Default:** 00462030h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x0<br>RO | **RSVD0:** Reserved |
| 26 | 0x0<br>RW/P | **Poisoned TLP Egress Blocked Severity (PTLPEBS):** Reserved. |
| 25 | 0x0<br>RO | **TLP Prefix Blocked Error Severity (TPBES):** Reserved. |

| 5 | 0x1<br>RW/P | **Surprise Down Error Severity (SLDES):** This bit does not apply to the upstream port or end point |
| 4 | 0x1<br>RW/P | **Data Link Protocol Error Severity (DLPES):** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3:0 | 0x0<br>RO | **RSVD2:** Reserved |

## 48.2.79 ERRCORSTS—Offset 110h

This register reports the error status of individual correctable error sources on a PCI Express device. An individual error status bit set to 1 indicates that a particular error has occurred. Software can clear the error status by writing a 1 to the respective bit.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 110h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15 | 0x0<br>RW/1C/V/P | **Header Log Overflow Error (HLOE):** Reserved. |
| 14 | 0x0<br>RW/1C/V/P | **Correctable Internal Error (CIE):** Reserved. |
| 13 | 0x0<br>RW/1C/V/P | **Advisory Non-Fatal Error (ANFE):** Reserved. |
| 12 | 0x0<br>RW/1C/V/P | **Replay Timer Timeout Error (RTTE):** The PCIe sets this bit when replay timer time-out occurs. |
| 11:9 | 0x0<br>RO | **RSVD1:** Reserved |
| 8 | 0x0<br>RW/1C/V/P | **Replay Number Rollover Error (RNRE):** The PCIe sets this bit when the replay number rolls over from 11 to 00. |
| 7 | 0x0<br>RW/1C/V/P | **Bad DLLP Error (BDLLPE):** The switch sets this bit on CRC errors on DLLP. |
| 6 | 0x0<br>RW/1C/V/P | **Bad TLP Error (BTLPE):** The switch sets this bit on CRC errors on TLP. |
| 5:1 | 0x0<br>RO | **RSVD2:** Reserved |
| 0 | 0x0<br>RW/1C/V/P | **Receiver Error (RE):** The PCIe sets this bit when the physical layer detects a receiver error. |

## 48.2.80 ERRCORMSK—Offset 114h

This register controls the reporting of individual correctable errors via ERR_COR message. A masked error (respective bit set in mask register) is not reported to the host bridge by the switch. There is a mask bit corresponding to every bit in the Correctable Error Status Register.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 114h

**Default:** 0000E000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15 | 0x1<br>RW/P | **Header Log Overflow Error Mask (HLOEM):** Reserved. |
| 14 | 0x1<br>RW/P | **Correctable Internal Error Mask (CIEM):** Reserved. |
| 13 | 0x1<br>RW/P | **Advisory Non-Fatal Error Mask (ANFEM):** Reserved. |
| 12 | 0x0<br>RW/P | **Replay Timer Timeout Error Mask (RTTEM):** Reserved. |
| 11:9 | 0x0<br>RO | **RSVD1:** Reserved |
| 8 | 0x0<br>RW/P | **Replay Number Rollover Error Mask (RNREM):** Reserved. |
| 7 | 0x0<br>RW/P | **Bad DLLP Error Mask (BDLLPEM):** Reserved. |
| 6 | 0x0<br>RW/P | **Bad TLP Error Mask (BTLPEM):** Reserved. |
| 5:1 | 0x0<br>RO | **RSVD2:** Reserved |
| 0 | 0x0<br>RW/P | **Receiver Error Mask (REM):** Reserved. |

## 48.2.81 AERCAPCTL—Offset 118h

This register gives the status and control for ECRC checks and also the pointer to the first uncorrectable error that happened.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 118h

**Default:** 00001000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:13 | 0x0<br>RO | **RSVD0:** Reserved |
| 12 | 0x1<br>RW/L | **Completion Timeout Prefix/Header Log Capable (CTPHLC):** If Set, this bit indicates that the Function records the prefix/header of Request TLPs that experience a Completion Timeout error.<br><br>**Power Well:** PRST |
| 11 | 0x0<br>RO/V/P | **TLP Prefix Log Present (TLPPLP):** If Set and the First Error Pointer is valid, indicates that the TLP Prefix Log register contains valid information.<br>If Clear or if First Error Pointer is invalid, the TLP Prefix Log register is undefined. |
| 10 | 0x0<br>RO | **Multiple Header Recording Enable (MHRE):** When set, this bit enables the function to record more than one error header. |
| 9 | 0x0<br>RO | **Multiple Header Recording Capable (MHRC):** Supports more than one error header. |
| 8 | 0x0<br>RW/P | **ECRC Check Enable (ECE):** When Set, ECRC checking is enabled.<br>Functions that do not implement the associated mechanism are permitted to hardwire this bit to 0b. |
| 7 | 0x0<br>RW/L | **ECRC Check Capable (ECC):** If Set, this bit indicates that the Function is capable of checking ECRC.<br><br>**Power Well:** PRST |
| 6 | 0x0<br>RW/P | **ECRC Generation Enable (EGE):** When Set, ECRC generation is enabled.<br>Functions that do not implement the associated mechanism are permitted to hardwire this bit to 0b.<br>Default value of this bit is 0b. |
| 5 | 0x0<br>RW/L | **ECRC Generation Capable (EGC):** If Set, this bit indicates that the Function is capable of generating ECRC.<br><br>**Power Well:** PRST |
| 4:0 | 0x0<br>RO/V/P | **First Error Pointer (FEP):** This field identifies the bit position of the first error reported in the Uncorrectable Error Status Register (xref).<br>This register re-arms itself (which does not change its current value) as soon as the error status bit indicated by the pointer is cleared by the software by writing a 1 to that status bit. |

## 48.2.82 AERHDRLOG1—Offset 11Ch

This register logs the 4 Dwords of the transaction header for PCI Express errors.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 11Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RO/V/P | **TLP Header Log (TLPHDRLOG):** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again). |

## 48.2.83 AERHDRLOG2—Offset 120h

This register logs the 4 Dwords of the transaction header for PCI Express errors.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 120h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RO/V/P | **TLP Header Log (TLPHDRLOG):** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again). |

## 48.2.84 AERHDRLOG3—Offset 124h

This register logs the 4 Dwords of the transaction header for PCI Express errors.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 124h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RO/V/P | **TLP Header Log (TLPHDRLOG):** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again). |

## 48.2.85 AERHDRLOG4—Offset 128h

This register logs the 4 Dwords of the transaction header for PCI Express errors.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 128h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V/P | **TLP Header Log (TLPHDRLOG):** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again). |

## 48.2.86 ROOTERRCMD—Offset 12Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 12Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0x0<br>RO | **RSVD0:** Reserved |
| 2 | 0x0<br>RW | **Fatal Error Reporting Enable (FERE):** When set, this bit enables the generation of an interrupt when a Fatal error is reported by any of the functions in the hierarchy associated with this Root Port. |
| 1 | 0x0<br>RW | **Non-Fatal Error Reporting Enable (NFERE):** When set, this bit enables the generation of an interrupt when a Non-Fatal error is reported by any of the functions in the hierarchy associated with this Root Port. |
| 0 | 0x0<br>RW | **Correctable Error Reporting Enable (CERE):** When set, this bit enables the generation of an interrupt when a Correctable error is reported by any of the functions in the hierarchy associated with this Root Port. |

## 48.2.87 ROOTERRSTS—Offset 130h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 130h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x0<br>RO/V | **Advanced Error Interrupt Message Number (AEMN):** This register indicates which MSI/MSI-X vector is used for the interrupt message generated in association with any of the status bits of this Capability.<br>For MSI, the value in this register indicates the offset between the base Message Data and the interrupt message that is generated.<br>Hardware is required to update this field so that it is correct if the number of MSI Messages assigned to the Function changes when software writes to the Multiple Message Enable field in the MSI Message Control register.<br>For MSI-X, the value in this register indicates which MSI-X Table entry is used to generate the interrupt message.<br>The entry must be one of the first 32 entries even if the Function implements more than 32 entries.<br>For a given MSI-X implementation, the entry must remain constant.<br>For remaining fields info, please refer to PCIe Spec. for more details. |
| 26:7 | 0x0<br>RO | **RSVD0:** Reserved |
| 6 | 0x0<br>RW/1C/V/P | **Fatal Error Message Received (FEMR):** Reserved. |
| 5 | 0x0<br>RW/1C/V/P | **Non-Fatal Error message Received (NFEMR):** Reserved. |
| 4 | 0x0<br>RW/1C/V/P | **First Uncorrectable Fatal (FUF):** Reserved. |
| 3 | 0x0<br>RW/1C/V/P | **Multiple Error Fatal/Non-Fatal Received (MEFR):** Reserved. |
| 2 | 0x0<br>RW/1C/V/P | **Error Fatal/Non-Fatal Received (EFR):** Reserved. |
| 1 | 0x0<br>RW/1C/V/P | **Multiple Error Correctable Error Received (MCER):** Reserved. |
| 0 | 0x0<br>RW/1C/V/P | **Correctable Error Received (CER):** Reserved. |

## 48.2.88 ERRSRCID—Offset 134h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 134h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO/V/P | **Fatal/Non-Fatal Error Source ID (EFSID):** Requester ID of the source when an Fatal or No Fatal Error is received and the Fatal Error Message Received (FEMR) or Non-Fatal Error message Received (NFEMR) bit is not already set. |
| 15:0 | 0x0<br>RO/V/P | **Correctable Error Source ID (ECSID):** Requester ID of the source when a correctable error is received and the Correctable Error Received (CER) bit is not already set. |

## 48.2.89 ACSCAPHDR—Offset 138h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 138h

**Default:** 1501000Dh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x150<br>RW/L | **Next Capability Offset (NCO):** Contains the offset of the next structure in the Extended Capabilities. Software will need to program this field appropriately for linked capabilities list if default is not supported.<br><br>**Power Well:** PRST |
| 19:16 | 0x1<br>RO | **Capability Version (CV):** Indicates the version of the Capability structure present. |
| 15:0 | 0xd<br>RO | **Extended Capability ID (ECID):** Identifies the function as Access Control Services capable. |

## 48.2.90 ACSCAP—Offset 13Ch

This register identifies the Access Control Services (ACS) capabilities.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 13Ch

**Default:** 005Fh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **Egress Control Vector Size (ECVS):** Indicates the number of bits in the Egress Control Vector. This is set to 00h as ACS P2P Egress Control (ACSP2PEC) bit 5 in this register is 0b. |
| 7 | 0x0<br>RO | **RSVD0:** Reserved |
| 6 | 0x1<br>RO | **ACS Direct Translated P2P (TACSDTP2P):** Indicates that the component does implement ACS Direct Translated P2P. Required for Root Ports that support Address Translation Services (ATS) and also support peer-to-peer traffic with other Root Ports, required for Switch Downstream Ports, |
| 5 | 0x0<br>RO | **ACS P2P Egress Control (EACSP2PEC):** Hardwired to 0. Indicates that the component does not implement ACS P2P Egress Control. |
| 4 | 0x1<br>RO | **ACS Upstream Forwarding (UACSUF):** Indicates that the component implements ACS Upstream Forwarding. |
| 3 | 0x1<br>RO | **ACS P2P Completion Redirect (CACSP2PRR):** Indicates that the component implements ACS P2P Completion Redirect.<br>This includes Read Completions, AtomicOp Completions, and other Completions, either with or without data. |
| 2 | 0x1<br>RO | **ACS P2P Request Redirect (RACSP2PRR):** Indicates that the component implements ACS P2P Request Redirect. |
| 1 | 0x1<br>RO | **ACS Translation Blocking (BACSTB):** Indicates that the component implements ACS Translation Blocking. |
| 0 | 0x1<br>RO | **ACS Source Validation (VACSSV):** Indicates that the component implements ACS Source Validation. |

## 48.2.91 ACSCTL—Offset 13Eh

This register identifies the Access Control Services (ACS) control bits.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 13Eh

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:7 | 0x0<br>RO | **RSVD0:** Reserved |
| 6 | 0x0<br>RW | **ACS Direct Translated P2P Enable (TACSP2PECE):** When Set, overrides the ACS P2P Request Redirect and ACS P2P Egress Control mechanisms with peer-to-peer Memory Requests whose Address Translation (AT) field indicates a Translated address.<br>This bit is ignored if ACS Translation Blocking (B) is enabled. |
| 5 | 0x0<br>RO | **ACS P2P Egress Control Enable (EACSP2PECE):** This is hardwired to 0b as the component does not implement ACS P2P Egress Control. |
| 4 | 0x0<br>RW | **ACS Upstream Forwarding Enable (UACSUFE):** When set, the component forwards upstream any Request or Completion TLPs it receives that were redirected upstream by a component lower in the hierarchy.<br>Note that the U bit only applies to upstream TLPs arriving at a Downstream Port, and whose normal routing targets the same Downstream Port. |
| 3 | 0x0<br>RW | **ACS P2P Completion Redirect Enable (CACSP2PCRE):** Determines when the component redirects peer-to-peer Completions upstream, applicable only to Read Completions whose Relaxed Ordering Attribute is clear. |
| 2 | 0x0<br>RW | **ACS P2P Request Redirect Enable (RACSP2PRRE):** This bit determines when the component redirects peer-to-peer Requests upstream. |
| 1 | 0x0<br>RW | **ACS Translation Blocking Enable (BACSTBE):** When set, the component blocks all upstream Memory Requests whose Address Translation (AT) field is not set to the default value. |
| 0 | 0x0<br>RW | **ACS Source Validation Enable (VACSSVE):** When set, the component validates the Bus Number from the Requester ID of upstream Requests against the secondary / subordinate Bus Numbers. |

## 48.2.92 ERRUNCDETMSK—Offset 140h

A value of 1 masks the field and prevents detection as well as logging.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 140h

**Default:** 04000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x0<br>RO | **RSVD0:** Reserved |
| 26 | 0x1<br>RW/P | **Poisoned TLP Egress Blocked Detect Mask (PTLPEBDM):** Reserved. |
| 25 | 0x0<br>RO | **TLP Prefix Blocked Error Detect Mask (TPBEDM):** Reserved. |
| 24 | 0x0<br>RW/P | **AtomicOp Egress Blocked Error Detect Mask (AEBEDM):** Reserved. |
| 23 | 0x0<br>RW/P | **MC Blocked TLP Error Detect Mask (MCEDM):** Reserved. |
| 22 | 0x0<br>RW/P | **Uncorrectable Internal Error Detect Mask (UIEDM):** Reserved. |

| 0 | 0x0<br>RW/P | **Receiver Error Detect Mask (REDM):** Reserved. |

## 48.2.94 ROOTERRDETMSK—Offset 148h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 148h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0x0<br>RO | **RSVD0:** Reserved |
| 2 | 0x0<br>RW/P | **Received Fatal Message Detect Mask (RFMDM):** Reserved. |
| 1 | 0x0<br>RW/P | **Received Non-Fatal Message Detect Mask (RNFMDM):** Reserved. |
| 0 | 0x0<br>RW/P | **Received Correctable Message Detect Mask (RCEMDM):** Reserved. |

## 48.2.95 MCSTCAPHDR—Offset 150h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 150h

**Default:** 18010012h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x180<br>RW/L | **Next Capability Offset (NCO):** Contains the offset of the next structure in the Extended Capabilities. Software will need to program this field appropriately for linked capabilities list if default is not supported.<br><br>**Power Well:** PRST |
| 19:16 | 0x1<br>RO | **Capability Version (CV):** Indicates the version of the Capability structure present. |
| 15:0 | 0x12<br>RO | **Extended Capability ID (ECID):** Identifies the function as Multicast Capability. |

## 48.2.96 MCSTCAP—Offset 154h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 154h

**Default:** 000Fh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO | **MC ECRC Regeneration supported (MCERS):**<br>1: When set, this bit indicates that ECRC regeneration is supported. |
| 14:6 | 0x0<br>RO | **RSVD0:** Reserved |
| 5:0 | 0xf<br>RO | **MC Max Group (MCMG):** This field indicates the maximum number of Multicast Groups that the component supports, encoded as M-1.<br>A value of 00h indicates that one multicast Group is supported. |

## 48.2.97 MCSTCTL—Offset 156h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 156h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW | **MC Enable (MCEN):** When set, this bit indicates the Multicast Capability is enabled for the component.<br>This is a global field that controls MC for the specific function. |
| 14:6 | 0x0<br>RO | **RSVD0:** Reserved |
| 5:0 | 0x0<br>RW | **MC Number Group (MCNG):** This field indicates the number of Multicast Groups configured for use, encoded as N-1.<br>A value of 00h indicates that one Multicast Group is configured for use.<br>Behavior is undefined if value exceeds MC Max Group.<br>This parameter indirectly defines the upper limit of the Multicast address range.<br>This field is ignored if MC Enable is Clear. |

## 48.2.98 MCSTBAR—Offset 158h

The MC_Base_Address register contains the MC_Base_Address and the MC_Index_Position for calculating whether a MC hit occurred or not. Refer to the PCI Local Bus Specification, Revision 3.0 for details on how the MC hit/miss and the MC group number is calculated. This register is 4K aligned and hence only the top 20 bits are useable for the base address.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 158h

**Default:** 0000000Ch

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RW | **Lower Address 32-bit (L32ADR):** Reserved. |
| 11:6 | 0x0<br>RO | **RSVD0:** Reserved |
| 5:0 | 0xc<br>RW | **MC Index Position (MCIP):** This field indicates the location of the LSB of the Multicast Group number within the address.<br>Behavior is undefined if this field is less than 12 when MC Enable is set. |

## 48.2.99 MCSTUBAR—Offset 15Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 15Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Upper Address 32-bit (U32ADR):** Reserved. |

## 48.2.100 MCSTRCV—Offset 160h

The MC_Receive register provides a bit vector denoting which Multicast groups the Function should accept

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 160h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15:0 | 0x0<br>RW | **MC Receive (MCR):** For each bit that is set, this function gets a copy of any Multicast TLPs for the associated Multicast Group. Bits above MC Number Groups are ignored by hardware. |

## 48.2.101 MCSTBLKALL—Offset 168h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 168h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15:0 | 0x0<br>RW | **MC Block All (MCBA):** For each bit that is set, this function is blocked from sending TLPs to the associated Multicast Group.<br>Bits above MC Number Groups are ignored by hardware. |

## 48.2.102 MCSTOLBAR—Offset 178h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 178h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RW | **MC Overlay BAR (MCOVRBAR):** Specifies the base address of the window onto which MC TLPs passing through this function will be overlaid.<br>The overlay BAR is 4K aligned. Default is 0. |
| 11:6 | 0x0<br>RO | **RSVD0:** Reserved |
| 5:0 | 0x0<br>RW | **MC Overlay Size (MCOVRSZ):** If 6 or greater, specifies the size in bytes of the overlay aperture as a power of 2. If less than 6, disables the overlay mechanism. Default is 0. |

## 48.2.103 MCSTUOLBAR—Offset 17Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 17Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **MC Overlay BAR Upper 32 (MCOVRBARU32):** Specifies the base address of the window onto which MC TLPs passing through this function will be overlaid. |

## 48.2.104 EINJCAPHDR—Offset 180h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 180h

**Default:** 1901000Bh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x190<br>RW/L | **Next Capability Offset (NCO):** Contains the offset of the next structure in the Extended Capabilities. Software will need to program this field appropriately for linked capabilities list if default is not supported.<br><br>**Power Well:** PRST |
| 19:16 | 0x1<br>RO | **Capability Version (CV):** Indicates the version of the Capability structure present. |
| 15:0 | 0xb<br>RO | **Extended Capability ID (ECID):** Vendor Defined Capability |

## 48.2.105 EINJHDR—Offset 184h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 184h

**Default:** 00A00003h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0xa<br>RO | **VSEC Length (VSECLEN):** This field indicates the number of bytes in the entire VSEC structure, including the PCI Express Extended Capability header, the Vendor-Specific header, and the Vendor-Specific registers. |
| 19:16 | 0x0<br>RO | **VSEC Rev (VSECREV):** This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field. |
| 15:0 | 0x3<br>RO | **VSEC ID (VSECID):** This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure.<br>Software must qualify the Vendor ID before interpreting this field.<br>3h is assigned to WHEA Error Injection. |

## 48.2.106 EINJCTL—Offset 188h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 188h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:3 | 0x0<br>RO | **RSVD0:** Reserved |
| 2 | 0x0<br>RW | **Inject Completion Timeout Error (INJCTOERR):** When this bit is written from 0 to 1, one and only one error assertion pulse is produced on the error source signal for the given port.<br>This error will appear equivalent to an actual error assertion because this event is OR'd into the existing error reporting structure.<br>To log another error, this bit must be cleared first, before setting again.<br>Leaving this bit in a 1 state does not produce a persistent error condition. |
| 1 | 0x0<br>RW | **Inject Receiver Error (INJRCVERR):** When this bit is written from 0 to 1, one and only one error assertion pulse is produced on the error source signal for the given port.<br>This error will appear equivalent to an actual error assertion because this event is OR'd into the existing error reporting structure.<br>To log another error, this bit must be cleared first, before setting again.<br>Leaving this bit in a 1 state does not produce a persistent error condition. |
| 0 | 0x0<br>RW/L | **Error Injection Disable (EINJDIS):** This bit disables the usage of the PCIe Error Injection bits for EINJCTL.INJRCVERR, INJCTOERR This bit is self-locking.<br>Once this bit is set to a 1b, this key bit can not be unlocked.<br>Writing a 0b has no affect on this bit.<br><br>**Power Well:** PRST |

## 48.2.107 SECEXPCAP—Offset 200h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 200h

**Default:** 00010019h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RW/L | **Next Capability Offset (NCO):** Contains the offset of the next structure in the Extended Capabilities list.<br>Set to Null.<br>Software will need to program this field appropriately for linked capabilities list if default is not supported.<br><br>**Power Well:** PRST |
| 19:16 | 0x1<br>RO | **Capability Version (CV):** Indicates the version of the Capability structure present. |
| 15:0 | 0x19<br>RO | **Extended Capability ID (ECID):** PCI Express Extended Capability ID for the Secondary PCI Express Extended Capability is 0019h |

## 48.2.108 LINKCTL3—Offset 204h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 204h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15:9 | 0x0<br>RW | **Enable Lower SKP OS Generation Vector (ELSKPOSGV):** When the Link is in L0 and the bit in this field corresponding to the current Link speed is Set, SKP Ordered Sets are scheduled at the rate defined for SRNS, overriding the rate required based on the clock tolerance architecture.<br>See section 4.2.7 for additional requirements.<br>Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Bits in this field are RW if the corresponding bit in the Lower SKP OS Generation Supported Speeds Vector is Set, otherwise they are permitted to be hardwired to 0.<br>Behavior is undefined if a bit is Set in this field and the corresponding bit in the Lower SKP OS Generation Supported Speeds Vector is not Set.<br>The default value of this field is 000 0000b. |
| 8:2 | 0x0<br>RO | **RSVD1:** Reserved |
| 1 | 0x0<br>RW | **Link Equalization Request Interrupt Enable (LNKEQREQINTEN):** When Set, this bit enables the generation of interrupt to indicate that the Link Equalization Request bit has been set.<br>This bit is not applicable and is reserved for Endpoints, PCI Express to PCI/PCIX bridges, and Upstream Ports of Switches. |
| 0 | 0x0<br>RW/V | **Perform Equalization (PE):** When this register is 1b and a 1b is written to the 'Link Retrain' register with 'Target Link Speed' set to 8 GT/s, the Downstream Port must perform Transmitter Equalization.<br>Software must guarantee that no transactions are pending in the link while the link is in Recovery when this bit is set to 1b.<br>This bit is not applicable and is reserved for Endpoints, PCI Express to PCI/PCIX bridges, and Upstream Ports of Switches. |

## 48.2.109 LANEERRSTS—Offset 208h

The Equalization Control Register consist of control fields required for per lane equalization and the number of entries in this register are sized by Max Link Width

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 208h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7 | 0x0<br>RW/1C/V/P | **Lane 7 Error (L7ERR):** A value of 1b indicates that a lane based error was detected on the corresponding PCI Express Lane Number. |
| 6 | 0x0<br>RW/1C/V/P | **Lane 6 Error (L6ERR):** A value of 1b indicates that a lane based error was detected on the corresponding PCI Express Lane Number. |
| 5 | 0x0<br>RW/1C/V/P | **Lane 5 Error (L5ERR):** A value of 1b indicates that a lane based error was detected on the corresponding PCI Express Lane Number. |
| 4 | 0x0<br>RW/1C/V/P | **Lane 4 Error (L4ERR):** A value of 1b indicates that a lane based error was detected on the corresponding PCI Express Lane Number. |
| 3 | 0x0<br>RW/1C/V/P | **Lane 3 Error (L3ERR):** A value of 1b indicates that a lane based error was detected on the corresponding PCI Express Lane Number. |
| 2 | 0x0<br>RW/1C/V/P | **Lane 2 Error (L2ERR):** A value of 1b indicates that a lane based error was detected on the corresponding PCI Express Lane Number. |
| 1 | 0x0<br>RW/1C/V/P | **Lane 1 Error (L1ERR):** A value of 1b indicates that a lane based error was detected on the corresponding PCI Express Lane Number. |
| 0 | 0x0<br>RW/1C/V/P | **Lane 0 Error (L0ERR):** A value of 1b indicates that a lane based error was detected on the corresponding PCI Express Lane Number. |

## 48.2.110 LANEEQCTL0—Offset 20Ch

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 20Ch

**Default:** 0000h

| 31:0 | 0x0 RW/V | **PM data counter low value (CNTL):** Low order bits [31:0] for PM data counter[1:0]. |

## 48.2.120 XPPMCL0—Offset 288h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 288h

**Default:** FFFFFFFFh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0xffffffff RW/V | **PM compare low value (CMPL):** Low order bits [31:0] for PM compare register[1:0]. |

## 48.2.121 XPPMCL1—Offset 28Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 28Ch

**Default:** FFFFFFFFh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0xffffffff RW/V | **PM compare low value (CMPL):** Low order bits [31:0] for PM compare register[1:0]. |

## 48.2.122 XPPMDH—Offset 290h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 290h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:12 | 0x0<br>RO | **RSVD0:** Reserved |
| 11:8 | 0x0<br>RW/V | **High Nibble PEX Counter1 value (CNTH1):** High order bits [35:32] of the 36-bit PM Data1 register. |
| 7:4 | 0x0<br>RO | **RSVD1:** Reserved |
| 3:0 | 0x0<br>RW/V | **High Nibble PEX Counter0 value (CNTH0):** High order bits [35:32] of the 36-bit PM Data0 register. |

## 48.2.123 XPPMCH—Offset 292h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 292h

**Default:** 0F0Fh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:12 | 0x0<br>RO | **RSVD0:** Reserved |
| 11:8 | 0xf<br>RW/V | **High Nibble PEX Compare1 value (CMPH1):** High order bits [35:32] of the 36-bit PM Compare1 register. |
| 7:4 | 0x0<br>RO | **RSVD1:** Reserved |
| 3:0 | 0xf<br>RW/V | **High Nibble PEX Compare0 value (CMPH0):** High order bits [35:32] of the 36-bit PM Compare0 register. |

## 48.2.124 XPPMR0—Offset 294h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 294h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Local/Global Event Select (LOCGLOBEVSEL):** This register bit allows for standalone cluster simulation.<br>Normally the global events are used as control signals for the performance monitors.<br>When this bit is set to1, the internal IPTRIG[0-3] signals are selected respectively in place of the external GE[0-3] signals.<br>***Note:*** It is possible to have one PERFMON use the internal events, while the other PERFMON uses the external events.<br>• 0:Global events are selected<br>• 1:Local events are selected |
| 30 | 0x0<br>RW | **Not greater than comparison (NOTGRTCMP):**<br>• 0: PMC will compare a greater than function. When clear the perfmon status will assert when the PMD is greater than the PMC.<br>• 1: PMC will compare with NOT (greater than) function. When set the perfmon status will assert when the PMD is less than or equal to the PMC.<br>CSPEC NOTE: This bit was not in Seaburg. |
| 29 | 0x0<br>RW | **Force PMD counter to add zero to input (FRCPMDADDZ):** This feature is used with the queue measurement bus.<br>When this bit is set the value on the queue measurement bus is added to zero so the result in PMD will always reflect the value from the queue measurement bus.<br>• 0: Do not add zero. Normal PerfMon operation.<br>• 1: Add zero with input queue bus. |
| 28 | 0x0<br>RW | **Latched Count Enable Select (LATCNTENSEL):**<br>• 0: Normal PM operation. Use CENS as count enable.<br>• 1: Use Latched count enable from queue empty events |
| 27 | 0x0<br>RW | **Reset Pulse Enable (RSTPULSEN):** Setting this bit will select a pulsed version of the reset signal source in the reset block.<br>• 0: Normal reset signaling<br>• 1: Select a pulsed reset from the reset signal sources. |
| 26:24 | 0x0<br>RO | **RSVD0:** Reserved |
| 23:22 | 0x0<br>RW | **DFX Byte Lane Selection for PerfMon (DFXLNSEL):** This bit field is only active when LDES is asserted.<br>These bits select which set of 3 byte lanes from the 72 bit (9 byte lane) local debug bus is active for DFx event counting with the PerfMons.<br>• 00: Local Debug Byte Lanes 0-2<br>• 01: Local Debug Byte Lanes 3-5<br>• 10: Local Debug Byte Lanes 6-8<br>• 11: Reserved |
| 21 | 0x0<br>RW | **Local DFT Event Select (LDES):** This selection enables the local debug bus to be selected for event counting.<br>Enabling this selection changes the PMEVL,H register into 24bits of DFx masking and matching.<br>• 0: Disable DFx event monitoring<br>• 1: Enable DFx event monitoring. |
| 20:19 | 0x0<br>RW | **Event Group Selection (EGS):** Selects which event register to use for performance monitoring.<br>• 00: Bus events (XPPMEVL,H register)<br>• 01: Resource utilizations (in the XPPMER register)<br>• 10: Queue measurement (in the XPPMER register)<br>• 11: FIFO queue measurements (selects 1h on the queue measurement bus). |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 18:17 | 0x0<br>RW | **Count Event Select (CNTEVSEL):** Selects the condition for incrementing the performance monitor counter.<br>• 00: Event source selected by PMEVL,H<br>• 01: Partner event status (max compare or overflow)<br>• 10: All clocks when enabled<br>• 11: Reserved |
| 16 | 0x0<br>RW | **Event Polarity Invert (EVPOLINV):** This bit inverts the polarity of the conditioned event signal.<br>• 0: No inversion<br>• 1: Invert the polarity of the conditioned event signal |
| 15:14 | 0x0<br>RW | **Count Mode (CNTMD):** This field sets how the events will be counted.<br>• 00: Count clocks for the duration of event signal is active.<br>• 01: Count rising edge events (for active low signals EVPOLINV must be set for correct measurements).<br>• 10: Count clocks continuously after the event was asserted. The latched state of this condition is cleared by PerfMon reset block, PMR.CNTRST bit, or XPPERFCON.GRST.<br>• 11: Enable queue threshold measuring.<br>This mode will reassign the event selection registers from both PerfMons, selects a modified count enable, and enables add/sub operation.<br>Selecting this mode will not allow normal PerfMon operations to occur.<br>To simplify the logic a strict assignment of functions is applied.<br>PM0's event selection registers are assigned to the add (increment) function and PM1's event selection registers are assigned to the subtract (decrement) function.<br>When both PM0 and PM1 events are asserted or when both are not asserted do not add or subtract values from the queue.<br>PM0Ev.....PM1Ev.....PM condition<br>....0.....0.....Do not add/sub<br>....1.....0.....Add queue value<br>....0.....1.....Sub queue value<br>....1.....1.....Do not add/sub<br><br>Setting this mode enables the PM event registers as described but it also enables the selection of a empty signal to be used a count enable signal.<br>The count enable is latched high continuously and only cleared with PM global reset or local counter reset.<br>The THRQMSRSTR bit field selects which bit[3] of each nibble in each byte lane that acts as a count enable.<br>Once this event occurs it is latched and queue counting begins.<br>Because this signal is latched a counter reset or PERCON global reset is required to start another measurement.<br>This latched condition is cleared by the PMR.CNTRST bit, or XPPERFCON.GRST. |
| 13:11 | 0x0<br>RW | **Counter enable source (CENS):** These bits identify which input enables the counter.<br>Default value disables counting.<br>• 000: Disabled<br>• 001: Local Count Enabled (LCEN). This bit is always a logic 1.<br>• 010: Partner counter's event status (max compare or overflow)<br>• 011: Header MatchOut signal<br>• 100: GE[0], from the Global Debug Event Block<br>• 101: GE[1], from the Global Debug Event Block<br>• 110: GE[2], from the Global Debug Event Block<br>• 111: GE[3], from the Global Debug Event Block<br>***Note:*** Address/Header MatchOut signal must align with PMEVL,H events for this to be effective.<br>***Note:*** The GEs used are dependent on bit 31 (LOCGLOBEVSEL). If bit 31 is used, local events will be used instead of global events. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 10:8 | 0x0<br>RW | **Reset Event Select (RSTEVSEL):** This bit field will reset the PMD counter.<br>For details regarding usage and pair mode operation see Chapter 21.<br>• 000: No reset condition<br>• 001: Partner's event status: When the partner counter causes an event status condition to be activated, either by a counter overflow or max comparison, then this counter will reset and continue counting.<br>• 010: Partners PME register event: When the partner counter detects a match condition which meets its selected PME register qualifications, then this counter will reset and continue counting.<br>• 011: This PM counter's status output.<br>• 100: GE[0], from the Global Debug Event Block.<br>• 101: GE[1], from the Global Debug Event Block.<br>• 110: GE[2], from the Global Debug Event Block.<br>• 111: GE[3], from the Global Debug Event Block.<br>***Note:*** The GEs used are dependent on bit 31 (LOCGLOBEVSEL). If bit 31 is used, local events will be used instead of global events. |
| 7:6 | 0x0<br>RW | **Compare Mode (CMPMD):** This field defines how the PMC (compare) register is to be used.<br>• 00: compare mode disabled (PMC register not used) sig p = sig s<br>• 01: max compare only: The PMC register value is compared with the counter value. If the counter value is greater then the Compare Status (CMPSTAT) will be set. sig p = sig n<br>• 10: max compare with update of PMC at end of sample: The PMC register value is compared with the counter value, and if the counter value is greater, the PMC register is updated with the counter value. Note: The Compare Status field is not affected in this mode. sig p = sig n<br>• 11: Reserved |
| 5 | 0x0<br>RW | **PM Status Signal Output (PMSSIG):**<br>• 0: Level output from status/overflow signals.<br>• 1: Pulsed output from status/overflow signals. |
| 4:3 | 0x0<br>RW | **PerfMon Trigger Output (PTO):** This field selects what the signal is communicated to the chip's event logic structure.<br>• 00: No cluster trigger output from PerfMons or header match.<br>• 01: PM Status.<br>• 10: PM Event Detection.<br>• 11: Address Header Match |
| 2 | 0x0<br>RW/1C/V | **Compare Status (CMPSTAT):** This status bit captures a count compare event.<br>• 0: no event<br>• 1: count compare - PMD counter greater than PMC register when in compare mode.<br>This bit remains set once an event is reported even though the original condition is no longer valid. Writing a logic '1' clears the bit. |
| 1 | 0x0<br>RW/1C/V | **Overflow Status Bit (OVS):** This status bit captures the overflow event from the PMD counter.<br>This bit remains set once an event is reported even though the original condition is no longer valid. Writing a logic '1' clears the bit. |
| 0 | 0x0<br>RW | **Counter Reset (CNTRST):** Setting this bit resets the following bit fields.<br>This only applies to the set of registers for this PM block. Setting this bit resets the PMD counter, the associated adder storage register and the count mode state latch (see bits CNTMD) to the default state.<br>It does not change the state of this PMR register, the event selections, or the value in the compare register.<br>Note: This bit must be cleared by software, otherwise the counters remain in reset.<br>There is also a reset bit in the XPPERFCON register which clears all PM registers including the PMR. |

## 48.2.125 XPPMR1—Offset 298h

**Type:** PCI Configuration Register (Size: 32 bits)

There is also a reset bit in the XPPERFCON register which clears all PM registers including the PMR. |

## 48.2.126 XPPMEVL0—Offset 29Ch

Selections in this register correspond to fields within the PEX packet header. Each field selection is ANDed with all other fields in this register including the XPPMEVH except where noted.

