Pulse Tolerance Specifications

Pulse tolerance is defined as a single pulse of a half sine wave (1/2 cycle or 8 milliseconds) that will not trip the breaker. An inertia wheel for increased pulse tolerance is available by specifying "P" after the time delay curve number in the ordering information. The table at right lists pulse tolerance values of standard and inertia delay models.

| Voltage | Time Delay Curve | Pulse Tolerance Value | |
|--------------|------------------|-----------------------|---------------|
| | | Standard | Inertia Delay |
| AC 50/60 Hz. | 2 | 7.5 | 18 |
| | 3 | 6 | 18 |
| | 10 | 18 | 30 |
| | 12 | 18 | 30 |
| | 13 | 18 | 30 |

To determine pulse tolerance multiply breaker rating by value in table. For example, a 2A breaker with time delay curve 3 has a standard pulse tolerance of 12A (2A x 6). The same breaker with an inertia delay has a pulse tolerance of 36A (2A x 18).
