

+5V Powered Isolated RS-232 Drivers/Receivers

General Description

The MAX250 and MAX251 chip set form the heart of a complete, electrically isolated, RS-232 dual transmitter/receiver. By combining many functions on two chips, the cost and complexity required for an isolated digital interface is greatly reduced. Four low cost optocouplers, four capacitors, a diode and a small pot-core type transformer are all that are required to complete a 19.2k baud transceiver. Faster data rates are possible by using high speed optocouplers. In addition to the driving and receiving circuitry for the optocouplers, the chip set includes a push-pull transformer driver to supply power to the interface's isolated side.

Other convenient features include single +5V operation, a low power shutdown mode, and output enable control for three-state operation. The MAX250 and MAX251 are supplied in 14 lead DIP, 14 lead small outline and 20 leadless chip carrier packages.

The MAX252 has all the required components for RS-232 communication in a single package.

Applications

High Noise Data Communications
Industrial Communications
Data Links To Analog Circuits
Bridge Ground Differentials

Features

- ◆ Isolated Data Interface
- ◆ Single +5V Supply
- ◆ Uses Low Cost Optocouplers
- ◆ 5μW Low Power Shutdown
- ◆ 2 Transmitters and 2 Receivers

Ordering Information

| PART | TEMP. RANGE | PACKAGE* |
|-----------|-----------------|---------------------|
| MAX250CPD | 0°C to +70°C | 14 Lead Plastic DIP |
| MAX250CSD | 0°C to +70°C | 14 Lead SO |

MAX250/MAX251

+5V Powered Isolated RS-232 Drivers/Receivers

Figure 1. MAX250 Block Diagram

Figure 2. MAX251 Block Diagram

Typical Applications

Figure 3 shows the typical connection for a complete 19.2k baud isolated RS-232 circuit. Figure 3 also shows how 4N26 optocouplers can be replaced by 6N136 devices to achieve 90k baud rates.

A recommended printed circuit board layout is shown in Figure 4. This may be modified for individual designs but two important factors should be considered. 1.) To maximize isolation, the "isolation line" through the center of Figure 4 should not be breached. Connections and components from one side should not be located near those of the other side. 2.) Since the optocoupler outputs are relatively high impedance nodes, they should be located as close as possible to the MAX250 and MAX251. This minimizes stray capacitance and maximizes data rate.

When the MAX250's shutdown input (SHDN) is taken high, power is removed from the MAX251, and the RS-232 transmitter outputs (T1OUT, T2OUT) go to high impedance states. Timing plots in the Typical Operating Characteristics section show the turn-on and enable delays for various control functions.

The circuit in Figure 4 has been laid out so that it can be used for either a one or two sided PC board. The lines that are thick from one IC pad to the next IC pad are on the bottom side. Lines that are broken by a thin line can

either go on the top side of the board or on the bottom side with jumpers where the thin lines appear. At no time should any lines cross the middle of the board at the isolation barrier.

The MAX250 and MAX251 have a logic inversion in the optocoupler when using the standard configuration. For applications where no inversion is required, or more LED drive current is needed, Figure 5 shows the output structure of the LDR output. The LDR output can typically source 7mA and sink 25mA. Because of the higher sinking capability, a current limiting resistor is required.

Detailed Description

The MAX250 and MAX251, together with four optocouplers and a transformer, form an isolated dual RS-232 transmitter and receiver (See Figure 3). The MAX250 connects to the non-isolated or "logic" side of the interface, translating logic signals to and from the optocouplers, while the MAX251 resides on the isolated or "cable" side, translating data between the optocouplers and RS-232 line drivers and receivers. In addition to the optocoupler drivers and receivers, the MAX250 also contains isolation transformer drive circuitry which supplies power to the isolated side of the interface, and the MAX251.