The qualifications for fields in this register are as follows: PMEV Match = ((IO_Cfg_Write_event + IO_Cfg_Read_event _+ Mem_Write_event + Mem_Read_event + Trusted_write_event + Trusted_read_event + General_event) and INOUTBND) + GESEL IO_Cfg_Write_event = (REQCMP[0] and CMPR[1] and RDWR[1] and DATALEN and (TTYP[2] + (TTYP[1] and CFGTYP))) IO_Cfg_Read_event = (REQCMP[0] and CMPR[1] and RDWR[0] and DATALEN and (TTYP[2] + (FMTTYP[1] and CFGTYP))) Mem_Write_event = (REQCMP[0] and CMPR[0] and RDWR[1] and DATALEN and TTYP[3] and LOCK and EXTADDR and SNATTR)

*Note:* An outbound memory write does not have a snoop attribute as an inbound memory write has. So the user should set SNATTR='11' for outbound memory write transaction event counting. Mem_Read_event = (REQCMP[0] and CMPR[1] and RDWR[0] and DATALEN and (( TTYP[3] and LOCK and EXTADDR and SNATTR) + TTYP[2] + (TTYP[1] and CFGTYP)))

*Note:* For outbound memory reads there is no concept of issuing a snoop cycle. The user should select SNATTR='11' for either snoop attribute. Msg_event = (TTYP[0] and DND) (INOUTBND[0] and (MatchEq) + (IOBND[1] and (MatchEq)

*Note:* Setting both bits in INOUTBND is acceptable however the performance data gathered will not be accurate since once one header can be counted at a time.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 29Ch

## 48.2.127 XPPMEVL1—Offset 2A0h

Selections in this register correspond to fields within the PEX packet header. Each field selection is ANDed with all other fields in this register including the XPPMEVH except where noted. The qualifications for fields in this register are as follows: PMEV Match = ((IO_Cfg_Write_event + IO_Cfg_Read_event _+ Mem_Write_event + Mem_Read_event + Trusted_write_event + Trusted_read_event + General_event) and INOUTBND) + GESEL IO_Cfg_Write_event = (REQCMP[0] and CMPR[1] and RDWR[1] and DATALEN and (TTYP[2] + (TTYP[1] and CFGTYP))) IO_Cfg_Read_event = (REQCMP[0] and CMPR[1] and RDWR[0] and DATALEN and (TTYP[2] + (FMTTYP[1] and CFGTYP))) Mem_Write_event = (REQCMP[0] and CMPR[0] and RDWR[1] and DATALEN and TTYP[3] and LOCK and EXTADDR and SNATTR)

*Note:* An outbound memory write does not have a snoop attribute as an inbound memory write has. So the user should set SNATTR='11' for outbound memory write transaction event counting. Mem_Read_event = (REQCMP[0] and CMPR[1] and RDWR[0] and DATALEN and (( TTYP[3] and LOCK and EXTADDR and SNATTR) + TTYP[2] + (TTYP[1] and CFGTYP)))

*Note:* For outbound memory reads there is no concept of issuing a snoop cycle. The user should select SNATTR='11' for either snoop attribute. Msg_event = (TTYP[0] and DND) (INOUTBND[0] and (MatchEq) + (IOBND[1] and (MatchEq)

*Note:* Setting both bits in INOUTBND is acceptable however the performance data gathered will not be accurate since once one header can be counted at a time.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 2A0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0<br>RW | **Data or No Data Attribute (DND):**<br>• x1: Request/completion/message packet with data<br>• 1x: Request/completion/message packet without data |
| 29:28 | 0x0<br>RW | **Snoop Attribute (SNATTR):**<br>• x1: Snoop required<br>• 1x: No snoop required<br>• 11: Either |
| 27:26 | 0x0<br>RW | **Request or Completion Packet Selection (REQCMP):**<br>• x1: Request packet<br>• 1x: Completion packet<br>• 11: Either |
| 25:24 | 0x0<br>RW | **Read or Write Selection (RDWR):**<br>• x1: Read<br>• 1x: Write<br>• 11: Either |
| 23:22 | 0x0<br>RW | **Completion Required (CMPR):** (Request packet only)<br>• x1: No completion required<br>• 1x: Completion required<br>• 11: Either |

## 48.2.128 XPPMEVH0—Offset 2A4h

Selections in this register correspond to fields within the PEX packet header. Each field selection is ANDed with all other fields in this register including the XPPMEVL except for the Global Event signals. These signals are OR'ed with any event in the XPPMEVL and enables for debug operations requiring the accumulation of specific debug signals.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 2A4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RO | **RSVD0:** Reserved |
| 5:2 | 0x0<br>RW | **Global Event Selection (GESEL):** Selects which GE[3:0] is used for event counting.<br>This field is OR'd with other fields in this register.<br>The GEs cannot be qualified with other PerfMon signals.<br>If more than 1 GE is selected then the resultant event is the OR between each GE.<br>However, properly counting Global Event based on design, XP PM Response Control Register bit [13:11] CENS must be set to choose GE[3:0] and also bit[18:17] CNTEVSEL must be set to 2'b10.<br>• 1xxx: GE[3]<br>• x1xx: GE[2]<br>• xx1x: GE[1]<br>• xxx1: GE[0] |
| 1:0 | 0x0<br>RW | **Receive or Transmit Selection (RXTXSEL):** Selects which path to count transactions.<br>• 1x: Transmit<br>• x1: Receive (from PCI bus)<br>• 11: Either |

## 48.2.129 XPPMEVH1—Offset 2A8h

Selections in this register correspond to fields within the PEX packet header. Each field selection is ANDed with all other fields in this register including the XPPMEVL except for the Global Event signals. These signals are OR'ed with any event in the XPPMEVL and enables for debug operations requiring the accumulation of specific debug signals.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 2A8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RO | **RSVD0:** Reserved |
| 5:2 | 0x0<br>RW | **Global Event Selection (GESEL):** Selects which GE[3:0] is used for event counting.<br>This field is OR'd with other fields in this register.<br>The GEs cannot be qualified with other PerfMon signals.<br>If more than 1 GE is selected then the resultant event is the OR between each GE.<br>However, properly counting Global Event based on design, XP PM Response Control Register bit [13:11] CENS must be set to choose GE[3:0] and also bit[18:17] CNTEVSEL must be set to 2'b10.<br>• 1xxx: GE[3]<br>• x1xx: GE[2]<br>• xx1x: GE[1]<br>• xxx1: GE[0] |

## 48.2.136 XPPERFCON—Offset 2C4h

The XPPERFCON register is a local performance monitor control register used to clear all of the counters or to assign which XP (PCIe) device participates in the performance monitoring event. All perfmon blocks will needs this register. We will perform ORing this register and global PERFCON from full chip for backup usage and self contained purpose.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 2C4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RO | **RSVD0:** Reserved |
| 1 | 0x0<br>RW | **Global Count Enable (GCE):** This bit is AND'ed with the PMR.CENS mux enable selection.<br>• 0: Disable all counters.<br>• 1: Enable local selection of CENS. |
| 0 | 0x0<br>RW | **Global Reset (GRST):** Setting this bit to a logic 1 will reset the following bit fields in all PerfMon blocks throughout the component.<br><br>xxxPMDx.CNT<br>xxxPMR.OVS<br>xxxPMR.CMPSTAT<br>xxxPMCx.PMCx registers, and count mode state latch selected by xxxPMR.CNTMD = '01'.<br>Where xxx is the cluster prefix name.<br><br>***Note:*** Software must clear this bit after setting it, otherwise the PerfMons remain in a reset state. |

## 48.2.137 XPPERFSTAT—Offset 2C8h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 2C8h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:2 | 0x0<br>RO | **RSVD0:** Reserved |
| 1 | 0x0<br>RW/1C/V | **XP cluster PM1 Status (XPPM1STAT):** This bit indicates the status of PM0 from either the compare or overflow status.<br>This is bit is cleared by writing a '1'. |
| 0 | 0x0<br>RW/1C/V | **XP cluster PM0 Status (XPPM0STAT):** This bit indicates the status of PM0 from either the compare or overflow status.<br>This is bit is cleared by writing a '1'. |

## 48.2.138 XPCDTHROTTLEP—Offset 2D0h

This register controls the withholding of posted credits for throttling and survivability. For PCIe ports, the receive direction applies to PCIe credits and the transmit direction applies to IOSF credits. For the vSP/RP where both sides are IOSF credits, the receive credits apply to the IDF credits. Lock Key bit is located in the Personality Lock Key Control Register ('PLKCTL.TLCL').

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 2D0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:23 | 0x0<br>RW/P/L | **Tx Posted Request Data Throttling (TXPRD):** Remove this many credits from the available pool of credits for this type of transaction. |
| 22:16 | 0x0<br>RW/P/L | **Tx Posted Request Header Throttling (TXPRH):** Remove this many credits from the available pool of credits for this type of transaction. |
| 15:7 | 0x0<br>RW/P/L | **Rx Posted Request Data Throttling (RXPRD):** Remove this many credits from the available pool of credits for this type of transaction. |
| 6:0 | 0x0<br>RW/P/L | **Rx Posted Request Header Throttling (RXPRH):** Remove this many credits from the available pool of credits for this type of transaction. |

## 48.2.139 XPCDTHROTTLEN—Offset 2D4h

This register controls the withholding of non-posted credits for throttling and survivability. For PCIe ports, the receive direction applies to PCIe credits and the transmit direction applies to IOSF credits. For the vSP/RP where both sides are IOSF credits, the receive credits apply to the IDF credits. Lock Key bit is located in the Personality Lock Key Control Register ('PLKCTL.TLCL').

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 2D4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:23 | 0x0 RW/P/L | **Tx Non-Posted Request Data Throttling (TXNPRD):** Remove this many credits from the available pool of credits for this type of transaction. |
| 22:16 | 0x0 RW/P/L | **Tx Non-Posted Request Header Throttling (TXNPRH):** Remove this many credits from the available pool of credits for this type of transaction. |
| 15:7 | 0x0 RW/P/L | **Rx Non-Posted Request Data Throttling (RXNPRD):** Remove this many credits from the available pool of credits for this type of transaction. |
| 6:0 | 0x0 RW/P/L | **Rx Non-Posted Request Header Throttling (RXNPRH):** Remove this many credits from the available pool of credits for this type of transaction. |

## 48.2.140 XPCDTHROTTLEC—Offset 2D8h

This register controls the withholding of completion credits for throttling and survivability. For PCIe ports, the receive direction applies to PCIe credits and the transmit direction applies to IOSF credits. For the vSP/RP where both sides are IOSF credits, the receive credits apply to the IDF credits. Lock Key bit is located in the Personality Lock Key Control Register ('PLKCTL.TLCL').

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 2D8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:23 | 0x0 RW/P/L | **Tx Completion Data Throttling (TXCPLD):** Remove this many credits from the available pool of credits for this type of transaction. |
| 22:16 | 0x0 RW/P/L | **Tx Completion Header Throttling (TXCPLH):** Remove this many credits from the available pool of credits for this type of transaction. |
| 15:7 | 0x0 RW/P/L | **Rx Completion Data Throttling (RXCPLD):** Remove this many credits from the available pool of credits for this type of transaction. |
| 6:0 | 0x0 RW/P/L | **Rx Completion Header Throttling (RXCPLH):** Remove this many credits from the available pool of credits for this type of transaction. |

## 48.2.141 IOSFDEVCLKGCTL—Offset 2E4h

It is included for DMI EP in RC as an extension of Rootport definition.

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 2E4h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW | **Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur.<br><br>**Power Well:** PRST |
| 14:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:0 | 0x10<br>RW | **Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block controls the delay before going into IDLE.<br>16 (default value) is the minimum number of clocks recommended.<br><br>**Power Well:** PRST |

## 48.2.142 SBDEVCLKGCTL—Offset 2E6h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 2E6h

**Default:** 8010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x1<br>RW | **Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer.<br><br>**Power Well:** PRST |
| 14:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:0 | 0x10<br>RW | **Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins.<br>16 (default value) is the minimum number of clocks recommended.<br><br>**Power Well:** PRST |

## 48.2.143 VDHDRCAP—Offset 300h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 300h

**Default:** 0001000Bh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RW/L | **Next Capability Offset (PCIeNextPtr):** Contains the offset of the next item in the capabilities list.<br><br>**Power Well:** PRST |
| 19:16 | 0x1<br>RO | **Capability Version (PCIeCapVersion):** These bits indicate the version number of the PCI Express capability structure. |
| 15:0 | 0xb<br>RO | **Extended Capability ID (PCIeCapID):** Identifies the function as a Vendor Specific capability. |

## 48.2.144 IBSTHDRCAP—Offset 304h

This register stores the version number of the capability item and other base information contained in the capability structure.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 304h

**Default:** 2A800001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x2a8<br>RO | **Vendor Specific Extended Capability Length (VSECLength):** These bits indicate the length of the PCI Express extended capability structure. |
| 19:16 | 0x0<br>RO | **Revision Number (VSECIDRev):** These bits indicate the Revision number of the PCI Express capability structure. |
| 15:0 | 0x1<br>RO | **Vendor Specific Extended Capability ID (VSECID):** Reserved. |

## 48.2.145 IBSTENGLKSPDCAP—Offset 310h

REUT-ENG-LSCAPDevice: 7

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 310h

**Default:** 00000007h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0<br>RO | **RSVD0:** Reserved |
| 29 | 0x0<br>RO | **Unique Speed (UniqSpd):** Reserved. |
| 28 | 0x0<br>RO | **LSCTR is Passive (SpdCtlPassive):** Link speed is set by Link Speed Control (IBISTENGLKSPDCTL) register or it is passive where REUT-ENG-LSCTR (IBISTENGLKSPDCTL) does not control link speed. |
| 27:26 | 0x0<br>RO | **RSVD1:** Reserved |
| 25:24 | 0x0<br>RO/V | **Number of Test Controllers (NumTestContr):** Need to update with respect to port type. |
| 23:16 | 0x0<br>RO | **RSVD2:** Reserved |
| 15:8 | 0x0<br>RO | **Link Speed Capability1 (LinkSpeedCap1):** This field indicates the link speed.<br>Valid only if Unique Speed is 1b and # of Test Controllers is ) 0.<br>• 00000001b: Gen 1 Speed (2.5 GT/s)<br>• 00000010b: Gen 2 Speed (5 GT/s)<br>• 00000100b: Gen 3 Speed (8 GT/s)<br>• Others: Reserved. |
| 7:0 | 0x7<br>RO/V | **Link Speed Capability (LinkSpeedCap):** This field indicates the link speed capabilities of test controller 0 (if Unique Speed = 1b) or all Test Controllers (if Unique Speed = 0).<br>• 00000001b: Gen 1 Speed (2.5 GT/s)<br>• 00000010b: Gen 2 Speed (5 GT/s - Never used)<br>• 00000011b: Gen 1 and Gen 2 Speeds<br>• 00000100b: Gen 3 Speed Only (Unique Speed = 1)<br>• 00000111b: Gen 1, Gen2, and Gen3 Speed<br>• Others: Reserved. |

## 48.2.146 IBSTENGLKSPDCTL—Offset 314h

REUT-ENG-LSCTR

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 314h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RW/L | **Link 3 Speed Select (Link3SpeedSel):** This field controls the link speed of Link 3 if defined. This field overrides target link speed field defined in PCI Express spec and forces the link to operate at specified speed when programmed to a non-zero value.<br>• 00000000b: Force link speed control off<br>• 00000001b: Gen 1 Speed (2.5 GT/s)<br>• 00000010b: Gen 2 Speed (5 GT/s)<br>• 00000100b: Gen 3 Speed (8 GT/s)<br>• Others: Reserved. |
| 23:16 | 0x0<br>RW/L | **Link 2 Speed Select (Link2SpeedSel):** This field controls the link speed of Link 2 if defined. This field overrides target link speed field defined in PCI Express spec and forces the link to operate at specified speed when programmed to a non-zero value.<br>• 00000000b: Force link speed control off<br>• 00000001b: Gen 1 Speed (2.5 GT/s)<br>• 00000010b: Gen 2 Speed (5 GT/s)<br>• 00000100b: Gen 3 Speed (8 GT/s)<br>• Others: Reserved. |
| 15:8 | 0x0<br>RW/L | **Link 1 Speed Select (Link1SpeedSel):** This field controls the link speed of Link 1 if defined. This field overrides target link speed field defined in PCI Express spec and forces the link to operate at specified speed when programmed to a non-zero value.<br>• 00000000b: Force link speed control off<br>• 00000001b: Gen 1 Speed (2.5 GT/s)<br>• 00000010b: Gen 2 Speed (5 GT/s)<br>• 00000100b: Gen 3 Speed (8 GT/s)<br>• Others: Reserved. |
| 7:0 | 0x0<br>RW/L | **Link 0 Speed Select (Link0SpeedSel):** This field controls the link speed of Link 0. This field overrides target link speed field defined in PCI Express spec and forces the link to operate at specified speed when programmed to a non-zero value.<br>• 00000000b: Force link speed control off<br>• 00000001b: Gen 1 Speed (2.5 GT/s)<br>• 00000010b: Gen 2 Speed (5 GT/s)<br>• 00000100b: Gen 3 Speed (8 GT/s)<br>• Others: Reserved. |

## 48.2.147 IBSTENGLKTXRXCFG—Offset 31Ch

REUT-ENG-LTRCON

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 31Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:26 | 0x0<br>RO | **RSVD0:** Reserved |
| 25 | 0x0<br>RO | **Link Automatic Configuration (LinkAutoConfiguration):** Link automatic configuration is not supported by this IBIST engine. |
| 24 | 0x0<br>RW/P/L | **IBIST Write Disable (ReutDisable):** When set, this bit will prevent software writes to the IBIST engine's PCI Express Extended Capability Register Structure to prevent unwanted usage of the IBIST engine.<br>Once set, the registers are unwritable until next Powergood reset.<br>***Note:*** At a Minimum, REUT-ENG-LSCTR.LinkSpeedSel, REUT-ENG-LTRCON.LinkControl, REUT-PAT-TEC.StartTest, and REUT-PH-CTR.Initialization Mode are cleared and locked. |
| 23:15 | 0x0<br>RO | **RSVD1:** Reserved |
| 14:8 | 0x0<br>RO | **Link Control 1 (LinkControl1):** This field is only valid if Unique Speed is a 1b and Number tof test controllers is ) 0. |
| 7 | 0x0<br>RO | **RSVD2:** Reserved |
| 6:0 | 0x0<br>RW/P/L | **Link Control (LinkControl):** This field indicates the number of links under the control of the IBIST Engine.<br>This control bit or field requires a link re-initialization though the LTSSM Detect state before any action is taken by hardware.<br>All the odd bits can not be set by SW. Need to become RO-V to reflect LWCTRL register for downstream or Root ports. |

## 48.2.148 IBSTERRCRCSTS0—Offset 320h

REUT-ERR-CED0-3

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 320h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15 | 0x0<br>RW/1C/V/P | **CRC Error Overflow (CrcECC2Ovrflow):** Reserved. |
| 14:0 | 0x0<br>RW/1C/V/P | **CRC Error Counter (CrcECC2ErrCnt):** Reserved. |

## 48.2.149 IBSTERRRCRVSTS0—Offset 324h

REUT-ERR-ECCRCV0-3 IBSTERRRCRVSTS[1-3] are valid only for multi-port configuration.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 324h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0 RW/1C/V/P | **Recovery Overflow (LinkRecovOverflow):** This bit when 1b, indicates the recovery counter has overflowed. |
| 30:16 | 0x0 RW/1C/V/P | **Recovery Counter (RecovCnt):** This field indicates the number of times the link(s) LTSSM state machine has entered the recovery state. |
| 15 | 0x0 RW/1C/V/P | **Receiver Error Overflow (RxErrCntOvrflow):** This bit when 1b, indicates the receive error counter has overflowed. |
| 14:0 | 0x0 RW/1C/V/P | **Receiver Error Counter (RxErrCnt):** This field indicates the number of times the link(s) has detected an 8b/10b receiver error. |

## 48.2.150 IBSTERRCRCSTS1—Offset 328h

REUT-ERR-CED0-3

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 328h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0 RO | **RSVD0:** Reserved |
| 15 | 0x0 RW/1C/V/P | **CRC Error Overflow (CrcECC2Ovrflow):** Reserved. |
| 14:0 | 0x0 RW/1C/V/P | **CRC Error Counter (CrcECC2ErrCnt):** Reserved. |

## 48.2.151 IBSTERRRCRVSTS1—Offset 32Ch

REUT-ERR-ECCRCV0-3 IBSTERRRCRVSTS[1-3] are valid only for multi-port configuration.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 32Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0 RW/1C/V/P | **Recovery Overflow (LinkRecovOverflow):** This bit when 1b, indicates the recovery counter has overflowed. |
| 30:16 | 0x0 RW/1C/V/P | **Recovery Counter (RecovCnt):** This field indicates the number of times the link(s) LTSSM state machine has entered the recovery state. |
| 15 | 0x0 RW/1C/V/P | **Receiver Error Overflow (RxErrCntOvrflow):** This bit when 1b, indicates the receive error counter has overflowed. |
| 14:0 | 0x0 RW/1C/V/P | **Receiver Error Counter (RxErrCnt):** This field indicates the number of times the link(s) has detected an 8b/10b receiver error. |

## 48.2.152 IBSTERRCRCSTS2—Offset 330h

REUT-ERR-CED0-3

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 330h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |

## 48.2.160 IBSTTXLCTL—Offset 354h

REUT-PH-TDC

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 354h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15:0 | 0x0<br>RW/P | **Tx Data Lane Disable (TxDataLaneDisable):** This register field is used to selectively disable Tx lanes of the link.<br>• Bit 0: Lane 0 disable<br>• ...<br>• Bit 15: lane 15 disable.<br>It gates data from the REUT engine on to the lane. Disabled Lanes is not actually dead. |

## 48.2.161 IBSTTDSTS—Offset 358h

REUT-PH-TDS

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 358h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15:0 | 0x0<br>RO/V | **Tx Data Lane Detection Status (TxLaneDetectStat):** This register field indicates that the Tx lanes did not detect a receiver termination upon existing Detect LTSSM state.<br>• Bit 0: Lane 0 disable<br>• ...<br>• Bit 15: lane 15 disable. |

## 48.2.162 IBSTPLLNSTS0—Offset 36Ch

REUT-PH-LSR0-1

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 36Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO/V | **Lane 7 Present State (Lane7PresState):** This field identifies the current state for lane 7 (or lane 15 for IBSTPLLNSTS1). |
| 27:24 | 0x0<br>RO/V | **Lane 6 Present State (Lane6PresState):** This field identifies the current state for lane 6 (or lane 14 for IBSTPLLNSTS1). |
| 23:20 | 0x0<br>RO/V | **Lane 5 Present State (Lane5PresState):** This field identifies the current state for lane 5 (or lane 13 for IBSTPLLNSTS1). |
| 19:16 | 0x0<br>RO/V | **Lane 4 Present State (Lane4PresState):** This field identifies the current state for lane 4 (or lane 12 for IBSTPLLNSTS1). |
| 15:12 | 0x0<br>RO/V | **Lane 3 Present State (Lane3PresState):** This field identifies the current state for lane 3 (or lane 11 for IBSTPLLNSTS1). |
| 11:8 | 0x0<br>RO/V | **Lane 2 Present State (Lane2PresState):** This field identifies the current state for lane 2 (or lane 10 for IBSTPLLNSTS1). |
| 7:4 | 0x0<br>RO/V | **Lane 1 Present State (Lane1PresState):** This field identifies the current state for lane 1 (or lane 9 for IBSTPLLNSTS1). |
| 3:0 | 0x0<br>RO/V | **Lane 0 Present State (Lane0PresState):** This field identifies the current state for lane 0 (or lane 8 for IBSTPLLNSTS1). |

## 48.2.163 IBSTPRECFG0—Offset 370h

REUT-PH-PRE0-1

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 370h

**Default:** FFFFFFFFh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0xf<br>RO/V | **Pre Configuration Lane 7 ID (PreConfigLane7ID):** This field identifies the Pre-configuration Link ID for lane 7 (or lane 15 for IBSTPRECFG1). |
| 27:24 | 0xf<br>RO/V | **Pre Configuration Lane 6 ID (PreConfigLane6ID):** This field identifies the Pre-configuration Link ID for lane 6 (or lane 14 for IBSTPRECFG1). |
| 23:20 | 0xf<br>RO/V | **Pre Configuration Lane 5 ID (PreConfigLane5ID):** This field identifies the Pre-configuration Link ID for lane 5 (or lane 13 for IBSTPRECFG1). |
| 19:16 | 0xf<br>RO/V | **Pre Configuration Lane 4 ID (PreConfigLane4ID):** This field identifies the Pre-configuration Link ID for lane 4 (or lane 12 for IBSTPRECFG1). |
| 15:12 | 0xf<br>RO/V | **Pre Configuration Lane 3 ID (PreConfigLane3ID):** This field identifies the Pre-configuration Link ID for lane 3 (or lane 11 for IBSTPRECFG1). |
| 11:8 | 0xf<br>RO/V | **Pre Configuration Lane 2 ID (PreConfigLane2ID):** This field identifies the Pre-configuration Link ID for lane 2 (or lane 10 for IBSTPRECFG1). |
| 7:4 | 0xf<br>RO/V | **Pre Configuration Lane 1 ID (PreConfigLane1ID):** This field identifies the Pre-configuration Link ID for lane 1 (or lane 9for IBSTPRECFG1). |
| 3:0 | 0xf<br>RO/V | **Pre Configuration Lane 0 ID (PreConfigLane0ID):** This field identifies the Pre-configuration Link ID for lane 0 (or lane 8 for IBSTPRECFG1). |

## 48.2.164 IBSTPOSTCFG0—Offset 374h

REUT-PH-POST0-1

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 374h

**Default:** FFFFFFFFh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0xf RO/V | **Post Configuration Lane 7 ID (PostConfigLane7ID):** This field identifies the Post-configuration Link ID for lane 7 (or lane 15 for IBSTPOSTCFG1). |
| 27:24 | 0xf RO/V | **Post Configuration Lane 6 ID (PostConfigLane6ID):** This field identifies the Post-configuration Link ID for lane 6 (or lane 14 for IBSTPOSTCFG1). |
| 23:20 | 0xf RO/V | **Post Configuration Lane 5 ID (PostConfigLane5ID):** This field identifies the Post-configuration Link ID for lane 5 (or lane 13 for IBSTPOSTCFG1). |
| 19:16 | 0xf RO/V | **Post Configuration Lane 4 ID (PostConfigLane4ID):** This field identifies the Post-configuration Link ID for lane 4 (or lane 12 for IBSTPOSTCFG1). |
| 15:12 | 0xf RO/V | **Post Configuration Lane 3 ID (PostConfigLane3ID):** This field identifies the Post-configuration Link ID for lane 3 (or lane 11 for IBSTPOSTCFG1). |
| 11:8 | 0xf RO/V | **Post Configuration Lane 2 ID (PostConfigLane2ID):** This field identifies the Post-configuration Link ID for lane 2 (or lane 10 for IBSTPOSTCFG1). |
| 7:4 | 0xf RO/V | **Post Configuration Lane 1 ID (PostConfigLane1ID):** This field identifies the Post-configuration Link ID for lane 1 (or lane 9 for IBSTPOSTCFG1). |
| 3:0 | 0xf RO/V | **Post Configuration Lane 0 ID (PostConfigLane0ID):** This field identifies the Post-configuration Link ID for lane 0 (or lane 8 for IBSTPOSTCFG1). |

## 48.2.165 IBSTPLLNSTS1—Offset 378h

REUT-PH-LSR0-1

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 378h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO/V | **Lane 7 Present State (Lane7PresState):** This field identifies the current state for lane 7 (or lane 15 for IBSTPLLNSTS1). |
| 27:24 | 0x0<br>RO/V | **Lane 6 Present State (Lane6PresState):** This field identifies the current state for lane 6 (or lane 14 for IBSTPLLNSTS1). |
| 23:20 | 0x0<br>RO/V | **Lane 5 Present State (Lane5PresState):** This field identifies the current state for lane 5 (or lane 13 for IBSTPLLNSTS1). |
| 19:16 | 0x0<br>RO/V | **Lane 4 Present State (Lane4PresState):** This field identifies the current state for lane 4 (or lane 12 for IBSTPLLNSTS1). |
| 15:12 | 0x0<br>RO/V | **Lane 3 Present State (Lane3PresState):** This field identifies the current state for lane 3 (or lane 11 for IBSTPLLNSTS1). |
| 11:8 | 0x0<br>RO/V | **Lane 2 Present State (Lane2PresState):** This field identifies the current state for lane 2 (or lane 10 for IBSTPLLNSTS1). |
| 7:4 | 0x0<br>RO/V | **Lane 1 Present State (Lane1PresState):** This field identifies the current state for lane 1 (or lane 9 for IBSTPLLNSTS1). |
| 3:0 | 0x0<br>RO/V | **Lane 0 Present State (Lane0PresState):** This field identifies the current state for lane 0 (or lane 8 for IBSTPLLNSTS1). |

## 48.2.166 IBSTPRECFG1—Offset 37Ch

REUT-PH-PRE0-1

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 37Ch

**Default:** FFFFFFFFh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0xf RO/V | **Pre Configuration Lane 7 ID (PreConfigLane7ID):** This field identifies the Pre-configuration Link ID for lane 7 (or lane 15 for IBSTPRECFG1). |
| 27:24 | 0xf RO/V | **Pre Configuration Lane 6 ID (PreConfigLane6ID):** This field identifies the Pre-configuration Link ID for lane 6 (or lane 14 for IBSTPRECFG1). |
| 23:20 | 0xf RO/V | **Pre Configuration Lane 5 ID (PreConfigLane5ID):** This field identifies the Pre-configuration Link ID for lane 5 (or lane 13 for IBSTPRECFG1). |
| 19:16 | 0xf RO/V | **Pre Configuration Lane 4 ID (PreConfigLane4ID):** This field identifies the Pre-configuration Link ID for lane 4 (or lane 12 for IBSTPRECFG1). |
| 15:12 | 0xf RO/V | **Pre Configuration Lane 3 ID (PreConfigLane3ID):** This field identifies the Pre-configuration Link ID for lane 3 (or lane 11 for IBSTPRECFG1). |
| 11:8 | 0xf RO/V | **Pre Configuration Lane 2 ID (PreConfigLane2ID):** This field identifies the Pre-configuration Link ID for lane 2 (or lane 10 for IBSTPRECFG1). |
| 7:4 | 0xf RO/V | **Pre Configuration Lane 1 ID (PreConfigLane1ID):** This field identifies the Pre-configuration Link ID for lane 1 (or lane 9for IBSTPRECFG1). |
| 3:0 | 0xf RO/V | **Pre Configuration Lane 0 ID (PreConfigLane0ID):** This field identifies the Pre-configuration Link ID for lane 0 (or lane 8 for IBSTPRECFG1). |

## 48.2.167 IBSTPOSTCFG1—Offset 380h

REUT-PH-POST0-1

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 380h

**Default:** FFFFFFFFh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0xf<br>RO/V | **Post Configuration Lane 7 ID (PostConfigLane7ID):** This field identifies the Post-configuration Link ID for lane 7 (or lane 15 for IBSTPOSTCFG1). |
| 27:24 | 0xf<br>RO/V | **Post Configuration Lane 6 ID (PostConfigLane6ID):** This field identifies the Post-configuration Link ID for lane 6 (or lane 14 for IBSTPOSTCFG1). |
| 23:20 | 0xf<br>RO/V | **Post Configuration Lane 5 ID (PostConfigLane5ID):** This field identifies the Post-configuration Link ID for lane 5 (or lane 13 for IBSTPOSTCFG1). |
| 19:16 | 0xf<br>RO/V | **Post Configuration Lane 4 ID (PostConfigLane4ID):** This field identifies the Post-configuration Link ID for lane 4 (or lane 12 for IBSTPOSTCFG1). |
| 15:12 | 0xf<br>RO/V | **Post Configuration Lane 3 ID (PostConfigLane3ID):** This field identifies the Post-configuration Link ID for lane 3 (or lane 11 for IBSTPOSTCFG1). |
| 11:8 | 0xf<br>RO/V | **Post Configuration Lane 2 ID (PostConfigLane2ID):** This field identifies the Post-configuration Link ID for lane 2 (or lane 10 for IBSTPOSTCFG1). |
| 7:4 | 0xf<br>RO/V | **Post Configuration Lane 1 ID (PostConfigLane1ID):** This field identifies the Post-configuration Link ID for lane 1 (or lane 9 for IBSTPOSTCFG1). |
| 3:0 | 0xf<br>RO/V | **Post Configuration Lane 0 ID (PostConfigLane0ID):** This field identifies the Post-configuration Link ID for lane 0 (or lane 8 for IBSTPOSTCFG1). |

## 48.2.168 TLPCIECLKGCTL—Offset 8E0h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 8E0h

**Default:** 001Fh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW | **DIDT Mode (DIDT):** This bit when set to 1b will ensure that all clock gating is staggered by the amount of time determined by the Stagger Timer field in this register.<br><br>**Power Well:** PRST |
| 14:9 | 0x0<br>RO | **RSVD0:** Reserved |
| 8:0 | 0x1f<br>RW | **Stagger Timer (ST):** This field indicates the number of clocks that the IP block must be wait before the clock can be disable process begins.<br><br>**Power Well:** PRST |

## 48.2.169 TLPCIECLKGCCTL—Offset 8E2h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 8E2h

**Default:** 0055h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:6 | 0x1<br>RW | **Port Grant Count 3 (PGC3):** Reserved.<br><br>**Power Well:** PRST |
| 5:4 | 0x1<br>RW | **Port Grant Count 2 (PGC2):** Reserved.<br><br>**Power Well:** PRST |
| 3:2 | 0x1<br>RW | **Port Grant Count 1 (PGC1):** Reserved.<br><br>**Power Well:** PRST |
| 1:0 | 0x1<br>RW | **Port Grant Count 0 (PGC0):** Reserved.<br><br>**Power Well:** PRST |

## 48.2.170 PT0TXNCLKGCTL—Offset 8E4h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 8E4h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW | **Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer.<br><br>**Power Well:** PRST |
| 14:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:0 | 0x10<br>RW | **Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended.<br><br>**Power Well:** PRST |

## 48.2.171 PT1TXNCLKGCTL—Offset 8E6h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 8E6h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW | **Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer.<br><br>**Power Well:** PRST |
| 14:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:0 | 0x10<br>RW | **Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended.<br><br>**Power Well:** PRST |

## 48.2.172 PT2TXNCLKGCTL—Offset 8E8h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 8E8h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW | **Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer.<br><br>**Power Well:** PRST |
| 14:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:0 | 0x10<br>RW | **Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended.<br><br>**Power Well:** PRST |

## 48.2.173 PT3TXNCLKGCTL—Offset 8EAh

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 8EAh

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW | **Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer.<br><br>**Power Well:** PRST |
| 14:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:0 | 0x10<br>RW | **Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended.<br><br>**Power Well:** PRST |

## 48.2.174 XPTDEF2—Offset 8F8h

Lock Key bit is located in the Personality Lock Key Control Register ('PLKCTL.TLCL').

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 8F8h

**Default:** 00001D00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0 RW/1C/V/P | **MSI Address Violation Status (MSIAVS):** MSI address violation check status that does not target 0xFEEx_xxxx while MSIAVCD is not being set. This is only valid for RPs usage. |
| 30:19 | 0x0 RW/P/L | **Reserved ECO (RECO):** This field is reserved for ECO purpose. |
| 18 | 0x0 RW/P/L | **Hold Retrain during Surprise Removal Disable (HRSRD):** For Surprise Removal, EIP RPs will not allow retrain to occur until the SLOTSTS.PDCS bit has been cleared by software for the removal event. This bit is to disable the above behavior and allow the retrain to occur. This field is only applicable to RPs and should be treated as reserved for other devices. |
| 17 | 0x0 RW/P/L | **ECRC Malformed Error Precedence Disable (ECRCMFEPD):** This bit changes the error precedence if a TLP has both a ECRC error and is malform.<br>• When this bit is set to 1, the packet will be logged as an ECRC error.<br>• When set to 0, the packet will be logged as a malform TLP, which is compliant to the PCIe spec errata.<br>Only the type of error logged is affected. If the TLP is malform, it will be dropped with no credit return. If there is only an ECRC error detected on a packet, it will be dropped and credits will be returned per PCI-SIG Errata. |
| 16 | 0x0 RW/P/L | **MSI Address Violation Check Disable (MSIAVCD):** Disable MSI address violation check that does not target 0xFEEx_xxxx. This is only valid for RPs usage. |
| 15 | 0x0 RW/P/L | **Force Downstream Relaxed Order (FORCERODN):** Forces all downstream completions to follow relaxed ordering rules. This allows downstream completions to pass downstream posted requests. Note that setting this bit breaks the producer consumer model when the data is in the address space below the port and the flag is in the address space outside the port, because the read of the flag will not push the data writes down the port. The belief is that usage model is not used. |
| 14 | 0x0 RW/P/L | **Downstream Relaxed Order Disable (DNRODIS):** Disables the ability of downstream relaxed ordered completions from passing posted requests in the same direction. |
| 13 | 0x0 RW/P/L | **Upstream Relaxed Order Disable (UPRODIS):** Disables the ability of upstream relaxed ordered completions from passing posted requests in the same direction. |
| 12 | 0x1 RW/P/L | **IOSF tdparity check disable (TDPAR_CHK_DIS):** When set this bit disables the data parity check for incoming data into the IOSF Target block. The logic will ignore the data parity bit and will operate as though the parity bit did not exist. No errors will be logged and good DW based parity will be written into the data queue. |
| 11 | 0x1 RW/P/L | **IOSF tcparity check disable (TCPAR_CHK_DIS):** When set this bit disables the command parity check for incoming commands into the IOSF Target block. The logic will ignore the command parity bit and will operate as though the parity bit did not exist. No errors will be logged and good DW based parity will be written into the header queue. |
| 10 | 0x1 RW/P/L | **MCTP Message Bus Number Check Enable (MMBNCE):** When set, if the Requester ID bus number of an MCTP message request received on the PCIe link does not fall within the range between SCBN and SBBN, the MCTP message will be silently discarded. |
| 9 | 0x0 RW/P/L | **Completion credit advertisement enable (CPLCDT_EN):** Endpoints are required to advertise infinite completion credits. Setting this defeature bit breaks that rule and enables the advertisement of non-infinite completion credits and flow control updates for completion credits. This is only valid for project specific |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 8 | 0x1<br>RW/P/L | **Enable Virtual Port IDs (EVPID):**<br>• 1: Enables SB Virtual Port ID mode with allocated VPIDs which is associated with ports for all the egress INTx and LTR messages based on project specific. We will assign (N-1) virtual sideband PortID's to associate with the physical PortID which is port 0. The physical one is the same one as being assigned by the router as we have now, and would be used for all non-INTx messages and INTx messages from port 0. However, the VPIDs would be used for INTx messages routing from port(N-1:1), respectively. This allows all INTx from N ports to be forwarded to the ILB accordingly, so ILB can differentiate the source of the INTx message.<br>• 0: Normal operation with single SB Port ID per cluster for INTx delivery. This is only valid for project specific with multi root ports. |
| 7 | 0x0<br>RW/P/L | **Enable Receive Completion Ordering (ERCO):** The default ordering is to allow received completions to pass received posted requests to avoid receiver overflow conditions if posted requests cannot be processed. Setting this bit will enable PCI Express ordering for completions, preventing completions from passing posted requests. This is only valid for project specific |
| 6 | 0x0<br>RW/P/L | **Enable MSI Generation Override (MSIGENOV):**<br>• 1: Enables Root Port MSI generation override even if PCICMD.BME = 0 for the root port device as required by PCI Express specification.<br>• 0: Normal operation for Root Port behavior. If PCICMD.BME = 0, the root port will not generate a MSI. This is only valid for project specific. |
| 5 | 0x0<br>RW/P/L | **Completion Combining Disable (CPLCOMBINE_D):** When a larger read request is split into smaller read requests, the completions for the small requests may be opportunistically combined into larger completions to enable higher bandwidth and link utilization, as long as packet formation rules are not violated. This bit disables the port from combining completions. This is only valid for project specific . |
| 4 | 0x0<br>RW/P/L | **Config Retry Disable (CRD):** Setting this bit disables the re-issuing of a configuration request if the request is completed with a configuration retry status (CRS). The completion with CRS will be returned to the requestor. |
| 3 | 0x0<br>RW/P/L | **Optional Unexpected Completion Check Disable (UCCHKD):** Setting this bit disables some optional unexpected checks on completions. Specifically, it disables the checking on the byte count and lower address fields. |
| 2 | 0x0<br>RW/P/L | **MCTP Disable Bus Check (MCTPDBC):** Setting this bit will disable the Bus 0 check for all MCTP VDM Type1 messages. The check is enabled by default as following:<br>• Upstream - ReqBus =/= 0<br>• Downstream - TgtBus =/= 0 |
| 1 | 0x0<br>RW/P/L | **MSI-X Single Message Vector (MSIXSMSGV):** This bit when set, causes only a single MSI-X vector to be generated if MSI-X is enabled. This bit affects the default value of the MSI-X Table Size field |
| 0 | 0x0<br>RW/P/L | **Global Stop Disable (GBLSTOPD):** When the design detects an uncorrectable internal error, a stop signal in the design asserts, blocking the processing of transactions in both directions in the transaction layer. Setting this bit, disables the stop mechanism, allowing the transactions to proceed as if no error occurred. |

## 48.2.175 PMIDLTMR—Offset 948h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 948h

**Default:** 00000306h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/P | **ENPMTIMEOUT:** A number of pci-e cards have a particular erratum which causes them to send spurious PM requests.<br>When such spurious behavior happens, the northbridge starts the pm negotiation from its side and results in a system failure.<br>This bit when set enables an exit to recovery if the power management request did not terminate within 64-96us. |
| 30:28 | 0x0<br>RW/P | **PMDLLPCNT:** Only useful for upstream devices.<br>Do not take action based on seeing ASPM/PM DLLPs until 'PMDLLPCNT' DLLPs have been observed.<br>When set to 0, a single ASPM/PM DLLP will cause a response.<br>Used to work around broken devices that fail to flush all ASPM/PM DLLPs before entering the low power state and send spurious DLLPs upon return to L0 state. |
| 27:12 | 0x0<br>RO | **RSVD0:** Reserved |
| 11:8 | 0x3<br>RW/P | **L0s_IDLE_TIMER:** Indicates the amount of idle time in [us], as defined in the PCI-E spec, after which a tx-L0s transition will be initiated.<br>Timers have an accuracy of -1/+0us. A setting of 0 will disable tx-L0s transitions. |
| 7:5 | 0x0<br>RO | **RSVD1:** Reserved |
| 4:0 | 0x6<br>RW/P | **L1_IDLE_TIMER:** Only used for Downstream devices.<br>Not useful for an RC. Downstream device will initiate ASPM L1 request after the specified number of us of idle time.<br>For RH can be used as a scratch register.<br>A setting of 0 can be used as a non-specd way of disabling ASPM L1. |

