

## FEATURES

Extreme high temperature operation up to 210°C

Latch-up proof

JESD78D Class II rating

Low leakage

Ultralow capacitance and charge injection

Source capacitance, off: 2.9 pF at ±15 V dual supply

Drain capacitance, off: 34 pF at ±15 V dual supply

Charge injection: 0.2 pC at ±15 V dual supply and  
+12 V single supply

Low on resistance: 290 Ω typical for dual supply at 210°C  
±9 V to ±22 V dual-supply operation

9 V to 40 V single-supply operation

48 V supply maximum rating

Fully specified at ±15 V, ±20 V, +12 V, and +36 V

V<sub>SS</sub> to V<sub>DD</sub> analog signal range

## APPLICATIONS

Downhole drilling and instrumentation

Avionics

Heavy industrial

High temperature environments

## GENERAL DESCRIPTION

The **ADG5298** is a latch-up proof, monolithic, complementary metal-oxide semiconductor (CMOS) analog multiplexer designed for operation up to 210°C. The **ADG5298** switches one of eight inputs to a common output, as determined by the 3-bit binary address lines, A0, A1, and A2.

An EN input enables or disables the device. When EN is disabled, all channels switch off. The ultralow capacitance and charge injection of this switch makes it an ideal solution for data acquisition and sample-and-hold applications, where low glitch and fast settling are required.

The switch conducts equally well in both directions when on, and it has an input signal range that extends to the power supplies. In the off condition, signal levels up to the supplies are blocked.

This multiplexer is available in a 16-lead ceramic flat package (FLATPACK) and a 16-lead ceramic flat package with reverse formed gullwing leads (FLATPACK\_RF). Both packages are designed for robustness at extreme temperatures and are qualified for up to 1000 hours of operation at the maximum temperature rating.

The **ADG5298** is a member of a growing series of high temperature qualified products offered by Analog Devices, Inc. For a complete selection table of available high temperature products, see the high temperature product list and qualification data available at [www.analog.com/hightemp](http://www.analog.com/hightemp).

## PRODUCT HIGHLIGHTS

1. Trench Isolation Guards Against Latch-Up and Minimizes Parasitic Leakage.  
A dielectric trench separates the P channel and N channel transistors to prevent latch-up even under severe overvoltage conditions.
2. Achieved JESD78D Class II rating.  
The **ADG5298** was stressed to ±500 mA with a 10 ms pulse at the maximum temperature of the device (210°C).
3. 0.2 pC Charge Injection.
4. Dual-Supply Operation.  
For applications where the analog signal is bipolar, the **ADG5298** can operate from dual supplies of up to ±22 V.
5. Single-Supply Operation.  
For applications where the analog signal is unipolar, the **ADG5298** can operate from a single rail power supply of up to 40 V.
6. 3 V Logic-Compatible Digital Inputs.  
V<sub>INH</sub> = 2.0 V, V<sub>INL</sub> = 0.8 V.
7. No Logic Power Supply (V<sub>L</sub>) Required.

Temperature Range	$-55^\circ\text{C}$ to $+210^\circ\text{C}$
Junction Temperature	$212^\circ\text{C}$
Reflow Soldering Peak Temperature, Pb Free	$260^\circ\text{C}$ (+ $0^\circ\text{C}$ / - $5^\circ\text{C}$ )

<sup>1</sup> Overvoltages at the Ax, EN, Sx, or D pins are clamped by internal diodes. Limit the current to the maximum ratings given.

<sup>2</sup> See Table 5.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

Only one absolute maximum rating can be applied at any one time.

## THERMAL RESISTANCE

Thermal performance is directly linked to printed circuit board (PCB) design and operating environment. Careful attention to PCB thermal design is required.

<sup>1</sup> Thermal impedance simulated values are based on JEDEC 2s2p thermal test board. See JEDEC JESD51.

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## TERMINOLOGY

### $I_{DD}$

$I_{DD}$  represents the positive supply current.

### $I_{SS}$

$I_{SS}$  represents the negative supply current.

### $V_D, V_S$

$V_D$  and  $V_S$  represent the analog voltage on Terminal D and Terminal Sx, respectively.

### $R_{ON}$

$R_{ON}$  is the ohmic resistance between Terminal D and Terminal Sx.

### $\Delta R_{ON}$

$\Delta R_{ON}$  represents the difference between the  $R_{ON}$  of any two channels.

### $R_{FLAT(ON)}$

Flatness that is defined as the difference between the maximum and minimum value of on resistance measured over the specified analog signal range is represented by  $R_{FLAT(ON)}$ .