MAX250/MAX251

+5V Powered Isolated RS-232 Drivers/Receivers

Figure 5. LDR Output Structure

MAX250

The MAX250 contains four identical noninverting drivers whose outputs may be used either as optocoupler LED drivers or as TTL/CMOS logic outputs. Each driver input ($T1_{IN}$, $T2_{IN}$, $R1_{DIN}$, $R2_{DIN}$) has a "weak" $4\mu A$ internal pull-up current source, and 0.5V of hysteresis to improve noise rejection. The input logic thresholds conform to standard TTL/CMOS specifications.

In normal operation, the MAX250 driver outputs ($T1_{LDR}$, $T2_{LDR}$, $R1_{OUT}$, $R2_{OUT}$) source 7mA via internal current sources and do not require limiting resistors when driving grounded optocoupler LEDs or CMOS/TTL logic inputs. The outputs can also sink up to 25mA when the current is limited by external resistors.

D1 and D2 are open-drain N-Channel MOSFETs which drive an external isolation transformer in push-pull fashion at 150kHz with a 50% duty cycle. A 1:1 transformer turns ratio provides a 10V peak-to-peak output at the secondary. Specifications and suitable manufacturer's part numbers for this transformer are listed in Tables 2 and 3. No transformer snubbers are required because D1 and D2 are protected against switching transients by internal 13.5V zener clamp diodes as shown in Figure 1.

The MAX250 functions also include an output enable control (EN) and a SHUTDOWN pin (SHDN). EN puts all driver outputs into a high impedance state when driven high. SHDN, when pulled high, disables the following MAX250 functions:

- 1.) Disables D1 and D2;
- 2.) Turns off the oscillator;
- 3.) Shuts off $4\mu A$ pull-up currents at driver inputs;
- 4.) Resets driver outputs to a low state;
- 5.) Lowers power consumption to $5\mu W$.

MAX251

The MAX251 connects to the "cable" side of the RS-232 interface and includes two line drivers and receivers along with circuitry to translate these levels to optocoupler signals. The RS-232 inputs ($R1_{IN}$, $R2_{IN}$) and outputs ($T1_{OUT}$, $T2_{OUT}$) completely conform to all EIA RS-232C and CCITT V.28 specifications. The receiver outputs ($R1_{LDR}$, $R2_{LDR}$) source 7mA and can drive optocoupler inputs without external current limiting resistors. The MAX251 transmitter inputs ($T1_{DIN}$, $T2_{DIN}$) contain $4\mu A$ internal pull-ups which allow direct connection to optocoupler output transistors, again without external resistors.

When the MAX251's $RTRI$ input is pulled high, the receiver outputs ($R1_{LDR}$, $R2_{LDR}$) are disabled and go to a high impedance state. In normal operation, this pin is left open or grounded.

Optocoupler Limitations

In Figure 3, the 4N26 optocouplers are connected in "diode mode" to optimize cost and data rate. While Current Transfer Ratio (CTR) is generally unspecified for this configuration, optocouplers from several manufacturers have been successfully tested in this circuit. The MAX250/MAX251 require a minimum optocoupler current transfer ratio of 0.12%, but may exhibit data rate limitations from the combined effect of higher MAX250/MAX251 drive and high optocoupler CTR.

The 6N136 optocouplers, shown in the inset in Figure 3 and listed in Table 1, operate in phototransistor mode, with limiting values of CTR specified by the manufacturers.

If further information is required, please contact Maxim Applications.

MAX250/MAX251

+5V Powered Isolated RS-232 Drivers/Receivers

Component Selection

Optoisolators

Optoisolator manufacturers are listed in Table 1 for easy selection. The MAX250/251 combination can be used with a 4N26 to obtain a 19.2k baud rate when used in the

diode-to-diode mode (base tied to the emitter). When the MAX250/251 is used with the 6N136, a 90k baud rate can be achieved when a 4k Ω pull-up resistor to 5V is used on pin 6 of the 6N136.

Table 1. Manufacturers of Optoisolators

| PART NO. | MFGS | SUGGESTED R _L | V _{IOS} (V _{PK}) | TYP. PROP t _{pHL} | t _{pLH} |

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