## 48.2.176 LLRBSIZE—Offset 98Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 98Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x0<br>RO | **RSVD0:** Reserved |
| 26:16 | 0x0<br>RO/V | **LUT_SIZE:** Number of physical entries in LUT (does not account for RTRYCTL.UNUSABLE_MAP_ENTRIES). Units are 'TLPs'. |
| 15:11 | 0x0<br>RO | **RSVD1:** Reserved |
| 10:0 | 0x0<br>RO/V | **LLRB_SIZE:** Number of symbol times of data in the LLRB (does not account for RTRYCTL.UNUSABLE_LLRB_ENTRIES). Units are symbol times. |

## 48.2.177 FRMERRMSK—Offset 99Ch

These errors in FRMERRMSK, STS only apply to Gen1/Gen2.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 99Ch

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:10 | 0x0<br>RO | **RSVD0:** Reserved |
| 9 | 0x0<br>RW/P | **DUMP_IN_DLLP_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register. |
| 8 | 0x0<br>RW/P | **DUMP_IN_TLP_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register. |
| 7 | 0x0<br>RW/P | **ILL_STP_END_ERR_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register. |
| 6 | 0x0<br>RW/P | **SDP_FRQ_ERR_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register. |
| 5 | 0x0<br>RW/P | **STP_FRQ_ERR_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register. |
| 4 | 0x0<br>RW/P | **GAP_SDP_ERR_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register. |
| 3 | 0x0<br>RW/P | **GAP_STP_ERR_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register. |
| 2 | 0x0<br>RW/P | **IDL_ERR_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register. |
| 1 | 0x0<br>RW/P | **PAD_ERR_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register. |
| 0 | 0x0<br>RW/P | **DW1_ERR_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register. |

## 48.2.178 FRMERRSTS—Offset 99Eh

These errors in FRMERRMSK, STS only apply to Gen1/Gen2.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 99Eh

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:10 | 0x0<br>RO | **RSVD0:** Reserved |
| 9 | 0x0<br>RW/1C/V/P | **DUMP_IN_DLLP_ERR:** Preprocessor block detected error in DLLP framing. |
| 8 | 0x0<br>RW/1C/V/P | **DUMP_IN_TLP_ERR:** Preprocessor block detected error in TLP framing. |
| 7 | 0x0<br>RW/1C/V/P | **ILL_STP_END_ERR:** STP/SDP/END/EDB seen in illegal lanes. |
| 6 | 0x0<br>RW/1C/V/P | **SDP_FRQ_ERR:** SDP seen too frequently in otherwise legal lanes. |
| 5 | 0x0<br>RW/1C/V/P | **STP_FRQ_ERR:** STP seen too frequently in otherwise legal lanes. |
| 4 | 0x0<br>RW/1C/V/P | **GAP_SDP_ERR:** Framing error: Gap seen between first packet and DLLP. |
| 3 | 0x0<br>RW/1C/V/P | **GAP_STP_ERR:** Framing error: Gap seen between first packet and TLP. |
| 2 | 0x0<br>RW/1C/V/P | **IDL_ERR:** Framing error: Logic idles not seen where expected. |
| 1 | 0x0<br>RW/1C/V/P | **PAD_ERR:** Framing error: PADs not seen where expected. |
| 0 | 0x0<br>RW/1C/V/P | **DW1_ERR:** Framing error in 1st DW of a TLP/DLLP. |

## 48.2.179 LLPCIECLKGCTL—Offset 9E0h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + 9E0h

**Default:** 001Fh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW | **DIDT Mode (DIDT):** This bit when set to 1b will ensure that all clock gating is staggered by the amount of time determined by the Stagger Timer field in this register.<br><br>**Power Well:** PRST |

## 48.2.196 UPCFGCSR—Offset AB8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + AB8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:23 | 0x0<br>RO | **RSVD0:** Reserved |
| 22 | 0x0<br>RO/V | **RCVDUPCFGCAP:** Received up configure support by link partner. |
| 21:16 | 0x0<br>RO/V | **ILW:** Initial Link Width (maximum width to up configure to).<br>ILW format is the same as MLW. |
| 15:8 | 0x0<br>RO | **RSVD1:** Reserved |
| 7 | 0x0<br>RW/P | **UPCFGCAPEN:** This bit when set to 1 enables advertising dynamic width support in the training sequences.<br>When this bit is set 1 from 0, the link will move through Recovery to Config advertising upconfigure capability.<br>It will also ignore the settings in fields TLW and UPCFGEN at the time the bit is set. |
| 6:1 | 0x0<br>RW/P | **TLW:** This is the target link width used when mastering a dynamic width change.<br>If TLW is greater than the initial trained link width when LinkUp goes to 0--)1, then the initial link width is chosen as a cap. |
| 0 | 0x0<br>RW/V | **UPCFGEN:** When UPCFGCAPEN is set to 1 and this bit is set to 1, a dynamic width change is initiated if the TLW field is not equal to the current link width (if other end advertises support for it), this bit is cleared by hardware after making one attempt to change width.<br>On error, this bit will be cleared and TLW != NLW. If TLW==NLW and this bit is set, hardware will clear it without entering Recovery/Config. |

## 48.2.197 SOSCTL—Offset AC8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + AC8h

**Default:** 00025A4Eh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:23 | 0x0<br>RO | **RSVD0:** Reserved |
| 22 | 0x0<br>RW/V/P | **SRISEN:** This field should be set prior to link training and may be loaded via fuse or strap.<br>When enabled, the high frequency SOS interval is defined in SRISSOSINT and the low frequency SOS interval is defined in SOSINTERVAL. |
| 21:11 | 0x4b<br>RW/P | **SRISSOSINT:** SOS interval used in SRIS mode (high frequency interval).<br>Same interval definition as the SOSINTERVAL field. |
| 10:0 | 0x24e<br>RW/P | **SOSINTERVAL:**<br>Symbol between SOS insertions For 2.5GTs/ and 5GT/s modes = val * 2 For 8GT/s mode = val * 8 |

## 48.2.198 G3SOSERRSTS—Offset ACCh

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + ACCh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/1C/V/P | **LFSRERR:** 8GT/s SOS block LFSR state mis-compare. |
| 15:0 | 0x0<br>RW/1C/V/P | **PARERR:** 8GT/s SOS block parity error. |

## 48.2.199 PLPCIECLKGCTL—Offset AE0h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + AE0h

**Default:** 001Fh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW | **DIDT Mode (DIDT):** This bit when set to 1b will ensure that all clock gating is staggered by the amount of time determined by the Stagger Timer field in this register.<br><br>**Power Well:** PRST |
| 14:9 | 0x0<br>RO | **RSVD0:** Reserved |
| 8:0 | 0x1f<br>RW | **Stagger Timer (ST):** This field indicates the number of clocks that the IP block must be wait before the clock can be disable process begins.<br><br>**Power Well:** PRST |

## 48.2.200 PLPCIECLKGCCTL—Offset AE2h

The grant count needs to be greater than 0 for the arbitration to function. A grant count of 0 means no resources available and the requester will never be serviced.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + AE2h

**Default:** 0055h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:6 | 0x1<br>RW | **Port Grant Count 3 (PGC3):** This field is valid only for multi-port configuration.<br><br>**Power Well:** PRST |
| 5:4 | 0x1<br>RW | **Port Grant Count 2 (PGC2):** This field is valid only for multi-port configuration.<br><br>**Power Well:** PRST |
| 3:2 | 0x1<br>RW | **Port Grant Count 1 (PGC1):** This field is valid only for multi-port configuration.<br><br>**Power Well:** PRST |
| 1:0 | 0x1<br>RW | **Port Grant Count 0 (PGC0):** Reserved.<br><br>**Power Well:** PRST |

## 48.2.201 PT0PHYCLKGCTL—Offset AE4h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + AE4h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW | **Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer.<br><br>**Power Well:** PRST |
| 14:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:0 | 0x10<br>RW | **Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended.<br><br>**Power Well:** PRST |

## 48.2.202 PT1PHYCLKGCTL—Offset AE6h

This register is valid only for multi-port configuration.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + AE6h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW | **Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer.<br><br>**Power Well:** PRST |
| 14:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:0 | 0x10<br>RW | **Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended.<br><br>**Power Well:** PRST |

## 48.2.203 PT2PHYCLKGCTL—Offset AE8h

This register is valid only for multi-port configuration.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + AE8h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW | **Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer.<br><br>**Power Well:** PRST |
| 14:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:0 | 0x10<br>RW | **Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended.<br><br>**Power Well:** PRST |

## 48.2.204 PT3PHYCLKGCTL—Offset AEAh

This register is valid only for multi-port configuration.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + AEAh

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW | **Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer.<br><br>**Power Well:** PRST |
| 14:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:0 | 0x10<br>RW | **Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended.<br><br>**Power Well:** PRST |

## 48.2.205 LTLGCAP—Offset B00h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + B00h

**Default:** 36000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x3600<br>RO | **BAROFFSET:** Memory bar offset for ram entry 0 |
| 15:4 | 0x0<br>RO/V | **RAMSIZE:** Number of total ram entries. |
| 3 | 0x0<br>RO | **RSVD0:** Reserved |
| 2:0 | 0x0<br>RO/V | **NUMSUBLOG:** Number of sub-loggers supported. |

## 48.2.206 LTLGCTRL—Offset B04h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + B04h

**Default:** 00321000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:23 | 0x0<br>RO | **RSVD0:** Reserved |
| 22:20 | 0x3<br>RW/P | **SUBLOG3PT:** Port to assign to sub-logger 3. |
| 19 | 0x0<br>RO | **RSVD1:** Reserved |
| 18:16 | 0x2<br>RW/P | **SUBLOG2PT:** Port to assign to sub-logger 2. |
| 15 | 0x0<br>RO | **RSVD2:** Reserved |
| 14:12 | 0x1<br>RW/P | **SUBLOG1PT:** Port to assign to sub-logger 1. |
| 11 | 0x0<br>RO | **RSVD3:** Reserved |
| 10:8 | 0x0<br>RW/P | **SUBLOG0PT:** Port to assign to sub-logger 0. |
| 7:5 | 0x0<br>RO | **RSVD4:** Reserved |
| 4 | 0x0<br>RW/V/P | **CLEARALL:** Clear and restart all sub-loggers. |
| 3 | 0x0<br>RO | **RSVD5:** Reserved |
| 2:0 | 0x0<br>RW/P | **SPLITCTL:** Control of splitting logger if 1 sub log, ignored if 2 sub logs, only bit 0 used<br>[0] = 1, sublog0 owns full ram<br>[0] = 0, sublog0/1 split ram if 4 sub-logs<br>• 1-- = sublog0 owns full ram<br>• 011 = sublog0/2 split ram in half<br>• 001 = sublog0 gets half, sublog2/3 get a quarter each<br>• 010 = sublog0/1 get a quarter each, sublog2 gets half<br>• 000 = sublog0/1/2/3 get a quarter each |

## 48.2.207 LTLGSTART0—Offset B08h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + B08h

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0x0<br>RW/P | **STARTTRGMSK:**<br>If XSTOPTRGEN = 0, and any bit is set to 1, it will make that corresponding start trigger bit a don't care (always match).<br>If XSTOPTRGEN = 1, bits [19:18] are used and [31:20] reserved. Here is the definition for a and b which is the OR mask to dmona/b. a = bit[18] \| dmona b = bit[19] \| dmonb |
| 17:4 | 0x0<br>RW/P | **STARTTRG:**<br>If XSTOPTRGEN = 0, start trigger value, used in conjunction with the start trigger mask [13:10] State exit arc [9:8] RxL0s state [7:4] LTSSM main state [3:0] LTSSM sub state.<br>If XSTOPTRGEN = 1, bits [6:4] are used, [17:7] reserved.<br>Here is the definition of the external trigger event using the mask and dmona/b values<br>• 000 - trigger (= (!a and !b)<br>• 001 - trigger (= ( a and !b)<br>• 010 - trigger (= (!a and b)<br>• 011 - trigger (= ( a and b)<br>• 100 - trigger (= (!a \| !b)<br>• 101 - trigger (= ( a \| !b)<br>• 110 - trigger (= (!a \| b)<br>• 111 - trigger (= ( a \| b) a = bit[18] \| dmona b = bit[19] \| dmonb |
| 3 | 0x0<br>RW/P | **STARTTRGEN:** If set, logging starts when the start trigger field and mask match the current LTSSM state/arc |
| 2 | 0x0<br>RW/1C/V/P | **STARTTRIGGERED:** If 1, the start trigger event was hit. |
| 1 | 0x0<br>RO | **RSVD0:** Reserved |
| 0 | 0x1<br>RW/V/P | **START:** Enable logging. 0--)1 transition will clear log data If using the stop trigger, this bit will clear if the stop trigger event occurs. LTLGSTART[3:0] is based on one per sub-logger. |

## 48.2.208 LTLGSTART1—Offset B0Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + B0Ch

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|

| 1 | 0x0<br>RO | **RSVD0:** Reserved |
| 0 | 0x1<br>RW/V/P | **START:** Enable logging.<br>0--)1 transition will clear log data If using the stop trigger, this bit will clear if the stop trigger event occurs. LTLGSTART[3:0] is based on one per sub-logger. |

## 48.2.211 LTLGSTP0—Offset B18h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + B18h

**Default:** 1E000009h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/1C/V/P | **TRIGGERED:** If 1, the trigger event was hit. |
| 30 | 0x0<br>RW/1C/V/P | **XTRIGGERED:** If 1, external stop trigger event occurred. |
| 29 | 0x0<br>RW/P | **XSTOPTRGEN:** Use external trigger event to stop logging, see LTLGCTL.STARTTRG and STARTTRGMSK for configuration details.<br>Enabling this does not disable the state match stop event and it does disable the state match start event (acts as if STARTTRGEN=0). |
| 28:15 | 0x3c00<br>RW/P | **STOPTRGMSK:** if any bit is set to 1, it will make that corresponding stopt trigger bit a don't care (always match) |
| 14:1 | 0x4<br>RW/P | **STOPTRG:** Stop trigger value, used in conjunction with the stop trigger mask [13:10]<br>State exit arc [9:8] RxL0s state [7:4] LTSSM main state [3:0] LTSSM sub state |
| 0 | 0x1<br>RW/P | **STOPTRGEN:** If set, logging stops when the stop trigger field and mask match the current LTSSM state/arc. LTLGSTP[3:0] is based on one per sub-logger. |

## 48.2.212 LTLGSTP1—Offset B1Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + B1Ch

**Default:** 1E000009h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/1C/V/P | **TRIGGERED:** If 1, the trigger event was hit. |
| 30 | 0x0<br>RW/1C/V/P | **XTRIGGERED:** If 1, external stop trigger event occurred. |
| 29 | 0x0<br>RW/P | **XSTOPTRGEN:** Use external trigger event to stop logging, see LTLGCTL.STARTTRG and STARTTRGMSK for configuration details.<br>Enabling this does not disable the state match stop event and it does disable the state match start event (acts as if STARTTRGEN=0). |
| 28:15 | 0x3c00<br>RW/P | **STOPTRGMSK:** if any bit is set to 1, it will make that corresponding stop trigger bit a don't care (always match) |
| 14:1 | 0x4<br>RW/P | **STOPTRG:** Stop trigger value, used in conjunction with the stop trigger mask [13:10]<br>State exit arc [9:8] RxL0s state [7:4] LTSSM main state [3:0] LTSSM sub state |
| 0 | 0x1<br>RW/P | **STOPTRGEN:** If set, logging stops when the stop trigger field and mask match the current LTSSM state/arc. LTLGSTP[3:0] is based on one per sub-logger. |

## 48.2.213 LTLGSTP2—Offset B20h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + B20h

**Default:** 1E000009h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0 RW/1C/V/P | **TRIGGERED:** If 1, the trigger event was hit. |
| 30 | 0x0 RW/1C/V/P | **XTRIGGERED:** If 1, external stop trigger event occurred. |
| 29 | 0x0 RW/P | **XSTOPTRGEN:** Use external trigger event to stop logging, see LTLGCTL.STARTTRG and STARTTRGMSK for configuration details.<br>Enabling this does not disable the state match stop event and it does disable the state match start event (acts as if STARTTRGEN=0). |
| 28:15 | 0x3c00 RW/P | **STOPTRGMSK:** if any bit is set to 1, it will make that corresponding stopt trigger bit a don't care (always match) |
| 14:1 | 0x4 RW/P | **STOPTRG:** Stop trigger value, used in conjunction with the stop trigger mask [13:10]<br>State exit arc [9:8] RxL0s state [7:4] LTSSM main state [3:0] LTSSM sub state |
| 0 | 0x1 RW/P | **STOPTRGEN:** If set, logging stops when the stop trigger field and mask match the current LTSSM state/arc. LTLGSTP[3:0] is based on one per sub-logger. |

## 48.2.214 LTLGSTP3—Offset B24h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + B24h

**Default:** 1E000009h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0 RW/1C/V/P | **TRIGGERED:** If 1, the trigger event was hit. |
| 30 | 0x0 RW/1C/V/P | **XTRIGGERED:** If 1, external stop trigger event occurred. |
| 29 | 0x0 RW/P | **XSTOPTRGEN:** Use external trigger event to stop logging, see LTLGCTL.STARTTRG and STARTTRGMSK for configuration details.<br>Enabling this does not disable the state match stop event and it does disable the state match start event (acts as if STARTTRGEN=0). |
| 28:15 | 0x3c00 RW/P | **STOPTRGMSK:** if any bit is set to 1, it will make that corresponding stop trigger bit a don't care (always match) |
| 14:1 | 0x4 RW/P | **STOPTRG:** Stop trigger value, used in conjunction with the stop trigger mask [13:10]<br>State exit arc [9:8] RxL0s state [7:4] LTSSM main state [3:0] LTSSM sub state |
| 0 | 0x1 RW/P | **STOPTRGEN:** If set, logging stops when the stop trigger field and mask match the current LTSSM state/arc. LTLGSTP[3:0] is based on one per sub-logger. |

## 48.2.215 LTLGTMEV0—Offset B28h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + B28h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|

| 30:27 | 0x7<br>RW/P | **PhSTimerVal:** Slave phase (UP=Phase3, DP=Phase2) timeout. time limit is (val+1)*4ms. |
| 26:23 | 0x5<br>RW/P | **PhMTimerVal:** Master phase (UP=Phase2, DP=Phase3) timeout. time limit is (val+1)*4ms. |
| 22:20 | 0x0<br>RW/P | **PhaseTODis:** Disable phase 1/2/3 timeouts bit 0 - phase 1 bit 1 - phase 2 bit 3 - phase 3 |
| 19:12 | 0x7f<br>RW/P | **USEPREEVALWAIT:** Time to wait after lock (or lock timeout) before enabling the IOs to evaluate the new tx preset settings.<br>This allows the circuits some extra time to setup their evaluation logic.<br>Time is value*4us. |
| 11:4 | 0x0<br>RW/P | **COEFFEVALWAIT:** Time to wait after lock (or lock timeout) before enabling the IOs to evaluate the new coeff settings.<br>This allows the circuits some extra time to setup their evaluation logic.<br>Time is value*4us. |
| 3:0 | 0x3<br>RW/P | **LOCKTIME:** Max time to allow block lock on new coeff request.<br>Time is value*4us.<br>When this field is set to 0, it will remain in Lock state until lock is achieved or the primary timer for Phase2/3 expires (thus an EQ failure). |

## 48.2.247 LEKBLNERRCNT0—Offset BC0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + BC0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0<br>RO | **RSVD0:** Reserved |
| 29:25 | 0x0<br>RO/V | **Lane 5 Error Count (ERRCNT5):** Error count seen on a lane for the current time window.<br>Decrements progressively to 0 if no errors seen over a prolonged time period. |
| 24:20 | 0x0<br>RO/V | **Lane 4 Error Count (ERRCNT4):** Error count seen on a lane for the current time window.<br>Decrements progressively to 0 if no errors seen over a prolonged time period. |
| 19:15 | 0x0<br>RO/V | **Lane 3 Error Count (ERRCNT3):** Error count seen on a lane for the current time window.<br>Decrements progressively to 0 if no errors seen over a prolonged time period. |
| 14:10 | 0x0<br>RO/V | **Lane 2 Error Count (ERRCNT2):** Error count seen on a lane for the current time window.<br>Decrements progressively to 0 if no errors seen over a prolonged time period. |
| 9:5 | 0x0<br>RO/V | **Lane 1 Error Count (ERRCNT1):** Error count seen on a lane for the current time window.<br>Decrements progressively to 0 if no errors seen over a prolonged time period. |
| 4:0 | 0x0<br>RO/V | **Lane 0 Error Count (ERRCNT0):** Error count seen on a lane for the current time window.<br>Decrements progressively to 0 if no errors seen over a prolonged time period. |

## 48.2.248 LEKBLNERRCNT1—Offset BC4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + BC4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 0x0<br>RO | **RSVD0:** Reserved |
| 9:5 | 0x0<br>RO/V | **Lane 7 Error Count (ERRCNT7):** Error count seen on a lane for the current time window. Decrements progressively to 0 if no errors seen over a prolonged time period. |
| 4:0 | 0x0<br>RO/V | **Lane 6 Error Count (ERRCNT6):** Error count seen on a lane for the current time window. Decrements progressively to 0 if no errors seen over a prolonged time period. |

## 48.2.249 EQEVALCTL—Offset BD0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + BD0h

**Default:** 00080808h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **RSVD0:** Reserved |
| 30 | 0x0<br>RW/P | **BYPASSEQ:** Bypass all aspects of Adaptive EQ. |
| 29 | 0x0<br>RW/P | **NODLINITBLK:** Don't block the DL state machine from starting DL Init once initial L0 reached. |
| 28 | 0x0<br>RW/P | **BYPASSEQTS2:** For a downstream link, this allows entry to Gen3 w/out sending EQTS2 in 8b/10b mode prior to transmitting at 8GT/s. |
| 27:24 | 0x0<br>RW/P | **DEFPRESET:** Preset that will be used if 8GT/s entered w/out receiving EQTS2s. preset 0000 is -6dB de-emphasis and 0dB preshoot. |
| 23 | 0x0<br>RW/P | **FLIPCOEFFUPDPOL:** Chicken bit to flip what coeff up/down means to core. |
| 22:16 | 0x8<br>RW/P | **PREACCTHR:** Pre cursor eval threshold. The threshold used is value*8 for calculation. |
| 15 | 0x0<br>RO | **RSVD1:** Reserved |
| 14:8 | 0x8<br>RW/P | **MAINACCTHR:** Main cursor eval threshold. The threshold used is value*8 for calculation. |
| 7 | 0x0<br>RO | **RSVD2:** Reserved |
| 6:0 | 0x8<br>RW/P | **POSTACCTHR:** Post cursor eval threshold. The threshold used is value*8 for calculation. |

## 48.2.250 EQEVALCTL2—Offset BD4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + BD4h

**Default:** 0000FF55h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/P | **BLKUPEQREQ:** When this bit is set to 1, the following two events will NOT set the request eq bit in TS2s during Rec.RcvrCfg following Rec.Equalization.<br>• Equalization engine deems link usable but not optimal (this would normally trigger an immediate eq request in TS2s)<br>• Coeff received in Rec.RcvrLck follow Rec.Eq don't match negotiated coeff during Eq. |
| 30 | 0x0<br>RW/P | **BLKUPSPEED:** H/W will not initiate an up step in speed to 8GT/s in order to advertise or re-do equalization |
| 29 | 0x0<br>RW/P | **IGNOREQUIESCE:** H/W will ignore quiesce bit received from downstream component |
| 28 | 0x0<br>RW/P | **HWQUIESCE:** H/W will require quiescing of the link prior to re-equalization |
| 27 | 0x0<br>RW/P | **HWREEQEN:** Allow HW to initiate re-equalization. |
| 26 | 0x0<br>RW/P | **EXTEIEOS:** Enable extended EIEOS request during master eval stage (up component phase 3, down component phase 2). |
| 25 | 0x0<br>RW/P | **IGNOREMD:** Echo coeff back but don't change them to the IO. |
| 24 | 0x0<br>RW/P | **SKIPEVALPH:** Skip execution of the master eval coeff phase (up component phase 3, down component phase 2).<br>For downstream it skips phase2/3 completely per PCIe Spec.<br>For upstream it passes quickly through phase2 doing no real eval. |
| 23 | 0x0<br>RW/P | **REEQSPDDEGRADE:** When set, a self detected need to re-equalize will result in a down shift in speed and a disabling of the current rate (8GT/s or higher) and all rates above it. |
| 22:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15:8 | 0xff<br>RW/V/P | **EVALATT:** Max number of coeff for a lane to eval before quitting eval phase.<br>Value of 0 means no limit.<br>The value is scaled by the link partners advertised FS value (adj_val = roundup(val*(FS+1)/64)).<br>If FS is 63, the spec max, the value would be unaltered, whereas for a FS of 31, the value written to the config register would be halved.<br>One attempt will be made if the programmed value is greater than 0 and the adjusted value would have resulted in a value of 0.<br>Any evaluation attempt following an InvalidRequest indication on the PIPE interface is not counted as an attempt. |
| 7:0 | 0x55<br>RW/P | **EVALTIME:** Field defined to do each coeff eval as following.<br>Evaltime[7:6] = unit Evaltime[5:0] = value Unit:<br>• 11=)1ms<br>• 10=)128us<br>• 01=)16u<br>• 00=)1us<br>This field should not be programmed in value of 0 (unit=any, value=0) for devices connected to WM design. |

## 48.2.251 EQEVALCTL3—Offset BD8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + BD8h

**Default:** 33F30802h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x3<br>RW/P | **REPEATLIM:** Maximum number of times a previously tried coeff can be attempted.<br>A value of 0 means disable the repeat check.<br>Repeats are defined as coeff already seen in the history matrix.<br>Each time a coeff lookup in the history matrix returns a hit and the limit not reached, the history matrix is reset and the repeat counter incremented. |
| 27:24 | 0x3<br>RW/P | **INVREQATTLIM:** Maximum number of repeated times the MAC will allow the PIPE-Phy to request an out-of-bounds coeff (MAC responds to each by asserting InvalidRequest) before aborting the equalization evaluation process.<br>The PIPE3 spec gives no bounds, but if after some number of attempts, the PIPE-Phy keeps requesting the same invalid update, it makes no sense to continue.<br>A value of 0 disables this check. |
| 23 | 0x1<br>RW/P | **AllowFromMainOnly:** When set to 1, the main cursor is the only cursor pre or post can get a unit from.<br>So if main is at its minimum value, then an addition to post (or pre) can only occur if a subtraction from pre (or post) is also requested.<br>This prevents adjusting the cursor ratio of pre or post in the opposite direction than is desired.<br>When set to 0, a pre/post edit will take a unit from post/pre if the main cursor does not have a unit to give. |
| 22 | 0x1<br>RW/P | **OptCursorEdit:** If pre and post cursor movement requests are in opposite directions, service both at once if legally possible.<br>If not set, it will only edit 1 cursor using the priority defined by PreVsPostRR and PreOverPost |
| 21 | 0x1<br>RW/P | **PreVsPostRR:** Edits to pre vs post cursor will be done in a fair round robin manner.<br>The PreOverPost field will dictate the first cursor to be modified.<br>If not set, it will follow a strict priority to pre or post based on PreOverPost field. |
| 20 | 0x1<br>RW/P | **PreOverPost:** Pre-cursor adjustments will be taken over post-cursor adjustments when set to 1, else post has priority. |
| 19:18 | 0x0<br>RO | **RSVD0:** Reserved |
| 17 | 0x1<br>RW/P | **UNDERT2REDO:** If block error count under Threshold 2 but equal to or over Threshold 1, request a redo of equalization |
| 16 | 0x1<br>RW/P | **OVERT2SPDFAIL:** If block error count measured over Threshold 2, force link to fail down to lower speed |
| 15:8 | 0x8<br>RW/P | **ERRTHRESH2:** Block error count limit considered usable, but may spawn a redo of Equalization if enabled.<br>Setting of 0 causes all checks to at least pass the Threshold 2 check. |
| 7:0 | 0x2<br>RW/P | **ERRTHRESH1:** Block error count limit considered optimal.<br>Setting of 0 disables block error check. |

## 48.2.252 EQEVALSTS—Offset BDCh

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + BDCh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **RSVD0:** Reserved |
| 23 | 0x0<br>RO/V/P | **Lane 7 at EVAL Loop (LNLOOP7):**<br>FBDIR = Lane hit Loop Limit: Lane evaluation stopped due to repeated coeff (IO tap update resulted in a loop)<br>FOM = Lane in Paused state: PAUSE gets set when lane SM goes to PAUSE |
| 22 | 0x0<br>RO/V/P | **Lane 6 at EVAL Loop (LNLOOP6):**<br>FBDIR = Lane hit Loop Limit: Lane evaluation stopped due to repeated coeff (IO tap update resulted in a loop)<br>FOM = Lane in Paused state: PAUSE gets set when lane SM goes to PAUSE |

## 48.2.255 G3FRAMEERR—Offset BECh

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:9-12, 14-17, F:0] + BECh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **RSVD0:** Reserved |
| 30:27 | 0x0<br>RO/V/P | **G3FRAMEFERR:** First error pointer to bits 26:0 of this register |
| 26:12 | 0x0<br>RO | **RSVD1:** Reserved |
| 11 | 0x0<br>RW/1C/V/P | **FCRC:** TLP framing crc error |
| 10 | 0x0<br>RW/1C/V/P | **ITKNL0:** Invalid token on lane 0 (may include misplaced legal token) |
| 9 | 0x0<br>RW/1C/V/P | **ITKNLI:** Invalid token post logical idle (may include misplaced legal token) |
| 8 | 0x0<br>RW/1C/V/P | **ITKNDL:** Invalid token post DLLP (may include misplaced legal token) [as x1, means in DLLP token too] |
| 7 | 0x0<br>RW/1C/V/P | **ITKNTL:** Invalid token post TLP (may include misplaced legal token) [as x1/x2, includes bad EDB token] |
| 6 | 0x0<br>RW/1C/V/P | **SDSFE:** bad/unexpected data following SDS block |
| 5 | 0x0<br>RW/1C/V/P | **BKFE:** block framing error (header mismatch, bad header, etc.) |
| 4 | 0x0<br>RW/1C/V/P | **BK1FE:** unexpected type 1 (OS) header |
| 3 | 0x0<br>RW/1C/V/P | **EDS:** bad data following EDS (includes EDS not at end of block) |
| 2 | 0x0<br>RW/1C/V/P | **STP2:** two TLP start tokens in same symbol time |
| 1 | 0x0<br>RW/1C/V/P | **SDP2:** two DLLP start tokens in same symbol time |
| 0 | 0x0<br>RW/1C/V/P | **RDOK:** rcvd data ok removed unexpectedly (rcvr. imp. specific) |

## 48.3 Sideband Registers - Devices 9-12

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

### 48.3.1 PPBIFCTL_PRIV—Offset 10h

Port Configuration Bifurcation Control for MLW (x8) vs Port number

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xB4] + 10h
**Host Memory Space:** SBREG_BAR + 0xB40000 + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/L | **Capability Lock (CL):** Lock key bit for all RW-L bits of PPBIFCTL register only.<br>• 1b: Lock<br>• 0b: Unlocked<br>This bit is self-locking. Once this bit is set to a 1b, this key bit can not be unlocked. Writing a 0b has no affect on this bit. |
| 30:3 | 0x0<br>RO | **RSVD0:** Reserved |
| 2:0 | 0x0<br>RW/V/L | **Bifurcation Control 0 (BIFCTL0):**<br>• 111-101: Reserved<br>• 100: x8<br>• 011: x4x4<br>• 010: x4x2x2<br>• 001: x2x2x4<br>• 000: x2x2x2x2<br>A write of '1' on the CL will lock this register field down as bifurcation control status information. |

## 48.4 Sideband Registers - Devices 14-17

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

### 48.4.1 PPBIFCTL_PRIV—Offset 10h

Port Configuration Bifurcation Control for MLW (x8) vs Port number

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xB3] + 0h
**Host Memory Space:** SBREG_BAR + 0xB30000 + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/L | **Capability Lock (CL):** Lock key bit for all RW-L bits of PPBIFCTL register only.<br>• 1b: Lock<br>• 0b: Unlocked<br>This bit is self-locking. Once this bit is set to a 1b, this key bit can not be unlocked. Writing a 0b has no affect on this bit. |
| 30:3 | 0x0<br>RO | **RSVD0:** Reserved |
| 2:0 | 0x0<br>RW/V/L | **Bifurcation Control 0 (BIFCTL0):**<br>• 111-101: Reserved<br>• 100: x8<br>• 011: x4x4<br>• 010: x4x2x2<br>• 001: x2x2x4<br>• 000: x2x2x2x2<br>A write of '1' on the CL will lock this register field down as bifurcation control status information. |

§ §

# 49 SMBus - Host - B0, D18, F0

## 49.1 Introduction and Index

The host-accessible registers for the SMBus - Host are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

### 49.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 18 (decimal), Function 0. The offset addresses are listed.

**Table 49-1. Summary of PCI Configuration Registers—0/18/0**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 2 | 8086 | "VID—Offset 0h" on page 1820 |
| 2 | 2 | 19AC | "DID—Offset 2h" on page 1820 |
| 4 | 2 | 0000 | "PCICMD—Offset 4h" on page 1821 |
| 6 | 2 | 0010 | "PCISTS—Offset 6h" on page 1822 |
| 8 | 1 | 00 | "RID—Offset 8h" on page 1823 |
| 9 | 3 | 00088000 | "CCR—Offset 9h" on page 1823 |
| 10 | 8 | 0000000000000004 | "SMTBAR—Offset 10h" on page 1824 |
| 2C | 2 | 8086 | "SVID—Offset 2Ch" on page 1824 |
| 2E | 2 | 0000 | "SID—Offset 2Eh" on page 1825 |
| 3C | 1 | 00 | "INTL—Offset 3Ch" on page 1825 |
| 3D | 3 | 01 | "INTP—Offset 3Dh" on page 1826 |
| 40 | 2 | 8010 | "EXPCAPLST—Offset 40h" on page 1826 |
| 44 | 4 | 10008001 | "DEVCAP—Offset 44h" on page 1827 |
| 48 | 2 | 0000 | "DEVCTL—Offset 48h" on page 1829 |
| 4A | 2 | 0000 | "DEVSTS—Offset 4Ah" on page 1830 |
| 80 | 2 | 8C01 | "PMCAPLST—Offset 80h" on page 1831 |
| 8C | 2 | 0005 | "MSICAPLST—Offset 8Ch" on page 1831 |
| 8E | 2 | 0180 | "MSICTL—Offset 8Eh" on page 1832 |
| 90 | 8 | 0000000000000000 | "MSIADDR—Offset 90h" on page 1832 |
| 98 | 4 | 00000000 | "MSIDATA—Offset 98h" on page 1833 |
| 9C | 4 | 00000000 | "MSIMSK—Offset 9Ch" on page 1834 |
| EA | 2 | 0000 | "PLKCTL—Offset EAh" on page 1834 |

## 49.1.2 Host Memory Space—SMTBAR

An index of the registers that are accessible in Host Memory Space is shown here.

**Table 49-2. Summary of Memory Mapped I/O Registers—SMTBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 00000000 | "GCTRL—Offset 0h" on page 1835 |
| 8 | 8 | 0000000000000000 | "SMTICL—Offset 8h" on page 1836 |
| 10 | 4 | 00000000 | "ERRINTMSK—Offset 10h" on page 1837 |
| 14 | 4 | 00000000 | "ERRAERMSK—Offset 14h" on page 1838 |
| 18 | 4 | 00000000 | "ERRSTS—Offset 18h" on page 1839 |
| 1C | 4 | 00000000 | "ERRINFO—Offset 1Ch" on page 1840 |
| 100 | 8 | 0000000000000000 | "MDBA—Offset 100h" on page 1840 |
| 108 | 4 | 00000000 | "MCTRL—Offset 108h" on page 1841 |
| 10C | 4 | 00000000 | "MSTS—Offset 10Ch" on page 1842 |
| 110 | 4 | 00000000 | "MDS—Offset 110h" on page 1843 |
| 114 | 4 | 00061020 | "RPOLICY—Offset 114h" on page 1844 |
| 200 | 8 | 0000000000000000 | "TBBA—Offset 200h" on page 1846 |
| 208 | 4 | 00000010 | "TCTRL—Offset 208h" on page 1847 |
| 20C | 4 | 00000000 | "TSTS—Offset 20Ch" on page 1848 |
| 210 | 4 | 00000000 | "TBS—Offset 210h" on page 1849 |
| 218 | 4 | 00000000 | "HTHP—Offset 218h" on page 1849 |
| 21C | 4 | 00000000 | "FTTP—Offset 21Ch" on page 1850 |
| 220 | 4 | 00000058 | "TRxCTRL—Offset 220h" on page 1850 |
| 224 | 4 | 00000000 | "TRxSTS—Offset 224h" on page 1851 |
| 228 | 4 | 00000000 | "TACTRL—Offset 228h" on page 1852 |
| 22C | 4 | 00000000 | "TPOLICY—Offset 22Ch" on page 1853 |
| 240 | 4 | 00000000 | "GPBRCTRL—Offset 240h" on page 1855 |
| 244 | 4 | 00000000 | "GPBRDBUF—Offset 244h" on page 1856 |
| 280 | 4 | 00000000 | "SMTARPCTRL—Offset 280h" on page 1857 |
| 290 | 8 | 8086000000000000 | "UDID0—Offset 290h" on page 1858 |
| 298 | 8 | 8108808600000024 | "UUDID0—Offset 298h" on page 1859 |
| 2A0 | 8 | 8086000000000000 | "UDID1—Offset 2A0h" on page 1860 |
| 2A8 | 8 | 8108808600000024 | "UUDID1—Offset 2A8h" on page 1861 |
| 300 | 4 | 00000005 | "SPGT—Offset 300h" on page 1862 |
| 304 | 4 | 08080000 | "SPMT—Offset 304h" on page 1863 |
| 308 | 4 | 00000000 | "SPST—Offset 308h" on page 1864 |
| 30C | 4 | 00002024 | "SMBFT—Offset 30Ch" on page 1865 |
| 310 | 4 | 000015E1 | "CLTC—Offset 310h" on page 1866 |
| 380 | 4 | 80000000 | "DCLKGT—Offset 380h" on page 1866 |
| 384 | 4 | 00000011 | "SUSCHKB—Offset 384h" on page 1867 |
| 388 | 4 | 00000003 | "DBCTRL—Offset 388h" on page 1868 |
| 38C | 4 | 00000300 | "DBSTS—Offset 38Ch" on page 1869 |

## 49.2 Registers in Configuration Space

### 49.2.1 VID—Offset 0h

The Vendor ID Register identifies this device as an Intel device and adheres to the definitions in the PCI Local Bus Specification, Revision 3.0.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:18, F:0] + 0h

**Default:** 8086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x8086<br>RO | **Vendor ID (VID):** This is the standard 16-bit value assigned to Intel by PCI-SIG. |

### 49.2.2 DID—Offset 2h

The Device ID Register identifies this device and adheres to the PCI Local Bus Specification, Revision 3.0.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:18, F:0] + 2h

**Default:** 19ACh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x19ac<br>RO/V | **Device ID (DID):** This is the SMT Device identification Number. |

## 49.2.3 PCICMD—Offset 4h

The PCI Command Register follows a subset of the PCI Local Bus Specification, Revision 3.0. This register provides the basic control of the ability of the device to initiate and respond to transactions sent to it and maintains compatibility with PCI configuration space.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:18, F:0] + 4h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **RSVD0:** Reserved |
| 10 | 0x0<br>RW | **Interrupt Disable (INTxD):** Controls the ability to generate legacy INTx interrupt messages. When set, functions are prevented from asserting INTx interrupt messages. |
| 9 | 0x0<br>RO | **Fast Back to Back Enable (FBE):** Hard-wired to 0. |
| 8 | 0x0<br>RW | **SERR# Enable (SEE):** This bit indicates whether the device is allowed to signal a PCIe SERR condition.<br>• 0: The device is disabled from generating fatal/non-fatal errors.<br>• 1: The device is enabled to send fatal/non-fatal errors. |
| 7 | 0x0<br>RO | **RSVD:** Reserved |
| 6 | 0x0<br>RW | **Parity Error Response (PERE):** This bit controls the setting of the master data parity error bit in the Status Register in response to a parity error received on the PCI Express interface (either internal queue errors or a poisoned TLP).<br>• 0: Parity errors are ignored by the device.<br>• 1: The device reports parity errors. |
| 5 | 0x0<br>RO | **RSVD:** Reserved |
| 4 | 0x0<br>RO | **RSVD:** Reserved |
| 3 | 0x0<br>RO | **RSVD:** Reserved |
| 2 | 0x0<br>RW | **Bus Master Enable (BME):** Controls the ability of this device to initiate transactions to memory including MMIO.<br>• 0: The function is not allowed to issue any memory requests.<br>• 1: The function is allowed to issue memory requests. |
| 1 | 0x0<br>RW | **Memory Space Enable (MSE):** Controls whether the device responds to memory space transactions as located by its memory space BAR.<br>• 0: Disables device's memory BAR to be decoded as a valid target address.<br>• 1: Enables device's memory BAR to be decoded as a valid target address. |
| 0 | 0x0<br>RO | **RSVD:** Reserved |

## 49.2.4 PCISTS—Offset 6h

The PCI Status Register follows a subset of the PCI Local Bus Specification, Revision 3.0. This register maintains compatibility with PCI configuration space. Since this register is part of the standard PCI header, there is a PCISTS register per PCI function.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:18, F:0] + 6h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C/V | **Detected Parity Error (DPE):** This bit is set when the device receives an uncorrectable data error or Address/Control parity error regardless of the Parity Error Response bit in the "PCICMD—Offset 4h" on page 1821. |
| 14 | 0x0<br>RW/1C/V | **SERR# Asserted (SSE):**<br>• 0: No internal device port errors are signaled.<br>• 1: The device reported internal fatal/non-fatal errors. |
| 13 | 0x0<br>RW/1C/V | **Received Master Abort (RMA):** This bit is set when device experiences a master abort on a transaction it has mastered on IOSF. |
| 12 | 0x0<br>RW/1C/V | **Received Target Abort (RTA):** This bit is set when device accesses to IOSF return a failed completion status. |
| 11 | 0x0<br>RW/1C/V | **Signaled Target Abort (STA):** The IPI interface of the SMT will flag a completer abort for requests to its MMIO space that are greater than 8B in length. |
| 10:9 | 0x0<br>RO | **RSVD:** Reserved |
| 8 | 0x0<br>RW/1C/V | **Master Data Parity Error (MDPD):** This bit is set if the Parity Error Response bit in the PCI Command register set is set and it receives a completion with poisoned data from IOSF. |
| 7 | 0x0<br>RO | **RSVD:** Reserved |
| 6 | 0x0<br>RO | **RSVD0:** Reserved |
| 5 | 0x0<br>RO | **RSVD:** Reserved |
| 4 | 0x1<br>RO | **Capabilities List (CAPE):** This bit indicates that this device implements a PCI Capability list. |
| 3 | 0x0<br>RO/V | **Interrupt Status (INTS):** When set, this bit indicates that an INTx emulation interrupt is pending internally in this function, it is reset when the internal signal is de-asserted.<br>This bit has meaning only in the legacy interrupt mode.<br>This bit is always 0 when MSI-X has been selected for DMA interrupts. |
| 2:0 | 0x0<br>RO | **RSVD1:** Reserved |

## 49.2.5 RID—Offset 8h

Revision ID Register bit definitions adhere to PCI Local Bus Specification, Revision 3.0.