### $I_S$ (Off)

$I_S$  (off) is the source leakage current with the switch off.

### $I_D$ (Off)

$I_D$  (off) is the drain leakage current with the switch off.

### $I_D$ (On), $I_S$ (On)

$I_D$  (on) and  $I_S$  (on) represent the channel leakage currents with the switch on.

### $V_{INL}$

$V_{INL}$  is the maximum input voltage for Logic 0.

### $V_{INH}$

$V_{INH}$  is the minimum input voltage for Logic 1.

### $I_{INL}, I_{INH}$

$I_{INL}$  and  $I_{INH}$  represent the low and high input currents of the digital inputs.

### $C_D$ (Off)

$C_D$  (off) represents the off switch drain capacitance, which is measured with reference to ground.

### $C_S$ (Off)

$C_S$  (off) represents the off switch source capacitance, which is measured with reference to ground.

### $C_D$ (On), $C_S$ (On)

$C_D$  (on) and  $C_S$  (on) represent on switch capacitances, which are measured with reference to ground.

### $C_{IN}$

$C_{IN}$  represents the digital input capacitance.

### $t_{ON}$ (EN)

$t_{ON}$  (EN) represents the delay time between the 50% and 90% points of the digital input and switch on condition.

### $t_{OFF}$ (EN)

$t_{OFF}$  (EN) represents the delay time between the 50% and 90% points of the digital input and switch off condition.

### $t_{TRANSITION}$

$t_{TRANSITION}$  represents the delay time between the 50% and 90% points of the digital inputs and the switch on condition when switching from one address state to another.

### Break-Before-Make Time Delay ( $t_D$ )

$t_D$  represents the off time measured between the 80% point of both switches when switching from one address state to another.

### Off Isolation

Off isolation is a measure of unwanted signal coupling through an off channel.

### Charge Injection

Charge injection is a measure of the glitch impulse transferred from the digital input to the analog output during switching.

### Crosstalk

Crosstalk is a measure of unwanted signal that is coupled through from one channel to another as a result of parasitic capacitance.

### Bandwidth

Bandwidth is the frequency at which the output is attenuated by -3 dB.

### On Response

On response is the frequency response of the on switch.

### AC Power Supply Rejection Ratio (ACPSRR)

ACPSRR is a measure of the ability of a device to avoid coupling noise and spurious signals that appear on the supply voltage pin to the output of the switch. The dc voltage on the device is modulated by a sine wave of 0.62 V p-p. The ratio of the amplitude of signal on the output to the amplitude of the modulation is the ACPSRR.

## THEORY OF OPERATION

The [ADG5298](#) is a latch-up proof, bidirectional, 8:1 CMOS multiplexer that is designed to operate at very high temperatures. The device is controlled by four parallel digital inputs (EN, A0, A1, and A2). The EN input allows for the [ADG5298](#) to be enabled or disabled. When the [ADG5298](#) is disabled, the source pins (S1 to S8) disconnect from the drain pin (D). When the [ADG5298](#) is enabled, the address lines (A0, A1, and A2) can determine which source pin (S1 to S8) is connected to the drain pin (D).

### TRENCH ISOLATION

In the [ADG5298](#), an insulating oxide layer (trench) is placed between the negative channel metal-oxide semiconductor (NMOS) and the positive channel metal-oxide semiconductor (PMOS) transistors of each CMOS switch. Parasitic junctions, which occur between the transistors in junction isolated switches, are eliminated, and the result is a completely latch-up proof switch that has minimal leakage over temperature.

In junction isolation, the N well and P well of the PMOS and NMOS transistors form a diode that is reverse biased under normal operation. However, during overvoltage conditions, this diode can become forward-biased. A silicon controlled rectifier (SCR) type circuit is formed by the two transistors, causing a significant amplification of the current that, in turn, leads to latch-up. With trench isolation, this diode is removed, and the result is a latch-up proof switch.

Figure 40. Trench Isolation

## APPLICATIONS INFORMATION

The ultralow capacitance and charge injection of this switch makes it an ideal solution for data acquisition and sample-and-hold applications, where low glitch and fast settling are required.

The [ADG5298](#) can operate in a wide ambient temperature range from  $-55^{\circ}\text{C}$  to  $+210^{\circ}\text{C}$ . Its wide range coupled with its

latch-up immune and low leakage features makes the [ADG5298](#) perfect for use in harsh environments, such as downhole drilling and avionics. The [ADG5298](#) has achieved a JESD78D Class II rating, handling stresses to  $\pm 500$  mA with a 10 ms pulse at the maximum operating temperature of the device ( $210^{\circ}\text{C}$ ).

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