**Type:** PCI Configuration Register
(Size: 8 bits)

**Offset:** [B:0, D:18, F:0] + 8h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V/P | **Revision ID (RID):** This value is initially 0 for the first release and is incremented for subsequent releases in order to identify any changes. |

## 49.2.6 CCR—Offset 9h

Class Code Register bit definitions adhere to PCI Local Bus Specification, Revision 3.0. Auto configuration software reads this register to determine the PCI device function.

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + 9h

**Default:** 00088000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **RSVD0:** Reserved |
| 23:16 | 0x8<br>RW/O | **Base Class (BASE):** Indicates it is a 'Generic System Peripheral'.<br><br>**Power Well:** PRST |
| 15:8 | 0x80<br>RW/O | **Sub Class (SUB):** Indicates 'Other System Peripheral'.<br><br>**Power Well:** PRST |
| 7:0 | 0x0<br>RO | **RSVD:** Reserved<br><br>**Power Well:** PRST |

## 49.2.7 SMTBAR—Offset 10h

This base address register marks the memory-mapped registers used for SMBus Management Transport functionality. These registers are listed subsequently.

**Type:** PCI Configuration Register (Size: 64 bits)

**Offset:** [B:0, D:18, F:0] + 10h

**Default:** 0000000000000004h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:10 | 0x0<br>RW | **Base Address (MBA):** Base address of SMT control registers. |
| 9:4 | 0x0<br>RO | **Memory Size (MS):** Reserved. |
| 3 | 0x0<br>RO | **Prefetchable (PFMEM):** This bit is hardwired to 0b to indicate non-prefetchable. |
| 2:1 | 0x2<br>RO | **Type (MTYPE):** The SMT MMIO registers should have the ability to be relocated anywhere within 64-bit address space. |
| 0 | 0x0<br>RO | **Memory space indicator (MSI):** Hardwired to 0 to indicate that this is a memory space BAR. |

## 49.2.8 SVID—Offset 2Ch

The Subsystem Vendor ID Register bit definitions adhere to PCI Local Bus Specification, Revision 3.0.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:18, F:0] + 2Ch

**Default:** 8086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x8086<br>RW/O | **Subsystem Vendor ID (SVID):** This register uniquely identifies the add-in board or subsystem vendor.<br><br>**Power Well:** PRST |

## 49.2.9 SID—Offset 2Eh

The Subsystem ID Register bit definitions adhere to PCI Local Bus Specification, Revision 3.0.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:18, F:0] + 2Eh

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW/O | **Subsystem ID (SID):** uniquely identifies the add-in board or subsystem.<br><br>**Power Well:** PRST |

## 49.2.10 INTL—Offset 3Ch

Interrupt Line Register bit definitions adhere to PCI Local Bus Specification, Revision 3.0.

This register identifies interrupt line routing information.

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:18, F:0] + 3Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Interrupt Assigned (INTL):** system-assigned value identifies which system interrupt controller's interrupt request has the device's PCI interrupt request routed to it (as specified in the interrupt pin register).<br>A value of FFH signifies 'no connection' or 'unknown'. |

## 49.2.11 INTP—Offset 3Dh

Interrupt Pin Register bit definitions adhere to PCI Local Bus Specification, Revision 3.0. This register must be programmed before legacy interrupts are enabled.

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:18, F:0] + 3Dh

**Default:** 01h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x1<br>RW/L | **Interrupt Pin (INTP):** Indicates which INTx assert/deassert legacy interrupt messages are used.<br>• 01h: Generate INTA.<br>• 02h: Generate INTB.<br>• 03h: Generate INTC.<br>• 04h: Generate INTD.<br>• Others: Reserved.<br><br>**Power Well:** PRST |

## 49.2.12 EXPCAPLST—Offset 40h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:18, F:0] + 40h

**Default:** 8010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x80<br>RO | **Next Pointer (NP):** Contains the offset of the next item in the capabilities list ("PMCAPLST—Offset 80h"). |
| 7:0 | 0x10<br>RO | **Capability ID (CAPID):** Identifies the function as PCI Express capable. |

## 49.2.13 DEVCAP—Offset 44h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + 44h

**Default:** 10008001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0x0<br>RO | **RSVD0:** Reserved. |
| 28 | 0x1<br>RW/O | **Function Level Reset Capability (FLR):** This field when set indicates this function supports function Level Reset mechanism.<br>Lock key bit for DEVCTL.IFLR.<br>• 0b: Lock.<br>• 1b: Unlocked.<br><br>**Power Well:** PRST |
| 27:26 | 0x0<br>RO | **RSVD:** Reserved |
| 25:18 | 0x0<br>RO | **RSVD:** Reserved |
| 17:16 | 0x0<br>RO | **RSVD1:** Reserved. |
| 15 | 0x1<br>RO | **Role-Based Error Reporting (RBER):** The PCIe cluster supports Role-based Error Reporting. |
| 14:12 | 0x0<br>RO | **RSVD:** Reserved. |
| 11:9 | 0x0<br>RO | **Endpoint L1 Acceptable Latency (EPL1AL):**<br>• 000b Maximum of 1 us<br>• 001b Maximum of 2 us<br>• 010b Maximum of 4 us<br>• 011b Maximum of 8 us<br>• 100b Maximum of 16 us<br>• 101b Maximum of 32 us<br>• 110b Maximum of 64 us<br>• 111b No limit<br>This field does not apply to SMT device. The minimal latency is shown here as default |
| 8:6 | 0x0<br>RO | **Endpoint L0s Acceptable Latency (EPL0AL):**<br>• 000b Maximum of 64 ns<br>• 001b Maximum of 128 ns<br>• 010b Maximum of 256 ns<br>• 011b Maximum of 512 ns<br>• 100b Maximum of 1 us<br>• 101b Maximum of 2 us<br>• 110b Maximum of 4 us<br>• 111b No limit<br>This field does not apply to SMT device. The minimal latency is shown here as default |
| 5 | 0x0<br>RO | **Extended Tag Field Supported (ETFG):**<br>• 0: The device supports 5-bit extended tag<br>• 1: The device supports 8-bit extended tag<br>Currently, only 5-bit tag is supported and validated for the EP |
| 4:3 | 0x0<br>RO | **RSVD:** Reserved |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2:0 | 0x1<br>RO | **Max Payload size Supported (MPSS):** This is an internal device and can send/receive up to 256B packets internally from/to the IOSF fabric. |

## 49.2.14 DEVCTL—Offset 48h

The MPS register field is coded with NFLRST attribute to indicate it is not reset by FLR.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:18, F:0] + 48h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/V/L | **Initiate Function Level Reset (IFLR):** A write of 1 initiates Function Level Reset.<br>The value read by software from this bit is always 0b.<br>Only applies to end point.<br>This field is locked by the complement of the DEVCAP.FLR LockKey: ~DEVCAP.FLR<br><br>**Power Well:** NFLRST |
| 14:12 | 0x0<br>RO | **Max_Read_Request_Size (MRRS):** This field sets the maximum Read Requests size of the function as a requester on PCIe. |
| 11 | 0x0<br>RW | **Enable No Snoop (ENOSNP):** If this bit this is set, the function is permitted to set the No Snoop bit in the Requester attributes of transactions. |
| 10 | 0x0<br>RO | **RSVD:** Reserved |
| 9 | 0x0<br>RO | **RSVD:** Reserved |
| 8 | 0x0<br>RO | **RSVD:** Reserved |
| 7:5 | 0x0<br>RW | **Maximum Payload Size (MPS):** This field sets maximum TLP payload size for the function.<br>• 000b: 128 bytes maximum payload size (default)<br>• 001b: 256 bytes maximum payload size<br>• Others: Reserved<br><br>**Power Well:** NFLRST |
| 4 | 0x0<br>RO | **RSVD:** Reserved |
| 3 | 0x0<br>RW | **Unsupported Request Reporting Enable (URRE):** This bit controls the enabling of ERR_CORR, ERR_NONFATAL, or ERR_FATAL messages for reporting 'Unsupported Request' errors. |
| 2 | 0x0<br>RW | **Fatal Error Reporting Enable (FERE):** When this bit is set, generation of the ERR_FATAL message is enabled. |
| 1 | 0x0<br>RW | **NonFatal Error Reporting Enable (NFERE):** When this bit is set, generation of the ERR_NONFATAL message is enabled. |
| 0 | 0x0<br>RW | **Correctable Error Reporting Enable (CERE):** When this bit is set, generation of the ERR_CORR message is enabled. |

## 49.2.15 DEVSTS—Offset 4Ah

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:18, F:0] + 4Ah

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:6 | 0x0<br>RO | **RSVD0:** Reserved |
| 5 | 0x0<br>RO/V | **Transactions Pending (TP):** When set, this bit indicates that the device has issued non-posted PCI Express transactions which have not yet completed. |
| 4 | 0x0<br>RO | **RSVD:** Reserved |
| 3 | 0x0<br>RW/1C/V | **Unsupported Request Detected (URD):** This bit indicates that this function received an unsupported request from PCI Express link.<br>Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. |
| 2 | 0x0<br>RW/1C/V | **Fatal Error Detected (FED):** This bit indicates that the function has detected a Fatal error.<br>Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. |
| 1 | 0x0<br>RW/1C/V | **Non-Fatal Error Detected (NFED):** This bit indicates that the function has detected a Non-Fatal error.<br>Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. |
| 0 | 0x0<br>RW/1C/V | **Correctable Error Detected (CED):** This bit indicates that the function has detected a Correctable error.<br>Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. |

## 49.2.16 PMCAPLST—Offset 80h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:18, F:0] + 80h

**Default:** 8C01h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x8c<br>RO | **Next Pointer (NP):** Contains the offset of the next item in the capabilities list ("MSICAPLST—Offset 8Ch"). |
| 7:0 | 0x1<br>RO | **Capability ID (CAPID):** Identifies the function as PCI Power Management capable. |

## 49.2.17 MSICAPLST—Offset 8Ch

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:18, F:0] + 8Ch

**Default:** 0005h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **Next Pointer (NP):** Contains the offset of the next item in the capabilities list. |
| 7:0 | 0x5<br>RO | **Capability ID (CAPID):** Identifies the function as MSI capable. |

## 49.2.18 MSICTL—Offset 8Eh

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:18, F:0] + 8Eh

**Default:** 0180h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:9 | 0x0<br>RO | **RSVD0:** Reserved. |
| 8 | 0x1<br>RO | **Per-vector masking capable (PVM):** This bit indicates that this device supports MSI per-vector masking. |
| 7 | 0x1<br>RO | **Address 64-Bit Capable (AD64C):** When set, this bit indicates that this function is capable of generating a 64-bit message address.<br>• 1: Function is capable of sending 64-bit message address.<br>• 0: Function is not capable of sending 64-bit message address. |
| 6:4 | 0x0<br>RW | **Multiple Message Enable (MMEN):** These bits are R/W for software compatibility.<br>SMT supports only one message.<br>• 000b = 1 Message.<br>• Others = Reserved. |
| 3:1 | 0x0<br>RO | **Multiple Message Capable (MMC):** SMT supports only one MSI message (power of 2).<br>There is no option of supporting multiple messages. |
| 0 | 0x0<br>RW | **MSI Enable (MSIE):** When set, MSI is enabled and traditional interrupt pins are not used to generate interrupts.<br>Software must disable INTx and MSI-X for this device when using MSI. |

## 49.2.19 MSIADDR—Offset 90h

**Type:** PCI Configuration Register
(Size: 64 bits)

**Offset:** [B:0, D:18, F:0] + 90h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:2 | 0x0<br>RW | **Address (ADDR):** Message address specified by the system, always Dword aligned. |
| 1:0 | 0x0<br>RO | **RSVD0:** Reserved. |

## 49.2.20 MSIDATA—Offset 98h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + 98h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved. |
| 15 | 0x0<br>RW | **Trigger Mode (TM):**<br>• 0: Edge Triggered.<br>• 1: Level Triggered. |
| 14 | 0x0<br>RW | **Level (LVL):** If TM is 0h, then this field is a don't care.<br>Edge-triggered messages are always treated as assert messages.<br>If TM is 1h, then:<br>• 0: Deassert Messages<br>• 1: Assert Messages.<br>For level-triggered interrupts, this bit reflects the state of the interrupt input. |
| 13:12 | 0x0<br>RW | **Future:** These bits are don't care for an IOxAPIC interrupt message data field specification. |
| 11:8 | 0x0<br>RW | **Delivery Mode (DM):**<br>• 0000: Fixed: Trigger Mode can be edge or level.<br>• 0001: Lowest Priority: Trigger Mode can be edge or level.<br>• 0010: SMI/PMI/MCA - Not supported via MSI of root port<br>• 0011: Reserved - Not supported via MSI of root port.<br>• 0100: NMI - Not supported via MSI of root port.<br>• 0101: INIT - Not supported via MSI of root port.<br>• 0110: Reserved.<br>• 0111: ExtINT - Not supported via MSI of primary port.<br>• 1000 -1111 - Reserved. |
| 7:0 | 0x0<br>RW | **Interrupt Vector (IV):** The interrupt vector (LSB) will be modified by the IIO to provide context-sensitive interrupt information for different events that require attention from the processor. e.g Hot plug, Power Management and RAS error events. |

## 49.2.21 MSIMSK—Offset 9Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + 9Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x0<br>RO | **RSVD0:** Reserved. |
| 0 | 0x0<br>RW | **Mask Bits (MSKB):** For each Mask bit that is set, the PCI Express port is prohibited from sending the associated message.<br>The SMT supports 1 MSI message. Corresponding bits are masked if set to '1'. |

## 49.2.22 PLKCTL—Offset EAh

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:18, F:0] + EAh

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:1 | 0x0<br>RO | **RSVD0:** Reserved. |
| 0 | 0x0<br>RW/L | **Capability Lock (CL):** Lock key bit for all RW-L bits (capabilities, next capability pointer, SSID/SVID, slot register, etc) bits for the function.<br>• 1b: Lock.<br>• 0b: Unlocked.<br>This bit is self-locking.<br>Once this bit is set to a 1b, this key bit can not be unlocked. Writing a 0b has no effect on this bit.<br><br>**Power Well:** PRST |

## 49.3 Registers in Memory Space—SMTBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) SMTBAR described in Section 49.2.7, "SMTBAR—Offset 10h" on page 1824.

### 49.3.1 GCTRL—Offset 0h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [SMTBAR] + 0h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:7 | 0x0<br>RO | **RSVD0:** Reserved. |
| 6 | 0x0<br>RW/V/P | **SRST (SoftReset):** Set by the FW to asynchronously Reset the SMT Master and Target logic, Clear all the MMIO registers, and Release the SMBus Clock and Data lines. |
| 5:4 | 0x0<br>RO | **RSVD1:** Reserved. |
| 3 | 0x0<br>RW/V/P | **KILL:** FW sets the bit to cause HW to cause clock low timeout on the SMBus and generate stop after the timeout. |
| 2 | 0x0<br>RW/V/P | **Target Reset (TRST):** Set by FW to force HW to idle its internal SMBus clock and data. |
| 1:0 | 0x0<br>RO | **RSVD2:** Reserved. |

## 49.3.2 SMTICL—Offset 8h

This address register marks the location of where SMT interrupt cause information is written before an MSI is sent. The two least-significant bits are fixed at 00b so that the memory address is Dword-aligned.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [SMTBAR] + 8h

**Default:** 0000000000000000h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:2 | 0x0<br>RW | **Base Address (BA):** Base address of SMT interrupt cause. |
| 1:0 | 0x0<br>RO | **Memory Size (MS):** Reserved. |

## 49.3.3 ERRINTMSK—Offset 10h

Interrupt masking applies to both MSI and INTx.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [SMTBAR] + 10h

**Default:** 00000000h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:25 | 0x0<br>RO | **RSVD0:** Reserved. |
| 24 | 0x0<br>RW/P | **SMBus Clock Low Timeout Error Interrupt Mask (CKLTO):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.CKLTO being set. |
| 23:18 | 0x0<br>RO | **RSVD1:** Reserved. |
| 17 | 0x0<br>RW/P | **Target Ring Buffer Full Error Interrupt Mask (TRBF):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.TRBF being set. |
| 16 | 0x0<br>RW/P | **Target Ring Buffer Almost Full Error Interrupt Mask (TRBAF):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.TRBAF being set. |
| 15:13 | 0x0<br>RO | **RSVD2:** Reserved. |
| 12 | 0x0<br>RW/P | **IPI Host Interface Error (IHIE):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.IHIE being set. |
| 11 | 0x0<br>RW/P | **IPI Master Abort Error (IMAE):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.IMAE being set.<br>ERRINTMSK.IMAE: this bit is assumed to be '1' when MSICTL.MSIE is set.<br>IMAE will occur only if PCICMD.BME is clear and MSI requires BME to be set. |
| 10 | 0x0<br>RO | **IPI Transmit Error Interrupt Mask (ITE):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.ITE being set.<br>This error condition is deprecated. |
| 9 | 0x0<br>RW/P | **IPI Receive Data Parity Error Interrupt Mask (IRDPE):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.IRDPE being set. |
| 8 | 0x0<br>RO | **IPI Receive Error Interrupt Mask (IRE):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.IRE being set.<br>This error condition is deprecated. |
| 7:2 | 0x0<br>RO | **RSVD3:** Reserved. |
| 1 | 0x0<br>RW/P | **SPD Write Error Mask (SPDWE):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.SPDWE being set. |
| 0 | 0x0<br>RW/P | **CSR Parity Error Interrupt Mask (CPE):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.CPE being set. |

## 49.3.4 ERRAERMSK—Offset 14h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [SMTBAR] + 14h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:25 | 0x0<br>RO | **RSVD0:** Reserved. |
| 24 | 0x0<br>RW/P | **SMBus Clock Low Timeout Error AER Mask (CKLTO):** FW sets this bit to mask HW from escalating through AER Uncorrectable Internal Error due to ERRSTS.CKLTO being set. |
| 23:18 | 0x0<br>RO | **RSVD1:** Reserved. |
| 17 | 0x0<br>RW/P | **Target Ring Buffer Full Error AER Mask (TRBF):** FW sets this bit to mask HW from escalating through AER Uncorrectable Internal Error due to ERRSTS.TRBF being set. |
| 16 | 0x0<br>RW/P | **Target Ring Buffer Almost Full Error AER Mask (TRBAF):** FW sets this bit to mask HW from escalating through AER Uncorrectable Internal Error due to ERRSTS.TRBAF being set. |
| 15:13 | 0x0<br>RO | **RSVD2:** Reserved. |
| 12 | 0x0<br>RW/P | **IPI Host Interface Error (IHIE):** FW sets this bit to mask HW from escalating through AER Uncorrectable Internal Error due to ERRSTS.IHIE being set. |
| 11 | 0x0<br>RW/P | **IPI Master Abort Error (IMAE):** FW sets this bit to mask HW from escalating through AER Correctable Internal Error due to ERRSTS.IMAE being set.<br>This error is escalated as Correctable. |
| 10 | 0x0<br>RO | **IPI Transmit Error AER Mask (ITE):** FW sets this bit to mask HW from escalating through AER Uncorrectable Internal Error due to ERRSTS.ITE being set.<br>This error condition is deprecated. |
| 9 | 0x0<br>RW/P | **IPI Receive Data Parity Error AER Mask (IRDPE):** FW sets this bit to mask HW from escalating through AER Uncorrectable Internal Error due to ERRSTS.IRDPE being set. |
| 8 | 0x0<br>RO | **IPI Receive Error AER Mask (IRE):** FW sets this bit to mask HW from escalating through AER Uncorrectable Internal Error due to ERRSTS.IRE being set.<br>This error condition is deprecated. |
| 7:2 | 0x0<br>RO | **RSVD3:** Reserved. |
| 1 | 0x0<br>RW/P | **SPD Write Error AER Mask (SPDWE):** FW sets this bit to mask HW from escalating through AER Correctable Internal Error due to ERRSTS.SPDWE being set. |
| 0 | 0x0<br>RW/P | **CSR Parity Error AER Mask (CPE):** FW sets this bit to mask HW from escalating through AER Uncorrectable Internal Error due to ERRSTS.CPE being set. |

## 49.3.5 ERRSTS—Offset 18h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [SMTBAR] + 18h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:25 | 0x0<br>RO | **RSVD0:** Reserved. |
| 24 | 0x0<br>RW/1C/V/P | **SMBus Clock Low Timeout Error Status (CKLTO):** This bit is set by HW when SMBus clock is seen low for the time programmed in CLTC.CNT.<br>FW clears this register by writing '1'. |
| 23:18 | 0x0<br>RO | **RSVD1:** Reserved. |
| 17 | 0x0<br>RW/1C/V/P | **Target Ring Buffer Full Error Status (TRBF):** HW sets this bit when it needs to write data and/or header to memory and does not have enough free space in the ring buffer in memory.<br>Once the ring buffer full status bit is set, HW will silently NACK all incoming target transactions on the command phase to indicate that it is busy.<br>FW clears this register by writing '1'. |
| 16 | 0x0<br>RW/1C/V/P | **Target Ring Buffer Almost Full Error Status (TRBAF):** HW sets this bit after it has completed writing data and/or header to memory and checks if there is less than 85B of free space in the ring buffer.<br>FW clears this register by writing '1'. |
| 15:13 | 0x0<br>RO | **RSVD2:** Reserved. |
| 12 | 0x0<br>RW/1C/V/P | **IPI Host Interface Error (IHIE):** HW sets this bit when a read completion returns with non-successful status.<br>FW clears this register by writing '1'. |
| 11 | 0x0<br>RW/1C/V/P | **IPI Master Abort Error (IMAE):** HW sets this bit if a request is made when PCICMD.BME is clear.<br>FW clears this register by writing '1'. |
| 10 | 0x0<br>RO | **IPI Transmit Error Status (ITE):** HW sets this bit if an error is detected in any IPI transmit transaction.<br>This error condition is deprecated. |
| 9 | 0x0<br>RW/1C/V/P | **IPI Receive Data Parity Error Status (IRDPE):** HW sets this bit if a data parity error is detected in any IPI receive transaction.<br>FW clears this register by writing '1'. |
| 8 | 0x0<br>RO | **IPI Receive Error Status (IRE):** HW sets this bit if an error is detected in any IPI receive transaction.<br>This error condition is deprecated. |
| 7:2 | 0x0<br>RO | **RSVD3:** Reserved. |
| 1 | 0x0<br>RW/1C/V/P | **SPD Write Error Status (SPDWE):** HW sets this bit if a write is attempted to SPD address range (A0h-AEh) and write disable (MCTRL.SPDDIS) has been set.<br>FW clears this register by writing '1'. |
| 0 | 0x0<br>RW/1C/V/P | **CSR Parity Error Status (CPE):** HW sets this bit if a parity error is detected in any CSR.<br>FW clears this register by writing '1'. |

## 49.3.6 ERRINFO—Offset 1Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [SMTBAR] + 1Ch

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved. |
| 15:13 | 0x0<br>RO/V/P | **Second Error Info (SERRINFO):** Scratchpad. |
| 12:8 | 0x0<br>RO/V/P | **Second Error Pointer (SERRPTR):** Upon the second occurrence of any error, as included in ERRSTS, HW sets this register to point to the specific bit which was set. |
| 7:5 | 0x0<br>RO/V/P | **First Error Info (FERRINFO):** Scratchpad. |
| 4:0 | 0x0<br>RO/V/P | **First Error Pointer (FERRPTR):** Upon the first occurrence of any error, as included in ERRSTS, HW sets this register to point to the specific bit which was set. |

## 49.3.7 MDBA—Offset 100h

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**Default:** 0000000000000000h

**BAR and Offset:** [SMTBAR] + 100h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:6 | 0x0<br>RW | **Master Descriptor Base Address (MDBA):** 64Byte aligned base address of the master descriptor ring buffer in FW memory.<br>HW uses this base to add to MSTS.HMTP to calculate the physical address of the memory location it wants to access.<br>FW must update this register only when MCTRL.SS and MSTS.IP bits are cleared. |
| 5:0 | 0x0<br>RO | **RSVD0:** Reserved. |

## 49.3.8 MCTRL—Offset 108h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [SMTBAR] + 108h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **RSVD0:** Reserved. |
| 23:16 | 0x0<br>RW | **Firmware Master Head Pointer (FMHP):** Address offset of the number of descriptors available in the descriptor ring.<br>Updated by FW when it has programmed one or more new descriptors in the master descriptor ring buffer.<br>Always points to the descriptor offset that FW will next write to.<br>FW can increment this register at most to be 'MSTS.HMTP - 1' thus implying that Master Descriptor Ring Buffer can only hold 'MDS - 1' valid descriptors.<br>FW must roll this register to 0 after MDS is reached. |
| 15:5 | 0x0<br>RO | **RSVD1:** Reserved. |
| 4 | 0x0<br>RW | **Master Error Interrupt Enable (MEIE):** Set by FW to enable HW to generate MSI (if MSICTL.MSIE set) if MSTS.MEIS bit is set. |
| 3 | 0x0<br>RW/O/P | **SPD Write Disable (SPDDIS):** This bit must be set to '1' to disable writes to DIMM SPD, which are located in address range A0h-AEh.<br>If set, this address range is unwritable until the next platform reset.<br>Reads are unaffected.<br>This bit is reset only upon platform reset. It should be set by BIOS MRC (Memory Reference Code). |
| 2:1 | 0x0<br>RO | **RSVD2:** Reserved. |
| 0 | 0x0<br>RW/V | **Start/Stop (SS):** Set by the FW when it has programmed at least one descriptor in the descriptor ring.<br>Cleared by FW when it wants HW to stop processing more descriptors.<br>FW must monitor the MSTS.IP bit which indicates that HW is truly stopped.<br>HW clears this register for the following fatal error scenario, regardless of Stop-on-Error (SOE) bit in the master descriptor:<br>• HW receives unsuccessful completion on internal IOSF.<br>HW clears this register for the following non-fatal scenario:<br>• Master descriptor SOE bit was set and the transaction was unsuccessful for any condition as reported in the Status WB Dword. |

## 49.3.9 MSTS—Offset 10Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [SMTBAR] + 10Ch

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **RSVD0:** Reserved. |
| 23:16 | 0x0<br>RW/V | **Hardware Master Tail Pointer (HMTP):** Descriptor offset in the descriptor ring.<br>Incremented by HW and points to the descriptor that HW is currently processing or will process next.<br>Initialized by FW with the descriptor location where it wants the master to start transaction from (typically 0).<br>This register must only be written by FW when the MCTRL.SS bit is '0' and the MSTS.IP bit is '0'.<br>HW must not increment this pointer in the case that due to the failure of a descriptor-initiated cycle, HW clears the MCTRL.SS bit.<br>HW uses MSTS.HMTP and MCTRL.FMHP to calculate Full and Empty conditions.<br>FW must never initialize this buffer to a value greater than MDS. |
| 15:6 | 0x0<br>RO | **RSVD1:** Reserved. |
| 5 | 0x0<br>RW/1C/V | **Master Interrupt Status (MIS):** Set by HW to indicate that the descriptor that was being processed was successfully done over SMBus.<br>HW proceeds normally to process the next descriptor if the MCTRL.SS bit is set.<br>HW auto-clears this register if INT bit in the descriptor which it finished processing is set and the associated MSI is sent.<br>If INT bit in descriptor is cleared, FW clears this bit by writing '1'. |
| 4 | 0x0<br>RW/1C/V | **Master Error Interrupt Status (MEIS):** Set by HW to indicate that the descriptor that was being processed was not successfully done on SMBus.<br>HW halts the descriptor engine by clearing the MCTRL.SS bit if this bit is set and the SOE bit in the descriptor which was processed was set.<br>HW auto-clears this register if MCTRL.MEIE register is set and the associated Master Error MSI is sent.<br>If MCTRL.MEIE is cleared, FW clears this bit by writing '1'. |
| 3:1 | 0x0<br>RO | **RSVD2:** Reserved. |
| 0 | 0x0<br>RO/V | **In Progress (IP):** Set by the HW to indicate that its DMA processor is active meaning that it is processing a descriptor.<br>HW will clear this bit after it has finished processing the current descriptor (which is the completion of the descriptor's status write back into memory and Interrupt if enabled is sent).<br>This is to aid the stopping of HW even if there are multiple descriptors to be processed. |

## 49.3.10 MDS—Offset 110h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [SMTBAR] + 110h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **RSVD0:** Reserved. |
| 7:0 | 0x0<br>RW | **Master Descriptor Size (MDS):** Defines the size of the master descriptor ring buffer that is pointed to by MDBA. 0-based number of 16B descriptors.<br>The top of the ring buffer is MDBA+MDS including the last location.<br>A value of '1' represents a total possible capacity of 2 descriptors in the ring, and a value of '255' represents capacity of 256 descriptors in the ring.<br>Used by HW to calculate if it has reached the top of the buffer and must wrap back to 0. |

## 49.3.11 RPOLICY—Offset 114h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00061020h

**BAR and Offset:** [SMTBAR] + 114h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **RSVD0:** Reserved. |
| 23:16 | 0x6<br>RW | **Time Between Retry Clock Count (TBRCLKCNT):** This register is programmed by the FW to set the retry timer clock count.<br>The reference clock used for this timer count is specified by FW in RPOLICY.TBRBCLK.<br>The combination of the setting in this register and the reference tick used in RPOLICY.TBRBCLK determines how long the HW waits before issuing an automatic retry for master transactions.<br>A value of '0' indicates HW should retry the transaction without any additional delay.<br>***Note:*** Retry count is not applicable for retries due to collision on SMBus. Those must be retried as soon as SMBus is free.<br>This timer must be reloaded every time HW attempts a retry or a completely new cycle is initiated by FW.<br>***Note:*** (FW) Since the timer ticks in register RPOLICY.TBRBCLK are free running and not independently generated by HW, there is a possibility of inaccuracy in delay time. This inaccuracy is at most 1 complete duration of the timer tick, e.g. if 1ms tick is chosen the inaccuracy is never greater than 1ms. Hence FW should use its judgment in which timer tick is selected. Recommendation would be to use a faster tick so that the inaccuracy is smaller. |
| 15:14 | 0x0<br>RO | **RSVD1:** Reserved. |

Should HW NACK such an overflowing transaction it is the responsibility of the bus master to recover and retry.)<br>Default is defined for MCTP with 80B MCTP packet payload:<br>(8B) MCTP SMBus Packet Header (includes 4B SMBus medium-specific header and 4B MCTP transport header)<br>(80B) MCTP Packet Payload (1B) SMBus PEC = 89B --) 88d (0's-based encoding). |

## 49.3.19 TRxSTS—Offset 224h

This register is updated by HW for cycles received as a target. HW updates this register with every new target cycle received even during EP well power available. The contents are similar to the target header updates by HW, so refer to the header fields for explanation, unless noted below.

This register is primarily a debug feature. This register is updated based on HW responding to transactions on SMBus. There is no ordering maintained w.r.t. updating this register and header/data write back to memory.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [SMTBAR] + 224h

**Default:** 00000000h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO/V | **Payload Byte Count (PBC):** HW updates this field to indicate how many bytes were ACKed on SMBus sent by the external master and stored within the target buffer locally.<br>For writes coming in, this data will include the sum total of all bytes ACKed from 'start' to 'stop'.<br>For error scenarios where the master drives more data than expected or command code does not match, HW will update the count with all bytes ACKed on SMBus from 'Start' until the first byte NACKed by HW (this byte is not added to the count). |

| 21:16 | 0x0<br>RO/V | **Read Byte Count (RBC):** This byte count is for externally generated read transactions only.<br>HW updates this field to indicate the sum total of data bytes it successfully provided over SMBus to the external master. |
| 15:12 | 0x0<br>RO | **RSVD1:** Reserved. |
| 11:8 | 0x0<br>RO/V | **MTYPE:** Check the Target header description. |
| 7:4 | 0x0<br>RO/V | **TSTS:** Check the Target header description. |
| 3:0 | 0x0<br>RO/V | **TTYPE:** Check the Target header description. |

## 49.3.20 TACTRL—Offset 228h

Each address supported by SMT device must be unique since they all logically reside on the same SMBus segment.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [SMTBAR] + 228h

**Default:** 00000000h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved. |
| 15:9 | 0x0<br>RW | **Address1 (ADDR1):** FW programs this field with an address of the SMT logic. |
| 8 | 0x0<br>RO | **RSVD1:** Reserved. |
| 7:1 | 0x0<br>RW | **Address0 (ADDR0):** FW programs this field with an address of the SMT logic. |
| 0 | 0x0<br>RO | **RSVD2:** Reserved. |

## 49.3.21 TPOLICY—Offset 22Ch

The target addresses referenced above are located in the following registers:

- TACTRL.ADDR0
- TACTRL.ADDR1
- GPBRCTRL.GPTRADR

FW can write to this register to enable/disable functionality pertaining to a target address. FW requests HW to update the new policy by setting TPOLICY.PTUREQ register.

HW waits until all the pending target cycles are over, and copies the contents of this register into internal non-FW-visible register bits. Once it is done, HW clears the TPOLICY.PTUREQ register as confirmation to FW that the new policy is in effect. FW can always read this register and see the current policy that HW is using if the PTUREQ bit is cleared. Any setting or clearing of the policies in this register without setting the PTUREQ bit first must not cause HW to change policies.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [SMTBAR] + 22Ch

**Default:** 00000000h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/V/P | **Target Policy Update Request (PTUREQ):** FW sets this bit to indicate to the HW that it wants to update registers/policies in the target interface.<br>The new policy that the FW needs is programmed in the lower word of this register.<br>HW clears this bit when it has updated the new policy.<br>When this bit is cleared the other registers indicate the current policy in effect in HW. |
| 30:11 | 0x0<br>RO | **RSVD0:** Reserved. |
| 10 | 0x0<br>RW | **C2_BSY:** When set forces HW to ACK only matching C2h address byte and NACK in any subsequent bytes to indicate device is busy. |
| 9 | 0x0<br>RW | **Host Busy (HOSTBSY):** When set forces HW to ACK only matching 10h address byte and NACK in any subsequent bytes to indicate device is busy. |
| 8 | 0x0<br>RW | **ADDR1 Busy (ADDR1BSY):** When set forces HW to ACK only matching ADDR1 address byte and NACK in any subsequent bytes to indicate device is busy. |
| 7 | 0x0<br>RO | **RSVD1:** Reserved. |
| 6 | 0x0<br>RW | **ADDR0 Busy (ADDR0BSY):** When set forces HW to ACK only matching ADDR0 address byte and NACK in any subsequent bytes to indicate device is busy. |
| 5 | 0x0<br>RO | **RSVD2:** Reserved. |
| 4 | 0x0<br>RW/V/P | **Device Address0 Enable (ADDR0_EN):** When set, enables target logic to ACK ADDR0 address on the SMBus. Fuse load. |
| 3 | 0x0<br>RW/V/P | **Host SMBus Address Enable (Host_SMBADDR_EN):** When set, enables HW to accept write cycles targeting address 10h.<br>This bit must be set to '1' when SoC is the SMBus Segment Owner. Fuse load. |
| 2 | 0x0<br>RW | **Default SMBus Address Enable (DEF_SMBADDR_EN):** When set, enables HW to ACK cycles targeting address C2h, which is the SMBus default address. |
| 1 | 0x0<br>RW/V/P | **Device Address1 Enable (ADDR1_EN):** When set, enables target logic to ACK ADDR1 address on the SMBus. Fuse load. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 0 | 0x0<br>RW | **Target Enable (TGTEN):** Set to '1' by the FW after it has programmed the base address in the Target Data Ring Buffer and updated target policies.<br>While in default state '0' all bytes will be NACKed on SMBus including the address byte of the enabled addresses.<br>TGTEN applies to all target addresses: ADDR0_EN, ADDR1_EN, Host_SMBADDR_EN, DEF_SMBADDR_EN, and GPBRCTRL.EN. |

## 49.3.22 GPBRCTRL—Offset 240h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [SMTBAR] + 240h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/V/P | **Enable (EN):** This bit is set by FW to enable HW to respond to a block read command to address GPBRCTRL.GPTRADR and command GPBRCTRL.CMD.<br>HW clears this bit after HW ACKs the command code (CMD) on the Block Read command if GPBRCTRL.HWCLRDIS is cleared. |
| 30 | 0x0<br>RW | **PEC Enable (PECEN):** This bit is set by FW to indicate that HW must provide PEC at the end of the transaction to the external master. |
| 29 | 0x0<br>RW | **HW Clear Disable (HWCLRDIS):** This bit is set by FW to disable the HW from clearing of the GPBRCTRL.EN bit.<br>This functionality allows HW to continuously provide current data in the GPRDx registers to the external master without FW involvement.<br>When this bit is set, HW must start sending data from byte 0 (of the buffer behind GPBRDBUF) when responding to a new Block Read cycle. |
| 28 | 0x0<br>RW/V | **GPBR Buffer Contents Reset (BUFRST):** This bit is set by FW to reset (zero) the contents of the GPBR buffer ("GPBRDBUF—Offset 244h").<br>HW clears this bit after it has reset the GPBR buffer contents. |
| 27 | 0x0<br>RW/V | **GPBR Buffer Pointer Reset (PTRRST):** This bit is set by FW to reset the pointer into the GPBR buffer ("GPBRDBUF—Offset 244h").<br>HW clears this bit after it has reset the GPBR buffer pointer. |
| 26:24 | 0x0<br>RO | **RSVD0:** Reserved. |
| 23:16 | 0x0<br>RW | **Byte Count (BC):** Byte count indicating how many bytes are programmed in the Generic Read Data buffer ("GPBRDBUF—Offset 244h") by FW.<br>The maximum count is 32B, which is the maximum number of bytes that the buffer can hold.<br>On the block read, after HW matches the address and command, HW sends the contents of this byte on the SMBus and then sends out those many bytes from the Generic Read Data Buffer starting from the LSB of GPBRDBUF0 register, i.e. the byte 0 of GPBRDBUF0. |
| 15:8 | 0x0<br>RW | **Command (CMD):** Command byte of the block read command. |
| 7:0 | 0x0<br>RW/V/P | **General Purpose Target Read Address (GPTRADR):** Target address of the externally initiated Block Read command cycle. Bit [0] of this register is the 'Enable' for this address.<br>HW does not take any action based on the value of bit [0].<br>It is simply provided to FW for reading. Fuse load. |

## 49.3.23 GPBRDBUF—Offset 244h

This register is used to load data into the generic programmable read data buffer. The buffer is used to provide a mechanism of supporting generic programmable reads (GPBR) by an external SMBus master under FW initiated flow. The data buffer is filled by FW initiating DW writes to this register. A hidden pointer always points to the next available buffer location reading and writing to GPBRDBUF cause the pointer to increment automatically.

Because the pointer auto-increments after each write, a read of GPBRDBUF will NOT return the most recently written data. Normal usage requires the buffer contents to be cleared prior to filling it with a new data payload, therefore a read (of the next 'empty' location) will return 0s (See also GPBRCTRL.BUFRST and GPBRCTRL.PTRRST).

HW provides read data payload starting from bit [7:0] of Dword0 of the buffer, then bit [15:8] of Dword0, and so on. All bytes must be programmed in the sequence to be sent out without gaps. HW will simply count the number of bytes indicated in the GPBRCTRL.BC register and start sending them out sequentially starting at byte 0 of Dword 0 until the byte count is decremented to 0.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [SMTBAR] + 244h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **Data DWORD (GPBRD):** Reserved. |

## 49.3.24 SMTARPCTRL—Offset 280h

The flags AV0 and AR0 refer to UDID0 and its corresponding target address TACTRL.ADDR0. The flags AV1 and AR1 refer to UDID1 and its corresponding target address TACTRL.ADDR1.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [SMTBAR] + 280h

**Default:** 00000000h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Disable 'Notify ARP Master' (NOTIFYD):** If asserted, the SMT will not issue a 'Notify ARP Master' command.<br>Otherwise, if SMT is not the ARP Host, it is permitted to issue a 'Notify ARP Master' command. |
| 30:7 | 0x0<br>RO | **RSVD0:** Reserved. |
| 6 | 0x0<br>RW | **Address Resolved (AR1):** If asserted, the device's slave address has been resolved by the ARP Master. |
| 5 | 0x0<br>RW | **Address Valid (AV1):** If asserted, the device's slave address is valid. |
| 4 | 0x0<br>RW | **UDID1 Enable (UDID1E):** If cleared the SMT will not ACK or respond to ARP transactions directed to UDID1. |
| 3 | 0x0<br>RO | **RSVD1:** Reserved |
| 2 | 0x0<br>RW | **Address Resolved (AR0):** If asserted, the device's slave address has been resolved by the ARP Master. |
| 1 | 0x0<br>RW | **Address Valid (AV0):** If asserted, the device's slave address is valid. |
| 0 | 0x0<br>RW | **UDID0 Enable (UDID0E):** If cleared the SMT will not ACK or respond to ARP transactions directed to UDID0. |

## 49.3.25 UDID0—Offset 290h

These bits are programmed by FW and are provided by the HW to external master when it initiates a Directed Get UDID Block Read command (with PEC) to UDID0's SMBus target address.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [SMTBAR] + 290h

**Default:** 8086000000000000h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:48 | 0x8086<br>RO | **Subsystem Vendor ID (SVID):** Subsystem Vendor ID Indicates that the device subsystem vendor is Intel. |
| 47:32 | 0x0<br>RO | **Subsystem Device ID (SDID):** Subsystem Device ID. |
| 31:0 | 0x0<br>RW/V/P | **Vendor Specific ID (VSID):** Vendor Specific ID must uniquely identify this device when dynamic, volatile addressing is enabled.<br>At least 24 bits should be provided from fuses to uniquely identify over 16 million the SoC devices (without resorting to other revision fields). Fuse load |

## 49.3.26 UUDID0—Offset 298h

These bits are programmed by FW and are provided by the HW to external master when it initiates a Directed Get UDID Block Read command (with PEC) to UDID0 SMBus target address.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [SMTBAR] + 298h

**Default:** 8108808600000024h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:56 | 0x81<br>RW | **Device Capabilities (DEVCAP):** Device Capabilities by default indicate that the device is a dynamic and volatile address device which supports PEC.<br>FW may modify the capability, for instance to behave as a fixed-address device. |
| 55:48 | 0x8<br>RO | **Version/Revision (RID):** Version/ Revision indicating UDID version 1 and Revision 0 of the silicon. |
| 47:32 | 0x8086<br>RO | **Vendor ID (VID):** Vendor ID indicates that the device vendor is Intel. |
| 31:16 | 0x0<br>RO | **Device ID (DID):** Device ID. |
| 15:0 | 0x24<br>RW | **Interface (INTF):** Interface field indicates that the device supports SMBus 2.0 and its ASF capabilities bit set. |

## 49.3.27 UDID1—Offset 2A0h

These bits are programmed by FW and are provided by the HW to external master when it initiates a Directed Get UDID Block Read command (with PEC) to UDID1 SMBus target address.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [SMTBAR] + 2A0h

**Default:** 8086000000000000h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:48 | 0x8086<br>RO | **Subsystem Vendor ID (SVID):** Subsystem Vendor ID Indicates that the device subsystem vendor is Intel. |
| 47:32 | 0x0<br>RO | **Subsystem Device ID (SDID):** Subsystem Device ID. |
| 31:0 | 0x0<br>RW/V/P | **Vendor Specific ID (VSID):** Vendor Specific ID must uniquely identify this device when dynamic, volatile addressing is enabled.<br>At least 24 bits should be provided from fuses to uniquely identify over 16 million the SoC devices (without resorting to other revision fields). Fuse load |

## 49.3.28 UUDID1—Offset 2A8h

These bits are programmed by FW and are provided by the HW to external master when it initiates a Directed Get UDID Block Read command (with PEC) to UDID1's SMBus target address.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**BAR and Offset:** [SMTBAR] + 2A8h

**Default:** 8108808600000024h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:56 | 0x81<br>RW | **Device Capabilities (DEVCAP):** Device Capabilities by default indicate that the device is a dynamic and volatile address device which supports PEC.<br>FW may modify the capability, for instance to behave as a fixed-address device. |
| 55:48 | 0x8<br>RO | **Version/Revision (RID):** Version/ Revision indicating UDID version 1 and Revision 0 of the silicon. |
| 47:32 | 0x8086<br>RO | **Vendor ID (VID):** Vendor ID indicates that the device vendor is Intel. |
| 31:16 | 0x0<br>RO | **Device ID (DID):** Device ID. |
| 15:0 | 0x24<br>RW | **Interface (INTF):** Interface field indicates that the device supports SMBus 2.0 and its ASF capabilities bit set. |

## 49.3.29 SPGT—Offset 300h

Setting of these timing parameters by FW, will affect both master and target timing on the physical.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [SMTBAR] + 300h

**Default:** 00000005h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0<br>RW/V/P | **SMBus Speed (SPD):** Value to indicate what speed physical bus must operate.<br>It is up to the system designer to ensure that all devices on the same SMBus segment are capable of operating at the programmed speed.<br>• 00: Standard (80 kHz).<br>• 01: Standard (100 kHz).<br>• 10: Fast Mode (400 kHz).<br>• 11: Fast Mode Plus (1 MHz). |
| 29 | 0x0<br>RW | **Speed Lock (SPDLK):** FW sets this register if it overrides the settings of SPGT.SPD register.<br>If this bit is set, HW must not load the SPGT.SPD from the soft strap. |
| 28:20 | 0x0<br>RO | **RSVD0:** Reserved. |
| 19:16 | 0x0<br>RW | **T-Hold Data (THDDAT):** The value in this field will be added to the Thddat timing parameter as defined in the SMBus 2.0 spec.<br>• 0000: 0 Clocks (0ns).<br>• 0001: 1 Clocks (10ns).<br>• 0010: 2 Clocks (20ns).<br>• ...<br>• 1111: 15 Clocks (150ns). |
| 15:12 | 0x0<br>RO | **RSVD1:** Reserved. |
| 11:8 | 0x0<br>RW | **T-Setup Data (TSUDAT):** The value in this field will be added to the Tsudat timing parameter as defined in the SMBus 2.0 spec.<br>• 0000: 0 Clocks (0ns).<br>• 0001: 1 Clocks (10ns).<br>• 0010: 2 Clocks (20ns).<br>• ...<br>• 1111: 15 Clocks (150ns). |
| 7:0 | 0x5<br>RW | **De-Glitch (DG):** The value in this field defines the minimum de-glitch pulse that the de-glitch logic will reject from the SMBus clock and data lines.<br>• 000000xx: No de-glitch.<br>• 00000100: 4 Clocks (40ns glitch pulse).<br>• 00000101: 5 Clocks (50ns glitch pulse).<br>• ...<br>• 11111111: 255 Clocks (2550ns glitch pulse). |

## 49.3.30 SPMT—Offset 304h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 08080000h

**BAR and Offset:** [SMTBAR] + 304h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x8<br>RW | **Time high (Thigh):** The value in this field will be added/subtracted to the Thigh timing parameter as defined in the SMBus 2.0 spec.<br>• 00000000: 0 Clock (0ns).<br>• 00000001: -1 Clock (-10ns).<br>• ...<br>• 00000111: -7 Clocks (-70ns).<br>• 00001000: 0 Clock (0ns).<br>• 00001001: +1 Clock (+10ns).<br>• ...<br>• 11111111: +247 Clocks (+2,470ns).<br>These are offsets that control the range of the nominal Thigh value in the PHY layers. |
| 23:16 | 0x8<br>RW | **Time low (Tlow):** The value in this field will be added/subtracted to the Tlow timing parameter as defined in SMBus 2.0 spec. See Thigh field above for encoding. |
| 15:12 | 0x0<br>RW | **Thdsta:** The time value in this field will be added/subtracted to the Thdsta timing parameter as defined in SMBus 2.0 spec.<br>• 1111: -7 Clocks (-70ns).<br>• 1110: -6 Clocks (-60ns).<br>• ...<br>• x000: 0 Clock (0ns).<br>• 0001: +1 Clock (+10ns).<br>• ...<br>• 0111: +7 Clocks (+70ns). |
| 11:8 | 0x0<br>RW | **Tsusta:** The time value in this field will be added/subtracted to the Tsusta timing parameter as defined in SMBus 2.0 spec. See Thdsta field above. |
| 7:4 | 0x0<br>RW | **Tbuf:** The time value in this field will be added/subtracted to the Tbuf timing parameter as defined in SMBus 2.0 spec. See Thdsta field above. |
| 3:0 | 0x0<br>RW | **Tsusto:** The time value in this field will be added/subtracted to the Tsusto timing parameter as defined in SMBus 2.0 spec. See Thdsta field above. |

## 49.3.31 SPST—Offset 308h

These values should only be changed when the physical is idle. These timings are based off the 100-MHz PHY clock. A higher-frequency PHY clock will scale the timings accordingly.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [SMTBAR] + 308h

**Default:** 00000000h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RW | **Slave Tlow Extension (Slave_Tlow_Ext):** The time value in this field will be added to the SMBCLK Tlow extension timing parameter on a per bit basis.<br>• 00000000: 0 Clock (0ns).<br>• 00000001: 1 Clock (10ns).<br>• ----<br>• 11111111: 255 Clocks (2,550ns).<br>These Tlow extensions are only visible when set ) Tlow:min as defined in the SMBus 2.0 spec.<br>The slave will attempt to stretch the CLK on every bit, thus slowing down the entire bus segment, regardless of whether it is currently the target addressed by an external master. |
| 23:12 | 0x0<br>RO | **RSVD0:** Reserved. |
| 11:8 | 0x0<br>RW | **Slave Tsusta (Slave_Tsusta):** The time value in this field will be added/subtracted to the detection of Tsusta timing parameter as defined in SMBus 2.0 spec.<br>• 1111: -7 Clocks (-70ns).<br>• 1110: -6 Clocks (-60ns).<br>• ----<br>• x000: 0 Clock (0ns).<br>• 0001: +1 Clock (+10ns).<br>• ----<br>• 0111: +7 Clocks (+70ns).<br>These are offsets that control the range of the nominal Tsusta value detected as a slave the PHY layers. |
| 7:4 | 0x0<br>RW | **Slave Tthdsta (Slave_Tthdsta):** The time value in this field will be added/subtracted to the detection of Thdsta timing parameter as defined in SMBus 2.0 spec. See Slave_Tsusta field above. |
| 3:0 | 0x0<br>RW | **Slave Ttsusto (Slave_Ttsusto):** The time value in this field will be added/subtracted to the detection of Tsusto timing parameter as defined in SMBus 2.0 spec. See Slave_Tsusta field above. |

## 49.3.32 SMBFT—Offset 30Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00002024h

**BAR and Offset:** [SMTBAR] + 30Ch

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO/V | **Fair Flag (FF):** HW sets this bit when it has mastered a cycle by processing a descriptor in which 'FAIR' control bit was set.<br>This flag when set is an internal state for the HW to wait longer before it attempts to master the next cycle on SMBus.<br>The next cycle does not necessarily have to be descriptor-based or have the 'FAIR' bit set in the descriptor if it is descriptor-based.<br>Mastering a cycle is defined as when HW attempts to do a SMBus block write and in the data phase following byte count it sees its own SMBus address (with RW bit = 1) on the SMBus.<br>This is per MCTP spec. HW clears this flag after the expiry of SMBFT.SFIC. |
| 30:16 | 0x0<br>RO | **RSVD0:** Reserved. |
| 15:8 | 0x20<br>RW | **SMBus Start Delay (SSD):** This count is the number of ticks (in increments of 1us) that HW must count after SMBFT.FF is cleared before it can attempt to master another SMBus cycle.<br>HW must look for transition of SMBFT.FF bit to transition from 1-)0 before it starts counting off this delay time.<br>• 0h: Reserved (see note).<br>• 1h: Reserved (see note).<br>• 2h: 2us.<br>• ...<br>• FFh: 255us.<br>***Note:*** The base delay for this in each timing mode is defined as T_IDLE_DELAY in MCTP spec.<br>For Standard Mode (100kHz) or lower SMBus operation the minimum is 31us.<br>For Fast Mode (400kHz) the minimum is 16us.<br>For Fast Mode Plus (1MHz) the minimum is 10us (MCTP over SMBus/I2C spec has no definition of timings for Fast Mode Plus).<br>The 1us tick used by the HW to count off this delay is not internally generated in SMBus controller, hence the count could be off by a 1us tick therefore 1us guard band should be added to compensate for this. |
| 7:0 | 0x24<br>RW | **SMBus Fair Idle Count (SFIC):** This count represents the minimum SMBus Idle Time (in increments of 1us) that the HW must detect after SMBus Stop is seen before clearing the SMBFT.FF register.<br>• 0h: reserved (see note).<br>• 1h: reserved (see note).<br>• 2h: 2us.<br>• ...<br>• FFh: 255us.<br>***Note:*** The base delay for Fair Idle Count timings is designed to match the T_IDLE_WINDOW minimum plus T_BUF.<br>For Standard Mode (100kHz) or lower SMBus operation the window is 30-60us to which must be added 4.7us (T_BUF).<br>For Fast Mode (400kHz) the window is 5-20us to which must be added 1.3us (T_BUF).<br>For Fast Mode Plus (1MHz) the window is 3us to which must be added 0.5us (T_BUF) (MCTP over SMBus/I2C spec has no definition of timings for Fast Mode Plus.).<br>The 1us tick used by the HW to count off this delay is not internally generated in SMBus controller, hence the count could be off by a 1us tick therefore 1us guard band should be added to compensate for this. |

## 49.3.33 CLTC—Offset 310h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 000015E1h

**BAR and Offset:** [SMTBAR] + 310h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved. |
| 15:4 | 0x15e<br>RW | **Count (CNT):** FW sets this to the desired count that the HW must count while SMBus clock is low before flagging SMBus Clock Low Timeout.<br>• 0h: Reserved (see note for BCLK).<br>• 1h: Reserved (see note for BCLK).<br>• Others: Count per BCLK.<br>Default value is set to provide 35ms clock low timeout detection (for default 100us BCLK). |
| 3 | 0x0<br>RO | **RSVD1:** Reserved. |
| 2:0 | 0x1<br>RW | **Base Clock (BCLK):** FW programs this register to set the granularity of the count.<br>The value in this register selects which timer ticks are used to count off the value programmed in CLTC.CNT register.<br>• 000: 10us.<br>• 001: 100us (default).<br>• 010: 1ms.<br>• 011: 10ms.<br>• 100: 100ms.<br>• Others: Reserved.<br>The timer ticks are not internally generated by HW hence the count could be off by 1 timer tick. |

## 49.3.34 DCLKGT—Offset 380h

By default, clock gating is enabled in HW. However in case clock gating has to be disabled in HW, FW can set these register bits to disable clock gating at the individual levels defined below.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 80000000h

**BAR and Offset:** [SMTBAR] + 380h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x1<br>RW | **Global Clock Gating Enable (GCGE):** This bit when set enables dynamic clock gating of the transaction, link, and PHY layers.<br>When set, HW enables global clock gating and the other register policies are followed (DCLKGT bits [6:0]). When cleared, HW disables all clock gating and overrides the policies set by DCLKGT bits [6:0]. |
| 30:0 | 0x0<br>RO | **RSVD0:** Reserved. |

## 49.3.35 SUSCHKB—Offset 384h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000011h

**BAR and Offset:** [SMTBAR] + 384h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RO | **RSVD0:** Reserved. |
| 5 | 0x0<br>RW | **NOA Select (NOASEL):** When set allows NOA signals of instance #2 of SMT to be viewed on NOA for debug purposes. |
| 4 | 0x1<br>RW | **Auto Slave Clock Low Disable (ASCKLDIS):** When set disables the auto-clock low stretching by the slave. |
| 3 | 0x0<br>RW | **25ms Timeout Detection Enable (TODE25):** When set bypasses the FW controlled Clock low timeout detection and reverts back to fixed 25ms Clock low timeout detection. |
| 2 | 0x0<br>RO | **RSVD1:** Reserved. |
| 1 | 0x0<br>RW | **Ignore R/W bit on Start Address (IRWST):** When set, HW ignores the value of R/W bit on the start address for all of its SMBus target addresses.<br>HW just matches bits [7:1] to ACK the address.<br>If this bit is clear and R/W bit does not match, HW will ACK the address on SMBus, but will NACK all further bytes until stop is seen.<br>There is no FW notification for this transaction.<br>Cycles targeting address C2h and 10h are also applicable to this policy. |
| 0 | 0x1<br>RW | **Ignore R/W bit on Repeated Start Address (IRWRST):** When set, HW ignores the value of R/W bit on the repeated start address for an SMBus transaction.<br>HW just matches bits [7:1] on repeated start address.<br>Cycles targeting address C2h are also applicable to this policy. |

## 49.3.36 DBCTRL—Offset 388h

*Note:* For FW: HW provides the FW a generic ability to bit bang on the SMBUs. It is however the responsibility of the FW that: HW DMA engine is completely stopped and no transactions are pending within HW, HW target interface is disabled, and SMBus is idle prior to bit banging. FW must guarantee all SMBus protocol and timing.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [SMTBAR] + 388h

**Default:** 00000003h

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Enable (EN):** This register is set by FW when it is bit banging on SMBus.<br>This bit must always be set when FW is bit banging on SMBus.<br>FW must clear this bit when it is done bit banging.<br>It is recommended that FW first set the enable bit before it starts bit banging on the clock and data line. |
| 30:2 | 0x0<br>RO | **RSVD0:** Reserved. |
| 1 | 0x1<br>RW | **SMBus Clock (SMBCK):** This register provides ability for the FW to bit bang directly on the SMBus Clock pin.<br>When FW writes a '0' to this register, HW will drive the SMBus Clock low. |
| 0 | 0x1<br>RW | **SMBus Data (SMBDT):** This register provides ability for the FW to bit bang directly on the SMBus Data pin.<br>When FW writes a '0' to this register, HW will drive the SMBus Data low. |

## 49.3.37 DBSTS—Offset 38Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000300h

**BAR and Offset:** [SMTBAR] + 38Ch

**SMTBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMTBAR Reference:** [B:0, D:18, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 0x0<br>RO | **RSVD0:** Reserved. |
| 9 | 0x1<br>RO/V | **SMBus Clock (SMBCK):** This register shows the live state of SMBus clock signal as seen by HW from the buffer after HW deglitch and synchronization. |
| 8 | 0x1<br>RO/V | **SMBus Data (SMBDT):** This register shows the live state of SMBus data signal as seen by HW from the buffer after HW deglitch and synchronization. |
| 7 | 0x0<br>RO/C | **SMBus Clock Change (SMBCKC):** This register when set indicates that there was a 1-)0 or 0-)1 transition on SMBus clock line.<br>This register is cleared by HW on reads by FW. |
| 6 | 0x0<br>RO/C | **SMBus Data Change (SMBDC):** This register when set indicates that there was a 1-)0 or 0-)1 transition on SMBus data line.<br>This register is cleared by HW on reads by FW. |
| 5:3 | 0x0<br>RO | **RSVD1:** Reserved. |
| 2:0 | 0x0<br>RO/V | **Last SMBus State (LSMBS):** This register reflects the last seen state of the SMBus.<br>Since the SMBus state is dynamic, it is advised that FW use its judgment when interpreting this data.<br>• 000: SMBus Idle.<br>• 001: Start Seen.<br>• 010: ACK Seen.<br>• 011: Repeated Start Seen.<br>• 100: Stop Seen.<br>• 101: Reserved.<br>• 110: Reserved.<br>• 111: Reserved |

§ §

# 50 SATA Controllers - B0, D(19, 20), F0

## 50.1 Introduction and Index

The host-accessible registers for the SATA Controllers are described here.

To determine the number of devices/functions available refer to the following:

- Intel Atom® Processor C3000 Product Family
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

### 50.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 19 (decimal), Function 0. Another set of configuration registers start at Bus 0, Device 20 (decimal), Function 0. The offset addresses are listed.

**Table 50-1. Summary of PCI Configuration Registers—0/19 (or 20)/0**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 1C028086 | "Identifiers (ID)—Offset 0h" on page 1879 |
| 4 | 2 | 0000 | "Command (CMD)—Offset 4h" on page 1880 |
| 6 | 2 | 02B0 | "Device Status (STS)—Offset 6h" on page 1881 |
| 8 | 1 | 00 | "Revision ID (RID)—Offset 8h" on page 1882 |
| 9 | 1 | 01 | "Programming Interface (PI)—Offset 9h" on page 1882 |
| A | 2 | 0106 | "Class Code (CC)—Offset Ah" on page 1882 |
| 10 | 4 | 00000000 | "MSI-X Table Base Address (MXTBA)—Offset 10h" on page 1883 |
| 18 | 4 | 00000001 | "SCMDBA—Offset 18h" on page 1884 |
| 1C | 4 | 00000001 | "SCTLBA—Offset 1Ch" on page 1884 |
| 20 | 4 | 00000001 | "AHCI Index Data Pair Base Address (AIDPBA)—Offset 20h" on page 1885 |
| 24 | 4 | 00000000 | "AHCI Base Address (ABAR)—Offset 24h" on page 1886 |
| 34 | 1 | 80 | "Capabilities Pointer (CAP)—Offset 34h" on page 1887 |
| 3C | 2 | 0100 | "Interrupt Information (INTR)—Offset 3Ch" on page 1887 |
| 70 | 2 | A801 | "PCI Power Management Capability ID (PID)—Offset 70h" on page 1887 |
| 72 | 2 | 4003 | "PCI Power Management Capabilities (PC)—Offset 72h" on page 1888 |

## 50.1.2 Host Memory Space—MXTBA

An index of the registers that are accessible in Host Memory Space is shown here.

**Table 50-2. Summary of Memory Mapped I/O Registers—MXTBA**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 00000000 | "MSI-X Table Entries n Message Lower Address (MXTEnMLA)" on page 1904 |
| 4 | 4 | 00000000 | "MSI-X Table Entries n Message Upper Address (MXTEnMUA)" on page 1904 |
| 8 | 4 | 00000000 | "MSI-X Table Entries n Message Data (MXTEnMD)" on page 1905 |
| 10 | 4 | 00000000 | "MSI-X Table Entries n Message Lower Address (MXTEnMLA)" on page 1904 |
| 14 | 4 | 00000000 | "MSI-X Table Entries n Message Upper Address (MXTEnMUA)" on page 1904 |
| 18 | 4 | 00000000 | "MSI-X Table Entries n Message Data (MXTEnMD)" on page 1905 |
| 20 | 4 | 00000000 | "MSI-X Table Entries n Message Lower Address (MXTEnMLA)" on page 1904 |
| 24 | 4 | 00000000 | "MSI-X Table Entries n Message Upper Address (MXTEnMUA)" on page 1904 |
| 28 | 4 | 00000000 | "MSI-X Table Entries n Message Data (MXTEnMD)" on page 1905 |
| 30 | 4 | 00000000 | "MSI-X Table Entries n Message Lower Address (MXTEnMLA)" on page 1904 |
| 34 | 4 | 00000000 | "MSI-X Table Entries n Message Upper Address (MXTEnMUA)" on page 1904 |
| 38 | 4 | 00000000 | "MSI-X Table Entries n Message Data (MXTEnMD)" on page 1905 |
| 40 | 4 | 00000000 | "MSI-X Table Entries n Message Lower Address (MXTEnMLA)" on page 1904 |
| 44 | 4 | 00000000 | "MSI-X Table Entries n Message Upper Address (MXTEnMUA)" on page 1904 |
| 48 | 4 | 00000000 | "MSI-X Table Entries n Message Data (MXTEnMD)" on page 1905 |
| 50 | 4 | 00000000 | "MSI-X Table Entries n Message Lower Address (MXTEnMLA)" on page 1904 |
| 54 | 4 | 00000000 | "MSI-X Table Entries n Message Upper Address (MXTEnMUA)" on page 1904 |
| 58 | 4 | 00000000 | "MSI-X Table Entries n Message Data (MXTEnMD)" on page 1905 |
| 60 | 4 | 00000000 | "MSI-X Table Entries n Message Lower Address (MXTEnMLA)" on page 1904 |
| 64 | 4 | 00000000 | "MSI-X Table Entries n Message Upper Address (MXTEnMUA)" on page 1904 |
| 68 | 4 | 00000000 | "MSI-X Table Entries n Message Data (MXTEnMD)" on page 1905 |
| 70 | 4 | 00000000 | "MSI-X Table Entries n Message Lower Address (MXTEnMLA)" on page 1904 |
| 74 | 4 | 00000000 | "MSI-X Table Entries n Message Upper Address (MXTEnMUA)" on page 1904 |
| 78 | 4 | 00000000 | "MSI-X Table Entries n Message Data (MXTEnMD)" on page 1905 |

### 50.1.3 Host Memory Space—ABAR

An index of the registers that are accessible in Host Memory Space is shown here.

**Table 50-3. Summary of Memory Mapped I/O Registers—ABAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | FF36FF07 | "HBA Capabilities (GHC_CAP)—Offset 0h" on page 1906 |
| 4 | 4 | 80000000 | "HBA Capabilities (GHC_CAP)—Offset 0h" on page 1906 |
| 8 | 4 | 00000000 | "Interrupt Status Register (IS)—Offset 8h" on page 1909 |
| C | 4 | 00000000 | "Ports Implemented (GHC_PI)—Offset Ch" on page 1910 |
| 10 | 4 | 00010300 | "AHCI Version (VS)—Offset 10h" on page 1911 |
| 20 | 4 | 07010000 | "Enclosure Management Control (EM_CTL)—Offset 20h" on page 1912 |
| 24 | 4 | 0000003C | "HBA Capabilities Extended (GHC_CAP2)—Offset 24h" on page 1914 |
| A0 | 4 | 00000048 | "Vendor Specific (VSP)—Offset A0h" on page 1915 |
| C0 | 4 | 00311C02 | "RAID Platform ID (RPID)—Offset C0h" on page 1917 |
| C8 | 2 | 003F | "SW Feature Mask (SFM)—Offset C8h" on page 1918 |
| 100 | 4 | 00000000 | "Port [0-7] Command List Base Address (PxCLB0)—Offset 100h" on page 1919 |
| 104 | 4 | 00000000 | "Port [0-7] Command List Base Address Upper 32-bits (PxCLBU0)—Offset 104h" on page 1919 |
| 108 | 4 | 00000000 | "Port [0-7] FIS Base Address (PxFB0)—Offset 108h" on page 1920 |
| 10C | 4 | 00000000 | "Port [0-7] FIS Base Address Upper 32-bits (PxFBU0)—Offset 10Ch" on page 1920 |
| 110 | 4 | 00000000 | "Port [0-7] Interrupt Status (PxIS0)—Offset 110h" on page 1921 |
| 114 | 4 | 00000000 | "Port [0-7] Interrupt Enable (PxIE0)—Offset 114h" on page 1923 |
| 118 | 4 | 00000004 | "Port [0-7] Command (PxCMD0)—Offset 118h" on page 1924 |
| 128 | 4 | 00000000 | "Port [0-7] Serial ATA Status (PxSSTS0)—Offset 128h" on page 1926 |
| 12C | 4 | 00000000 | "Port [0-7] Serial ATA Control (PxSCTL0)—Offset 12Ch" on page 1926 |
| 130 | 4 | 00000000 | "Port [0-7] Serial ATA Error (PxSERR0)—Offset 130h" on page 1927 |
| 134 | 4 | 00000000 | "Port [0-7] Serial ATA Active (PxSACT0)—Offset 134h" on page 1927 |
| 138 | 4 | 00000000 | "Port [0-7] Commands Issued (PxCI0)—Offset 138h" on page 1927 |
| 13C | 4 | 00000000 | "Port [0-7] SNotification (PxSNTF0)—Offset 13Ch" on page 1928 |
| 180 | 4 | 00000000 | "Port [0-7] Command List Base Address (PxCLB1)—Offset 180h" on page 1928 |
| 184 | 4 | 00000000 | "Port [0-7] Command List Base Address Upper 32-bits (PxCLBU1)—Offset 184h" on page 1928 |
| 188 | 4 | 00000000 | "Port [0-7] FIS Base Address (PxFB1)—Offset 188h" on page 1929 |
| 18C | 4 | 00000000 | "Port [0-7] FIS Base Address Upper 32-bits (PxFBU1)—Offset 18Ch" on page 1929 |
| 190 | 4 | 00000000 | "Port [0-7] Interrupt Status (PxIS1)—Offset 190h" on page 1930 |
| 194 | 4 | 00000000 | "Port [0-7] Interrupt Enable (PxIE1)—Offset 194h" on page 1932 |
| 198 | 4 | 00000004 | "Port [0-7] Command (PxCMD1)—Offset 198h" on page 1933 |
| 1A8 | 4 | 00000000 | "Port [0-7] Serial ATA Status (PxSSTS1)—Offset 1A8h" on page 1935 |
| 1AC | 4 | 00000000 | "Port [0-7] Serial ATA Control (PxSCTL1)—Offset 1ACh" on page 1935 |
| 1B0 | 4 | 00000000 | "Port [0-7] Serial ATA Error (PxSERR1)—Offset 1B0h" on page 1936 |
| 1B4 | 4 | 00000000 | "Port [0-7] Serial ATA Active (PxSACT1)—Offset 1B4h" on page 1936 |
| 1B8 | 4 | 00000000 | "Port [0-7] Commands Issued (PxCI1)—Offset 1B8h" on page 1936 |

## Table 50-3. Summary of Memory Mapped I/O Registers—ABAR (Continued)

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 1BC | 4 | 00000000 | "Port [0-7] SNotification (PxSNTF1)—Offset 1BCh" on page 1937 |
| 200 | 4 | 00000000 | "Port [0-7] Command List Base Address (PxCLB2)—Offset 200h" on page 1937 |
| 204 | 4 | 00000000 | "Port [0-7] Command List Base Address Upper 32-bits (PxCLBU2)—Offset 204h" on page 1937 |
| 208 | 4 | 00000000 | "Port [0-7] FIS Base Address (PxFB2)—Offset 208h" on page 1938 |
| 20C | 4 | 00000000 | "Port [0-7] FIS Base Address Upper 32-bits (PxFBU2)—Offset 20Ch" on page 1938 |
| 210 | 4 | 00000000 | "Port [0-7] Interrupt Status (PxIS2)—Offset 210h" on page 1939 |
| 214 | 4 | 00000000 | "Port [0-7] Interrupt Enable (PxIE2)—Offset 214h" on page 1941 |
| 218 | 4 | 00000004 | "Port [0-7] Command (PxCMD2)—Offset 218h" on page 1942 |
| 228 | 4 | 00000000 | "Port [0-7] Serial ATA Status (PxSSTS2)—Offset 228h" on page 1944 |
| 22C | 4 | 00000000 | "Port [0-7] Serial ATA Control (PxSCTL2)—Offset 22Ch" on page 1944 |
| 230 | 4 | 00000000 | "Port [0-7] Serial ATA Error (PxSERR2)—Offset 230h" on page 1945 |
| 234 | 4 | 00000000 | "Port [0-7] Serial ATA Active (PxSACT2)—Offset 234h" on page 1945 |
| 238 | 4 | 00000000 | "Port [0-7] Commands Issued (PxCI2)—Offset 238h" on page 1945 |
| 23C | 4 | 00000000 | "Port [0-7] SNotification (PxSNTF2)—Offset 23Ch" on page 1946 |
| 280 | 4 | 00000000 | "Port [0-7] Command List Base Address (PxCLB3)—Offset 280h" on page 1946 |
| 284 | 4 | 00000000 | "Port [0-7] Command List Base Address Upper 32-bits (PxCLBU3)—Offset 284h" on page 1946 |
| 288 | 4 | 00000000 | "Port [0-7] FIS Base Address (PxFB3)—Offset 288h" on page 1947 |

**Table 50-3. Summary of Memory Mapped I/O Registers—ABAR (Continued)**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 28C | 4 | 00000000 | "Port [0-7] FIS Base Address Upper 32-bits (PxFBU3)—Offset 28Ch" on page 1947 |
| 290 | 4 | 00000000 | "Port [0-7] Interrupt Status (PxIS3)—Offset 290h" on page 1948 |
| 294 | 4 | 00000000 | "Port [0-7] Interrupt Enable (PxIE3)—Offset 294h" on page 1950 |
| 298 | 4 | 00000004 | "Port [0-7] Command (PxCMD3)—Offset 298h" on page 1951 |

## 50.2 Registers in Configuration Space

### 50.2.1 Identifiers (ID)—Offset 0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 0h

**Default:** 1C028086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x1c02<br>RO | **Device ID (DID):** The specific value is dependent on config bits and fuses. |
| 15:0 | 0x8086<br>RO | **Vendor ID (VID):** 16-bit field which indicates the company vendor as Intel. |

## 50.2.2 Command (CMD)—Offset 4h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 4h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **RSVD0:** Reserved. |
| 10 | 0x0<br>RW | **Interrupt Disable (ID):** This disables pin-based INTx# interrupts.<br>This bit has no effect on MSI operation. When set, internal INTx# will not be generated.<br>When cleared, internal INTx# are generated if there is an interrupt and MSI is not enabled. |
| 9 | 0x0<br>RO | **Fast Back-to-Back Enable (FBE):** Reserved. |
| 8 | 0x0<br>RW | **SERR# Enable (SEE):** When set to 1, the HBA is allowed to generate SERR# on DPD or SATAGC.URD event that is enabled for SERR# generation.<br>When cleared to 0, it is not. |
| 7 | 0x0<br>RO | **Wait Cycle Enable (WCC):** Reserved. |
| 6 | 0x0<br>RW | **Parity Error Response Enable (PEE):** When set, the SATA Controller will corrupt the outbound DATA FIS CRC if a forwarded data parity error is indicated. |
| 5 | 0x0<br>RO | **VGA Palette Snooping Enable (VGA):** Reserved. |
| 4 | 0x0<br>RO | **Memory Write and Invalidate Enable (MWIE):** Reserved. |
| 3 | 0x0<br>RO | **Special Cycle Enable (SCE):** Reserved. |
| 2 | 0x0<br>RW | **Bus Master Enable (BME):** Controls the SATA Controller's ability to act as a master for data transfers.<br>This bit does not impact the generation of completions for split transaction commands. |
| 1 | 0x0<br>RW | **Memory Space Enable (MSE):** Controls access to the SATA Controller's target memory space (for AHCI). |
| 0 | 0x0<br>RW | **I/O Space Enable (IOSE):** Controls access to the SATA Controller's target I/O space. |

## 50.2.3 Device Status (STS)—Offset 6h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 6h

**Default:** 02B0h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C | **Detected Parity Error (DPE):** Set when the SATA Controller detects a parity error on its interface. |
| 14 | 0x0<br>RW/1C | **Signaled System Error (SSE):** Set when SATA Controller generates an SERR#. |
| 13 | 0x0<br>RW/1C | **Received Master-Abort Status (RMA):** Set when the SATA Controller receives a master abort to a cycle it generated. |
| 12 | 0x0<br>RW/1C | **Received Target-Abort Status (RTA):** Set when the SATA Controller receives a target abort to a cycle it generated. |
| 11 | 0x0<br>RW/1C | **Signaled Target-Abort Status (STA):** This bit must be set by a target device whenever it terminates a transaction with Target-Abort.<br>Devices that will never signal Target-Abort do not need to implement this bit. |
| 10:9 | 0x1<br>RO | **DEVSEL# Timing Status (DEVT):** Controls the device select time for the SATA Controller's PCI interface. |
| 8 | 0x0<br>RW/1C | **Master Data Parity Error Detected (DPD):** Set when the SATA Controller, as a master, either detects a parity error or sees the parity error line asserted, and the parity error response bit (bit 6 of the command register) is set.<br>This bit can only be set on read completions received from the backbone where there is a parity error. |
| 7 | 0x1<br>RO | **Fast Back-to-Back Capable (FBC):** Reserved. |
| 6 | 0x0<br>RO | **RSVD0:** Reserved. |
| 5 | 0x1<br>RO | **66 MHz Capable (RSV):** Reserved. |
| 4 | 0x1<br>RO | **Capabilities List (CL):** Indicates the presence of a capabilities list. |
| 3 | 0x0<br>RO | **Interrupt Status (IS):** Reflects the state of INTx# messages, IRQ14 or IRQ15.<br>This bit is set when the interrupt is to be asserted.<br>This bit is a 0 after the interrupt is cleared. |
| 2:0 | 0x0<br>RO | **RSVD1:** Reserved. |

## 50.2.4 Revision ID (RID)—Offset 8h

**Type:** PCI Configuration Register
(Size: 8 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 8h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Revision ID (RID):** Indicates stepping of the host controller hardware. |

## 50.2.5 Programming Interface (PI)—Offset 9h

**Type:** PCI Configuration Register
(Size: 8 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 9h

**Default:** 01h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x1<br>RO | **Interface (IF):** If CC.SCC=06h(AHCI mode), it indicates that this is an AHCI HBA that has a major revision of 1 (as specified in the AHCI Version register).<br>If CC.SCC=04h(RAID mode), it indicates that there is no programming interface(IF=00h).<br>Internally, under this condition, the SATA controller is in native mode and its I/O spaces are only accessible through the I/O BARs. |

## 50.2.6 Class Code (CC)—Offset Ah

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:19 or 20, F:0] + Ah

**Default:** 0106h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x1<br>RO | **Base Class Code (BCC):** Indicates that this is a mass storage device. |
| 7:0 | 0x6<br>RO | **Sub Class Code (SCC):** The value reported in this field is dependent on SATAGC.SMS and various fuses and configuration bits. |

## 50.2.7 MSI-X Table Base Address (MXTBA)—Offset 10h

This BAR is used to allocate 32K, 16K or 8K Memory space for the MSI-X Table. The Memory space size is determined by BIOS by making bit-14 and bit-13 Read-Only '1' or Read-Write '0' based on SATAGC.MSS[1:0].

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:15 | 0x0<br>RW | **Base Address (BA):** Base address of memory space. |
| 14 | 0x0<br>RW | **Base Address Bit 14 (BAB14):** When SATAGC.MSS [1:0]=00, this bit is Read Only '0' else it's Read Write '0'. |
| 13 | 0x0<br>RW | **Base Address Bit 13 (BAB13):** When SATAGC.MSS [1:0]=00 or 01, this bit is Read Only '0' else it's Read Write '0'. |
| 12:4 | 0x0<br>RO | **RSVD0:** Reserved. |
| 3 | 0x0<br>RO | **Prefetchable (PF):** Indicates that this range is not prefetchable. |
| 2:1 | 0x0<br>RO | **Type (TP):** Indicates that this range can be mapped anywhere in 32-bit address space. |
| 0 | 0x0<br>RO | **Resource Type Indicator (RTE):** Indicates a request for Memory space. |

## 50.2.8 SCMDBA—Offset 18h

BAR2 register define a 8-byte I/O space but this space is not implemented. Accesses to this space will get master abort.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 18h

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved. |
| 15:3 | 0x0<br>RW | **Base Address (BAR):** Base address of the I/O space. |
| 2:1 | 0x0<br>RO | **RSVD1:** Reserved. |
| 0 | 0x1<br>RO | **Resource Type Indicator (RTE):** Indicates a request for IO space. |

## 50.2.9 SCTLBA—Offset 1Ch

BAR3 register define a 4-byte I/O space but this space is not implemented. Accesses to this space will get master abort.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 1Ch

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved. |
| 15:2 | 0x0<br>RW | **Base Address (BAR):** Base address of the I/O space. |
| 1 | 0x0<br>RO | **RSVD1:** Reserved. |
| 0 | 0x1<br>RO | **Resource Type Indicator (RTE):** Indicates a request for IO space. |

## 50.2.10 AHCI Index Data Pair Base Address (AIDPBA)—Offset 20h

This BAR is used to allocate I/O space for the AHCI index/data pair mechanism.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 20h

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved. |
| 15:5 | 0x0<br>RW | **Base Address (BA):** Base address of the I/O space. |
| 4:1 | 0x0<br>RO | **RSVD1:** Reserved. |
| 0 | 0x1<br>RO | **Resource Type Indicator (RTE):** Indicates a request for IO space. |

## 50.2.11 AHCI Base Address (ABAR)—Offset 24h

This register represents a memory BAR allocating space for the AHCI memory registers.

*Note:* Bit [31:16] of this register must be programmed to a value greater than 0 to ensure the memory is mapped to an address of 1 Mbyte and greater (i.e. ABAR must be 00010000h or greater). Otherwise, memory cycle targeting the ABAR range may not be accepted.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 24h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0x0<br>RW | **Base Address (BA):** Base address of register memory space. |
| 18 | 0x0<br>RW | **Base Address Bit 18 (BAB18):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 256K, this bit is Read Only '0' else it's Read Write '0'. |
| 17 | 0x0<br>RW | **Base Address Bit 17 (BAB17):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 128K, this bit is Read Only '0' else it's Read Write '0'. |
| 16 | 0x0<br>RW | **Base Address Bit 16 (BAB16):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 64K, this bit is Read Only '0' else it's Read Write '0'. |
| 15 | 0x0<br>RW | **Base Address Bit 15 (BAB15):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 32K, this bit is Read Only '0' else it's Read Write '0'. |
| 14 | 0x0<br>RW | **Base Address Bit 14 (BAB14):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 16K, this bit is Read Only '0' else it's Read Write '0'. |
| 13:11 | 0x0<br>RW | **Base Address Bit 13-11 (BAB1311):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 2K, this bit is Read Only '0' else it's Read Write '0'. |
| 10:4 | 0x0<br>RO | **RSVD0:** Reserved. |
| 3 | 0x0<br>RO | **Prefetchable (PF):** Indicates that this range is not prefetchable |
| 2:1 | 0x0<br>RO | **Type (TP):** Indicates that this range can be mapped anywhere in 32-bit address space. |
| 0 | 0x0<br>RO | **Resource Type Indicator (RTE):** Indicates a request for register memory space. |

## 50.2.12 Capabilities Pointer (CAP)—Offset 34h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 34h

**Default:** 80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x80<br>RW/L | **Capability Pointer (CP):** Indicates that the first capability pointer offset is offset 80h (the Message Signaled Interrupt capability).<br>The following capability structures are linked by default:<br>• (CAP.CP -) 80h<br>• (MSI) -) D0h<br>• (MSI-X)-) 70h<br>• (PCI Power) -) A8h<br>• (SATA) -) 00h end. |

## 50.2.13 Interrupt Information (INTR)—Offset 3Ch

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 3Ch

**Default:** 0100h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x1<br>RW/O | **Interrupt Pin (IPIN):** This register tells which interrupt pin the device function uses.<br>• A value of 1 corresponds to INTA#.<br>• A value of 2 corresponds to INTB#.<br>• A value of 3 corresponds to INTC#.<br>• A value of 4 corresponds to INTD#.<br>This register is not reset by FLR. |
| 7:0 | 0x0<br>RW | **Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to.<br>No hardware action is taken on this register.<br>Interrupt Line register is not reset by FLR. |

## 50.2.14 PCI Power Management Capability ID (PID)—Offset 70h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 70h

**Default:** A801h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0xa8<br>RW/L | **Next Capability (NEXT):** A8h is location of the Serial ATA Capability structure.<br>The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function.<br>Refer to SATAGC.REGLOCK description in order to lock the register to become RO.<br>This register is not reset by FLR. |
| 7:0 | 0x1<br>RO | **Cap ID (CID):** Indicates that this pointer is a PCI power management capability. |

## 50.2.15 PCI Power Management Capabilities (PC)—Offset 72h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 72h

**Default:** 4003h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x8<br>RO | **PME_Support:** The default value is 01000 which indicates PME# can be generated from the D3HOT state in the SATA controller. |
| 10 | 0x0<br>RO | **D2_Support:** The D2 state is not supported. |
| 9 | 0x0<br>RO | **D1_Support:** The D1 state is not supported. |
| 8:6 | 0x0<br>RO | **Aux_Current:** PME# from D3COLD state is not supported, therefore this field is 000b. |
| 5 | 0x0<br>RO | **Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required. |
| 4 | 0x0<br>RO | **RSVD0:** Reserved |
| 3 | 0x0<br>RO | **PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#. |
| 2:0 | 0x3<br>RO | **Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification. |

## 50.2.16 PCI Power Management Control and Status (PMCS)—Offset 74h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 74h

**Default:** 0008h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C | **PME Status (PMES):** This bit is set when a PME event is to be requested, and if this bit is set and PMEE is set, a PME# will be generated.<br>This register field is not reset by FLR. |
| 14:9 | 0x0<br>RO | **RSVD0:** Reserved. |
| 8 | 0x0<br>RW | **PME Enable (PMEE):** When set, the SATA controller generates PME# from D3HOT on a wake event.<br>Note: Software is advised to clear PMEE together with PMES prior to changing CC.SCC thru SATAGC.SMS.<br>This register field is not reset by FLR. |
| 7:4 | 0x0<br>RO | **RSVD1:** Reserved. |
| 3 | 0x1<br>RO | **No Soft Reset (NSFRST):** A 1 indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset.<br>Configuration context is preserved. |
| 2 | 0x0<br>RO | **RSVD2:** Reserved. |
| 1:0 | 0x0<br>RW | **Power State (PS):** This field is used both to determine the current power state of the SATA Controller and to set a new power state.<br>The values are:<br>• 00 = D0 state.<br>• 11 = D3HOT state. |

## 50.2.17 Message Signaled Interrupt Identifier (MID)—Offset 80h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 80h

**Default:** 7005h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x70<br>RW/L | **Next Pointer (NEXT):** Indicates the next item in the list is the PCI power management pointer. |
| 7:0 | 0x5<br>RO | **Capability ID (CID):** Capabilities ID indicates MSI. |

## 50.2.18 Message Signaled Interrupt Message Control (MC)—Offset 82h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 82h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **RSVD0:** Reserved. |
| 7 | 0x0<br>RO | **64 Bit Address Capable (C64):** Capable of generating a 32-bit message only. |
| 6:4 | 0x0<br>RO | **Multiple Message Enable (MME):** When this field is cleared to 000 (and MSIE is set), only a single MSI message will be generated for all SATA ports, and bits [15:0] of the message vector will be driven from MD[15:0]. |
| 3:1 | 0x0<br>RO | **Multiple Message Capable (MMC):** Not supported. |
| 0 | 0x0<br>RW | **MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. |

## 50.2.19 Message Signaled Interrupt Message Address (MA)—Offset 84h

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 84h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **Address (ADDR):** Lower 32 bits of the system specified message address, always DWORD aligned. |
| 1:0 | 0x0<br>RO | **RSVD0:** Reserved. |

## 50.2.20 Message Signaled Interrupt Message Data (MD)—Offset 88h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 88h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW | **Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled.<br>Its content is driven onto the lower word of the data bus of the MSI memory write transaction. |

## 50.2.21 Port Mapping Register (MAP)—Offset 90h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 90h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **RSVD0:** Reserved. |
| 23 | 0x0<br>RW/O | **SATA Port 7 Disable (SPD7):** Similar to SPD0 but for port 7.<br>This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero.<br>PCIe/SATA muxing for port 7 based on fuses, soft straps and GPIO does not select SATA.<br>This bit is only applicable to project(s): that has port 7 physically. |
| 22 | 0x0<br>RW/O | **SATA Port 6 Disable (SPD6):** Similar to SPD0 but for port 6.<br>This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero.<br>PCIe/SATA muxing for port 6 based on fuses, soft straps and GPIO does not select SATA.<br>This bit is only applicable to project(s): that has port 6 physically. |
| 21 | 0x0<br>RW/O | **SATA Port 5 Disable (SPD5):** Similar to SPD0 but for port 5.<br>This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero.<br>PCIe/SATA muxing for port 5 based on fuses, soft straps and GPIO does not select SATA.<br>This bit is only applicable to project(s): that has port 5 physically. |
| 20 | 0x0<br>RW/O | **SATA Port 4 Disable (SPD4):** Similar to SPD0 but for port 4.<br>This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero.<br>PCIe/SATA muxing for port 4 based on fuses, soft straps and GPIO does not select SATA.<br>This bit is only applicable to project(s): that has port 4 physically. |
| 19 | 0x0<br>RW/O | **SATA Port 3 Disable (SPD3):** Similar to SPD0 but for port 3.<br>This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero.<br>• 1. Fuse FFSATA7 (disable port 2 and 3).<br>• 2. Fuse FFSATA8 (disable port 1 and 3).<br>• 3. PCIe/SATA muxing for port 3 based on fuses, soft straps and GPIO does not select SATA.<br>This bit is only applicable to project(s): that has port 3 physically. |
| 18 | 0x0<br>RW/O | **SATA Port 2 Disable (SPD2):** Similar to SPD0 but for port 2.<br>This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero.<br>• 1. Fuse FFSATA7 (disable port 2 and 3).<br>• 2. PCIe/SATA muxing for port 3 based on fuses, soft straps and GPIO does not select SATA.<br>This bit is only applicable to project(s): that has port 3 physically. |
| 17 | 0x0<br>RW/O | **SATA Port 1 Disable (SPD1):** Similar to SPD0 but for port 1.<br>This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero.<br>• 1. Fuse FFSATA8 (disable port 1 and 3).<br>• 2. PCIe/SATA muxing for port 3 based on fuses, soft straps and GPIO does not select SATA.<br>This bit is only applicable to project(s): that has port 1 physically. |
| 16 | 0x0<br>RW/O | **SATA Port 0 Disable (SPD0):** A 1 prevents the SATA port from being enabled via config PCS.PxE. Write of 1 to PCS.PxE has no effect when the corresponding SPD[x] bit is 1.<br>In preventing a port(s) from being enabled, BIOS shall first configure MAP.SPDx. And only then BIOS configures the PCS.PxE.<br>This field is not reset by FLR.<br>This bit is only applicable to project(s): that has port 0 physically. |
| 15:8 | 0x0<br>RO | **RSVD1:** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Port Clock Disable (PCD):** When any of these bits is set to 1, the backbone clock driven to the associated port logic is gated and will not toggle.<br>When this bit is cleared to 0, all clocks to the associated port logic will operate normally.<br>Assignment of the bits is:<br>• Bit 7: Port 7, this bit is applicable to projects: that has port 7 physically<br>• Bit 6: Port 6, this bit is only applicable to project(s): that has port 6 physically<br>• Bit 5: Port 5, this bit is only applicable to project(s): that has port 5 physically<br>• Bit 4: Port 4, this bit is only applicable to project(s): that has port 4 physically<br>• Bit 3: Port 3, this bit is only applicable to project(s): that has port 3 physically<br>• Bit 2: Port 2, this bit is only applicable to project(s): that has port 2 physically<br>• Bit 1: Port 1, this bit is only applicable to project(s): that has port 1 physically<br>• Bit 0: Port 0, this bit is only applicable to project(s): That has port 0 physically.<br>If a particular port is not available, software shall set the corresponding bit to 1.<br>Software can also set the corresponding bit(s) to 1 after disabling particular port(s).<br>Software cannot set the PCD[port x]=1 if the corresponding config PCS.PxE=1 or AHCI MMIO GHC.PI[x]=1. |

## 50.2.22 Port Control and Status (PCS)—Offset 94h

By default, the SATA ports are set (by hardware) to the disabled state (e.g. bits[5:0] == '0') as a result of an initial power on reset. When enabled by software, the ports can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. This register is not reset by FLR.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 94h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **RSVD0:** Reserved. |
| 23 | 0x0<br>RO | **Port 7 Present (P7P):** Same as P0P, except for port 7.<br>This bit is only applicable to project(s): That has port 7 physically. |
| 22 | 0x0<br>RO | **Port 6 Present (P6P):** Same as P0P, except for port 6.<br>This bit is only applicable to project(s): That has port 6 physically. |
| 21 | 0x0<br>RO | **Port 5 Present (P5P):** Same as P0P, except for port 5.<br>This bit is only applicable to project(s): That has port 5 physically. |
| 20 | 0x0<br>RO | **Port 4 Present (P4P):** Same as P0P, except for port 4.<br>This bit is only applicable to project(s): That has port 4 physically. |
| 19 | 0x0<br>RO | **Port 3 Present (P3P):** Same as P0P, except for port 3.<br>This bit is only applicable to project(s): That has port 3 physically. |
| 18 | 0x0<br>RO | **Port 2 Present (P2P):** Same as P0P, except for port 2.<br>This bit is only applicable to project(s): That has port 2 physically. |
| 17 | 0x0<br>RO | **Port 1 Present (P1P):** Same as P0P, except for port 1.<br>This bit is only applicable to project(s): That has port 1 physically. |
| 16 | 0x0<br>RO | **Port 0 Present (P0P):** When set, the SATA controller has detected the presence of a device on port 0. It may change at any time. Clearing P0E bit leads to clearing of this bit after implementation delay.<br>***Note:*** For system software that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again in two consecutive write cycles, software shall poll on this bit being 0 before setting P0E bit to 1. This bit is only applicable to project(s): That has port 0 physically. |
| 15:8 | 0x0<br>RO | **RSVD1:** Reserved. |
| 7 | 0x0<br>RW | **Port 7 Enabled (P7E):** When MAP.SPD[7] is 1, this bit is reserved and is read-only 0.<br>Otherwise if none of the above is true, this field is RW and the definition of this bit is the same as P0E, except for port 7.<br>This bit takes precedence over P7CMD.SUD.<br>This bit is only applicable to project(s): That has port 7 physically. |
| 6 | 0x0<br>RW | **Port 6 Enabled (P6E):** When MAP.SPD[6] is 1, this bit is reserved and is read-only 0.<br>Otherwise if none of the above is true, this field is RW and the definition of this bit is the same as P0E, except for port 6.<br>This bit takes precedence over P6CMD.SUD.<br>This bit is only applicable to project(s): That has port 6 physically. |
| 5 | 0x0<br>RW | **Port 5 Enabled (P5E):** When MAP.SPD[5] is 1, this bit is reserved and is read-only 0.<br>Otherwise if none of the above is true, this field is RW and the definition of this bit is the same as P0E, except for port 5.<br>This bit takes precedence over P5CMD.SUD.<br>This bit is only applicable to project(s): That has port 5 physically. |
| 4 | 0x0<br>RW | **Port 4 Enabled (P4E):** When MAP.SPD[4] is 1, this bit is reserved and is read-only 0.<br>Otherwise if none of the above is true, this bit is RW and same as P0E but for port 4 and takes precedence over P4CMD.SUD.<br>This bit is only applicable to project(s): That has port 4 physically. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3 | 0x0<br>RW | **Port 3 Enabled (P3E):** When MAP.SPD[3] is 1, this bit is reserved and is read-only 0.<br>Otherwise if none of the above is true, this bit is RW and same as P0E but for port 3 and takes precedence over P3CMD.SUD.<br>This bit is only applicable to project(s): That has port 3 physically. |
| 2 | 0x0<br>RW | **Port 2 Enabled (P2E):** When MAP.SPD[2] is 1, this bit is reserved and is read-only 0.<br>Otherwise if none of the above is true, this bit is RW and same as P0E but for port 2 and takes precedence over P2CMD.SUD.<br>This bit is only applicable to project(s): That has port 2 physically. |
| 1 | 0x0<br>RW | **Port 1 Enabled (P1E):** When MAP.SPD[1] is 1, this bit is reserved and read-only 0.<br>Otherwise if none of the above is true, this bit is RW and same as P0E but for port 1 and takes precedence over P1CMD.SUD.<br>This bit is only applicable to project(s): That has port 1 physically. |
| 0 | 0x0<br>RW | **Port 0 Enabled (P0E):** When MAP.SPD[0] is 1, this bit is reserved and read-only 0.<br>When set, the port is enabled.<br>When cleared, the port is disabled.<br>When enabled, the port can transition between the on, partial, and slumber states and can detect devices.<br>When disabled, the port is in the off state and cannot detect any devices.<br>This bit takes precedence over P0CMD.SUD. |

## 50.2.23 SATA General Configuration (SATAGC)—Offset 9Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:19 or 20, F:0] + 9Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/O | **Register Lock (REGLOCK):** BIOS can set this bit to 1 to lock the following registers with RW/L attribute:<br>• CAP<br>• CP<br>• MID.NEXT<br>• PIE.NEXT<br>• SATACR0.NEXT.<br>Once locked the register attribute of above list changes from RW/L to RO holding the existing value.<br>This field is not reset by FLR. |
| 30:17 | 0x0<br>RO | **RSVD0:** Reserved. |
| 16 | 0x0<br>RW | **SATA Mode Select (SMS):** Software (SW) programs these bits to control the mode in which the SATA HBA should operate:<br>• 0b = AHCI mode.<br>• 1b = RAID mode.<br>This register field is not reset by FLR. |
| 15 | 0x0<br>RW | **Data Phase Parity Error Enable (DPPEE):**<br>When 1, IOSF data phase parity error handling is enabled.<br>When 0, the data phase parity error handling is disabled. |
| 14:12 | 0x0<br>RW | **Write Request_Size Select/Max_Payload_Size (WRRSELMPS):** These two bits select the max write request size that SATA host controller will initiate for DMA write to memory.<br>SATA host controller will internally break up larger write request based on these bits.<br>The request is address-aligned to the selected size.<br>Defined encodings for this field are:<br>• 000b = 128 address aligned bytes max payload size.<br>• 111b = 64 address aligned bytes max payload size.<br>• All other values are reserved for SATA host controller.<br>This field is not reset by FLR. |
| 11 | 0x0<br>RW | **Command Parity Error Enable (CPEE):**<br>When 1, command parity error handing is enable.<br>When 0 the command parity error handling is disable |
| 10 | 0x0<br>RW | **SATA Controller Function Disable (SCFD):** BIOS program this bit to 1 to disable the SATA Controller function.<br>When 0, SATA Controller function is enabled. |
| 9 | 0x0<br>RW | **Unsupported Request Reporting Enable (URRE):** If set to 1 by software, it allows reporting of an Unsupported Request as a system error.<br>If both URRE and PCI configuration SERR# Enable registers are set to a 1, then the agent must set the Signaled System Error bit in the PCI Status register and send a DO_SERR message in IOSF-SB interface. |
| 8 | 0x0<br>RW/1C | **Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unsupported Request on IOSF Primary interface that is not considered Advisory Non-Fatal.<br>Cleared to 0 by SW. |
| 7 | 0x0<br>RW/O | **Alternate ID Enable (AIE):** When programmed to 0, HW will report the following device id's: 2822h for desktop or 282Ah for mobile.<br>When programmed to a 1, HW will not report these device id's.<br>This field is not reset by FLR. |
| 6 | 0x0<br>RW/O | **AIE0 DevID Selection (DEVIDSEL):** This register allows BIOS to select Device ID when AIE=0 and Server Feature (SATA AIE DEVIDSEL) Disable Fuse =0.<br>This field is not reset by FLR. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 5 | 0x0<br>RW/O | **FLR Capability Selection (FLRCSSEL):** This allows the FLR Capability to be bypassed. |
| 4:3 | 0x0<br>RW/O | **MXTBA Size Select (MSS):** These 2 bits select the size of the Memory space for the MSI-X Table defined in BAR 0 (Configuration space offset 10h).<br>MSI-X Table Memory space size is:<br>• 32k when MSS[1:0]=00.<br>• 16k when MSS[1:0]=01.<br>• 8k when MSS[1:0]=10.<br>This field is not reset by FLR. |
| 2:0 | 0x0<br>RW/O | **ABAR Size Select (ASSEL):** These 3 bits select the size of the Memory space for the ABAR in BAR 5 (Configuration space offset 24h).<br>ABAR Memory space size is:<br>• 2k when ASSEL[2:0]=000.<br>• 16k when ASSEL[2:0]=001.<br>• 32k when ASSEL[2:0]=010.<br>• 64k when ASSEL[2:0]=011.<br>• 128k when ASSEL[2:0]=100.<br>• 256k when ASSEL[2:0]=101.<br>• 512k when ASSEL[2:0]=110.<br>This field is not reset by FLR. |

## 50.2.24 SATA Initialization Register Index (SIRI)—Offset A0h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:19 or 20, F:0] + A0h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:2 | 0x0<br>RW | **Index (IDX):** 6-bit index pointer into the 256-byte space.<br>Data is written into the SIRD register and read from the SIRD register.<br>This points to a DWord register.<br>The byte enables on the SIRD register affect what will be written. |
| 1:0 | 0x0<br>RO | **RSVD0:** Reserved. |

## 50.2.25 SATA Initialization Register Data (SIRD)—Offset A4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:19 or 20, F:0] + A4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Data (DTA):** 32-bit data value that is written to the register pointed to by SIRI, or read from the register pointed to by SIRI. |

## 50.2.26 Serial ATA Capability Register 0 (SATACR0)—Offset A8h

Note that the SATACR0.NEXT is not changed from RO to become RWO because there is an existing method (SATAGC.FLRCSSEL bit) to bypass the FLR Capability structure.

FLR Capability ID.NEXT is already indicating end of capability structure, it does not need to change to be RWO.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:19 or 20, F:0] + A8h

**Default:** 00100012h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **RSVD0:** Reserved. |
| 23:20 | 0x1<br>RO | **Major Revision (MAJREV):** Major revision number of the SATA Capability Pointer implemented. |
| 19:16 | 0x0<br>RO | **Minor Revision (MINREV):** Minor revision number of the SATA Capability Pointer implemented. |
| 15:8 | 0x0<br>RW/L | **Next Capability Pointer (NEXT):** 00h indicating the final item in the Capability List.<br>The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. |
| 7:0 | 0x12<br>RO | **Capability ID (CAP):** The value of 12h has been assigned by the PCI SIG to designate the SATA Capability pointer. |

## 50.2.27 Serial ATA Capability Register 1 (SATACR1)—Offset ACh

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:19 or 20, F:0] + ACh

**Default:** 00000048h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved. |
| 15:4 | 0x4<br>RO | **BAR Offset (BAROFST):** Indicates the offset into the BAR where the AHCI Index/Data pair are located (in Dword granularity).<br>The Index and Data I/O registers are located at offset 10h within the I/O space defined by LBAR (BAR4).<br>A value of 004h indicates offset 10h.<br>• 000h = 0h offset.<br>• 001h = 4h offset.<br>• 002h = 8h offset.<br>• 003h = Ch offset.<br>• 004h = 10h offset.<br>• ...<br>• FFFh = 3FFFh offset (max 16 KB). |
| 3:0 | 0x8<br>RO | **BAR Location (BARLOC):** Indicates the absolute PCI Configuration Register address of the BAR containing the Index/Data pair (in Dword granularity).<br>The Index and Data I/O registers reside within the space defined by LBAR (BAR4) in the SATA controller.<br>A value of 8h indicates offset 20h, which is LBAR (BAR4).<br>• 0000 - 0011b = Reserved<br>• 0100b = 10h =) BAR0<br>• 0101b = 14h =) BAR1<br>• 0110b = 18h =) BAR2<br>• 0111b = 1Ch =) BAR3<br>• 1000b = 20h =) AIDPBA<br>• 1001b = 24h =) BAR5<br>• 1010 - 1110b = Reserved<br>• 1111b = Index/Data pair in PCI Configuration space which is not supported. |

## 50.2.28 FLR Capability ID (FLRCID)—Offset B0h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:19 or 20, F:0] + B0h

**Default:** 0013h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **Next Capability (NEXT):** 00h indicating the final item in the Capability List. |
| 7:0 | 0x13<br>RO | **Capability ID (CID):** The value of this field depends on the FLRCSSEL bit:<br>• SATAGC.FLRCSSEL = 0, Capability ID = 13h.<br>• SATAGC.FLRCSSEL = 1, Capability ID = 00h (capability is bypassed). |

## 50.2.29 FLR Control (FLRCTL)—Offset B4h

This register shall be read-only 0 when SATAGC.FLRCSSEL=1.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:19 or 20, F:0] + B4h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:9 | 0x0<br>RO | **RSVD0:** Reserved. |
| 8 | 0x0<br>RO | **Transactions Pending (TXP):**<br>A 1 indicates that the controller has issued Non-Posted request which has not been completed.<br>A 0 indicates that Completions for all non-posted requests have been received by the controller. |
| 7:1 | 0x0<br>RO | **RSVD1:** Reserved. |
| 0 | 0x0<br>RW | **Initiate FLR (Initiate_FLR):** Used to initiated FLR transition.<br>A write of 1 indicates FLR transition.<br>Since hardware must not respond to any cycles till FLR completion, the value read by software from this bit is 0.<br>Refer to Function Level Reset (FLR) on specifics to SATA. |

## 50.2.30 MSI-X Message Control (MXC)—Offset D2h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:19 or 20, F:0] + D2h

**Default:** 0007h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW | **MSI-X Enable (MXE):** If set to '1' and the MSI Enable bit in the MSI Message Control register is cleared to '0', the function is permitted to use MSI-X to request service and is prohibited from using its INTx# pin (if implemented).<br>If cleared to '0', the function is prohibited from using MSI-X to request service. |
| 14 | 0x0<br>RW | **Function Mask (FM):**<br>If set to '1', all of the vectors associated with the function are masked, regardless of their per vector Mask bit states.<br>If cleared to '0', each vector's Mask bit determines whether the vector is masked or not.<br>Setting or clearing the MSI-X Function Mask bit has no effect on the state of the per vector Mask bits. |
| 13:11 | 0x0<br>RO | **RSVD0:** Reserved. |
| 10:0 | 0x7<br>RO | **Table Size (TS):** This value indicates the size of the MSI-X Table as the value n, which is encoded as n - 1. |

## 50.2.31 MSI-X Table Offset / Table BIR (MXT)—Offset D4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:19 or 20, F:0] + D4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0x0<br>RO | **Table Offset (TO):** Used as an offset from the address contained by one of the function's Base Address registers to point to the base of the MSI-X Table.<br>The lower three Table BIR bits are masked off (cleared to 000b) by system software to form a 32-bit Qword-aligned offset. |
| 2:0 | 0x0<br>RO | **Table BIR (TBIR):** This field indicates which one of a function's Base Address registers, located beginning at 10h in Configuration Space, is used to map the function's MSI-X Table into system memory.<br>A read-only value of '0' means 10h. |

## 50.2.32 MSI-X PBA Offset / PBA BIR (MXP)—Offset D8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:19 or 20, F:0] + D8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0x0<br>RO | **PBA Offset (PBAO):** Used as an offset from the address contained by one of the function's Base Address registers to point to the base of the MSI-X PBA.<br>The lower three PBA BIR bits are masked off (cleared to 000b) by software to form a 32-bit Qword-aligned offset. |
| 2:0 | 0x0<br>RO | **PBA BIR (PBIR):** This field indicates which one of a function's Base Address registers, located beginning at 10h in Configuration Space, is used to map the function's MSI-X PBA into system memory.<br>A read-only value of '1' means 14h. |

## 50.2.33 BIST FIS Control/Status (BFCS)—Offset E0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:19 or 20, F:0] + E0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0x0<br>RO | **RSVD0:** Reserved |
| 17 | 0x0<br>RW | **Port 7 BIST FIS Initiate (P7BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 7, using the parameters specified in this register and BFTD1 and BFTD2.<br>This bit is only applicable to project(s): That has port 7 physically. |
| 16 | 0x0<br>RW | **Port 6 BIST FIS Initiate (P6BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 6, using the parameters specified in this register and BFTD1 and BFTD2.<br>This bit is only applicable to project(s): That has port 6 physically. |
| 15 | 0x0<br>RW | **Port 5 BIST FIS Initiate (P5BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 5, using the parameters specified in this register and BFTD1 and BFTD2.<br>This bit is only applicable to project(s): That has port 5 physically. |
| 14 | 0x0<br>RW | **Port 4 BIST FIS Initiate (P4BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 4, using the parameters specified in this register and BFTD1 and BFTD2.<br>This bit is only applicable to project(s): That has port 4 physically. |
| 13 | 0x0<br>RW | **Port 3 BIST FIS Initiate (P3BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 3, using the parameters specified in this register and BFTD1 and BFTD2.<br>This bit is only applicable to project(s): That has port 3 physically. |
| 12 | 0x0<br>RW | **Port 2 BIST FIS Initiate (P2BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 2, using the parameters specified in this register and BFTD1 and BFTD2.<br>This bit is only applicable to project(s): That has port 2 physically. |
| 11 | 0x0<br>RW/1C/V | **BIST FIS Successful (BFS):** This bit is set any time a BIST FIS transmitted by the SATA controller receives an R_OK completion status from the device. |
| 10 | 0x0<br>RW/1C/V | **BIST FIS Failed (BFF):** This bit is set any time that a BIST FIS transmitted by the SATA controller receives an R_ERR completion status from the device. |
| 9 | 0x0<br>RW | **Port 1 BIST FIS Initiate (P1BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 1, using the parameters specified in this register and BFTD1 and BFTD2.<br>This bit is only applicable to project(s): That has port 1 physically. |
| 8 | 0x0<br>RW | **Port 0 BIST FIS Initiate (P0BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 0, using the parameters specified in this register and BFTD1 and BFTD2.<br>This bit is only applicable to project(s): That has port 0 physically. |
| 7:2 | 0x0<br>RW | **BIST FIS Parameters (BFP):** These bits form the contents of the upper 6 bits of the BIST FIS Pattern Definition in the BIST FIS transmitted by the SATA controller.<br>This field is not port specific - its contents will be used for any BIST FIS initiated on the SATA controller.<br>The specific bit definitions are:<br>• Bit 7 (T) Far End Transmit mode.<br>• Bit 6 (A) Align Bypass mode.<br>• Bit 5 (S) Bypass Scrambling.<br>• Bit 4 (L) Far End Retimed Loopback.<br>• Bit 3 (F) Far End Analog Loopback.<br>• Bit 2 (P) Primitive bit for use with Transmit mode. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1:0 | 0x0<br>RO | **RSVD1:** Reserved. |

## 50.2.34 BIST FIS Transmit Data 1 (BFTD1)—Offset E4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:19 or 20, F:0] + E4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Data (DATA):** The data programmed into this register will form the contents of the second DW of any BIST FIS initiated by the SATA controller.<br>This register is not port specific - its contents will be used for BIST FIS initiated on any port.<br>Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 2nd DW regardless of whether or not the T bit is indicated in the BFCS register. |

## 50.2.35 BIST FIS Transmit Data 2 (BFTD2)—Offset E8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:19 or 20, F:0] + E8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Data (DATA):** The data programmed into this register will form the contents of the third DW of any BIST FIS initiated by the SATA controller.<br>This register is not port specific - its contents will be used for BIST FIS initiated on any port.<br>Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 3rd DW regardless of whether or not the T bit is set in the BFCS register. |

## 50.2.36 Manufacturing ID (MFID)—Offset F8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:19 or 20, F:0] + F8h

**Default:** 08000FB1h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **RSVD0:** Reserved. |
| 27:24 | 0x8<br>RO/V | **Dot portion of Process ID (DPID):** Indicates the dot.<br>Process is reflected in bits [7:0].<br>This 8-bit value is received via the IOSF Sideband SetID message. |
| 23:16 | 0x0<br>RO/V | **Stepping Identifier (SID):** This field is incremented for each stepping of the part.<br>***Note:*** This field can be used by software to differentiate steppings when the Revision ID may not change.<br>This is SIP customer implementation specific and SIP customer provides this 8-bit value via the Sideband SetID message. |
| 15:8 | 0xf<br>RO/V | **Manufacturer Identifier (MID):** This is SIP customer implementation specific and SIP customer provides this 8-bit value via the Sideband SetID message. |
| 7:0 | 0xb1<br>RO/V | **Process/Dot Identifier (PID):** Indicates the Process.<br>Dot is reflected in bits [27:24].<br>This is SIP customer implementation specific and SIP customer provides this 8-bit value via the Sideband SetID message. |

## 50.3 Registers in Memory Space—MXTBA

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) MXTBA described in Section 50.2.7, "MSI-X Table Base Address (MXTBA)—Offset 10h" on page 1883.

### 50.3.1 MSI-X Table Entries n Message Lower Address (MXTEnMLA)

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MXTBA] + 0h + n*10h (where n<=7)

**MXTBA Type:** PCI Configuration Register (Size: 32 bits)
**MXTBA Reference:** [B:0, D:(19,20), F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **MSI-X message lower address (MXMLA):** Specifies the lower 32-bit of the DWORD-aligned address (Addr[31:02]) of the MSI-X Message. |
| 1:0 | 0x0<br>RO | **RSVD0:** Reserved. |

### 50.3.2 MSI-X Table Entries n Message Upper Address (MXTEnMUA)

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MXTBA] + 4h + n*10h (where n<=7)

**MXTBA Type:** PCI Configuration Register (Size: 32 bits)
**MXTBA Reference:** [B:0, D:(19,20), F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **MSI-X message upper 32-bit address (MXMUA):** Specifies the lower 32-bit of the DWORD-aligned address (Addr[31:02]) of the MSI-X Message. |

## 50.3.3 MSI-X Table Entries n Message Data (MXTEnMD)

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MXTBA] + 8h + n*10h (where n<=7)

**MXTBA Type:** PCI Configuration Register (Size: 32 bits)
**MXTBA Reference:** [B:0, D:(19,20), F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **MSI-X message Data (MXMD):** Specifies the 32-bit Data of the MSI-X Message. |

## 50.4 Registers in Memory Space—ABAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) ABAR described in Section 50.2.11, "AHCI Base Address (ABAR)—Offset 24h" on page 1886.

### 50.4.1 HBA Capabilities (GHC_CAP)—Offset 0h

This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon PLTRST#. This register is not reset by FLR.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** FF36FF07h

**BAR and Offset:** [ABAR] + 0h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x1<br>RW/O | **Supports 64-bit Addressing (S64A):** Indicates the S-ATA controller can access 64-bit data structures.<br>The 32-bit upper bits of the port DMA Descriptor, the PRD Base, and each PRD entry are read/write. |
| 30 | 0x1<br>RW/O | **Supports Native Command Queuing Acceleration (SCQA):** Indicates the SATA controller supports Serial-ATA Native Command Queuing.<br>The HBA will handle DMA Setup FISes in hardware, including support for auto-activate optimization through the FIS. |
| 29 | 0x1<br>RW/O | **Supports SNotification Register (SSNTF):** When set to 1, indicates that the HBA supports the PxSNTF (SNotification) register and its associated functionality.<br>When cleared to 0., the HBA does not support the PxSNTF (SNotification) register and its associated functionality. |
| 28 | 0x1<br>RW/O | **Supports Mechanical Presence Switch (SMPS):** When set to 1, the HBA supports mechanical presence switches on its ports for use in hot plug operations.<br>When cleared to 0, this function is not supported. This value is loaded by the BIOS prior to OS initialization. |
| 27 | 0x1<br>RW/O | **Supports Staggered Spin-up (SSS):** Indicates whether the S-ATA controller supports staggered spin-up on its ports, for use in balancing power spikes.<br>This value is loaded by platform BIOS prior to OS initialization. |
| 26 | 0x1<br>RW/O | **Supports Aggressive Link Power Management (SALP):** Indicates the S-ATA controller supports auto-generating link requests to the partial or slumber states when there are no commands to process.<br>When cleared to 0, software shall treat the PxCMD.ALPE and PxCMD.ASP bits as reserved. |
| 25 | 0x1<br>RW/O | **Supports Activity LED (SAL):** Indicates the S-ATA controller supports a single output pin (SATALED#) which indicates activity. |
| 24 | 0x1<br>RW/O | **Supports Command List Override (SCLO):** When set to 1, indicates that the HBA supports the PxCMD.CLO bit and it's associated function.<br>When cleared to 0., The HBA is not capable of clearing the BSY and DRQ bits in the Status register in order to issue a software reset if these bits are still set from a previous operation. |
| 23:20 | 0x3<br>RW/O | **Interface Speed Support (ISS):** Indicates the maximum speed the S-ATA controller can support on its ports.<br>These encodings match the system software programmable PxSCTL.DET.SPD field.<br>• 0000 = Reserved<br>• 0001 = Gen 1 (1.5 Gbps)<br>• 0010 = Gen 2 (3 Gbps)<br>• 0011 = Gen 3 (6 Gbps)<br>• 0100 - 1111 = Reserved.<br>***Note:*** If (FFSATA0p0, FFSATA0p1, FFSATA0p2, FFSATA0p3, FFSATA0p4 and FFSATA0p5) is 1, this field is RWO defaulting to 0010 and ignores software write value of 0011.<br>If either FFSATA0p0, FFSATA0p1, FFSATA0p2, FFSATA0p3, FFSATA0p4 or FFSATA0p5 is 0, this field is RWO defaulting to 0011. |
| 19 | 0x0<br>RO | **Supports Non-Zero DMA Offsets (SNZO):** Reserved as per AHCI 1.3. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 18 | 0x1<br>RO | **Supports AHCI mode only (SAM):** The SATA controller may optionally support AHCI access mechanism only.<br>A value of 1 indicates that the SATA controller does not implement a legacy, task-file based register interface. |
| 17 | 0x1<br>RO | **Supports Port Multiplier (SPM):** The SATA controller may optionally support command-based switching Port Multipliers. |
| 16 | 0x0<br>RO | **FIS-based Switching Supported (FBSS):** Not supported. |
| 15 | 0x1<br>RO | **PIO Multiple DRQ Block (PMD):** If set to 1, the HBA supports multiple DRQ block data transfers for the PIO command protocol. |
| 14 | 0x1<br>RW/O | **Slumber State Capable (SSC):** The SATA controller supports the slumber state. |
| 13 | 0x1<br>RW/O | **Partial State Capable (PSC):** The SATA controller supports the partial state. |
| 12:8 | 0x1f<br>RO | **Number of Command Slots (NCS):** 1Fh indicating support for 32 slots. |
| 7 | 0x0<br>RO | **Command Completion Coalescing Supported (CCCS):** When set to 1, indicates that the HBA supports command completion coalescing. |
| 6 | 0x0<br>RW/O/V | **Enclosure Management Supported (EMS):** When set to 1, indicates that the HBA supports enclosure management. |
| 5 | 0x0<br>RW/O | **Supports External SATA (SXS):** When set to 1, indicates that the HBA has one or more Serial ATA ports that has a signal only connector that is externally accessible. |
| 4:0 | 0x7<br>RO/V | **Number of Ports (NP):** 0's based value indicating the maximum number of ports supported. |

## 50.4.2 Global HBA Control (GHC)—Offset 4h

This register controls various global actions of the HBA.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [ABAR] + 4h

**Default:** 80000000h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x1<br>RO | **AHCI Enable (AE):** When set, indicates that an AHCI driver is loaded and communication to the HBA shall be via AHCI mechanisms. |
| 30:3 | 0x0<br>RO | **RSVD0:** Reserved |
| 2 | 0x0<br>RO | **Reserved:** Reserved |
| 1 | 0x0<br>RW | **Interrupt Enable (IE):** This global bit enables interrupts from the HBA.<br>When cleared (reset default), all interrupt sources from all ports are disabled.<br>When set, interrupts are enabled. |
| 0 | 0x0<br>RW/1S | **HBA Reset (HR):** When set by SW, this bit causes an internal reset of the HBA.<br>All state machines that relate to data transfers and native command queuing will return to an idle condition, and all ports will be re-initialized via COMRESET. |

## 50.4.3 Interrupt Status Register (IS)—Offset 8h

This register indicates which of the ports within the controller have an interrupt pending and require service.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [ABAR] + 8h

**Default:** 00000000h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7 | 0x0<br>RW/1C/V | **Interrupt Pending Status Port 7 (IPS7):** If set, indicates that port 7 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt.<br>This bit is only applicable to project(s): That has port 7 physically. |
| 6 | 0x0<br>RW/1C/V | **Interrupt Pending Status Port 6 (IPS6):** If set, indicates that port 6 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt.<br>This bit is only applicable to project(s): That has port 6 physically. |
| 5 | 0x0<br>RW/1C/V | **Interrupt Pending Status Port 5 (IPS5):** If set, indicates that port 5 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt.<br>This bit is only applicable to project(s): That has port 5 physically. |
| 4 | 0x0<br>RW/1C/V | **Interrupt Pending Status Port 4 (IPS4):** If set, indicates that port 4 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt.<br>This bit is only applicable to project(s): That has port 4 physically. |
| 3 | 0x0<br>RW/1C/V | **Interrupt Pending Status Port 3 (IPS3):** If set, indicates that port 3 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt.<br>This bit is only applicable to project(s): That has port 3 physically. |
| 2 | 0x0<br>RW/1C/V | **Interrupt Pending Status Port 2 (IPS2):** If set, indicates that port 2 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt.<br>This bit is only applicable to project(s): That has port 2 physically. |
| 1 | 0x0<br>RW/1C/V | **Interrupt Pending Status Port 1 (IPS1):** If set, indicates that port 1 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt.<br>This bit is only applicable to project(s): That has port 1 physically. |
| 0 | 0x0<br>RW/1C/V | **Interrupt Pending Status Port 0 (IPS0):** If set, indicates that port 0 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt.<br>This bit is only applicable to project(s): That has port 0 physically. |

## 50.4.4 Ports Implemented (GHC_PI)—Offset Ch

This register indicates which ports are exposed to the HBA. It indicates which ports that the device supports are available for software to use. Any available port may not be implemented. This register is not reset by FLR. There is BIOS programming requirement on the PI register. Please refer to section 7.9.13.1.1 for details.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [ABAR] + Ch

**Default:** 00000000h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7 | 0x0<br>RW/O/V | **Port 7 Implemented (PI7):** If set, then port 7 is available for use.<br>If cleared, the port is not available for use.<br>This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 7 is not available. |
| 6 | 0x0<br>RW/O/V | **Port 6 Implemented (PI6):** If set, then port 6 is available for use.<br>If cleared, the port is not available for use.<br>This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 6 is not available. |
| 5 | 0x0<br>RW/O/V | **Port 5 Implemented (PI5):** If set, then port 5 is available for use.<br>If cleared, the port is not available for use.<br>This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 5 is not available. |
| 4 | 0x0<br>RW/O/V | **Port 4 Implemented (PI4):** If set, then port 4 is available for use.<br>If cleared, the port is not available for use.<br>This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 4 is not available. |
| 3 | 0x0<br>RW/O/V | **Port 3 Implemented (PI3):** If set, then port 3 is available for use.<br>If cleared, the port is not available for use.<br>This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 3 is not available. |
| 2 | 0x0<br>RW/O/V | **Port 2 Implemented (PI2):** If set, then port 2 is available for use.<br>If cleared, the port is not available for use.<br>This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 2 is not available. |
| 1 | 0x0<br>RW/O/V | **Port 1 Implemented (PI1):** If set, then port 1 is available for use.<br>If cleared, the port is not available for use.<br>This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 1 is not available. |
| 0 | 0x0<br>RW/O/V | **Port 0 Implemented (PI0):** If set, then port 0 is available for use.<br>If cleared, the port is not available for use.<br>This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 0 is not available. |

## 50.4.5 AHCI Version (VS)—Offset 10h

This register indicates the major and minor version of the AHCI specification. It is BCD encoded. The upper two bytes represent the major version number, and the lower two bytes represent the minor version number. Example: Version 3.12 would be represented as 00030102h.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [ABAR] + 10h

**Default:** 00010300h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x1<br>RO | **Major Version Number (MJR):** Indicates the major version is 1 |
| 15:0 | 0x300<br>RO | **Minor Version Number (MNR):** Indicates the minor version is 30 |

## 50.4.6 Enclosure Management Control (EM_CTL)—Offset 20h

This register is used to control and obtain status for the enclosure management interface. The register includes information on the attributes of the implementation, enclosure management messages supported, the status of the interface, whether any messages are pending, and is used to initiate sending messages. This register is not implemented if enclosure management is not supported (i.e. CAP.EMS = 0).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [ABAR] + 20h

**Default:** 07010000h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **RSVD0:** Reserved |
| 27 | 0x0<br>RO | **Port Multiplier Support (ATTR_PM):** The HBA does not support enclosure management messages for devices attached via a Port Multiplier.<br>Software should use the Serial ATA enclosure management bridge that is built into many Port Multipliers for enclosure services with these devices.<br>For more information on Serial ATA enclosure management bridges, refer to the Serial ATA II: Extensions to Serial ATA 1.0a revision 1.2 specification. |
| 26 | 0x1<br>RW/O | **Activity LED Hardware Driven (ATTR_ALHD):** If set to 1, the HBA drives the activity LED for the LED message type in hardware and does not utilize software settings for this LED.<br>The HBA does not begin transmitting the hardware based activity signal until after software has written CTL.TM=1 after a reset condition. |
| 25 | 0x1<br>RO | **Transmit Only (ATTR_XMT):** If set to 1, the HBA only supports transmitting messages and does not support receiving messages.<br>If cleared to 0, the HBA supports transmitting and receiving messages. |
| 24 | 0x1<br>RO | **Single Message Buffer (ATTR_SMB):** If set to 1, the HBA has one message buffer that is shared for messages to transmit and messages received.<br>In this case, unsolicited receive messages are not supported and it is software's responsibility to manage access to this buffer.<br>If cleared to 0, there are separate receive and transmit buffers such that unsolicited messages could be supported. |
| 23:20 | 0x0<br>RO | **RSVD1:** Reserved |
| 19 | 0x0<br>RO | **SGPIO Enclosure Management Messages (SUPP_SGPIO):** If set to 1, the HBA supports the SGPIO register interface message type. |
| 18 | 0x0<br>RO | **SES-2 Enclosure Management Messages (SUPP_SES2):** If set to 1, the HBA supports the SES-2 message type. |
| 17 | 0x0<br>RO | **SAF-TE Enclosure Management Messages (SUPP_SAFTE):** If set to 1, the HBA supports the SAF-TE message type. |
| 16 | 0x1<br>RO | **LED Message Types (SUPP_LED):** If set to 1, the HBA supports the LED message type defined in LED Message Type. |
| 15:10 | 0x0<br>RO | **RSVD2:** Reserved |
| 9 | 0x0<br>RW/1S | **Reset (RST):** When set to 1 by software, the HBA shall reset all enclosure management message logic and take all appropriate reset actions to ensure messages can be transmitted/received after the reset. After the HBA completes the reset operation, the HBA shall set the value to 0. A write of 0 by software to this field shall have no effect. |
| 8 | 0x0<br>RW/1S | **Transmit Message (CTL_TM):** When set to 1 by software, the HBA shall transmit the message contained in the message buffer.<br>When the message is completely sent, the HBA shall clear this bit to 0.<br>A write of 0 to this bit by software shall have no effect.<br>Software shall not change the contents of the message buffer while CTL.TM is set to 1. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:1 | 0x0<br>RO | **RSVD3:** Reserved |
| 0 | 0x0<br>RO | **Message Received (STS_MR):** Message received is not supported. |

## 50.4.7 HBA Capabilities Extended (GHC_CAP2)—Offset 24h

This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon PLTRST#. This register is not reset by FLR.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [ABAR] + 24h

**Default:** 0000003Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RO | **RSVD0:** Reserved |
| 5 | 0x1<br>RW/O | **DEVSLP Entrance from Slumber Only (DESO):** This field specifies that the HBA shall only assert DEVSLP if the interface is in Slumber.<br>When this bit is set to 1, the HBA shall ignore software directed entrance to DEVSLP via PxCMD.ICC unless PxSSTS.IPM = 6h. |
| 4 | 0x1<br>RW/O/V | **Supports Aggressive DEVSLP Management (SADM):** When set to 1, the HBA supports hardware assertion of the DEVSLP signal after the idle timeout expires. |
| 3 | 0x1<br>RW/O/V | **Supports DEVSLP (SDS):** When set to 1, the HBA supports the DEVSLP feature. When cleared to 0, DEVSLP is not supported. |
| 2 | 0x1<br>RW/O/V | **Automatic Partial to Slumber Transitions (APST):** When set to 1, the HBA supports Automatic Partial to Slumber Transitions. |
| 1 | 0x0<br>RO | **RSVD1:** Reserved |
| 0 | 0x0<br>RO | **Reserved:** Reserved |

## 50.4.8 Vendor Specific (VSP)—Offset A0h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000048h

**BAR and Offset:** [ABAR] + A0h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:7 | 0x0<br>RO | **RSVD0:** Reserved |
| 6 | 0x1<br>RO | **Software Feature Mask Supported (SFMS):** Set to 1 if the platform is enabled for premium storage features mask (SFM) as described in VS MMIO space at offset ABAR[RPID.(OFST*4)+4]. |
| 5 | 0x0<br>RO/V | **Premium Features Supported (PFS):** Set to 1 if the platform is enabled for premium storage features (PFB) as described in VS MMIO space at offset ABAR[RPID.OFST*4].<br>Set to 0 if the platform is not enabled for premium storage features. |
| 4 | 0x0<br>RO/V | **Platform Type (PT):** Set to 1 if mobile platform. Clear (0) if desktop. |
| 3 | 0x1<br>RO | **Supports RAID Platform ID Reporting (SRPIR):** If set to 1, then indicates that the RAID Platform ID is reported via ABAR + C0h.<br>Set to 0 if this ID is not reported via MMIO space. |
| 2:0 | 0x0<br>RO | **RSVD1:** Reserved |

## 50.4.9 Vendor Specific Capabilities Register (VS_CAP)—Offset A4h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 001002DEh

**BAR and Offset:** [ABAR] + A4h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **RSVD0:** Reserved |
| 27:16 | 0x10<br>RW/O | **NVM Remapped Register Offset (NRMO):** Specifies the offset (in 128B unit) within ABAR as to where the PCIe NAND memory BAR register space is remapped.<br>For example, NRMO=1 means ABAR + 128B.<br>This allows the remapped offset to shift between ABAR + 0B, and ABAR + 512KK - 128B, with 128B step.<br>The remapped offset into the AHCI memory space must not overlap with the memory space used for SATA.<br>The remapped offset into the AHCI memory space and the remapped size must not exceed the allocated AHCI memory space of the integrated AHCI controller.<br>Only valid when NRMBE = 1.<br>The reset default of this field is 10h, this places the start of the PCIe NAND memory BAR register space at ABAR + 2K. This field is not reset by FLR. |
| 15:13 | 0x0<br>RO | **RSVD1:** Reserved |
| 12:1 | 0x16f<br>RW/O | **Memory Space Limit. (MSL):** This field specifies the size (in 128B unit) of the remapped memory space for the PCIe NAND device.<br>It is a 0-based field. For example, MSL=1 means 256B.<br>This allows the remapped size to shift between 128B and 512K with the step of 128B.Memory BAR offset from 0 to MSL of the PCIe NAND device are remapped under the integrated AHCI controller memory space.<br>The remapped offset into the AHCI memory space and the value programmed in this field must not exceed the allocated AHCI memory space of the integrated AHCI controller.<br>Only valid when NRMBE = 1.<br>The reset default of this field is 16Fh which specifies the size of the remapped memory space as 34k.<br>This field is not reset by FLR. |
| 0 | 0x0<br>RW/O | **PCIe NAND Memory BAR Remapped Enable (NRMBE):** Set to 1 if a PCIe NAND device is present and remapping of its memory BAR register space is enabled.<br>Cleared to 0 if there is no PCIe NAND device present or the remapping of its memory BAR register space is disabled.<br>This bit is not reset by FLR. |

## 50.4.10 RAID Platform ID (RPID)—Offset C0h

This register is used by the Intel Matrix Storage Manager OROM to match the features supported by the OROM with the platform on which the OROM is executing. This prevents the use of an OROM designed for newer chipsets from being use on older chipsets as this could reduce up-sell potential.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [ABAR] + C0h

**Default:** 00311C02h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x31<br>RO | **Offset (OFST):** The offset of the Premium Feature Block (PFB) in DWords from the beginning of the ABAR. SFM follows directly after PFB. |
| 15:0 | 0x1c02<br>RO/V | **RAID Platform ID (RPID):** Specifies the DID value that has been assigned to the platform. This is the same DID that is reported by the SATA controller when SATAGC.AIE is set to 1 except that the DID is always reported through this register, regardless if the programming of SATAGC.AIE. |

## 50.4.11 SW Feature Mask (SFM)—Offset C8h

The following will be programmed by the BIOS when VS_CAP.SFMS == 1. The feature mask is used by SW to determine which non-premium features shall be supported by SW. These register bits are not reset by FLR since they are programmed by BIOS.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**BAR and Offset:** [ABAR] + C8h

**Default:** 003Fh

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:12 | 0x0<br>RO | **RSVD0:** Reserved |
| 11:10 | 0x0<br>RW/O | **OROM UI Normal Delay. (OROM_UI_Normal_Delay):** Values of these bits specify the delay of the OROM UI Splash Screen in a normal status.<br>• 00 = 2 secs (default and previous value)<br>• 01 = 4 secs<br>• 10 = 6 secs<br>• 11 = 8 secs.<br>If bit 5 == 0, then these values are disregarded. |
| 9 | 0x0<br>RW/O | **Smart Response Technology. (Smart_Response_Technology):** If set to '1', then Smart Response Technology is enabled. If cleared to '0', the feature is disabled. |
| 8 | 0x0<br>RW/O | **RRT Only on ESATA (IRRT_Only_on_ESATA):** If set to 1, then only RRT volumes can span internal and external SATA ports (e.g. eSATA).<br>If cleared to 0, then any RAID volume can span internal and external SATA ports (e.g. eSATA). |
| 7 | 0x0<br>RW/O | **LED Locate (LED_Locate):** If set to 1, then LED/SGPIO hardware is attached and the ping to locate feature is enabled in the OS. |
| 6 | 0x0<br>RW/O | **HDDUNLOCK:** If set to 1, then HDD password unlock is enabled in the OS. |
| 5 | 0x1<br>RW/O | **OROM UI and BANNER (OROM_UI_and_BANNER):** If set to 1, then the OROM UI is displayed. When cleared to 0, the OROM UI and BANNER are not displayed if all disks and volumes have a normal status. |
| 4 | 0x1<br>RW/O | **RRT (IRRT):** If set to 1, then Rapid Recovery Technology is enabled. |
| 3 | 0x1<br>RW/O | **R5:** If set to 1, then RAID5 is enabled |
| 2 | 0x1<br>RW/O | **R10:** If set to 1, then RAID10 is enabled |
| 1 | 0x1<br>RW/O | **R1:** If set to 1, then RAID1 is enabled |
| 0 | 0x1<br>RW/O | **R0:** If set to 1, then RAID0 is enabled |

## 50.4.12 Port [0-7] Command List Base Address (PxCLB0)—Offset 100h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 100h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 0x0<br>RW | **Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute.<br>This address must be 1K aligned as indicated by bits 31:10 being read/write.<br>***Note:*** These bits are not reset on a HBA reset. |
| 9:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 50.4.13 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU0)—Offset 104h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 104h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Command List Base Address Upper (CLBU):** indicates the upper 32-bits for the command list base address for this port.<br>This base is used when fetching commands to execute.<br>***Note:*** These bits are not reset on a HBA reset. |

## 50.4.14 Port [0-7] FIS Base Address (PxFB0)—Offset 108h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 108h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RW | **FIS Base Address (FB):** Indicates the 32-bit base for received FISes.<br>This address must be 256-byte aligned as indicated by bits 31:08 being read/write.<br>When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned.<br>***Note:*** These bits are not reset on a HBA reset. |
| 7:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 50.4.15 Port [0-7] FIS Base Address Upper 32-bits (PxFBU0)—Offset 10Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 10Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port.<br>***Note:*** These bits are not reset on a HBA reset. |

## 50.4.16 Port [0-7] Interrupt Status (PxIS0)—Offset 110h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 110h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect. |
| 30 | 0x0<br>RW/1C/V | **Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set. |
| 29 | 0x0<br>RW/1C/V | **Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer.<br>In PCI, such an indication would be a target or master abort. |
| 28 | 0x0<br>RW/1C/V | **Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory. |
| 27 | 0x0<br>RW/1C/V | **Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop. |
| 26 | 0x0<br>RW/1C/V | **Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation. |
| 25 | 0x0<br>RO | **RSVD0:** Reserved |
| 24 | 0x0<br>RW/1C/V | **Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command. |
| 23 | 0x0<br>RW/1C/V | **Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected.<br>The IPMS bit may be set during enumeration process.<br>It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier. |
| 22 | 0x0<br>RO/V | **PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state.<br>This bit reflects the state of PxSERR.DIAG.N.<br>This bit is RO and is only cleared when PxSERR.DIAG.N is cleared. |
| 21:8 | 0x0<br>RO | **RSVD1:** Reserved |
| 7 | 0x0<br>RW/1C/V | **Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device.<br>This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set). |
| 6 | 0x0<br>RO/V | **Port Connect Change Status (PCS):**<br>• 1=Change in Current Connect Status.<br>• 0=No change in Current Connect Status.<br>This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared. |
| 5 | 0x0<br>RW/1C/V | **Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data. |
| 4 | 0x0<br>RO/V | **Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory.<br>This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0.<br>Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory.<br>Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync. |
| 3 | 0x0<br>RW/1C/V | **Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2 | 0x0<br>RW/1C/V | **DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory. |
| 1 | 0x0<br>RW/1C/V | **PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred.<br>This bit shall be set even if the data transfer resulted in an error. |
| 0 | 0x0<br>RW/1C/V | **Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory. |

## 50.4.17 Port [0-7] Interrupt Enable (PxIE0)—Offset 114h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 114h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect. |
| 30 | 0x0<br>RW | **Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt. |
| 29 | 0x0<br>RW | **Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt. |
| 28 | 0x0<br>RW | **Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt. |
| 27 | 0x0<br>RW | **Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt. |
| 26 | 0x0<br>RW | **Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt. |
| 25 | 0x0<br>RO | **RSVD0:** Reserved |
| 24 | 0x0<br>RW | **Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt. |
| 23 | 0x0<br>RW | **Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt. BIOS is required to program this field to '0'.<br>The same applies to AHCI driver. |
| 22 | 0x0<br>RW | **PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt. |
| 21:8 | 0x0<br>RO | **RSVD1:** Reserved |
| 7 | 0x0<br>RW/V | **Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt. |
| 6 | 0x0<br>RW | **Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt. |
| 5 | 0x0<br>RW | **Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt. |
| 4 | 0x0<br>RW | **Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt. |
| 3 | 0x0<br>RW | **Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt. |
| 2 | 0x0<br>RW | **DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt. |
| 1 | 0x0<br>RW | **PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt. |
| 0 | 0x0<br>RW | **Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt. |

## 50.4.18 Port [0-7] Command (PxCMD0)—Offset 118h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [ABAR] + 118h

**Default:** 00000004h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RW | **Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface.<br>If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested.<br>If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect. |
| 27 | 0x0<br>RW | **Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h.<br>When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h.<br>If CAP.SALP is cleared to 0., software shall treat this bit as reserved. |
| 26 | 0x0<br>RW | **Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit.<br>Software shall only set this bit to 1 if CAP.SALP is set to 1.<br>If CAP.SALP is cleared to 0, software shall treat this bit as reserved.<br>BIOS is recommended to program this field to 1. |
| 25 | 0x0<br>RW | **Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI.<br>When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0.<br>This bit is set by software. |
| 24 | 0x0<br>RW | **Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device.<br>This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active. |
| 23 | 0x0<br>RW | **Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions.<br>When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions.<br>Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved. |
| 22 | 0x0<br>RO | **FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching. |
| 21 | 0x0<br>RW/O | **External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device.<br>When set to 1, CAP.SXS must also be set to 1.<br>When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only.<br>If ESP is set to '1', then the port may experience hot plug events. |
| 20 | 0x0<br>RO | **Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect. |
| 19 | 0x0<br>RW/O | **Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port.<br>If cleared to 0, the platform does not support a mechanical presence switch attached to this port. |
| 18 | 0x0<br>RW/O | **Hot Plug Capable Port (HPCP):** This indicates whether the this port is connected to a device which can be hot plugged.<br>SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example).<br>This bit can be used by system software to indicate a feature such as eject device to the end-user. |
| 17 | 0x0<br>RW/V | **Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port.<br>When cleared, a Port Multiplier is not attached to the HBA for this port.<br>This bit is a read only 0. when CAP.PMS = 0., and read/write when CAP.PMS = 1.<br>Note that this bit is set by software; hardware does not auto-detect that a Port Multiplier is attached. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15 | 0x0<br>RO/V | **Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running. |
| 14 | 0x0<br>RO/V | **FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running.<br>Note to software: When FR bit stays set, please read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any |
| 13 | 0x0<br>RO/V | **Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port.<br>If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0.<br>If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1.<br>If CAP.SMPS is set to 0 then this bit is cleared to 0.<br>Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1. |
| 12:8 | 0x0<br>RO | **Current Command Slot (CCS):** Indicates the current command slot the HBA is processing.<br>This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA.<br>This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command.<br>When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0.<br>After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0.<br>After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1.<br>For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1. |
| 7:5 | 0x0<br>RO | **RSVD1:** Reserved |
| 4 | 0x0<br>RW | **FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU.<br>When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence. |
| 3 | 0x0<br>RW/1S | **Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0.<br>This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register.<br>The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0.<br>A write to this register with a value of 0 shall have no effect. |
| 2 | 0x1<br>RO | **Power On Device (POD):** The SATA controller does not support cold presence detect. |
| 1 | 0x0<br>RW/V | **Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS.<br>This bit is read only 1. for HBAs that do not support staggered spin-up.<br>On an edge detect from 0. to 1, the HBA shall start a COMRESET initialization sequence to the device.<br>Clearing this bit causes no action on the interface.<br>Clearing this bit to0 does not cause any OOB signal to be sent on the interface.<br>When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode. |
| 0 | 0x0<br>RW | **Start (ST):** When set, the HBA may process the command list.<br>When cleared, the HBA may not process the command list.<br>Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0.<br>Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also. |

## 50.4.19 Port [0-7] Serial ATA Status (PxSSTS0)—Offset 128h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 128h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RO | **RSVD0:** Reserved |
| 11:8 | 0x0<br>RO/V | **Interface Power Management (IPM):** Indicates the current interface state |
| 7:4 | 0x0<br>RO/V | **Current Interface Speed (SPD):** Indicates the negotiated interface communication speed. |
| 3:0 | 0x0<br>RO/V | **Device Detection (DET):** Indicates the interface device detection and Phy state. |

## 50.4.20 Port [0-7] Serial ATA Control (PxSCTL0)—Offset 12Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 12Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RO | **RSVD0:** Reserved |
| 19:16 | 0x0<br>RW | **Port Multiplier Port (PMP):** This field is not used by AHCI. |
| 15:12 | 0x0<br>RW | **Select Power Management (SPM):** This field is not used by AHCI. |
| 11:8 | 0x0<br>RW | **Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to.<br>If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state. |
| 7:4 | 0x0<br>RW | **Speed Allowed (SPD):** Indicates the highest allowable speed of the interface. |
| 3:0 | 0x0<br>RW | **Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization. |

## 50.4.21 Port [0-7] Serial ATA Error (PxSERR0)—Offset 130h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 130h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/1C/V | **Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes. |
| 15:0 | 0x0<br>RW/1C/V | **Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition.<br>If one or more of bits 11:8 of this register are set, the controller will stop the current transfer. |

## 50.4.22 Port [0-7] Serial ATA Active (PxSACT0)—Offset 134h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 134h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/1S/V | **Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry.<br>This field is cleared via the Set Device Bits FIS. |

## 50.4.23 Port [0-7] Commands Issued (PxCI0)—Offset 138h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 138h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device.<br>When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot.<br>Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1. |

## 50.4.24 Port [0-7] SNotification (PxSNTF0)—Offset 13Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 13Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15:0 | 0x0<br>RW/1C/V | **PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set.<br>PM Port 0h sets bit 0.<br>PM Port Fh sets bit 15.<br>Individual bits are cleared by software writing 1's to the corresponding bit positions.<br>Note that, while this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST |

## 50.4.25 Port [0-7] Command List Base Address (PxCLB1)—Offset 180h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 180h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 0x0<br>RW | **Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute.<br>This address must be 1K aligned as indicated by bits 31:10 being read/write.<br>***Note:*** These bits are not reset on a HBA reset. |
| 9:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 50.4.26 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU1)—Offset 184h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 184h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port.<br>This base is used when fetching commands to execute.<br>***Note:*** These bits are not reset on a HBA reset. |

## 50.4.27 Port [0-7] FIS Base Address (PxFB1)—Offset 188h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 188h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RW | **FIS Base Address (FB):** Indicates the 32-bit base for received FISes.<br>This address must be 256-byte aligned as indicated by bits 31:08 being read/write.<br>When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned.<br>***Note:*** These bits are not reset on a HBA reset. |
| 7:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 50.4.28 Port [0-7] FIS Base Address Upper 32-bits (PxFBU1)—Offset 18Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 18Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port.<br>***Note:*** These bits are not reset on a HBA reset. |

## 50.4.29 Port [0-7] Interrupt Status (PxIS1)—Offset 190h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 190h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect. |
| 30 | 0x0<br>RW/1C/V | **Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set. |
| 29 | 0x0<br>RW/1C/V | **Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer.<br>In PCI, such an indication would be a target or master abort. |
| 28 | 0x0<br>RW/1C/V | **Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory. |
| 27 | 0x0<br>RW/1C/V | **Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop. |
| 26 | 0x0<br>RW/1C/V | **Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation. |
| 25 | 0x0<br>RO | **RSVD0:** Reserved |
| 24 | 0x0<br>RW/1C/V | **Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command. |
| 23 | 0x0<br>RW/1C/V | **Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected.<br>The IPMS bit may be set during enumeration process.<br>It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier. |
| 22 | 0x0<br>RO/V | **PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N.<br>This bit is RO and is only cleared when PxSERR.DIAG.N is cleared. |
| 21:8 | 0x0<br>RO | **RSVD1:** Reserved |
| 7 | 0x0<br>RW/1C/V | **Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device.<br>This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set). |
| 6 | 0x0<br>RO/V | **Port Connect Change Status (PCS):**<br>• 1=Change in Current Connect Status.<br>• 0=No change in Current Connect Status.<br>This bit reflects the state of PxSERR.DIAG.X.<br>This bit is only cleared when PxSERR.DIAG.X is cleared. |
| 5 | 0x0<br>RW/1C/V | **Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data. |
| 4 | 0x0<br>RO/V | **Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory.<br>This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0.<br>Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory.<br>Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3 | 0x0<br>RW/1C/V | **Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory. |
| 2 | 0x0<br>RW/1C/V | **DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory. |
| 1 | 0x0<br>RW/1C/V | **PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred.<br>This bit shall be set even if the data transfer resulted in an error. |
| 0 | 0x0<br>RW/1C/V | **Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory. |

## 50.4.30 Port [0-7] Interrupt Enable (PxIE1)—Offset 194h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 194h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect. |
| 30 | 0x0<br>RW | **Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt. |
| 29 | 0x0<br>RW | **Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt. |
| 28 | 0x0<br>RW | **Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt. |
| 27 | 0x0<br>RW | **Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt. |
| 26 | 0x0<br>RW | **Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt. |
| 25 | 0x0<br>RO | **RSVD0:** Reserved |
| 24 | 0x0<br>RW | **Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt. |
| 23 | 0x0<br>RW | **Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt.<br>BIOS is required to program this field to '0'.<br>The same applies to AHCI driver. |
| 22 | 0x0<br>RW | **PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt. |
| 21:8 | 0x0<br>RO | **RSVD1:** Reserved |
| 7 | 0x0<br>RW/V | **Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt. |
| 6 | 0x0<br>RW | **Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt. |
| 5 | 0x0<br>RW | **Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt. |
| 4 | 0x0<br>RW | **Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt. |
| 3 | 0x0<br>RW | **Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt. |
| 2 | 0x0<br>RW | **DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt. |
| 1 | 0x0<br>RW | **PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt. |
| 0 | 0x0<br>RW | **Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt. |

## 50.4.31 Port [0-7] Command (PxCMD1)—Offset 198h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [ABAR] + 198h

**Default:** 00000004h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RW | **Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface.<br>If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested.<br>If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect. |
| 27 | 0x0<br>RW | **Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h.<br>When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h.<br>If CAP.SALP is cleared to 0., software shall treat this bit as reserved. |
| 26 | 0x0<br>RW | **Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit.<br>Software shall only set this bit to 1 if CAP.SALP is set to 1.<br>If CAP.SALP is cleared to 0, software shall treat this bit as reserved.<br>BIOS is recommended to program this field to 1. |
| 25 | 0x0<br>RW | **Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI.<br>When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0.<br>This bit is set by software. |
| 24 | 0x0<br>RW | **Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device.<br>This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active. |
| 23 | 0x0<br>RW | **Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions.<br>When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions.<br>Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved. |
| 22 | 0x0<br>RO | **FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching. |
| 21 | 0x0<br>RW/O | **External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device.<br>When set to 1, CAP.SXS must also be set to 1.<br>When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to '1', then the port may experience hot plug events. |
| 20 | 0x0<br>RO | **Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect. |
| 19 | 0x0<br>RW/O | **Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port.<br>If cleared to 0, the platform does not support a mechanical presence switch attached to this port. |
| 18 | 0x0<br>RW/O | **Hot Plug Capable Port (HPCP):** This indicates whether the this port is connected to a device which can be hot plugged.<br>SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example).<br>This bit can be used by system software to indicate a feature such as eject device to the end-user. |
| 17 | 0x0<br>RW/V | **Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port.<br>When cleared, a Port Multiplier is not attached to the HBA for this port.<br>This bit is a read only 0. when CAP.PMS = 0., and read/write when CAP.PMS = 1.<br>Note that this bit is set by software; hardware does not auto-detect that a Port Multiplier is attached. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15 | 0x0<br>RW/V | **Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running. |
| 14 | 0x0<br>RW/V | **FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running.<br>Note to software: When FR bit stays set, please read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any |
| 13 | 0x0<br>RO | **Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port.<br>If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0.<br>If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1.<br>If CAP.SMPS is set to 0 then this bit is cleared to 0.<br>Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1. |
| 12:8 | 0x0<br>RO | **Current Command Slot (CCS):** Indicates the current command slot the HBA is processing.<br>This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA.<br>This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command.<br>When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0.<br>After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1.<br>For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1. |
| 7:5 | 0x0<br>RO | **RSVD1:** Reserved |
| 4 | 0x0<br>RW | **FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU.<br>When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence. |
| 3 | 0x0<br>RW/1S | **Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0.<br>This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register.<br>The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0.<br>A write to this register with a value of 0 shall have no effect. |
| 2 | 0x1<br>RO | **Power On Device (POD):** The SATA controller does not support cold presence detect. |
| 1 | 0x0<br>RW/V | **Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS.<br>This bit is read only 1. for HBAs that do not support staggered spin-up.<br>On an edge detect from 0. to 1, the HBA shall start a COMRESET initialization sequence to the device.<br>Clearing this bit causes no action on the interface.<br>Clearing this bit to0 does not cause any OOB signal to be sent on the interface.<br>When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode. |
| 0 | 0x0<br>RW | **Start (ST):** When set, the HBA may process the command list.<br>When cleared, the HBA may not process the command list.<br>Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0.<br>Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also. |

## 50.4.32 Port [0-7] Serial ATA Status (PxSSTS1)—Offset 1A8h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 1A8h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RO | **RSVD0:** Reserved |
| 11:8 | 0x0<br>RO/V | **Interface Power Management (IPM):** Indicates the current interface state |
| 7:4 | 0x0<br>RO/V | **Current Interface Speed (SPD):** Indicates the negotiated interface communication speed. |
| 3:0 | 0x0<br>RO/V | **Device Detection (DET):** Indicates the interface device detection and Phy state. |

## 50.4.33 Port [0-7] Serial ATA Control (PxSCTL1)—Offset 1ACh

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 1ACh

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RO | **RSVD0:** Reserved |
| 19:16 | 0x0<br>RW | **Port Multiplier Port (PMP):** This field is not used by AHCI. |
| 15:12 | 0x0<br>RW | **Select Power Management (SPM):** This field is not used by AHCI. |
| 11:8 | 0x0<br>RW | **Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to.<br>If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state. |
| 7:4 | 0x0<br>RW | **Speed Allowed (SPD):** Indicates the highest allowable speed of the interface. |
| 3:0 | 0x0<br>RW | **Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization. |

## 50.4.34 Port [0-7] Serial ATA Error (PxSERR1)—Offset 1B0h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 1B0h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0 RW/1C/V | **Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes. |
| 15:0 | 0x0 RW/1C/V | **Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition.<br>If one or more of bits 11:8 of this register are set, the controller will stop the current transfer. |

## 50.4.35 Port [0-7] Serial ATA Active (PxSACT1)—Offset 1B4h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 1B4h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RW/1S/V | **Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry.<br>This field is cleared via the Set Device Bits FIS. |

## 50.4.36 Port [0-7] Commands Issued (PxCI1)—Offset 1B8h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 1B8h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RW/1S/V | **Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device.<br>When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot.<br>Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1. |

## 50.4.37 Port [0-7] SNotification (PxSNTF1)—Offset 1BCh

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 1BCh

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15:0 | 0x0<br>RW/1C/V | **PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set.<br>PM Port 0h sets bit 0.<br>PM Port Fh sets bit 15.<br>Individual bits are cleared by software writing 1's to the corresponding bit positions.<br>Note that, while this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST. |

## 50.4.38 Port [0-7] Command List Base Address (PxCLB2)—Offset 200h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 200h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 0x0<br>RW | **Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute.<br>This address must be 1K aligned as indicated by bits 31:10 being read/write.<br>***Note:*** These bits are not reset on a HBA reset. |
| 9:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 50.4.39 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU2)—Offset 204h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 204h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port.<br>This base is used when fetching commands to execute.<br>***Note:*** These bits are not reset on a HBA reset. |

## 50.4.40 Port [0-7] FIS Base Address (PxFB2)—Offset 208h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 208h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RW | **FIS Base Address (FB):** Indicates the 32-bit base for received FISes.<br>This address must be 256-byte aligned as indicated by bits 31:08 being read/write.<br>When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned.<br>***Note:*** These bits are not reset on a HBA reset. |
| 7:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 50.4.41 Port [0-7] FIS Base Address Upper 32-bits (PxFBU2)—Offset 20Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 20Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port.<br>***Note:*** These bits are not reset on a HBA reset. |

## 50.4.42 Port [0-7] Interrupt Status (PxIS2)—Offset 210h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 210h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect. |
| 30 | 0x0<br>RW/1C/V | **Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set. |
| 29 | 0x0<br>RW/1C/V | **Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer.<br>In PCI, such an indication would be a target or master abort. |
| 28 | 0x0<br>RW/1C/V | **Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory. |
| 27 | 0x0<br>RW/1C/V | **Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop. |
| 26 | 0x0<br>RW/1C/V | **Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation. |
| 25 | 0x0<br>RO | **RSVD0:** Reserved |
| 24 | 0x0<br>RW/1C/V | **Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command. |
| 23 | 0x0<br>RW/1C/V | **Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected.<br>The IPMS bit may be set during enumeration process.<br>It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier. |
| 22 | 0x0<br>RO/V | **PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state.<br>This bit reflects the state of PxSERR.DIAG.N.<br>This bit is RO and is only cleared when PxSERR.DIAG.N is cleared. |
| 21:8 | 0x0<br>RO | **RSVD1:** Reserved |
| 7 | 0x0<br>RW/1C/V | **Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device.<br>This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set). |
| 6 | 0x0<br>RO/V | **Port Connect Change Status (PCS):**<br>• 1=Change in Current Connect Status.<br>• 0=No change in Current Connect Status.<br>This bit reflects the state of PxSERR.DIAG.X.<br>This bit is only cleared when PxSERR.DIAG.X is cleared. |
| 5 | 0x0<br>RW/1C/V | **Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data. |
| 4 | 0x0<br>RO/V | **Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory.<br>This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0.<br>Note that this bit does not directly reflect the PxSERR.DIAG.F bit.<br>PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory.<br>Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3 | 0x0<br>RW/1C/V | **Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory. |
| 2 | 0x0<br>RW/1C/V | **DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory. |
| 1 | 0x0<br>RW/1C/V | **PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred.<br>This bit shall be set even if the data transfer resulted in an error. |
| 0 | 0x0<br>RW/1C/V | **Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory. |

## 50.4.43 Port [0-7] Interrupt Enable (PxIE2)—Offset 214h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 214h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect. |
| 30 | 0x0<br>RW | **Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt. |
| 29 | 0x0<br>RW | **Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt. |
| 28 | 0x0<br>RW | **Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt. |
| 27 | 0x0<br>RW | **Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt. |
| 26 | 0x0<br>RW | **Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt. |
| 25 | 0x0<br>RO | **RSVD0:** Reserved |
| 24 | 0x0<br>RW | **Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt. |
| 23 | 0x0<br>RW | **Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt. BIOS is required to program this field to '0'.<br>The same applies to AHCI driver. |
| 22 | 0x0<br>RW | **PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt. |
| 21:8 | 0x0<br>RO | **RSVD1:** Reserved |
| 7 | 0x0<br>RW/V | **Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt. |
| 6 | 0x0<br>RW | **Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt. |
| 5 | 0x0<br>RW | **Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt. |
| 4 | 0x0<br>RW | **Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt. |
| 3 | 0x0<br>RW | **Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt. |
| 2 | 0x0<br>RW | **DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt. |
| 1 | 0x0<br>RW | **PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt. |
| 0 | 0x0<br>RW | **Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt. |

## 50.4.44 Port [0-7] Command (PxCMD2)—Offset 218h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000004h

**BAR and Offset:** [ABAR] + 218h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RW | **Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface.<br>If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested.<br>If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect. |
| 27 | 0x0<br>RW | **Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h.<br>When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h.<br>If CAP.SALP is cleard to 0., software shall treat this bit as reserved. |
| 26 | 0x0<br>RW | **Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit.<br>Software shall only set this bit to 1 if CAP.SALP is set to 1.<br>If CAP.SALP is cleared to 0, software shall treat this bit as reserved. BIOS is recommended to program this field to 1. |
| 25 | 0x0<br>RW | **Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI.<br>When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0.<br>This bit is set by software. |
| 24 | 0x0<br>RW | **Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device.<br>This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active. |
| 23 | 0x0<br>RW | **Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions.<br>When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions.<br>Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved. |
| 22 | 0x0<br>RO | **FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching. |
| 21 | 0x0<br>RW/O | **External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device.<br>When set to 1, CAP.SXS must also be set to 1.<br>When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only.<br>If ESP is set to '1', then the port may experience hot plug events. |
| 20 | 0x0<br>RO | **Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect. |
| 19 | 0x0<br>RW/O | **Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port.<br>If cleared to 0, the platform does not support a mechanical presence switch attached to this port. |
| 18 | 0x0<br>RW/O | **Hot Plug Capable Port (HPCP):** This indicates whether the this port is connected to a device which can be hot plugged.<br>SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example).<br>This bit can be used by system software to indicate a feature such as eject device to the end-user. |
| 17 | 0x0<br>RW/V | **Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port.<br>When cleared, a Port Multiplier is not attached to the HBA for this port.<br>This bit is a read only 0. when CAP.PMS = 0., and read/write when CAP.PMS = 1.<br>Note that this bit is set by software; hardware does not auto-detect that a Port Multiplier is attached. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15 | 0x0<br>RO/V | **Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running. |
| 14 | 0x0<br>RO/V | **FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running.<br>Note to software: When FR bit stays set, please read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any |
| 13 | 0x0<br>RO/V | **Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port.<br>If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0.<br>If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1.<br>If CAP.SMPS is set to 0 then this bit is cleared to 0.<br>Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1. |
| 12:8 | 0x0<br>RO | **Current Command Slot (CCS):** Indicates the current command slot the HBA is processing.<br>This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA.<br>This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command.<br>When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0.<br>After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0.<br>After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1.<br>For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1. |
| 7:5 | 0x0<br>RO | **RSVD1:** Reserved |
| 4 | 0x0<br>RW | **FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU.<br>When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence. |
| 3 | 0x0<br>RW/1S | **Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0.<br>This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register.<br>The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0.<br>A write to this register with a value of 0 shall have no effect. |
| 2 | 0x1<br>RO | **Power On Device (POD):** The SATA controller does not support cold presence detect. |
| 1 | 0x0<br>RW/V | **Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS.<br>This bit is read only 1. for HBAs that do not support staggered spin-up.<br>On an edge detect from 0. to 1, the HBA shall start a COMRESET initialization sequence to the device.<br>Clearing this bit causes no action on the interface.<br>Clearing this bit to0 does not cause any OOB signal to be sent on the interface.<br>When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode. |
| 0 | 0x0<br>RW | **Start (ST):** When set, the HBA may process the command list.<br>When cleared, the HBA may not process the command list.<br>Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0.<br>Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state.<br>PxTFD shall be updated also. |

## 50.4.45 Port [0-7] Serial ATA Status (PxSSTS2)—Offset 228h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 228h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RO | **RSVD0:** Reserved |
| 11:8 | 0x0<br>RO/V | **Interface Power Management (IPM):** Indicates the current interface state |
| 7:4 | 0x0<br>RO/V | **Current Interface Speed (SPD):** Indicates the negotiated interface communication speed. |
| 3:0 | 0x0<br>RO/V | **Device Detection (DET):** Indicates the interface device detection and Phy state. |

## 50.4.46 Port [0-7] Serial ATA Control (PxSCTL2)—Offset 22Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 22Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RO | **RSVD0:** Reserved |
| 19:16 | 0x0<br>RW | **Port Multiplier Port (PMP):** This field is not used by AHCI. |
| 15:12 | 0x0<br>RW | **Select Power Management (SPM):** This field is not used by AHCI. |
| 11:8 | 0x0<br>RW | **Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to.<br>If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state. |
| 7:4 | 0x0<br>RW | **Speed Allowed (SPD):** Indicates the highest allowable speed of the interface. |
| 3:0 | 0x0<br>RW | **Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization. |

## 50.4.47 Port [0-7] Serial ATA Error (PxSERR2)—Offset 230h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 230h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0 RW/1C/V | **Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes. |
| 15:0 | 0x0 RW/1C/V | **Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition.<br>If one or more of bits 11:8 of this register are set, the controller will stop the current transfer. |

## 50.4.48 Port [0-7] Serial ATA Active (PxSACT2)—Offset 234h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 234h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RW/1S/V | **Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry.<br>This field is cleared via the Set Device Bits FIS. |

## 50.4.49 Port [0-7] Commands Issued (PxCI2)—Offset 238h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 238h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RW/1S/V | **Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device.<br>When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot.<br>Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1. |

## 50.4.50 Port [0-7] SNotification (PxSNTF2)—Offset 23Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 23Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15:0 | 0x0<br>RW/1C | **PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set.<br>PM Port 0h sets bit 0.<br>PM Port Fh sets bit 15.<br>Individual bits are cleared by software writing 1's to the corresponding bit positions.<br>Note that, while this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST |

## 50.4.51 Port [0-7] Command List Base Address (PxCLB3)—Offset 280h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 280h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 0x0<br>RW | **Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute.<br>This address must be 1K aligned as indicated by bits 31:10 being read/write.<br>***Note:*** These bits are not reset on a HBA reset. |
| 9:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 50.4.52 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU3)—Offset 284h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 284h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. Note that these bits are not reset on a HBA reset. |

## 50.4.53 Port [0-7] FIS Base Address (PxFB3)—Offset 288h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 288h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RW | **FIS Base Address (FB):** Indicates the 32-bit base for received FISes.<br>This address must be 256-byte aligned as indicated by bits 31:08 being read/write.<br>When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned.<br>***Note:*** These bits are not reset on a HBA reset. |
| 7:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 50.4.54 Port [0-7] FIS Base Address Upper 32-bits (PxFBU3)—Offset 28Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 28Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port.<br>***Note:*** These bits are not reset on a HBA reset. |

## 50.4.55 Port [0-7] Interrupt Status (PxIS3)—Offset 290h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 290h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect. |
| 30 | 0x0<br>RW/1C/V | **Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set. |
| 29 | 0x0<br>RW/1C/V | **Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer.<br>In PCI, such an indication would be a target or master abort. |
| 28 | 0x0<br>RW/1C/V | **Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory. |
| 27 | 0x0<br>RW/1C/V | **Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop. |
| 26 | 0x0<br>RW/1C/V | **Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation. |
| 25 | 0x0<br>RO | **RSVD0:** Reserved |
| 24 | 0x0<br>RW/1C/V | **Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command. |
| 23 | 0x0<br>RW/1C | **Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected.<br>The IPMS bit may be set during enumeration process.<br>It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier. |
| 22 | 0x0<br>RO/V | **PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state.<br>This bit reflects the state of PxSERR.DIAG.N.<br>This bit is RO and is only cleared when PxSERR.DIAG.N is cleared. |
| 21:8 | 0x0<br>RO | **RSVD1:** Reserved |
| 7 | 0x0<br>RW/1C/V | **Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device.<br>This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set). |
| 6 | 0x0<br>RO/V | **Port Connect Change Status (PCS):**<br>1=Change in Current Connect Status.<br>0=No change in Current Connect Status.<br>This bit reflects the state of PxSERR.DIAG.X.<br>This bit is only cleared when PxSERR.DIAG.X is cleared. |
| 5 | 0x0<br>RW/1C/V | **Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data. |
| 4 | 0x0<br>RO/V | **Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory.<br>This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0.<br>***Note:*** This bit does not directly reflect the PxSERR.DIAG.F bit.<br>PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory.<br>Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3 | 0x0<br>RW/1C/V | **Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory. |
| 2 | 0x0<br>RW/1C/V | **DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory. |
| 1 | 0x0<br>RW/1C/V | **PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred.<br>This bit shall be set even if the data transfer resulted in an error. |
| 0 | 0x0<br>RW/1C/V | **Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory. |

## 50.4.56 Port [0-7] Interrupt Enable (PxIE3)—Offset 294h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 294h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect. |
| 30 | 0x0<br>RW | **Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt. |
| 29 | 0x0<br>RW | **Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt. |
| 28 | 0x0<br>RW | **Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt. |
| 27 | 0x0<br>RW | **Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt. |
| 26 | 0x0<br>RW | **Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt. |
| 25 | 0x0<br>RO | **RSVD0:** Reserved |
| 24 | 0x0<br>RW | **Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt. |
| 23 | 0x0<br>RW | **Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt. BIOS is required to program this field to '0'.<br>The same applies to AHCI driver. |
| 22 | 0x0<br>RW | **PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt. |
| 21:8 | 0x0<br>RO | **RSVD1:** Reserved |
| 7 | 0x0<br>RW/V | **Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt. |
| 6 | 0x0<br>RW | **Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt. |
| 5 | 0x0<br>RW | **Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt. |
| 4 | 0x0<br>RW | **Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt. |
| 3 | 0x0<br>RW | **Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt. |
| 2 | 0x0<br>RW | **DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt. |
| 1 | 0x0<br>RW | **PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt. |
| 0 | 0x0<br>RW | **Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt. |

## 50.4.57 Port [0-7] Command (PxCMD3)—Offset 298h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [ABAR] + 298h

**Default:** 00000004h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RW | **Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface.<br>If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested.<br>If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect. |
| 27 | 0x0<br>RW | **Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h.<br>When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h.<br>If CAP.SALP is cleared to 0., software shall treat this bit as reserved. |
| 26 | 0x0<br>RW | **Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit.<br>Software shall only set this bit to 1 if CAP.SALP is set to 1.<br>If CAP.SALP is cleared to 0, software shall treat this bit as reserved.<br>BIOS is recommended to program this field to 1. |
| 25 | 0x0<br>RW | **Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI.<br>When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0.<br>This bit is set by software. |
| 24 | 0x0<br>RW | **Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device.<br>This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active. |
| 23 | 0x0<br>RW | **Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions.<br>When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions.<br>Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved. |
| 22 | 0x0<br>RO | **FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching. |
| 21 | 0x0<br>RW/O | **External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device.<br>When set to 1, CAP.SXS must also be set to 1.<br>When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only.<br>If ESP is set to '1', then the port may experience hot plug events. |
| 20 | 0x0<br>RO | **Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect. |
| 19 | 0x0<br>RW/O | **Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port.<br>If cleared to 0, the platform does not support a mechanical presence switch attached to this port. |
| 18 | 0x0<br>RW/O | **Hot Plug Capable Port (HPCP):** This indicates whether the this port is connected to a device which can be hot plugged.<br>SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example).<br>This bit can be used by system software to indicate a feature such as eject device to the end-user. |
| 17 | 0x0<br>RW/V | **Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port.<br>When cleared, a Port Multiplier is not attached to the HBA for this port.<br>This bit is a read only 0. when CAP.PMS = 0., and read/write when CAP.PMS = 1.<br>Note that this bit is set by software; hardware does not auto-detect that a Port Multiplier is attached. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15 | 0x0<br>RO/V | **Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running. |
| 14 | 0x0<br>RO/V | **FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running. Note to software: When FR bit stays set, please read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any |
| 13 | 0x0<br>RO/V | **Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port.<br>If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0.<br>If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1.<br>If CAP.SMPS is set to 0 then this bit is cleared to 0.<br>Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1. |
| 12:8 | 0x0<br>RO | **Current Command Slot (CCS):** Indicates the current command slot the HBA is processing.<br>This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA.<br>This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command.<br>When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0.<br>After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0.<br>After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1.<br>For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1. |
| 7:5 | 0x0<br>RO | **RSVD1:** Reserved |
| 4 | 0x0<br>RW | **FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU.<br>When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence. |
| 3 | 0x0<br>RW/1S | **Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0.<br>This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register.<br>The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0.<br>A write to this register with a value of 0 shall have no effect. |
| 2 | 0x1<br>RO | **Power On Device (POD):** The SATA controller does not support cold presence detect. |
| 1 | 0x0<br>RW/V | **Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS.<br>This bit is read only 1. for HBAs that do not support staggered spin-up.<br>On an edge detect from 0. to 1, the HBA shall start a COMRESET initialization sequence to the device.<br>Clearing this bit causes no action on the interface.<br>Clearing this bit to0 does not cause any OOB signal to be sent on the interface.<br>When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode. |
| 0 | 0x0<br>RW | **Start (ST):** When set, the HBA may process the command list.<br>When cleared, the HBA may not process the command list.<br>Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0.<br>Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also. |

## 50.4.58 Port [0-7] Serial ATA Status (PxSSTS3)—Offset 2A8h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 2A8h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RO | **RSVD0:** Reserved |
| 11:8 | 0x0<br>RO/V | **Interface Power Management (IPM):** Indicates the current interface state |
| 7:4 | 0x0<br>RO/V | **Current Interface Speed (SPD):** Indicates the negotiated interface communication speed. |
| 3:0 | 0x0<br>RO/V | **Device Detection (DET):** Indicates the interface device detection and Phy state. |

## 50.4.59 Port [0-7] Serial ATA Control (PxSCTL3)—Offset 2ACh

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 2ACh

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RO | **RSVD0:** Reserved |
| 19:16 | 0x0<br>RW | **Port Multiplier Port (PMP):** This field is not used by AHCI. |
| 15:12 | 0x0<br>RW | **Select Power Management (SPM):** This field is not used by AHCI. |
| 11:8 | 0x0<br>RW | **Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to.<br>If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state. |
| 7:4 | 0x0<br>RW | **Speed Allowed (SPD):** Indicates the highest allowable speed of the interface. |
| 3:0 | 0x0<br>RW | **Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization. |

## 50.4.60 Port [0-7] Serial ATA Error (PxSERR3)—Offset 2B0h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 2B0h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0 RW/1C/V | **Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes. |
| 15:0 | 0x0 RW/1C/V | **Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition.<br>If one or more of bits 11:8 of this register are set, the controller will stop the current transfer. |

## 50.4.61 Port [0-7] Serial ATA Active (PxSACT3)—Offset 2B4h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 2B4h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RW/1S/V | **Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry.<br>This field is cleared via the Set Device Bits FIS. |

## 50.4.62 Port [0-7] Commands Issued (PxCI3)—Offset 2B8h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 2B8h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RW/1S/V | **Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device.<br>When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot.<br>Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1. |

## 50.4.63 Port [0-7] SNotification (PxSNTF3)—Offset 2BCh

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 2BCh

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15:0 | 0x0<br>RW/1C/V | **PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set.<br>PM Port 0h sets bit 0.<br>PM Port Fh sets bit 15.<br>Individual bits are cleared by software writing 1's to the corresponding bit positions.<br>Note that, while this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST |

## 50.4.64 Port [0-7] Command List Base Address (PxCLB4)—Offset 300h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 300h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 0x0<br>RW | **Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute.<br>This address must be 1K aligned as indicated by bits 31:10 being read/write.<br>Note that these bits are not reset on a HBA reset. |
| 9:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 50.4.65 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU4)—Offset 304h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 304h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port.<br>This base is used when fetching commands to execute.<br>***Note:*** These bits are not reset on a HBA reset. |

## 50.4.66 Port [0-7] FIS Base Address (PxFB4)—Offset 308h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 308h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RW | **FIS Base Address (FB):** Indicates the 32-bit base for received FISes.<br>This address must be 256-byte aligned as indicated by bits 31:08 being read/write.<br>When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned.<br>***Note:*** These bits are not reset on a HBA reset. |
| 7:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 50.4.67 Port [0-7] FIS Base Address Upper 32-bits (PxFBU4)—Offset 30Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 30Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port.<br>***Note:*** These bits are not reset on a HBA reset. |

## 50.4.68 Port [0-7] Interrupt Status (PxIS4)—Offset 310h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 310h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect. |
| 30 | 0x0<br>RW/1C/V | **Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set. |
| 29 | 0x0<br>RW/1C/V | **Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer.<br>In PCI, such an indication would be a target or master abort. |
| 28 | 0x0<br>RW/1C/V | **Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory. |
| 27 | 0x0<br>RW/1C/V | **Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop. |
| 26 | 0x0<br>RW/1C/V | **Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation. |
| 25 | 0x0<br>RO | **RSVD0:** Reserved |
| 24 | 0x0<br>RW/1C/V | **Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command. |
| 23 | 0x0<br>RW/1C/V | **Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected.<br>The IPMS bit may be set during enumeration process.<br>It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier. |
| 22 | 0x0<br>RO/V | **PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N.<br>This bit is RO and is only cleared when PxSERR.DIAG.N is cleared. |
| 21:8 | 0x0<br>RO | **RSVD1:** Reserved |
| 7 | 0x0<br>RW/1C/V | **Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device.<br>This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set). |
| 6 | 0x0<br>RO/V | **Port Connect Change Status (PCS):**<br>• 1=Change in Current Connect Status.<br>• 0=No change in Current Connect Status.<br>This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared. |
| 5 | 0x0<br>RW/1C/V | **Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data. |
| 4 | 0x0<br>RO/V | **Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory.<br>This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0.<br>***Note:*** This bit does not directly reflect the PxSERR.DIAG.F bit.<br>PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory.<br>Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3 | 0x0<br>RW/1C/V | **Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory. |
| 2 | 0x0<br>RW/1C/V | **DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory. |
| 1 | 0x0<br>RW/1C/V | **PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred.<br>This bit shall be set even if the data transfer resulted in an error. |
| 0 | 0x0<br>RW/1C/V | **Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory. |

## 50.4.69 Port [0-7] Interrupt Enable (PxIE4)—Offset 314h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 314h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect. |
| 30 | 0x0<br>RW | **Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt. |
| 29 | 0x0<br>RW | **Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt. |
| 28 | 0x0<br>RW | **Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt. |
| 27 | 0x0<br>RW | **Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt. |
| 26 | 0x0<br>RW | **Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt. |
| 25 | 0x0<br>RO | **RSVD0:** Reserved |
| 24 | 0x0<br>RW | **Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt. |
| 23 | 0x0<br>RW | **Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt.<br>BIOS is required to program this field to '0'. The same applies to AHCI driver. |
| 22 | 0x0<br>RW | **PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt. |
| 21:8 | 0x0<br>RO | **RSVD1:** Reserved |
| 7 | 0x0<br>RW/V | **Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt. |
| 6 | 0x0<br>RW | **Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt. |
| 5 | 0x0<br>RW | **Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt. |
| 4 | 0x0<br>RW | **Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt. |
| 3 | 0x0<br>RW | **Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt. |
| 2 | 0x0<br>RW | **DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt. |
| 1 | 0x0<br>RW | **PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt. |
| 0 | 0x0<br>RW | **Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt. |

## 50.4.70 Port [0-7] Command (PxCMD4)—Offset 318h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000004h

**BAR and Offset:** [ABAR] + 318h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RW | **Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface.<br>If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested.<br>If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect. |
| 27 | 0x0<br>RW | **Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h.<br>When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h.<br>If CAP.SALP is cleard to 0., software shall treat this bit as reserved. |
| 26 | 0x0<br>RW | **Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit.<br>Software shall only set this bit to 1 if CAP.SALP is set to 1.<br>If CAP.SALP is cleared to 0, software shall treat this bit as reserved.<br>BIOS is recommended to program this field to 1. |
| 25 | 0x0<br>RW | **Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI.<br>When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0.<br>This bit is set by software. |
| 24 | 0x0<br>RW | **Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device.<br>This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active. |
| 23 | 0x0<br>RW | **Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions.<br>When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions.<br>Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved. |
| 22 | 0x0<br>RO | **FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching. |
| 21 | 0x0<br>RW/O | **External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device.<br>When set to 1, CAP.SXS must also be set to 1.<br>When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only.<br>If ESP is set to '1', then the port may experience hot plug events. |
| 20 | 0x0<br>RO | **Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect. |
| 19 | 0x0<br>RW/O | **Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port.<br>If cleared to 0, the platform does not support a mechanical presence switch attached to this port. |
| 18 | 0x0<br>RW/O | **Hot Plug Capable Port (HPCP):** This indicates whether this port is connected to a device which can be hot plugged.<br>SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example).<br>This bit can be used by system software to indicate a feature such as eject device to the end-user. |
| 17 | 0x0<br>RW/V | **Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port.<br>When cleared, a Port Multiplier is not attached to the HBA for this port.<br>This bit is a read only 0 when CAP.PMS = 0., and read/write when CAP.PMS = 1.<br>Note that this bit is set by software; hardware does not auto-detect that a Port Multiplier is attached. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15 | 0x0<br>RO/V | **Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running. |
| 14 | 0x0<br>RO/V | **FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running. Note to software: When FR bit stays set, please read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any |
| 13 | 0x0<br>RO/V | **Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port.<br>If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0.<br>If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1.<br>If CAP.SMPS is set to 0 then this bit is cleared to 0.<br>Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1. |
| 12:8 | 0x0<br>RO | **Current Command Slot (CCS):** Indicates the current command slot the HBA is processing.<br>This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA.<br>This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command.<br>When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0.<br>After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0.<br>After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1.<br>For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1. |
| 7:5 | 0x0<br>RO | **RSVD1:** Reserved |
| 4 | 0x0<br>RW | **FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU.<br>When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence. |
| 3 | 0x0<br>RW/1S | **Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0.<br>This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register.<br>The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0.<br>A write to this register with a value of 0 shall have no effect. |
| 2 | 0x1<br>RO | **Power On Device (POD):** The SATA controller does not support cold presence detect. |
| 1 | 0x0<br>RW/V | **Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS.<br>This bit is read only 1. for HBAs that do not support staggered spin-up.<br>On an edge detect from 0. to 1, the HBA shall start a COMRESET initialization sequence to the device.<br>Clearing this bit causes no action on the interface.<br>Clearing this bit to0 does not cause any OOB signal to be sent on the interface.<br>When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode. |
| 0 | 0x0<br>RW | **Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list.<br>Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0.<br>Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also. |

## 50.4.71 Port [0-7] Serial ATA Status (PxSSTS4)—Offset 328h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 328h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RO | **RSVD0:** Reserved |
| 11:8 | 0x0<br>RO/V | **Interface Power Management (IPM):** Indicates the current interface state |
| 7:4 | 0x0<br>RO/V | **Current Interface Speed (SPD):** Indicates the negotiated interface communication speed. |
| 3:0 | 0x0<br>RO/V | **Device Detection (DET):** Indicates the interface device detection and Phy state. |

## 50.4.72 Port [0-7] Serial ATA Control (PxSCTL4)—Offset 32Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 32Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RO | **RSVD0:** Reserved |
| 19:16 | 0x0<br>RW | **Port Multiplier Port (PMP):** This field is not used by AHCI. |
| 15:12 | 0x0<br>RW | **Select Power Management (SPM):** This field is not used by AHCI. |
| 11:8 | 0x0<br>RW | **Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to.<br>If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state. |
| 7:4 | 0x0<br>RW | **Speed Allowed (SPD):** Indicates the highest allowable speed of the interface. |
| 3:0 | 0x0<br>RW | **Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization. |

## 50.4.73 Port [0-7] Serial ATA Error (PxSERR4)—Offset 330h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 330h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0 RW/1C/V | **Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes. |
| 15:0 | 0x0 RW/1C/V | **Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition.<br>If one or more of bits 11:8 of this register are set, the controller will stop the current transfer. |

## 50.4.74 Port [0-7] Serial ATA Active (PxSACT4)—Offset 334h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 334h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RW/1S/V | **Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry.<br>This field is cleared via the Set Device Bits FIS. |

## 50.4.75 Port [0-7] Commands Issued (PxCI4)—Offset 338h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 338h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RW/1S/V | **Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device.<br>When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot.<br>Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1. |

## 50.4.76 Port [0-7] SNotification (PxSNTF4)—Offset 33Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 33Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15:0 | 0x0<br>RW/1C/V | **PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set.<br>PM Port 0h sets bit 0.<br>PM Port Fh sets bit 15.<br>Individual bits are cleared by software writing 1's to the corresponding bit positions. Note that, while this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST |

## 50.4.77 Port [0-7] Command List Base Address (PxCLB5)—Offset 380h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 380h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 0x0<br>RW | **Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute.<br>This address must be 1K aligned as indicated by bits 31:10 being read/write.<br>***Note:*** These bits are not reset on a HBA reset. |
| 9:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 50.4.78 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU5)—Offset 384h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 384h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port.<br>This base is used when fetching commands to execute.<br>***Note:*** These bits are not reset on a HBA reset. |

## 50.4.79 Port [0-7] FIS Base Address (PxFB5)—Offset 388h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 388h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RW | **FIS Base Address (FB):** Indicates the 32-bit base for received FISes.<br>This address must be 256-byte aligned as indicated by bits 31:08 being read/write.<br>When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned.<br>***Note:*** These bits are not reset on a HBA reset. |
| 7:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 50.4.80 Port [0-7] FIS Base Address Upper 32-bits (PxFBU5)—Offset 38Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 38Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port.<br>***Note:*** These bits are not reset on a HBA reset. |

## 50.4.81 Port [0-7] Interrupt Status (PxIS5)—Offset 390h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 390h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect. |
| 30 | 0x0<br>RW/1C/V | **Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set. |
| 29 | 0x0<br>RW/1C/V | **Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer.<br>In PCI, such an indication would be a target or master abort. |
| 28 | 0x0<br>RW/1C/V | **Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory. |
| 27 | 0x0<br>RW/1C/V | **Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop. |
| 26 | 0x0<br>RW/1C/V | **Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation. |
| 25 | 0x0<br>RO | **RSVD0:** Reserved |
| 24 | 0x0<br>RW/1C/V | **Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command. |
| 23 | 0x0<br>RW/1C/V | **Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected.<br>The IPMS bit may be set during enumeration process.<br>It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier. |
| 22 | 0x0<br>RO/V | **PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state.<br>This bit reflects the state of PxSERR.DIAG.N.<br>This bit is RO and is only cleared when PxSERR.DIAG.N is cleared. |
| 21:8 | 0x0<br>RO | **RSVD1:** Reserved |
| 7 | 0x0<br>RW/1C/V | **Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device.<br>This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set). |
| 6 | 0x0<br>RO/V | **Port Connect Change Status (PCS):**<br>• 1=Change in Current Connect Status.<br>• 0=No change in Current Connect Status.<br>This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared. |
| 5 | 0x0<br>RW/1C/V | **Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data. |
| 4 | 0x0<br>RO/V | **Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory.<br>This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0.<br>Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory.<br>Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync. |
| 3 | 0x0<br>RW/1C/V | **Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2 | 0x0<br>RW/1C/V | **DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory. |
| 1 | 0x0<br>RW/1C/V | **PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred.<br>This bit shall be set even if the data transfer resulted in an error. |
| 0 | 0x0<br>RW/1C/V | **Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory. |

## 50.4.82 Port [0-7] Interrupt Enable (PxIE5)—Offset 394h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 394h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect. |
| 30 | 0x0<br>RW | **Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt. |
| 29 | 0x0<br>RW | **Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt. |
| 28 | 0x0<br>RW | **Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt. |
| 27 | 0x0<br>RW | **Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt. |
| 26 | 0x0<br>RW | **Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt. |
| 25 | 0x0<br>RO | **RSVD0:** Reserved |
| 24 | 0x0<br>RW | **Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt. |
| 23 | 0x0<br>RW | **Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt. BIOS is required to program this field to '0'.<br>The same applies to AHCI driver. |
| 22 | 0x0<br>RW | **PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt. |
| 21:8 | 0x0<br>RO | **RSVD1:** Reserved |
| 7 | 0x0<br>RW/V | **Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt. |
| 6 | 0x0<br>RW | **Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt. |
| 5 | 0x0<br>RW | **Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt. |
| 4 | 0x0<br>RW | **Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt. |
| 3 | 0x0<br>RW | **Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt. |
| 2 | 0x0<br>RW | **DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt. |
| 1 | 0x0<br>RW | **PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt. |
| 0 | 0x0<br>RW | **Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt. |

## 50.4.83 Port [0-7] Serial ATA Status (PxSSTS5)—Offset 3A8h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 3A8h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RO | **RSVD0:** Reserved |
| 11:8 | 0x0<br>RO/V | **Interface Power Management (IPM):** Indicates the current interface state |
| 7:4 | 0x0<br>RO/V | **Current Interface Speed (SPD):** Indicates the negotiated interface communication speed. |
| 3:0 | 0x0<br>RO/V | **Device Detection (DET):** Indicates the interface device detection and Phy state. |

## 50.4.84 Port [0-7] Serial ATA Control (PxSCTL5)—Offset 3ACh

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 3ACh

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RO | **RSVD0:** Reserved |
| 19:16 | 0x0<br>RW | **Port Multiplier Port (PMP):** This field is not used by AHCI. |
| 15:12 | 0x0<br>RW | **Select Power Management (SPM):** This field is not used by AHCI. |
| 11:8 | 0x0<br>RW | **Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to.<br>If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state. |
| 7:4 | 0x0<br>RW | **Speed Allowed (SPD):** Indicates the highest allowable speed of the interface. |
| 3:0 | 0x0<br>RW | **Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization. |

## 50.4.85 Port [0-7] Serial ATA Error (PxSERR5)—Offset 3B0h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 3B0h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0 RW/1C/V | **Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes. |
| 15:0 | 0x0 RW/1C/V | **Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition.<br>If one or more of bits 11:8 of this register are set, the controller will stop the current transfer. |

## 50.4.86 Port [0-7] Serial ATA Active (PxSACT5)—Offset 3B4h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 3B4h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RW/1S/V | **Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry.<br>This field is cleared via the Set Device Bits FIS. |

## 50.4.87 Port [0-7] Commands Issued (PxCI5)—Offset 3B8h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 3B8h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RW/1S/V | **Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device.<br>When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot.<br>Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1. |

## 50.4.88 Port [0-7] SNotification (PxSNTF5)—Offset 3BCh

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 3BCh

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15:0 | 0x0<br>RW/1C/V | **PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set.<br>PM Port 0h sets bit 0. PM Port Fh sets bit 15.<br>Individual bits are cleared by software writing 1's to the corresponding bit positions.<br>***Note:*** While this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST |

## 50.4.89 Port [0-7] Device Sleep (PxDEVSLP5)—Offset 3C4h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 1E022852h

**BAR and Offset:** [ABAR] + 3C4h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0x0<br>RO | **RSVD0:** Reserved |
| 28:25 | 0xf<br>RW/O/V | **DITO Multiplier (DM):** 0's based value that specifies the DITO multiplier that the HBA applies to the specified DITO value, effectively extending the range of DITO from 1ms to 16368ms.<br>A value of 0h indicates a multiplier of 1.<br>A maximum multiplier of 16 may be applied. |
| 24:15 | 0x4<br>RW/V | **DEVSLP Idle Timeout (DITO):** This field specifies the amount of the time (in approximate 1ms granularity) that the HBA shall wait before driving the DEVSLP signal. |
| 14:10 | 0xa<br>RW/V | **DEVSLP Minimum Assertion Time (MDAT):** This field specifies the minimum amount of time (in 1ms granularity) that the HBA must assert the DEVSLP signal before it may be de-asserted.<br>The nominal value is 10ms and the minimum is 1ms depending on device identification information. |
| 9:2 | 0x14<br>RW/V | **DEVSLP Exit Timeout (DETO):** This field specifies the maximum duration (in approximate 1ms granularity) from DEVSLP de-assertion until the device is ready to accept OOB.<br>The nominal value is 20ms while the max value is 255ms depending on device identification information. |
| 1 | 0x1<br>RW/O | **DEVSLP Present (DSP):** If set to '1', the platform supports DEVSLP on this port.<br>If cleared to '0', the platform does not support DEVSLP on this port. |
| 0 | 0x0<br>RW/V | **Aggressive DEVSLP Enable (ADSE):** This bit is read/write for HBAs that support aggressive DEVSLP management (CAP2. SADM = 1). |

## 50.4.90 Port [0-7] Command List Base Address (PxCLB6)—Offset 400h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 400h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 0x0<br>RW | **Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute.<br>This address must be 1K aligned as indicated by bits 31:10 being read/write.<br>***Note:*** These bits are not reset on a HBA reset. |
| 9:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 50.4.91 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU6)—Offset 404h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 404h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port.<br>This base is used when fetching commands to execute. Note that these bits are not reset on a HBA reset. |

## 50.4.92 Port [0-7] FIS Base Address (PxFB6)—Offset 408h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 408h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RW | **FIS Base Address (FB):** Indicates the 32-bit base for received FISes.<br>This address must be 256-byte aligned as indicated by bits 31:08 being read/write.<br>When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned.<br>***Note:*** These bits are not reset on a HBA reset. |
| 7:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 50.4.93 Port [0-7] FIS Base Address Upper 32-bits (PxFBU6)—Offset 40Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 40Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port.<br>***Note:*** These bits are not reset on a HBA reset. |

## 50.4.94 Port [0-7] Interrupt Status (PxIS6)—Offset 410h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 410h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect. |
| 30 | 0x0<br>RW/1C/V | **Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set. |
| 29 | 0x0<br>RW/1C/V | **Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer.<br>In PCI, such an indication would be a target or master abort. |
| 28 | 0x0<br>RW/1C/V | **Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory. |
| 27 | 0x0<br>RW/1C/V | **Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop. |
| 26 | 0x0<br>RW/1C/V | **Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation. |
| 25 | 0x0<br>RO | **RSVD0:** Reserved |
| 24 | 0x0<br>RW/1C/V | **Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command. |
| 23 | 0x0<br>RW/1C/V | **Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected.<br>The IPMS bit may be set during enumeration process.<br>It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier. |
| 22 | 0x0<br>RO/V | **PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state.<br>This bit reflects the state of PxSERR.DIAG.N.<br>This bit is RO and is only cleared when PxSERR.DIAG.N is cleared. |
| 21:8 | 0x0<br>RO | **RSVD1:** Reserved |
| 7 | 0x0<br>RW/1C/V | **Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device.<br>This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set). |
| 6 | 0x0<br>RO/V | **Port Connect Change Status (PCS):**<br>• 1=Change in Current Connect Status.<br>• 0=No change in Current Connect Status.<br>This bit reflects the state of PxSERR.DIAG.X.<br>This bit is only cleared when PxSERR.DIAG.X is cleared. |
| 5 | 0x0<br>RW/1C/V | **Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data. |
| 4 | 0x0<br>RO/V | **Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory.<br>This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0.<br>Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory.<br>Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3 | 0x0<br>RW/1C/V | **Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory. |
| 2 | 0x0<br>RW/1C/V | **DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory. |
| 1 | 0x0<br>RW/1C/V | **PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred.<br>This bit shall be set even if the data transfer resulted in an error. |
| 0 | 0x0<br>RW/1C/V | **Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory. |

## 50.4.95 Port [0-7] Interrupt Enable (PxIE6)—Offset 414h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 414h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect. |
| 30 | 0x0<br>RW | **Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt. |
| 29 | 0x0<br>RW | **Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt. |
| 28 | 0x0<br>RW | **Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt. |
| 27 | 0x0<br>RW | **Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt. |
| 26 | 0x0<br>RW | **Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt. |
| 25 | 0x0<br>RO | **RSVD0:** Reserved |
| 24 | 0x0<br>RW | **Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt. |
| 23 | 0x0<br>RW | **Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt. BIOS is required to program this field to '0'. The same applies to AHCI driver. |
| 22 | 0x0<br>RW | **PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt. |
| 21:8 | 0x0<br>RO | **RSVD1:** Reserved |
| 7 | 0x0<br>RW/V | **Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt. |
| 6 | 0x0<br>RW | **Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt. |
| 5 | 0x0<br>RW | **Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt. |
| 4 | 0x0<br>RW | **Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt. |
| 3 | 0x0<br>RW | **Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt. |
| 2 | 0x0<br>RW | **DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt. |
| 1 | 0x0<br>RW | **PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt. |
| 0 | 0x0<br>RW | **Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt. |

## 50.4.96 Port [0-7] Command (PxCMD6)—Offset 418h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000004h

**BAR and Offset:** [ABAR] + 418h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RW | **Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface.<br>If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested.<br>If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect. |
| 27 | 0x0<br>RW | **Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h.<br>When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h.<br>If CAP.SALP is cleared to 0., software shall treat this bit as reserved. |
| 26 | 0x0<br>RW | **Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit.<br>Software shall only set this bit to 1 if CAP.SALP is set to 1.<br>If CAP.SALP is cleared to 0, software shall treat this bit as reserved.<br>BIOS is recommended to program this field to 1. |
| 25 | 0x0<br>RW | **Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI.When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0.<br>This bit is set by software. |
| 24 | 0x0<br>RW | **Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device.<br>This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active. |
| 23 | 0x0<br>RW | **Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions.<br>When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions.<br>Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved. |
